CASE NUMBER: 99.070 Filed 7.30.99

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 40 a and b Witness: Betty Adams

Data Request:

Refer to the Application, Volume 10 of 10, Tab 8, Schedule H.

- a. Explain how the Uncollectible Accounts Expense percentage was determined. Include all supporting workpapers, assumptions, and calculations.
- b. Provide a schedule showing Western's actual Uncollectible Accounts Expense percentage for the base year and the five previous fiscal years. Include all supporting workpapers, assumptions, and calculations.

Response:

- a. According to the attached schedule we used the most current five year average, rounded.
- b. This information is found on the same schedule as the response to a, above. Actual percentage for the base year will not be available until the end of the fiscal year.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 40 c. Witness: Rebecca M. Buchanan

Data Request:

40. Refer to the Application, Volume 10 of 10, Tab 8, Schedule H.

c. Explain how the PSC Fees percentage was determined. Include all supporting workpapers, assumptions, and calculations.

Response:

40c.) The PSC Fees percentage of .153919%, shown on Schedule H, is a five year average from 1995 to 1999 of the Tax liability divided by the Revenues. The calculation used to arrive at this percentage is contained below:

Tax Period	Tax Liability	Revenues	Percentage
7/94 – 6/95	\$200,928.43	\$125,658,807	.1599%
7/95 – 6/96	\$200,815.74	\$133,078,686	.1509%
7/96 – 6/97	\$160,419.87	\$128,028,624	.1253%
7/97 – 6/98	\$230,394.32	\$156,517,883	.1472%
7/98 – 6/99	\$276,351.00	\$151,176,695	.1828%
	\$1,068,909.36	\$694,460,695	.1539%

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 41 Witness: Rebecca M. Buchanan

Data Request:

41. Refer to the Application, Volume 10 of 10, Tab 8, Schedule I-1. In light of the revenue increase requested by Western, explain why Schedule I-1 shows Western is forecasted to experience net losses beginning in fiscal year 2001.

Response:

41.) Western's forecasted revenues were calculated using the currently approved rates. Schedule I-1 demonstrates that without rate relief, Western will experience net losses beginning in fiscal year 2001. In fact, without rate relief, and considering the ratemaking adjustments shown in Schedule C-2, Vol. 10, Tab 3, Western will experience net losses after taxes and interest in the Forecasted Test Year.

(Note: In some copies of the filing, Schedule "I" was placed under the wrong tab. All Schedules "I" should be under Tab 9. The Company apologizes for any confusion that this may have caused).

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 42 a., b., c., and d. Witness: Rebecca M. Buchanan

Data Request:

42. Refer to the Application, Volume 10 of 10, Tab 15, Summary of Factors schedule, referenced as "WP Factors." Concerning the calculation of the Residual Factor:

a. Explain why the Residual Factor is based on calendar year 1998 data.

b. Provide the Residual Factors for all other Atmos utility and non-utility business divisions.

c. Explain why it is reasonable to base the Residual Factor on the Western to Atmos ratios for Gross Direct PP&E, Average Number of Customers, and Total O&M Expense.

d. Explain the reference to the "Gray Book."

Response:

42a.) Barring a major shift in the structure of Atmos, there will be little change in the residual factor from year to year. For ratemaking purposes, the residual factor was updated to a period within the base year. At the time the calculation was made, twelve months ended December 31, 1998 was the period for which the data was most readily available. Had the calculation been made on a different 12 month period within the base year, the change in the residual factor would be minimal.

42b.) See the attached schedule titled "<u>Attachment #1 – Fiscal 1998</u> <u>Computation of Allocation Factors (Including UCG) - Atmos Energy Corporation</u>" and marked "response to DR 42b." These are the residual factors actually used by the Atmos Accounting department for fiscal year 1998 allocations. The residual factor for Western on the attachment (column headed "WKG" with a factor of 16.53% circled) differs slightly from the factor used in the filing. (As explained in 42a above, the residual factor for Western was updated for purposes of the rate case to 16.657%). 42c.) The residual factor used by Atmos is a modified Massachusetts formula. It is used to allocate the General Plant related items (plant and accumulated depreciation) of Division 02 General Office to the business units of Atmos. The three part allocator alleviates the inequities that can occur if only one of the components is used as an allocator. Gross plant, average customers and O&M expenses are a better reflection of the types of functions provided by the General Office (also known as Shared Services). The General Plant assets of Division 02 are used in conjunction with providing these "shared services" to the business units. (Some examples of the functions performed by the General Office Division 02 are Gas Control, Billing & Remittance, and Investor Relations. A complete listing of the Shared Services functions is provided in FR 10(9)(u), Volume 9, tab 2).

For an extensive discussion of allocations and the use of a residual factor, please refer to the direct testimony of Mr. Arthur L. Litke who testified on behalf of Western Kentucky Gas Company in Case No. 90-013.

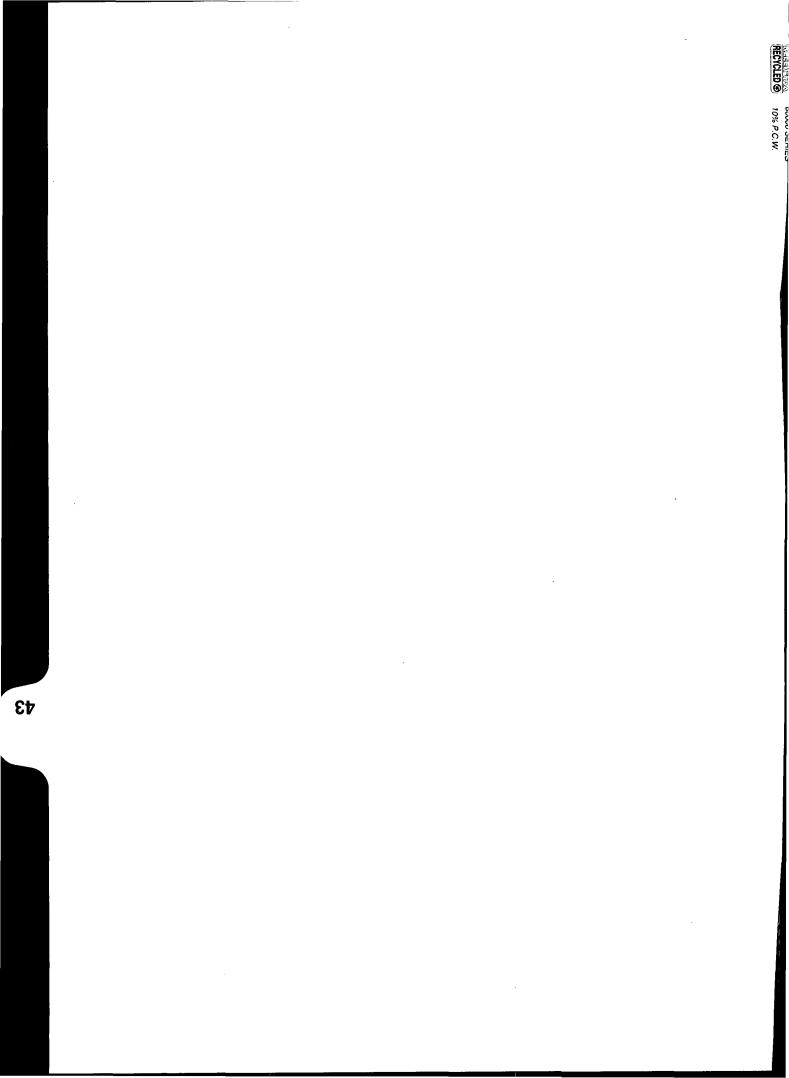

42d.) The term "Gray Book" refers to the financial reports that are distributed internally (the managerial reports). In years past, the cover on the report was gray in color. Western's "Gray Book" is provided in the filing as FR10(9)(n) in Volumes 5, 6, and 7.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 43 a. – e. Witness: Rebecca M. Buchanan

Data Request:

43. Refer to the Application, Volume 10 of 10, Tab 15, WP B-2, base period for Division 09, pages 3 and 4 of 4. For each of the column headings listed below, identify the source of information for the items contained in the column and provide the cross-reference to where that item can be found in the Application. If the item has not been provided in the Application, provide the source of information for the item in question.

- a. "WKG Direct Additions FY 99."
- b. "service prog. WKG adds April 1999."
- c. "WKG OH 98 carryover."
- d. "WKG OH FY 99."
- e. "02 OH FY 99."

Response:

43 a, d, e.) The source for "WKG Direct Additions FY 99," "WKG OH FY 99," and "02 OH FY 99" is Volume 3 of 10, tab 1, exhibit DHD-1, page 1 of 6.

43b.) The source for "service prog. WKG adds April 1999" is the attached worksheet titled "Service Programs Investment Closed April 1999 – Western Kentucky Gas Company" and marked "response to DR 43b."

As explained in response to DR 35a, there is a final column on page 4 of WP B-2 B09 that was unintentionally excluded from the print range in the original filing. The column is headed "service program additional". (A copy of this workpaper page including the final column has been provided in response to DR 35a, and for convenience it is attached to this response as well). The source of the amount in this final column titled "service program additional", \$2,632,460, is the same source document as the April 1999 service program investments referenced above and attached. The \$2,632,460 is the estimated cost to complete the Service Programs, and will be closed between May and September 1999. Together, these two columns total \$21,868,300 and make up the service program investment forecast for fiscal year 1999. This topic is discussed in the direct testimony of Mr. Conrad E. Gruber, found in Volume 2, tab 1, page 15 of the filing.

43c.) At fiscal year end 1998, there remained a balance in the Western's overhead account 1070 to be applied to the 1999 capital expenditures. During fiscal year 1999, as direct capital expenditures are closed to plant, an additional 16% of overhead is applied in order to draw down the remaining 1998 balance. The column headed "WKG OH 98 carryover" is Western's budget for the 16% overhead clearing. The budgeted percent and amount has been verified by Western's Controller.

Service Programs Investment Closed April 1999 Western Kentucky Gas Company

response to DR 43b

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 44 a. – d. Witness: Rebecca M. Buchanan

Data Request:

44. Refer to the Application, Volume 10 of 10, Tab 15, WP B-2, forecasted period for Division 09, pages 3 and 4 of 4. For each of the column headings listed below, identify the source of information for the items contained in the column and provide the cross-reference to where that item can be found in the Application. If the item has not been provided in the Application, provide the source of information for the item in question.

a. "WKG Direct Additions FY2000."

- b. "WKG OH FY2000."
- c. "02 OH FY2000."
- d. "WKG Additions FY2001."

Response:

44 a, b, c.) The source for "WKG Direct Additions FY2000," "WKG OH FY2000," and "02 OH FY2000" is Volume 3 of 10, tab 1, exhibit DHD-1, page 2 of 6. (Note: The test year includes 9/12 of these additions, because the test year is made up of 9/12 of fiscal year 2000).

44d.) The source for "WKG Additions FY2001" is Volume 3 of 10, tab 1, exhibit DHD-1, page 4 of 6. (Note: The test year includes 3/12 of these additions, because the test year is made up of 3/12 of fiscal year 2001). Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 45 a. – e. Witness: Rebecca M. Buchanan

Data Request:

45. Refer to the Application, Volume 10 of 10, Tab 15, WP B-3.2, for both the base and forecasted periods, Division 09.

a. For the base period, explain the reason for the columns titled "Total Company Adjusted Jurisdiction – Reserve" and "Reserve Computation."

b. For the forecasted period, explain the reason for the columns titled"Division 09 13 Month Avg. – Reserve" and "Reserve Computation."

c. For both periods, explain why the "12 Month Expense" column includes a reference to 95.45 percent.

d. Provide the calculations used to determine the 95.45 percent.

e. For the forecasted period, explain the reference to "ELG" in the annual accrual rate column.

Response:

45a.) The Company apologizes for any confusion caused by the column titles. For the base period workpaper WP B-3.2, the dollar amounts in the column titled "Total Company Adjusted Jurisdiction – Reserve" are the Western Division 09 13-monthaverage base period accumulated reserve balances. This column is for display purposes only. The source is Schedule WP B-3.1 B 09, pages 1 and 2.

The dollar amounts in the column titled "Reserve Computation" are the annual reserve accruals. The reserve accrual is calculated by multiplying the 13-month-average investment (column D) by the Annual Accrual Rate (column G).

45b.) For the forecasted period workpaper WP B-3.2, the dollar amounts in the column titled "DIVISION 09, 13 Month Avg. – Reserve" are the Western Division 09 13-month-average forecast period accumulated reserve balances. This column is for display purposes only. The source is WP B-3.1 F 09, pages 1 and 2.

The dollar amounts in the column titled "Reserve Computation" are the annual reserve accruals. The reserve accrual is the 13-month-average investment (column D) multiplied by the Annual Accrual Rate (column G).

45c.) For depreciation expense, certain items are recapitalized. Column F on workpaper WP B-3.2 B 09 and F 09 shows that on average, 95.45% of the Division 09 annual reserve computation will be expensed.

45d.) The 95.45% Division 09 expense factor was calculated as follows:
12 months depreciation and amortization expense per book at September 1998
\$6,486,839 divided by 12 months of Provision for depreciation and amortization per book as of September 1998 \$6,796,268.

45e.) For the forecasted period, the reference to "ELG" in the annual accrual rate column of WP B-3.2 refers to the depreciation rates from the latest depreciation study by Deloitte Touche. This study can be found in Volume 8, tab 4. According to the Deloitte Touche study, ELG means "equal life group".

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 46 Witness: Betty Adams

Data Request:

Refer to the Application, Volume 10 of 10, Tab 15, WP B-4.1, Working Capital Components, for both base and forecasted periods. Provide a breakdown showing all accounts and subaccounts contained in the Prepayments for each period. This breakdown should use the same accounting system as was used to show the detail for Materials and Supplies.

Response:

Attached is the breakdown by account and subaccount of the Prepayments contained within WP B-4.1.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, a Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

a. Provide the name of the model used for the cost-of-service study and specify whether this is an industry model or an in-house model. Provide a narrative description of the study and written operating procedures for running the model.

Response:

The class-cost-of-service study filed in this case was developed in-house on an Excel spreadsheet. It is generally referred to as the Western Kentucky Gas Class Cost of Service Study. The study is an embedded cost of service study which allocates total costs among customer classes in a manner consistent with the incurrence of those costs. The resulting class rates of return are shown on page 1 of the study. The study is conducted by first functionalizing costs as production, transmission, distribution, storage or gas cost. The functionalization of rate base is shown on page 3 of the study with support presented on sheet 1 attached to the study. Then the functionalized costs are classified as customer, demand, commodity or direct. The classifications are shown on pages 4, 6, 8, 10, 12 and 14 of the study with support presented on sheet 2 attached to the study. The classified costs are then allocated among customer classes. Rate class comparisons are shown on page 2 of the study. The allocations are shown on pages 5, 7, 9, 11, 13 and 15 of the study. The allocation factors are derived on pages 16 and 17 of the study. Billing data for each of the customer classes is presented on page 18 of the study. Page 19 shows allocated customer costs for each of the classes. Other data inputs are shown on sheets 3, Sheet 5 summarizes classified and allocated 4, 6, 7, 8, and 9 attached to the study. amounts. The study is in a standard Excel workbook and does not contain any macros. No special operating procedures are required for running the model.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, b Witness: Thomas H. Petersen

١.

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

b. Do any of Western's affiliates use this model? If so, identify any concerns that have been expressed or modifications that have been made other state regulatory commissions in cases in which this model has been presented in support of those affiliates' revenue allocation or rate design proposals.

Responses:

None of Western's (Atmos Energy Corporation dba Western Kentucky Gas in Kentucky) affiliates are regulated public utilities. Therefore, they would not use a model that allocates a utility cost-of-service among classes of utility customers. The other business units of Atmos which are regulated as public utilities are not separate corporate entities. The business units are described in the response to Data Request 2. Atmos Energy Corporation dba Greeley Gas Company in Colorado filed a similar class cost of service study in docket no. 95S-146G. That case was settled in September 1995. The settlement agreement did not specify any concerns or modifications regarding the class cost-of-service study. None of the other Atmos business units currently utilize this model.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, c Witness: Thomas H. Petersen

Y

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

c. Identify any other models that were considered by Western prior to selecting this model and whether the other models provided similar results and guidance. If other models were reviewed, why was this model considered superior? If no other models were reviewed, how can the Commission be assured that the guidance represented by this model is the most reasonable?

Response:

Western first filed a class cost-of-service study with this commission using a form of the model filed in this case in Case no. 9556 in 1986. In its next case, no. 90-013, Western filed a class cost-of-service study that was based on the study from case no. 9556 with modifications to address the Commissions comments about the study in the final order in case no. 9556. In its next case, no. 95-010, Western again filed a class cost-of-service study using the model from the prior studies with further modifications to address the Commissions comments about the study in case no. 90-013. Thus, the model has evolved over the last 13 years to reflect the Commission's input. In this case Western again filed a class cost-of-service study based on the prior studies with limited modifications as disclosed in Mr. Petersen's testimony. Since the Company had available a class cost-of-service study model that had been presented to the Commission in three prior cases and had been modified to address the Commission's comments in those cases, the Company did not believe a search for an alternative model was necessary and therefore no other models were reviewed.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, d Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

d. Class load factor is defined by Mr. Petersen as the average daily use divided by design day use or maximum daily contract level. Expand on this definition and explain how this factor is used in the model.

Response:

Class load factor is calculated on page 2 of the class cost of service study as average daily use per class (annual volume from line 2 of page 16 divided by 365 days) divided by total design day use per class from line 20 of page 16. Design day use on line 20 of page 16 includes the maximum daily contract level for customers who have such contracts. The class load factor is not used in any of the cost allocators in the study. It is shown on page 2 of the study as part of a comparison of differences in load characteristics among the five rate classes used in the study.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, e Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

e. On page 3 of his testimony Mr. Petersen states that the rate classes selected use available data that captures the class differences in load characteristics. Can the available data be readily subdivided into groupings other than the five rate classes used in this study?

Response:

Yes, the data can be subdivided into groupings other than the five classes used in the study. Some alternative groupings can be accomplished more readily than others. The primary data challenges for grouping customers into classes involve customer usage data and design day data. Usage data is readily available by type of service, i.e. firm residential sales service, interruptible carriage service etc. Since some customers use multiple services, any customer grouping requires some customer by customer analysis. If further segregation is desired, such as separating customers who use over 200,000 mcf per year, additional customer by customer analysis would be required. Design day estimates are developed by areas or zones within Western for supply planning. Within each area, residential sales, firm commercial sales and firm industrial sales requirements are estimated in total for each group. Requirements for larger customers are developed on a customer by customer basis. Therefore, any customer grouping requires a customer by customer analysis to assign customers to customer groups.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, f Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

f. Mr. Petersen also states that the study was performed using fiscal year 1998 data and that results using the forecasted test period would follow a pattern similar to that of the historic cost-of-service analysis. Provide the results for the forecasted period and the appropriate workpapers in the same form as provided in the original filing (i.e., nineteen pages of model results and nine pages of supporting workpapers).

Response:

This item requests a study that has not been performed and cannot be completed by the due day for responding to these questions. The data necessary to perform the study is being assembled and the study will be provided upon completion.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, g Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

g. What are the results of the model for the historic test period normalized for weather using the proposed rates and the resulting revenue levels? What are the results of the model using the forecasted test year with the proposed rates and resulting revenue levels? Provide these results and the appropriate workpapers in the same form as provided in the original filing.

Response:

The attached study presents the class cost-of-service study for fiscal 1998 with revenues calculated by applying proposed rates to fiscal 1998 weather normalized usage. Please see the response to item 47f, for the class cost-of-service study using the forecasted test year with the proposed rates.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, h Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

h. An adjustment for customer accounts was incorporated into the model. Explain why this was the only adjustment other than the adjustment to normalize weather incorporated into the model.

Response:

Forecasted test year information was not fully available at the time the class cost-ofservice study was prepared. Therefore, the study was prepared using the most recent fiscal year data available. Since the primary objective of the study was to distribute the Company's fiscal 1998 costs among customer classes in a reasonable manner and not to determine an overall proforma revenue requirement, the only adjustments to per books data that were included were adjustments that could materially affect the relative level of costs among customer classes.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item Question 47, i Witness: Thomas H. Petersen

Data Request:

47. Refer to the Application, Volume 2 of 10, the Testimony of Thomas H. Petersen and Volume 9 of 10, Tab 3, the class cost-of-service study.

i. Notes are included in many pages of the study describing rules, actions or assumptions applied to the particular worksheet. Provide a narrative description of these rules and actions and the source of the assumptions.

Response:

The notes on page 3 of the study generally describe how each rate base item was assigned to a function. Some notes provide information about the source of the data. For example footnote 4 indicates a 12 month average balance. The assignments were done in the same way as in previous studies filed with the Commission. Work in progress (note 2) was all assigned based on gross plant percentage. Prepaid gas purchases (note 4) was all assigned to gas cost. Customer advances and materials and supplies (notes 6 and 7) are mostly related to distribution facilities, with some related to transmission plant. This is reflected in the 95 percent allocation of customer advances, materials and supplies to the distribution function with the remainder to the transmission function.

The notes on pages 4, 6, 8, 10, 12 and 14 generally describe how each item was classified. Some notes provide information about the source of the data. The classifications were done in the same way as in previous studies filed with the Commission. The 50 percent demand, 50 percent commodity split for most storage items reflects the dual use of storage to help meet peak day requirements and to reduce seasonal differences in purchases. Gas Cost administrative costs, excluding commodity prepayments were generally considered to be demand related. Distribution expense accounts 878, 879, 880, 892, 893 and 894 primarily relate to meters and other customer premises costs and so were classified as customer related. Transmission and production costs were generally considered to be demand related.

