Q.

## PLEASE STATE YOUR FULL NAME, ADDRESS, AND OCCUPATION.

A. My name is J. Randall Woolridge and my business address is 120 Haymaker Circle,
State College, PA 16801. I am a Professor of Finance and the Goldman, Sachs & Co.
and Frank P. Smeal Endowed University Fellow in Business Administration at the
University Park Campus of the Pennsylvania State University. I am also the Director
of the Smeal College Trading Room and President of the Nittany Lion Fund, LLC. A
summary of my educational background, research, and related business experience is
provided in Appendix A.

10

# 11 I. <u>SUBJECT OF TESTIMONY AND SUMMARY OF RECOMMENDATIONS</u>

12

### 13 Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

14 A. I have been asked by the Office of Attorney General (OAG) to provide an opinion as
15 to the overall fair rate of return or cost of capital for the Delta Natural Gas Company,
16 Inc. ("Delta" or "Company").

17

### 18 Q. PLEASE REVIEW YOUR COST OF CAPITAL RETURN FINDINGS.

A. To arrive at an equity cost rate for the Company, I have applied the Discounted Cash
Flow Model ("DCF") and the Capital Asset Pricing Model ("CAPM") to a group of
gas distribution companies. I have established an equity cost rate of 9.0% for Delta.
Utilizing my equity cost rate, capital structure ratios, and senior capital cost rates, I am

recommending an overall fair rate of return of 7.64% for Delta. This recommendation
 is summarized in Exhibit JRW-1.

As discussed in my testimony, my recommendation is consistent with the 3 current economic environment. Long-term capital costs are at historical low levels. 4 5 The yields on long-term Treasury bonds have been in the 4-5 percent range for 6 several years. Prior to this cyclical decline in rates that began in 2002, these yields 7 had not been this low over an extended period of time since the 1960s. Long-term 8 capital costs are also low due to the decline in the equity risk premium and the Jobs 9 and Growth Tax Relief Reconciliation Act of 2003 which reduced the tax rates on 10 dividend income and capital gains.

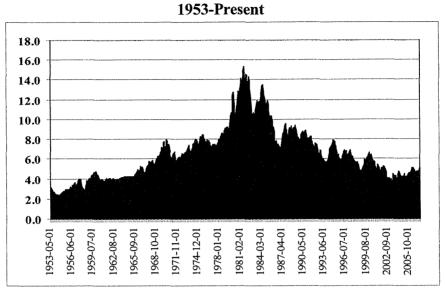

In developing my recommendation, I have reviewed the testimony and
recommendations of Delta witnesses Mr. John B. Brown and Mr. Martin J. Blake.
The Company's recommended rate of return is too high due to an overstated equity
cost rate.

Mr. Brown presents the Company's capital structure ratios and senior capital cost rates. I have adopted these ratios and cost rates. Mr. Blake has recommended an equity cost rate estimate of 12.1%, while my analysis indicates an equity cost rate of 9.0% is appropriate for Delta. We have both used DCF and CAPM approaches to estimating an equity cost rate for the Company. Mr. Blake has also used a Risk Premium study. We have both used the same proxy group of gas distribution companies.

22

1		Mr. Blake's equity cost rate recommendation of 12.1% is based primarily on
2		his risk premium results. Nonetheless, there are three primary errors in Mr. Blake's
3		equity cost rate analyses which serve to inflate his equity cost rate recommendation:
4		(1) he makes an inappropriate market value - book value adjustment to his DCF
5		results, (2) his CAPM equity cost rate includes excessive equity premium and size
6		risk premiums, and (3) he employs an overstated equity risk premium in his RP study
7		and does not account for the riskiness of Delta or the gas distribution business.
8		
9		II. CAPITAL COSTS IN TODAY'S MARKETS
		II. <u>CAPITAL COSTS IN TODAY'S MARKETS</u>
10		
11	Q.	PLEASE DISCUSS CAPITAL COSTS IN TODAY'S MARKETS.
11 12	<b>Q.</b> A.	PLEASE DISCUSS CAPITAL COSTS IN TODAY'S MARKETS. Long-term capital cost rates for U.S. corporations are currently at their lowest levels
12		Long-term capital cost rates for U.S. corporations are currently at their lowest levels

The base level of interest rates in the U.S. economy is indicated by the rates on ten-year U.S. Treasury bonds. The rates are provided in the graph below from 1953 to the present. As indicated in the graph below, prior to the

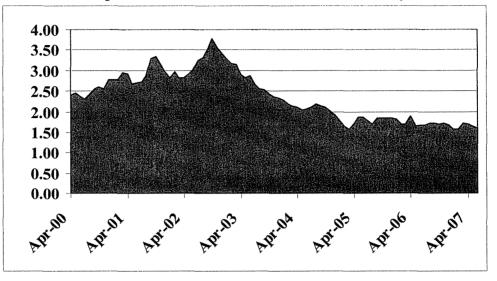

#### Source: http://research.stlouisfed.org/fred2/data/GS10.txt

The second base component of the corporate capital cost rates is the risk 5 premium. The risk premium is the return premium required by investors to purchase 6 7 securities that are riskier than treasury bonds. Risk premiums for bonds are the yield 8 differentials between different bond classes as rated by agencies such as Moody's, 9 and Standard and Poor's. The graph below provides the yield differential between 10 Baa-rated corporate bonds and 10-year Treasuries. This yield differential peaked at 350 basis points (BPs) in 2002 and has declined significantly since that time. This is 11 12 an indication that the market price of risk has declined and therefore the risk premium 13 has declined in recent years.

4

1

Source: http://www.treas.gov/offices/domestic-finance/debt-management/interest-rate/index.html

5 The equity risk premium is the return premium required to purchase stocks as 6 opposed to Treasury bonds. Since the equity risk premium is not readily observable 7 in the markets (as are bond risk premiums), and there are alternative approaches to 8 estimating the equity premium, it is the subject of much debate. One way to estimate 9 the equity risk premium is to compare the mean returns on bonds and stocks over 10 long historical periods. Measured in this manner, the equity risk premium has been in the 5-7 percent range. But recent studies by leading academics indicate the forward-11 looking equity risk premium is in the 3-4 percent range. These authors indicate that 12 13 historical equity risk premiums are upwardly biased measures of expected equity risk premiums. Jeremy Siegel, a Wharton finance professor and author of the book Stocks 14 for the Long Term, published a study entitled "The Shrinking Equity Risk Premium."<sup>1</sup> 15 16 He concludes:

<sup>2</sup> 

<sup>&</sup>lt;sup>1</sup> Jeremy Siegel, "The Shrinking Equity Risk Premium," The Journal of Portfolio Management (Fall, 1999), p.15.

1 2 3 4 5 6 7 8 9	The degree of the equity risk premium calculated from data estimated from 1926 is unlikely to persist in the future. The real return on fixed-income assets is likely to be significantly higher than estimated on earlier data. This is confirmed by the yields available on Treasury index-linked securities, which currently exceed 4%. Furthermore, despite the acceleration in earnings growth, the return on equities is likely to fall from its historical level due to the very high level of equity prices relative to fundamentals.
10	Numerous other academic studies, which are discussed later in my testimony, come to
11	the same conclusion. Even Alan Greenspan, the former Chairman of the Federal
12	Reserve Board, indicated in an October 14, 1999, speech on financial risk that the fact
13	that equity risk premiums have declined during the past decade is "not in dispute."
14	His assessment focused on the relationship between information availability and
15	equity risk premiums.
16	There can be little doubt that the dramatic improvements in
17	information technology in recent years have altered our
18	approach to risk. Some analysts perceive that information
19	technology has permanently lowered equity premiums and,
20	hence, permanently raised the prices of the collateral that
21	underlies all financial assets.
22	The reason, of course, is that information is critical to the
23	evaluation of risk. The less that is known about the current
24	state of a market or a venture, the less the ability to project
25	future outcomes and, hence, the more those potential outcomes
26	will be discounted.
27	The rise in the availability of real-time information has reduced
28	the uncertainties and thereby lowered the variances that we
29	employ to guide portfolio decisions. At least part of the
30	observed fall in equity premiums in our economy and others
31	over the past five years does not appear to be the result of
32	ephemeral changes in perceptions. It is presumably the result
33	of a permanent technology-driven increase in information
34	availability, which by definition reduces uncertainty and
35	therefore risk premiums. This decline is most evident in equity
36	risk premiums. It is less clear in the corporate bond market,
37	where relative supplies of corporate and Treasury bonds and

other factors we cannot easily identify have outweighed the effects of more readily available information about borrowers.<sup>2</sup>
In sum, the relatively low interest rates in today's markets as well as the lower risk premiums required by investors indicate that capital costs for U.S. companies are the lowest in decades. In addition, the 2003 federal tax law further lowered capital cost rates for companies.

### 7

8

# Q. HOW DID THE JOBS AND GROWTH TAX RELIEF RECONCILIATION ACT OF 2003 REDUCE THE COST OF CAPITAL FOR COMPANIES?

9 A. On May 28, 2003, President Bush signed the Jobs and Growth Tax Relief 10 Reconciliation Act of 2003. The primary purpose of this legislation was to reduce 11 taxes to enhance economic growth. A primary component of the new tax law was a 12 significant reduction in the taxation of corporate dividends for individuals. Dividends have been described as "double-taxed." First, corporations pay taxes on the income 13 they earn before they pay dividends to investors, then investors pay taxes on the 14 15 dividends that they receive from corporations. One of the implications of the double 16 taxation of dividends is that, all else equal, it results in a higher cost of raising capital 17 The tax legislation reduced the effect of double taxation of for corporations. 18 dividends by lowering the tax rate on dividends from the 30 percent range (the 19 average tax bracket for individuals) to 15 percent.

Overall, the 2003 tax law reduced the pre-tax return requirements of investors,
thereby reducing corporations' cost of equity capital. This is because the reduction in

<sup>&</sup>lt;sup>2</sup> Alan Greenspan, "Measuring Financial Risk in the Twenty-First Century," Office of the Comptroller of the Currency Conference, October 14, 1999.

the taxation of dividends for individuals enhances their after-tax returns and thereby reduces their pre-tax required returns. This reduction in pre-tax required returns (due to the lower tax on dividends) effectively reduces the cost of equity capital for companies. The 2003 tax law also reduced the tax rate on long-term capital gains from 20% to 15%. The magnitude of the reduction in corporate equity cost rates is debatable, but my assessment indicates that it could be as large as 100 basis points.

7

### III. COMPARISON GROUP SELECTION

# 8 Q. PLEASE DESCRIBE YOUR APPROACH TO DEVELOPING A FAIR RATE 9 OF RETURN RECOMMENDATION FOR DELTA.

A. To develop a fair rate of return recommendation for Delta, I evaluated the return
 requirements of investors on the common stock of a group of publicly-held natural
 gas distribution companies.

# 13 Q. PLEASE DESCRIBE YOUR GROUP OF GAS DISTRIBUTION 14 COMPANIES.

A. I am using the group of gas distribution companies employed by Delta Witness Mr.
Martin J. Blake. These companies include AGL Resources, Delta Natural Gas
Company, EnergySouth, Inc., Energy West, Laclede Group, New Jersey Resources,
Nicor, Northwest Natural Gas Co., Piedmont Natural Gas Company, South Jersey
Industries, and WGL Holdings. Two companies, Peoples Energy and Cascade, have
been acquired by other companies and no longer trade in the markets.

1		Summary financial statistics for the group are provided on page 1 of Exhibit
2		JRW-2. On average, the group has average revenues and net plant of \$1610.2M and
3		\$1316.9M, respectively, and earns 69% of revenues from regulated gas operations.
4		The group has a mean common equity ratio and earned return on common equity are
5		of 51.4% and 11.8%.
6		
7		IV. CAPITAL STRUCTURE RATIOS AND DEBT COST RATES
8		
9	Q.	PLEASE REVIEW DELTA'S PROPOSED CAPITAL STRUCTURE RATIOS.
10	A.	Exhibit JRW-3 provides Delta's proposed capital structure. Mr. Brown has proposed
11		a capital structure consisting of 13.43% short-term debt, 46.90% long-term debt, and
12		39.67% common equity. The average capital structure ratios of the SWC and LWC
13		groups include 5.63% short-term debt, 42.93% long-term debt, and 51.44% common
14		equity. As such, Delta has somewhat less common equity in its capital structure than
15		the average capitalization of the companies in the gas distribution group.
16		
17	Q.	ARE YOU EMPLOYING DELTA'S RECOMMENDED CAPITAL
18		STRUCTURE?
19	A.	Yes.
20		
21	Q.	HAVE YOU ASSESSED THE RISK OF DELTA RELATIVE TO THE
22		GROUP?

1	A.	Yes. On page 2 of Exhibit J	RW-2, I have compared Delta	a to the average of the group
2		for six different risk measure	es published by Value Line. T	hese measures include Beta,
3		Safety, Financial Strength,	Stock Price Stability, Pric	e Growth Persistence, and
4		Earnings Predictability. The	e results suggest that Delta	is comparable in risk to the
5		average of the group. Nonet	heless, I am making an adjus	tment to my equity cost rate
6		to reflect the higher degree o	f financial risk of Delta.	
7				
8	Q.	WHAT CAPITAL STRU	CTURE RATIOS AND S	ENIOR CAPITAL COST
9		RATES ARE YOU USI	NG TO ESTIMATE AN	OVERALL RATE OF
10		<b>RETURN FOR DELTA?</b>		
11	A.	I am adopting Delta's propo	sed capital structure. I am als	o employing the Company's
12		proposed short-term debt co	ost rate of 6.49% and long-te	erm debt cost rate of 6.81%.
13		These ratios and cost rates an	re summarized below.	
14 15 16			lta Natural Gas Company Structure and Senior Capital	Cost Rates
		Source of Capital	Capitalization Ratio	Cost Rate
		Short-Term Debt	13.43%	6.49%
		Long-Term Debt	46.90%	6.81%
17		Common Equity	39.67%	
17 18				
10				
19		V. THE COST	<u>OF COMMON EQUITY C</u>	CAPITAL
20				

### 1 A. Overview

# 2 Q. WHY MUST AN OVERALL COST OF CAPITAL OR FAIR RATE OF 3 RETURN BE ESTABLISHED FOR A PUBLIC UTILITY?

4 In a competitive industry, the return on a firm's common equity capital is determined A. 5 through the competitive market for its goods and services. Due to the capital requirements needed to provide utility services, however, and to the economic benefit 6 7 to society from avoiding duplication of these services, some public utilities are monopolies. It is not appropriate to permit monopoly utilities to set their own prices 8 9 because of the lack of competition and the essential nature of the services. Thus, 10 regulation seeks to establish prices which are fair to consumers and at the same time 11 are sufficient to meet the operating and capital costs of the utility, i.e., provide an 12 adequate return on capital to attract investors.

