**DIRECT TESTIMONY OF**
**GLENN A. WATKINS**
**IN THE MATTER OF THE APPLICATION OF**
**DUKE ENERGY CAROLINAS**
**DOCKET NO. E-7, SUB 909**

## I. INTRODUCTION

**Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

A. My name is Glenn A. Watkins. My business address is James Center III, 1051 East Cary Street, Suite 601, Richmond, VA 23219.

**Q. WHAT IS YOUR PROFESSIONAL AND EDUCATIONAL BACKGROUND?**

A. I am a Principal and Senior Economist with Technical Associates, Inc., which is an economics and financial consulting firm with an office in Richmond, Virginia. Except for a six month period during 1987 in which I was employed by Old Dominion Electric Cooperative, as its forecasting and rate economist, I have been employed by Technical Associates continuously since 1980.

During my career at Technical Associates, I have conducted marginal and embedded cost of service, rate design, cost of capital, and load forecasting studies involving numerous electric, gas, water/wastewater, and telephone utilities, and have provided expert testimony in Alabama, Arizona, Georgia, Kansas, Kentucky, Maine, Maryland, Massachusetts, Michigan, New Jersey, Ohio, Illinois, Pennsylvania, Vermont, Virginia, South Carolina, Washington, and West Virginia. A more complete description of my education and experience is provided in Watkins Exhibit 1.

**Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?**

A. Technical Associates has been retained by the North Carolina Office of Attorney General ("OAG") to evaluate the accuracy and reasonableness of Duke Energy Carolinas ("Duke" or "Company") jurisdictional retail class cost of service study ("CCOSS"), proposed distribution of revenues by class, and residential rate design. The purpose of my testimony, therefore, is to comment on Duke's proposals on these issues and to present my findings and recommendations based on the results of the studies I have undertaken on behalf of the OAG.

**Q. DOES YOUR TESTIMONY INCLUDE ANY EXHIBITS?**

A. Yes. I have prepared seven exhibits. Watkins Exhibit 1 provides my background and experience profile. Watkins Exhibit 2 evaluates specific generation units within Duke Energy Carolina's portfolio of generation assets as to their purposes and utilizations within the overall portfolio of assets. Watkins Exhibit 3 provides the results of my class cost of service study for Duke's North Carolina retail customers under current rates using my recommended "Base Intermediate Peak" method to assign generation investment to individual classes. Watkins Exhibit 4 provides the results of an alternative class cost of service study using the "Summer Peak & Average" method, which is also an acceptable approach for allocating of Duke's production investment. Watkins Exhibit 5 provides the details of Duke's customer-related costs for Residential customers. Watkins Exhibit 6 provides a sample bill rendered to Duke's North Carolina customers, while Watkins Exhibit 7 provides a much better and more detailed sample bill provided to customers in Kentucky.

1 **Q. PLEASE PROVIDE A SUMMARY OF YOUR TESTIMONY.**

2 A. First, I will provide an explanation of cost of service study concepts.

3 Second, I will discuss the strengths and weaknesses of the summer CP method
4 advocated by Duke for allocation of production costs and the alternative study that Duke
5 prepared using the Summer Winter Peak & Average method. I will recommend two
6 other methods that allocate production costs based on factors that drive those costs; the
7 Base Intermediate Peak method or the Summer Peak and average method.

8 Third, I will describe Duke's proposal for allocation of the proposed revenue
9 increase among rate classes, and my alternative recommendations based on the results of
10 my analysis of class cost of service studies and other ratemaking considerations.

11 Fourth, I will discuss Duke's proposed rate design and recommend a reduction of
12 the Basic Facilities Charge applicable to residential customers from $7.87 per month to
13 $7.00 per month, or maintenance of the same rate, depending on whether an overall
14 percentage increase in rates is approved. In addition, I will recommend that Duke
15 conduct a study of the potential benefits and impacts of adopting an inverted block rate
16 structure designed to send a price signal to residential customers to conserve energy and
17 reduce incremental usage in peak months, and present its findings in advance of its next
18 rate case.

19 Fifth, I will discuss the lack of information currently provided in Duke's bills
20 rendered to its North Carolina customers and recommend that more detailed information
21 be provided in customer's bills as is the practice in some other Duke jurisdictions.

22

23

## II. CLASS COST OF SERVICE

**Q. PLEASE EXPLAIN THE CONCEPTS OF COST OF SERVICE STUDIES.**

A. First, I note that there are two types of cost of service studies used for public utility ratemaking: marginal cost studies; and embedded, fully allocated cost studies. Duke has utilized a traditional embedded cost of service concept in this case for purposes of establishing its overall retail revenue requirement, as well as for its class cost of service study. As such, I will limit my explanation to embedded class cost of service studies.

Embedded cost of service studies are often referred to as fully allocated cost studies. This is because the vast majority of an electric utility's plant investment serves all customers, and the majority of expenses are incurred in a joint manner such that these costs cannot be specifically attributed to any individual customer or group of customers. To the extent that certain costs can be specifically attributable to a particular customer (or group of customers), these costs are directly assigned in a cost of service study. However, the vast majority of a utility's Production, Transmission, and Distribution plant and expenses are incurred jointly to serve all (or most) customers. These joint costs are then allocated to jurisdictions and/or rate classes. It is generally recognized that to the extent possible, joint costs should be allocated to classes based on the concept of cost causation; i.e., costs are allocated based on specific factors that cause costs to be incurred by the utility. Although cost analysts generally strive to abide by the concept of cost causation to the greatest extent practical, some costs (particularly overhead costs), cannot be attributed to specific exogenous factors and must be subjectively assigned or allocated

to rate classes. With regard to those costs in which cost causation can be attributed, cost of service experts often disagree as to what is the most cost causative factor; e.g., peak demand, energy usage, number of customers, etc.

**Q. PLEASE IDENTIFY AND EXPLAIN THE PURPOSES AND USE OF COST OF SERVICE STUDIES IN THIS PROCEEDING.**

A. Duke utilizes its embedded cost of service studies for two purposes in this case. First, Duke's cost of service model is used to allocate joint Company-wide costs to its various jurisdictions and types of business (e.g., North Carolina retail, wholesale, etc.) for purposes of determining its jurisdiction's overall revenue requirement. Second, the Company's model assigns the previously assigned (allocated) North Carolina retail costs to individual retail classes in order to assess the relative contributions to operating income each class is making under current rates which then serves as a guide in establishing class revenue responsibility.

My investigation and analyses have focused on the latter purpose; i.e., the assignment of cost responsibility to North Carolina retail classes. I have utilized the same jurisdictional costs throughout my investigation. In this way, the Commission and parties will have a consistent apples to apples comparison of the effects and impacts on North Carolina retail classes under various class cost of service methodologies and results.

**Q. PLEASE EXPLAIN HOW YOU PROCEEDED WITH YOUR ANALYSIS OF DUKE'S CCOSS.**

A. The process in which I conducted my analysis in this case was identical to how I evaluate all CCOSSs. First, I reviewed the structure and organization of the Company's CCOSS sponsored by witness Phillip Stillman. Once the basic structure was understood, I reviewed the accuracy and completeness of the primary drivers (allocators) used to assign costs to rate schedules and classes. Next, I reviewed Duke's selection of allocators to specific rate base, revenue and expense accounts. I then verified the accuracy of the Company's CCOSS model by replicating its results using my own computer model. Finally, I adjusted certain aspects of the Company's study to better reflect cost causation and cost incidence by rate schedule and customer class.

