**RECEIVED**

APR 22 2010

**PUBLIC SERVICE  
COMMISSION**

**RE: Case No. 2009-00548**

Dear Mr. Derouen:

Enclosed for filing, please find the original and twelve (12) copies of the DIRECT TESTIMONY OF JAMES T. SELECKY ON BEHALF OF WAL-MART STORES EAST, LP AND SAM'S EAST, INC.

By copy of this letter, all parties listed on the Certificate of Service have been served.

Please stamp as received the extra copy of this filing and kindly return it in the enclosed postage-prepaid envelope.

Please do not hesitate to contact me should you have questions.

Sincerely,

Holly Rachel Smith

**Direct Testimony of James T. Selecky**

1   **Q   PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2   A   James T. Selecky. My business address is 16690 Swingley Ridge Road, Suite 140,  
3   Chesterfield, MO 63017.

4   **Q   WHAT IS YOUR OCCUPATION?**

5   A   I am a consultant in the field of public utility regulation and managing principal of  
6   Brubaker & Associates, Inc., energy, economic and regulatory consultants.

7   **Q   PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND EXPERIENCE.**

8   A   This information is included in Appendix A to my testimony.

9   **Q   ON WHOSE BEHALF ARE YOU APPEARING IN THIS PROCEEDING?**

10  A   I am testifying on behalf of Wal-Mart Stores East, L.P. and Sam's East, Inc.  
11  (collectively referred to as "Wal-Mart"). Wal-Mart purchases its electricity from  
12  Kentucky Utilities Company, Inc. ("KU") primarily on Power Service-Secondary and  
13  Time of Day-Secondary.

1 Q WHAT IS THE SUBJECT OF YOUR TESTIMONY?

2 A My testimony will address KU's cost of service study and revenue allocation. The fact  
3 that an issue is not addressed should not be construed as an endorsement of KU's  
4 position.

5 Q PLEASE SUMMARIZE YOUR CONCLUSIONS AND RECOMMENDATIONS.

6 A My conclusions and recommendations are summarized as follows:

- 7 1. KU has filed the results of the class cost of service study ("CCOSS") that allocates  
8 the fixed production and transmission cost utilizing Base-Intermediate-Peak  
9 methodology ("BIP methodology").
- 10 2. Under the BIP methodology, approximately 35% of the fixed production and  
11 transmission costs are allocated based on energy rather than peak demands.  
12 This results in allocating a disproportionate share of these costs to high load  
13 factor customers.
- 14 3. The Commonwealth of Kentucky Public Service Commission ("Commission")  
15 should utilize a coincident peak cost allocation methodology for allocating fixed  
16 production and transmission cost in future rate cases.
- 17 4. Because of the significant under-collection that the Residential and All Electric  
18 Schools rate classes are providing, based on the results of KU's cost of service  
19 study, the Commission should utilize the results of this cost study to allocate any  
20 increase.
- 21 5. If the Commission awards a revenue increase that is less than the amount  
22 requested by KU, at least 50% of the reduction from the Company's request  
23 should be utilized to reduce the over-collection that certain rate classes are  
24 providing. That is, rates should be adjusted so parity will exist between cost of  
25 service and revenue collection.

## 26 Cost of Service Overview

27 Q HAS KU FILED A CCOSS IN THIS PROCEEDING?

28 A Yes. KU has filed an embedded CCOSS in this case. A CCOSS is used to  
29 determine the costs that KU incurs to serve the various customer classes.

1 **Q WHAT INFORMATION IS CONTAINED IN A CCOSS?**

2 A A CCOSS compares the cost that each customer class imposes on the system to the  
3 revenues each class contributes. This relationship is generally presented by  
4 comparing the rate of return that a class is providing with the utility's overall  
5 jurisdictional rate of return.

6 For example, when a customer class produces the same rate of return as the  
7 total utility rate of return, the customer class is paying revenue to the utility just  
8 sufficient to cover the costs that the utility incurs to serve that class. If a class  
9 produces a below-average rate of return, it may be concluded that the revenue  
10 provided by the class is insufficient to cover all relevant costs to serve that class. On  
11 the other hand, if a class produces a rate of return above the system average, it is not  
12 only paying revenues sufficient to cover the cost attributable to it, but in addition, it is  
13 paying part of the cost attributable to other classes who produce below system  
14 average rates of return.

