# SECTION 1.0 EXECUTIVE SUMMARY

Bisnk Fago

## Section 1.0 Executive Summary

East Kentucky Power Cooperative Inc. (EKPC) is a generation and transmission electric cooperative located in Winchester, Kentucky. EKPC is owned by 16 member distribution cooperatives who serve approximately 520,000 retail meters. Member distribution cooperatives served by EKPC include:

Big Sandy RECC Jackson Energy Cooperative

Blue Grass Energy Coop. Corp. Licking Valley RECC

Clark Energy Cooperative, Inc. Nolin RECC

Cumberland Valley Electric Owen Electric Cooperative

Farmers RECC Salt River Electric Cooperative

Fleming-Mason Energy Cooperative Shelby Energy Cooperative, Inc.

Grayson RECC South Kentucky RECC

Inter-County Energy Coop. Corp. Taylor County RECC

EKPC's load forecast is prepared every two years in accordance with EKPC's Rural Utilities Service (RUS) approved Work Plan. The Work Plan details the methodology used in preparing the projections. EKPC prepares the load forecast by working jointly with each member system to prepare their load forecast. Member projections are then summed to determine EKPC's forecast for the 20-year period. Member cooperatives use their load forecasts in developing construction work plans, long range work plans, and financial forecasts. EKPC uses the load forecast in such areas as demand-side management analyses, marketing analyses, transmission planning, power supply planning, and financial forecasting.

EKPC's load forecast indicates that total energy requirements are projected to increase by 1.6 percent per year over the 2010 through 2030 period. Net winter peak demand will increase by approximately 1,000 MW, and net summer peak demand will increase by approximately 800 MW. Annual load factor projections are remaining steady at approximately 50 percent. Historical and projected total energy requirements, seasonal peak demands, and annual load factor for the EKPC system are presented in Table 1-1 (page 5). Peak demands are based on coincident hourly-integrated demand intervals. Load Factor is calculated using net peak demand and energy requirements.

Energy projections for the residential, small commercial, and large commercial classifications indicate that during the 2010 through 2030 period, sales to the residential class will increase by 1.4 percent per year, and total commercial and industrial sales will increase by 2.3 percent per year. Class sales are presented in Table 1-5. One member system serves a thin-slab steel mill. This large load is on an interruptible rate and the forecast assumes 360 hours of interruption each year.

Energy Sales and Peak Demands Growth Rates									
	2010-2015	2010-2020	2010-2030						
Total Net Energy Requirements	1.1%	1.4%	1.6%						
Residential Sales	0.7%	1.2%	1.4%						
Total Commercial and Industrial Sales (Excluding steel milll)	2.7%	2.5%	2.3%						
Net Winter Peak Demand	2.8%	2.2%	2.0%						
Net Summer Peak Demand	0.2%	0.9%	1.4%						

Factors considered in preparing the forecast include national, regional, and local economic performance, population and housing trends, service area industrial development, electric price, household income, appliance saturations and efficiencies, demand-side management programs, and weather. A demand-side impacted load forecast is presented in Table 1-1. Descriptions of the demand-side management programs are provided in Section 8 of this report.

# SECTION 2.0 LOAD FORECAST METHODOLOGY

Blank Pago

## Section 2.0 Load Forecast Methodology

#### 2.1 Coordination with Member Systems

EKPC prepares a load forecast by working jointly with its member systems in preparing their individual load forecasts. These individual forecasts are included in Appendix A. Member system projections are then summed to determine EKPC's forecast for the 20-year period. Factors considered in preparing the forecasts include national, regional, and local economic performance, appliance saturations and efficiencies, population and housing trends, service area industrial development, electric price, household income, and weather. Each member system reviews the preliminary forecast for reasonability. Final projections reflect analysis of historical data combined with the experience and judgment of the member system President/CEO and staff. In recognition of the uncertainty present in long-term forecasting, both high and low case projections are also prepared (see Section 8).

The general steps followed by EKPC in developing its load forecast are summarized as follows:

- 1. EKPC subscribes to IHS Global Insight, Inc., in order to analyze regional economic performance. IHS Global Insight provides EKPC projections for population, employment, and income as well as other variables. Details are provided in Section 4.0.
- 2. EKPC prepares a preliminary forecast for each of its member systems for each classification as reported on the Rural Utilities Services (RUS) Form 7, which contains publicly available retail sales data for member systems. These include: residential, seasonal, small commercial, public buildings, large commercial, and public street and highway lighting. EKPC's sales to member systems are then determined by adding distribution losses to total retail sales. EKPC's total requirements are estimated by adding transmission losses to total member system sales. Seasonal peak demands are determined by applying load factors for heating, cooling, and water heating to energy. The same methodology is used in developing each of the 16 member system forecasts.

- 3. EKPC meets with each member system to discuss their preliminary forecast. Member system staff at these meetings includes the President/CEO and other key individuals.
- 4. The preliminary forecast is usually revised based on mutual agreement of EKPC staff and member system's President/CEO and staff. This final forecast is approved by the board of directors of each member system.
- 5. The EKPC forecast is the summation of the forecasts of its 16 members.