**Q. ONCE YOU UNDERSTOOD THE STRUCTURE AND ORGANIZATION OF DUKE'S MODEL, DID YOU FIND IT TO BE MATHEMATICALLY ACCURATE?**

A. Yes. With the exception of one inconsequential item, I found Duke's CCOSS to be mathematically accurate and I was able to replicate the results.[1]

**Q. DID YOUR INVESTIGATION RESULT IN ANY DISAGREEMENTS WITH THE ASSUMPTIONS OR METHODOLOGIES USED BY MR. STILLMAN?**

A. Yes. The substantial disagreement that I have with Mr. Stillman is his use and reliance on the single coincident peak (1-CP) method to allocate generation costs. My recommendation concerning allocation of generation costs has a material impact on CCOSS results. I do not pursue changes to the study relating to Duke's transmission and

[1] This exception relates to the allocation of a single account (Adjustment Merger Condition #23). The allocator used for this account was not properly calculated such that the amount assigned to the General Service class served as a residual to ensure the sum of the classes equal the total North Carolina retail amount.

distribution plant costs because, although I do not agree with the methods used by Mr. Stillman in some respects, the impact of any changes I would make on the CCOSS would not appear to make a substantial enough difference to pursue in this case.

**Q. YOU INDICATE THAT YOU DISAGREE WITH MR. STILLMAN'S RELIANCE ON THE 1-CP METHOD TO ALLOCATE GENERATION COSTS. ARE THERE OTHER RECOGNIZED METHODOLOGIES WHICH MAY BE USED TO ALLOCATE GENERATION-RELATED PLANT AND EXPENSES?**

A. Yes. Although not supported by Mr. Stillman, he also conducted another CCOSS using an alternative methodology known generically as the Peak and Average method. In addition to the 1-CP and Peak and Average methods, there are several other allocation methods utilized in the electric industry to assign generation-related costs. The current National Association of Regulatory Utility Commissioners ("NARUC") Electric Utility Cost Allocation Manual discusses at least thirteen embedded demand allocation methods, while Dr. James Bonbright notes the existence of at least 29 demand allocation methods in his treatise, Principles of Public Utilities Rates.

**Q. WHY DO SO MANY GENERATION ALLOCATION METHODS EXIST FOR THE ELECTRIC INDUSTRY?**

A. Utilities design and build generation facilities to meet both the energy and demand requirements of their customers on a collective basis. Because of this, and the physical laws of electricity, it is impossible to determine which customers are being served by which facilities. As such, production facilities are joint costs; i.e., used by all

customers. Because of this commonality, production-related costs are not directly known for any customer or customer group and must somehow be allocated.

If all customer classes used electricity at a constant rate throughout the year, there would be no disagreement as to the proper assignment of generation-related costs: all analysts would agree that energy usage in terms of KWH would be the proper approach to reflect cost causation and cost incidence. However, such is not the case in that Duke experiences periods (hours) of much higher demand during certain times of the year and across various hours of the day. Moreover, all customer classes do not contribute in equal proportions to these varying demands placed on the generation system. To complicate matters, the electric utility industry is somewhat unique in that there is a distinct energy/capacity trade-off relating to generation costs. That is, utilities design their mix of production facilities (generation and power supply) to minimize the total costs of energy, while also ensuring there is enough available capacity to meet peak demands. The trade-off occurs between the level of fixed investment per unit of capacity (KW) and the variable cost of producing a unit of output (KWH). Coal and nuclear units require high capital expenditures resulting in large investments per KW, whereas smaller units with higher variable production costs generally require significantly less investment per KW of capacity. Due to varying levels of demand placed on the system over the course of each day, month, and year, there is a unique optimal mix of production facilities for each utility that minimizes the total cost of capacity and energy; i.e., its cost of service.

Therefore, as a result of the energy/capacity cost trade-off, and the fact that the service requirements of each utility are unique, many different allocation methodologies

have evolved in an attempt to equitably allocate joint production costs to individual classes.

**Q. PLEASE EXPLAIN.**

A. Total production costs vary each hour of the year. Theoretically, energy and capacity costs should be allocated to classes each and every hour of the year. This would result in 8,760 hourly allocations during non-leap years. Although such an analysis is certainly possible with today's technology, the time and cost necessary for such an undertaking would likely exceed the additional benefits obtained over simpler methods. This is because the analyst does not know actual class loads each and every hour, and subjective decisions must still be made regarding the assignment of fixed investment (capacity costs) to individual hours. With this practical constraint in mind, each method has its strengths and weaknesses regarding its reasonableness in reflecting cost causation as well as the cost and effort required to produce a study.

**Q. PLEASE DISCUSS THE SINGLE COINCIDENT PEAK METHOD ADVOCATED BY DUKE.**

A. The basic concept underlying the Single Coincident Peak ("1-CP") method is that an electric utility must have enough capacity available to meet its customers' peak coincident demand. As such, advocates of the 1-CP method reason that customers (or classes) should be responsible for fixed capacity costs based on their respective contributions to this peak system load. The major advantages to the 1-CP method are that the concepts are easy to understand, the analyses required to conduct a CCOSS are

relatively simple, and the data requirements are significantly smaller than some of the more complex methods.

The 1-CP method has several shortcomings, however. First, and foremost, is the fact that the 1-CP method totally ignores the capacity/energy trade-off inherent in the electric utility industry. That is, the sole criterion for assigning one hundred percent of fixed capacity costs is the classes' relative contributions to load during a single hour of the year. This method ignores and does not consider, in any way, the extent to which customers use these facilities during the other 8,759 hours of the year, nor does it consider the bases or reasons that the plant investment was incurred; i.e., why the generation mix of plants were placed into service. This may have severe consequences because a utility's planning decisions regarding the amount and type of generation capacity to build and install is predicated not only on the maximum system load, but also on how customers demand electricity throughout the year, i.e., load duration. To illustrate, if a utility such as Duke, had a peak load of 20,000 MW and its actual optimal generation mix included an assortment of nuclear, coal, hydro, combined cycle and combustion turbine units, the total actual cost of capacity would be significantly higher than if the utility only had to consider meeting 20,000 MW for 1 hour of the year. This is because the utility would install the cheapest type of plant, (i.e., peaker units) if it only had to consider one hour a year.

There are two other major shortcomings of the 1-CP method, First, the results produced with this method can be unstable from year to year. This is because the hour in which a utility peaks annually is largely a function of weather. Therefore, annual peak load depends on when severe weather occurs. If this occurs on a weekend or holiday,

relative class contributions to the peak load will likely be significantly different than if the peak occurs during a weekday. The other major shortcoming of the 1-CP method is often referred to as the "free ride" problem. This problem can easily be seen with a summer peaking utility that peaks about 5:00 p.m. in a Summer month. Because outdoor lights are not illuminated at this time of day, this class is not assigned any capacity costs at all and will enjoy a free ride in terms of the assignment of generation costs.

Indeed, all of the shortcomings of the 1-CP methodology are present in Duke's CCOSS. As will be discussed in more detail later, the majority of Duke's generation portfolio (in terms of capacity) is comprised of base load nuclear and coal units that were very expensive per KW of capacity to install, but produce inexpensive energy throughout the year. As such, because the base load units operate almost constantly throughout the year, these high fixed costs are spread over many units of energy (KWH) output. However, the 1-CP method advocated by Duke does not reflect this reality in that all production (generation) rate base is assigned based on the load at an instantaneous (one hour) point in time.