15 **Q WHY IS A CCOSS OF IMPORTANCE?**

16 A A CCOSS shows the costs that a utility incurs to serve each customer class. It is a  
17 widely held principle that costs should be allocated among customer classes on the  
18 basis of cost-causation. That principle is perhaps the most universally accepted  
19 principle of allocating costs that cannot be directly assigned to a particular customer  
20 class. The costs should be allocated to those classes on the basis of how or why  
21 those costs are incurred by the utility. The results of such studies are used in  
22 assigning cost responsibilities to various customer classes in regulatory proceedings.

1 **Q DO YOU SUPPORT THAT PRINCIPLE?**

2 A Yes. Rates that are based on consistently applied cost-causation principles are not  
3 only fair and reasonable, but further the causes of stability, conservation and  
4 efficiency. When consumers are presented with price signals that convey the  
5 consequences of their consumption decisions (i.e., how much energy to consume, at  
6 what rate, and when), they tend to take actions which not only minimize their own  
7 costs, but those of the utility as well.

8 Although factors such as simplicity, gradualism, economic development and  
9 ease of administration may also be taken into consideration when determining the  
10 final spread of the revenue requirement among classes, the fundamental starting  
11 point and guideline should be the cost of serving each customer class produced by  
12 the CCOSS.

13 **Q HOW IS THE COST OF SERVING EACH CUSTOMER CLASS DETERMINED?**

14 A The appropriate mechanism to determine the cost of serving each customer class is a  
15 fully allocated embedded CCOSS. It follows, however, that the objective of  
16 cost-based rates cannot be attained unless the CCOSS is developed using  
17 cost-causation principles consistently.

18 **Q BRIEFLY DESCRIBE THE MAJOR STEPS IN PERFORMING A CCOSS?**

19 A The first step in a CCOSS is known as functionalization. This simply refers to the  
20 process by which the Company's investments and expenses are reviewed and put  
21 into different categories of cost. The primary functions utilized are production,  
22 transmission and distribution. Of course, each broad function may have several  
23 subcategories to provide for a more refined determination of cost of service.

1           The second major step is known as classification. In the classification step,  
2           the functionalized costs are separated into the categories of demand-related,  
3           energy-related and customer-related costs in order to facilitate the allocation of costs  
4           applying the cost-causation principles.

5           Demand or capacity-related costs are those costs that are incurred by the  
6           utility to serve the amount of demand that each customer class places on the system.  
7           A traditional example of capacity-related costs is the investment associated with  
8           generating stations, transmission lines and a portion of the distribution system. Once  
9           the utility makes an investment in these facilities, the costs continue to be incurred,  
10          irrespective of the number of kilowatthours generated and sold or the number of  
11          customers taking service from the utility.

12          Energy-related costs are those costs that are incurred by the utility to provide  
13          the energy required by its customers. Thus, the fuel expense is almost directly  
14          proportional to the amount of kilowatthours supplied by the utility system to meet its  
15          customers' energy requirements.

16          Customer-related costs are those costs that are incurred to connect  
17          customers to the system and are independent of the customers' demand and energy  
18          requirements. Primary examples of customer-related costs are investments in  
19          meters, services and the portion of the distribution system that is necessary to  
20          connect customers to the system. For example, some level of investment must be  
21          incurred to meet minimum safety requirements when connecting customers to the  
22          system.<sup>1</sup> This minimum level of investment is generally independent of either the  
23          demand level of the customers or the energy usage over time. In addition, such

---

<sup>1</sup>This level of investment is sometimes referred to as the "minimum system" or "minimum distribution system."

1 accounting functions as meter reading, bill preparation and mailing, and revenue  
2 accounting are considered customer-related costs.