# 13 Q. PLEASE PROVIDE AN OVERVIEW OF THE COST OF CAPITAL IN THE

### 14 CONTEXT OF THE THEORY OF THE FIRM.

A. The total cost of operating a business includes the cost of capital. The cost of common equity capital is the expected return on a firm's common stock that the marginal investor would deem sufficient to compensate for risk and the time value of money. In equilibrium, the expected and required rates of return on a company's common stock are equal.

20 Normative economic models of the firm, developed under very restrictive 21 assumptions, provide insight into the relationship between firm performance or 22 profitability, capital costs, and the value of the firm. Under the economist's ideal

1 model of perfect competition where entry and exit is costless, products are 2 undifferentiated, and there are increasing marginal costs of production, firms produce 3 up to the point where price equals marginal cost. Over time, a long-run equilibrium is 4 established where price equals average cost, including the firm's capital costs. In 5 equilibrium, total revenues equal total costs, and because capital costs represent 6 investors' required return on the firm's capital, actual returns equal required returns 7 and the market value and the book value of the firm's securities must be equal.

In the real world, firms can achieve competitive advantage due to product 8 9 market imperfections. Most notably, companies can gain competitive advantage 10 through product differentiation (adding real or perceived value to products) and by 11 achieving economies of scale (decreasing marginal costs of production). Competitive 12 advantage allows firms to price products above average cost and thereby earn accounting profits greater than those required to cover capital costs. When these 13 profits are in excess of that required by investors, or when a firm earns a return on 14 15 equity in excess of its cost of equity, investors respond by valuing the firm's equity in 16 excess of its book value.

17 James M. McTaggart, founder of the international management consulting firm Marakon Associates, has described this essential relationship between the return 18 on equity, the cost of equity, and the market-to-book ratio in the following manner:<sup>3</sup> 19 20 Fundamentally, the value of a company is determined by the cash flow it generates over time for its owners, and the 21 22 minimum acceptable rate of return required by capital 23 investors. This "cost of equity capital" is used to discount the 24 expected equity cash flow, converting it to a present value.

<sup>&</sup>lt;sup>3</sup> James M. McTaggart, "The Ultimate Poison Pill: Closing the Value Gap," Commentary (Spring 1988), p. 2.

1 The cash flow is, in turn, produced by the interaction of a 2 company's return on equity and the annual rate of equity 3 growth. High return on equity (ROE) companies in low-growth 4 markets, such as Kellogg, are prodigious generators of cash 5 flow, while low ROE companies in high-growth markets, such 6 as Texas Instruments, barely generate enough cash flow to 7 finance growth.

- 8 A company's ROE over time, relative to its cost of equity, also 9 determines whether it is worth more or less than its book value. 10 If its ROE is consistently greater than the cost of equity capital (the investor's minimum acceptable return), the business is 11 economically profitable and its market value will exceed book 12 13 value. If, however, the business earns an ROE consistently less than its cost of equity, it is economically unprofitable and its 14 market value will be less than book value. 15
  - As such, the relationship between a firm's return on equity, cost of equity, and
- 17 market-to-book ratio is relatively straightforward. A firm which earns a return on
- 18 equity above its cost of equity will see its common stock sell at a price above its book
- 19 value. Conversely, a firm which earns a return on equity below its cost of equity will
- 20 see its common stock sell at a price below its book value.

## 21 Q. PLEASE PROVIDE ADDITIONAL INSIGHTS INTO THE RELATIONSHIP

### 22 BETWEEN RETURN ON EQUITY AND MARKET-TO-BOOK RATIOS.

23 A. This relationship is discussed in a classic Harvard Business School case study entitled

- 24 "A Note on Value Drivers." On page 2 of that case study, the author describes the
- 25 relationship very succinctly:<sup>4</sup>

16

For a given industry, more profitable firms – those able to generate higher returns per dollar of equity – should have higher market-to-book ratios. Conversely, firms which are unable to generate returns in excess of their cost of equity should sell for less than book value.

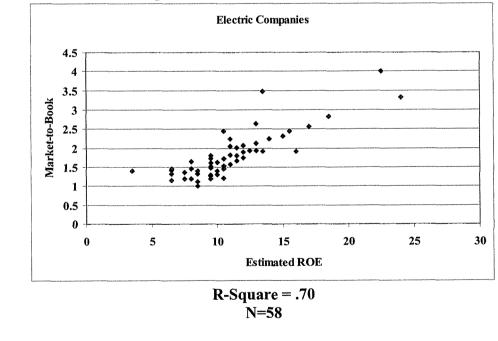

<sup>&</sup>lt;sup>4</sup> Benjamin Esty, "A Note on Value Drivers," Harvard Business School, Case No. 9-297-082, April 7, 1997.

1	Profitability	Value
2	If $ROE > K$	then Market/Book > 1
3	If $ROE = K$	then Market/Book =1
4	If $ROE < K$	then Market/Book < 1

5 To assess the relationship by industry, as suggested above, I have performed a 6 regression study between estimated return on equity and market-to-book ratios using 7 natural gas distribution, electric utility and water utility companies. I used all 8 companies in these three industries which are covered by *Value Line* and who have 9 estimated return on equity and market-to-book ratio data. The results are presented 10 below.

11

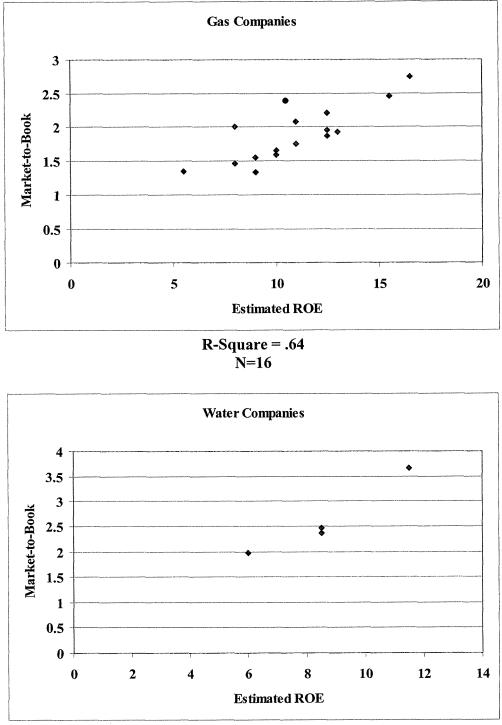

12The Relationship Between Estimated ROE and Market-to-Book Ratios13Value Line Electric Companies, Gas Distribution Companies, and Water Utilities

18

17

14

1 The average R-squares for the electric, gas, and water companies are 0.70, 0.64, and 2 0.93. This demonstrates the strong positive relationship between ROEs and market-3 to-book ratios for public utilities.<sup>5</sup>

# 4 Q. WHAT ECONOMIC FACTORS HAVE AFFECTED THE COST OF EQUITY 5 CAPITAL FOR PUBLIC UTILITIES?

6 Exhibit JRW-4 provides indicators of public utility equity cost rates over the past A. 7 decade. Page 1 shows the yields on 10-year, 'A' rated public utility bonds. These 8 yields peaked in the 1990s at 8.5%, then declined and again hit the 8.0 percent range 9 in the year 2000. They subsequently declined and hovered in the 4.5 to 5.0 percent 10 range between 2003 and 2005. They increased to 6.0% in June of 2006, and have 11 since retreated to the 5.50 percent range. Page 2 provides the dividend yields for the 12 fifteen utilities in the Dow Jones Utilities Average over the past decade. These yields 13 peaked in 1994 at 7.2%. Since that time they have declined and were at 3.5% as of 2006. 14

Average earned returns on common equity and market-to-book ratios are given on page 3 of Exhibit JRW-4. Over the past decade, earned returns on common equity have consistently been in the 10.0-13.0 percent range. The high point was 13.45% in 2001, and they subsequently decreased before recovering in 2005 and 2006. As of 2006, the average was 13.1%. Over the past decade, market-to-book ratios for this group have increased gradually, but with several ups and downs. The

<sup>&</sup>lt;sup>5</sup> R-square measures the percent of variation in one variable (e.g., market-to-book ratios) explained by another variable (e.g., expected return on equity). R-squares vary between zero and 1.0, with values closer to 1.0 indicating a higher relationship between two variables.

1 market-to-book average was 1.75 as of 2001, declined to 1.45 in 2003, and increased 2 to 2.10 as of 2006.

The indicators in Exhibit JRW-4, coupled with the overall decrease in interest rates, suggest that capital costs for the Dow Jones Utilities have decreased over the past decade.

# 6 Q. WHAT FACTORS DETERMINE INVESTORS' EXPECTED OR REQUIRED 7 RATE OF RETURN ON EQUITY?

8 The expected or required rate of return on common stock is a function of A. market-wide, as well as company-specific, factors. The most important market factor 9 10 is the time value of money as indicated by the level of interest rates in the economy. 11 Common stock investor requirements generally increase and decrease with like 12 changes in interest rates. The perceived risk of a firm is the predominant factor that 13 influences investor return requirements on a company-specific basis. A firm's 14 investment risk is often separated into business and financial risk. Business risk 15 encompasses all factors that affect a firm's operating revenues and expenses. 16 Financial risk results from incurring fixed obligations in the form of debt in financing 17 its assets.

18

# 19 Q. HOW DOES THE INVESTMENT RISK OF NATURAL GAS DISTRIBUTION 20 COMPANIES COMPARE WITH THAT OF OTHER INDUSTRIES?

A. Due to the essential nature of their service as well as their regulated status, public
utilities are exposed to a lesser degree of business risk than other, non-regulated

businesses. The relatively low level of business risk allows public utilities to meet 1 2 much of their capital requirements through borrowing in the financial markets, thereby incurring greater than average financial risk. Nonetheless, the overall 3 4 investment risk of public utilities is below most other industries. Exhibit JRW-5 provides an assessment of investment risk for 100 industries as measured by beta, 5 6 which according to modern capital market theory is the only relevant measure of 7 investment risk that need be of concern for investors. These betas come from the Value Line Investment Survey and are compiled by Aswath Damodoran of New York 8 University.<sup>6</sup> The study shows that the investment risk of public utilities is relatively 9 10 low. The average beta for natural gas distribution companies of 0.73 is in the bottom 10% of the 100 industries in terms of beta. As such, the cost of equity for the natural 11 12 gas distribution industry is among the lowest of all industries in the U.S.

13

14

# Q. HOW CAN THE EXPECTED OR REQUIRED RATE OF RETURN ON COMMON EQUITY CAPITAL BE DETERMINED?

A. The costs of debt and preferred stock are normally based on historical or book values and can be determined with a great degree of accuracy. The cost of common equity capital, however, cannot be determined precisely and must instead be estimated from market data and informed judgment. This return to the stockholder should be commensurate with returns on investments in other enterprises having comparable risks.

<sup>&</sup>lt;sup>6</sup> They may be found on the Internet at http://www.stern.nyu.edu/~adamodar/.

According to valuation principles, the present value of an asset equals the discounted value of its expected future cash flows. Investors discount these expected cash flows at their required rate of return that, as noted above, reflects the time value of money and the perceived riskiness of the expected future cash flows. As such, the cost of common equity is the rate at which investors discount expected cash flows associated with common stock ownership.

Models have been developed to ascertain the cost of common equity capital for a firm. Each model, however, has been developed using restrictive economic assumptions. Consequently, judgment is required in selecting appropriate financial valuation models to estimate a firm's cost of common equity capital, in determining the data inputs for these models, and in interpreting the models' results. All of these decisions must take into consideration the firm involved as well as conditions in the economy and the financial markets.

# 14 Q. HOW DO YOU PLAN TO ESTIMATE THE COST OF EQUITY CAPITAL 15 FOR THE COMPANY?

A. I rely primarily on the DCF model to estimate the cost of equity capital. Given the
investment valuation process and the relative stability of the utility business, I believe
that the DCF model provides the best measure of equity cost rates for public utilities.
I have also performed a CAPM study, but I give these results less weight because I
believe that risk premium studies, of which the CAPM is one form, provide a less
reliable indication of equity cost rates for public utilities.

18

### B. <u>Discounted Cash Flow Analysis</u>

# 2 Q. BRIEFLY DESCRIBE THE THEORY BEHIND THE TRADITIONAL DCF 3 MODEL.

4 A. According to the discounted cash flow model, the current stock price is equal to the 5 discounted value of all future dividends that investors expect to receive from their 6 investment in the firm. As such, stockholders' returns ultimately result from current 7 as well as future dividends. As owners of a corporation, common stockholders are entitled to a pro-rata share of the firm's earnings. The DCF model presumes that 8 9 earnings that are not paid out in the form of dividends are reinvested in the firm so as 10 to provide for future growth in earnings and dividends. The rate at which investors 11 discount future dividends, which reflects the timing and riskiness of the expected cash 12 flows, is interpreted as the market's expected or required return on the common stock. 13 Therefore this discount rate represents the cost of common equity. Algebraically, the 14 DCF model can be expressed as:

 15
  $D_1$   $D_2$   $D_n$  

 16
 P
 =
 --- +
 --- +
 --- 

 17
  $(1+k)^1$   $(1+k)^2$   $(1+k)^n$ 

19 where P is the current stock price,  $D_n$  is the dividend in year n, and k is the cost of 20 common equity.

# Q. IS THE DCF MODEL CONSISTENT WITH VALUATION TECHNIQUES EMPLOYED BY INVESTMENT FIRMS?

A. Yes. Virtually all investment firms use some form of the DCF model as a valuation
technique. One common application for investment firms is called the three-stage

DCF or dividend discount model ("DDM"). The stages in a three-stage DCF model are discussed below. This model presumes that a company's dividend payout progresses initially through a growth stage, then proceeds through a transition stage, and finally assumes a steady-state stage. The dividend-payment stage of a firm depends on the profitability of its internal investments, which, in turn, is largely a function of the life cycle of the product or service. These stages are depicted in the graphic below labeled the Three-Stage DCF Model.<sup>7</sup>

- 8 1. Growth stage: Characterized by rapidly expanding sales, high profit margins, 9 and abnormally high growth in earnings per share. Because of highly 10 profitable expected investment opportunities, the payout ratio is low. 11 Competitors are attracted by the unusually high earnings, leading to a decline 12 in the growth rate.
- 13 2. Transition stage: In later years, increased competition reduces profit margins
  14 and earnings growth slows. With fewer new investment opportunities, the
  15 company begins to pay out a larger percentage of earnings.
- 163.Maturity (steady-state) stage: Eventually the company reaches a position17where its new investment opportunities offer, on average, only slightly18attractive returns on equity. At that time its earnings growth rate, payout ratio,19and return on equity stabilize for the remainder of its life. The constant-20growth DCF model is appropriate when a firm is in the maturity stage of the life21cycle.