**Q. PLEASE DISCUSS AND EXPLAIN THE BASE INTERMEDIATE PEAK METHOD THAT YOU RECOMMEND.**

A. The Base/Intermediate/Peak ("BIP") method, also known as a production stacking method, explicitly recognizes the capacity and energy tradeoff inherent with generating facilities in general, and specifically recognizes the mix of a particular utility's resources used to serve the varying demands throughout the year. The BIP method classifies and

assigns individual generating resources based on their specific purpose and role within the utility's actual portfolio of production resources.

The basic premise of the BIP method is that individual generating units are placed into service to meet various needs of the system. Expensive base load units, with high capacity factors run constantly throughout the year to meet the energy needs of all customers. These units operate during all periods of demand including low system load as well as during peak use periods. Base load units are, therefore, classified and allocated based on their roles within the utility's portfolio of resource; i.e., energy requirements. At the other extreme are the utility's peaker units that are designed, built, and operated only to run a few hours of the year during peak system requirements. These peaker units serve only peak loads and are, therefore, classified and allocated on peak demand. Situated between the high capacity cost/low energy cost baseload units and low capacity cost/high energy cost peaker units are intermediate generating resources. These units may not be dispatched during the lowest periods of system load but, due to their relatively efficient energy costs, are operated during many hours of the year. Intermediate resources are classified and allocated based on their relative usage to peak capability ratios; i.e., their capacity factor. Finally, hydro units are evaluated on a case by case basis. This is because there are several types of hydro generating facilities including run of the river units that run most of the time with no fuel costs, and units powered by stored water in reservoirs that operate under several environmental and hydrological constraints including flood control, downstream flow requirements, management of fisheries, and watershed replenishment. Within the constraint just noted and due to their ability to store potential energy, these units are generally dispatched on a seasonal or

diurnal basis to minimize short-term energy costs and also assist with peak load requirements. Pumped storage units are unique in that water is pumped up to a reservoir during off-peak hours (with low energy costs) and released during peak hours of the day. Depending on the characteristics of a unit, hydro facilities may be classified as energy-related (e.g., run of the river), peak-related (e.g., pumped storage) or a combination of energy and demand-related (traditional reservoir storage).

**Q. PLEASE DISCUSS THE PEAK AND AVERAGE METHOD USED IN DUKE'S ALTERNATIVE COST STUDY AND IN YOUR ALTERNATIVE COST STUDY.**

A. There are various Peak and Average ("P&A") methodologies that rest on the premise that a utility's actual generation facilities are placed into service to meet peak load and to serve consumers' loads throughout the entire year. Hence, the P&A method assigns capacity costs partially on the basis of contributions to peak load and partially on the basis of consumption throughout the year. Although there is not universal agreement on how peak demands should be measured or how the weighting between Peak and Average demands should be performed, most P&A studies use class contributions to coincident-peak demand for the "peak" portion, and weight the Peak and Average loads based on the system coincident load factor, e.g., the load factor represents the portion assigned based on consumption (average demand).

A major strength of the P&A method is that an attempt is made to recognize the capacity/energy trade-off in the assignment of fixed capacity costs. Another strength is that data requirements are minimal. However, recognition of the capacity/energy trade-off is not based on a detailed analysis of operational and design factors.

As mentioned by Mr. Stillman, a potential weakness of the P&A method is that a significant amount of fixed capacity investment is allocated to classes based on energy consumption, with no recognition given to lower variable fuel costs that occur during off-peak periods. This can result in an overburdening of costs if fuel costs vary significantly by hour. However, depending on consumption patterns of the utility's various classes , the impact may be insubstantial on an overall annual basis, and the P&A method can produce fair and reasonable results. I will explain the significance of this potential weakness as it specifically applies to Duke later in my testimony.

**Q. MR. WATKINS, YOU HAVE DISCUSSED THE STRENGTHS AND WEAKNESSES OF VARIOUS GENERATION ALLOCATION METHODOLOGIES. ARE ANY OF THESE METHODS CLEARLY INFERIOR IN YOUR VIEW?**

A. Yes. In my opinion the 1-CP method does not reasonably reflect cost causation for integrated electric utilities because it ignores how a utility's facilities are used. If a utility were only concerned with being able to meet peak load with no regard to running costs, it would simply install inexpensive peakers. Under such an unrealistic system design, plant investment costs would be much lower but variable fuel costs would be extremely high and would result in a higher overall cost to serve customers. This is because generation investment costs vary from a low of a few hundred dollars per KW of capacity for high running cost (energy cost) peakers to several thousand dollars per KW for base load nuclear facilities with low running costs. The 1-CP and seasonal CP methods ignore this very important fact.

**Q. WITH REGARD TO THE SPECIFIC CHARACTERISTICS OF THE DUKE SYSTEM, WHICH METHODS ARE MORE APPROPRIATE?**

A. Recognition should be given to the actual utilization of Duke's generating resources. More than half of Duke's installed capacity (KW) consists of baseload units designed to serve energy use and load requirements throughout the year and about two-thirds of the gross investment in generation plant is comprised of base load units. Approximately 88% of Duke's total annual energy is generated from these baseload units. Thus, a cost allocation method that recognizes annual usage (energy) is most appropriate. In my opinion, the BIP method is best suited for Duke, followed by the Peak and Average method using Summer only demands.

**Q. HOW DOES YOUR SUMMER ONLY PEAK AND AVERAGE STUDY DIFFER FROM THE PEAK AND AVERAGE STUDY CONDUCTED BY DUKE?**

A. Duke's Peak and Average study assigns the Peak portion of generation costs based on the average of the Summer and Winter contributions to coincident peak demands. Mr. Stillman opines that this method is not appropriate (in part) because Duke is a Summer only peaking utility and that Winter demands should not be considered. I agree with Mr. Stillman, at least for purposes of conducting a Peak and Average study. The concepts behind the Peak and Average method are simply that generation costs should consider both energy (average demand) and Peak demand. Duke's peak demand clearly occurs in the Summer and Duke has not been a Summer/Winter peaking utility for many years. Therefore, it is appropriate to use the Summer only Peak and Average method.

**Q. EARLIER YOU DISCUSSED A POTENTIAL WEAKNESS OF METHODS THAT ALLOCATE A SIGNIFICANT AMOUNT OF FIXED PLANT INVESTMENT BASED ON ANNUAL ENERGY CONSUMPTION WITHOUT RECOGNITION OF LOWER VARIABLE FUEL COSTS THAT OCCUR DURING OFF PEAK HOURS. IS THIS POTENTIAL WEAKNESS APPLICABLE TO DUKE?**

A. For all intents and purposes, no.

**Q. PLEASE EXPLAIN.**

A. The potential weakness of not specifically recognizing time-differentiated fuel energy costs by customer class is generally present when there is a wide difference between off-peak and average annual fuel costs. In order to understand this relationship, one must consider the load duration curve of the utility in relation to its mix of generating resources. Duke's load duration curve is such that the vast majority of hours within the year are either low cost or intermediate cost hours. Although the fuel cost per KWH produced during peak periods is high, the total energy produced during high cost hours is small relative to total annual overall output. Similarly, because the vast majority of Duke's annual energy is produced from low-fuel-cost baseload units -- even during periods of peak demand -- the cost of off-peak energy is not considerably lower than the average energy cost over the entire year.