3 The final step in the CCOSS is the allocation of each category of the  
4 functionalized and classified costs to the various customer classes using the  
5 cost-causation principles. Demand-related costs are allocated on the basis which  
6 gives recognition to each class's responsibility for the Company's need to build plant  
7 to serve demands imposed on the system. Energy-related costs are allocated on the  
8 basis of energy use by each customer class. Customer-related costs are allocated  
9 based upon the number of customers in each class, weighted to account for the  
10 complexity of servicing the needs of the different classes of customers.

11 **Q WHAT CUSTOMER CLASSES DID KU INCLUDE IN ITS CCOSS?**

12 A KU developed CCOSS for Residential, General Service, All Electric Schools, Power  
13 Service-Primary and Secondary, Time of Day-Primary and Secondary, Retail  
14 Transmission Service, Fluctuating Load Service and Lighting. These classes conform  
15 to KU's current electric tariffs. The test year that was used for the CCOSS was the  
16 12-month period ending October 31, 2009.

17 **KU's Class Cost of Service Study and Results**

18 **Q PLEASE COMMENT ON KU'S CCOSS.**

19 A Yes. KU's witness Steven Seelye performed a cost of service study utilizing a  
20 modified BIP methodology. Under this methodology, production and transmission  
21 demand related costs were assigned to three categories of "capacity" – base,  
22 intermediate and peak. These three categories of demand related costs are allocated  
23 to the various rate classes using different allocation factors.

1 Q UNDER THE BIP METHODOLOGY, ARE ALL DEMAND-RELATED PRODUCTION  
2 AND TRANSMISSION COSTS ALLOCATED BASED ON DEMANDS?

3 A No. Under the BIP methodology, the base load costs are allocated to the various rate  
4 classes based on average demand or energy. However, the intermediate and peak  
5 demand related or fixed production and transmission costs are allocated using the  
6 winter and summer demands, respectively. As a result, approximately 35% of the  
7 production and transmission fixed costs are allocated to the various rate classes  
8 based on energy rather than peak demands.

9 Q BEFORE YOU DISCUSS THE BIP METHODOLOGY, HAVE YOU PREPARED AN  
10 EXHIBIT THAT SHOWS THE RESULTS OF KU'S CCROSS?

11 A Yes. Selecky Exhibit 1 shows the results of KU's cost of service study under present  
12 rates. Selecky Exhibit 1 shows the rate of return, index of return, the revenue  
13 under-collection and over-collection and the percent increase needed to bring rates  
14 to cost of service for each rate class. A revenue under-collection means a class is  
15 providing revenues below its cost of service. For each rate class, a revenue  
16 over-collection means that a class is providing revenues in excess of its cost of  
17 service.

18 The results of KU's CCROSS show that the Residential-Rate RS and the All  
19 Electric Schools-Rate AES are providing revenues insufficient to meet their cost to  
20 serve. Those two rate classes would need rate increases of 17.5% and 18.8% to  
21 bring their rates to cost of service under the BIP methodology. All other rate classes  
22 are paying rates that exceed their cost of service.

1 **Q DO YOU SUPPORT THE USE OF THE BIP METHOD FOR ALLOCATING FIXED**  
2 **AND/OR DEMAND RELATED PRODUCTION AND TRANSMISSION COSTS?**

3 A No. Generally, those who endorse the methodology similar to the BIP argue that it  
4 reflects resources planning because it accounts for both coincident peak and average  
5 demand. Typically, the reasons for using this type of method is because this method  
6 assumes that the electric utility will invest in more expensive types of generation  
7 capacity solely because of more fuel cost associated with that capacity. As a result,  
8 this assumes a substitution of capital investment for fuel costs.

9 **Q WHAT ARE THE FLAWS WITH THE BIP METHOD?**

10 A The basic flaws with utilizing the BIP method are:

- 11 1. Energy consumption or average demand is double counted in the allocation  
12 process.
- 13 2. The BIP method, which is used as capital substitution, fails to approximately  
14 recognize the tradeoffs between capital and operating costs. This is some times  
15 referred to as fuel symmetry problem.
- 16 3. The BIP method is an over-simplification of the utility planning process.