<sup>&</sup>lt;sup>7</sup> This description comes from William F. Sharp, Gordon J. Alexander, and Jeffrey V. Bailey, *Investments* (Prentice-Hall, 1995), pp. 590-91.

In using this model to estimate a firm's cost of equity capital, dividends are projected into the future using the different growth rates in the alternative stages, and then the equity cost rate is the discount rate that equates the present value of the future dividends to the current stock price.

## 7 Q. HOW DO YOU ESTIMATE STOCKHOLDERS' EXPECTED OR REQUIRED

### 8 **RATE OF RETURN USING THE DCF MODEL?**

9 A. Under certain assumptions, including a constant and infinite expected growth rate, 10 and constant dividend/earnings and price/earnings ratios, the DCF model can be 11 simplified to the following:

- $\begin{array}{ccc} 12 & & D_1 \\ 13 & P & = & ------ \end{array}$ 
  - r -----k - g
- 16 where  $D_1$  represents the expected dividend over the coming year and g is the expected 17 growth rate of dividends. This is known as the constant-growth version of the DCF

model. To use the constant-growth DCF model to estimate a firm's cost of equity, one solves for k in the above expression to obtain the following:

 $k = \frac{D_1}{P} + g$ 

The economics of the public utility business indicate that the industry is in the 6 steady-state or constant-growth stage of a three-stage DCF. The economics include 7 the relative stability of the utility business, the maturity of the demand for public 8 9 utility services, and the regulated status of public utilities (especially the fact that their returns on investment are effectively set through the ratemaking process). The DCF 10 valuation procedure for companies in this stage is the constant-growth DCF. In the 11 12 constant-growth version of the DCF model, the current dividend payment and stock 13 price are directly observable. Therefore, the primary problem and controversy in 14 applying the DCF model to estimate equity cost rates entails estimating investors' 15 expected dividend growth rate.

### Q. WHAT FACTORS SHOULD ONE CONSIDER WHEN APPLYING THE DCF

# 17

16

1

2

3

4 5

### **METHODOLOGY?**

A. One should be sensitive to several factors when using the DCF model to estimate a firm's cost of equity capital. In general, one must recognize the assumptions under which the DCF model was developed in estimating its components (the dividend yield and expected growth rate). The dividend yield can be measured precisely at any point in time, but tends to vary somewhat over time. Estimation of expected growth is considerably more difficult. One must consider recent firm performance, in

2

conjunction with current economic developments and other information available to investors, to accurately estimate investors' expectations.

3

#### PLEASE DISCUSS EXHIBIT JRW-6. **Q**.

4 A. My DCF analysis is provided in Exhibit JRW-6. The DCF summary is on page 1 of 5 this Exhibit and the supporting data and analysis for the dividend yield and expected 6 growth rate are provided on the following pages.

7

#### 8 WHAT DIVIDEND YIELDS ARE YOU EMPLOYING IN YOUR DCF Q. 9 ANALYSIS FOR YOUR GROUP OF NATURAL GAS DISTRIBUTION 10 **COMPANIES?**

11 A. The dividend yields on the common stock for the companies in the group are 12 provided on page 2 of Exhibit JRW-6 for the six-month period ending August, 2007. 13 Over this period, the average monthly dividend yields for the group of gas companies 14 was 3.7%. As of August, 2007, the mean dividend yields for the group was 3.8%. 15 For the DCF dividend yields for the group, I use the average of the six month and 16 August, 2007 dividend yields. Hence, I am employing a DCF dividend yield of 17 3.75%.

#### 18 **Q**. PLEASE DISCUSS THE APPROPRIATE ADJUSTMENT TO THE SPOT 19 **DIVIDEND YIELD.**

20 According to the traditional DCF model, the dividend yield term relates to the A. 21 dividend yield over the coming period. As indicated by Professor Myron Gordon, 22 who is commonly associated with the development of the DCF model for popular use,

this is obtained by: (1) multiplying the expected dividend over the coming quarter by
 4, and (2) dividing this dividend by the current stock price to determine the
 appropriate dividend yield for a firm, which pays dividends on a quarterly basis.<sup>8</sup>

In applying the DCF model, some analysts adjust the current dividend for growth over the coming year as opposed to the coming quarter. This can be complicated because firms tend to announce changes in dividends at different times during the year. As such, the dividend yield computed based on presumed growth over the coming quarter as opposed to the coming year can be quite different. Consequently, it is common for analysts to adjust the dividend yield by some fraction of the long-term expected growth rate.

11 The appropriate adjustment to the dividend yield is further complicated in the 12 regulatory process when the overall cost of capital is applied to a projected rate base. 13 The net effect of this application is an overstatement of the equity cost rate estimate derived from the DCF model. In the context of the constant-growth DCF model, both 14 15 the adjusted dividend yield and the growth component are overstated. The 16 overstatement results from applying an equity cost rate computed using current 17 market data to a future or test-year-end rate base which includes growth associated with the retention of earnings during the year. In other words, an equity cost rate 18 19 times a future, yet to be achieved rate base, results in an inflated dividend yield and 20 growth rate.

<sup>&</sup>lt;sup>8</sup> Petition for Modification of Prescribed Rate of Return, Federal Communications Commission, Docket No. 79-05, Direct Testimony of Myron J. Gordon and Lawrence I. Gould at 62 (April 1980).

# Q. GIVEN THIS DISCUSSION, WHAT ADJUSTMENT FACTOR WILL YOU USE FOR YOUR DIVIDEND YIELD?

A. I will adjust the dividend yield by one-half (1/2) the expected growth so as to reflect
growth over the coming year.

# 5 Q. PLEASE DISCUSS THE GROWTH RATE COMPONENT OF THE DCF 6 MODEL.

- A. There is much debate as to the proper methodology to employ in estimating the
  growth component of the DCF model. By definition, this component is investors'
  expectation of the long-term dividend growth rate. Presumably, investors use some
  combination of historical and/or projected growth rates for earnings and dividends per
  share and for internal or book value growth to assess long-term potential.
- 12

# 13 Q. WHAT GROWTH DATA HAVE YOU REVIEWED FOR THE GROUP OF

## 14 NATURAL GAS DISTRIBUTION COMPANIES?

15 A. I have analyzed a number of measures of growth for the gas distribution companies. I 16 have reviewed *Value Line's* historical and projected growth rate estimates for 17 earnings per share (EPS), dividends per share (DPS), and book value per share 18 (BVPS). In addition, I have utilized the average EPS growth rate forecasts of Wall 19 Street analysts as provided by Zacks, Reuters, and First Call. These services solicit 17 five-year earning growth rate projections from securities analysts and compile and 18 publish the averages of these forecasts on the Internet. Finally, I have also assessed prospective growth as measured by prospective earnings retention rates and earned
 returns on common equity.

# 3 Q. PLEASE DISCUSS HISTORICAL GROWTH IN EARNINGS AND 4 DIVIDENDS AS WELL AS INTERNAL GROWTH.

5 Historical growth rates for EPS, DPS, and BVPS are readily available to virtually all A. 6 investors and presumably an important ingredient in forming expectations concerning 7 future growth. However, one must use historical growth numbers as measures of 8 investors' expectations with caution. In some cases, past growth may not reflect 9 future growth potential. Also, employing a single growth rate number (for example, 10 for five or ten years), is unlikely to accurately measure investors' expectations due to 11 the sensitivity of a single growth rate figure to fluctuations in individual firm 12 performance as well as overall economic fluctuations (i.e., business cycles). 13 However, one must appraise the context in which the growth rate is being employed. 14 According to the conventional DCF model, the expected return on a security is equal 15 to the sum of the dividend yield and the expected long-term growth in dividends. 16 Therefore, to best estimate the cost of common equity capital using the conventional 17 DCF model, one must look to long-term growth rate expectations.

Internally generated growth is a function of the percentage of earnings retained within the firm (the earnings retention rate) and the rate of return earned on those earnings (the return on equity). The internal growth rate is computed as the retention rate times the return on equity. Internal growth is significant in determining long-run earnings and, therefore, dividends. Investors recognize the importance of

internally generated growth and pay premiums for stocks of companies that retain earnings and earn high returns on internal investments.

3

### 4 Q. PLEASE DISCUSS THE HISTORICAL GROWTH OF THE COMPANIES IN

## 5 THE GROUP AS PROVIDED IN THE VALUE LINE INVESTMENT SURVEY.

A. Historic growth rates for the companies in the group, as published in the *Value Line Investment Survey*, are provided on page 3 of Exhibit JRW-6. Due to the presence of
outliers among the historic growth rate figures, both the mean and medians are used
in the analysis. The historical growth measures in EPS, DPS, and BVPS for the
group, as measured by the means and medians, range from 2.4% to 6.0%, with an
average of 4.5%.

12

# 13 Q. PLEASE SUMMARIZE VALUE LINE'S PROJECTED GROWTH RATES

## 14 FOR THE GROUP OF NATURAL GAS DISTRIBUTION COMPANIES.

- A. *Value Line's* projections of EPS, DPS, and BVPS growth for the group are shown on
  page 4 of Exhibit JRW-6. As above, due to the presence of outliers, both the mean
  and medians are used in the analysis. For the group, the central tendency measures
  range from 3.9% to 4.4%, with an average of 4.0%.
- Also provided on page 4 of Exhibit JRW-6 is prospective internal growth for the group as measured by *Value Line*'s average projected retention rate and return on shareholders' equity. The average prospective internal growth rate for the group is 4.7%.
- 23

# 1Q.PLEASE ASSESS GROWTH FOR THE GROUP AS MEASURED BY2ANALYSTS' FORECASTS OF EXPECTED 5-YEAR GROWTH IN EPS.

A. Zacks, First Call, and Reuters collect, summarize, and publish Wall Street analysts'
five-year EPS growth rate forecasts for companies. These forecasts are provided for
the companies in the group of natural gas distribution companies on page 5 of Exhibit
JRW-6. The mean/median of the analysts' projected EPS growth rates for the group
are 4.8%/5.0%.<sup>9</sup>

8

# 9 Q. PLEASE SUMMARIZE YOUR ANALYSIS OF THE HISTORICAL AND 10 PROSPECTIVE GROWTH OF THE GAS COMPANY GROUP.

11 The table below shows the summary DCF growth rate indicators for the group of gas A. 12 distribution companies. For the group, the average of Value Line's historical mean 13 and median growth rate measures in EPS, DPS, and BVPS is 4.5%. Value Line's 14 average projected growth rate for EPS, DPS, and BVPS is 4.0%. The average 15 internal growth rate is 4.7%, and the mean/median of the projected EPS growth rate 16 for companies in the group are 4.8%/5.0%. These results indicate an expected DCF 17 growth rate in 4.0-5.0 percent range. Given these results, I will use 5.0% which is at the upper end of the range of expectations for the group. 18

- 19
- 20
- 21

<sup>&</sup>lt;sup>9</sup> Since there is considerable overlap in analyst coverage between the three services, and not all of the companies have forecasts from the different services, I have averaged the expected five-year EPS growth rates from the three services for each company to arrive at an expected EPS growth rate by company.

Q. PLEASE DIS	SCUSS THE C	APITAL ASSE	T PRICING MODEI	L (CAPM).

1	А.	The CAPM is a risk premium approach to gauging a firm's cost of equity capital.
2		According to the risk premium approach, the cost of equity is the sum of the interest
3		rate on a risk-free bond $(R_f)$ and a risk premium (RP), as in the following:
4		$k = R_f + RP$
5		The yield on long-term Treasury securities is normally used as R <sub>f</sub> . Risk
6		premiums are measured in different ways. The CAPM is a theory of the risk and
7		expected returns of common stocks. In the CAPM, two types of risk are associated
8		with a stock: firm-specific risk or unsystematic risk; and market or systematic risk,
9		which is measured by a firm's beta. The only risk that investors receive a return for
10		bearing is systematic risk.
11		According to the CAPM, the expected return on a company's stock, which is
12		also the equity cost rate (K), is equal to:
12		
12		$K = (R_f) + \beta_i * [E(R_m) - (R_f)]$
13		$K = (R_f) + \beta_i * [E(R_m) - (R_f)]$
13 14		$K = (R_f) + \beta_i * [E(R_m) - (R_f)]$ Where:
13 14 15 16		<ul> <li>K = (R<sub>f</sub>) + β<sub>i</sub> * [E(R<sub>m</sub>) - (R<sub>f</sub>)]</li> <li>Where:</li> <li>K represents the estimated rate of return on the stock;</li> <li>E(R<sub>m</sub>) represents the expected return on the overall stock market. Frequently,</li> </ul>
13 14 15 16 17		<ul> <li>K = (R<sub>f</sub>) + β<sub>i</sub> * [E(R<sub>m</sub>) - (R<sub>f</sub>)]</li> <li>Where:</li> <li>K represents the estimated rate of return on the stock;</li> <li>E(R<sub>m</sub>) represents the expected return on the overall stock market. Frequently, the 'market' refers to the S&amp;P 500;</li> </ul>
<ol> <li>13</li> <li>14</li> <li>15</li> <li>16</li> <li>17</li> <li>18</li> <li>19</li> <li>20</li> <li>21</li> <li>22</li> </ol>		<ul> <li>K = (R<sub>f</sub>) + β<sub>i</sub> * [E(R<sub>m</sub>) - (R<sub>f</sub>)]</li> <li>Where:</li> <li>K represents the estimated rate of return on the stock;</li> <li>E(R<sub>m</sub>) represents the expected return on the overall stock market. Frequently, the 'market' refers to the S&amp;P 500;</li> <li>(R<sub>f</sub>) represents the risk-free rate of interest;</li> <li>[E(R<sub>m</sub>) - (R<sub>f</sub>)] represents the expected equity or market risk premium—the excess return that an investor expects to receive above the risk-free rate for</li> </ul>
<ol> <li>13</li> <li>14</li> <li>15</li> <li>16</li> <li>17</li> <li>18</li> <li>19</li> <li>20</li> <li>21</li> </ol>		<ul> <li>K = (R<sub>f</sub>) + β<sub>i</sub> * [E(R<sub>m</sub>) - (R<sub>f</sub>)]</li> <li>Where:</li> <li>K represents the estimated rate of return on the stock;</li> <li>E(R<sub>m</sub>) represents the expected return on the overall stock market. Frequently, the 'market' refers to the S&amp;P 500;</li> <li>(R<sub>f</sub>) represents the risk-free rate of interest;</li> <li>[E(R<sub>m</sub>) - (R<sub>f</sub>)] represents the expected equity or market risk premium—the excess return that an investor expects to receive above the risk-free rate for investing in risky stocks; and</li> </ul>
<ol> <li>13</li> <li>14</li> <li>15</li> <li>16</li> <li>17</li> <li>18</li> <li>19</li> <li>20</li> <li>21</li> <li>22</li> <li>23</li> </ol>		<ul> <li>K = (R<sub>f</sub>) + β<sub>i</sub> * [E(R<sub>m</sub>) - (R<sub>f</sub>)]</li> <li>Where:</li> <li>K represents the estimated rate of return on the stock;</li> <li>E(R<sub>m</sub>) represents the expected return on the overall stock market. Frequently, the 'market' refers to the S&amp;P 500;</li> <li>(R<sub>f</sub>) represents the risk-free rate of interest;</li> <li>[E(R<sub>m</sub>) - (R<sub>f</sub>)] represents the expected equity or market risk premium—the excess return that an investor expects to receive above the risk-free rate for investing in risky stocks; and</li> <li>Beta—(β<sub>i</sub>) is a measure of the systematic risk of an asset.</li> </ul>
<ol> <li>13</li> <li>14</li> <li>15</li> <li>16</li> <li>17</li> <li>18</li> <li>19</li> <li>20</li> <li>21</li> <li>22</li> <li>23</li> <li>24</li> </ol>		<ul> <li>K = (Rp) + Bi * [E(Rm) - (Rp)]</li> <li>Where:</li> <li>K represents the estimated rate of return on the stock;</li> <li>E(Rm) represents the expected return on the overall stock market. Frequently, the 'market' refers to the S&amp;P 500;</li> <li>(Rp) represents the risk-free rate of interest;</li> <li>[E(Rm) - (Rp)] represents the expected equity or market risk premium—the excess return that an investor expects to receive above the risk-free rate for investing in risky stocks; and</li> <li>Beta—(Bi) is a measure of the systematic risk of an asset.</li> <li>To estimate the required return or cost of equity using the CAPM requires</li> </ul>

1 more difficult to measure because there are different opinions about what 2 adjustments, if any, should be made to historical betas due to their tendency to regress 3 to 1.0 over time. And finally, an even more difficult input to measure is the expected 4 equity or market risk premium,  $[E(R_m) - (R_f)]$ . I will discuss each of these inputs, 5 with most of the discussion focusing on the expected equity risk premium.