The notes on page 16 define or describe the term they are applied to. For example, note 2 defines Winter Period as November through March. The notes on sheet 1 explain two calculations that would not otherwise be disclosed on this page. The notes on sheet 8 list the assumptions used to facilitate the analysis of readily available data on meter investment. The meter analysis determines the relative meter investment by customer class that is used in CUST-D and CUST-M allocators on page 16. These assumptions were made by Mr. Petersen after consultation with other company personnel.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 48 Witness: Smith

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Rate G-1 and G-2. Why is there no page reference for: (1) the Weather Normalization Adjustment; (2) the Gas Cost Adjustment Rider; and (3) the Margin Loss Recovery Rider? Does Western agree that including page references for each of these items would enable the tariff reader to better follow the tariffs without being required to constantly refer to the tariff index?

Response:

The side by side comparison of tariff sheets 11 (Rate G-1) and 17 (Rate G-2) demonstrate that Western had not previously used a format which identified a page reference for items such as the Gas Cost Adjustment in its current tariff. Consequently, Western applied the same format for listing all of the components which would be applicable in the determination of the G-1 and G-2 Rates, including (1) the Weather Normalization Adjustment; (2) the Gas Cost Adjustment Rider; and (3) the Margin Loss Recovery Rider.

Western has no objection to including a page reference for each of these items, and agrees that such references would make the tariff easier to follow.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 49 a-c Witness: Smith

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 26, Weather Normalization Adjustment Rider ("WNA").

a. The tariff shows an effective date of July 24, 1999, while page 37 of the Testimony of Gary L. Smith indicates the WNA would go into effect November 1, 2000. What is the correct effective date for the WNA?

b. The tariff states "Base loads and heating sensitivity factors will be determined by class and computed annually." Provide a detailed description of how base loads and heating sensitivity factors will be determined. Include example calculations if necessary.

c. Page 38 of the Testimony of Gary L. Smith sets out a proposed schedule for filing periodic reports with the Commission. Should the schedule and a description of these reports be included in the tariff? Why or why not?

Response:

a. Although it is unclear in the proposed tariff, at Sheet No 26, Western's proposal is to implement the Weather Normalization Adjustment beginning November 1, 2000. Western agrees that this implementation date should be clarified in the proposed tariff.

b. The annual computation of class base loads ("BL") and heating sensitive factors ("HSF") closely parallels the process utilized for the weather normalization adjustment, set forth in EXHIBIT GLS-4, in Volume 2 of 10, Tab 11 of the Application.

The annual computation of these factors would be completed prior to November 1 of each year, based on a twelve month period ending August 31. Exhibit GLS-4, Schedule 3 of 5, provides an example of this process for the residential class (with the minor exception that this Exhibit uses a twelve month period through September, instead of August). Referring to this Exhibit, note that the BL (line 14, column e - referred to as the "constant") is calculated based on the average customer usage during the summer months of July and August. In

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 49a-c Witness: Smith

this case the BL equals 1.5444 Mcf per month. The HSF (column c - referred to as the "coefficient") is calculated based on the annual heating Mcf for the class divided by the actual heating degree days. In this case the HSF equals 0.0155 Mcf per degree day.

To provide an example of the calculation using the equation noted in the proposed tariff, we will utilize these BL and HSF factors applied to November 1997 data included in Exhibit GLS-4. This example is based on a residential customer whose billing cycle is November 1-30, 1997. Other key variable in the equation are:

- Normal Degree Days ("NDD") for 11/1-11/30 = 520 (reference GLS-3, Schedule 2 of 5).
- Actual Degree Days ("ADD") for 11/1/97-11/30/97 = 658 (reference GLS-3, Schedule 2 of 5).
- Distribution Charge ("R") for Residential Class = \$1.0615 (reference current tariff rate schedule).

 $WNA_{residential} = R \frac{(HSF x (NDD - ADD))}{(BL + (HSF x ADD))}$

WNA_{residential} =
$$\$1.0615 \frac{(0.0155 \times (520-658))}{(1.5444 + (0.0155 \times 658))}$$

thus, the residential WNA factor for the referenced billing cycle in this example would be:

 $WNA_{residential} = (\$0.1933) \text{ per Mcf}$

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 49 Witness: Smith

c. Western proposes to submit the monthly reports, summarizing the WNA effect on customer bills by cycle for each customer class as well as the actual and normal degree days in each cycle, as set forth in the referenced testimony. If the Commission would like Western to put the proposed schedule for reporting of these details in the proposed WNA tariff, we would have no objection.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 49 d Witness: Smith

Data Request:

At page 37 of the Testimony of Gary L. Smith he states that the proposed WNA mirrors that of Western's affiliate, United Cities Gas Company. Provide for the last three years (fiscal or calendar), a comparison of United Cities' residential revenues both with and without the impacts of its WNA.

Response:

United Cities Gas Residential Revenues With WNA	United Cities Gas Residential Revenues Without WNA
\$75,217,538	\$77,489,090
\$79,231,951	\$77,174,469
\$85,109,110	\$84,598,930
	Residential Revenues With WNA \$75,217,538 \$79,231,951

.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 50 a & b Witness: Smith

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 27, Gas Cost Adjustment Rider ("GCA").

- a. Since the proposed GCA is zero-based, is it still necessary that Western file its GCA on a monthly basis?
- b. Explain in detail why quarterly GCA filings, as submitted by Kentucky's other major LDCs, would not be sufficient to meet Western's gas cost recovery needs.

Response:

a. Western's original reasoning for filing its GCA's on a monthly basis was:
1) to assure responsiveness to volatile market gas price swings, and, 2) provide for a more accurate reflection of gas costs in our sales rates to avoid sending false pricing signals to T-2 transportation customers, who have the option to either transport or utilize Western's sales service. Western's proposal to adopt a zero-based GCA does not affect the above-stated factors.

b. Although not a consequence of our zero-based GCA, Western would certainly reconsider the frequency of our GCA filings. Since implementing the monthly frequency in early 1994, the volumes of T-2 service have declined dramatically. A vast majority of Western's current transporters utilize carriage services T-3 or T-4, no longer retaining the option to swing from sales to transportation service and then back again. Western still, however, desires to responsively track the changes in gas supply costs in our GCA. Western has no objection to filing quarterly GCA's as a general practice, but would prefer to retain the flexibility to file more frequently, from time to time, to respond to significant gas supply cost changes.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 51 Witness: Smith

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 291, the Margin Loss Recovery Rider ("MLR").

a. The tariff does not specify this, but the Testimony of Gary L. Smith, at page 29, indicates that the proposal will shift lost revenues to sales customers. Why is the proposed shift to sales customers only? Explain how the proposed 90 percent / 10 percent sharing between customers and the company was developed.

b. The MLR tariff does not specify the rate schedules to which it would be applied. Was this an oversight or was it done intentionally? Explain why an "Applicable" provision designating the appropriate rate schedules should not be included in the tariff.

c. How was it determined that the MLR should be adjusted on a semi-annual basis, as opposed to monthly, quarterly, or annually?

Response:

a. Western proposes to apply the MLR equally, on a per Mcf basis, to each of its sales services (Rates G-1, G-2, LVS-1 and LVS-2). Western proposed to exclude transportation services, recognizing that applying this additional component could contribute to further pricing difficulties in the competitive large industrial transportation market.

As stated in testimony, Western proposed this sharing ratio, absorbing 10% of the revenue reduction, as a continued assurance that Western would maximize contract revenues through the highest possible negotiated price. Testimony also referenced that another Atmos business unit has similar mechanisms in place in Tennessee, Georgia and South Carolina. The respective sharing ratios (customers/company) in these jurisdictions are: 90/10, 75/25 and 100/0.

b. Although the proposed tariff, at Sheet 29L, does not clearly state that the MLR applies to the margins for sales services, each of Western's sales services (Rates G-1, G-2, LVS-1 and LVS-2), do include a reference to the Margin Loss Recovery Rider as a component of the rate. Western agrees that including an

"Applicable" section designating the sales rate schedules to which the rider is applied would be a beneficial cross-reference.

c. The proposal synchronizes the filing of the MLR with the semi-annual updates of Western's GCA Correction Factor. Western does not anticipate that distribution charge losses recovered through this rider will exhibit any extreme variability; therefore, we felt that filings more frequent than semi-annually would be unnecessary. Extending the filing frequency to longer periods than we proposed, say annually, would merely serve to delay the responsiveness of the recovery mechanism.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 52 a Witness: Hack

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 30d, Gas Research Institute ("GRI") R & D Rider.

a. The unit charge in the tariff is proposed to be billed "according to the transition schedule outlined in the pipeline's tariffs." Provide the transition schedules for each of the pipelines serving Western.

Response:

The attached GRI Surcharges schedule was obtained from Texas Gas Transmission. The FERC established the same schedule for all pipelines, although the pipelines may, of course, apply different rates within that schedule.

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 30d, Gas Research Institute ("GRI") R & D Rider.

c. Why is the proposed tariff rider to be "applicable to all gas transported by the Company other than Rate T-3 and T-4 Carriage Service"?

d. Does "all gas transported" mean sales and transportation volumes or transportation volumes only? Explain why it should be one or the other.

Response:

c. Carriage services (Rates T-3 and T-4) do not utilize Western's interstate pipeline capacity or rely upon our commodity deliveries through the interstate pipelines. Since the GRI R&D surcharge is, historically and currently, a component of gas cost from the interstate pipelines, these services have not borne any of these costs through Western's Gas Cost Adjustment ("GCA"). Western's intent is to continue to collect GRI charges from the same services that have historically contributed to the charges and not impose an increased cost of service to any tariff service as of the GRI R&D funding changes. Therefore, the "exemption" of Rate T-3 and Rate T-4 Carriage Services from GRI charges merely recognizes that these services have not borne these costs through Western's GCA.

d. "All gas transported" means all sales and transportation volumes. As stated in the response to part c. of this data request, Western's intent is to continue to collect GRI charges from the same services that have historically contributed to the charges.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 52 e Witness: Smith

Data Request:

Identify any other methods of GRI cost recovery that Western considered and explain why those methods were not selected.

Response:

The only other means considered by Western was to continue the treatment of GRI R&D costs as a gas cost via the GCA. In the past, GRI costs had been flowed through as a mandatory component of pipeline transportation charges. However, more recent FERC action, partly in response to the pipelines' desires for more competitive pricing, allowed pipelines to discount their service by removing GRI R&D costs from their rates. Western's customers have been a beneficiary of such discounting. Over time, GRI R&D costs will be phased out of all pipeline charges and become a purely optional cost to LDCs. At a presentation by GRI at the KPSC in April, there was discussion that GRI R&D costs would be better collected as a component of transportation (distribution) service in light of the increasingly competitive retail gas market. The GCA is and will continue to be subject to increasing competition, putting greater pressure to eliminate components such as GRI costs. Recovering GRI R&D costs through Western's proposed distribution charges would ensure GRI a sounder source of R&D funding in the future. Hence, Western has proposed a multi-year transition of shifting GRI R&D cost recovery responsibility from the GCA to a rider applicable to Western's proposed distribution charges, mirroring the transition plan outlined by the FERC.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 52 f Witness: Smith

Data Request:

Identify the benefits that accrue to Western's ratepayers from Western's funding of GRI's R & D activities.

Response:

Benefits of GRI R&D Results That Have Been Placed in Commercial Use in 1993 Through 1997

Prepared by:

Athanasios D. Bournakis Energy Resources Center University of Illinois at Chicago

and

Gerald D. Pine Gas Research Institute

May 1998

Abstract

This report provides a brief description of the twenty-seven new GRI R&D items introduced in 1997 and quantifies the economic benefits of one hundred and eleven items commercialized between 1993 and 1997 that are known to have produced significant economic benefits for their users. The calculated ratio of the benefits to gas customers to total GRI costs incurred in 1993 through the end of 1997 was 9 to 1.

In a similar analysis carried out in 1997 for ninety-seven R&D items placed in commercial use between 1992 and 1996, the calculated ratio of the benefits to gas customers to total GRI costs incurred during the same period was 7.1 to 1.

Legal Notice

This report was prepared by the University of Illinois at Chicago (UIC) Energy Resources Center as an account of work sponsored by Gas Research Institute (GRI). Neither GRI, members of GRI, UIC, officers, trustees, or staff of UIC, nor any person acting on behalf of either:

- a. Makes any warranty or representation, express or implied, with respect to the accuracy, completeness, or usefulness of the information contained in this report, or that the use of any apparatus, method, or process disclosed in this report may not infringe privately owned rights; or
- b. Assumes any liability with respect to the use of, or for damages resulting from the use of, any information, apparatus, method, or process disclosed in this report.

f;

Acknowledgments

The authors gratefully acknowledge the significant contribution provided by the following personnel of the Energy Resources Center of the University of Illinois at Chicago: Irene D. Banas for evaluating the benefits of GRI's Supply and Environment and Safety R&D; Dr. Paul L. Brillhart on his analysis of the Basic Research, Industrial, and Power Generation R&D benefits; David A. Eslinger on his analysis of the Residential and Natural Gas Vehicles R&D benefits; and Darryl M. Lang on his analysis of the Distribution and Transmission R&D benefits.

Also, we want to thank the GRI personnel for their continued support in the evaluation of benefits from GRI R&D results.

Ø,

Introduction

Between January 1, 1997 and December 31, 1997, twenty-seven GRI R&D results were placed in commercial service. In addition, enhanced versions of four previously commercialized items were placed in use. Those items are listed in Table 1, and brief descriptions of the 31 items are included in Appendix A. With these new additions, some 165 GRI R&D results have entered the commercial marketplace during the 5-year period between January 1993 and December 1997. The full list of the 165 items is included in Appendix B. As one measure of the value of the GRI R&D program, the economic benefits accruing to users of 111 out of the 165 products can be compared to the total outlays of GRI during the past five years. This paper highlights the new GRI products that have entered the market during the past five years.

Notable additions to the list of GRI R&D results placed in commercial service in 1997 are the introduction of a new residential water heater for outdoor installation; the introduction of a new enginedriven chiller with a footprint equivalent to the electric competition; a new gas refrigeration system; equipment and software that improve refueling for natural gas vehicles; the application of low emission combustion systems for power generation; a new system that can significantly cut the cost of determining the effectiveness of cathodic protection systems for steel piping used to transport gas; an innovative, time and money-saving trenchless technology for renewing gas service lines; guidelines for directional drilling used by gas utilities to install polyethylene pipe; information on the potential health risks associated with PCB (polychlorinated biphenyls) releases from pipelines; a research program to develop and evaluate an integrated chemical-biological treatment process capable of enhancing the rate and extent of polynuclear aromatic hydrocarbons; a testing method for identifying important resin failure characteristics in plastic pipe; atlases of natural gas and oil reservoirs for the Appalachian Basin and for deep water drilling in the Gulf of Mexico; a manual about underbalanced drilling; and an improved analysis protocol for determining the reservoir parameters used for calculating the gas-in-place volume of coalbed reservoirs.

Benefits Results

The full list of the 165 items placed in commercial use between January 1993 and December 1997 is included in Appendix B, but we chose to focus the benefits analysis of GRI's R&D on 111 of the 165 items that are known to have produced significant *economic* benefits for their users. The 111 items are listed in Table 2. Benefits to product users in typical applications were calculated by comparing the economics of the GRI-sponsored products with the economics of products that would have been used in the absence of the GRI product. Product cost and performance data were obtained from product vendors, from field test results, or from product users. The measure of product benefit is the net present value of the incremental cash flow to the user (cost savings minus incremental cost) over the product lifetime using a real discount rate of 5% (above inflation). The GRI Baseline [1] national average projections of energy prices were used, when appropriate, to estimate cost savings. Total benefits were calculated by multiplying the unit benefits by the sales projected by product vendors from the first year in which the product was sold through 2002. The results are shown in Table 2. A range of product sales is shown to protect proprietary vendor sales projections.

As shown in Table 2, calculated economic benefits for the 111 items are estimated to be between \$7.2 to \$14.0 billion. Table 3 shows the expected value of benefits, at about \$9.75 billion, and the breakdown of the economic benefits by sector. We estimate that the 111 items account for most of the economic benefits that would be calculated for the entire set of 165 products. Omitted items often offer significant benefits to their users, but have not achieved widespread use as have the 111 high impact items. More importantly, many of the omitted items produce benefits that are not easily quantifiable in economic terms. For example, R&D related to natural gas vehicles has been undertaken primarily to provide a natural gas transportation option that meets existing or anticipated emissions requirements. Other R&D results provide test methods for new gas equipment. Finally, many of the 165 items provide information that is useful to the gas industry in developing the gas resource and in delivering it to the customer.

Table 3. Total Expected Benefits by Sector (Millions of 1997\$)

GRI R&D Costs

Between January 1993 and December 1997, GRI outlays totaled \$925 million. For comparison to the R&D benefits calculated above, the cost cash flow stream was converted to an equivalent net present value lump sum expenditure at the beginning of 1997. As with the benefits calculation, a 5% real discount rate was used in the net present value calculation. The calculated equivalent cost was \$1.08 billion. These costs include all outlays made by GRI during the past 5-year period, not just the costs incurred to produce the 165 R&D products. Consequently, a portion of the calculated cost will yet generate benefits as additional products are commercialized in the future.

Benefit-to-Cost Ratio

Dividing the calculated benefits by the costs results in a calculated benefit-to-cost ratio range of 6.7:1 to 13:1 (benefits of \$7.2 to \$14.0 billion divided by outlays of \$1.08 billion) with an expected value of 9:1 (\$9.75 billion divided by \$1.08 billion). In a similar analysis carried out in 1997 for R&D items placed in commercial use between 1992 and 1996, the calculated ratio of the benefits to gas customers to total GRI costs incurred during the same period was 7.1 to 1 [Reference 2, "1997 Winners Analysis"].

Continuing Successes of GRI R&D Results Commercialized Prior to 1993

Although the focus of this analysis has been on GRI's most recent successes, several past successes continue to significantly impact the markets in which they are used. GRI is proud of the continuing success of these products, and we believe that a few comments about some of them are appropriate here.

Residential Space Heating. The residential space heating sector has long been a stronghold for natural gas. With approximately 50 million natural gas heated homes (51% of the market, [1]), gas furnace sales represented 84 percent of all furnaces shipped in 1997. In 1997 shipments of gas furnaces totaled about 2.8 million units [4]. GRI's R&D program in space conditioning had its first major success in the central furnace market with the introduction of the Lennox Pulse[™] Combustion furnace in 1981. This furnace is one of the most efficient furnaces on the market today with a steady-state efficiency of 96%. Within two years of the introduction of the pulse combustion furnace, every furnace manufacturer introduced a condensing high-efficiency (over 90% AFUE) furnace in the market. However, several condensing furnace models experienced problems with the condensed vapor, causing corrosion of internal furnace

parts. GRI sponsored research on condensing appliances to: (1) define the corrosion environment in condensing heat exchanger; and (2) evaluate materials for corrosion resistance in the condensing heat exchanger environment. Based on results from GRI's research, manufacturers responded quickly by redesigning these furnaces using corrosion-resistant materials. GRI's contribution in the development of the pulse combustion furnace and the materials research for condensing furnaces have significantly contributed to the development of the high-efficiency furnace market. According to the "Air Conditioning, Heating & Refrigeration News" (March 29, 1993, pp. 38-39), "The advent of the pulse combustion furnace more than a decade ago brought about a watershed in contractor marketing practices. A suggested installation price of two to three times that of an atmospheric gas furnace amused competitors --until it was proven that a substantial number of homeowners in colder climates were willing to scrap inefficient furnaces in good working order in order to gain fuel savings in the 50% range. Within two years, every furnace manufacturer was offering a condensing furnace line." In 1997, condensing furnaces captured about 25 percent of the gas furnace market.

Conventional gas furnaces have a long tradition of providing consumers with reliable, low-cost space heating and trouble-free venting. However, federal standards requiring a minimum 78% AFUE took effect in 1992. To increase efficiency, fan-assisted gas furnaces were developed that have lower flue-gas temperature, reduced air flow, and a combustion fan instead of a draft hood. Data from utilities and manufacturers indicate that these characteristics can increase condensation in venting systems designed for conventional atmospheric furnaces. High levels of condensation can cause premature corrosion in the vent and furnace, with associated repair costs. The need to prevent premature corrosion required changes in the recommended way of designing the vent system for most mid-efficiency furnaces. "The integrity of the gas industry within the residential market is at stake any time a significant change takes place which impacts the installation and proper operation of gas products," says Michael K. Barnett, Director of Planning & Residential Marketing, Alabama Gas Corporation (Alagasco). "Consumers will benefit from more efficient gas products, and it is the responsibility of our industry and our company to ensure that these products are installed properly and safely." GRI led an industry-wide effort to develop new venting guidelines for broad application. Through this Venting/Flue-Gas Management Project, recommendations for installation instructions and vent sizing tables were developed and disseminated to manufacturers for inclusion in all shipments of mid-efficiency fan-assisted gas furnaces. "GRI and the members of the Venting/Flue-Gas Management Project provided a non-judgmental technical forum within which the manufacturers could participate and learn," says William J. Thomaston, Director, Technical Assistance, Marketing, Alabama Gas Corporation. "This was no small accomplishment, due to the intense competition which exists within this increasingly consolidated industry." As a result of the GRI-led effort, new venting systems are properly sized for today's mid-efficiency fan-assisted furnaces and natural gas continues to be a safe, economical resource for meeting residential energy needs.