17 **Q WHY DO YOU SAY THAT THE BIP METHOD DOUBLE COUNTS AVERAGE**  
18 **DEMAND OR ENERGY?**

19 A Double counting occurs because the average demand, which is equivalent to the  
20 year-round energy consumption divided by 8,760 hours, is also a component of the  
21 coincident peak demand. By allocating some capital costs relative to average  
22 demand, and some relative to coincident peak demand, energy is counted  
23 twice – once by itself and the second time as a subset of the coincident peak. If the  
24 year-round energy is analogous to base load units, which supply capacity on a  
25 continuing basis throughout the year, then it follows that the only time when

1 intermediate and peaking units would be needed to meet the system demands are  
2 when they are in excess of the average year demand. The BIP method improperly  
3 allocates the cost of this additional capacity relative to the total coincident demand,  
4 rather than the excess demand.

5 **Q TURNING TO YOUR SECOND CRITICISM, HOW DOES THE BIP METHOD, AS A**  
6 **CAPITAL SUBSTITUTION METHOD, FAIL TO PROVIDE A SYMMETRICAL**  
7 **ALLOCATION OF BOTH CAPITAL AND OPERATING COSTS?**

8 A The BIP method focuses on the allocation of fixed production costs. For example, the  
9 BIP method allocates more production plant to high load factor classes than the  
10 coincident peak method. This method will be discussed later in my testimony.  
11 Allocating fixed production costs on average demand or energy is claimed to be fair  
12 by proponents of these allocation methodologies because high load factor customers  
13 require more base load capacity and because the capital cost of base load units  
14 tends to be higher than peaking plants. However, the BIP method, as applied, makes  
15 no attempt to recognize the other side of the capital cost/operating cost trade-off.  
16 Base load plants may have above average capital costs, but they also have below  
17 average operating costs relative to peaking units. To ignore the fuel cost differential  
18 creates a mismatch between the theory and application. If system planning principles  
19 are to be applied in determining the allocation of production plant, it is also logical and  
20 consistent to apply the same principles to the allocation of fuel expense.

1 Q DO UTILITY PLANNERS CONSTRUCT MORE CAPITAL-INTENSIVE CAPACITY  
2 FOR THE SOLE PURPOSE OF REDUCING FUEL COSTS?

3 A No. This belief is based on an oversimplification of the planning process. In reality,  
4 planners are faced with the decision of providing reliable service and minimizing total  
5 costs.

6 Utilities are required to minimize costs (i.e., provide service at the lowest  
7 overall cost). The utility strives to install a mix of generating capacity that, along with  
8 its existing generation, yields the lowest total cost. In other words, the economic  
9 choice between a base load plant and a peaking plant must consider both capital  
10 costs and operating costs.

11 The utility's investment decisions can also be affected by existing generation  
12 mix, the availability of a suitable site for the plant, environmental restrictions and fuel  
13 diversification, just to mention a few factors.

14 Q IS THE BIP METHOD APPROPRIATE FOR ALLOCATING PRODUCTION AND  
15 TRANSMISSION COSTS?

16 A No. It is inappropriate for allocating fixed production and transmission cost for the  
17 reasons I have previously stated.

18 **Alternative Allocation Methods For**  
19 **Production and Transmission Fixed Costs**

20 Q WHAT METHOD WOULD BE MORE APPROPRIATE THAN BIP FOR  
21 ALLOCATING MP'S PRODUCTION AND TRANSMISSION COSTS?

22 A I believe that the coincident peak method best reflects cost-causation principles.

1 Q PLEASE DESCRIBE THE COINCIDENT PEAK METHOD.

2 A The coincident peak method uses each customer class's coincident peak (the peak  
3 for each class at the time of the system peak) demand to allocate the fixed costs of  
4 production and transmission.

5 Q WHY DO YOU BELIEVE THE COINCIDENT PEAK METHOD IS APPROPRIATE  
6 FOR ALLOCATING PRODUCTION AND TRANSMISSION COSTS?

7 A The method used to allocate production and transmission costs should be consistent  
8 with the principles of cost-causation. The allocation method should reflect the  
9 contribution of each customer class to the demands that cause utilities to incur  
10 demand-related or capacity-related costs.