6

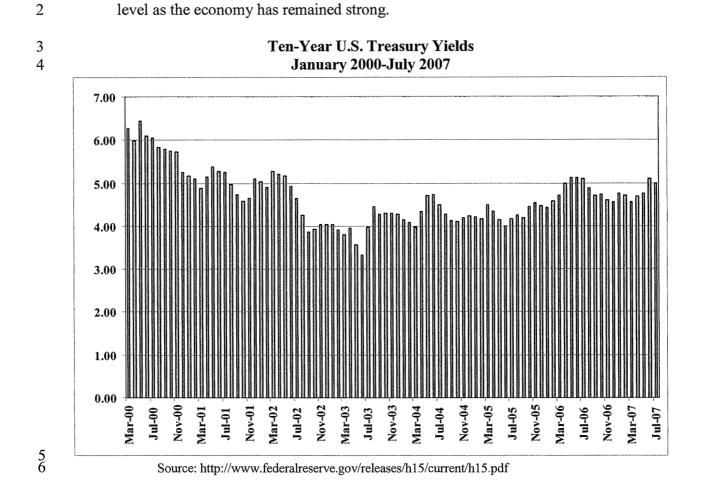

0.

#### PLEASE DISCUSS EXHIBIT JRW-7.

A. Exhibit JRW-7 provides the summary results for my CAPM study. Page 1 shows the
results, and the pages following it, contain the supporting data.

### 9 Q. PLEASE DISCUSS THE RISK-FREE INTEREST RATE.

10 The yield on long-term Treasury bonds has usually been viewed as the risk-free rate A. of interest in the CAPM. The yield on long-term Treasury bonds, in turn, has been 11 12 considered to be the yield on Treasury bonds with 30-year maturities. However, 13 when the Treasury's issuance of 30-year bonds was interrupted for a period of time in recent years, the yield on 10-year Treasury bonds replaced the yield on 30-year 14 15 Treasury bonds as the benchmark long-term Treasury rate. The 10-year Treasury 16 yields over the past five years are shown in the chart below. These rates hit a 60-year 17 low in the summer of 2003 at 3.33%. They increased with the rebounding economy 18 and fluctuated in the 4.0-4.50 percent range over the past three years until advancing 19 to 5.0% in early 2006 in response to a strong economy and increases in energy, commodity, and consumer prices. In late 2006, long-term interest rates retreated to 20 below 4.5 percent as commodity and energy prices declined and inflationary 21

pressures have subsided. However, these rates have since rebounded to the 5.0%

## 7 Q. WHAT RISK-FREE INTEREST RATE ARE YOU USING IN YOUR CAPM?

8 A. With the growing budget deficit, the U.S. Treasury has decided to again begin issuing 9 a 30-year bond. As such, the market may again begin to focus on its yield as the 10 benchmark for long-term capital costs in the U.S. In recent months, the yields on the 11 10- and 30- year Treasuries have increased and have been in the 4.75%-5.25% range. As 12 of July 26, 2007, as shown in Table 4-7, the rates on 10- and 30- Treasuries were 13 4.80% and 4.95%, respectively. Given this recent range and recent movement, I will 14 use 5.25%, which is at the high end of the recent range, as the risk-free rate, or Rf, in 15 my CAPM.

16

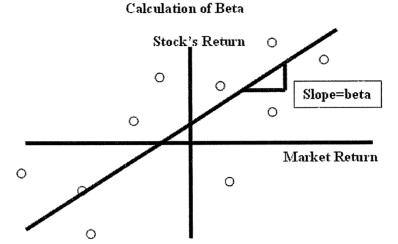

U.S. Treasury Yields July 26, 2007						
NOTES/BONDS						
	COUPON	MATURITY DATE	CURRENT PRICE/YIELD			
2-YEAR	4.625	07/31/2009	100-03¼ / 4.57			
3-YEAR	4,500	05/15/2010	99-27 / 4.5			
5-YEAR	4.875	06/30/2012	101-02+/4.63			
10-YEAR	4,500	05/15/2017	97-22 / 4.80			
30-YEAR	4.750	02/15/2037	96-26¾ / 4.95			

<sup>3</sup> 4

Source: www.bloomberg.com

### 5 Q. WHAT BETAS ARE YOU EMPLOYING IN YOUR CAPM?

6 A. Beta  $(\beta)$  is a measure of the systematic risk of a stock. The market, usually taken to 7 be the S&P 500, has a beta of 1.0. The beta of a stock with the same price movement 8 as the market also has a beta of 1.0. A stock whose price movement is greater than 9 that of the market, such as a technology stock, is riskier than the market and has a 10 beta greater than 1.0. A stock with below average price movement, such as that of a 11 regulated public utility, is less risky than the market and has a beta less than 1.0. 12 Estimating a stock's beta involves running a linear regression of a stock's return on 13 the market return as in the following:

The slope of the regression line is the stock's β. A steeper line indicates the stock is
more sensitive to the return on the overall market. This means that the stock has a
higher β and greater than average market risk. A less steep line indicates a lower β
and less market risk.

Numerous online investment information services, such as Yahoo and 6 Reuters, provide estimates of stock betas. Usually these services report different 7 8 betas for the same stock. The differences are usually due to (1) the time period over 9 which the  $\beta$  is measured and (2) any adjustments that are made to reflect the fact that betas tend to regress to 1.0 over time. In estimating an equity cost rate for the group 10 11 of gas distribution companies, I am using the betas for the companies as provided in the Value Line Investment Survey. As shown on page 2 of Exhibit JRW-7, the 12 13 median beta for the companies in the gas distribution group is 0.78.

#### 14 Q. PLEASE DISCUSS THE EQUITY RISK PREMIUM.

15 A. The equity or market risk premium— $[E(R_m) - R_f$  - is equal to the expected return on 16 the stock market (e.g., the expected return on the S&P 500 (E( $R_m$ )) minus the risk-free 1 rate of interest  $(R_f)$ . The equity premium is the difference in the expected total return 2 between investing in equities and investing in "safe" fixed-income assets, such as long-3 term government bonds. However, while the equity risk premium is easy to define 4 conceptually, it is difficult to measure because it requires an estimate of the expected 5 return on the market.

### 6 Q. PLEASE DISCUSS THE ALTERNATIVE APPROACHES TO ESTIMATING 7 THE EQUITY RISK PREMIUM.

8 A. The table below highlights the primary approaches to, and issues in, estimating the 9 expected equity risk premium. The traditional way to measure the equity risk 10 premium was to use the difference between historical average stock and bond returns. 11 In this case, historical stock and bond returns, also called ex post returns, were used 12 as the measures of the market's expected return (known as the ex ante or forward-13 looking expected return). This type of historical evaluation of stock and bond returns 14 is often called the "Ibbotson approach" after Professor Roger Ibbotson who 15 popularized this method of using historical financial market returns as measures of 16 expected returns. Most historical assessments of the equity risk premium suggest an 17 equity risk premium of 5-7 percent above the rate on long-term Treasury bonds. 18 However, this can be a problem because (1) ex post returns are not the same as ex 19 ante expectations, (2) market risk premiums can change over time, increasing when 20 investors become more risk-averse, and decreasing when investors become less risk-21 averse, and (3) market conditions can change such that ex post historical returns are 22 poor estimates of ex ante expectations.

#### **Risk Premium Approaches**

	Historical Ex Post Excess Returns	Surveys	Ex Ante Models and Market Data
Means of Assessing the Equity-Bond Risk Premium	Historical average is a popular proxy for the ex ante premium – but likely to be misleading	Investor and expert surveys can provide direct estimates of prevailing expected returns/premiums	Current financial market prices (simple valuation ratios or DCF- based measures) can give most objective estimates of feasible ex ante equity-bond risk premium
Problems/Debated Issues	Time variation in required returns and systematic selection and other biases have	Limited survey histories and questions of survey representativeness.	Assumptions needed for DCF inputs, notably the trend earnings growth rate, make even these models' outputs subjective.
	boosted valuations over time, and have exaggerated realized excess equity returns compared with ex ante expected premiums	Surveys may tell more about hoped-for expected returns than about objective required premiums due to irrational biases such as extrapolation.	The range of views on the growth rate, as well as the debate on the relevant stock and bond yields, leads to a range of premium estimates.

Source: Antti Ilmanen, Expected Returns on Stocks and Bonds," Journal of Portfolio Management, (Winter 2003).

4 The use of historical returns as market expectations has been criticized in 5 numerous academic studies.<sup>10</sup> The general theme of these studies is that the large 6 equity risk premium discovered in historical stock and bond returns cannot be 7 justified by the fundamental data. These studies, which fall under the category "Ex 8 Ante Models and Market Data," compute ex ante expected returns using market data 9 to arrive at an expected equity risk premium. These studies have also been called 10 "Puzzle Research" after the famous study by Mehra and Prescott in which the authors 11 first questioned the magnitude of historical equity risk premiums relative to 12 fundamentals.<sup>11</sup> 13

<sup>&</sup>lt;sup>10</sup> The problems with using ex post historical returns as measures of ex ante expectations will be discussed at length later in my testimony.

<sup>&</sup>lt;sup>11</sup> Rahnish Mehra and Edward Prescott, "The Equity Premium: A Puzzle," Journal of Monetary Economics (1985).

### Q. PLEASE BRIEFLY SUMMARIZE SOME OF THE ACADEMIC STUDIES THAT DEVELOPED EX ANTE EQUITY RISK PREMIUMS.

3 A. Two of the most prominent studies of ex ante expected equity risk premiums were by 4 Eugene Fama and Ken French (2002) and James Claus and Jacob Thomas (2001). 5 The primary debate in these studies revolves around two related issues: (1) the size of 6 expected equity risk premium, which is the return equity investors require above the 7 yield on bonds; and (2) the fact that estimates of the ex ante expected equity risk 8 premium using fundamental firm data (earnings and dividends) are much lower than 9 estimates using historical stock and bond return data. Fama and French (2002), two of the most preeminent scholars in finance, use dividend and earnings growth models 10 to estimate expected stock returns and ex ante expected equity risk premiums.<sup>12</sup> They 11 12 compare these results to actual stock returns over the period 1951-2000. Fama and French estimate that the expected equity risk premium from DCF models using 13 14 dividend and earnings growth to be between 2.55% and 4.32%. These figures are much lower than the ex post historical equity risk premium produced from the 15 16 average stock and bond return over the same period, which is 7.40%.

Fama and French conclude that the ex ante equity risk premium estimates using DCF models and fundamental data are superior to those using ex post historical stock returns for three reasons: (1) the estimates are more precise (a lower standard error); (2) the Sharpe ratio, which is measured as the [(expected stock return – riskfree rate)/standard deviation], is constant over time for the DCF models but varies considerably over time and more than doubles for the average stock-bond return

<sup>&</sup>lt;sup>12</sup> Eugene F. Fama and Kenneth R. French, "The Equity Premium," *The Journal of Finance*, (April 2002).

1 model; and (3) valuation theory specifies relationships between the market-to-book 2 ratio, return on investment, and cost of equity capital that favor estimates from 3 fundamentals. They also conclude that the high average stock returns over the past 4 50 years were the result of low expected returns and that the average equity risk 5 premium has been in the 3-4 percent range.

The study by Claus and Thomas provides direct support for the findings of 6 Fama and French.<sup>13</sup> These authors compute ex ante expected equity risk premiums 7 over the 1985-1998 period by (1) computing the discount rate that equates market 8 9 values with the present value of expected future cash flows, and (2) then subtracting 10 the risk-free interest rate. The expected cash flows are developed using analysts' 11 earnings forecasts. The authors conclude that over this period the ex ante expected 12 equity risk premium is in the range of 3.0%. Claus and Thomas note that, over this 13 period, ex post historical stock returns overstate the ex ante expected equity risk 14 premium because, as the expected equity risk premium has declined, stock prices 15 In other words, from a valuation perspective, the present value of have risen. expected future returns increases when the required rate of return decreases. The 16 higher stock prices have produced stock returns that have exceeded investors' 17 expectations and therefore ex post historical equity risk premium estimates are biased 18 19 upwards as measures of ex ante expected equity risk premiums.

<sup>&</sup>lt;sup>13</sup> James Claus and Jacob Thomas, "Equity Risk Premia as Low as Three Percent? Empirical Evidence from Analysts' Earnings Forecasts for Domestic and International Stock Market," *Journal of Finance*. (October 2001).

