

COMMONWEALTH OF KENTUCKY
BEFORE THE PUBLIC SERVICE COMMISSION

Drop Box
RECEIVED

JUL 15 2005

IN RE THE MATTER OF:

PUBLIC SERVICE
COMMISSION

JOINT APPLICATION OF LOUISVILLE GAS)
AND ELECTRIC COMPANY AND KENTUCKY)
UTILITIES COMPANY FOR A CERTIFICATE OF)
PUBLIC CONVENIENCE AND NECESSITY FOR)
CONSTRUCTION OF TRANSMISSION FACILITIES)
IN JEFFERSON, BULLITT, MEADE, AND HARDIN)
COUNTIES, KENTUCKY)

CASE NO.
2005-00142

* * * * *

INTERVENERS DENNIS AND CATHY CUNNINGHAM
DIRECT TESTIMONY OF GEOFFREY YOUNG
AND
MOTION FOR EXTENSION OF TIME WITHIN WHICH
TO FILE DIRECT TESTIMONY

* * * * *

Come the Interveners Dennis Cunningham and Cathy Cunningham, ("Cunningham"), by and through counsel, and file the Direct Testimony of Geoffrey Young as per the scheduling order in this action, and MOVE THE PUBLIC SERVICE COMMISSION FOR AN EXTENSION OF TIME within which to file additional Direct Testimony, as follows:

1. The Public Service Commission ("PSC") order setting the schedule for this application directed that Parties shall file direct testimony, if any, no later than July 15, 2005.

2. The Applicants, Louisville Gas and Electric Company and Kentucky Utilities Company ("LG&E/KU") filed

direct testimony with the application, and Cunninghams are on this date filing direct testimony of one witness.

3. LG&E/KU filed responses to the Cunningham Data Request and the PSC Staff Data Request. Cunninghams have determined that the responses by LG&E/KU appear to be either incomplete or misleading. Specifically, Cunninghams sought to require LG&E/KU identify all applications to and all federal action taken or to be taken on such applications. See Question #5, #6, #8, and #10. Cunninghams sought copies of all such applications and all supporting studies that were part of such applications. See Question #1, #2, and #9. None were produced. Subsequently, Cunninghams have received information and believe LG&E/KU has an application for a federal permit pending and as part of that application, has submitted materials to the Kentucky State Historic Preservation Officer (KY SHPO).

4. LG&E/KU concedes that they are currently in "ongoing discussions" with the Department of Defense regarding the crossing of Fort Knox Military Reservation, and provided a February 15, 2005, March 15, 2005, and March 15, 2005 letters from LG&E/KU to Fort Knox, but failed to provide any communication from the Department of Defense in

reply and failed to provide any environmental studies that are required by NEPA that must proceed federal action.

5. LG&E/KU may provide additional Direct Testimony today, as per the scheduling order. However, this motion is made whether or not additional Direct Testimony is received today.

6. Cunninghams sought to retain additional engineering and scientific review of the LG&E/KU application, but two of the engineers approached were required to decline because they had a conflict based upon other clients.

7. Cunninghams have not had sufficient time to complete their Direct Testimony by July 15, 2005. This application clearly matters to the public as witnessed by the large outpouring of public opposition in Elizabethtown, Kentucky at the July 12, 2005 Local Public Hearing. On a case with this degree of public opposition, these Interveners should be given sufficient time to prepare their case. They will not be able to complete such preparation unless they are given additional time to submit direct testimony.

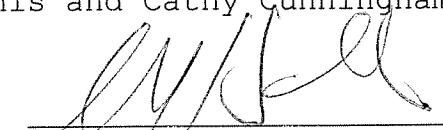

8. Based upon the foregoing, Interveners Dennis Cunningham and Cathy Cunningham move the PCS to allow them until July 22, 2005 within which to file their Direct Testimony.