11 Q WHEN UTILIZING A COINCIDENT PEAK DEMAND, WHAT FACTORS SHOULD  
12 BE CONSIDERED IN ALLOCATING THE PRODUCTION AND TRANSMISSION  
13 COSTS?

14 A The selection of the coincident peak allocation factor should properly reflect the  
15 operating characteristics of the loads that are served by the utility. For example, if a  
16 utility has a substantially higher summer peak relative to the demands during the  
17 other times during the year, then the production and transmission fixed cost should  
18 be allocated based on each customer's contribution to the summer peak. On the  
19 other hand, if a utility has predominant peaks in both the summer and winter months,  
20 then the allocation of the production and transmission fixed cost should be based on  
21 both the summer and winter peak periods.

1 Q EARLIER IN YOUR TESTIMONY, YOU DISCUSSED ALLOCATING FIXED  
2 PRODUCTION AND TRANSMISSION COST ON USING A COINCIDENT PEAK  
3 METHODOLOGY. HAVE YOU PERFORMED A COST STUDY UTILIZING THIS  
4 METHODOLOGY?

5 A No. As shown on Selecky Exhibit 1, the current BIP methodology shows that the  
6 Residential and All Electric Schools rate classes are already significantly below cost  
7 of service. Since the BIP method generally provides more favorable allocation to  
8 lower load factor customers utilizing a coincident peak method would only farther  
9 increase the under-collection from the Residential class. Therefore, I recommend for  
10 purposes of this case that the Commission utilize the results of the Company's cost of  
11 service to allocate any revenue requirement increase.

12 **Revenue Allocation**

13 Q HAS KU ALLOCATED THE INCREASE IN THIS CASE RECOGNIZING THE  
14 RESULTS OF THEIR COST OF SERVICE STUDY?

15 A Yes, to some extent, KU's proposed revenue allocation does recognize the results of  
16 KU's cost of service study. However, the revenue allocation that is proposed still  
17 results in the Residential and All Electric Schools rate classes providing revenues  
18 significantly below their cost to serve.

19 Q HAVE YOU PREPARED A SCHEDULE THAT SHOWS THE RESULTS OF KU'S  
20 COST OF SERVICE STUDY AT PROPOSED RATES?

21 A Yes. Selecky Exhibit 2 shows the results of the cost of service study under KU's  
22 proposed revenue allocation. The results of this CCOSS shows that the Residential  
23 and the All Electric Schools rate classes are providing revenues insufficient to meet

1           their cost of service. In fact, those two rate classes would need rate increases of  
2           16.5% and 17.8%, respectively to bring their rates to cost of service.

3   **Q     DO YOU PROPOSE ANY ALTERNATIVE ALLOCATION?**

4   A     Although I would like to see more movement toward cost of service, I am limiting the  
5           Residential rate increase to the level proposed by KU in this proceeding. However, if  
6           the Commission authorizes an increase that is less than that level proposed by the  
7           Company, that reduction should be utilized to reduce the subsidies of those classes  
8           that are paying rates above cost of service.

9   **Q     HAVE YOU PREPARED A SCHEDULE THAT SHOWS THIS ALTERNATIVE**  
10   **ALLOCATION?**

11  A     Yes. Selecky Exhibit 3 shows alternative allocations assuming the Company receives  
12           two-third or 66.7% of its requested amount. Under this proposed allocation, 50% of  
13           the reduction from the requested amount is used to reduce the revenue increases to  
14           all classes proposed by KU. The other 50% is used to reduce the over-collection  
15           from those classes that are providing revenues in excess of their cost to serve.

16  **Q     DOES THIS CONCLUDE YOUR DIRECT TESTIMONY?**

17  A     Yes, it does.

**Qualifications of James T. Selecky**

1   **Q    PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2   A    James T. Selecky. My business address is 16690 Swingley Ridge Road, Suite 140,  
3        Chesterfield, MO 63017.