### Q. PLEASE PROVIDE A SUMMARY OF THE EX ANTE EQUITY RISK PREMIUM STUDIES.

3 A. Richard Derrig and Elisha Orr (2003) completed the most comprehensive paper to date which summarizes and assesses the many risk premium studies.<sup>14</sup> These authors 4 5 reviewed the various approaches to estimating the equity risk premium, and the overall results. Page 3 of Exhibit JRW-7 provides a summary of the results of the 6 7 primary risk premium studies reviewed by Derrig and Orr. In developing page 3 of 8 Exhibit JRW-7, I have (1) updated the results of the studies that have been updated by 9 the various authors, (2) included the results of several additional studies and surveys, and (3) included the results of the "Building Blocks" approach to estimating the 10 11 equity risk premium, including a study I performed which is presented below.

On page 3, the risk premium studies listed under the 'Social Security' and 'Puzzle Research' sections are primarily ex ante expected equity risk premium studies (as discussed above). Most of these studies are performed by leading academic scholars in finance and economics. Also provided are the results of studies by Ibbotson and Chen and myself which use the Building Blocks approach.

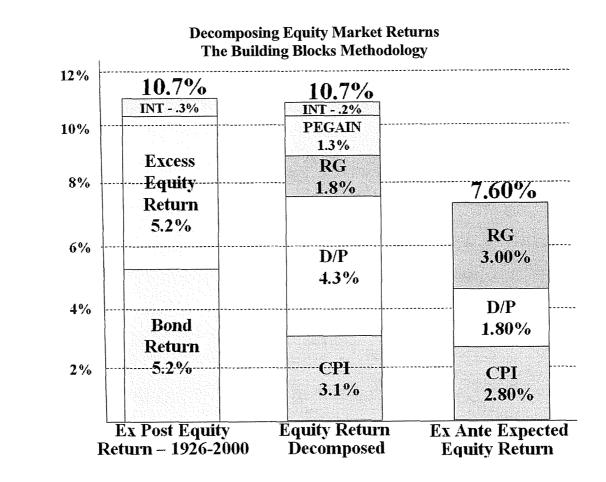

# 17 Q. PLEASE DISCUSS YOUR DEVELOPMENT OF AN EX ANTE EXPECTED 18 EQUITY RISK PREMIUM COMPUTED USING THE BUILDING BLOCKS 19 METHODOLOGY.

<sup>&</sup>lt;sup>14</sup> Richard Derrig and Elisha Orr, "Equity Risk Premium: Expectations Great and Small," Working Paper (version 3.0), Automobile Insurers Bureau of Massachusetts, August 28, 2003.

1 A. Ibbotson and Chen (2002) evaluate the ex post historical mean stock and bond returns in what is called the Building Blocks approach.<sup>15</sup> They use 75 years of data and 2 relate the compounded historical returns to the different fundamental variables 3 employed by different researchers in building ex ante expected equity risk premiums. 4 5 Among the variables included were inflation, real EPS and DPS growth, ROE and book value growth, and P/E ratios. By relating the fundamental factors to the ex post 6 7 historical returns, the methodology bridges the gap between the ex post and ex ante 8 equity risk premiums. Ilmanen (2003) illustrates this approach using the geometric 9 returns and five fundamental variables - inflation (CPI), dividend yield (D/P), real 10 earnings growth (RG), repricing gains (PEGAIN) and return interaction/reinvestment (INT).<sup>16</sup> This is shown in the graph below. The first column breaks the 1926-2000 11 12 geometric mean stock return of 10.7% into the different return components demanded 13 by investors: the historical Treasury bond return (5.2%), the excess equity return 14 (5.2%), and a small interaction term (0.3%). This 10.7% annual stock return over the 15 1926-2000 period can then be broken down into the following fundamental elements: 16 inflation (3.1%), dividend yield (4.3%), real earnings growth (1.8%), repricing gains 17 (1.3%) associated with higher P/E ratios, and a small interaction term (0.2%).

<sup>&</sup>lt;sup>15</sup> Roger Ibbotson and Peng Chen, "Long Run Returns: Participating in the Real Economy," *Financial Analysts Journal*, January 2003.

<sup>&</sup>lt;sup>16</sup> Antti Ilmanen, Expected Returns on Stocks and Bonds," Journal of Portfolio Management, (Winter 2003), p. 11.

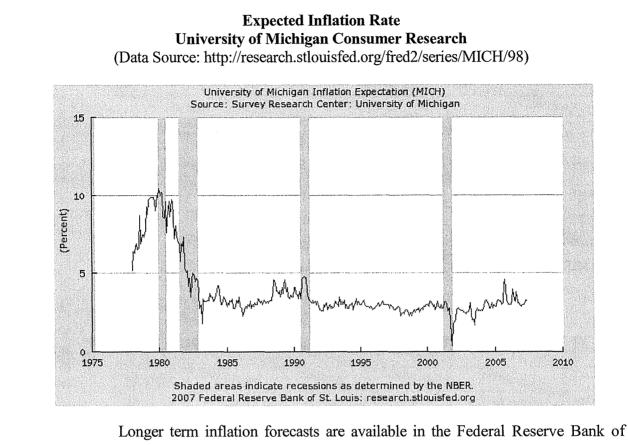

### 4 Q. HOW ARE YOU USING THIS METHODOLOGY TO DERIVE AN EX ANTE

#### 5 **EXPECTED EQUITY RISK PREMIUM?**

- A. The third column in the graph above shows current inputs to estimate an ex ante
  expected market return. These inputs include the following:
- 8 CPI To assess expected inflation, I have employed expectations of the short-9 term and long-term inflation rate. The graph below shows the expected annual 10 inflation rate according to consumers, as measured by the CPI, over the coming year. 11 This survey is published monthly by the University of Michigan Survey Research 12 Center. In the most recent report, the expected one-year inflation rate was 3.3%.

1 2

3 4

5

6 Longer term inflation forecasts are available in the Federal Reserve Bank of 7 Philadelphia's publication entitled *Survey of Professional Forecasters*.<sup>17</sup> This survey 8 of professional economists has been published for almost 50 years. While this survey 9 is published quarterly, only the first quarter survey includes long-term forecasts of 10 GDP growth, inflation, and market returns. In the first quarter, 2007 survey, 11 published on February 13, 2007, the median long-term (10-year) expected inflation 12 rate as measured by the CPI was 2.35% (see page 4 of Exhibit JRW-7).

Given these results, I will use the average of the University of Michigan and
Philadelphia Federal Reserve's surveys (3.3% and 2.35%), or 2.8%.

<sup>&</sup>lt;sup>17</sup>Federal Reserve Bank of Philadelphia, *Survey of Professional Forecasters*, February 13, 2007. The *Survey of Professional Forecasters* was formerly conducted by the American Statistical Association (ASA) and the National Bureau of Economic Research (NBER) and was known as the ASA/NBER survey. The survey, which began in 1968, is conducted each quarter. The Federal Reserve Bank of Philadelphia, in cooperation with the NBER, assumed responsibility for the survey in June 1990.

D/P – As shown in the graph below, the dividend yield on the S&P 500 has decreased gradually over the past decade. Today, it is far below its norm of 4.3% over the 1926-2000 time period. Whereas the S&P dividend yield bottomed out at less than 1.4% in 2000, it is currently at 1.8% which I use in the ex ante risk premium analysis.

1

2

3

4

5

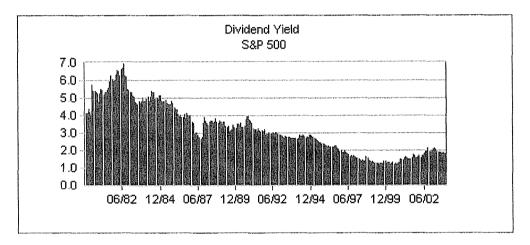

6

7

8

#### S&P 500 Dividend Yield

(Data Source: http://www.barra.com/Research/fund\_charts.asp)

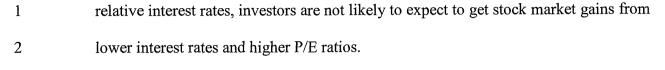

9 RG - To measure expected real growth in earnings, I use (1) the historical real 10 earnings growth rate for the S&P 500, and (2) expected real GDP growth. The S&P 11 500 was created in 1960. It includes 500 companies which come from ten different 12 sectors of the economy. Over the 1960-2005 period, nominal growth in EPS for the S&P 500 was 7.38%. On page 5 of Exhibit JRW-7, real EPS growth is computed 13 14 using the CPI as a measure of inflation. As indicated by Ibbotson and Chen, real 15 earnings growth over the 1926-2000 period was 1.8%. The real growth figure over 16 1960-2006 period for the S&P 500 is 3.0 %.

17 The second input for expected real earnings growth is expected real GDP 18 growth. The rationale is that over the long-term, corporate profits have averaged a

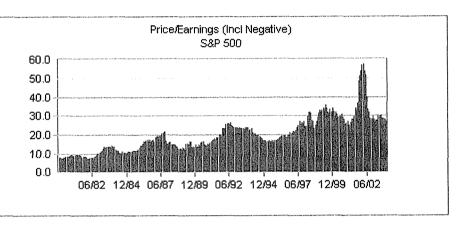

relatively consistent 5.50% of US GDP.<sup>18</sup> Real GDP growth, according to McKinsey, 1 has averaged 3.5% over the past 80 years. Expected GDP growth, according to the 2 Federal Reserve Bank of Philadelphia's Survey of Professional Forecasters, is 3.0% 3 (see page 4 of Exhibit JRW-7). 4 Given these results, I will use the average of the historical S&P EPS real 5 6 growth and the projected real GDP growth (as reported by the Philadelphia Federal 7 Reserve Survey) -- 3.0% and 3.0% -- or 3.0%, for real earnings growth. PEGAIN - the repricing gains associated with increases in the P/E ratio 8 9 accounted for 1.3% of the 10.7% annual stock return in the 1926-2000 period. In 10 estimating an ex ante expected stock market return, one issue is whether investors 11 expect P/E ratios to increase from their current levels. The graph below shows the 12 P/E ratios for the S&P 500 over the past 25 years. The run-up and eventual peak in 13 P/Es is most notable in the chart. The relatively low P/E ratios (in the range of 10) over two decades ago are also quite notable. As of August, 2007 the P/E for the S&P 14 15 500, using the trailing 12 months EPS, is 20.4 according to <u>www.investor.reuters.com</u>. 16 Given the current economic and capital markets environment, I do not believe 17 that investors expect even higher P/E ratios. Therefore, a PEGAIN would not be 18 appropriate in estimating an ex ante expected stock market return. There are two 19 primary reasons for this. First, the average historical S&P 500 P/E ratio is 15 - thus 20 the current P/E exceeds this figure. Second, as previously noted, interest rates are at a 21 cyclical low not seen in almost 50 years. This is a primary reason for the high current 22 P/Es. Given the current market environment with relatively high P/E ratios and low

#### S&P 500 P/E Ratios (Data Source: http://www.barra.com/Research/fund\_charts.asp)

5

# 6 Q. GIVEN THIS DISCUSSION, WHAT IS YOUR EX ANTE EXPECTED 7 MARKET RETURN AND EQUITY RISK PREMIUM USING THE 8 "BUILDING BLOCKS METHODOLOGY"?

9 A. My expected market return is represented by the last column on the right in the graph
10 entitled "Decomposing Equity Market Returns: The Building Blocks Methodology"
11 set forth on page 42 of my testimony. As shown, my expected market return is 7.60%
12 which is composed of 2.80% expected inflation, 1.80% dividend yield, and 3.00%
13 real earnings growth rate.

14 15 16 17	Expected Market Return	=	Expected Inflation	+	Dividend Yield	+	Real Earnings Growth
18	Expected						
19	Market		2.80%	+-	1.80%	+	3.0%
20	Return						
21							
22							

1 Expected 2 Market = 7.6% 3 Return 4

### 5 Q. GIVEN THAT THE HISTORICAL COMPOUNDED ANNUAL MARKET 6 RETURN IS IN EXCESS OF 10%, WHY DO YOU BELIEVE THAT AN 7 EXPECTED MARKET RETURN OF 7.6% IS REASONABLE?

A. As discussed above in the development of the expected market return, stock prices are relatively high at the present time in relation to earnings and dividends and interest rates are relatively low. Hence, it is unlikely that investors are going to experience high stock market returns due to higher P/E ratios and/or lower interest rates. In addition, as shown in the decomposition of equity market returns, the dividend portion of the return was historically 4.3%, whereas the current dividend yield is only 1.8%. Due to these reasons, lower market returns are expected for the future.

15

Q.

### IS YOUR EXPECTED MARKET RETURN OF 7.60% CONSISTENT WITH

16 THE FORECASTS OF MARKET PROFESSIONALS?

A. Yes. In the first quarter, 2007 survey, published on February 13, 2007, the median
long-term expected return on the S&P 500 was 7.50% (see page 4 of Exhibit JRW-7).
This is clearly consistent with my expected market return of 7.60%.

### 20 Q. IS YOUR EXPECTED MARKET RETURN CONSISTENT WITH THE 21 EXPECTED MARKET RETURNS OF CORPORATE CHIEF FINANCIAL 22 OFFICERS (CFOS)?

 A. Yes. John Graham and Campbell Harvey of Duke University conduct an annual survey of corporate CFOs. The survey is a joint project of Duke University and *CFO Magazine*. In the March, 2007 survey, the mean expected return on the S&P 500 over the next ten years is 8.12%.<sup>19</sup>

### 5 Q. GIVEN THIS EXPECTED MARKET RETURN, WHAT IS YOUR EX ANTE 6 EQUITY RISK PREMIUM USING THE BUILDING BLOCKS 7 METHODOLOGY?

- A. As shown above, the current 30-year treasury yield is 4.95%. My ex ante equity risk
  premium is simply the expected market return from the Building Blocks methodology
  minus this risk-free rate:
- 11 Ex Ante Equity Risk Premium = 7.60% 4.95% = 2.65%
- 12

### 13 Q. GIVEN THIS DISCUSSION, HOW ARE YOU MEASURING AN EXPECTED

14 EQUITY RISK PREMIUM IN THIS PROCEEDING?

A. As discussed above, page 3 of Exhibit JRW-7 provides a summary of the results of a variety of the equity risk premium studies. These include the results of (1) the study of historical risk premiums as provided by Ibbotson, (2) ex ante equity risk premium studies (studies commissioned by the Social Security Administration as well as those labeled 'Puzzle Research'), (3) equity risk premium surveys of CFOs, Financial Forecasters, as well as academics, (4) Building Block approaches to the equity risk premium, and (5) other miscellaneous studies. The overall average equity risk

<sup>&</sup>lt;sup>19</sup> The survey results are available at www.cfosurvey.org.

2

premium of these studies is 4.14%, which I will use as the equity risk premium in my CAPM study.