WHEREFORE, the Interveners, Dennis Cunningham and Cathy Cunningham MOVE THE PSC TO EXTEND THE TIME FOR THESE PARTIES TO FILE DIRECT TESTIMONY TO NOT LATER THAN JULY 22, 2005.

Respectfully submitted,

W. H. GRADDY & ASSOCIATES

Counsel for Interveners
Dennis and Cathy Cunningham

By:

W. Henry Graddy, IV

CERTIFICATE OF SERVICE

I hereby certify that a true and correct copy has been duly served by first-class mail upon the following:

Hon. A.W. Turner
Public Service Commission
211 Sower Boulevard
P.O. Box 615
Frankfort, Kentucky 40602

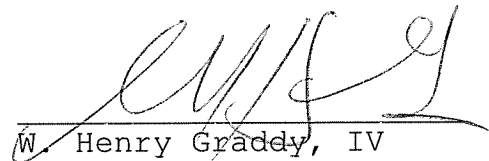

Hon. Kendrick R. Riggs
Hon. J. Gregory Cornett
Ogden, Newell & Welch PLLC
1700 PNC Plaza
500 West Jefferson Street
Louisville, Kentucky 40202

Hon. Robert M. Watt, III
Hon. Lindsey W. Ingram, III
Stoll, Keenon, & Park, LLP
300 West Vine Street, Suite 2100
Lexington, Kentucky 40507

Hon. Elizabeth L. Cocanougher
Senior Regulatory Counsel
Louisville Gas and Electric Company
220 West Main Street
Post Office Box 32010
Louisville, Kentucky 40232
Counsel for Louisville Gas and Electric
Company and Kentucky Utilities Company

Hon. Greg Stumbo
Attorney General
State Capital
Frankfort, Kentucky 40601

This the 15 day of July, 2005.

W. Henry Graddy, IV

PREPARED TESTIMONY OF
GEOFFREY M. YOUNG

* * * * *

Filed July 15, 2005

1. **Q. Please state your name and place of employment.**

2. A. My name is Geoffrey M. Young. I work out of an
3. office in my home, which is at 454 Kimberly Place,
4. Lexington, KY 40503.

5. **Q. What is your position?**

6. A. I resigned from State Government in the fall of
7. 2004 to start working as a private consultant on
8. issues related to energy efficiency, renewable energy,
9. energy policy, and utility regulation and rate
10. structures. I have also been authorized to speak for
11. the Kentucky Sierra Club (i.e., the Cumberland
12. Chapter) on these issues. I am submitting the
13. following testimony in my role as a private energy
14. consultant and not on behalf of the Sierra Club.

15. **Q. Please describe your education and employment
16. experience.**

17. A. I received a bachelor's degree in Economics from
18. the Massachusetts Institute of Technology, a master's
19. degree in Mechanical Engineering from the University
20. of Massachusetts, and a master's degree in
21. Agricultural Economics from the University of
22. Kentucky.
23. From 2/78 to 8/79, I worked as a Staff Engineer at

1. Technology + Economics, a research consulting firm in
2. Cambridge, Massachusetts. I analyzed the economic and
3. energy savings resulting from energy efficiency
4. technologies and prepared a commercialization plan for
5. a low-cost passive solar heating and cooling system.
6. From 7/82 to 6/83, I was the Staff Engineer at the
7. Small Business Development Center, administered by the
8. University of Kentucky in Lexington. I performed
9. cost-benefit analyses of energy efficiency and
10. renewable energy technologies, provided technical
11. assistance to small businesses, and maintained and
12. updated a manual with descriptions of energy
13. technologies.
14. From 4/90 to 9/91, I worked for the Kentucky Division
15. of Waste Management in the Department for
16. Environmental Protection as an Environmental
17. Engineering Technologist Senior. I performed
18. technical and administrative reviews of applications
19. for hazardous waste facility permits. I provided
20. technical assistance to field and enforcement
21. personnel, conducted hazardous waste facility
22. assessments, and provided information to the public.