4   **Q    PLEASE STATE YOUR OCCUPATION.**

5   A    I am a consultant in the field of public utility regulation and am a principal with the firm  
6        of Brubaker & Associates, Inc. (BAI), energy, economic and regulatory consultants.

7   **Q    PLEASE STATE YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL  
8        EMPLOYMENT EXPERIENCE.**

9   A    I graduated from Oakland University in 1969 with a Bachelor of Science degree with  
10       a major in Engineering. In 1978, I received the degree of Master of Business  
11       Administration with a major in Finance from Wayne State University.

12           I was employed by The Detroit Edison Company (DECo) in April of 1969 in its  
13       Professional Development Program. My initial assignments were in the engineering  
14       and operations divisions where my responsibilities included evaluation of equipment  
15       for use on the distribution and transmission system; equipment performance testing  
16       under field and laboratory conditions; and troubleshooting and equipment testing at  
17       various power plants throughout the DECo system. I also worked on system design  
18       and planning for system expansion.

19           In May of 1975, I transferred to the Rate and Revenue Requirement area of  
20       DECo. From that time, and until my departure from DECo in June 1984, I held  
21       various positions which included economic analyst, senior financial analyst,  
22       supervisor of the Rate Research Division, supervisor of the Cost-of-Service Division

1 and director of the Revenue Requirement Department. In these positions, I was  
2 responsible for overseeing and performing economic and financial studies and book  
3 depreciation studies; developing fixed charge rates and parameters and procedures  
4 used in economic studies; providing a financial analysis consulting service to all  
5 areas of DECo; developing and designing rate structure for electrical and steam  
6 service; analyzing profitability of various classes of service and recommending  
7 changes therein; determining fuel and purchased power adjustments; and all aspects  
8 of determining revenue requirements for ratemaking purposes.

9 In June of 1984, I joined the firm of Drazen-Brubaker & Associates, Inc.  
10 (DBA). In April 1995 the firm of Brubaker & Associates, Inc. (BAI) was formed. It  
11 includes most of the former DBA principals and staff. At DBA and BAI I have testified  
12 in electric, gas and water proceedings involving almost all aspects of regulation. I  
13 have also performed economic analyses for clients related to energy cost issues.

14 In addition to our main office in St. Louis, the firm also has branch offices in  
15 Phoenix, Arizona and Corpus Christi, Texas.

16 **Q HAVE YOU PREVIOUSLY APPEARED BEFORE A REGULATORY**  
17 **COMMISSION?**

18 **A** Yes. I have testified on behalf of DECo in its steam heating and main electric cases.  
19 In these cases I have testified to rate base, income statement adjustments, changes  
20 in book depreciation rates, rate design, and interim and final revenue deficiencies.

21 In addition, I have testified before the regulatory commissions of the States of  
22 Colorado, Connecticut, Georgia, Illinois, Indiana, Iowa, Kansas, Louisiana, Maryland,  
23 Massachusetts, Minnesota, Missouri, New Hampshire, New Jersey, North Carolina,  
24 Ohio, Oklahoma, Oregon, Tennessee, Texas, Utah, Washington, Wisconsin, and

1 Wyoming, and the Provinces of Alberta, Nova Scotia and Saskatchewan. I also have  
2 testified before the Federal Energy Regulatory Commission. In addition, I have filed  
3 testimony in proceedings before the regulatory commissions in the States of Florida,  
4 Montana, New York and Pennsylvania and the Province of British Columbia. My  
5 testimony has addressed revenue requirement issues, cost of service, rate design,  
6 financial integrity, accounting-related issues, merger-related issues, and performance  
7 standards. The revenue requirement testimony has addressed book depreciation  
8 rates, decommissioning expense, O&M expense levels, and rate base adjustments  
9 for items such as plant held for future use, working capital, and post test year  
10 adjustments. In addition, I have testified on deregulation issues such as stranded  
11 cost estimates and rate design.

12 **Q ARE YOU A REGISTERED PROFESSIONAL ENGINEER?**

13 **A** Yes, I am a registered professional engineer in the State of Michigan.