High Temperature Industrial Burners. High temperature industrial burners are employed by manufacturers in hundreds of different types of furnaces, ovens, reactors, kilns, and incinerators. Because of the great diversity of applications, process heating represents the industrial sector's most technologically complex market segment. In 1989, total energy consumption by manufacturers for process heating accounted for over 4.3 quadrillion BTU, with natural gas accounting for nearly one half or 2.2 quadrillion BTU. GRI pursues technological developments that will maintain gas as a cost-effective option for process heating and keep gas-based technologies abreast of current standards of convenience, performance, and environmental impact. For some applications the advantages of electrotechnologies –precise control, higher temperatures, and enhanced process capabilities- are becoming important enough to offset their traditional disadvantage of high operating cost. The R&D challenge for the natural gas industry is to identify and develop new, high-temperature, precision control technologies that exploit the qualities and capabilities of natural gas in order to provide a performance

premium when using natural gas. Path-breaking R&D efforts in ceramic burner development and burner control technologies have since led to component, equipment, and process innovations in the high temperature market. Technologies include the Pyrocore[®] Burner, Regenerative Burner with Integral Heat Recovery, NO_x Control for Glass Furnaces, Single-Ended Radiant Tube Burners, Industrial Fluid Heater, High Temperature Integral Quench Furnace, Vacuum Furnace, Ceramic Radiant Tubes, and a high-level gas injection process for blast furnaces. Advanced gas heat-treating technology, like the high efficiency TwinBed[™] Burner developed by North American Manufacturing Company, has convinced some high volume customers to stay with natural gas. The TwinBed regenerative burner, developed with GRI R&D funding, permits the manufacturer to use an alternate fuel, but performs best with natural gas. The system consists of a compact regenerative heat exchanger to preheat combustion air, with a pair of burners that take turns firing and recovering heat. In 1993, the TwinBed burners accounted for approximately 38 Bcf of gross gas load. TwinBed burners have also been used with indirect-fired metallic radiant tubes, which heat products without exposing them to combustion gases. Inland Steel Company has seen fuel savings in excess of 45 percent when compared with the use of direct-fired burners and has not adopted the competing electrotechnology.

Blast Furnaces. Due to environmental regulations imposed on the pollutant emissions from coke ovens, metallurgical coke is increasingly scarce and expensive. In conjunction with this, the renewed steel demand has strained the productive capacity of the current blast furnace population. These two factors have poised the blast furnace industry to look for alternate fuel sources to decrease costs and increase productivity. The advantages of using high levels of natural gas include: reduced coke usage, improved furnace stability, increased iron-making productivity, lower operating costs, high quality (lower sulfur content) hot metal product, lower air pollution emissions, and gas-injection equipment has lower capital costs than pulverized-coal or oil-injection equipment. For over 25% of blast furnace coke requirements, high-level gas injection is an attractive substitute. However, there was insufficient information to determine the upper limit of natural gas injection to maximize its benefits. GRI and Charles River Associates have demonstrated the technical and operational value of using natural gas injection at high levels on blast furnaces. GRI supported the use of natural gas injection at high levels at Acme Steel Company, which has the last operational blast furnace in Chicago. Acme increased its rate of natural gas injection to 260lb/THM while it realized a production increase of 30%. Also, coke consumption went down by 30%. "The blast furnace ran very smoothly, and the hot metal chemistry remained right on target, allowing us to reach previously unattainable production levels," said Frank Gambol, Acme Steel Division Manager of Blast Furnaces. One of the major advantages of using natural gas as an injection fuel is its high hydrogen content which is very efficient at reducing the iron ore. Information and guidelines developed for the use of high level of natural gas in blast injection furnaces are refined and made available to iron and steel manufacturers throughout North America. Over the past decade, gas use has increased dramatically, growing from 38 Bcf in 1987 to 106 Bcf in 1995.

Natural Gas Vehicles. Vehicular transportation applications use large quantities of liquid fuels and are a major source of urban air pollution. There is a broad and increasing support for greater use of clean, alternative transportation fuels, such as natural gas. Approximately 63,000 NGVs were in use in the United States in 1996, virtually all in commercial fleets [3]. However, to attain a significant share of the transportation market, NGVs must overcome several technical and economic barriers. These barriers include the current range between refueling, an inadequate fueling station network, and the high capital cost premium of NGVs compared to liquid-fueled vehicles. GRI's objective is to develop and deploy NGVs and supporting infrastructure so that consumers can benefit from the economic, environmental, and energy security value of natural gas. Currently, several technologies developed with GRI funding are commercially available, including heavy- and medium-duty engines by Detroit Diesel Corporation and Cummins Engine Company, a light-duty CNG van by Chrysler Corporation, a dedicated natural gas

passenger vehicle (Ford Crown Victoria), and a Qualified Vehicle Modifier Program (QVM) by Ford Motor Co. in which qualified outside companies convert Ford vehicles to operate on gas in selected markets. In 1996, new gas engines serving the medium- and heavy-duty fleet vehicle markets were introduced by Cummins Engine Company and Detroit Diesel Corporation. Also, John Deere Company, Caterpillar Inc., and Mack Trucks, Inc. entered the NGV market and Ford introduced dedicated gaspowered Vans and Pickups originally offered as QVM bifuel vehicles. In addition, GRI conducts studies to improve the performance and durability of natural gas engines. GRI's general strategy is to lead in technical development, innovation, and deployment of NGVs by addressing the following issues: the vehicle range and capital cost by developing innovative, lighter, and less expensive fuel storage systems; the fueling infrastructure; support quality bifuel conversion in the near term; develop efficient, dedicated OEM engines in the long-term; facilitate commercialization of NGVs through coordination with GRI member companies, manufacturers, and other organizations; pursue deployment of NGV technologies through various means including extended field tests; and provide safety research data as necessary to facilitate the regulatory process.

Advanced Stimulation Technologies (AST). GRI's AST program encompasses multiple technologies such as: quality control; stress profiling; and a 3-D modeling software program (FRACPRO™). These various stimulation techniques aid producers in optimizing the hydraulic fracture design and executions. FRACPRO was developed to estimate total fluid and sand needed to generate cost effective fracture treatments while enhancing ultimate production. An engineer can design, analyze, and evaluate the success of fracture treatments so that more gas can be recovered from tight sands and other lowpermeability formations. Main benefits involve increased gas production and/or decreased fracture treatment costs. In the early 1980s, Gas Research Institute began a comprehensive research effort to evaluate and enhance technologies associated with hydraulic fracturing. Through a series of cooperative research and Staged Field Experiment wells, GRI collected evidence that challenged traditional hydraulic fracturing methodologies and theories. By analyzing detailed reservoir data and real-time fracture treatment data, new insights into the fracturing process were gained, and critical factors associated with successful fracture treatments were identified. These insights formed the core of GRI's ongoing AST deployment program. Although there are many interrelated concepts in the AST approach, all involve the acquisition and analysis of data in real time to improve fracturing results. The primary elements of AST include: onsite treatment quality control; pretreatment stress profiling and the use of 3-D fracture models; fracture treatment pressure history matching (in real time or offsite); and performing fracture treatment diagnostics on location to identify well-specific fracturing mechanisms (near-wellbore tortuosity, multiple fracture creation, etc.). As part of the AST deployment project, GRI developed a Communication Tool Kit that explains the methodology and technologies within AST. This Tool Kit is available to industry and includes a new 38-minute video introduction to AST, concise technology descriptions of key AST elements, and an eight-part training manual with more than 500 slides, sufficient for over 30 hours of instruction. Short courses and in-house GRI training programs are being used to increase the number of producing and service company personnel using AST on a regular basis. The rapid adoption of these technologies will help the industry develop more gas reserves, more quickly and at lower cost.

11

Conclusions

GRI's planning and budget allocation process strives to put in place a program with the maximum ratio of benefits to R&D costs for the mutual benefit of the gas customer and the gas industry. The economic evaluation of GRI's commercially successful R&D results have consistently shown that benefits far exceed the costs of the R&D program.

Analysis of the benefits of approximately 111 of the 165 GRI R&D items placed into commercial service between January 1993 and December 1997 shows that GRI R&D will return about \$9 for every dollar invested in GRI during the same period. In addition to the fact that only portion of GRI's commercialized R&D items are included in the benefits calculation, all of the costs of GRI's operations during the 1993 to 1997 period have been included in the calculation of the benefit-to-cost ratio.

Appendix A GRI R&D Results That Have Been Placed in Commercial Use in 1997

RESIDENTIAL

Outdoor Gas Water Heater. American Water Heater Company has developed the Weather-Pro water heater, a residential/light commercial gas unit designed for easy outdoor installation and low operating costs. Currently, most gas-fired water heaters are installed indoors in basements, closets or garages. In warm regions of the country, many buildings do not have basements, so indoor water heaters occupy valuable living area or commercial space. While outdoor installation eliminates the need for venting, chimney paths and drip pans, until now gas water heaters could be installed outdoors in mild climates only if protected by a shed. The Weather-Pro's tough construction allows customers in warm regions to place the unit outdoors without a costly protective enclosure. In addition, the Weather-Pro requires no electrical hookup, thus reducing installation costs and enabling operation during power outages. The Weather-Pro has an input of 50,000 Btu/hr, enough for small commercial users, compared with an average of only 15,354 Btu/hr for standard residential electric water heaters.

Advanced Gas Fireplace. Lennox Industries has introduced a new enhanced gas fireplace to complement their extensive product line of gas hearth appliances. The result of extensive consumer research and comparisons of existing technologies, the Advanced Gas Fireplace combines the most popular product and safety features. Innovative burner port design and materials enhance flame realism and reduce emissions. The new fireplace also employs an advanced control system accessed by a wall-mounted remote control. Its modular design ensures easy installation and servicing while interchangeable log assemblies provide a range of aesthetic options. The Lennox fireplace represents the next generation of hearth products in the fastest growing segment of the residential natural gas appliance market. In addition to the product enhancements for Lennox, the generic burner design guidelines for improved efficiency and realism will be available to any gas hearth product manufacturer.

COMMERCIAL

BinMaker[™]: The Weather Summary Tool. BinMaker[™] software tool, developed by GARD Analytics, Inc., Quantitative Decision Support, Linric Co., and Bluejay Software Associates, upgrades bin energy analysis by creating a wide range of accurate summaries of U.S. hourly weather data for 239 locations. Weather data files used by BinMaker are based on the TMY-2 (Typical Meteorological Year) data produced by the National Renewable Energy Laboratory in Golden, CO. The files reflect typical weather for all 8760 hours per year at 239 locations. They contain actual weather observations rather than smoothed or adjusted data, ensuring of a good presentation of weather behavior in the real world. The resulting electronic file can be exported for use in spreadsheets or other computer analysis programs. BinMaker CD-ROM-based program runs under Windows® 95 or 3.1. Among its other features, BinMaker avoids the error of underestimating loads associated with coincident variables by creating a joint-frequency table of hours at each combination of temperature and humidity.

TecoFROST[™] Gas Engine Driven Refrigeration. GRI has formed a partnership with two divisions of ThermoPower Corporation—Tecogen, which markets TECOCHILL® gas engine-driven chillers, and FES, which manufactures packaged refrigeration compressors and TECOCHILL units—to develop the TecoFROST[™] refrigeration system. The TecoFROST system, manufactured by FES and marketed by Tecogen, utilizes the same reliable refrigeration components - screw compressor, oil separator - as electric refrigeration systems manufactured by FES. The electric motor is simply replaced by a more efficient natural gas engine, the TecoDrive 7400, an industrial version of the General Motors 7.4-liter V8, which was developed with GRI support. Because the engine operates at variable speeds (ranging from 2000 to 3000 rpm), the system can follow refrigeration loads more closely than an electric motor, which optimizes energy consumption. The control panel on the TecoFROST features precise and efficient operating control to ensure high reliability. It also features a Remote Monitoring Control System (RMCS) for off-site monitoring and trouble-shooting. The TecoFROST uses non-CFC refrigerants (R-717 or R-22). The TecoFROST system is available for refrigeration applications as low as -70°F and up to 45°F. Sizes range from 100 to 150 hp (up to 140 tons). Tecogen is currently designing larger systems with capacities of 200-500 hp. Low emission packages are available as an option to meet all local emissions standards. Other options include engine jacket and exhaust heat recovery.

York Millennium™ GED, Model YB. York's Millennium™ line was developed by York and Caterpillar Inc. in partnership with GRI and was introduced in 1994. Millennium products are based on Caterpillar engines and York centrifugal compressors. The product line offers single-stage, centrifugal chillers with capacities from 400 tons to 2,100 tons, using HFC refrigerant 134a. The Millennium chillers have an exceptionally high part-load efficiency, a COP of 2.6 (highest heating value without heat recovery), and are supported by a York and Caterpillar service network. At the Gas Cooling Technology Conference & Expo in May, 1997, York unveiled a 400-ton gas-engine-driven (GED) chiller with a footprint equivalent to the electric competition. The YB model integrates an industrial-grade Caterpillar engine (turbocharged six-cylinder, 365-hp) with York's high- efficiency centrifugal compressor. The full-load coefficient of performance (COP) of the YB chiller is 1.8 at Air-conditioning and Refrigeration Institute (ARI) design conditions and based on the fuel's higher heating value (HHV). When heat is recovered from the chiller's engine and put to use, the system COP (HHV) increases to 2.2, generating additional cost savings. To shrink the chiller's footprint, York packaged all of the engine/compressor components in a steel driveline base and mounted it on the evaporator/condenser tube sheets using neoprene vibration isolators. The rigid driveline maintains the integrity of the system, minimizes vibration on heat exchanger shells, and allows easy disassembly/reassembly if necessary to fit through narrow, low-overhead passageways during installation.

*Pulse-Combustion Hydronic Boiler. Fulton Boiler has recently been able to improve the powerdensity of their pulse-combustion hydronic boiler by a factor of two. However, the sound level of the product was increased by 3dba in the process, an unacceptable result. Under the leadership of GRI's Gas Appliance Technology Center (GATC), a team of experts in sound transmission and abatement was quickly assembled to address the issue and to make recommendations for solution. The team identified 61 concepts for sound reduction. Of these, 24 were selected as 1st effort candidates. Within two more weeks, Fulton had selected and tested six of these and found them to be very effective in sound reduction without compromising product design. The result: a 10dba drop in sound level, well below the initial target. Fulton introduced the new line of boilers the next month at the 1997 ASHRAE show in Philadelphia. The benefits of this new line include high power density (small footprint for the same output), quieter operation, and a significant cost reduction.

TRANSPORTATION

FuelMaker-Quantum Vehicle Refueling Appliance Line. A well-established manufacturer of vehicle refueling appliances, FuelMaker Corporation produces a variety of compressors including the low-cost FM4 unit, ideal for time-filling of small and growing fleets. GRI, along with Natural Resources Canada and Gas Technology Canada, supported efforts to make this unit even more economical and useful to a greater

variety of fleets. The resulting "Quantum" product line includes three single-compressor and two multicompressor models, featuring increased gas flow rate, longer service intervals, and elevated discharge pressures. Improving the flow rate from 1.9 scfm to up to 10 scfm for the multi-compressor model reduces the number of refueling appliances needed per fleet. In addition, the two units capable of pressures of 3600 psi extend the driving range of some NGVs. Together with the longer service interval, enhancements in the FuelMaker product line result in a 38% operating cost improvement. The FuelMaker is the only compression system certified by the International Approval Services (IAS).

AccuFill Dispenser Fill Algorithm. During fast-filling of vehicle CNG tanks, the gas temperature inside the cylinder can rise rapidly to 150-160°F. Soon after the dispenser stops filling, the gas inside cools to ambient temperature, and the internal pressure drops, resulting in the underfilling of the tank by up to 20%. This temperature-rise phenomenon was identified by the Institute of Gas Technology, in a GRI-sponsored research, as the worst culprit in the underfilling of NGV tanks. Some dispensers currently attempt to offset these factors during slow time-filling using ambient-temperature compensation devices, but they cannot give a complete fill in fast-fill applications. The new control software, now being licensed to dispenser manufacturers, provides a complete, safe fill under many conditions within 4% of maximum capacity. Walking the line between under filling and over filling will translate to an increased driving range of nearly 10-20% for fast-filled CNG vehicles.

NGV-1 Receptacle/Nozzle Standard Design. In the infancy of the natural gas vehicle market, several refueling accessory manufacturers produced varied and incompatible nozzles and vehicle fueling receptacles. Fleet and refueling station managers were forced to chose a nozzle configuration and then purchase expensive attachments to adapt to other vehicles or stations. In 1994, ANSI, A.G.A. and CGA published standards developed by a GRI program that addressed the design and testing of compressed gas fueling station dispenser nozzles and vehicle receptacles. Entitled NGV-1 "Compressed Natural Gas Vehicle Fueling Connection Devices," the standard ensures interchangeability between products made by different manufacturers. Now almost universally adopted in the NGV market, the NGV-1 nozzle standard has reduced refueling connector costs by up to 50%. Fleet and station managers can more efficiently and safely service the growing population of natural gas vehicles.

POWER GENERATION

*Allison LE IV Dry, Low-Emissions (DLE) Combustor. In partnership with GRI, Allison Engine Company has developed a dry, low emission combustor-called the LE IV-for its 501K series of 4-MW gas turbines. At a lower cost than selective catalytic reduction (SCR), and without the added maintenance requirements and increased CO emissions of water-injection, the LE combustor reduces NO_x emissions to less than 25 ppm. Both gas pipeline operators and industrial power generators can meet emissions requirements without reducing turbine operation or incurring excessive expenses and constraints associated with other emission control techniques.

*General Electric LM 1600. In conjunction with GRI, General Electric has developed a dry, low emission annular combustion system for the 13.75-MW LM 1600 aeroderivative gas turbine. The new DLE system dramatically improves the economics of the new installations, as-well-as offering a low cost compliance option for environmental regulations. In full engine test at GE, emissions goals of 25 ppm NO_x, 25 ppm CO, and 20 ppm UHC were met or exceeded.

GAS OPERATIONS

*Orifice Meter Information. Data developed and collected through GRI-funded projects at the National Institute of Standards and Technology (NIST) and Southwest Research Institute (SwRI) have been used by several gas industry organizations to calculate biases in orifice meter discharge coefficient measurements. These corrections have been used to increase the accuracy of orifice meter measurement and in studies to determine unaccounted-for gas by gas utilities. SwRI also has conducted research to investigate the benefit and feasibility of fitting flow conditioning devices, to assure proper flow conditions upstream of the orifice plate, into new and existing metering installations built to conform with American Gas Association Report No. 3. In an orifice meter installation, the purpose of the flow conditioner is to remove flow disturbances (such as swirl and velocity profile asymmetry) that may arise from common types of pipe fittings, such as elbows, tees and valves upstream of the meter run. The flow conditioner is placed in the meter tube between the disturbing pipe fitting and the orifice meter. The purpose of the flow conditioner device is to remove flow disturbances so values of the orifice discharge coefficients, C_d , are indiscernible from baseline values. Baseline orifice C_d data taken at the Metering Research Facility (MRF), flowing nitrogen, agree well with comparable high accuracy baseline data from other laboratories. The results of the SwRI research effort establish the flow measurement credentials of the MRF Low Pressure Loop. With the completion of the commissioning of the MRF High Pressure Loop, the orifice meter research was expanded to cover larger meter sizes (10") and higher flow/pressure conditions. Also, research was conducted to evaluate various orifice meter configurations without a flow conditioner. This research is being guided by an API working group for revision of the A.G.A./API/ANSI/GPA orifice meter standard (Chapter 14.3, Part 2 -Installation Requirements). The research will support necessary installation specification revisions for use with and without flow straighteners (tube-bundle) and the use of new, improved flow conditioning devices.

Pipeline Current Mapper. GRI and its industry partners have developed a new system that can significantly cut the cost of determining the effectiveness of cathodic protection systems for steel piping systems used to transport natural gas. The Pipeline Current Mapper (PCM) system—manufactured by Radiodetection Corporation—can be used to detect coating defects and points where underground metallic structures come in contact with the pipe. Use of the PCM system by two companies provided an estimated 50% increase in productivity over conventional methods. The payback period was less than six months due to savings in labor, excavations, and a substantial reduction in the number of "electrical test stations" installed to provide a metallic connection to the pipeline.

RENU Service Renewal Technology. GRI and NICOR Technologies Inc. (NTI) have adapted a British technology for U.S. use—named RENU[™]—that provides an innovative trenchless, time and moneysaving technology for renewing gas service lines. Because of the significant potential benefits, GRI funded with NTI both the transfer and the adaptation of the technology. NTI has a license to introduce the product in the United States and Canada. In the time it usually takes a crew (three or four men) to replace one service line using traditional methods of trenching or digging, two crew members can replace three or four lines using the RENU method. This means increased productivity and reduced labor costs for utility companies and contractors. A further advantage is that the equipment and tools for RENU fit easily into a small van, reducing the need for larger, more expensive utility trucks. The technology significantly reduces or eliminates landscaping and paving restoration costs and inconveniences associated with traditional repair and replacement methods. With RENU, standard polyethylene pipe is used for replacement and the method can be used in a variety of weather conditions. Initial installations conducted by Nicor Gas resulted in savings of more than 20 percent over conventional methods.

Pneumatic Tool Diagnostic System (Tool Tester). The Pneumatic Tool Diagnostic System (PTDS) provides a new means to quickly and accurately assess the performance of air-powered tools, such as pavement breakers, rock drills, tampers, and air compressors. Delivered blow energy, blow rate, air pressure, air flow, and rotational speeds are measured and stored in a computer database. The database tracks all tools by inventory number and stores each tool's performance test results and maintenance cost history. The test results allow the operator to quickly pinpoint the area of sub-par performance and then verify that proper operation has been restored after repair. Many utilities use pneumatic tools for hundreds of thousands of man-hours annually and may have inventories of several hundred to several thousand such tools. Field tests with three large U.S. gas utilities of the PTDS proved the system to be reliable and accurate. In addition, studies have shown that tool inefficiencies can cost tens of thousands of man-hours annually. Periodic testing of tools in inventory with the PTDS greatly reduces these losses.

