**PUBLIC SERVICE
COMMISSION**

Dear Public Service Commissioners,

I believe it is both irresponsible and immoral to require the public to pay for a utility rate increase in order to finance the installation of a new coal-fired power plant. At this crucial time, scientists warn us that the very survival of our planet depends on our willingness and our ability to wean ourselves of our dangerous addiction to coal. Moreover, the 1.5 billion dollar cost of construction of the Trimble County plant is enormous, and when the inevitable carbon caps are legislated, the plant would become excessively expensive to operate. All this at a time when middle-income families are already challenged by their utility bills, and low-income families are in real danger of being pushed over the edge.

Other communities have successfully avoided building new coal plants by investing instead in conservation and increased weatherization, and they have supported a variety of renewable and non-polluting energy sources. By following their examples, we can improve the air and water quality in our community and in the world, and we can spare our citizens the oppressive burden of this proposed rate increase.

Please consider carefully and courageously the choices you make on our behalf and on the behalf of future generations.

Thank you.

Sincerely,
Margaret Stewart
Louisville, KY 40205