## 3 Q. IS YOUR EX ANTE EQUITY RISK PREMIUM CONSISTENT WITH THE 4 EOUITY RISK PREMIUMS OF LEADING INVESTMENT FIRMS?

Yes. One of the first studies in this area was by Stephen Einhorn, one of Wall 5 A. Street's leading investment strategists.<sup>20</sup> His study showed that the market or equity 6 risk premium had declined to the 2.0 to 3.0 percent range by the early 1990s. Among 7 the evidence he provided in support of a lower equity risk premium is the inverse 8 9 relationship between real interest rates (observed interest rates minus inflation) and stock prices. He noted that the decline in the market risk premium has led to a 10 significant change in the relationship between interest rates and stock prices. One 11 implication of this development was that stock prices had increased higher than 12 13 would be suggested by the historical relationship between valuation levels and 14 interest rates.

The equity risk premiums of other leading investment firms today support the result of the academic studies. An article in *The Economist* indicated that some other firms like J.P. Morgan are estimating an equity risk premium for an average risk stock in the 2.0 to 3.0 percent range above the interest rate on U.S. Treasury Bonds.<sup>21</sup>

<sup>&</sup>lt;sup>20</sup> Steven G. Einhorn, "The Perplexing Issue of Valuation: Will the Real Value Please Stand Up?" *Financial Analysts Journal* (July-August 1990), pp. 11-16.

<sup>&</sup>lt;sup>21</sup> For example, see "Welcome to Bull Country," *The Economist* (July 18, 1998), pp. 21-3, and "Choosing the Right Mixture," *The Economist* (February 27, 1999), pp. 71-2.

# Q. IS YOUR EX ANTE EQUITY RISK PREMIUM CONSISTENT WITH THE EQUITY RISK PREMIUMS USED BY CORPORATE CHIEF FINANCIAL OFFICERS (CFOS)?

4 A. Yes. In the previously-referenced 2007 CFO survey conducted by John Graham and
5 Campbell Harvey, the average ex ante 10-year equity risk premium was 3.42%.

# 6 Q. IS YOUR EX ANTE EQUITY RISK PREMIUM CONSISTENT WITH THE 7 EX ANTE EQUITY RISK PREMIUMS OF PROFESSIONAL 8 FORECASTERS?

9 A. Yes. The financial forecasters in the previously-referenced Federal Reserve Bank of
10 Philadelphia survey project both stock and bond returns. As shown on page 4 of
11 Exhibit JRW-7, the median long-term expected stock and bond returns were 7.50%
12 and 5.00%, respectively. This provides an ex ante equity risk premium of 2.50%.

# Q. IS YOUR EX ANTE EQUITY RISK PREMIUM CONSISTENT WITH THE EQUITY RISK PREMIUMS USED BY THE LEADING CONSULTING FIRMS?

A. Yes. McKinsey & Co. is widely recognized as the leading management consulting firm in the world. They recently published a study entitled "The Real Cost of Equity" in which they developed an ex ante equity risk premium for the US. In reference to the decline in the equity risk premium, as well as what is the appropriate equity risk premium to employ for corporate valuation purposes, the McKinsey authors concluded the following:

1	We attribute this decline not to equities becoming less risky
2	(the inflation-adjusted cost of equity has not changed) but to
3	investors demanding higher returns in real terms on
4	government bonds after the inflation shocks of the late 1970s
5	and early 1980s. We believe that using an equity risk premium
6	of 3.5 to 4 percent in the current environment better reflects the
7	true long-term opportunity cost of equity capital and hence will
8	yield more accurate valuations for companies. <sup>22</sup>
9	
7	of 3.5 to 4 percent in the current environment better reflects the true long-term opportunity cost of equity capital and hence will

### 10 Q. WHAT EQUITY COST RATE IS INDICATED BY YOUR CAPM ANALYSIS?

## A. The results of my CAPM studies for the group of gas distribution companies areprovided below:

$$K = (R_f) + \beta i * [E(R_m) - (R_f)]$$

			Risk-Free Rate	Beta	Equity Risk Premium	Equity Cost Rate
		Gas Distribution Group	5.25%	0.78	4.14%	8.5%
14						
15						
16		D. <u>Equity Cost Ra</u>	te Summary			
17						
17						
18	Q.	PLEASE SUMMARI	ZE YOUR E	QUITY C	COST RATE STU	DY.
19	A.	The results for my D	OCF and CAF	M analv	vses for the group	of gas distrib

20 companies are indicated below:

13

	DCF	CAPM
Gas Distribution Group	8.8%	8.5%

### 21 Q. GIVEN THESE RESULTS, WHAT IS YOUR ESTIMATED EQUITY COST

#### 22 **RATE FOR THE GROUP?**

<sup>&</sup>lt;sup>22</sup> Marc H. Goedhart, et al, "The Real Cost of Equity," McKinsey on Finance (Autumn 2002), p. 15.

A. These results suggest that the equity cost rate for the group of gas distribution companies
 is in the 8.5-8.8 percent range. Giving more weight to the DCF results, an equity cost
 rate of 8.7% is appropriate for the group.

### 4 Q. ARE YOU USING 8.7% FOR DELTA AS YOUR RECOMMENDED EQUITY 5 COST RATE FOR DELTA?

A. No. Whereas my analysis indicates 8.7% is appropriate for the group, Delta's lower
common equity ratio suggests that the Company is exposed to a higher degree of
financial risk. To account for the higher financial risk, I am recommending an equity
cost rate for Delta of 9.0%. This represents a 30 basis point premium for Delta
relative to the group. As shown on page 2 of Exhibit JRW-1, this return premium
represents the return premium which is required by investors for one full bond rating
differential (e.g., the yields on A versus BBB bond ratings).

13

#### 14 Q. ISN'T THIS RATE OF RETURN LOW BY HISTORICAL STANDARDS?

A. Yes it is, and appropriately so. My rate of return is low by historical standards for
three reasons. First, as discussed above, current capital costs are very low by
historical standards, with interest rates at a cyclical low not seen since the 1960s.
Second, the 2003 tax law, which reduces the tax rates on dividend income and capital
gains, lowers the pre-tax return required by investors. And third, as discussed below,
the equity or market risk premium has declined.

2

### Q. FINALLY, PLEASE DISCUSS YOUR RATE OF RETURN IN LIGHT OF RECENT YIELDS ON 'A' RATED PUBLIC UTILITY BONDS.

- A. In recent months the yields on long-term public utility bonds have been in the 6.00
  percent range. My rate of return may appear to be too low given these yields.
  However, as previously noted, my recommendation must be viewed in the context of
  the significant decline in the market or equity risk premium. As a result, the return
  premium that equity investors require over bond yields is much lower than today.
  This decline was previously reviewed in my discussion of capital costs in today's
  markets.
- 10

### 11 Q. HOW DO YOU TEST THE REASONABLENESS OF YOUR COST OF 12 EQUITY AND OVERALL RATE OF RETURN RECOMMENDATION?

- A. To test the reasonableness of my 9.0% equity cost rate recommendation, I examine
  the relationship between the return on common equity and the market-to-book ratios
  for the companies in the group of gas distribution companies.
- 16

## 17Q.WHAT DO THE RETURNS ON COMMON EQUITY AND MARKET-TO-18BOOK RATIOS FOR THE GROUP OF GAS COMPANIES INDICATE

### 19 ABOUT THE REASONABLENESS OF YOUR 9.0% RECOMMENDATION?

A. Page 1 of Exhibit JRW-2 provides financial performance and market valuation
 statistics for the group of gas distribution companies. The average current return on
 equity and market-to-book ratios for the group are summarized below:

			Current ROE	Market-to-Book Ratio				
		Gas Group	11.8%	192				
1		Source: Exhibit JRW-2						
2 3		These results clearly indicate that, on average, these companies are earning returns on						
4		equity above their equity	quity above their equity cost rates. As such, this observation provides evidence that					
5		my recommended equity	ny recommended equity cost rate of 9.0% is reasonable and fully consistent with the					
6		financial performance a	financial performance and market valuation of the group of gas distribution					
7		companies.						
8

12 13	Q.	PLEASE EVALUATE 7	THE COMPANY'S RA	TE OF RETURN POSITION.				
14	A.	The Company's proposed	rate of return is too high	due to an overstated equity cost rate				
15		These issues are addressed	-	1				
16								
17	Q.	PLEASE REVIEW MR	. BLAKE'S EQUITY C	OST RATE APPROACHES.				
18	A.	Mr. Blake employs DCF,	CAPM, and Risk Premiu	m (RP) equity cost rate approaches.				
19								
20	Q.	PLEASE SUMMARIZE	E MR. BLAKE'S EQUI	TY COST RATE RESULTS.				
21	A.	Mr. Blake's equity cost ra	ate estimates for Delta are	e summarized in the table below. H				
22		concludes that the approp	priate equity cost rate for	the Company is 12.1% based on th				
23		RP approach.						
24								

1		Summary of Mr. Blake's Equit	<u>y Cost Rate</u>	Approaches an	d Results
2 3		Annyasah	High	Low	
4		Approach DCF (Sustainable	High 11.82%	11.41%	
5		Growth)	11.02/0	11.11/0	
6		DCF (Average Panel	14.07%	13.43%	
7		Growth)			
8		CAPM	18.73%	18.73%	
9		Risk Premium	12.1%	12.1%	
10					
11 12	Q.	PLEASE DISCUSS YOUR ISSU	FS WITH	MR BLAKE'S	RECOMMENDED
	-			VIR. DEARE 5	RECOMMENDED
13	EQU	UTY COST RATE.			
14	A.	Mr. Blake's proposed return on com	mon equity	is too high prima	arily for the following
15		reasons: (1) he makes an inappropr	riate market	value – book va	alue adjustment to his
16		DCF results, (2) his CAPM equity co	st rate includ	les excessive eq	uity premium and size
17		risk premiums, and (3) he employs a	an overstated	l equity risk prei	mium in his RP study
18		and does not account for the riskiness	of Delta or t	the gas distribution	on business
19					
20		A. <u>DCF Approach</u>			
21					
22	Q.	PLEASE SUMMARIZE MR. BLA	KE'S DCF	ESTIMATES.	
23	A.	On pages 18-24 of his testimony and	in Exhibits N	MJB-8 and MJB-	-9, Mr. Blake develops
24		an equity cost rate by applying a DO	CF model to	Delta. He uses	Delta's 2006 dividend
25		(1.20) and Delta's high (26.82) and L	.ow (24.11)	stock prices duri	ng 2006 and computes
26		two dividend yields. He then estin	nates equity	cost rates using	; two alternative DCF
27		growth rates: (1) Delta's sustainable	e growth (br	+ sv) of 2.37%	, and (2) the average
28		projected dividend growth rate of the	e proxy grou	p of gas compar	nies (3.67%). He then

makes what I call a market value – book value adjustment. He multiplies the DCF equity cost rates times Delta's market capitalization (at the high and low prices) to estimate the expected stockholder return. Finally, he divides the expected stockholder return by Delta's book equity to arrive at the adjusted DCF equity cost rate. Mr. Blake's DCF results are summarized below.

#### DCF Equity Cost Rate Delta Natural Gas Company, Inc

Dena Natural Gas Company, Inc.							
	Delta	Delta	Delta	Delta			
	(High	(Low	(High	(Low			
	Price)	Price)	Price)	Price)			
	Sustainable	Sustainable	Gas Co.	Gas Co.			
	Growth	Growth	Dividend	Dividend			
			Growth	Growth			
Dividend Yield	4.47%	4.98%	4.47%	4.98%			
Growth	2.37%	2.37%	3.67%	3.67%			
DCF Result	6.84%	7.35%	8.14%	8.65%			
Market/Book	X1.73	X1.55	X1.73	X1.55			
Adjustment							
Adjusted DCF Result	11.82%	11.41%	14.07%	13.43%			

8

6

7

#### 9 Q. PLEASE EXPRESS YOUR CONCERNS WITH MR. BLAKE'S DCF STUDY.

10 A. The primary error is the market value – book value adjustment.

11

## 12 Q. PLEASE ADDRESS MR. BLAKES'S MARKET VALUE – BOOK VALUE 13 ADJUSTMENT.

A. Mr. Blake claims that this adjustment is needed since (1) market values are greater than book values for utilities, and (2) the overall rate of return is applied to a book value capitalization in the ratemaking process. This adjustment increases his DCF equity cost rate estimates by a factor of approximately 500 basis points. This adjustment is erroneous and unwarranted for the following reasons: (1) As noted above, the market value of a firm's equity exceeds the book value of equity
 when the firm is expected to earn more on the book value of investment than investors
 require. As such, the reason that market values exceed book values is that the company
 is earning a return on equity in excess of its cost of equity;

5 (2) The application of allowed rates to book values is a long-standing paradigm of regulation with original cost ratemaking. Investors price utility stocks in the 6 market based on the original cost regulatory construct that has existed for many 7 8 decades. Investors understand that when rates are set for utilities in the ratemaking process, the overall cost of capital will be determined based on book 9 10 and not market values. Therefore, Mr. Blake's market value - book value adjustment is inconsistent with the paradigm used by investors in the markets; 11 12 and

# (3) The adjustment is illogical because it works to increase the returns for utilities that have high returns on common equity and decrease the returns for utilities that have low returns on common equity.

16 In the graphs on pages 14 and 15, I have demonstrated that there is a strong positive relationship between expected returns on common equity and market-to-book 17 ratios for public utilities. Hence, in the context of Mr. Blake's market value - book 18 19 value adjustment, this means that (1) for a utility with a relatively high market-to-book ratio (e.g., 2.5) and ROE (e.g., 12.0%), the market value – book value adjustment will 20 21 increase the estimated equity cost rate, while (2) for a utility with a relatively low market-to-book (e.g., 0.5) and ROE (e.g., 5.0%), the market value - book value 22 23 adjustment will decrease the estimated equity cost rate. Such an adjustment defies logic

1		because you are increasing the estimated equity	cost rate for the high market-to-book				
2		utility and decreasing the estimated equity cost	rate for the low market-to-book ratio				
3		utility. Therefore, the adjustment will result in even higher market-to-book ratios for					
4		utilities with relatively high ROEs and even lo	wer market-to-book ratios for utilities				
5		with relatively low ROEs.					
6							
7		B. <u>CAPM Analysis</u>					
8							
9	Q.	PLEASE DISCUSS MR. BLAKE'S USE OF T	ТНЕ САРМ.				
10	A.	On pages 24 to 26 of his testimony and in his E	xhibits MJB-12, Mr. Blake applies the				
11		CAPM to Delta. The results are summarized belo	)w:				
12		CAPM Equity Cost 1 Delta Natural Gas Comp					
13		Dena Natur al Gas Comp	CAPM				
		Risk-Free Rate	5.0%				
		Adjusted Beta	0.55				
		Market Risk Premium	7.1%				
		CAPM Result	8.91 %				
		Size Adjustment	9.83%				
		Size Adjusted CAPM Result	18.73%				
14							
15	Q.	WHAT ARE THE ERRORS IN MR. BLAKE	'S CAPM ANALYSES?				
16	A.	There are two errors with Mr. Blake's CAPM a	nalysis: (1) his equity risk premium of				
17		7.1% is overstated, and (2) he has adjusted his $C_A$	APM results for the size of Delta.				