1. From 9/91 to 11/94, I worked as an Environmentalist
2. Principal at the Kentucky Division of Energy (KDOE).
3. My major duty at that time was to coordinate the
4. Alternate Energy Development Program. I administered
5. small grants for the demonstration of renewable energy
6. technologies, developed fact sheets and other
7. information for the public, edited a national monthly
8. newsletter on energy efficiency programs in the 50
9. states, and wrote proposals for grant funding.
10. I was promoted to assistant director of KDOE in
11. November 1994. In addition to administrative duties
12. and continuing management of the Alternate Energy
13. Development Program, my work focused on demand-side
14. management, energy policy issues, energy-efficient
15. building systems, and alternative fuels for vehicles.
16. Between 1994 and 2004, I represented KDOE on demand-
17. side management collaboratives at Louisville Gas and
18. Electric Company (LG&E/KU/KU), Kentucky Power Company
19. (AEP), and Union Light, Heat and Power Company
20. (Cinergy). I was the lead person for the Division in
21. addressing electric industry regulatory issues before
22. the Commission. During 2005, KDOE was shifted into
23. the Commerce Cabinet, and is now known as the Division
24. of Renewable Energy and Energy Efficiency.

1. **Q. Have you participated in other cases before this**
2. **Commission?**

3. Yes. I submitted prepared testimony in the following
4. cases:

5. •Case No. 98-426, Application of Louisville Gas and
6. Electric Company for Approval of an Alternative Method
7. of Regulation of Its Rates and Service

8. •Case No. 98-474, Application of Kentucky Utilities
9. Company for Approval of an Alternative Method of
10. Regulation of Its Rates and Service

11. •Case No. 2000-459, The Joint Application of the
12. Louisville Gas and Electric Company and Kentucky
13. Utilities Company for the Review, Modification and
14. Continuation of DSM Programs and Cost Recovery
15. Mechanisms

16. •Case No. 2001-053, the Application of East Kentucky
17. Power Cooperative, Inc. for a Certificate of Public
18. Convenience and Necessity, and a Certificate of
19. Environmental Compatibility, for the Construction of a
20. 250 MW Coal-Fired Generating Unit (With a Circulating
21. Fluid Bed Boiler) at the Hugh L. Spurlock Power
22. Station and Related Transmission Facilities, Located
23. in Mason County, Kentucky, to be Constructed Only in
24. the Event that the Kentucky Pioneer Energy Power

1. Purchase Agreement is Terminated
2. •Administrative Case No. 387, A Review of the Adequacy
3. of Kentucky's Generation Capacity and Transmission
4. System.
5. I was the lead participant and representative for KDOE
6. in the following integrated resource planning cases:
7. •Kentucky Power Company (dba AEP), Cases No. 99-437 and
8. 2002-00377
9. Big Rivers Electric Corporation, Cases No. 99-429 and
10. 2002-00428
11. •East Kentucky Power Cooperative, Inc., Cases No. 2000-
12. 044 and 2003-00051
13. •Louisville Gas and Electric Company and Kentucky
14. Utilities Company, Cases No. 99-430 and 2002-00367
15. •The Union Light, Heat and Power Company, Case No. 99-
16. 449.
17. •I prepared testimony for the Division to submit in
18. Administrative Case No. 341, An Investigation Into the
19. Feasibility of Implementing Demand-Side Management
20. Cost Recovery and Incentive Mechanisms.
21. •I testified orally at a public hearing and submitted
22. written follow-up comments in Administrative Case No.
23. 2005-00090, An Assessment of Kentucky's Electrical
24. Generation, Transmission, and Distribution Needs.

1. Q. This case relates to a proposal by LG&E/KU to
2. build a new transmission line to handle the power
3. produced by a proposed new power plant. In general,
4. is building new power lines the only way to handle
5. increased power flows?