1 **Q. DID YOU ATTEMPT TO INVESTIGATE WHAT, IF ANY, SPECIFIC**
2 **DIFFERENCES EXIST IN DUKE'S ENERGY OR FUEL COSTS BY**
3 **CUSTOMER CLASS?**
4 A. Yes. In OAG Data Request 1-22, I requested that Duke provide time
5 differentiated fuel costs by classes. Duke was only able to provide average hourly costs
6 for the total Duke system, not class differentiated costs.
7
8 **Q. WERE YOU ABLE TO EVALUATE IF ANY SUCH DIFFERENCES EXIST?**
9 A. Yes. Duke's total annual energy output, and hence, average energy cost per
10 KWH is predominated by low cost base load generation. As shown on Page 1 of my
11 Watkins Schedule 2, Duke's base load units produce 88.7% of its generated electricity at
12 an average variable O&M cost of 2.659¢/KWH ($26.59/MWH). If we associate the base
13 load cost with the least expensive off-peak energy costs and compare it with the annual
14 average energy cost of 2.857¢/KWH (also presented in Watkins Schedule 2) the
15 difference in cost is about 2 mills per KWH (2.857¢ - 2.659¢). Considering that all but
16 perhaps street lighting customers also consume energy during periods of higher energy
17 costs (daylight hours), any difference in class energy costs is de minimus. Again, in
18 understanding this relationship, one must recognize two important factors: (1) high cost
19 peak hours represent a small percentage of the hours within a year; and, (2) the vast
20 majority of Duke's annual energy is produced from low cost units which operate during
21 the entire year. Furthermore, Duke has been able to significantly reduce peak period
22 energy costs with the operation of its pumped storage facilities. These pumped storage
23 units utilize cheap energy available at night in order to utilize this generation source

during high cost peak periods of the day, thereby significantly reducing the energy costs associated with peak periods.

**Q. HAVE YOU STUDIED CLASS ENERGY COSTS FOR OTHER UTILITIES SIMILAR TO DUKE?**

A. Yes. As an example, in a case before the Virginia State Corporation Commission, Dominion Power (known as Dominion North Carolina Power in this state) calculated fuel costs by retail rate class.[2] Dominion's portfolio of generating assets is similar to that of Duke's. Moreover, Dominion's load duration curve is very similar to Duke's profile. Dominion calculated fuel costs for each class and concluded that there were no material differences in non-lighting classes. The case in question involved an investigation as to whether fuel costs should be class- or time-differentiated. Dominion's analyses concluded that the differences were so small across classes that class differentiation was not warranted. Moreover, Dominion's study found the average fuel cost to the Large Commercial class was the same as the Residential class, and the Small Commercial class was about one-tenth of one mill ($0.0001) higher per KWH than that for the Residential and Large Commercial/Industrial classes. My own analysis in that case produced similar results to the study conducted by Dominion and only the street lighting class had an energy cost different than the other retail classes.[3]

---

[2] Virginia State Corporation Commission Case No. PUE960296.

[3] The street lighting class' fuel cost was found to be about five-tenths ($0.0005) of one mill cheaper per KWH compared to the non-lighting classes.

**Q. ON PAGE 15 OF HIS DIRECT TESTIMONY, DUKE WITNESS STILLMAN DISCUSSES WHAT HE PERCEIVES TO BE THE "ONE-SIDED" EFFECT OF USING A PEAK AND AVERAGE APPROACH. DO YOU AGREE WITH MR. STILLMAN'S ASSERTION?**

A. No. Mr. Stillman skirts the issue that most of Duke's investment in generating facilities is attributable to plant designed and placed in-service to meet energy requirements at low cost throughout the year and not simply to meet peak load for a single hour. As I discussed earlier, Duke's generation portfolio is dominated by base load units that serve all customers throughout the year. It is one-sided to focus only on peak demand, and to ignore what drives most of Duke's generation investment. Moreover, there are no significant differences among class energy costs for Duke.

**Q. MR. STILLMAN'S EXHIBIT 1 PROVIDES A COMPARISON OF GENERATION (PRODUCTION) PLANT ALLOCATED UNDER THE 1-CP AND SWPA METHODS. ON PAGE 15, MR. STILLMAN CLAIMS THAT THIS COMPARISON ILLUSTRATES THE INEQUITABLE IMPACT THE SUMMER/WINTER PEAK AND AVERAGE ("SWPA") METHOD WOULD HAVE ON HIGH LOAD FACTOR CUSTOMERS. DO YOU AGREE WITH MR. STILLMAN'S ASSESSMENT?**

A. No. Mr. Stillman's Exhibit 1 is expressed in terms of coincident peak demand only. That is, Mr. Stillman calculates class allocated production plant amounts and then expresses the allocated amounts in terms of contribution to coincident peak demands, which he calls "Production Plant Cost Per KW." This calculation is meaningless in that

only one hour under the 1-CP method is considered and two hours under the SWPA method are considered. Mr. Stillman's calculations in no way show how, or why production costs are incurred, nor do they show how Duke's facilities are dispatched throughout the year to serve all customer loads.

**Q. HAVE YOU CONDUCTED CCOSS ANALYSES USING THE METHODS YOU HAVE RECOMMENDED?**

A. Yes. I have conducted CCOSS analyses using the BIP method and the Summer (only) Peak and Average method.

**Q. OF THE TWO CCOSS METHODS YOU RECOMMEND, IS ONE SUPERIOR TO THE OTHER CONCEPTUALLY?**

A. Yes. The BIP method best reflects the cost causation and incidence of generating plant utilization. This is so because individual units are evaluated as to the purpose, need, and use within Duke's portfolio of production assets. That is, some generation units are clearly installed with a cost structure trade-off (capital costs versus energy costs) to meet energy requirements throughout the year (baseload units), other units are installed to serve peak demands based on the opposite trade-off, and still some units are installed with both an energy and peak demand trade-off of costs to meet Duke's energy and peak demand requirements of its load duration curve. The latter represents the distribution of Duke's hourly customer loads over an annual period that needs to be met by its available power supply resources. The actual dollar investment in facilities serving energy requirements are allocated on energy usage (MWH) while the actual investment in

facilities serving peak load requirements are allocated on coincident peak demand. The Summer only Peak and Average method, while not as strong analytically as the BIP method, produces very similar results to those achieved under my BIP method.