Horizontal Directional Drilling Guidelines. Directional drilling is a no-dig (trenchless) technology, increasingly used by gas utilities to install polyethylene pipes. It involves drilling a pilot hole from the entrance pit to the exit pit to define the installation profile, and pulling the pipeline from the exit pit to the entrance pit as the bore is enlarged through a back-reaming process. Some of the benefits are the ability to install pipelines in tight spaces, the cost-effectiveness of drilling compared to open trenching, the reduction in inconvenience to customers and neighborhoods, and the ability to install pipelines in environmentally sensitive areas. GRI developed guidelines for directional drilling from interviews with gas utilities that use in-house drilling crews, pipeline contractors, and construction companies that perform drilling operations. Additionally, the guidelines include the results of analyses performed on such issues as maximum pull length for a given size pipe. The guidelines are the best practices that should benefit gas utilities by enabling them to develop company-specific internal standards, specifications for contracting for services, and training and quality control procedures.

Hydrostatic Test Water Discharge. Federal (DOT) and state laws require natural gas pipeline companies to maintain the integrity of their pipelines to protect the public from accidents involving potential failure of the pipelines. Hydrostatic testing is the method of choice for verifying pipeline integrity. Little information on the characterization, management, and permitting of hydrostatic test water discharges has been available until recently. Sampling protocols, characterization requirements, permitting procedures, and discharge criteria vary substantially among states. Because of this, the gas industry faces a formidable challenge in developing technically feasible and cost effective approaches to managing hydrostatic test water discharges. In response to these issues and the possibility of more stringent regulatory requirements relating to the discharge of pipeline waters, GRI sponsored an effort to develop industry-specific information on test water discharges. The results of this research effort were documented in a five volume set of GRI reports published in 1992. The most recent GRI-sponsored effort consists of two complementary research programs. The objectives of the first research program were to determine the number of hydrostatic tests for new and used natural gas pipelines, determine the volume of water discharged, determine the management practices used for the discharged test water, assess federal and state regulations pertaining to hydrostatic testing, and to determine research issues. The objectives of the second research program were to develop representative hydrostatic test water characterization data for benzene, BTEX, oil and grease and total solids (TSS) under FIFO (first in, first out) discharge conditions and FILO (first in, last out) discharge conditions, and determine the effectiveness of new and normal industry control devices and water management procedures. A cost effectiveness study showed that pigging was the most effective means of reducing test water contamination, that filter covered hay bales reduced both oil & grease effectively when the pipeline was not pigged, and that air stripping was not cost effective.

18

PCB Contaminated Pipeline Abandonment Protocol. Fluids containing polychlorinated biphenyls (PCBs) were used as lubricants in natural gas transmission and air compressor systems. Evidence of external contamination from PCB condensate discharged from transmission and distribution systems was discovered about 1987. Use and disposal of materials contaminated with PCBs is governed under the Toxic Substances Control Act (TSCA) and various regulations promulgated by the U.S. Environmental Protection Agency (EPA) in response to TSCA. In 1989, GRI initiated a PCB management research program to investigate innovative PCB management and control technologies. The purpose was to support the gas industry with technical information and management guidance on PCBs, particularly in the areas of statistical sampling, analytical methods, transport, risk assessment, remediation, and removal and control technologies. In the risk assessment phase of the project, a PCB Task Force assessed the potential risks associated with hypothetical releases of PCE-conteminated condensate from natural gas pipelines. The task force evaluated five release scenarios. Results indicated that human hearth lisks associated with PCB releases from pipelines in many cases are within the acceptable range, suggesting that abandonment in place may be a viable disposal alternative. GRI published the information derived from this risk assessment in 1992 and produced a computer program that can be used to quantify the risk of cancer to humans from exposure to PCBs. In 1993, the research shifted in focus to mitigating PCB contamination in gas pipelines. Meeting this objective meant developing an understanding of PCB behavior in pipelines and on pipeline materials and translating this understanding into removal/control engineering guidance.

Low Cost Method for Formaldehyde Measurements. Title III of the 1990 Clean Air Act Amendments (CAAA) requires the U.S. Environmental Protection Agency to develop maximum achievable control technology (MACT) standards to reduce hazardous air pollutant (HAP) emissions from major sources. CAAA defines a major source of HAPs as any source that emits over 10 tons per year (tpy) of a single HAP or 25 tpy of a combination of HAPs. By the year 2000, EPA must issue MACT standards for combustion sources. The combustion source categories covered include stationary internal combustion engines, boilers, process heaters, and turbines. In addition to control requirements, the standards will stipulate monitoring requirements for determining compliance. Radian Corporation, a contractor for GRI, mapped emissions over the full operating range of clean-burn and lean-burn engines, and investigated alternative formaldehyde emission estimation approaches. With test data indicating that formaldehyde emissions vary with operating conditions and engine model, the program focused on identifying engine parameter-based models or low-cost measurement techniques that accurately estimate specific enginespecific formaldehyde emissions at the lowest possible cost. The project provides data and tools needed to develop an inexpensive, reliable method for estimating formaldehyde emissions, determines major source applicability, identifies and develops appropriate formaldehyde emissions control options, including operational modifications, design modifications, and add-on controls, and develops a low cost, reliable EM system to comply with the MACT requirements.

Contained Recovery of Oily Waste Technology Evaluation (CROW™) Technology for Water

Cleanup. From the early 1800s to about 1960, manufactured gas plants converted coal or oil to a gaseous fuel, sometimes known as "town gas." The gas was used to light and heat homes, businesses, and factories throughout the United States, although most MGPs operated in cities and towns in the Midwest and East. Many abandoned or demolished MGP sites remain contaminated with wastes and residues associated either with the gas-producing and purifying processes used at these sites or with demolition activities. The Contained Recovery of Oily Waste (CROWTM) process was developed and tested with funding from GRI and the EPA SITE program. The CROW process pumps hot water or steam into subsurface oily waste accumulations to make them less viscous and more buoyant and therefore more easily pumped to the surface.

CBT (Chemical-Biological Treatment) Cleanup Technology. Manufactured gas plant (MGP) operations, which generally ceased in the United States by about 1960, resulted in the release of various residuals and by-products to surrounding soils, sediments, and water. Of greatest concern are residual chemicals such as polynuclear aromatic hydrocarbons (PAHs), volatile aromatics, phenolics, inorganic chemicals, and trace metals. Some higher molecular weight PAHs are believed to be carcinogenic and PAH-contaminated soils are pervasive at many former MGP sites. Of the currently favored site remediation strategies, biological treatment appears to offer the best combination of relatively low cost and cleanup effectiveness. But in soils dominated by 4-6 ring PAHs, conventional biotreatment used alone is limited in its capacity to remove organic pollutants. Through a combination of two complementary remedial techniques - chemical oxidation and biological treatment - this limitation may be overcome. GRI, the Institute of Gas Technology's Sustaining Membership Program, U.S. EPA, and several gas companies have sponsored a research program to develop and evaluate an integrated chemical-biological treatment process capable of enhancing the rate and the extent of PAH degradation. The ultimate goal is a treatment technology that serves as a cost-effective alternative to landfilling. thermal treatment or incineration, and other technologies. The chemical-biological treatment is referred to as the MGP-REM process. Following pretreatment, microorganisms present in the PAH-contaminated soil biologically degrade the organic contaminants to carbon dioxide and water. The MGP-REM development and evaluation program consists of three phases: Solid-phase (landfarming) application of MGP-REM; Slurry-phase application of MGP-REM; and In Situ application of MGP-REM.

Gas Plant Emissions/Efficiency Report. This report is a result of a field evaluation of air emissions from combustion equipment at natural gas processing plants. The primary focus of the work was quantification of hazardous air pollutant emissions from natural gas-fired equipment, with other pollutants such as NO_x and CO also measured. Seven internal combustion engines, three incinerators, six heaters, three boilers, and three gas turbines were tested at five facilities. The internal combustion engines were found most likely to pose a potential regulatory concern, due to formaldehyde emissions. Other data indicated that the operating condition of the equipment can affect emissions and fuel consumption after maintenance exhibiting a decrease in formaldehyde emissions and fuel consumption after maintenance was performed. This two-volume report consists of volume I, which describes the test program and reports the results, and a series of detailed data appendices in volume II. This is the second in a series of two reports presenting the results of a field evaluation of air emissions from combustion equipment at natural gas industry facilities. The first report focused on transmission compressor stations and storage facilities.

Lomic SonicWareTM. Lomic, Inc. has developed a software package to assist natural gas metering engineers using ultrasonic metering devices. SonicWareTM provides the user with information to calibrate, monitor, audit and service ultrasonic meters.

Plastic Pipe Reliability (PENT Test). The Polyethylene Notch Test (PENT Test) is a newly developed testing method that facilitates the identification of slow crack growth (SCG) characteristics in polyethylene resin which subsequently identifies the longevity characteristics in polyethylene pipe used in the natural gas distribution industry. The PENT test is used by polyethylene resin manufacturers for broadly identifying important resin failure characteristics in pipe without having to use a more costly hydrostatic test to obtain similar information in PE pipe development. Also, the PENT test can identify SCG rates without having to test the PE pipe itself. The PENT Test can be done using a small sample of resin, eliminating the need to produce a section of pipe for testing.

SUPPLY

Mercury Soil Contamination Program. The natural gas industry used mercury manometers extensively to measure the flow of gas at wellheads, metering sites, and other gas industry operations. Several operational aspects may have caused mercury spillage from the manometers resulting in sites with mercury-contaminated soils. The release of elemental mercury into the natural environment from manometers is a potentially serious problem because of the toxicity of mercury. Research sponsored by GRI and the U.S. Department of Energy and conducted by the Energy & Environmental Research Center (EERC) to address this problem included an industry workshop with published proceedings, the publication of a critical literature review and citation database, a published review of remediation technologies, the development of a risk-based screening model, and a review of sampling and analytical methods for mercury. Additional research included monitoring of six field research sites, a study on containers and preservation techniques for mercury-contaminated samples, testing of thermal desorption, physical separation, chemical leaching and a combination of physical separation/chemical leaching. Activities to date have indicated: 1) contamination is extremely localized and does not migrate to shallow groundwater; 2) specific sampling and analytical techniques must be adopted to provide meaningful data; and 3) various remediation technologies can be used effectively to remove mercury from soil.

Offshore Atlases - Part 2. Radian International LLC, has updated the two-volume Atlas of Northern Gulf of Mexico natural gas and oil reservoirs with the most recent deep water drilling data in the Gulf. Published in late 1997, it includes data on deep water exploration activities from January 1995 to December 1996, a period of significant drilling activity in the Gulf. The atlas provides petroleum geologists with a direct link to vital engineering and geological data, which is a valuable new tool to help guide producers in planning, leasing, acquisitions, and exploring and exploiting the deep water trend in the Gulf. The atlas includes state and federal data that have been compiled into a single source by the Texas Bureau of Economic Geology. The atlas takes 9,947 oil and gas reservoirs from 1,212 fields and classifies them into a geological framework for the region, sorts the sands and fields into plays. The fields represent a total cumulative production of 134.9 trillion cubic feet of natural gas and 12.1 billion barrels of oil. Volume I, published in June, 1997, is a 200-page portfolio that includes descriptions and cross sections of the Miocene and older reservoirs, which account for the majority of plays in the region. Volume II, released in late 1997, covers the younger, Plio-Pleistocene reservoirs, including deeper water plays. The atlas also has a data component on CD-ROM that includes engineering attributes for the 9,947 reservoirs and 91 plays. The atlas is one in a series of six regional atlases on major natural gas plays developed by GRI, DOE and the MMS.

Appalachian Atlas. This is the most comprehensive atlas of natural gas and oil fields in the Appalachian Basin ever published. It is one in a series of six regional atlases on major natural gas plays. The Atlas of Major Appalachian Gas Plays features more than 700 maps, graphs, cross sections, stratigraphic columns, correlation charts, type logs, data tables, and references on more than 30 of the basin's most significant gas plays. It offers a comprehensive analysis of geological, engineering, and production data that will help producers identify exploration and development opportunities in the basin. The atlas is published by West Virginia Geological and Economic Survey.

Underbalanced Drilling Manual. GRI estimates that more than 30 percent of wells drilled in the United States could be safely and cost-effectively drilled using underbalanced technologies, which have been available since the 1970s. Currently, only about 10 percent of wells are drilled in this manner, due chiefly to a lack of knowledge and experience among producers about how to apply these technologies. To fill this knowledge gap, GRI contracted with Terra Tek Inc., to consolidate into one document a significant body of publicly-available knowledge, protocol and experience about underbalanced drilling. GRI's

21

Underbalanced Drilling Manual is a collation of industrial experience in underbalanced drilling. It is a state-of-the-art manual that provides the basic background knowledge for the evaluation, selection, design and planning of underbalanced drilling operations. The impacts of wider underbalanced drilling application are improved penetration rates (decreased drilling costs) and decreased formation damage. The manual characterizes various techniques and methodologies, including air, nitrogen, natural gas, mist, foam, mudcap drilling, flowdrilling, coiled tubing drilling, snub drilling, and closed systems. The manual is available from the Society of Petroleum Engineers or the International Association of Drilling Contractors.

Freeze/Thaw for Production Water. When natural gas is extracted at the wellhead or withdrawn from a storage reservoir, a substantial volume of water is co-produced with the gas. Produced water constitutes more than 80% of the wastes and residuals generated from the production of natural gas. Consequently, produced water management practices and water disposal costs are issues of growing importance. GRI supports research to identify and develop cost-effective and environmentally acceptable management strategies for produced water. One such treatment technology couples winter season freezing and thawing with summer season solar evaporation. The freeze-thaw/evaporation (FTESM) process works on the principle that a brine solution with elevated total dissolved solids (TDS) concentrations has a lower freezing point than purified water. The technology provides an opportunity to use natural conditions to purify or dispose of produced water year-round. A typical FTE facility design consists of a produced water holding pond, a freezing pad, and a treated water storage pond or facility. When the ambient temperature drops below 0°C, produced water is sprayed onto the freezing pad, forming an ice pile in the process. The dissolved solids concentrate in a brine, which drains from the pad. When the temperature is higher than 0°C, the ice pile melts and the treated water, which contains significantly lower TDS concentrations, drains from the freezing pad. Automated monitoring and processing through the use of a system of sensors and valves allows for ready identification and sorting of runoff. The brine is disposed of by conventional methods and the treated water is stored for later beneficial use or is discharged. Since 1992, research has been sponsored by Amoco Production Company, the U.S. Department of Energy, and GRI to develop a commercial, natural freeze-thaw/evaporation purification process for produced waters. Since 1995, B.C. Technologies, Ltd. (BCT) and the University of North Dakota Energy and Environmental Research Center (EERC) have been successfully testing an automated produced water treatment and disposal facility that uses the FTE process. The FTE process has a definite economic advantage over conventional evaporation technology in climates with seasonal subfreezing ambient temperatures. Importantly, reduced water treatment/disposal costs can result in increased production from economically marginal gas resources and in the development of new unconventional sources such as coalbed methane.

Glycol Dehydrator Controls/Monitoring. Monitoring glycol dehydrator control devices in the field to verify compliance with emissions limitations could be expensive. To provide a more cost-effective method, GRI established a control device monitoring program to validate the concept that the condenser outlet temperature is the only control device parameter needed for monitoring a still vent condenser. Another objective was to collect the data needed to validate the potential use of computer programs, such as GRI-GLYCalc 3.0, to generate accurate, site-specific condenser curves. GRI contracted Radian International LLC to perform the data collection and field evaluation. Radian collected data during nine tests over a range of condenser configurations and operating temperatures. Several types of condensers, including air-, glycol-, and water-cooled, were tested. Each of the nine tests consisted of six runs. Radian used the field data as inputs for various computer modeling approaches and compared the modeling results with the field measurements. The results of the study show that condenser outlet temperature can be used as a monitoring parameter for a given unit. The data also shows that computer programs such as GRI-GLYCalc 3.0 can be used to develop site specific condenser control device emission efficiency curves for use in conjunction with outlet temperature as a control device monitoring tool. Computer modeling of condenser performance is expected to cost less than direct field measurement of performance.

Coalbed Reservoir Gas-In-Place Analysis Short Courses. Tesseract Corporation and TICORA Geosciences in conjunction with GRI developed an improved analysis protocol for determining the reservoir parameters used for calculating the gas-in-place volume of coalbed reservoirs. GRI's research showed that many commonly used methods for determining critical reservoir parameters such as the gross thickness, average rock density, and average in-situ sorbed gas content have inherent shortcomings which collectively can result in up to 50% or greater underestimation error in the gas-in-place volume. GRI's improved analysis protocol enables the more accurate determination of these three critical reservoir parameters. During 1997, GRI conducted three, 2-day short courses which provided hands-on training to 65 petroleum geologists and reservoir engineers in the use of this improved analysis protocol.

^{*} Enhancement to a previous winner.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 53 Witness: Smith

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 49, Alternative Receipt Point Service. Provide cost support for the proposed distribution charge of \$.10 per Mcf.

Response:

Western's rationale for establishing the rate for the Alternate Receipt Point Service, Rate T-5, recognized several factors. First, as discussed in detail in the testimony, Volume 2 of 10, Tab 11, at pages 31-33, availability of this service is subject to several limitations. T-5 Service, if available to a specific customer, presents a new, "added-cost" option for the customer - in other words, the customer may choose to utilize an alternate receipt point under the conditions of the T-5 tariff, or avoid the additional \$0.10/Mcf fee by continuing to utilize their traditional upstream supply interconnect.

Administrative tasks for Western associated with providing this service include added transportation nomination and balancing complexities, additional system monitoring requirements at the point of receipt into Western's system, and accounting / contractual issues related to T-5 transactions.

Although Western did not perform cost or valuation analyses, the level of \$0.10 per Mcf was proposed in recognition of these additional complexities faced by Western in providing and managing this new service, as well as the clear capability of the customer to assess this cost in their election to utilize this service.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 54 a-d Witness: Smith

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 51, Special Charges.

- a. Even though rate schedules G-1, G-2, LVS-1, LVS-2, T-3, and T-4 all include sections headed "Late Payment Charge," Sheet No. 51 and the Testimony of Gary L. Smith, indicate the proposed Late Payment Charge of 5 percent will be applied only to Rate G-1 sales service. Explain the reasoning for applying the 5 percent charge to only one rate schedule.
- b. What other local gas distribution companies is Western aware of that have a late payment charge which is applicable to only one of several rate schedules?
- c. What is the purpose of the Late Payment Charge section in the tariffs, other than Rate G-1, identified in part (a) above?
- d. Provide the amount of annual revenue that Western expects the Late Payment Charge to generate. Include supporting calculations and sufficient narrative explanation to explain the calculations.

Response:

- a. Western's experience is that the residential class of customers served under Rate G-1 is the class of customers most likely not to pay on time. Since this is also the largest class of customers served, some 84%, Western believes that the greatest benefit can be derived by applying a late payment charge to that class of customers. Since one of the rate design goals of this case is Rate Equity, it is logical to first seek new sources of revenue from the class most likely responsible for the credit and collections costs incurred by the Company and most in need of an incentive to pay on time.
- b. Although Western determined that several other LDC's in Kentucky do apply Late Payment Charges, we did not conduct a survey of those LDC's to assess their application of late payment penalties among different rate classes.

١

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 54 a-d Witness: Smith

- c. This language has been in Western's tariffs for a long time. The language was designed to outline the conditions under which a late payment penalty would apply if in effect for a given rate class. Western prefers to leave this language in the tariff at this time, even though it is not proposing to apply a late payment penalty to these rate classes.
- d. Please refer to the response to Data Request 57 (d), which provides a workpaper that details the components of Other Revenue for the Test Year, applying present and proposed rates. Included on that attachment is Western's forecast of \$308,304.

Western estimated the dollar value to which the Late Payment Fee would be applied in the following manner.

Total Annual Residential Revenue, present margins:	\$68,349,045
Annual Rate Increase Requested:	9,221,264
Total Annual Residential Revenue, proposed margins:	77,570,309
Approximate Residential Revenues, 11months:	61,660,820
Assume Late Payment applied to 10% of Total Revenues	6,166,082

5% Late Payment Charge

\$308,304

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 55 Witness: Smith & Marks

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 30a, Demand-Side Management Cost Recovery Mechanism, and the Testimony of Gary L. Smith and Michael Marks on the same subject.

- a. Explain why the WKG CARES program is proposed for another three years, as opposed to one or two years, or on a permanent basis.
- b. What consideration, if any, was given to implementing the program on a permanent basis?
- c. Are the non-permanent nature of the proposed three-year program and the proposal to recover costs for the three-year pilot program the only reasons for proposing a surcharge mechanism rather than including the prospective costs for recovery through base rates? If there are other reasons for using a surcharge mechanism, explain them in detail.
- d. The tariff itself does not specifically mention the annual filing with the Commission discussed in the Testimony of Michael Marks. Was this an oversight or intentional? Provide any reasons why Western would be opposed to including a statement in the tariff identifying and describing the annual filings proposed by Mr. Marks.