### 19 Q. PLEASE REVIEW THE ERRORS IN MR. BLAKE'S EQUITY OR MARKET

**RISK PREMIUM.** 

A. The primary error with Mr. Blake's equity risk premium is the use of historical stock
 and bond returns to develop an equity risk premium. Mr. Blake's historical equity risk
 premium represents the difference in the arithmetic mean stock returns and bond
 income returns over the 1926-2005 period.

5

# 6 Q. PLEASE ADDRESS THE BIASES INVOLVED IN THE USE OF HISTORICAL 7 STOCK AND BOND RETURNS TO COMPUTE A FORWARD-LOOKING OR 8 EX ANTE RISK PREMIUM.

9 A. Using the historical relationship between stock and bond returns to measure an ex 10 ante equity risk premium is erroneous and overstates the true market equity risk 11 premium. The equity risk premium is based on expectations of the future and when 12 past market conditions vary significantly from the present, historic data does not 13 provide a realistic or accurate barometer of expectations of the future. At the present 14 time, using historical returns to measure the ex ante equity risk premium ignores 15 current market conditions and masks the dramatic change in the risk and return 16 relationship between stocks and bonds. This change suggests that the equity risk 17 premium has declined.

18

### 19 Q. PLEASE DISCUSS THE ERRORS IN USING HISTORIC STOCK AND BOND

### 20 **RETURNS TO ESTIMATE AN EQUITY RISK PREMIUM.**

- A. There are a number of flaws in using historic returns over long time periods to
  estimate expected equity risk premiums. These issues include:
- 23 (A) Biased historical bond returns;

1		(B) The arithmetic versus the geometric mean return;
2		(C) Unattainable and biased historical stock returns;
3		(D) Survivorship bias;
4		(E) The "Peso Problem;"
5		(F) Market conditions today are significantly different than the past; and
6		(G) Changes in risk and return in the markets.
7		These issues will be addressed in order.
8		
9		Biased Historical Bond Returns
10		
11	Q.	HOW ARE HISTORICAL BOND RETURNS BIASED?
12	A.	An essential assumption of these studies is that over long periods of time investors'
13		expectations are realized. However, the experienced returns of bondholders in the past
14		violate this critical assumption. Historic bond returns are biased downward as a measure
15		of expectancy because of capital losses suffered by bondholders in the past. As such,
16		risk premiums derived from this data are biased upwards.
17		
18		The Arithmetic versus the Geometric Mean Return
18 19		The Arithmetic versus the Geometric Mean Return
	Q.	The Arithmetic versus the Geometric Mean Return         PLEASE DISCUSS THE ISSUE RELATING TO THE USE OF THE
19	Q.	
19 20	Q.	PLEASE DISCUSS THE ISSUE RELATING TO THE USE OF THE

1 risk premium results. When analyzing a single security price series over time (i.e., a 2 time series), the best measure of investment performance is the geometric mean return. Using the arithmetic mean overstates the return experienced by investors. In 3 4 a study entitled "Risk and Return on Equity: The Use and Misuse of Historical Estimates," Carleton and Lakonishok make the following observation: "The 5 6 geometric mean measures the changes in wealth over more than one period on a buy and hold (with dividends invested) strategy."<sup>23</sup> Since Mr. Blake's study covers more 7 8 than one period (and he assumes that dividends are reinvested), he should be 9 employing the geometric mean and not the arithmetic mean.

10

11 Q. PLEASE PROVIDE AN EXAMPLE DEMONSTRATING THE PROBLEM
12 WITH USING THE ARITHMETIC MEAN RETURN.

A. To demonstrate the upward bias of the arithmetic mean, consider the following
example. Assume that you have a stock (that pays no dividend) that is selling for
\$100 today, increases to \$200 in one year, and then falls back to \$100 in two years.
The table below shows the prices and returns.

17

Time Period	Stock Price	Annual Return	
0	\$100		
1	\$200	100%	
2	\$100	-50%	

<sup>&</sup>lt;sup>23</sup> Willard T. Carleton and Josef Lakonishok, "Risk and Return on Equity: The Use and Misuse of Historical Estimates," *Financial Analysts Journal* (January-February, 1985), pp. 38-47.

The arithmetic mean return is simply (100% + (-50%))/2 = 25% per year. The 1 geometric mean return is  $((2 * .50)^{(1/2)}) - 1 = 0\%$  per year. Therefore, the arithmetic 2 mean return suggests that your stock has appreciated at an annual rate of 25%, while 3 the geometric mean return indicates an annual return of 0%. Since after two years, 4 5 your stock is still only worth \$100, the geometric mean return is the appropriate 6 return measure. For this reason, when stock returns and earnings growth rates are 7 reported in the financial press, they are generally reported using the geometric mean. 8 This is because of the upward bias of the arithmetic mean. As further evidence of the appropriate mean return measure, the U.S. Securities and Exchange Commission 9 requires equity mutual funds to report historic return performance using geometric 10 mean and not arithmetic mean returns.<sup>24</sup> Therefore, Mr. Blake's arithmetic mean 11 12 return measures are biased and should be disregarded. 13 14 Unattainable and Biased Historic Stock Returns 15 16 YOU NOTE THAT HISTORIC STOCK RETURNS ARE BIASED USING 17 Q. 18 THE IBBOTSON METHODOLOGY. PLEASE ELABORATE. 19 Returns developed using Ibbotson's methodology are computed on stock indexes and A. 20 therefore (1) cannot be reflective of expectations because these returns are unattainable to investors, and (2) produce biased results. This methodology assumes (a) monthly 21 22 portfolio rebalancing and (b) reinvestment of interest and dividends. Monthly portfolio

23 rebalancing presumes that investors rebalance their portfolios at the end of each month

<sup>&</sup>lt;sup>24</sup> U.S. Securities and Exchange Commission, Form N-1A.

1 in order to have an equal dollar amount invested in each security at the beginning of 2 each month. The assumption would obviously generate extremely high transaction costs 3 and thereby render these returns unattainable to investors. In addition, an academic 4 study demonstrates that the monthly portfolio rebalancing assumption produces biased 5 estimates of stock returns.<sup>25</sup>

6 Transaction costs themselves provide another bias in historic versus expected 7 returns. The observed stock returns of the past were not the realized returns of 8 investors due to the much higher transaction costs of previous decades. These higher 9 transaction costs are reflected through the higher commissions on stock trades, and 10 the lack of low cost mutual funds like index funds.

11

#### 12 <u>Survivorship Bias</u>

13

### 14 Q. HOW DOES SURVIVORSHIP BIAS AFFECT MR. BLAKE'S HISTORIC 15 EQUITY RISK PREMIUM?

A. Using historic data to estimate an equity risk premium suffers from survivorship bias.
 Survivorship bias results when using returns from indexes like the S&P 500. The
 S&P 500 includes only companies that have survived. The fact that returns of firms
 that did not perform so well were dropped from these indexes is not reflected.
 Therefore these stock returns are upwardly biased because they only reflect the
 returns from more successful companies.

<sup>&</sup>lt;sup>25</sup> See Richard Roll, "On Computing Mean Returns and the Small Firm Premium," Journal of Financial Economics (1983), pp. 371-86.

12

## 4 Q. WHAT IS THE "PESO PROBLEM" AND HOW DOES IT AFFECT 5 HISTORIC RETURNS AND EQUITY RISK PREMIUMS?

6 Mr. Blake's use of historic return data also suffers from the so-called "peso A. 7 problem." The "peso problem" issue was first highlighted by the Nobel laureate, 8 Milton Friedman, and gets its name from conditions related to the Mexican peso 9 market in the early 1970s. This issue involves the fact that past stock market returns 10 were higher than were expected at the time because despite war, depression, and other 11 social, political, and economic events, the US economy survived and did not suffer 12 hyperinflation, invasion, and the calamities of other countries. As such, highly 13 improbable events, which may or may not occur in the future, are factored into stock 14 prices, leading to seemingly low valuations. Higher than expected stock returns are 15 then earned when these events do not subsequently occur. Therefore, the "peso 16 problem" indicates that historic stock returns are overstated as measures of expected 17 returns.

18

#### 19

20 21

#### Market Conditions Today are Significantly Different than in the Past

Q. FROM AN EQUITY RISK PREMIUM PERSPECTIVE, PLEASE DISCUSS
HOW MARKET CONDITIONS ARE DIFFERENT TODAY.

A. The equity risk premium is based on expectations of the future. When past marketconditions vary significantly from the present, historic data does not provide a

1 realistic or accurate barometer of expectations of the future. As noted previously, 2 stock valuations (as measured by P/E) are relatively high and interest rates are 3 relatively low, on a historic basis. Therefore, given the high stock prices and low 4 interest rates, expected returns are likely to be lower on a going forward basis. 5 6 Changes in Risk and Return in the Markets 7 8 PLEASE DISCUSS THE NOTION THAT HISTORIC EQUITY RISK **Q**. 9 PREMIUM STUDIES DO NOT REFLECT THE CHANGE IN RISK AND 10 **RETURN IN TODAY'S FINANCIAL MARKETS.** 11 A. The historic equity risk premium methodology is unrealistic in that it makes the explicit 12 assumption that risk premiums do not change over time based on market conditions such 13 as inflation, interest rates, and expected economic growth. Furthermore, using historic 14 returns to measure the equity risk premium masks the dramatic change in the risk and 15 return relationship between stocks and bonds. The nature of the change, as I will discuss 16 below, is that bonds have increased in risk relative to stocks. This change suggests that 17 the equity risk premium has declined in recent years.

Page 1 of Exhibit JRW-8 provides the yields on long-term U.S. Treasury bonds from 1926 to 2006. One very obvious observation from this graph is that interest rates increase dramatically from the mid-1960s until the early 1980s, and since have returned to their 1960 levels. The annual market risk premiums for the 1926 to 2006 period are provided on page 2 of Exhibit JRW-8. The annual market risk premium is defined as the return on common stock minus the return on long-term

Treasury Bonds. There is considerable variability in this series and a clear decline in 1 recent decades. The high was 54% in 1933 and the low was -38% in 1931. Evidence 2 of a change in the relative riskiness of bonds and stocks is provided on page 3 of 3 Exhibit JRW-8 which plots the standard deviation of monthly stock and bond returns 4 5 since 1930. The plot shows that, whereas stock returns were much more volatile than 6 bond returns from the 1930s to the 1970s, bond returns became more variable than 7 stock returns during the 1980s. In recent years stocks and bonds have become much 8 more similar in terms of volatility, but stocks are still a little more volatile. The 9 decrease in the volatility of stocks relative to bonds over time has been attributed to 10 several stock related factors: the impact of technology on productivity and the new 11 economy; the role of information (see former Federal Reserve Chairman Greenspan's 12 comments referred to earlier in this testimony) on the economy and markets; better 13 cost and risk management by businesses; capital losses suffered bond investors during 14 periods of increasing interest rates; deregulation of the financial system; inflation fears and interest rates; and the increase in the use of debt financing. 15 Further 16 evidence of the greater relative riskiness of bonds is shown on page 4 of 17 Exhibit\_(JRW-8), which plots real interest rates (the nominal interest rate minus 18 inflation) from 1926 to 2006. Real rates have been well above historic norms during 19 the past 10-15 years. These high real interest rates reflect the fact that investors view 20 bonds as riskier investments.

The net effect of the change in risk and return has been a significant decrease in the return premium that stock investors require over bond yields. In short, the equity or market risk premium has declined in recent years. This decline has been discovered in

studies by leading academic scholars and investment firms, and has been acknowledged
 by government regulators. As such, using a historic equity risk premium analysis is
 simply outdated and not reflective of current investor expectations and investment
 fundamentals.

- 5

## 6 Q. DO YOU HAVE ANY OTHER THOUGHTS ON THE USE OF HISTORICAL 7 RETURN DATA TO ESTIMATE AN EQUITY RISK PREMIUM?

A. Yes. Jay Ritter, a Professor of Finance at the University of Florida, identified the use
of historical stock and bond return data to estimate a forward-looking equity risk
premium as one of the "Biggest Mistakes" taught by the finance profession.<sup>26</sup> His
argument is based on the theory behind the equity risk premium, the excessive results
produced by historical returns, and the previously-discussed errors of such as
survivorship bias in historical data.

14

### 15 <u>Size Adjustment</u>

16

## 17 Q. INITIALLY, PLEASE ADDRESS MR. BLAKE'S ADJUSTMENT FOR THE 18 SIZE OF THE COMPANY.

A. Mr. Blake adjusts his CAPM equity cost rate results (adding 9.83%) to account for
 the size of the Company. He supports his size premium on the basis of a historical
 return analysis performed by Ibbotson Associates. As discussed above, there are
 numerous errors in using historical market returns to compute risk premiums. These

<sup>&</sup>lt;sup>26</sup> Jay Ritter, "The Biggest Mistakes We Teach," Journal of Financial Research (Summer 2002).

errors provide inflated estimates of expected risk premiums. Among the errors are 1 the well-known survivorship bias (only successful companies survive - poor 2 companies do not survive) and unattainable return bias (the Ibbotson procedure 3 4 presumes monthly portfolio rebalancing). The net result is that Ibbotson's size premiums are poor measures for any risk adjustment to account for the size of the 5 Company. This observation is further supported by a review of the Ibbotson study. 6 The Ibbotson study used for the explicit size premium is based on the stock returns 7 for companies in the 10<sup>th</sup> size decile. A review of the Ibbotson document indicates 8 9 that these companies have betas that are larger than the betas of gas distribution 10 companies. Hence, these size premiums are not associated with the gas distribution industry. 11

Finally, and most significantly, Professor Annie Wong has tested for a size 12 premium in utilities and concluded that, unlike industrial stocks, utility stocks do not 13 exhibit a significant size premium.<sup>27</sup> As explained by Professor Wong, there are several 14 reasons why such a size premium would not be attributable to utilities. Utilities are 15 regulated closely by state and federal agencies and commissions and hence their 16 17 financial performance is monitored on an ongoing basis by both the state and federal governments. In addition, public utilities must gain approval from government entities 18 for common financial transactions such as the sale of securities. Furthermore, unlike 19 20 their industrial counterparts, accounting standards and reporting are fairly standardized 21 for public utilities. Finally, a utility's earnings are predetermined to a certain degree

<sup>&</sup>lt;sup>27</sup> Annie Wong, "Utility Stocks and the Size Effect: An Empirical Analysis," *Journal of the Midwest Finance Association*, 1993, pp. 95-101.

