COMMENTS:

I think LG+E has to start considering energy efficiency programs on a larger scale in combination with a slow transition to renewable energy. In the LONG TERM natural gas + coal fired energy will continue to rise. I understand that on the front end, renewables have some expense but over time would be cheaper. We should be more proactive about diversifying our energy sources, not only because energy diversity is a GOOD idea but it would also create jobs. Surrounding states like Ohio, Tennessee + North Carolina have diversified their energy portfolios + have experienced job growth in the 10-20,000.

I hurt to think of KY falling behind yet again because we weren't open to exploring ALL our options. Even if you don't believe that renewables can power us completely, why the resistance to diversifying our energy sources? Especially if research shows in the long term it would be cheaper for the rate payer. Is that not what the PSC is responsible for assuring?