Response:

- a. It seems appropriate that such a program should be periodically reviewed. Western's proposal to extend the program through 2002, anticipates that such an evaluation would be appropriate approximately every three years. Setting the program's termination date in concert with this interval ensures that any extension, modification or termination of the program occurs with the benefit of such a review. On page 17 of his testimony, Mr. Marks recommends a review of the program should the program be extended beyond 2002.
- b. None, for the reasons stated in the response to a. above.
- c. The surcharge mechanism is certainly not inconsistent with the nonpermanent nature of the proposed program and recovery of pilot program costs. However, the primary purpose of the proposed surcharge mechanism is to ensure that the costs of this program are recovered from the appropriate class of customers, consistent with KRS 278.285, and not from Western's shareholders. Mr. Smith's testimony points out that the "Revenue requirements associated with the DSM program are incremental to the Company's deficiency in this case; therefore, the DSM surcharge is excluded from the summary of proposed revenues" (page 33). Including these costs in the calculation of base rates would result in shareholders paying for a portion

or all of the program if Western's earnings were to fall below its allowed return.

Ņ

d. The tariff specifically mentions the annual filing referenced in Mr. Marks' testimony. Please see the bottom paragraph of proposed Tariff Sheet 30B.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 56 a Witness: Ives

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 67, Rules and Regulations, Part (1), Premises charge and the Testimony of Daniel Ives.

a) The proposed Premises Charge is only for the residential customer class and Mr. Ives discusses this on page 11 of his testimony. Even though 84 percent of customer growth is in the residential class, explain why Western would choose not to address the same problem of incremental versus embedded costs for the remaining one-sixth of its customer growth occurring in other customer classes.

Response:

a) As discussed in Section IV of Mr. Ives' testimony, the Residential class of customers has not earned the allowed rate of return when examined in class cost of service studies and when examined in studies by other consultants. Mr. Petersen's class cost of service study in this case indicates that the Firm Industrial and Interruptible and Carriage classes are each earning above the system average rate of return and the rate of return sought by the company in this case. Mr. Smith testifies that by-pass options in the highly competitive Large Interruptible and Carriage market preclude the company from increasing margins to that sector. Finally, with respect to the Firm Commercial class, a Premises Charge might be appropriate on an earned return basis, as the class earns less than a system average rate of return and less than the return requested by the company in this case. However, as the preponderance (84%) of customer growth is in the Residential class, it was deemed that the problem is essentially caused by Residential growth.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 56 b Witness: Ives

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 67, Rules and Regulations, Part (1), Premises charge and the Testimony of Daniel Ives.

N

b) On page 10 of his testimony Mr. Ives discusses the proposed fifteen-year recovery period for the Premises Charge. Explain why a shorter life, based on the Internal Revenue Service's MACRS system, is appropriate for per books accounting by a regulated entity.

Response:

b) Mr. Ives does not propose use of the IRS' MACRS depreciation system for per books accounting by a regulated entity. Mr. Ives simply references the IRS' MACRS depreciation system as one that recognizes that economic lives may be shorter than physical lives. Mr. Ives uses this analogy as part of his thought process in determining what life might be appropriate for recovery of the Premises Charge.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 56 c Witness: Ives

Data Request:

Refer to Volume 1 of 10 of the Application, Tab 6, Proposed Tariffs, at Sheet No. 67, Rules and Regulations, Part (1), Premises charge and the Testimony of Daniel Ives.

c) Provide support for Mr. Ives statement that "a fifteen-year recovery period is consistent with what is being used elsewhere in the industry."

Response:

c) Refer to Mr. Ives' testimony on Page 17, line 25, through Page 18, line 2. At least two other companies in the industry, Questar and Minnegasco, utilize 15-year recovery periods.

See also attached documents:

tenants. This exemption does not apply to RPO accounts initiated at the time of execution of the referenced agreement.

NEW-PREMISES FEE

Temporary charge assessed to the occupants of a residential premises, excluding multi-family dwellings and mobile homes, with a new premises number. The charge, as specified below is to be collected for twelve payments. Tax at the applicable state and local rates will be charged on the New-Premises Fee.

EXTENSION AREA CHARGE AND EXPIRATION DATE

The following table describes the areas in which the Extension Area Charge applies, the amount of the charge for residential and commercial customers and the date on which the charge is due to expire for each new extension area.

Area Ocfinition	EAC	Expiration Date
Ogden Valley - An area which includes the Town of Huntsville, the communities of Eden and Liberty and unincorporated areas in Eastern Weber County and Northwestern Morgan County adjacent to the gas line to this area.	Regular Tariff Rates Plus: Residential Customers: \$27.50/mo. Commercial Customers: \$27.50/mo. plus \$2.5191/Dth for usage over 45 Dth/mo.	November 1, 2011
New Harmony - New Harmony and the area adjacent to the tap line serving New Harmony.	Regular Tariff Rates Plus: Residential Customers: \$25.14/mo. Commercial Customers: \$25.14/mo. plus \$2.6235/Dth for usage over 45 Dth/mo.	November 1, 2007
Panguitch - Panguitch and the area adjacent to the tap line serving Panguitch.	Regular Tariff Rates Plus: Residential Customers: \$30.00/mo. Commercial Customers: \$30.00/mo. plus \$2.7481/Dth for usage over 45 Dth/mo.	November 1, 2013
Oak City - Oak City and the area adjacent to the tap line serving Oak City.	Regular Tariff Rates Plus: Residential Customers: \$20.00/mo. Commercial Customers: \$20.00/mo. plus \$2.0870/Dth for usage over 45 Dth/mo.	November 1, 2013
Joseph & Sevier - Joseph and Sevier and the areas adjacent to the tap lines serving Joseph and Sevier.	Regular Tariff Rates Plus: Residential Customers: \$20.00/mo. Commercial Customers: \$20.00/mo. plus \$2.0870/Dth for usage over 45 Dth/mo.	November 1, 2013

Ø002

Minnegasco Section V First Revised Page 10 Replacing Original Page 10

New Area Surcharge Rider

Availability: Service under this rate schedule is available only to geographical areas that have not previously been served by the Company. This rate schedule will enable natural gas service to be extended to areas where the cost would otherwise have been prohibitive under the Company's present rate and service extension policy. Nothing in this rate schedule shall obligate the Company to extend natural gas service to any area.

Applicability and Character of Service: All customers on this rate shall receive service according to the terms and conditions of one of the Company's gas tariff services.

Rate: As authorized by the MPUC, the total billing rate for any customer class will be the applicable cost of gas, approved rate (monthly basic plus delivery charge) for that customer class plus a fixed monthly new area surcharge. All customers in the same rate class will be billed the same surcharge. The New Area surcharge will be treated as a Contribution-in-Ald-of-Construction for accounting and ratemaking purposes.

Method: A standard model will be used that is designated to calculate the total revenue requirement for each year of the average service life of the plant installed. The model will compare the total revenue requirements for each year with the retail revenues generated from customers served (actual and/or expected) by the project to determine if a revenue deficiency or revenue excess exists.

The Net Present Value (NPV) of the yearly revenue deficiencies or excesses will be calculated using a discount rate equal to the overall rate of return authorized in the most recent general rate proceeding. Projected customer CIAC surcharge revenues are then introduced into the model and the resultant NPV calculation is made to decide if the project is self supporting. A total NPV of approximately zero (\$0) will show a project is self supporting.

The model will be run each year after the initial construction phase of a project wherein actual amounts for certain variables will be substituted for projected values to track recovery of expansion costs and the potential to end the customer surcharge before the full term. The variables which will be updated in the model each year will be:

The actual capital costs and projected remaining capital costs for the project.

Number of customers used to calculate the surcharge revenue and the retail margin revenue;

The actual surcharge and retail revenue received to date and the projected surcharge and retail revenue for the remaining term of the surcharge.

New Area Service Rider (Continued)

Term: The term of service under this rate schedule shall vary from area to area depending on the service extension project. However, under no circumstances shall the surcharge applicable to any project remain in effect for a term to exceed fifteen (15) years. The Company assumes the risk for underrecovery of expansion costs, if any, which may remain at the end of the maximum surcharge term.

Expiration: The surcharge for all customers in an area subject to the New Area Service Rider shall end on the date specified for the project tariff, on the date the approved revenue deficiency is retired, or at the end of fifteen (15) years, whichever occurs first.

Revenue Requirements Model

Definitions: All terms describe contents and general operation of the Revenue Requirements Model used to determine a New Area Surcharge Rider for a project.

Column/Description

- 1. Time Period: Twelve (12) month calendar interval which is one year of the project life. The year in which the project is constructed is designated as year 0.
- 2. Year.
- 3. Gross Plant Investment: Cumulative plant in service at the end of the year reduced by the net present value of surcharge revenues in year 0. Plant in service shall be all capitalized costs incurred to provide or capable of providing utility service to the consuming public. Capitalized costs will include items such as pipeline interconnects, pressure regulating facilities, measurement and instrumentation, lateral delivery lines, distribution mains, mapping, customer service lines, meters and regulators.
- 4. Accumulated Depreciation Reserve: Book depreciation for the current year plus all previous years.
- 5. Net Plant In Service: The difference between Gross Plant Investment (Column 3) and Accumulated Depreciation Reserve (Column 4).
- 6. Average Net Plant: Average of Column 5.
- 7. Average Accumulated Deferred Income Taxes: The average of the beginning and the end of the year accumulated deferred income tax. Accumulated deferred income tax (ADIT) consists of two components: accumulated deferred income taxes on depreciation and accumulated deferred income taxes on contribution in aid of construction. At the end of the service life of the plant installed the balance of ADIT will be zero.
- 8. Average Rate Base: Total of Average Net Plant (Column 6) plus Average Accumulated Deferred Income Taxes (Column 7).

Allowed Rate of Return

New Area Service Rider (Continued)

9. Allowed Return: Derived from Minnegasco's most recent general rate proceeding:

Equity Ratio	x	Return on Equity	X	(1+Tax Rate)	a	Weighted Cost
Long Term Debt Ratio	x	Debt Cost			=	Weighted Cost
Short Term Debt Ratio	x	Debt Cost			8	Weighted Cost

The Allowed Rate of Return multiplied by the Average Rate Base (Column 8) equals the Allowed Return.

- 10. Book Depreciation: The straight line cost recovery of the life of the assets for Gross Plant Investment defined in Column (3). The depreciation factor used is based on a weighted average of depreciation rates used in Minnegasco's most recent general rate proceeding.
- 11. O & M Expense: In any year shall be based on average incremental cost per customer. The cost per customer will include provisions for incremental distribution and customer accounting expenses.

The calculation is average customers multiplied by incremental cost per customer.

- 12. Property Tax: In any year shall be a factor of the gross plant investment (after contribution-in-aldof-construction). The factor is based on historical experiences of actual taxes paid as a percentage of gross plant.
- 13. Total Revenue Requirement: Total of Allowed Return (Column 9), Book Depreciation (Column 10), O & M Expenses (Column 11), and Property Tax (Column 12).
- 14. Retail Revenue: This amount represents the retail revenue generated by multiplying the various retail billing rates (basic charge and delivery charge) approved in the Company's most recent general rate case proceeding by the expected average annual number of customers connected to the project each year.
- 15: Revenue Excess or (Deficiency): Revenue excess or deficiency is the difference between the Total Revenue Requirement (Column 13) and the amount of Retail Revenue (Column 14). Excess occurs when the Total Revenue Requirement in a given year is less than the total Retail Revenue generated. Deficiency occurs when the Total Revenue Requirement in a given year is more than the total Retail Revenue generated.

Ň

New Area Service Rider (Continued)

16. Present Value of Cash Flows: The cash flows that produce either revenue excesses or deficiencies (Column 15) are discounted to a present value using a discount rate equal to the overall rate of return established in the most recent general rate proceeding.

If the sum of the present value calculations over the life of the project is zero, or as close to zero as possible, the model demonstrates that the project is "self supporting". That is, the customer CIAC surcharge is the proper amount of customer contributed capital necessary to support the project at the projected (or actual) level of retail revenues.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 57 a through c Witness: David H. Doggette

Data Request:

Refer to Volume 2 of 10 of the Application, the Testimony of David H. Doggette, pages 12-14, and Exhibit DHD-2.

 Some of the service charge studies discussed by Mr. Doggette and included in Exhibit DHD-2 covered Western's fiscal year 1998. Identify any studies, other than the April 1999 survey of banks, that cover a period other than fiscal year 1998.

Response:

In the Special Service Charge Analysis the average time to complete work orders covers the calendar year March 1998 through February 1999.

b. Does the summary analysis on Exhibit DHD-2, page 1 of 8, at Column 3, represent the actual number of orders charged for fiscal year 1998, or does it represent the actual number of orders for any period? Explain what Column 3 represents.

Response:

Column 3 on Exhibit DHD-2, page 1 of 8, represents adjustments to DHD-2, page 7 of 8, for anticipated changes in growth and to reflect the restructuring of special charges.

c. Explain why Exhibit DHD-2, page 1 of 8, does not include all the special charges included in Western's proposed tariffs at Sheet No. 51.

Response:

Exhibit DHD-2, page 1 of 8, only includes those special charges related to customer service activity that Western is seeking to change.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 57 (d) Witness: Smith

Data Request:

Refer to Volume 2 of 10 of the Application, the Testimony of David H. Doggette, pages 12-14, and Exhibit DHD-2.

d. What impact, if any, do the proposed revenues in Exhibit DHD-2, page 1 of 8, Column 15, or the increase in revenues in Column 16 have on the increase in Other Revenues derived from comparing Exhibits GLS-7 and GLS-1 of the Testimony of Gary L. Smith?

Response:

d. The workpapers utilized to calculate Other Revenues for Exhibits GLS-1 and GLS-7, are attached as Schedule PSC DR NO. 1, DR 57(d), Sheets 1 and 2 respectively. As noted on these workpapers, the charge for each service activity was set in accordance with the cost analysis of Mr. Doggette.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 58 a-d Witness: Smith

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 11, the Testimony of Gary L. Smith at pages 4-12.

- a. Provide the historical data for the three-year period referred to by Mr. Smith on page 6 of his testimony including: (1) the number of customers by customer class; (2) sales volumes, by customer class, adjusted for normal weather; (3) annual changes in volumes for industrial sales and transportation deliveries; and (4) the level of volume migration from sales to transportation volumes.
- b. Provide detailed calculations showing the derivation of the adjustment for industrial sales and transportation deliveries referred to by Mr. Smith on page 8, lines 25-28 of his testimony.
- c. On page 7, lines 5-6 of his testimony, Mr. Smith refers to "historical growth rates averaging slightly less than 2,000 for the three prior years." To what three years does Mr. Smith refer? How does this statement reconcile with the table on page 12 of his testimony that reflects an average of at least 2,156 for any three-year period included therein?
- d. For each year in the five-year period covered in the table on page 12 of Mr. Smith's testimony, provide a breakdown of growth in residential customers between "new construction" and "on-main conversions."

Response:

a. Please refer to the attached summary of the historical data utilized in the preparation of the FY 1999 Budget, PSC DR NO. 1, DR Item 58 (a).

b. Please refer to the response to Data Request 59 (a) which provides detailed calculations showing the derivation of the adjustment for industrial sales and transportation deliveries.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 58 a-d Witness: Smith

c. The statement in testimony was based on the 12-month ending average number of "customers" reported in the Financial Statements for Fiscal Years 1995 through 1997. Revenue budgets prepared for FY 1998 and 1999 were based on the number of customers within a class, as opposed to total meters in service. The average growth for the stated three year period, was 1,952.

The Table on Page 12 summarizes the total meters in service during the month of December in the years 1994-1998. Please note that the Table misidentifies the left-hand column as "Fiscal Year"; it should simply state "Year". In other words, the most recent meter count represents December 1998 (which is in the FY of 1999).

d. The only available resource for the information requested are Western's marketing reports, a manual tracking process monitoring residential additions and identifying whether the addition is a newly constructed home or an existing home converted from other fuels. It is difficult to correlate these reports to the customer additions noted in the financial statistics for a variety of reasons. For example, there may be timing differences between the reported addition in the marketing reports vs. the financial reports. The financial statistics rely upon billing system data, recording active accounts - with variances in the level of inactive accounts potentially distorting the correlation to the marketing statistics (which report only customer additions). Notwithstanding these difficulties, Western does review the marketing reports in the revenue budgeting process, concentrating primarily on indicated trends rather than the level of gross additions. Based on these marketing reports, the following additions were noted for FY 1994 to FY 1998 (timing again poses a problem, since the table on page 12 is a snapshot comparing meters in service in December of the noted year).

Fiscal	Residen	tial
Year	New Construction	Conversions
1994	2,037	1,026
1995	2,236	1,095
1996	1,466	834
1997	1,744	870
1998	1,783	363

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 59 a-c Witness: Smith

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 11, the Testimony of Gary L. Smith, and Exhibits GLS-1 through GLS-7.

- a. Exhibit GLS-3 summarizes the impact of industrial contract adjustments and volume changes. Provide supporting workpapers and narrative descriptions of these changes, by customer (the actual identity of the customers may be omitted and reference made by numbers and/or letters, i.e., - customer 1a).
- b. Exhibit GLS-6 summarizes the volume adjustment for declining customer usage. Provide supporting workpapers and narrative descriptions of the calculations made to derive the adjustment.
- c. Exhibit GLS-1 shows revenues at current rates reflecting all adjustments to derive test year volumes while Exhibit GLS-7 shows revenues at proposed rates reflecting the same adjustments. Are there any differences in the two exhibits other than: (1) different rates / margins; (2) Alternative Receipt Point volumes and revenues; (3) the amounts shown for Additional Contract Reformation; and (4) the amounts shown for Other Revenue? If yes, identify and explain those differences.

Response:

a. Supporting workpapers relating to Exhibit GLS-3 are attached as PSC DR NO. 1, DR Item 59(a), Sheets 1 through 8. Sheets 1 and 2 summarize the adjustments made for 81 industrial and commercial customers. These sheets also include the description of the specific adjustment for individual customers.

Sheets 3 through 5 identify the affected sales volumes relating to the adjustment, including the detail of the billing block within Western's tariff services. On line 20 of Sheet 5, the adjustments for overrun sales is shown.

Sheets 6 through 8 identify the affected transportation and carriage volumes relating to the adjustment, also providing the details of the billing block affected.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 59 a-c Witness: Smith

b. Supporting workpapers relating to Exhibit GLS-6 are attached as PSC DR NO. 1, DR Item 59(b), Sheets 1 through 5. Sheet 1 of the workpapers summarizes the volumetric trend analysis performed for the residential and commercial class from FY 1990 through FY 1998. Descriptions of these calculations are provided below. Sheets 2 through 5 provide the degree-day data from the National Oceanic and Atmospheric Administration ("NOAA") utilized for the study.

Testimony, at pages 12 and 13, provide an overview of the reasons for Western's investigation of average customer usage over the nine-year time period. The intent of the analysis was to determine the reliability of the proposed degreeday composite, consisting of the five First Order weather stations in or near Western's service area. This model was developed to assess the tracking of weather patterns and usage patterns for the temperature-sensitive classes of residential and commercial/public authority. Column "c" estimated the total residential class monthly base load, using the metered volumes for the nonheating months of July and August preceding the Fiscal Year winter period. Column "d" records the total actual residential class deliveries in Western's financial statistics. Column "e" subtracts the estimated base load times twelve months, to estimate the total annual heating load. Column "f", the Normal Heating Load calculation, divides the heating load by the computed % of normal heating degree-days, which is from the financial statistics for the previous degreeday basis and computed from data on Sheets 2 through 5 for the proposed composite degree-day basis. Column "g" adds the normal heating load and the annual base load to estimate the total, weather-normalized volumes for the residential class.

Column "h" records the average residential meters in service for the Fiscal Year from financial statistics. And, Column "i" computes the average, normalized usage per customer. Similarly, Columns "j" through "p" compute the normalize usage per Commercial/Public Authority customer.

Plotting the data graphically, and inserting a "best-fit" line, the slope of the decline indicated by the data was approximately -1.73 Mcf per year for normalized average residential customers, and -3 Mcf per year for Commercial/Public Authority.

Y.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 59 a-c Witness: Smith

The declining customer usage trend was incorporated in the adjustments from the Fiscal Year 1998 reference period to the Test Year of Calendar Year 2000. The volume adjustment for declining customer usage was labeled "Residential & Commercial Conservation and Energy Efficiency Adjustments", Exhibit GLS-6. For each class the indicated rate of decline was forecast to continue between Fiscal Year 1998 and the Test Year.

c. No, there are no additional differences in the two exhibits other that the four categories identified in the question.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 60 Witness: D. Donald A. Murry

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 8, the Testimony of Dr. Donald A. Murry.

- a. Page 6, lines 20 through 22, indicates that the Commission should make allowances for the added risk of the inclusion of short-term debt in the capital structure. In what way should the Commission make such an allowance?
- b. Page 5, beginning on line 17, indicates that Atmos raises capital for Western's operations. Is this beneficial to Western? If so, should the Commission make allowances for Western's ability to access this capital source? Would it be more risky for Western if it had to raise capital itself for its operations?
- c. Provide an explanation of why each company in the group of comparative companies is considered to be a viable comparison to Atmos.
- d. Provide the most recently approved return on equity for each of the comparable companies, along with the date each was approved.
- e. Do any of the comparable companies use a weather normalization adjustment, a premises charge, or a margin loss recovery mechanism to stabilize their earnings? If so, which ones?
- f. What effect would the implementation of a weather normalization adjustment have on Western's financial risk?
- g. What effect would the implementation of a premises charge have on Western's financial risk?
- h. What effect would a margin loss recovery mechanism have on Western's financial risk?

Response:

- a. The Commission should allow for the risk of short-term interest rate increase.
- b. Atmos is several times large than Western Kentucky Gas, and Atmos has a greater presence in the financial market than a standalone Western Kentucky Gas would have. As a result, Western Kentucky Gas would have a higher cost of capital as a stand-alone company. Please see page 20, lines 1-5 of the Direct Testimony of Donald A. Murry.