6. A. No. According to Clark Gellings and Kurt Yeager:
7. "We in the US cannot afford to abandon or entirely
8. replace our power delivery system. And we don't need
9. to. What we do need is to use advanced technology to
10. modernize and enhance the use of the existing asset
11. base. Computers, sensors, and computational ability
12. have transformed every major industry in the Western
13. world except the electric power industry... Several
14. available or emerging technologies will help transform
15. the grid into a smart power system capable of
16. supporting the digital society of the 21st Century. In
17. broad strokes, the transformed "intelligrid" will be
18. an integrated, self-healing, electronically controlled
19. electricity supply system of extreme resilience and
20. responsiveness that is capable of responding in real
21. time to the billions of decisions made by consumers
22. and their increasingly sophisticated microprocessor
23. agents. The transformation, we believe, will open the

1. door to a convergence of electricity and communication
2. that will usher in a new era of productivity and
3. prosperity." ("Transforming the Electric
4. Infrastructure," *Physics Today*, December 2004; web
5. site:

6. <http://www.physicstoday.org/vol-57/iss-12/p45.html>)

7. The authors list the following technologies that can
8. be used to enhance the performance, reliability,
9. resilience, economic value, and power-carrying
10. capacity of the grid:

11. •**Advanced conductors.** Various techniques can increase
12. the amount of power carried along existing
13. transmission corridors. Some of them, but not all,
14. involve new materials. The methods range from
15. reconfiguring existing lines to using new types of
16. conductors with carbon-fiber cores. The new conductors
17. have higher current-carrying capability, and because
18. of their greater strength and lighter weight, they sag
19. less at the high temperatures associated with high
20. power-flow rates. In the future, high-temperature
21. superconducting cables in underground systems might
22. carry triple the current of conventional conductors,
23. perhaps more. They may also be suitable for
24. retrofitting in some underground and ground-based

1. conduits.

2. •**Distributed energy resources**. Small generation and
3. storage devices distributed throughout and seamlessly
4. integrated with the power delivery system offer
5. potential solutions to several challenges the electric
6. power industry currently faces. Those challenges
7. include the needs to increase the resilience and
8. reliability of the power-delivery infrastructure, make
9. a range of services available to consumers, and
10. provide low-cost, digital-quality power.

11. •**Automation**. This is key to providing high levels of
12. reliability and quality. To a distribution-system
13. operator, automation may mean that in an emergency, a
14. distribution feeder, local distributed energy
15. resources, or both would be automatically isolated
16. from the grid. To a power-system operator, automation
17. could mean a self-healing, self-optimizing power-
18. delivery system that anticipates and quickly responds
19. to disturbances. As a result, power disruptions would
20. be minimized or eliminated altogether.

21. •**Power-electronics controllers**. Based on solid-state
22. components, these devices offer control of the power-
23. delivery system with the speed and accuracy of a

1. microprocessor, but at a power level 500 million times
2. higher.

3. **•Computer modeling of market tools.** To accommodate
4. changes in retail power markets worldwide, market-
5. based mechanisms will need to offer appropriate
6. incentives to buyers and sellers, facilitate efficient
7. planning for the expansion of the power-delivery
8. infrastructure, and effectively allocate risk.

9. Computer modeling will play an important role in
10. testing market models.

11. **•Communications architecture.** To realize the vision of
12. the smart power-delivery system, standardized
13. communications architecture must first be developed
14. and overlaid on today's system. EPRI recommends that
15. integrated energy and communications-system
16. architecture be based on publicly available standards.

17. **•Energy portals.** Distribution systems were designed to
18. perform one function—to distribute power to consumers.
19. But many value-added retail services require two-way
20. information exchange between the consumer and the
21. marketplace. An energy portal, which would sit between
22. a consumer's in-house communications network and a
23. wide-area access network, would enable two-way, secure
24. communication between a consumer's equipment and

1. energy-service or communications providers.”

2. (Gellings and Yeager, *Ibid.*)

3. This list should be supplemented by including the

4. concept of geographically-targeted demand-side

5. management (DSM) programs that may be able to relieve

6. transmission and distribution bottlenecks by reducing

7. customer demands and/or shifting the time when energy

8. is used.