**Q. PLEASE PROVIDE A SUMMARY OF RESULTS UNDER THE COMPANY'S 1-CP METHOD AND UNDER YOUR RECOMMENDED BIP AND SUMMER PEAK AND AVERAGE METHODS.**

A. The following is a summary of class rates of return on rate base as well as indexed class rates of return under current rates using the Company's 1-CP method, the BIP method and the Summer Peak and Average method to allocate generation plant:

| | Rate of Return | | | Indexed Rate of Return | | |
|---|---|---|---|---|---|---|
| | Company 1-CP | Watkins BIP | Watkins Peak & Avg. | Company 1-CP | Watkins BIP | Watkins Peak & Avg. |
| **Rate RS (Residential)** | | | | | | |
| Rate RS | 5.49% | 7.16% | 6.74% | 92.58% | 120.74% | 113.66% |
| Rate RE | 6.69% | 6.39% | 6.46% | 112.82% | 107.76% | 108.94% |
| **Total Rate RS** | **5.97%** | **6.83%** | **6.62%** | **100.67%** | **115.18%** | **111.64%** |
| **Rate GS (General Service)** | | | | | | |
| Rate SGS | 6.12% | 8.68% | 7.96% | 103.20% | 146.37% | 134.23% |
| Rate LGS | 8.02% | 9.13% | 8.86% | 135.24% | 153.96% | 149.41% |
| Rate NPL_SG | 8.38% | 9.60% | 9.30% | 141.32% | 161.89% | 156.83% |
| Rate NPL_LG | 11.21% | 8.93% | 9.43% | 189.04% | 150.59% | 159.02% |
| **Total Rate GS** | **6.95%** | **8.88%** | **8.36%** | **117.20%** | **149.75%** | **140.98%** |
| **Rate LT (Lighting)** | | | | | | |
| Rate OL | 10.09% | 7.48% | 8.04% | 170.15% | 126.14% | 135.58% |

1 **Q. DO YOU HAVE ANY SCHEDULES THAT PROVIDE THE DETAILS OF YOUR**
2 **ANALYSES?**
3 A. Yes. Watkins Exhibit 2 provides the details of the development of my Base
4 Intermediate Peak ("BIP") allocation factor in which each generation unit is evaluated to
5 determine whether it should be allocated based on energy, peak demand, or a
6 combination of energy and peak demand. Watkins Exhibit 3 provides the detailed output
7 of my CCOSS analyses (at current rates) using the BIP method, while Watkins Exhibit 4
8 provides the details of my Summer Peak and Average CCOSS. It should be noted that all
9 other aspects of my BIP and Summer Peak and Average studies are identical to Duke's 1-
10 CP study. Furthermore, as indicated earlier, my BIP and Summer Peak and Average
11 studies all use the same total North Carolina retail jurisdiction costs as used in Duke's 1-
12 CP study.
13
14 **Q. MR. WATKINS, WHAT IS YOUR RECOMMENDATION AS TO WHAT CCOSS**
15 **STUDY SHOULD BE USED FOR PURPOSES OF THIS PROCEEDING?**
16 A. My CCOSS utilizing the BIP method for allocation of generation plant costs
17 serves as the best measure for evaluating current contributions to Duke's profitability as
18 well as the best costing tool to use in evaluating class revenue responsibility. The
19 Summer Peak and Average study should be considered as a test of the reasonableness of
20 the BIP results. I accept Duke's methods of allocating other costs.
21

**Q. ARE THERE MATERIAL DIFFERENCES IN THE RESULTS OBTAINED FROM YOUR RECOMMENDED BIP CCOSS AND THOSE SUPPORTED BY DUKE?**

A. Yes. As is shown in the table on page 22, there are some material differences. Duke's 1-CP study finds that the Residential class is currently contributing about the same level of profitability as the system average as evidenced by its indexed rate of return (ROR) of 100.67%. In contrast, my study finds that current Residential rates are producing a relative, or indexed, ROR of 115% which is materially higher than the system average ROR.

With regard to the General Service class, my CCOSS indicates that this class is contributing substantially more to Duke's profits than under the 1-CP study method. Conversely, my recommended study finds that the Lighting class is contributing a lower indexed ROR than portrayed by Duke (119% v. 168%). Both studies conclude that the Lighting class is above the system average ROR.

My study indicates that the Industrial class is contributing at just under the system average ROR, while Duke's study shows that these customers' revenues produced an indexed ROR well below the system average.

With respect to the OPT rate schedule, my study concludes that these rates are producing an indexed ROR of only about half of the system average (50%), compared to the 80% indexed ROR resulting from the Company's 1-CP study. Finally, both my study and the Company's study finds that the Real Time Pricing class ("RTP") is producing an ROR well in excess of the system average ROR.

## III. CLASS REVENUE INCREASES

**Q. HOW DOES DUKE PROPOSE TO ALLOCATE ITS REQUESTED OVERALL REVENUE INCREASE AMONG THE RATE CLASSES?**

A. The following table provides Mr. Bailey's proposed class revenue increases net of migrations:[4]

[4] Company witness Bailey presents a class revenue allocation in Bailey Exhibit 4 which totals $496.046 million and is consistent with the Company's overall revenue increase request. At the same time, Bailey Exhibit 2 presents class revenue increases that total $499.064 million. As discussed by Mr. Bailey, this difference of $3.018 million represents customer migrations within the general and industrial rates due to a proposed change in rate structure. As such, Mr. Bailey has designed rates to collect an increase of $499.064 million, but due to anticipated customer migrations, the net revenue increase is expected to be only $496.046 million. Mr. Bailey claims that the net loss due to these migrations is $6.037 million. However, Mr. Bailey opines that only 50% of this $6.037 migration will actually occur leading to the net adjustment of $3.018 million.

| Customer Class | Current Revenue ($000) | Duke Proposed Net Revenue Increase[5] ($000) | Percent Increase |
|---|---|---|---|
| Residential | | | |
| Rate RS | $1,043,371 | $133,440 | 12.79% |
| Rate RE | $731,121 | $106,726 | 14.60% |
| Total | $1,774,493 | $240,166 | 13.53% |
| General Service (GS) | | | |
| Rate SGS | $378,209 | $49,862 | 13.18% |
| Rate LGS | $265,552 | $39,522 | 14.88% |
| Rate NPL_SG | $17,947 | $2,481 | 13.82% |
| Rate NPL_LG | $18,022 | -$18,022 | -100.00% |
| Total | $679,729 | $73,843 | 10.86% |
| Lighting (LT) | | | |
| Rate OL | $74,457 | $13,691 | 18.39% |
| Rate PL | $29,718 | $3,675 | 12.37% |
| Rate NPL_LT | $1,209 | $240 | 19.85% |
| Rate TS | $1,798 | $334 | 18.57% |
| Total | $107,183 | $17,940 | 16.74% |
| Industrial (IND) | | | |
| Rate I GA_IND | $128,021 | $16,899 | 13.20% |
| Rate NPL_IND | $2,138 | $518 | 24.22% |
| Total | $130,159 | $17,417 | 13.38% |
| Optional (OPT) | | | |
| Rate OPT_G & OPT_GA | $701,509 | $60,842 | 8.67% |
| Rate OPT_I & OPT GA_I | $543,947 | $85,783 | 15.77% |
| Total | $1,245,457 | $146,625 | 11.77% |
| Hourly Pricing (HP) | | | |
| Rate HP | $11,698 | $52 | 0.44% |
| TOTAL | $3,948,719 | $496,043 | 12.56% |

[5] Per Bailey Exhibit 2 net of migrations per Duke Response to PS 19-25.

**Q. BASED ON THE RESULTS OF YOUR CCOSS ANALYSES AND OTHER RATEMAKING CONSIDERATIONS, DO YOU RECOMMEND ALTERNATIVE CLASS REVENUE INCREASES?**

A. Yes.

**Q. PLEASE EXPLAIN.**

A. As I indicated earlier in my testimony, CCOSS results should be used as one of many tools in establishing class revenue responsibility. Other considerations should include gradualism and fairness. In this regard, gradualism means that revenue should not be drastically increased over a single rate change, while fairness dictates that all customer classes should share at least somewhat when total jurisdictional revenues are incurred to a significant degree. As such, I have used my CCOSS results as a guiding light, but have constrained minimum and maximum class percentage increases to reflect gradualism and fairness. Specifically, all classes receive at least some increase in revenue responsibility, such that all classes receive an increase of at least 50% of the system average percentage increase, and no class receives more than 150% of the system average percentage increase.