- c. The Moody's companies are recognized by financial analysts as representative of the gas distribution sector. Please see page 8, lines 8-15 of the Direct Testimony of Donald A. Murry.
- d. Dr. Murry does not have the requested records.
- e. Dr. Murry does not know if any of the comparable companies use a weather normalization adjustment, premises charge or margin loss recovery mechanism to stabilize their earnings.
- f. Generally, the weather normalization adjustment reduces the instability of revenues. However, revenue stability may or may not affect a company's business risk. Please see page 34, lines 1-30 and page 35, lines 1-30 of Mr. Gary L. Smith's Direct Testimony.
- g. As a mechanism to control the market risks of gas distribution companies associated with continued residential growth, a premises charge should reduce the business risk of the company slightly. In this case, the effect upon the expectations of investors will be inconsequential. Please see page 38, lines 11-18 of Mr. Gary L. Smith's Direct testimony.
- h. As a small distribution company, Western Kentucky Gas faces an inordinate business risk in competitive markets, and the margin loss recovery is likely to reduce the business risk of a company somewhat. However, in the case of Western Kentucky Gas, the impact on revenues may not be sufficient to influence capital costs. Please see page 29, line 19 through page 31, line 26 of Mr. Gary L. Smith's Direct Testimony.

١,

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 61 a-c Witness: Smith

Data Request:

Refer to Volume 10 of 10 of the Application, Tab 4, Summary of Jurisdictional Adjustments by Major Accounts, Schedule D-1, Sheet 1 of 4 and Schedule D-2.1, Sheets 1 and 2.

- a. Provide supporting workpapers for the revenue and gas purchases adjustments on these schedules, or reference where provided if already included in the application or in response to other requests contained in this Order.
- b. Provide narrative descriptions of the workpapers provided in response to part (a) above.
- c. Explain in detail the reasons for the proposed reductions to Service Revenues and Other Gas Service Revenues.

Response:

a. Please reference the testimony of Mr. Gary Smith, Volume 2 of 10, Tab 11 of the application, at pages 4 through 14, describe in detail the processes employed in the development of revenue forecasts for the Base Period and Test Period. As evidenced by the discussion in the testimony, the FY 2000 budget, although similar in process to the FY 1999 budget, does not build from the prior budget. Different degree-day bases were utilized, recognition of declining customer demand (previously not quantified), and several other variances present difficulties in analyzing the "gaps" between the periods.

FR 10(10)(m) details the monthly and annual comparisons of the Base Period and Test Period. As is noted the Base Period consists of 6 months actual data and six months of the FY 1999 budget. FR 10(10)(d)2.1provides a narrative summary of key components of "adjustments" or differences between the Base Period and Test Period. No workpapers were prepared to isolate the individual components within these differences.

Y.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 61 a-c Witness: Smith

- b. Not applicable. See response to part a. of this Data Request.
- c. The projection of Test Year Service Revenues and Other Gas Revenues was based solely on recent levels of service activities. Reference workpapers provided in response to DR Item 57(d), Sheet 1 of 2, for details of the actual orders charged for FY 1998.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 62 Witness: Gruber

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 1, the Testimony of Conrad E. Gruber, specifically, the table on page 11 which denotes Western's operating and maintenance cost efficiencies in comparison to industry averages.

- a. Provide copies of the A.G. Edwards study cited and a detailed schedule of Western's operating and maintenance expenses, identified by fiscal year ("FY"), used to determine Western's Costs per Meter as shown in the table.
- b. Provide a detailed schedule of Western's gas utility employees by job classification for the period used to determine Western's number of employees per 1,000 customers as shown in the table.
- c. Provide documentation used for external reporting purposes to substantiate the number of meters in service and thousands of customers served for the period represented by the table.

Response:

a.

The A.G. Edwards Study is attached. Atmos Energy is one of the large gas LDCs referenced in the study. The data on Atmos apparently reflects O&M costs which pre-date the merger of Atmos with United Cities Gas Company and the subsequent savings achieved through the significant downsizing of UCG and the overall reorganization of Atmos. The benefits of the merger and Atmos reorganization on O&M costs did not begin to materialize until 1998 and are clearly not reflected in the 1997 A.G. Edwards study.

Schedule A details Western's actual O&M expenses and comparable meter count for April 98 – March 99, the most recent 12-month period data available at filing, as shown in Mr. Gruber's testimony. (Mr. Gruber's testimony misidentifies this number as representing the base period in this case.)

- Schedule B details Western's April 98 March 99 employees, by job classification, and comparable customer meter count to determine the employees per 1000 customers (meters) ratio shown in Mr. Gruber's testimony. An appropriate allocation of Shared Services employees has also been reflected in Schedule B.
- c. Western's customer meter count and employees as used for the table in Mr. Gruber's testimony are not available through documents used for

external reporting purposes. However, this does not nullify the validity of these numbers for comparison of Western to the most recently published industry data. The customer meter count was obtained from Western's Financial Statements (the Gray Book, published monthly, see FR 10(9)(n)) and the employee data was obtained from Western's Human Resource system (see response to DR item 69).

Gas Utilities: Annual Productivity Study

DECEMBER 14, 1998

Michael C. Heim, CFA (314) 955-3272 Daniel M. Fidell (314) 955-5540 R. Michael Creager, Associate Analyst

Introduction

As both the natural gas and electric utility industries move toward market-based competition, the success of individual natural gas distributors depends more and more on their ability to control costs. In

this increasingly competitive marketplace, traditional local distribution companies (LDCs) face competition from a growing number of players. As retail unbundling unfolds, some LDCs will be competing with independent gas marketers for the supply of the gas commodity. Thus, the ability of the gas utility to deliver gas to the customer efficiently and inexpensively will become even more important as the LDC attempts to build and maintain customer loyalty. Natural gas distributors will likely face increasing competition from electric utilities as deregulation in that industry results in lower electric rates. In addition, the gas distributors will continue to face price competition from distributors of alternative fuels such as heating oil and propane. Indeed, the depressed oil prices over the last 12 months have led to a price advantage for heating oil over natural gas in many areas in the northeast.

A more competitive environment, however, will also present opportunities for those natural gas distributors that are able to effectively control costs. For example, some states are offering incentive- or performance-based rates that reward efficiently operated utilities by allowing them to keep additional profits above an established benchmark. We also expect the consolidation trend to continue with electric utilities seeking to diversify and gas utilities attempting to gain economies of scale. In this atmosphere, we expect a larger premium to be paid for those gas utilities that have been able to demonstrate a history of operating efficiency.

1 of

The goal of this report is to identify and analyze the key productivity measures that can provide some evidence of how the industry has positioned itself to survive in this rapidly changing environment. The results continue to support the relative advantages enjoyed by large utilities in each of the productivity categories studied. Current favorably rated stocks in the Large Distributor group that performed well in our study include NICOR Inc. (GAS-40 7/16-NYSE-rated Accumulate/Conservative) and Northwest Natural Gas (NWNG-27 5/8-Nasdaq-rated Accumulate/Conservative). In the Integrated and Diversified categories, Questar (STR-17 7/8-NYSE-rated Accumulate/Conservative) and CMS Energy Class G (CPG-25 1/8-NYSE-rated Accumulate/Conservative) were among those with favorable productivity results relative to their peers.

Methodology

This study examines the fiscal 1997 results of the 41 companies in the A.G. Edwards Gas Utility Index. (See Figures 1 and 2 on pages 2 and 3.) The index divides the universe of companies into four groups: Small Distributors, Large Distributors, Integrated Utilities and Diversified Utilities. The Small Distributors group is made up of the local distribution companies (LDCs) with market capitalizations in the range of \$100 million to \$400 million and relatively light daily trading volume. The Large Distributors group consists of the larger LDCs with a market capitalization range of \$400 million to \$2 billion. The Integrated Utilities group consists of those companies that have become involved in multiple segments of the

natural gas industry including exploration, production and transmission as well as distribution. In most cases, these companies have a market capitalization of at least \$1 billion. And finally, the Diversified Utilities group is a mixed bag of gas utilities that have characteristics unlike those of the other three groups, including companies currently involved in merger transactions as well as those utilities with significant nongas-related operations.

For this study, we have identified four categories of company performance in order to capture strategic competitive areas for gas utilities. The four categories include gas rates, operating costs, cost control and expansion costs. Within each category we used several different measures in order to provide an in-depth analysis of productivity and to avoid unduly weighting any one statistic. The data used in the study was gathered from a variety of sources, including direct company contact, company 10-Ks and annual reports. In addition, the preliminary results of the productivity study were sent to each company for verification. We attempted to single out only the information pertaining to the utility operations for all companies. It is important to note, however, that making any comparisons between individual companies based on these results can be difficult due to differences in geography, labor costs, customer class makeup and regulatory environments.

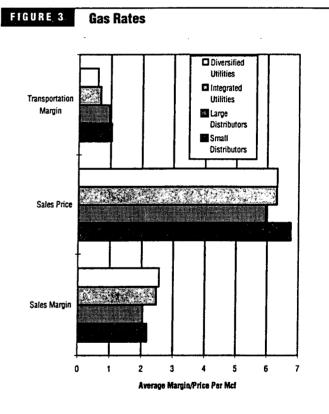

Gas Rates

The Gas Rates category provides an estimated L average rate charged for gas service. The Sales Margin per Mcf (thousand cubic feet) figure is calculated by subtracting the total cost of gas from the total gas sales revenue and dividing by total sales throughput. Because the cost of gas is passed through directly to the customers, the sales margin figure is more representative of the rates charged for the delivery of the commodity. The Sales Price per Mcf does not subtract the cost of gas and represents the rate charged for the delivery service as well as the commodity itself. The Firm Transportation Margin per Mcf represents the rate charged to those customers who have secured their own gas supply and require only transportation of the gas on the utility's distribution system.

Gas rate data for 1997 continues to reflect the relative rate advantage of large utilities compared with smaller utilities. (See Figure 3.) Small

distributors, lacking the operating efficiencies of the larger companies, usually suffer from higher operation and maintenance (O&M) costs and pass these costs onto customers in the form of higher rates. As we have mentioned in the past, the small utility group is likely impacted by the concentration of companies within that group that operate in the northeast. Companies in this part of the country typically face higher costs (labor, maintenance, etc.) relative to their peers. In the Transportation Margin category, the large diversified and integrated utilities have a relative rate advantage over smaller utilities, possibly due to many of these larger LDCs serving major cities with many large industrial customers that are able to negotiate lower rates. In addition, these companies have the opportunity to gain production efficiencies through their ability to spread out their overhead costs.

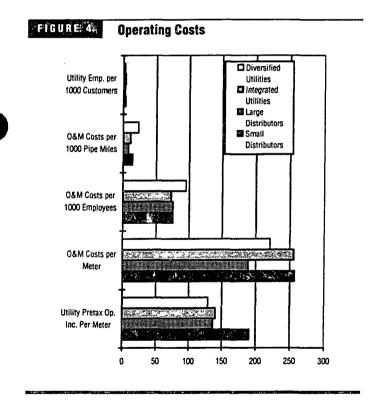

DR 6 4 of

Operating Costs

The analysis of utility operating costs focuses on five different ratios. In addition to comparing operations and maintenance costs to three different measures of distribution system size (meters in service, employees and pipe miles), we looked at ratios of utility employees per 1,000 customers and utility pretax operating income per meter.

Small distributors continue to have higher permeter operating costs than their larger counterparts. (See Figure 4.) Large utilities can gain cost advantages through economies of scale by spreading out corporate overhead and other fixed costs over a larger customer base. The concentration of small utilities in the northeast also contributes to the higher per meter O&M costs. The distribution systems in the northeast tend to be older and require more maintenance from a higher cost labor force. The higher pretax operating income per meter shown by the small group of distributors can likely be attributed to higher gas rates charged and the group's customer class profile. The small distributors have passed the higher O&M costs on to customers in the form of higher gas rates. They also tend to have a greater percentage of the higher margin residential customers compared with the other utility groups and, thus, a higher pretax operating income per customer.

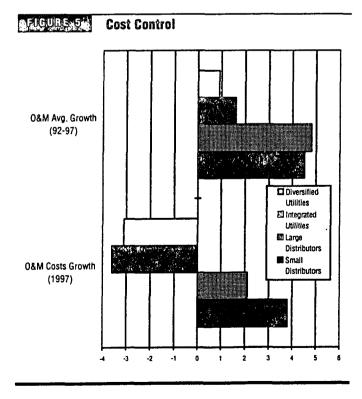

Cost Control

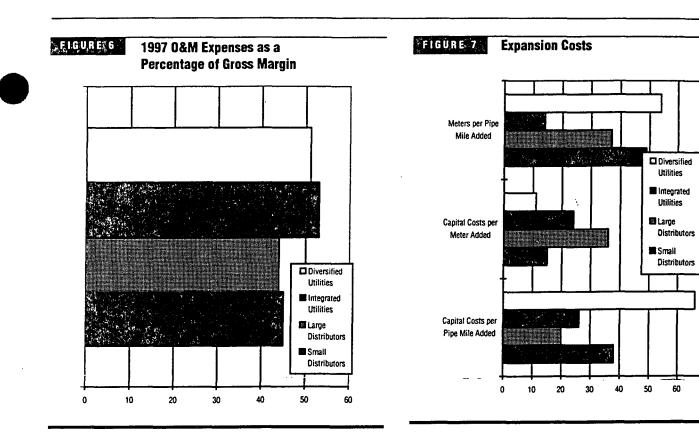

The Cost Control category measures the growth in utilities' operations & maintenance (O&M) costs. The growth in O&M expenses should be viewed in relationship to the companies' distribution system growth. High O&M cost growth by a utility company could reflect an expansion of DR 62 5 of 8

the distribution operations. As a general rule, we like to see O&M expenses increase at a rate below utility customer growth. Other contributing factors to O&M cost growth include labor costs, age of equipment and the makeup of the distribution service territory. For the 1997 study, we have added a category to track O&M expenses as a percentage of sales margin. This figure provides additional perspective on the relative performance of a company's ability to control O&M costs.

The small distributors experienced the largest growth in O&M costs during 1997, however, the large distributors have shown the largest growth over the last five years. (See Figure 5.) The integrated and diversified groups continue to keep O&M costs in check and actually reduced O&M expense in 1997. This would support the argument that the natural gas industry is moving toward an integration of upstream and downstream functions and that those concentrating solely on distribution are at a disadvantage. However, while these results show the recent cost-cutting diligence of the integrated and diversified groups, the small and large pure distributors still show a lower O&M expense as a percentage of gross margin. (See Figure 6 on page 6.) Again, it is difficult to draw general conclusions regarding O&M expense management without looking at the specific service territory and customer growth levels.

70

Expansion Costs

This category measures the cost and efficiency of distribution system expansion. The capital expenditures are analyzed based on the increase in pipe miles as well as the increase in meters served. Meters per pipe mile information is also calculated. The capital costs per meter added figure is an important measure because of its reflection on how the company's capital spending has created additional revenue.

The small distributors showed higher meters per pipe mile relative to the large distributors as well as lower capital costs per meter added. (See Figure 7.) These results are likely an indication of higher customer growth among some of the smaller gas utilities in our index. The higher capital costs per pipe mile added for the small distributors could once again be related to the northeastern location of many of the utilities in this group. In the northeast, much of the customer growth is derived from customer conversions to natural gas from alternative fuels, thus these utilities are able to add customers to an already existing main.

Comparing 1997 Results With 1996

uring 1997, the overall O&M costs for the group were flat per meter, increased slightly per employees and declined 9.1% in the per-mile category. (See Figure 8.) Because O&M expenses for many of the gas utilities actually declined in 1997, the higher per employees figure is largely due to slower growth in the denominator. For example, many of the utilities have been aggressively reducing their number of utility employees in preparation for a more competitive environment. The sharp decline in gas utility employees per thousand customers also serves as evidence of this trend. The capital cost per pipe mile and meter added for the group also showed declines in 1997. Although some of this decline could be weather related, we have seen evidence that many gas utilities are becoming more cautious in their capital expenditure programs. The current regulatory trend of lower allowed returns and reluctant rate relief has led to more calculated plans for system expansion. Many utilities have stated they can no longer afford to offer service to certain nonprofitable customers due to the uncertainty of future rate relief.

DR 62

Conclusions

The data in the 1997 study continues to highlight L the productivity advantages of large local distribution companies versus the small LDCs. though the gap seems to have narrowed compared with the 1996 study. Once again, it seems the smaller LDCs were faced with higher labor and operating costs which translated into higher gas rates charged from this group. Surprisingly, the integrated utilities showed a higher gas sales margin in 1997 compared with the small and large pure distributors. However, the results did reveal lower transportation margins achieved by the integrated utilities relative to the pure distributors. The operations and maintenance (O&M) expenses growth rate continues to decline for the industry as a whole. In fact, the integrated and diversified utilities actually reduced O&M expenses in 1997. We believe much of the operating cost reductions that have been achieved over the last few years from reducing utility employees and higher pension asset returns might be reaching a saturation point. As such, we anticipate O&M expenses for the industry will likely grow at a rate consistent with inflation going forward. Another interesting result from this year's study was the sharp decline in expansion costs. For example, the large distributor group experienced a 66% decline in capital cost per additional pipe mile over last year. We feel this

serves as further evidence that many gas utilities have realized they can no longer depend on rate relief for expanding their distribution system. In response, many of the gas utilities have become more effective in controlling their expansion costs.

Current favorably rated stocks in the Large Distributor group that performed well include NICOR Inc. and Northwest Natural Gas. In the Integrated and Diversified categories, Questar and CMS Energy Class G were among those with favorable productivity results relative to their peers. We should note that these productivity results are only one of many factors to consider when evaluating these gas utility stocks. Some companies operate in saturated markets where expansion comes only through building lines to new subdivisions which is more expensive than converting customers to gas. Some companies serve older cities with older pipes requiring higher cost maintenance. Construction and maintenance is also more expensive for those companies serving the areas with a colder climate. The state regulatory environments in which these companies operate can differ significantly and each company has its own unique management style and strategic direction. We do feel, however, that these productivity measures can be a useful tool in monitoring how well these companies have positioned themselves to operate in the increasingly competitive gas utility industry.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 63 a through c Witness: Conrad E. Gruber

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 1, the Testimony of Conrad E. Gruber, specifically page 16, which indicates that installation of the Oracle system was expected to be completed by July 1999, and refers to the series of IT projects that are essential for Y2K readiness.

a. Has the Oracle system been implemented and tested for Y2K readiness?

Response:

Yes.

b. Provide a description of the other projects scheduled for completion prior to the end of 1999 to assure Western's customers of Y2K readiness.

Response:

All hardware and software is, or will be Y2K ready by August 1, 1999. The only exception being the MV-90 system that supports large volume customer nominations. The MV-90 system does not affect gas supply. The MV-90 system will be implemented, tested and, Y2K ready by September 1, 1999.

c. Identify any costs associated with Western's Y2K readiness that are included in the base year or the forecasted year.

Response:

Western's total cost for the Y2K effort in the base year is \$167,000. Costs incurred as of August 27, 1999 are \$69,871. Western does not anticipate any Y2K costs in the forecasted year.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 64 Witness: Donald P. Burman

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 6, the Testimony of Donald P. Burman, and Volume 4 of 10, Tab 4, Filing Requirement 10(9)(m).

- a. Explain whether FR 10(9)(m) is a complete conversion table to NARUC accounts as presented for operating revenue and expenses in Volume 10 of 10, FR 10(10)(c), Schedule C-2.1 and Schedule C-2.2.
- b. Are the references in the "detail" sections of this exhibit to NARUC accounts the same as the accounts used to file the annual FERC Form No. 2 with the Commission?

Response:

- a. Rather than being a conversion table, FR 10(9)(m) is a detailed listing of the Company's NARUC chart of accounts.
- b. The "detail" sections of this exhibit are simply internal subdivisions of the individual NARUC account numbers.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 65 Witness: Betty L. Adams

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 4, the Testimony of Betty L. Adams. Does Western have a conversion table that converts its current chart of accounts for general ledger purposes to the NARUC accounts as presented for operating revenue and expenses in Volume 10, FR 10(10)(c), Schedule C-2.1 and Schedule C-2.2? If yes, provide the conversion table.

Response:

Yes, please see attached Chart of Accounts, Comparison of FERC and NARUC

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 66 Witness: Betty L. Adams

Data Request:

Are the NARUC account numbers referenced in Ms. Adams testimony at page 5, lines 5 through 23, the same as the account numbers used to determine the account balances for the annual FERC Form No. 2 filed with the Commission? If no, is there a conversion table that converts from NARUC accounts, to FERC accounts, to Western's general ledger chart of accounts?

Response:

No. See DR 65 referencing chart of accounts conversion.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 67 Witness: Betty L. Adams

Data Request:

Refer to Ms. Adams' testimony.

- a. Are the operating revenue and expenses in Volume 10, FR 10(10)(c), Schedule C-2.1 and Schedule C-2.2 according to NARUC accounts available according to Western's current general ledger chart of accounts? Resubmit these schedules according to the current chart of accounts.
- b. Does Western have operating revenue and expenses in the detailed manner described above according to its current chart of accounts which compare budgeted amounts to actual year-to-date totals for the FY 1998, 1997, 1996, 1995 and 1994?
- c. If yes to part (a) provide the budget to actual comparison for those years. Provide a brief explanation for accounts with a budget to actual variance of 5 percent or greater.
- d. Resubmit Volume 10 FR 10(10)(d), the summary of jurisdictional adjustments, according to Western's general ledger chart of accounts.
- e. Resubmit Volume 9, FR 10(9)(d) for the base year and test year according to Western's general ledger chart of accounts.
- f. Are the jurisdictional adjustments in Volume 10, FR 10(10)(d) and FR 10(9)(d) for the base year and test year by account as Western would submit to the Commission in a FERC Form No. 2 annual report? If not, resubmit these schedules according to the FERC accounts.
- g. Are the operating revenue and expenses in Volume 10, FR 10(10)(c), Schedule C-2.1 and Schedule C-2.2 according to FERC Form No. 2 as filed annually with the Commission available? If no, resubmit these schedules according to the FERC accounts.