9. In addition, time-of-use pricing is a tool that can

10. provide many benefits to the utility. These benefits

11. include improved load factors, reduced operating

12. costs, reduced economic inefficiency, relieving of

13. transmission and distribution constraints, improved

14. grid reliability, reduced wholesale market price

15. spikes, reduced potential for the exercise of

16. wholesale market power, and lower customer bills.

17. (“Demand Response: Not Just Rhetoric, It Can Truly Be

18. the Silver Bullet,” Michael O’Sheasy, *Electricity*

19. *Journal*, December 2003, pp.52-53.) Mr. O’Sheasy

20. describes and summarizes the characteristics of a set

21. of demand-response approaches: conventional time-of-

22. use (TOU) pricing, day-type TOU pricing, critical-

23. period TOU pricing, occasional real-time pricing, and

24. real-time pricing (RTP).

1. **Q. Are these technologies available today?**

2. A. Many of these technologies are available today
3. and others are currently under development. For
4. example, AEP has installed a full-scale power-
5. electronics controller system in its transmission
6. network. I was fortunate enough to be present at the
7. dedication ceremony of the world's first Unified Power
8. Flow Controller (UPFC), in Inez, Kentucky, on June 26,
9. 1998. This advanced solid-state transmission system
10. control technology, developed by AEP, Westinghouse
11. Electric and the Electric Power Research Institute
12. (EPRI), offers "a cost-effective way to increase the
13. amount of power that can be transferred," according to
14. a statement made that day by Karl Stahlkopf, EPRI vice
15. president. Quoting from the AEP press statement, "The
16. UPFC electronically alters the physical parameters
17. that determine where and how much power flows. It can
18. 'force' a line to carry power that would naturally
19. flow elsewhere, thereby eliminating bottlenecks and
20. diverting power to underutilized paths. 'The UPFC is
21. the most advanced high-power controller ever devised,'
22. said John Kessinger, Westinghouse general manager.

1. 'Its possibilities are so enormous that it is causing
2. utility operators to abandon much of what they've used
3. as historical guidelines and embrace a new era in
4. controlling transmission parameters.'" (Web site:
5. [http://www.companyreports.com/cgi-](http://www.companyreports.com/cgi-bin/stories.pl?ACCT=105&STORY=/www/story/06-26-1998/0000695669)
6. [bin/stories.pl?ACCT=105&STORY=/www/story/06-26-](http://www.companyreports.com/cgi-bin/stories.pl?ACCT=105&STORY=/www/story/06-26-1998/0000695669)
7. [1998/0000695669](http://www.companyreports.com/cgi-bin/stories.pl?ACCT=105&STORY=/www/story/06-26-1998/0000695669))
8. In addition to power-electronics controllers, DSM
9. programs, and real-time pricing plans, numerous
10. distributed energy technologies exist today and others
11. are under development. The same is true of advanced
12. conductors, automation technologies, and the other
13. approaches outlined by Gellings and Yeager.
14. It should be noted that numerous companies, research
15. institutions, and consortia are working to implement
16. the vision of an intelligent electric grid for the 21st
17. Century. One example in this country is the
18. IntelliGrid Consortium, which was created by EPRI to
19. help the energy industry pave the way to the power
20. grid of the future. The current partners are EPRI,
21. SRP, Long Island Power Authority, Alliant Energy, WE
22. Energies, Bonneville Power Administration, PSE&G, PSE,
23. US Department of Energy, EDF, Con Edison, New York

1. Power Authority, TXU Electric Delivery, PSE, and ABB.
2. Formerly known as the Consortium for Electric
3. Infrastructure to Support a Digital Society (CEIDS),
4. the IntelliGrid Consortium is dedicated to the
5. development of "A new electric power delivery
6. infrastructure that integrates advances in
7. communications, computing and electronics to meet the
8. energy needs of the future." (Web site:
9. <http://www.epri-intelligrid.com/intelligrid/home.jsp>)
10. It may be prudent for LG&E/KU to join this consortium
11. or another joint research and development initiative
12. with similar goals in order to obtain early access to
13. advanced technologies as they are developed.