The following are my proposed class increases at the Company's overall revenue increase of $496.046 million:

| Customer Class | ROR @ Current Rates[6] | Indexed ROR @ Current Rates[8] | Current Revenue ($000) | Percent System Increase | Watkins Increase ($000) Percent | Watkins Increase ($000) Amount |
|---|---|---|---|---|---|---|
| Residential | | | | | | |
| Rate RS | 7.16% | 121% | $1,043,371 | **78%** | 9.85% | $102,818 |
| Rate RE | 6.39% | 108% | $731,121 | **100%** | 12.56% | $91,845 |
| Total | 6.83% | 115% | $1,774,493 | **87%** | 10.97% | $194,663 |
| General Service (GS) | | | | | | |
| Rate SGS | 8.68% | 146% | $378,209 | **70%** | 8.79% | $33,258 |
| Rate LGS | 9.13% | 154% | $265,552 | **70%** | 8.79% | $23,351 |
| Rate NPL_SG | 9.60% | 162% | $17,947 | **70%** | 8.79% | $1,578 |
| Rate NPL_LG | 8.93% | 151% | $18,022 | **70%** | 8.79% | $1,585 |
| Total | 8.88% | 150% | $679,729 | **70%** | 8.79% | $59,772 |
| Lighting (LT) | | | | | | |
| Rate OL | 7.48% | 126% | $74,457 | **80%** | 10.05% | $7,483 |
| Rate PL | 6.21% | 105% | $29,718 | **100%** | 12.56% | $3,733 |
| Rate NPL_LT | 4.87% | 82% | $1,209 | **120%** | 15.07% | $182 |
| Rate TS | 0.12% | 2% | $1,798 | **150%** | 18.84% | $339 |
| Total | 7.04% | 119% | $107,183 | **87%** | 10.95% | $11,737 |
| Industrial (IND) | | | | | | |
| Rate I GA_IND | 5.74% | 97% | $128,021 | **100%** | 12.56% | $16,082 |
| Rate NPL_IND | -0.79% | -13% | $2,138 | **150%** | 18.84% | $403 |
| Total | 5.59% | 94% | $130,159 | **101%** | 12.67% | $16,485 |
| Optional (OPT) | | | | | | |
| Rate OPT_G & OPT_GA | 3.95% | 67% | $701,509 | **125%** | 15.70% | $110,156 |
| Rate OPT_I & OPT GA_I | 1.80% | 30% | $543,947 | **150%** | 18.84% | $102,498 |
| Total | 2.99% | 50% | $1,245,457 | **136%** | 17.07% | $212,654 |
| Hourly Pricing (HP) | | | | | | |
| Rate HP | 14.43% | 243% | $11,698 | **50%** | 6.28% | $735 |
| TOTAL | 5.93% | 100% | $3,948,719 | **100%** | 12.56% | $496,046 |

[6] Rate of return and indexed rates of return for Rate I GA_IND were obtained by combining Rate I and Rate GA_IND. Rate of return for Rate OPT_G & OPT_GA were obtained by combining Rate OPT_G and Rate OPT_GA. Rate of return for Rate OPT_I & OPT GA_I were obtained by combining Rate OPT_I and Rate OPT GA_I.

As can be seen above, the Hourly Pricing ("HP") rate class is assigned an increase of 50% of the system average increase (50% of 12.56% or 6.28%) due to its very high current contributions to profits (ROR). The General Service rates are increased at 70% of the system average (8.79%) because of the somewhat higher RORs than the current system average. The Lighting OL rate is increased at 80% of the system average (10.05%); Rates RE and PL, and Industrial Rate I Ga_IND are increased at 100% of the system average (12.56%), while rate schedules with significantly deficient ROR's are increased more than the system average percentage increase. These higher than system increase rates include Rate NPL_LT, Rate TS, Rate NPL_IND, and the OPT rate schedules. Due to its size, Rate RS serves as the residual such that this rate schedule receives a 9.85% increase or 78% of the system average percentage increase.

**Q. PLEASE PROVIDE A SUMMARY COMPARISON OF THE COMPANY'S AND YOUR PROPOSED INCREASE BY CLASS.**

A. The following is a comparison of Mr. Bailey's and my proposed class and rate revenue increases at the Company's overall requested increase of $496.046 million:

| Customer Class | Duke Allocation of Proposed Increase ($000) | Duke Allocation of Proposed Increase Percent | Watkins Allocation of Proposed Increase ($000) | Watkins Allocation of Proposed Increase Percent |
|---|---|---|---|---|
| Residential | | | | |
| Rate RS | $133,440 | 12.79% | $102,818 | 9.85% |
| Rate RE | $106,726 | 14.60% | $91,845 | 12.56% |
| Total | $240,166 | 13.53% | $194,663 | 10.97% |
| General Service (GS) | | | | |
| Rate SGS | $49,862 | 13.18% | $33,258 | 8.79% |
| Rate LGS | $39,522 | 14.88% | $23,351 | 8.79% |
| Rate NPL_SG | $2,481 | 13.82% | $1,578 | 8.79% |
| Rate NPL_LG | -$18,022 | -100.00% | $1,585 | 8.79% |
| Total | $73,843 | 10.86% | $59,772 | 8.79% |
| Lighting (LT) | | | | |
| Rate OL | $13,691 | 18.39% | $7,483 | 10.05% |
| Rate PL | $3,675 | 12.37% | $3,733 | 12.56% |
| Rate NPL_LT | $240 | 19.85% | $182 | 15.07% |
| Rate TS | $334 | 18.57% | $339 | 18.84% |
| Total | $17,940 | 16.74% | $11,737 | 10.95% |
| Industrial (IND) | | | | |
| Rate I GA_IND | $16,899 | 13.20% | $16,082 | 12.56% |
| Rate NPL_IND | $518 | 24.22% | $403 | 18.84% |
| Total | $17,417 | 13.38% | $16,485 | 12.67% |
| Optional (OPT) | | | | |
| Rate OPT_G & OPT_GA | $60,842 | 8.67% | $110,156 | 15.70% |
| Rate OPT_I & OPT GA_I | $85,783 | 15.77% | $102,498 | 18.84% |
| Total | $146,625 | 11.77% | $212,654 | 17.07% |
| Hourly Pricing (HP) | | | | |
| Rate HP | $52 | 0.44% | $735 | 6.28% |
| TOTAL | $496,043 | 12.56% | $496,046 | 12.56% |

**Q. IF THE COMMISSION AUTHORIZES AN OVERALL INCREASE LESS THAN THE $496.046 MILLION REQUESTED BY DUKE, HOW SHOULD THE FINAL OVERALL INCREASE BE ALLOCATED TO RATE CLASSES?**

A. My recommended relative percentage increases by class (percent of system average) should apply regardless of the overall dollar increase authorized by the Commission. In other words, if the Commission were to authorize an increase of $200.0 million (5.06%), the relative class percentage increases would remain the same; e.g., General Service at 70% of the system average, Rate OL at 80% of the system average, etc.