Response:

- a. Yes, the operating revenue and expenses as presented in Western's referenced schedules are according to the NARUC chart of accounts.
- b. No, the budget was not prepared by NARUC accounts.
- c. This is not available per our response to a and b above.
- d. The current schedule as filed is by Western's chart of accounts.
- e. Resubmission of FR 10(9)(d) is attached.
- f. Attached is a resubmission of FR 10(10)(d), see "e" above for FR 10(9)(d).
- g. Resubmission of FR 10(10)(c), Schedule C-2.1 and Schedule C-2.2 are attached.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 68 Witness: Betty L. Adams

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 4, the Testimony of Betty L. Adams. On page 6, line 24, a table is presented to point out Western's overall operating and maintenance ("O & M") budgeting effectiveness for FY 1994 through 1998. Provide the source documents from which this table was created, with amounts detailed according to Western's general ledger chart of accounts.

Response:

Attached are copies of the "Responsibility Management Report" for the FY 1994 through 1998. The report which is referenced as RESP-10 is the budget and actual for the categories that we used in our budgeting process. The report referenced RESP-30 is by NARUC account for actual expenses only according to Western's general ledger chart of accounts.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item (69 c) Witness: Betty Adams

Data Request:

On page 8, line 22 of Ms. Adams testimony there is a discussion of the increase in the forecasted test period labor costs that is attributed to "the planned filling of a number of vacant employee positions and...a four percent wage increase."

c. Does Western have both union and non-union employees? If there are union employees, provide the job classifications and a copy of the union contract.

Response:

c. Western does not have a union contract. The last contract ended when employees located in Paducah, Kentucky voted to decertify their union in 1992.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item (69 d) Witness: Betty Adams

Data Request:

On page 8, line 22 of Ms. Adams testimony there is a discussion of the increase in the forecasted test period labor costs that is attributed to "the planned filling of a number of vacant employee positions and...a four percent wage increase."

d. Provide a schedule showing the derivation of the proposed 4 percent wage increase along with an explanation of how wage increases are determined for management, union and non-union employees.

Response:

d. WKG's base wage program as described in the attached documents applies to management, exempt and non-exempt employees. There are no union employees.

Pay philosophy and strategy is communicated to all employees in the attachment "Your Base Pay Opportunities at Atmos". The methodology of establishing pay ranges is in the attachment "Job Assignments".

The guidelines for pay delivery and basis for FY salary budgets are in the attachment "Atmos Energy Corporation FY '99 Pay Guidelines".

Back Contents Next

Rewards clearly aligned with the Company's vision and strategy

Your Base Pay Opportunities at Atmos

Atmos' Base Pay Program is designed to be flexible and responsive to the organizational growth and changes we have experienced - and fully expect to continue - in the years ahead.

The new pay program looks externally at jobs and is driven by what the "market" -- other companies -- pays for a job skill. It will provide base pay opportunities within a specific, competitive market range based on performance, experience, skills and responsibilities.

In addition, we have created the Variable Pay Plan (see page 6) that specifically was designed to offer you the opportunity to share in the successes you and your team help create by meeting corporate and team performance goals.

More Flexibility

There are a couple of important changes from past programs:

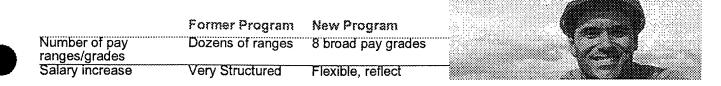

- Solution Jobs with similar market values are now grouped into broad pay grades based on "market pricing," and
- Jobs are no longer evaluated using the Hay system or any other pointfactor system.

"Market pricing" is determined using well-known, national surveys containing information on "benchmark" jobs. The surveys used with our program consider companies similar to Atmos in overall size in the gas industry as well as in general industry. A promotion to the next higher level pay grade is appropriate when:

As part of the shift to a purely market-driven strategy, the Base Pay Program will change from many different pay ranges to eight broad pay grades.

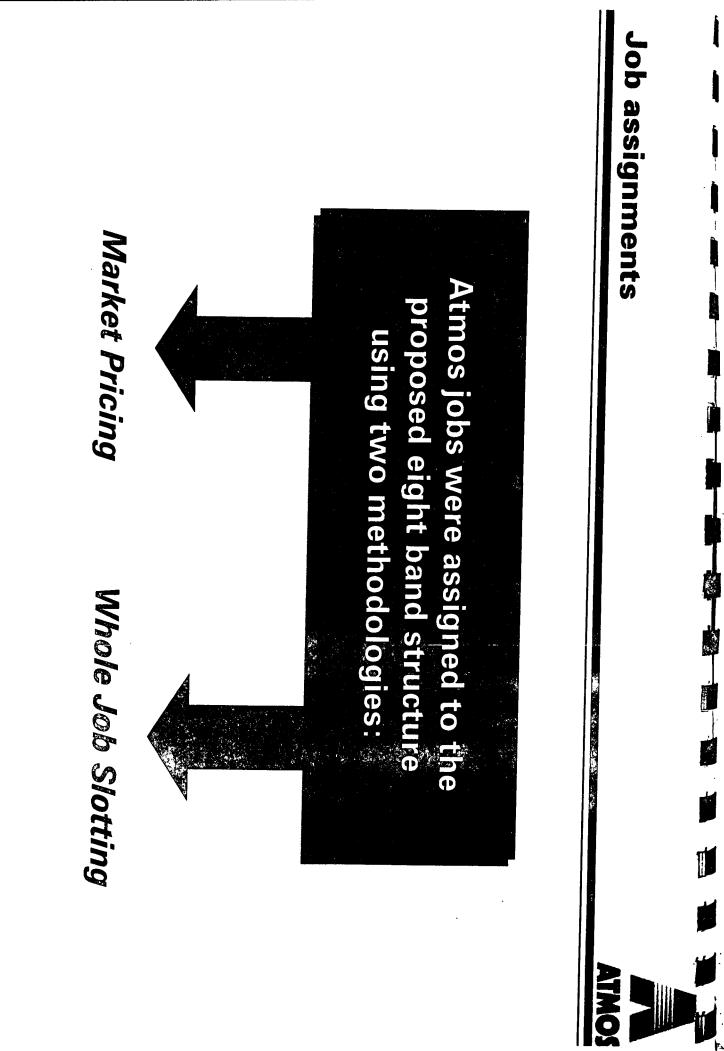

- Why broad pay grades? It's a better approach for both you and Atmos because broad pay grades:
- Better reflect broader, more fluid jobs and roles
- Provide a more flexible means to pay employees according to their responsibilities, skills, experience and performance, and
- Allow us to respond more quickly to changes in our industry.

Market pricing

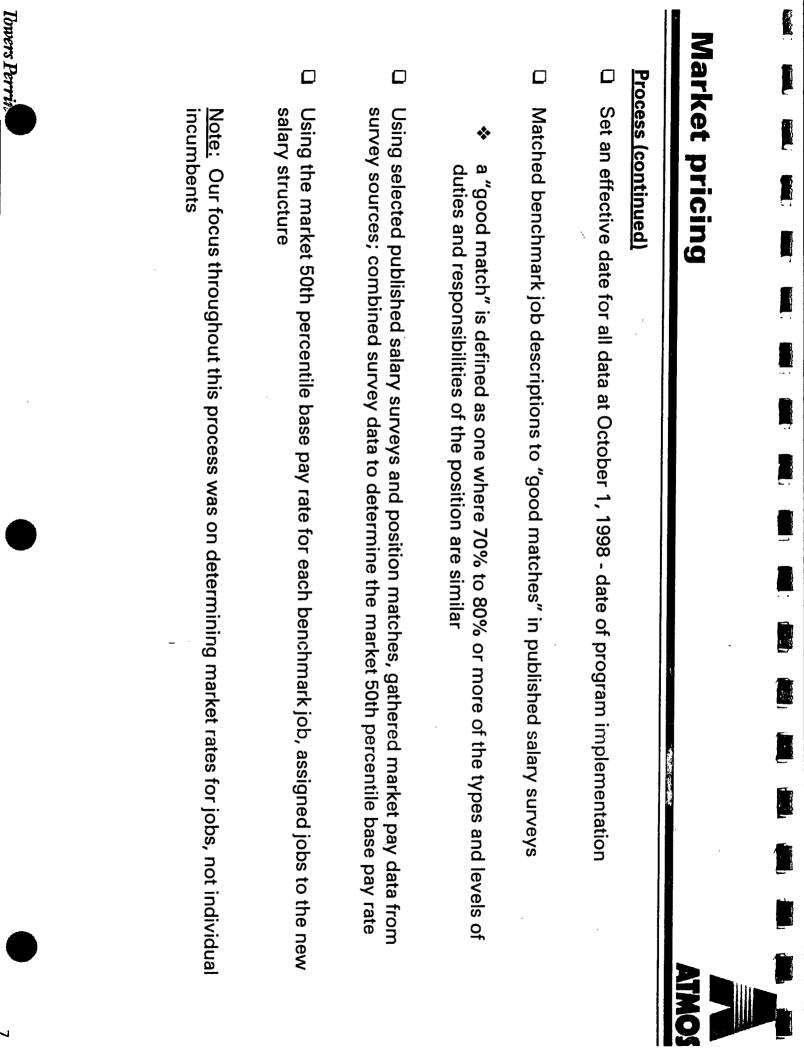

<u>Objective</u>

Determine competitive market pay rates for as many benchmark positions as possible

Process

- Selected benchmark jobs for market pricing; guidelines used in selection included:
- jobs that are common to other organizations
- jobs that cover a number of incumbents
- ∻ jobs that represent all job families and areas within the organization
- ۵ Determined appropriate survey sources to use in market pricing; criteria for survey selection included:
- * survey publisher is a reputable third-party, known for collecting, verifying and reporting data according to standard survey practices
- survey has been conducted for a number of years
- survey includes a sufficiently large participation base
- ł for industry surveys, participants include those that Atmos might compete with for talent
- ł for general industry surveys, participants represent a good cross-section of industries
- ٥ Verified target market to be the median or 50th percentile of the market

Whole job slotting

AIMO

Objective

Determine the appropriate band assignment for non-benchmark jobs (note: a "non-benchmark job" is defined here as a job which has not been assigned to a band based on market data)

Process

- Gathered appropriate reference materials
- salary structure - all bands and salary ranges to which jobs would be assigned
- band assignments for jobs that had been priced in the market place
- Iist of all non-benchmark jobs (those needing slotting)
- \$ any other information that was useful in making job slotting decisions such as any available Job documentation, organization charts, etc.
- through each non-benchmark job and made a decision regarding where the job should be slotted Using the reference materials and the considerations outlined on the following page, we went

Note: As with the market pricing activities, we evaluated and slotted jobs, not incumbents

Whole job slotting

とないのではないというないないであるであるというというという

ATMO

Considerations

- Where peer jobs were located/banded (peers in the same job family and across job families)
- •\$• for example, if the non-benchmark job was considered a peer of a benchmark job already the same band as that of the peer job assigned to a band based on market data, we may have assigned the non-benchmark job to
- Steps in career ladders
- •\$• entry or senior level; in such a situation, the non-benchmark levels may have been slotted for example, we may have been able to price an intermediate level for a job, but not the based on their relationship to the benchmark job
- Sources/Uses of incumbents
- •\$• for example, if we knew the job and band from which incumbents are typically promoted somewhere in between they are promoted from the non-benchmark job, we could slot the non-benchmark job into the non-benchmark job, and we knew the job and band into which incumbents go when
- Any relevant/related market data
- the job should receive for performing combined duties of the benchmark jobs benchmark job to a higher band level would depend on how much of a premium we believe band slightly higher than the jobs we were able to price; the decision to assign the nonfor example, if the non-benchmark job was a combination of two jobs we were able to price in the market place, the non-benchmark job may have been assigned to the same band or a

Atmos Energy Corporation FY 1999 Pay Guidelines

General Salary Increase Information:

Salary increases across the country are forecast to continue between 4.0 and 4.5 percent. The table below reflects actual experience for 1997 and 1998 and what is projected for 1999. The amounts shown include general cost-of-living adjustments, merit increases and other adjustments such as market or equity-related increases. Promotions are excluded from these salary increase amounts. Additionally, according to the Bureau of Labor Statistics, the rate of inflation from June 1997 through June 1998 was 1.7 percent.

Employee Category	Actual	Projected	Actual	Projected
	1997	1998	1998	1999
Operating Nonexempt Employees	4.1%	4.2%	4.2%	4.3%
Exempt Salaried Employees	4.3%	4.3%	4.5%	4.4%

Merit Increase Guidelines

Form - During the transition to the new performance management system, the current performance appraisal form will be used on which to partially base an employee's FY 99 merit salary increase until we introduce the enhanced process on or about April 1, 1999.

Merit Increase Considerations

- The following table provides guidelines to assist you in determining an employee's merit increase amount as a percentage of pay based on your evaluation of his/her performance.
- In addition to an employee's performance rating, consideration should also be given to the employee's position within the new pay band.

Performance	Recommended FY 99 Salary
Rating	Increase Range
1	0% to 8%
2	0% to 6%
3	0% to 4%
4	0% to 1%
5	0%

- The following specific considerations have been developed to assist supervisors/managers in the application of both merit increases and the transition to the company's new broad band base pay practice within the labor dollars that have been budgeted. Considerations are listed in priority order.
 - Employees whose pay is below the new band minimum immediately consider granting a pay adjustment to bring the employee's base pay to the pay band minimum or develop a plan of action that provides up to two pay adjustments to bring the employee's base pay to the pay band minimum by no later than September 30, 1999.

Example:

Situation - A new employee who is being paid \$18,000 on an annual basis and is in a job with a band minimum of \$20,500.

Action - You may immediately authorize a pay adjustment of \$2,500 (\$96 bi-weekly) or you may grant two increases of \$1,250 (\$48 bi-weekly) each over the next 12 months to bring this employee's pay to band minimum.

Employees whose pay falls in the Value Pay or the higher end of the Target Pay segment, but whose performance does not warrant this pay level - provide a lesser merit increase than you normally would provide based on the guidelines above.

Example:

Situation - An employee with long tenure but whose performance is average is being paid \$39,000 annually and is in a job with a Value Pay segment range of between \$36,000 and \$41,000.

Action - Instead of providing this employee a merit increase of 4% according to the guidelines above, consider granting a merit increase in the range of 2% to 3%.

Employees whose pay fails in the Entry or Target Pay segments but whose performance warrants Target or Value pay respectively - apply a greater merit increase than you normally would to move or start moving the employee's pay to higher and more appropriate levels within pay band.

Example:

Situation - An employee who is one of your best performers is being paid \$32,000 annually and is in a job where the Value Pay segment ranges from \$36,000 to \$41,000. Action - Instead of granting this employee a merit increase of 6% according to the guidelines above, consider granting a merit increase in the range of 7% to 8%.

Employees whose pay are close to or exceed the band maximum - consider granting a lump sum merit award. The amount of such lump sum award should be based on the employee's performance but no more than the average merit increase budget of 4%.

Example:

Situation - An employee who is a good solid performer is being paid \$35,000 annually and is in a job where the band maximum is \$33,000.

Action – You should not adjust the employee's base pay as he/she is already paid in excess of the band maximum. You should consider granting a lump sum merit award of \$350 - \$700, or 1% - 2% of base pay. (\$35,000 x 1% - 2%)

Your supervisor/manager must approve any pay increase that exceeds these guidelines.

An employee's pay may not be increased more than two times or a total of 20% in any fiscal year. If you feel that an exception should be made to these guidelines, please obtain approval from your respective BU President or Corporate VP prior to executing any pay action that exceeds these guidelines.

Executing a Pay Increase

- Merit Increase
 - Compute the actual dollar amount of the employee's salary increase in whole dollars based on the company's bi-weekly payroll schedule and forward this information to BU/Shared Services HR for entry into payroll. The payroll action form is to be used for this purpose.
 - For example, if an employee's merit increase is \$2,500 on an annual basis, divide \$2,500 by 26 pay periods to authorize a merit increase of \$96 on each bi-weekly paycheck.

- Below Band Minimum Increase
 - Compute the actual dollar amount of the employee's salary increase to bring the employee's salary to the band minimum and record this amount on the Transitional Pay Adjustment Request along with your rationale for such request. Forward the completed Transitional Pay Adjustment Request to your BU President or Corporate VP, as appropriate, for approval and forwarding to Dallas HR.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 69 e Witness: Betty L. Adams

Data Request:

On page 8, line 22 of Ms. Adams' testimony there is a discussion of the increase in the forecasted test period labor costs that is attributed to "the planned filling of a number of vacant employee positions and ...a four percent wage increase."

e. Provide a list of the planned positions being filled that were previously held by contractors, by job classification, and break down the list further by identifying contractors performing construction activities, not operational duties.

Response:

None of our planned positions to be filled were previously held by contractors.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 69 f Witness: David H. Doggette

Data Request:

On page 8, line 22 of Ms. Adams' testimony there is a discussion of the increase in the forecasted test period labor costs that is attributed to "the planned filling of a number of vacant employee positions and... a four percent wage increase."

f. Identify how many years the contractors have performed construction activities and whether these activities are now being considered in the planned construction budget.

Response:

Contractors have been utilized, for various projects, throughout Western's service territory dating back to the 1960's. Western does not separately budget for contract labor. At present, the use of contractors is not anticipated. The test year construction budget reflects total planned construction spending.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 69 g Witness: Betty L. Adams

Data Request:

On page 8, line 22 of Ms. Adams' testimony there is a discussion of the increase in the forecasted test period labor costs that is attributed to "the planned filling of a number of vacant employee positions and ...a four percent wage increase."

> g. If the planned positions are replacing contractors that have been performing construction services, and construction services with contractors are included in the planned construction budget, provide a detail description of the expected benefits from the addition of the planned operating and maintenance employees that Western's customers will receive that they have not been receiving.

Response:

None of our planned positions to be filled were previously held by contractors.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 70 Witness: Betty L. Adams

Data Request:

Resubmit Volume 3 (question reference to Volume 9 in error), FR 10(h)9 for the years 2000 through 2003 with employees separated by job classifications. Also, provide a comparison of budgeted to actual numbers of employees for FY 1994 through 1998. Provide references in each of these schedules to the employee numbers by Western's chart of account number, NARUC account, and FERC account. Explain any increases or decreases of 5 percent or more in employee numbers from year to year.

Response:

Please see DR 69 b, Schedule B for the employees separated by job classifications.

Attached is a schedule showing the comparison of authorized to actual employees for the FY 1994 through 1998. All of the authorized positions were not budgeted for all years. Our authorized positions were reduced starting in FY 97 due to the beginning of implementation of various service improvements as discussed in Mr. Gruber's Testimony.

We do not budget employees by NARUC or FERC accounts as most perform multiple functions.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 70

Year	No. Authorized	No. Employees
1994	404	387
1995	405	383
1996	393	373
1997	283	329
1998	283	267

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 71 Witness: Betty Adams

Data Request:

On page 9, lines 10 through 17 of Ms. Adams' testimony is a discussion of the increase in the forecasted test period communications expense that is attributed to increased use of mobile data terminals (MDT's) and higher cellular usage. Provide a schedule showing the cost amounts, MDT units acquired and plant accounts charged since the project inception, showing the years in which the investments in MDT's were made.

a. Does Western have contracts for communications expenses, such as long distance and cellular usage?

Response:

Yes. Western does have contracts for cellular service. These cellular contracts, as with most large business cellular contracts, are for the cellular line(s), i.e. the telephone number. Usage and long distance are an additional charge. Western's cellular usage and long distance has increased and is anticipated to increase in the forecasted year. The increase is primarily due to two effects. First, the growing direct contact between the customer and the technician that cellular phones afford. Second the installation of the mobile data terminals and their cellular modems have impacted cellular usage. Additionally, Western has seen a significant increase in technician calls to the Customer Support Center.

b. If yes, provide the old and new contracts and an explanation of why the usage was deemed to increase in the forecasted period considering any contractual changes or changes in services used.

Response:

Attached is a copy of a master contract with BellSouth as an example. Western has approximately twenty (20) similar contracts in place in order to provide adequate cellular coverage of our service territory. Please see the above response regarding increased cellular usage.

c. Give a quantified determination of how this increase was estimated and weather the costs are under contract or not.