14. **Q. Aren't technologies such as distributed**
15. **generation much more costly than the conventional**
16. **strategy of building more power plants and**
17. **transmission lines?**

18. A. Not necessarily. In 2002 the Rocky Mountain
19. Institute published a revolutionary book called *Small*
20. *Is Profitable*, which describes 207 ways in which the
21. size of "electrical resources" - devices that make,
22. save, or store electricity - affects their economic
23. value. Primary author Amory Lovins and his co-authors
24. found "that properly considering the economic benefits

1. of 'distributed' (decentralized) electrical resources
2. typically raises their value by a large factor, often
3. approximately tenfold, by improving system planning,
4. utility construction and operation (especially of the
5. grid), and service quality, and by avoiding societal
6. costs." (Web site:
7. <http://www.smallisprofitable.org/index.html>)
8. In support of the claim that distributed resources are
9. approximately ten times more valuable to the utility
10. company than their purchase price would suggest, the
11. authors present the following findings:
12. The most valuable distributed benefits typically flow
13. from financial economics—the lower risk of smaller
14. modules with shorter lead times, portability, and low
15. or no fuel-price volatility. These benefits often
16. raise value by most of an order of magnitude (factor
17. of ten) for renewables, and by about 3-5-fold for
18. nonrenewables.
19. Electrical-engineering benefits—lower grid costs and
20. losses, better fault management, reactive support,
21. etc.—usually provide another ~2-3-fold value gain, but
22. more if the distribution grid is congested or if
23. premium power quality or reliability are required.

1. Many miscellaneous benefits may together increase
2. value by another ~2-fold-more where waste heat can be
3. reused.
4. Externalities, though hard to quantify, may be
5. politically decisive, and some are monetized.
6. Capturing distributed benefits requires astute
7. business strategy and reformed public policy. (*Ibid.*,
8. Executive Summary)
9. When I was employed at KDOE, I tried to bring this
10. book and the issues it raises to the attention of
11. planning staff at LG&E/KU, but it is unclear whether
12. they gave these concepts serious consideration. If
13. the thesis set forth in this book is even close to
14. being correct, it would mean that alternative
15. technologies and programs that have been dismissed as
16. too costly are actually lower-cost options than the
17. traditional centralized approach that LG&E/KU is
18. proposing now.

19. **Q. What are the implications of advanced**
20. **technologies such as those described above?**

21. A. It may be possible for LG&E/KU to implement one
22. or more of these technologies and strategies during
23. the next few years instead of building a new power

1. line. The utility should analyze the total resource
2. cost of meeting its projected requirements by means of
3. the alternatives listed above, alone or in
4. combination. The economic impacts of enhanced
5. reliability, grid resilience, and power quality should
6. be factored into the analysis to the extent possible.
7. If any of the alternatives yield a lower total cost
8. than the proposed new transmission line, the utility
9. should select the lowest-cost option.

10. **Q. Is it necessarily the case that LG&E/KU's**
11. **proposed new power plant is the least-cost strategy to**
12. **meet the utility's future electricity needs?**

13. A. No. At the public hearing for Administrative
14. Case No. 2005-00090, held on June 14, 2005, several
15. energy professionals made the point that the potential
16. for cost-effective improvements in energy efficiency
17. throughout Kentucky's economy is very large. Dr.
18. Stephen Roosa, for example, made the point that over
19. the past 15 years, improved energy efficiency has been
20. the largest energy "source" for the United States.
21. Efficiency improvements are available throughout all
22. sectors of the economy at a cost of two to three cents
23. per kilowatt-hour saved.