## IV. RESIDENTIAL RATE DESIGN

**Q. MR. WATKINS, PLEASE DESCRIBE DUKE'S CURRENT RATE SCHEDULES AND RATE STRUCTURE.**

A. There are five (5) rate schedules available to residential customers: RS; RE; ES; WC; and RT. Rate Schedule RS is the basic Residential service rate schedule, Rate Schedule RE is for qualifying all electric home customers, and Rate Schedule ES is for customers with homes that qualify under the Energy Star Program. Rate Schedule WC is available to customers for submetered domestic water heating purposes with installed load control devices. Lastly, Schedule RT is a Residential Time of Use rate. The Company proposes to continue providing electric service under each of these schedules.

The specific structure of these rate schedules vary somewhat but all are comprised of a Basic Facilities Charge; i.e., fixed monthly customer charge, and energy (KWH) charge. The current monthly customer charge is $7.87 under each of the major Residential Rate Schedules (RS, RE and ES).

1 **Q. WHAT ARE DUKE'S PROPOSED INCREASES TO THE VARIOUS**
2 **RESIDENTIAL FIXED MONTHLY CUSTOMER CHARGES?**
3 A. The Company proposes to increase the customer charges for RS, RE, and ES to
4 $10.00. The Company proposes to increase the time of use customer charge (RT) from
5 $12.53 to $14.66, while the sub-metered fixed charge for water heater control (WC)
6 customers would increase from $1.35 to $1.72.
7
8 **Q. DOES THE COMPANY PROVIDE ANY JUSTIFICATION FOR ITS PROPOSED**
9 **27% INCREASE TO THE RESIDENTIAL FACILITIES CHARGE FROM $7.87**
10 **TO $10.00?**
11 A. On page 14 of his direct testimony, Company Witness Bailey indicates that the
12 Duke Cost of Service Study supports a cost of $14.72.
13
14 **Q. PLEASE COMMENT.**
15 A. I do not agree that the increased is justified. Duke's study overstates the
16 "customer" costs. Further, the increase is not justified because its impact will fall
17 disproportionately on households that use less electricity. The increase sends an
18 inappropriate signal from an energy conservation standpoint, since more of customers'
19 bills will be collected through the fixed charge providing less opportunity for them to
20 reduce costs through conservation.
21 Furthermore, a fundamental goal of regulatory policy is that regulation should
22 serve as a surrogate for competition to the greater extent practical. As such, the pricing
23 policy for a regulated public utility should mirror those of competitive firms to the extent

possible. Prices for competitive products and services in these industries are invariably established on a volumetric basis, including those that were once regulated; e.g., airline travel and rail service. As such, in competitive markets in which consumers dictate pricing structures, fixed charges are a rare occurrence. Indeed, competitive market pricing is overwhelmingly volumetric based with virtually no fixed charges.

**Q. EXPLAIN WHY DUKE'S PROPOSED INCREASE TO THE FIXED RESIDENTIAL CUSTOMER CHARGE IS NOT JUSTIFIED BY COSTS.**

A. As a result of Duke's response to discovery requests it was determined that this $14.72 includes not only those costs required to connect and maintain a customer's account, but also includes a host of overhead expenses as well as costs classified as "customer" as a result of composite internal allocators.

In my opinion, the inclusion of Company overhead costs in the determination of "customer costs" is improper because, while overheads are a legitimate cost of business, they are incurred in order to provide support for the products and services produced or rendered by Duke, namely the sale of electricity. Duke's customers invariably do not connect to its system or maintain an account simply for the luxury of being connected to the electric grid. Rather, customers rely upon Duke to provide electric energy for their needs. As such, various overhead costs are more appropriately collected in volumetric energy charges.

**Q. HAVE YOU CONDUCTED AN ANALYSIS OF CUSTOMER COSTS?**

A. Yes. I have conducted a traditional direct Residential customer cost analysis which is presented in Watkins Exhibit 5. These direct customer costs include the Company's investment in services and meters, as well as the operating expenses associated with meter reading, customer service, accounting and customer records and collections. As shown on Watkins Exhibit 5, my Residential customer cost study results in a monthly customer cost of $5.48 per month which is well below the current customer charge rate of $7.87

**Q. WHAT IS YOUR RECOMMENDATION REGARDING RESIDENTIAL CUSTOMER CHARGES?**

A. I recommend that if the Commission authorizes 50% or more of the overall increase requested by Duke, the current customer charge levels be maintained (e.g., $7.87). If the Commission authorizes less than 50% of Duke's original requested increase, I recommend that the Residential customer charges be reduced to $7.00.

**Q. PLEASE EXPLAIN WHY YOUR CUSTOMER CHARGE RECOMMENDATION IS CONDITIONAL ON THE REVENUE INCREASE AUTHORIZED BY THE COMMISSION.**

A. This is primarily due to gradualism. If the Commission were to authorize most of the increase requested by Duke and at the same time reduce Residential customer charges to $7.00, the required increase in energy charges would be even higher than that proposed by Duke.

**Q. PLEASE EXPLAIN DUKE'S PROPOSED CHANGES TO THE STRUCTURE OF ITS RESIDENTIAL ENERGY CHARGES?**

A. With regard to Residential energy charges, Mr. Bailey proposes to eliminate the current inverted block rate structure for Rate RS in both the Summer and Winter and instead implement a flat energy rate per KWH throughout the year. With regard to Rate RE, Mr. Bailey proposes to also restructure the Summer inverted block energy charge to a flat rate, while maintaining the current declining block rate during the non-Summer months.

**Q. WHY DOES DUKE PROPOSE TO GENERALLY MOVE FROM AN INVERTED BLOCK RATE STRUCTURE TO A FLAT RATE STRUCTURE?**

A. In response to discovery, Duke indicated that the current price differential between the initial usage and tail block usage rates is less than 1%. As a result, the elimination of this minimal difference simplifies the rate schedule.

**Q. HAS DUKE CONDUCTED ANY QUANTITATIVE ANALYSES TO SUPPORT THE MOVEMENT TO A FLAT (SINGLE BLOCK) CHARGE?**

A. Yes. Mr. Bailey conducted an analysis of the correlation between Residential customers' total energy usage (KW) during the peak month of June to their maximum KW demand (in terms of coincident peak demand). Mr. Bailey's analysis not surprisingly found that as customers' monthly energy usages (KWH) increase, so do their load requirements. However, Mr. Bailey may not have considered the impact that price has on influencing the relationship between peak demand and energy usage. That is,

would a more dramatic inverted block rate structure have any material impact on peak demands relative to annual energy usage?

**Q. WHAT IS YOUR RECOMMENDATION AS TO DUKE'S PROPOSED RATE STRUCTURE FOR RESIDENTIAL CUSTOMERS?**

A. Considering that the current inverted rate differential is negligible and likely does not influence incremental consumption or demand to any significant degree, I do not object to Duke's proposal to simplify its rate structure to a flat usage rate in this case. However, there is no denying the fact that a true inverted block rate structure would send a price signal to customers to conserve energy, and reduce incremental usage particularly in peak months. A truly inverted block rate structure would help reduce the need for additional peak generation capacity as well as promote a more constant utilization of Duke's existing resources. I recommend that the Commission direct Duke to study the potential benefits and impacts of developing an inverted rate structure designed to send a price signal to Residential customers to conserve energy and reduce incremental usage in peak months, and present its findings in advance of its next rate case.