Response:

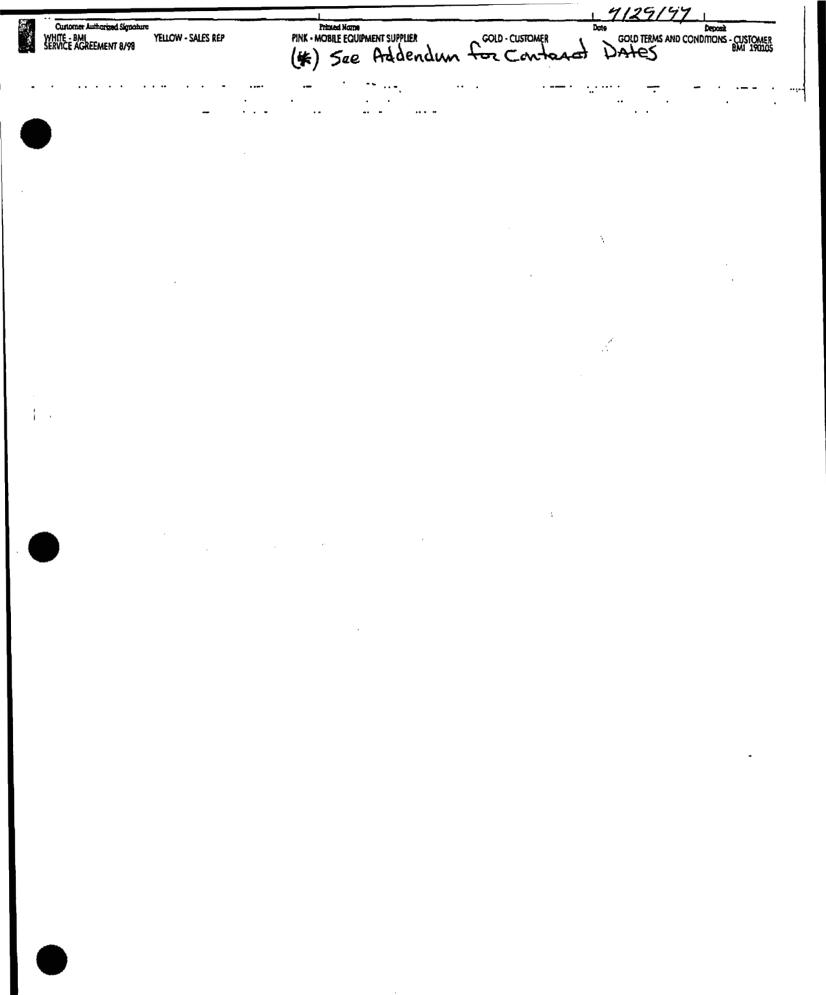

Annual cellular costs for the base period year are \$79,140. The cellular costs for the forecasted year are expected to be \$126,168.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 72 a,b,c Witness: Betty Adams

Data Request:

Refer to Ms. Adams' testimony. Provide an explanation, complete with a quantified determination, of how the increase in uncollectible write-offs was calculated for the forecasted test period.

- a. Provide the accounts receivable aging schedules for the last two fiscal years.
- b. Explain why under-budgeted write-offs for the six-month period in FY 1999 provided sufficient reason to adjust the forecasted period.
- c. Provide an accounts receivable aging schedule for the last month of actual results in the test period.

Response:

The increase in uncollectible write-offs was calculated for the forecast year by comparing the actual write-offs of the FY98 with our base year budget. As you will see the actual dollars in account 904 on the attached schedule titled RESP-30, is \$706,442 and our budget for the base year according to O&M expense budget as shown on the schedule BUD REPT is \$462,478. The assumption was that the write-offs were under budgeted for the base period, and we had no reason to not think that this trend would continue.

- a. This type of schedule is not available with the billing system used prior to June 1999. With our new billing system which is one of our various service improvement programs implement as of June 1, 1999, this information will be available.
- b. The actual write-offs for the first six months of FY99 is \$320,650 which is for the billing period ending December 1998. Due to the procedure of the timing of unpaid accounts to be written off, (which is three months) the months with the higher billings will be written in the second half of the year.
- c. See response to "a" above.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 72 d,e,f Witness: Betty Adams

Data Request:

Refer to Ms. Adams' testimony. Provide an explanation, complete with a quantified determination, of how the increase in uncollectible write-offs was calculated for the forecasted test period.

- d. Provide an account analysis of Western's reserve for uncollectibles comparing the actual charge-offs with the to date provision for uncollectibles(expense) for the six-month period of actual results in the FY 1999 that comprises part of the base year. If different, schedule Western's monthly provision for uncollectibles(expense) in comparison to the year-to-date("YTD") budget.
- e. Provide a comparison of the YTD budget to actual provision for uncollectibles(expense) for the last two fiscal years.
- f. Provide a comparison of the reserve for uncollectibles to accounts receivable for FY 1997, FY 1998 and the end of the six-month actual period included in the base year.

Response:

- d. See Schedule 72 d (attached) for the analysis of Western's reserve for uncollectibles comparison to actual write-offs.
- e. Attached are copies of the requested budget to actual comparison for the uncollectibles (expense)
- f. See Schedule 72 f (attached) for the comparison of the reserve for uncollectibles to accounts receivable.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 73 Witness: Betty Adams

Data Request:

In Volume 10 of 10 of the Application, Schedule D2.2, Sheet2 of 2, "ADJ 7" includes the "transfer of Human Resources expenses from Shared Services of \$67,700."

- a. Provide a list of the job(s) transferred, an explanation of the previous job(s) function with Shared Services, and an explanation of the job(s) function with Western.
- b. Did similar job reclassifications occur with Western's gas distribution affiliates? If yes, give an explanation of the reasoning. If no, why not?

Response:

- a. There were not any jobs transferred. In previous years Shared Services received the costs for the DOT and Drug testing (\$20,000) that was required as well as the cost of the employee service awards (\$47,700).
- b. All of Western's gas distribution affiliates received their portion of the same type charges.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 74 Witness: Betty Adams

Data Request:

In Volume 10 of 10 of the Application, Schedule D2.3, Sheet 1 of 1, "ADJ 2" is described as an adjustment to "reflect the amortization of the PSC Assessment for 1997 paid in 1999." Provide a detailed explanation and calculations to support the determination of this adjustment.

Response:

The PSC Assessment for 1997, was only half of the adjustment. The estimated for the period was approximately half of the previous year's assessment due to our decrease in revenues. Our 1998 assessment was \$276.113 and 1999 it was \$167,742.

Below you will find the calculations to support this adjustment.

Prior years amount paid	\$ 230,394
Expensed in 1997	(30,325)
Amount to be exp.(Oct, Nov. Dec. 99)	(20,836)
Additional amount expenses in FY 1998	177,232
Expected lower assessment to be expensed	
In calendar 2000	97,942
Total of decreased expense	\$ 275,184

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 75 Witness: Betty Adams

Data Request:

Refer to Ms. Adams' testimony at page 10, line 6, where adjustments to Western's FY 1999 budget decreasing O & M expenses and increasing Shared Services expenses are discussed in regard to the utilization of the new "Customer Support Center in Amarillo, Texas." Provide quantified schedules, referenced to Western's chart of accounts, with explanations of the cost shifts discussed, i.e., decreased number of employees by job classification to Western, new charges by Shared Services.

Response:

See response to DR 8. Much of the information necessary to develop the requested schedules is not available. Merger and reorganization tied to the various service improvement programs, including establishment of the Customer Support Center, makes it impossible to compare pre- and post-re-organizational costs by NARUC account.

For example, the attached report (RESP-30) shows \$669,663 in account 903, where most of the FY98 labor costs associated with business office personnel was recorded. Please refer to FR 10(10)(d)1, Schedule D-1, Sheet 3 of 4, for the FY99 base period cost in account 903 of \$64,355. This indicates the relative level of cost reduction associated with the closing of WKG's business offices. However, most costs associated with the transfer of responsibilities to Shared Services, including the Customer Support Center, is not recorded in a separate NARUC account other than account 922 where almost all Shared Services costs reside.

The only way to reasonably compare pre- and post-re-organizational changes is on a total cost basis as reflected in DR 8.

LAST PAGE OF REPORT

í,

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 76 Witness: Betty Adams

Data Request:

Refer to Ms. Adams' testimony at page 10, line 17, where adjustments to Western's FY 1999 budget decreasing O & M expenses and increasing Shared Services expenses are discussed in regard to the United Cities Gas merger. Provide quantified schedules, referenced to Western's chart of accounts, with explanations of the cost shifts discussed, i.e., decreased number of employees by job classification to Western, new charges by Shared Services.

Response:

See response to DR 8. Much of the information necessary to develop the requested schedules is not available. Merger and reorganization tied to the various service improvement programs makes it impossible to compare pre- and post-merger costs by NARUC account.

For example, the accounting functions which were transferred to Shared Services as a result of the merger decreased within account 870 by \$110,000 from FY98 to FY99, but the corresponding Shared Services amount in account 922 only increased by \$45,000 due to WKG's lower allocation factor following the merger. Further complicating any comparison in account 870 is the transfer of certain office personnel into a newly created job classification of Operations Assistant, the costs of which are largely recorded in account 870 masked the decreased associated with the reduction in accounting personnel.

The only way to reasonably compare pre- and post-merger and re-organizational changes is on a total cost basis as reflected in DR 8.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 77 Witness: David H. Doggette

Data Request:

Refer to Ms. Adams' testimony at page 10, line 22, where adjustments to Western's FY 1999 budget from non-labor savings in the "proposed Gas Meter Performance Control Program" are referenced. Provide a detailed schedule with a calculation showing how these savings were determined.

Response:

The "proposed Gas Meter Performance Control Program" is in reference to Case No. 99-059 Western Kentucky Gas. (See Application, Volume 2, Tab 1, Gruber testimony, page 19) Western Kentucky Gas is currently requesting to implement a statistical sampling program for the periodic testing of meters. The current program is testing meters on a ten year cycle. The savings indicated, in Ms. Adams' testimony at page 10, line 22, is based on a reduction of annual testing of meters. The estimated savings is related to the difference in number of meters tested under the current plan and the number of meters that would be tested under the proposed plan. The commission has requested eight changes to the proposed plan. These changes will increase the number of meters tested thereby reducing the savings indicated. Western Kentucky Gas will not be able to provide the final cost savings estimate until the program is approved. See attached Schedule A "Analysis of Expected Annual Savings" which was filed with case No. 99-059.

WESTERN KENTUCKY GAS COMPANY GAS METER PERFORMANCE CONTROL PROGRAM ANALYSIS OF EXPECTED DIRECT ANNUAL COST SAVINGS (Note 1)

Estimated average meters tested	annual reduction in	n number of	9,000										
· ·	from 10 year change life of 24 years and meters in service	cout											
	Approximate average cost for periodic changing and testing each domestic size meter (Note 2):												
New meter	(4,000)	\$49.82											
Repaired meter	(5,000)	\$24.09											
Total			\$35.53										
Estimated average	annual savings		\$319,730										

Note 1

The annual savings are a combination of reduced capital expenditures and reduced expenses. The annual savings reflect reductions in the growth of future operating costs not net reductions from current operating cost levels.

Note 2

Average quantity of meters either repaired, remanufactured, tested only, or retired per year is estimated at 5000 units with an average cost at \$24.09.

Average quantity of new meters installed per year is estimated at 4000.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 78 Witness: Gruber

Data Request:

Refer to Ms. Adams' testimony at page 10, line 26 (Correction: question references line 22 in error), where adjustments to Western's FY 1999 budget from transferring the rates and regulatory vice-president position from the Shared Services staff is mentioned. Did similar job reclassifications occur with Western's gas distribution affiliates? If yes, give an explanation of the reasoning. If no, why not?

Response:

Yes, on October 1, 1998. This reclassification is consistent with Atmos' reorganization strategy of placing decision-making and control associated with key business unit programs, such as rates and regulatory affairs, directly into the business units. For further explanation, see pages 4-5 of Mr. Fischer's prepared direct testimony.

「江道第六月秋秋」 80000 SERIES RECYCLED ④ 10% P.C.W.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 79 Witness: Betty Adams

Data Request:

Refer to Ms. Adams' testimony at page 13, lines 15 through 18, where the adjustments to Western's' "Shared Services" forecasted budget includes an adjustment for a "decrease in the labor portion of Atmos' administrative and general overheads, which is a capital expense."

- a. Provide a description of these costs and a schedule of these costs, with reference to the accounts charged in the Shared Services forecasted budget.
- b. Explain how these costs represent a capital expense as Atmos administrative and general overhead, but upon reclassification as a Shared Service expense become an operating and maintenance expense subject to recovery through customers' rates.
- c. Were these costs similarly reclassified for Shared Services charges to Western's gas distribution affiliates? If yes, give an explanation of the reasoning. If no, why not?

Response:

- a. Shared Services administrative and general overheads are a portion of the labor costs of the personnel that have duties that pertain to capital functions. Examples of this would be a person reviewing the project as well as an accounts payable clerk paying the invoices for capital projects. A schedule is not necessary. The \$172,000 will decrease within Account 107 Construction Work in Progress.
- b. The Shared Services O&M costs in calendar 2000 is increasing because direct capital spending is projected to decrease, causing a lower allocation to Shared Services overheads, which is a capital cost.
- c. Yes. Shared Services overhead allocations will decrease in calendar 2000 in every business unit because total capital spending decreased.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 80 Witness: Adams

Data Request:

Provide the basis for the beginning of Western's FY 1999 budgeting process in quantitative form, i.e., prior year's budget, prior year's actual results, by Western's current chart of accounts.

- a. Provide a listing of the known adjustments made at the beginning of Western's budgetary process, i.e., increase or decrease in employee numbers, reductions for expenses non-recurring in nature.
- b. Provide a listing of the known adjustments made at the major decision-points of Western's budgetary process, i.e., increase or decrease in employee numbers, reductions for expenses non-recurring in nature, deferring or accelerating maintenance projects.

Response:

a. and b. As indicated on page 4, lines 27-28 of my testimony, Western's budget is zero-based and constructed from the bottom up. Consequently, there was no basis or baseline formally used by Western for constructing the FY 1999 O&M budget. Prior year's budget or actual results available at the time may have been used as a guideline by the functional managers or officers in the preparation of their inputs to the budget, but this was not required or formalized into our process.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 81 Witness: Adams

Data Request:

Provide the basis for the beginning of the Western's "Shared Services" FY 1999 budgeting process in quantitative form, i.e., prior year's budget, prior year's actual results, prior year service adjusted by changes in affiliated charges, by Western's current chart of accounts.

- a. Provide a listing of the known adjustments made at the beginning of Shared Services' budgetary process, i.e., increase or decrease in employee numbers, reductions for expenses non-recurring in nature.
- b. Provide a listing of the known adjustments made at the major decision-points of Shared Services' budgetary process, i.e., increase or decrease in employee numbers, reductions for expenses non-recurring in nature, deferring or accelerating projects.

Response:

a. and b. As indicated on page 4, lines 27-28 of my testimony, Western's budget is zero-based and constructed from the bottom up. Consequently, there was no basis or baseline formally used by Western for constructing the FY 1999 Shared Services O&M budget. Prior year's budget or actual results available at the time may have been used as a guideline by the functional managers or officers in the preparation of their inputs to the budget, but this was not required or formalized into our process

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 82 Witness: Betty Adams

Data Request:

Refer to Volume 2 of 10 of the Application, Tab 4, the Testimony of Betty M. Adams, page 3, which shows her sponsoring FR 10(10)(d) and FR 10(10)(f) and Volume 10 of 10, Tabs 4 and 6, which include FR 10(10)(d) and FR 10(10)(f). Provide a schedule of the rate-making adjustments for country club dues, promotional advertising and sales expenses, employee party and gift expenses and pension expense in reference to the "Detailed Adjustments" in Volume 10, FR 10(10)(d)2.1, FR 10(10)(d)2.2 and FR 10(10)(d)2.3 as applicable.

- a. Provide the location of the above adjustments in FR 10(10)(d)1, with specific account number references.
- b. Provide the location of the above adjustments in FR 10(10)(d)1, with specific account number references to the same schedule as previously requested to be resubmitted in Western's general ledger account number form.

Response:

There were no rate making adjustments made in FR 10(10)(d)2.1, FR 10(10)(d)2.2 or FR 10(10)(d)2.3. These schedules reflect only budgeting adjustments between the base and forecasted year. Please refer to FR 10(10)(c)2, Volume 10 of 10, Tab 3, for how the rate making adjustments were made.

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 83 a and b Witness: Betty L. Adams

Data Request:

Refer to Volume 2 of 10 of the Application, Tabs 2 and 4, the testimony of R. Earl Fischer and Betty L. Adams. To some extent, both witnesses address the issue of direct billed intercompany services and allocated service costs from Atmos' Shared Services Business Unit ("Shared Services") to Western and other Atmos business units.

- a. Provide a detailed operating statement for Shared Services for FY 1997, 1998 and year to date FY 1999 actual, with detailed intercompany revenue accounts to reflect similar services provided by Shared Services for the Atmos operating divisions. Specifically, reference Shared Services' revenue accounts to Western's expense accounts by current chart of accounts. Provide the FY 1999 Shared Services budget and provide updates of FY 1999 actual data as it becomes available.
- b. Provide contractual agreements between Western and Shared Services since 1997, with a schedule of expected service cost increases that are included in the determination of the base year or the forecasted year. Reference these service costs to Western's expense accounts by current chart of accounts.

Response:

- a. There is not a detailed operating statement for Shared Services nor do they have revenues. Please see Volume 7 of 10, tab 3 for the monthly budget and actuals for FY 1999 through March. Attached is a copy of April's Financial Statements.
- b. Attached are the contracts for FY 1999 as there were no contracts prior to this as this is a new procedure.

MEMORANDUM

TO: Tom Blose Gene Ehler Earl Fischer B. J. Hackler Gary Schlessman

FROM: J. R. Jones

DATE: June 1, 1998

Costs associated with Purchasing's shared services for FY'99 were affected by the following:

- 1. Product P-1 (Procurement Services) up \$7,200
 - a. Overall costs were reduced; however the necessity to budget for software maintenance more than negated that reduction.
 - b. Costs allocated to the Propane unit in FY'98 were re-allocated to the regulated Business Units for FY'99
- 2. Product P-2 (Fleet Administration) up \$44,800
 - a. Fleet Administrator's position was under-budgeted in FY'98 and the Fleet Assistant was a new position in the FY'99 budget
 - b. Costs allocated to the Propane unit in FY'98 were re-allocated to the regulated Business Units for FY'99
- 3. Product P-3 (Mail & Supply) Flat Budget
 - a. Costs allocated to the Propane Unit in FY'98 were re-allocated to the regulated Business Units for FY'99

Should you need additional information, please call me.

Information Technology Shared Services Contract Fiscal Year 1999 Assumptions

- Assumes and includes O&M cost increases resulting from the implementation of the I.T. Strategy
- Assumes implementation of the I.T. Strategy will begin by July 1, 1998 and no Year 2000 work will be required on GEAC systems (additional \$250,000 will be required if Financial, HR and Payroll systems are not updated as part of the I.T. Strategy by September, 1999)
- All of the I.T. Strategy capital costs are in product IT11. These amounts are still under negotiation.
- Application software maintenance will be a part of the contract for the Shared Services units owning the application.
- Assumes inhouse labor for all areas except contractors in Information Systems Support.

Left header	eader	Right header
Te	mplate	Template One: Shared Services Product and Customer Definitions Background (cont'd)
	IT2 - Ir	IT2 - Information Systems Support
	•	Facilitate Business Unit identification of application system requirements
	•	Facilitate identification of technology applications
	•	Publish consolidated Information Technology Plan for Atmos Energy Corporation
	•	Assist with new product feasibility studies, RFI's, RFP's and development
	•	Provide 7 by 24 production system support
	•	Provide system modification and enhancement services
(1) Note:	•	Install vendor supplied software system upgrades

Western Kentucky Gas Company Case No. 99-070 KPSC Data Request Dated July 16, 1999 DR Item 83 c Witness: Betty Adams

Data Request:

83. Refer to Volume 2 of 10 of the Application, Tabs 2 and 4, the testimony of R. Earl Fischer and Betty L. Adams. To some extent, both witnesses address the issue of direct billed intercompany services and allocated service costs from Atmos's Shared Services Business Unit ("Shared Services") to Western and other Atmos business units:

١,

c. Provide Shared Services' cost allocation manual, if available. If none is available, describe the cost allocation process for the portion of the cost not directly billed to Western and provide copies of all internal policies and procedures relating to the allocation of costs from Shared Services to Western.

Response:

There is no formal manual discussing the allocation of Shared Service costs. Please refer to Response to DR 83 c - FR10(9)(u) Exhibit A: "Corporate Allocation Methodology" for a detailed description of the cost allocation process. Also, refer to the response to DR Item 34 c which describes the justification for each Shared Service Units' allocation method.

Response to DR 83 c - FR 10(9)(u) Exhibit A Corporate Allocation Methodology

Shared Services Contracting Process

Effective October 1, 1999, Atmos implemented its shared services contracting process whereby each Shared Services Unit formally contracts with each Business Unit for services to be rendered during the upcoming fiscal year. These contracts specify the services or products to be provided and projected cost of each product to each Business Unit. This structure gives the Business Units the opportunity to review, negotiate, and agree to the terms of service being provided.

For fiscal year 1999, the actual expenses incurred by the Shared Services Units are being billed to the business units based each Shared Service Unit's overall projected distribution of costs among the business units as reflected in its contract. This process is the basis for the billing cost allocation for the Base Year and the Test Year. The resulting dollars billed to WKG are shown in Schedule 1 (Base Period) and Schedule 2 (Test Period).

Allocation of Non-Contracted Costs

Aside from the contracted service costs described above, certain other costs are allocated to the Business Units, as described below:

- 1. <u>Shared Services Depreciation Costs</u> This represents depreciation of the general plant assets of Shared Service Units, which is allocated to the business units based on the Residual Factor.
- 2. <u>Shared Services Taxes Other Than Income Taxes</u> This includes such other taxes as ad valorem taxes, franchise taxes, payroll taxes, etc., related to shared service assets and operations. These are spread to each business unit based on the residual factor.
- 3. <u>Management Committee</u> This includes the expenses for the Executive Functions of Atmos. These costs are allocated to each business unit based on the residual factor for the fist two months of the base year and based on the average of the Shared Services Unit allocation of contracted costs for the final ten months of the base year.

Corporate Office Operation & Maintenance Direct Expense Methodology

Certain costs are not allocated, but rather are directly charged to the appropriate business unit when practical. Costs related to outside legal firms, insurance invoices, and other costs directly related to one business unit are coded directly to that business unit and are not included in the allocated costs from the Shared Service Units.