1. Kentucky has not taken as much advantage of this low-
2. cost, pollution-free energy "source" as several other
3. states have done. The potential for improved energy
4. efficiency in Kentucky is still largely untapped. Dr.
5. Roosa listed several available, cost-effective
6. technologies which exist today and simply need to be
7. incorporated by our residents, business owners,
8. industrial firms, and electric utilities: energy-
9. efficient lighting, motors, drives, cogeneration,
10. digital energy management systems, advanced glazing,
11. air sealing, efficient chillers, and small-scale
12. hydropower.

13. In my oral statement on June 14, I added the idea of
14. whole-system design, which combines a number of
15. technologies in clever ways to reduce the energy
16. requirements of the system as a whole, whether it be a
17. manufacturing process, a commercial building, or a new
18. home. I recommended the book, *Natural Capitalism*,
19. which provides a readable overview of the exciting
20. possibilities that can be achieved through better
21. design practices. The chapters on design and waste
22. reduction are particularly relevant. (Hawken, Paul,
23. Amory Lovins, and L. Hunter Lovins, Rocky Mountain

1. Institute, Snowmass, Colorado, 1999; web site:
2. www.natcap.org)
3. I would like to provide one example from the book that
4. describes the savings achievable through better design
5. and engineering practices in the industrial sector. A
6. major use of electricity in industry is to operate
7. pumps for moving liquids around. The Atlanta-based
8. carpet company, Interface, was planning to build a new
9. factory. One of the factory's production processes
10. required 14 pumps. A leading firm specializing in
11. factory design did a conventional engineering analysis
12. and sized the pumps to total 95 horsepower. An
13. Interface engineer, Jan Schilham, however, took a
14. fresh look and was able to come up with a different
15. design that was not only more efficient but cost *less*
16. to build. The first design change used larger pipes
17. and smaller pumps, greatly reducing frictional losses.
18. Second, Schilham laid out the pipes first and then the
19. equipment, in the reverse order from standard
20. practice, enabling him to use shorter and straighter
21. pipe runs. The combination of these two approaches
22. allowed for a system with only 7 horsepower of pumping
23. capacity - a 92% decrease. The lower capital cost of

1. the smaller pumps, motors, inverters, and associated
2. electrical system more than compensated for the
3. additional cost of larger diameter pipes. The payback
4. period for the higher-efficiency design was
5. instantaneous and its return on investment was
6. infinite because it was cheaper to build than the
7. inefficient design would have been. However,
8. "optimization" techniques in use throughout the
9. industrial sector routinely ignore systemic effects
10. such as these, focusing only on single-component or
11. partial-system optimization. (*Ibid.*, pp.116-117.)
12. Dr. Donald Colliver from the University of Kentucky
13. testified on 6/14/05 that a consortium of
14. organizations that include 145,000 design and
15. engineering professionals is now working on methods to
16. produce buildings which are 30%, 50% and 70% of the
17. way toward using zero net energy. In other words, the
18. buildings are extremely efficient and also include
19. distributed energy generation technologies that
20. produce as much energy as the building uses over the
21. course of a year. One example of such a technology is
22. solar shingles in place of the conventional shingles,
23. but which generate electricity and feed it back into
24. the electric grid during peak periods.

1. The implication of these points is that LG&E/KU may be
2. able to meet future needs for electric services by
3. developing and implementing a range of new DSM
4. programs, at a lower total resource cost than building
5. its proposed new power plant. At a minimum, the
6. construction of a new power plant might be
7. significantly delayed.
8. **Q. Does this conclude your testimony?**
9. **A. Yes.**

VERIFICATION

**COMMONWEALTH OF KENTUCKY
STATE AT LARGE**

The undersigned, **Geoffrey M. Young**, being duly sworn hereby verifies that the statements contained hereinabove are true and correct to the best of my knowledge and belief.

GEOFFREY M. YOUNG

COMMONWEALTH OF KENTUCKY, STATE AT LARGE

Subscribed and sworn to before me, by Geoffrey M. Young, on this _____ day of July, 2005.

NOTARY PUBLIC

My Commission Expires: _____