## V. <u>CUSTOMER BILL INFORMATION</u>

**Q. DO YOU HAVE ANY CONCERNS REGARDING THE INFORMATION PROVIDED IN DUKE'S BILLS RENDERED TO NORTH CAROLINA CUSTOMERS?**

A. Yes.

1 **Q. PLEASE EXPLAIN YOUR CONCERNS.**

2 A. Currently, Duke's bills rendered to its North Carolina Residential customers do
3 not provide billing rate (price) information and only show the total KWH usage and the
4 total bill. Even though a customer's bill is comprised of a separate fixed monthly
5 customer charge and seasonally differentiated and blocked energy charges, a breakdown
6 of the prices or consumptions within each pricing category is not provided. This lack of
7 information inhibits customers from understanding their electric bill and charges, and
8 does not provide needed price information about the implications of using energy during
9 the summer period in excess of the first usage block. In other words, the current billing
10 format provides insufficient price signals to inform consumers to wisely use and conserve
11 electricity. A sample of a current Duke North Carolina bill is provided in my Watkins
12 Exhibit 6.

13

14 **Q. DOES DUKE PROVIDE AN ITEMIZATION OF DETAILED PRICES AND**
15 **CHARGES IN ITS BILLS RENDERED TO CUSTOMERS IN OTHER**
16 **JURISDICTIONS?**

17 A. Yes. In Kentucky and Ohio, Duke provides detailed price information showing
18 each price and total charge for each rate element (e.g., customer charge, energy charge,
19 fuel adjustment charge). A copy of a sample bill used for Duke's Kentucky customers is
20 provided in Watkins Exhibit 7.

21

1 **Q. DO YOU HAVE A RECOMMENDATION REGARDING THE INFORMATION**
2 **THAT SHOULD BE PROVIDED WITHIN CUSTOMERS' BILLS IN NORTH**
3 **CAROLINA?**
4 A. Yes. The Commission should direct Duke to provide a breakdown of charges on
5 each customer's bill, similar to Duke's practice in Kentucky and Ohio, including the
6 Basic Facilities Charge, the volumetric rate, and adjustments for fuel, DSM/EE, and
7 REPS riders.
8
9 **Q. DOES THIS COMPLETE YOUR TESTIMONY?**
10 A. Yes.

## EXPERIENCE

### I. Public Utility Regulation

A. Costing Studies -- Conducted, and presented as expert testimony, numerous embedded and marginal cost of service studies. Cost studies have been conducted for electric, gas, telecommunications, water, and wastewater utilities. Analyses and issues have included the evaluation and development of alternative cost allocation methods with particular emphasis on ratemaking implications of distribution plant classification and capacity cost allocation methodologies. Distribution plant classifications have been conducted using the minimum system and zero-intercept methods. Capacity cost allocations have been evaluated using virtually every recognized method of allocating demand related costs (e.g., single and multiple coincident peaks, non-coincident peaks, probability of loss of load, average and excess, and peak and average).

Embedded and marginal cost studies have been analyzed with respect to the seasonal and diurnal distribution of system energy and demand costs, as well as cost effective approaches to incorporating energy and demand losses for rate design purposes. Economic dispatch models have been evaluated to determine long range capacity requirements as well as system marginal energy costs for ratemaking purposes.

B. Rate Design Studies -- Analyzed, designed and provided expert testimony relating to rate structures for all retail rate classes, employing embedded and marginal cost studies. These rate structures have included flat rates, declining block rates, inverted block rates, hours use of demand blocking, lighting rates, and interruptible rates. Economic development and special industrial rates have been developed in recognition of the competitive environment for specific customers. Assessed alternative time differentiated rates with diurnal and seasonal pricing structures. Applied Ramsey (Inverse Elasticity) Pricing to marginal costs in order to adjust for embedded revenue requirement constraints.

## GLENN A. WATKINS

C. Forecasting and System Profile Studies -- Development of long range energy (Kwh or Mcf) and demand forecasts for rural electric cooperatives and investor owned utilities. Analysis of electric plant operating characteristics for the determination of the most efficient dispatch of generating units on a system-wide basis. Factors analyzed include system load requirements, unit generating capacities, planned and unplanned outages, marginal energy costs, long term purchased capacity and energy costs, and short term power interchange agreements.

D. Cost of Capital Studies -- Analyzed and provided expert testimony on the costs of capital and proper capital structures for ratemaking purposes, for electric, gas, telephone, water, and wastewater utilities. Costs of capital have been applied to both actual and hypothetical capital structures. Cost of equity studies have employed comparable earnings, DCF, and CAPM analyses. Econometric analyses of adjustments required to electric utilities cost of equity due to the reduced risks of completing and placing new nuclear generating units into service.

E. Accounting Studies -- Performed and provided expert testimony for numerous accounting studies relating to revenue requirements and cost of service. Assignments have included original cost studies, cost of reproduction new studies, depreciation studies, lead-lag studies, Weather normalization studies, merger and acquisition issues and other rate base and operating income adjustments.

### II. Transportation Regulation

A. Oil and Products Pipelines -- Conducted cost of service studies utilizing embedded costs, I.C.C. Valuation, and trended original cost. Development of computer models for cost of service studies utilizing the "Williams" (FERC 154-B) methodology. Performed alternative tariff designs, and dismantlement and restoration studies.

B. Railroads -- Analyses of costing studies using both embedded and marginal cost methodologies. Analyses of market dominance and cross-subsidization, including the implementation of differential pricing and inverse elasticity for various railroad commodities. Analyses of capital and operation costs required to operate "stand alone" railroads. Conducted cost of capital and revenue adequacy studies of railroads.

### III. Insurance Studies

Conducted and presented expert testimony relating to market structure, performance, and profitability by line and sub-line of business within specific geographic areas, e.g. by state. These studies have included the determination of rates of return on Statutory Surplus and GAAP Equity by line - by state using the NAIC methodology, and comparison of individual insurance company performance vis a vis industry Country-Wide performance.

Conducted and presented expert testimony relating to rate regulation of workers compensation, automobile, and professional malpractice insurance. These studies have included the determination of a proper profit and contingency factor utilizing an internal rate of return methodology, the development of a fair investment income rate, capital structure, cost of capital.

Other insurance studies have included testimony before the Virginia Legislature regarding proper regulatory structure of Credit Life and P&C insurance; the effects on competition and prices resulting from proposed insurance company mergers, maximum and minimum expense multiplier limits, determination of specific class code rate increase limits (swing limits); and investigation of the reasonableness of NCCI's administrative assigned risk plan and pool expenses.

# GLENN A. WATKINS

## IV. Anti-Trust and Commercial Business Damage Litigation

Analyses of alleged claims of attempts to monopolize, predatory pricing, unfair trade practices and economic losses. Assignments have involved definitions of relevant market areas(geographic and product) and performance of that market, the pricing and cost allocation practices of manufacturers, and the economic performance of manufacturers' distributors.

Performed and provided expert testimony relating to market impacts involving automobile and truck dealerships, incremental profitability, the present value of damages, diminution in value of business, market and dealer performance, future sales potential, optimal inventory levels, fair allocation of products, financial performance; and business valuations.

## MEMBERSHIPS AND CERTIFICATIONS

Member, Association of Energy Engineers (1998)
Certified Rate of Return Analyst, Society of Utility and Regulatory Financial Analysts (1992)
Member, American Water Works Association
National Association of Business Economists
Richmond Association of Business Economists
National Economics Honor Society