1		through the ratemaking process in which performance is reviewed by state commissions
2		and other interested parties. Overall, in terms of regulation, government oversight,
3		performance review, accounting standards, and information disclosure, utilities are much
4	ł	different than industrials, which could account for the lack of a size premium.
5		
6		C. <u>Risk Premium Analysis</u>
7		
8	Q.	PLEASE DISCUSS MR. BLAKE'S USE OF THE RP MODEL.
9	A.	On pages 24 to 26 of his testimony and in his Exhibits MJB-12, Mr. Blake applies the
10		RP to Delta. The results are summarized below:
11 12		Risk Premium Equity Cost Rate Delta Natural Gas Company, Inc.
		RP
		Risk-Free Rate 5.0%
		Market Risk Premium 7.1%
13		RP Result         12.1 %
14	Q.	PLEASE REVIEW THE ERRORS IN MR. BLAKE'S RP ANALYSIS?
15	A.	Mr. Blake's RP analysis is very simplistic and includes two significant errors: (1) his
16		equity risk premium of 7.1% is overstated, and (3) he has not adjusted his RP results for
17		the riskiness of Delta.
18		
19	Q.	WHAT ARE THE ERRORS IN MR. BLAKE'S EQUITY RISK PREMIUM?
20	A.	As in his CAPM, Mr. Blake has employed an equity risk premium of 7.1% which
21		represents the difference in the arithmetic mean stock returns and bond income returns

over the 1926-2005 period. As discussed above, using historical returns to estimate
an ex ante equity risk premium is subject too a myriad of empirical biases which
result an overstatement of the expected market equity risk premium. Among the
errors are the well-known survivorship bias (only successful companies survive –
poor companies do not survive) and unattainable return bias (the Ibbotson procedure
presumes monthly portfolio rebalancing).

7

### 8 Q. DOES MR. BLAKE'S RP APPROACH ACCOUNT FOR THE RISKINESS OF 9 DELTA?

10 A. No. As demonstrated in his CAPM analysis, Delta's beta of 0.55 suggests that the
11 Company only has about <sup>1</sup>/<sub>2</sub> the relative risk or volatility of the overall market.
12 However, Mr. Blake's RP approach does not account for Delta's lower relative degree
13 of riskiness.

14

## Q. TO CONCLUDE THIS DISCUSSION, PLEASE SUMMARIZE MR. BLAKE'S CAPM AND RP RESULTS IN LIGHT OF THE EVIDENCE ON RISK PREMIUMS IN TODAY'S MARKETS.

- A. Mr. Blake's CAPM and RP analyses both employ an equity risk premium of 7.1%
  which is well in excess of the equity risk premium estimates (a) discovered in recent
  academic studies by leading finance scholars and (b) employed by leading investment
  banks, management consulting firms, financial forecasters and corporate CFOs.
- 22

### 23 Q. DOES THIS CONCLUDE YOUR TESTIMONY?

70

**A.** Yes.

.

### Exhibit JRW-2 Delta Natural Gas Company, Inc. *Value Line* Risk Metrics

Beta - A relative measure of the historical sensitivity of the stock's price to overall fluctuations in the New York Stock Exchange Composite Index. A Beta of 1.50 indicates a stock tends to rise (or fall) 50% more than the New York Stock Exchange Composite Index. The "Beta coefficient" is derived from a regression analysis of the relationship between weekly percentage changes in the price of a stock and weekly percentage changes in the price of a stock and weekly percentage changes in the NYSE Index over a period of five years. In the case of shorter price histories, a smaller time period is used, but two years is the minimum. The Betas are adjusted for their long-term tendency to converge toward 1.00. Additionally, Value Line shows betas computed based on monthly total returns for the trailing three year, five-year and 10-year periods.

Safety Rank - A measurement of potential risk associated with individual common stocks. The Safety Rank is computed by averaging two other Value Line indexes - the Price Stability Index and the Financial strength Rating. Safety Ranks range from 1 (Highest) to 5 (Lowest). Conservative investors should try to limit their purchases to equities ranked 1 (Highest) and 2 (Above Average) for Safety.

**Financial Strength Rating** - A relative measure of financial strength of the companies reviewed by Value Line. The relative ratings range from A++ (strongest) down to C (weakest), in nine steps.

**Price Stability Index** - A measure of the stability of a stock's price. It includes sensitivity to the market (see Beta) as well as the stock's inherent volatility. Value Line Stability ratings range from 100 (highest) to 5 (lowest).

**Price Growth Persistence** - The historic tendency of a stock to show persistent growth compared with the average stock. Expressed as an index ranging from 100 (highest) to 5 (lowest) in increments of 5.

**Earnings Predictability Index** - A measure of the reliability of an earnings forecast. Predictability is based upon the stability of year-to-year comparisons, with recent years being weighted more heavily that earlier ones. The most reliable forecasts tend to be those with the highest rating (100); the least reliable, the lowest (5). The earnings stability is derived from the standard deviation of percentage changes in quarterly earnings over an eight-year period. Special adjustments are made for comparisons around zero and from plus to minus.

### **APPENDIX A**

### EDUCATIONAL BACKGROUND, RESEARCH, AND RELATED BUSINESS EXPERIENCE

### J. RANDALL WOOLRIDGE

J. Randall Woolridge is a Professor of Finance and the Goldman, Sachs & Co. and Frank P. Smeal Endowed Faculty Fellow in Business Administration in the College of Business Administration of the Pennsylvania State University in University Park, PA. In addition, Professor Woolridge is Director of the Smeal College Trading Room and President and CEO of the Nittany Lion Fund, LLC.

Professor Woolridge received a Bachelor of Arts degree in Economics from the University of North Carolina, a Master of Business Administration degree from the Pennsylvania State University, and a Doctor of Philosophy degree in Business Administration (major area-finance, minor area-statistics) from the University of Iowa. At Iowa he received a Graduate Fellowship and was awarded membership in Beta Gamma Sigma, a national business honorary society. He has taught Finance courses at the University of Iowa, Cornell College, and the University of Pittsburgh, as well as the Pennsylvania State University. These courses include corporation finance, commercial and investment banking, and investments at the undergraduate, graduate, and executive MBA levels.

Professor Woolridge's research has centered on the theoretical and empirical foundations of corporation finance and financial markets and institutions. He has published over 35 articles in the best academic and professional journals in the field, including the *Journal of Finance*, the *Journal of Financial Economics*, and the *Harvard Business Review*. His research has been cited extensively in the business press. His work has been featured in the *New York Times*, *Forbes*, *Fortune, The Economist, Financial World, Barron's, Wall Street Journal, Business Week, Washington Post, Investors' Business Daily, Worth Magazine, USA Today*, and other publications. In addition, Dr. Woolridge has appeared as a guest on CNN's *Money Line* and CNBC's *Morning Call* and *Business Today*.

The second edition of Professor Woolridge's popular stock valuation book, *The StreetSmart Guide to Valuing a Stock* (McGraw-Hill, 2003), was released in its second edition. He has also co-authored *Spinoffs and Equity Carve-Outs: Achieving Faster Growth and Better Performance* (Financial Executives Research Foundation, 1999) as well as a new textbook entitled Applied Principles of *Finance* (Kendall Hunt, 2006). Dr. Woolridge is a founder and a managing director of <u>www.valuepro.net</u> - a stock valuation website.

Professor Woolridge has also consulted with and prepared research reports for major corporations, financial institutions, and investment banking firms, and government agencies. In addition, he has directed and participated in over 500 university- and company- sponsored professional development programs for executives in 25 countries in North and South America, Europe, Asia, and Africa.

Dr. Woolridge has prepared testimony and/or provided consultation services in the following cases:

**Pennsylvania**: Dr. Woolridge has prepared testimony on behalf of the Pennsylvania Office of Consumer Advocate in the following cases before the Pennsylvania Public Utility Commission: Bell Telephone Company (R-811819), Peoples Natural Gas Company (R-832315), Pennsylvania Power Company (R-832409), Western Pennsylvania Water Company (R-832381), Pennsylvania Power Company (R-842740), Pennsylvania Gas and Water Company (R-850178), Metropolitan Edison Company (R-860384), Pennsylvania Electric Company (R-860413), North Penn Gas Company (R-860535), Philadelphia Electric Company (R-870629), Western Pennsylvania Water Company (R- 870825), York Water Company (R-870749), Pennsylvania-American Water Company (R-880916), Equitable Gas Company (R-880971), the Bloomsburg Water Co. (R-891494), Columbia Gas of Pennsylvania, Inc. (R-891468), Pennsylvania-American Water Company (R-90562), Breezewood Telephone Company (R-901666), York Water Company (R-901813), Columbia Gas of Pennsylvania, Inc. (R-901873), National Fuel Electric utility Company (R-911912), Pennsylvania-American Water Company (R-911909), Borough of Media Water Fund (R-912150), UGI Utilities, Inc. - Electric Utility Division (R-922195), Dauphin Consolidated Water Supply Company - General Waterworks of Pennsylvania, Inc, (R-932604), National Fuel Electric utility Company (R-932548), Commonwealth Telephone Company (I-920020), Conestoga Telephone and Telegraph Company (I-920015), Peoples Natural Gas Company (R-932866), Blue Mountain Consolidated Water Company (R-932873), National Fuel Gas Company (R-942991), UGI - Gas Division (R-953297), UGI - Electric Division (R-953534), Pennsylvania-American Water Company (R-973944), Pennsylvania-American Water Company (R-994638), Philadelphia Suburban Water Company (R-994868;R-994877;R-994878; R-9948790), Philadelphia Suburban Water Company (R-994868), Wellsboro Electric Company (R-00016356), Philadelphia Suburban Water Company (R-00016750), National Fuel Electric utility Company (R-00038168), Pennsylvania-American Water Company (R-00038304), York Water Company (R-00049165), Valley Energy Company (R-00049345), Wellsboro Electric Company (R-00049313), National Fuel Gas Utility Corporation (R-00049656), T.W. Phillips Gas and Oil Co. (R-00051178), PG Energy (R-00061365), City of Dubois Water Company (Docket No. R-00050671), R-00049165), York Water Company (R-00061322), and Emporium Water Company (R-00061297).

**New Jersey:** Dr. Woolridge prepared testimony for the New Jersey Department of the Public Advocate, Division of Rate Counsel: New Jersey-American Water Company (R-91081399J), New Jersey-American Water Company (R-92090908J), and Environmental Disposal Corp (R-94070319).

Alaska: Dr. Woolridge prepared testimony for Attorney General's Office of Alaska: Golden Heart Utilities, Inc. and College Utilities Corp. (Water Public Utility Service TA-29-118 and Sewer Public Utility Service TA-82-97).

Arizona: Dr. Woolridge prepared testimony for Utility Division Staff of the Arizona Corporation Commission, Arizona Public Service Company (Docket No. E-01345A-06-0009).

Hawaii: Dr. Woolridge prepared testimony for the Hawaii Office of the Consumer Advocate: East Honolulu Community Services, Inc. (Docket No. 7718).

**Delaware:** Dr. Woolridge prepared testimony for the Delaware Division of Public Advocate: Artesian Water Company (R-00-649). Dr. Woolridge prepared testimony for the Staff of the Public Service Commission: Artesian Water Company (R-06-158).

**Ohio:** Dr. Woolridge prepared testimony for the Ohio Office of Consumers' Council: SBC Ohio (Case No. 02-1280-TP-UNC R-00-649), and Cincinnati Gas & Electric Company (Case No. 05-0059-EL-AIR).

**Texas**: Dr. Woolridge prepared testimony for the Atmos Cities Steering Committee: Mid-Texas Division of Atmos Energy Corp. (Docket No. 9670).

New York: Dr. Woolridge prepared testimony for the County of Nassau in New York State: Long Island Lighting Company (PSC Case No. 942354).

Florida: Dr. Woolridge prepared testimony for the Office of Peoples Counsel in Florida: Florida Power & Light Co. (Docket No. 050045-EL).

**Connecticut**: Dr. Woolridge prepared testimony for the Office of Consumer Counsel in Connecticut: United Illuminating (Docket No. 96-03-29), Yankee Gas Company (Docket No. 04-06-01), Southern Connecticut Gas Company (Docket No. 03-03-17), the United Illuminating Company (Docket No. 05-06-04), Connecticut Light and Power Company (Docket No. 05-07-18), Birmingham Utilities, Inc. (Docket No. 06-05-10), Connecticut Water Company (Docket No. 06-07-08), and Connecticut Natural Gas Corp. (Docket No. 06-03-04).

**California**: Dr. Woolridge prepared testimony for the Office of Ratepayer Advocate in California: San Gabriel Valley Water Company (Docket No. 05-08-021).

South Carolina: Dr. Woolridge prepared testimony for the Office of Regulatory Staff in South Carolina: South Carolina Electric and Gas Company (Docket No. 2005-113-G), Carolina Water Service Co. (Docket No. 2006-87-WS), Tega Cay Water Company (Docket No. 2006-97-WS), United Utilities Companies, Inc. Company (Docket No. 2006-107-WS).

**Missouri**: Dr. Woolridge prepared testimony for the Department of Energy in Missouri: Kansas City Power & Light Company (CASE NO. ER-2006-0314).

Kentucky: Dr. Woolridge prepared testimony for the Office of Attorney General in Kentucky: Kentucky-American Water Company (Case No. 2004-00103), Union Heat, Light, and Power Company (Case No. 2004-00042), Kentucky Power Company (Case No. 2005-00341), Union Heat, Light, and Power Company (Case No. 2006-00172),

Washington, D.C.: Dr. Woolridge prepared testimony for the Office of the People's Counsel in the District of Columbia: Potomac Electric Power Company (Formal Case No. 939).

Washington: Dr. Woolridge consulted with trial staff of the Washington Utilities and Transportation Commission on the following cases: Puget Energy Corp. (Docket Nos. UE-011570 and UG-011571); and Avista Corporation (Docket No. UE-011514).

Kansas: Dr. Woolridge prepared testimony on behalf of the Kansas Citizens' Utility Ratepayer Board Utilities in the following cases: Western Resources Inc. (Docket No. 01-WSRE-949-GIE), UtiliCorp (Docket No. 02-UTCG701-CIG), and Westar Energy, Inc. (Docket No. 05-WSEE-981-RTS).

**FERC:** Dr. Woolridge has prepared testimony on behalf of the Pennsylvania Office of Consumer Advocate in the following cases before the Federal Energy Regulatory Commission: National Fuel Gas Supply Corporation (RP-92-73-000) and Columbia Gulf Transmission Company (RP97-52-000).