There is close collaboration and coordination between EKPC and its member systems in this process. This working relationship is essential since EKPC has no retail members. Input from member systems relating to industrial development, subdivision growth, and other specific service area information is crucial to the preparation of accurate forecasts. Review meetings provide opportunities to critique the assumptions and the overall results of the preliminary forecast. The resulting load forecast reflects a combination of EKPC's structured forecast methodology tempered by the judgment and experience of the member system staff. Over the years, this forecasting process has resulted in projections useful to both EKPC and its members. Member cooperatives use their load forecast in developing two, three and four-year work plans, long-range work plans, and financial forecasts. EKPC uses the load forecast in such areas as demand-side management analyses, marketing analyses, transmission planning, resource planning, and financial forecasting.

#### 2.2 Forecast Model Summary

Models are used to develop the load forecast for each member system. A brief overview of each is given in this section. Specifics regarding the models and resulting forecasts are presented in Sections 4 through 8 of this report.

#### 2.2.1 Regional Economic Model

EKPC has divided its members' service area into seven economic regions with economic activity projected for each. Regional forecasts for population, income and employment are developed and used as inputs to residential customer and small commercial customer

and energy forecasts. Therefore, EKPC's economic assumptions regarding its load forecast are consistent.

#### 2.2.2 Residential Sales

This class of energy sales is forecasted using regression analysis. At the member system level, residential energy use per customer is projected using a statistically adjusted enduse model. Variables such as electric price, economic activity, appliance saturations and efficiencies are drivers. The number of residential customers is also projected with regression analysis using economic variables such as population. The member system results are summed to determine total residential customers and total class sales. System residential energy use per customer is calculated by dividing the forecasted number of customers into the energy sales forecast.

#### 2.2.3 Small Commercial Sales

Small commercial energy sales forecast results from regression analysis. The number of small commercial customers is forecasted by means of regression analysis on various regional economic data in addition to the resulting residential customer forecast described above. Exogenous variables include real electric price and economic activity. Energy use per customer is calculated by dividing the forecasted number of customers into the energy sales forecast.

#### 2.2.4 Large Commercial Sales

This class is projected by member systems and EKPC. Member systems project usage for existing large loads. EKPC projects new large loads based on historical development, the presence of industrial parks, and the economy of the service territory.

#### 2.2.5 Seasonal Sales

Seasonal sales are sales to customers with seasonal residences such as vacation homes and weekend retreats. Seasonal sales are relatively small and are reported by only one of EKPC's member systems.

#### 2.2.6 Public Building Sales

Public Building sales include sales to accounts such as government buildings and libraries. The sales are relatively small and are reported by only two of EKPC's member systems.

#### 2.2.7 Public Street and Highway Lighting Sales

The 'Public Street and Highway Lighting' class is relatively small and is usually projected as a function of residential sales. There are 11 member systems that report this class.

#### 2.2.8 Demand-Side Management

For over 20 years, EKPC and its 16 member systems have promoted the cost-effective use of energy by offering conservation and other marketing programs to the retail customer. These programs were designed to meet the needs of the customer, and to delay the need for additional generating capacity. EKPC considers the programs as part of its overall supply portfolio. To incorporate into the 2010 long term load forecast, a demand-side management plan was developed. The plan includes programs that are currently in existence and offered by EKPC's member systems to its customers as well as new programs.

#### 2.2.9 Peak Demand Forecast and Scenarios

Seasonal peak demands are projected using the summation of monthly energy usages and load factors for the various classes of customers. Residential energy usage components include heating, cooling, water heating, and other usage. Using load factors, demand is calculated for each component and then summed to obtain the residential portion of the seasonal peak. Small commercial and large commercial classes use load factors on the class usage to obtain the class contribution to the seasonal peak. High and low case projections have been constructed around the base case forecast. Weather, customer growth and electric price assumptions are significant inputs to the high and low cases.

### **SECTION 3.0**

### LOAD FORECAST DISCUSSION

Bleck Pego

## Section 3.0 Load Forecast Discussion

#### 3.1 Introduction

Key assumptions and trends used in the preparation of the load forecast are described in this section along with a discussion of the EKPC service area. Projected peak demand, annual energy requirements, and growth rates are summarized. Differences between the 2008 and 2010 load forecasts are discussed.

#### 3.2 Input Assumptions

Key forecast assumptions used in developing the EKPC and member system load forecasts are:

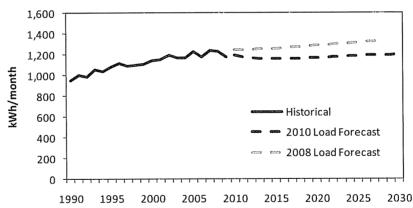

- 1. Regional population projections are based upon forecasts provided by IHS Global Insight.
- 2. EKPC's member systems will add approximately 153,000 residential accounts by 2030. This represents an increase of 1.4 percent per year.
- 3. EKPC uses an economic model to develop its load forecast. The model uses data for 87 Kentucky counties in seven geographic regions. The economy of these counties will experience modest growth over the next 20 years. The average unemployment rate rose to over 11 percent during 2010 and projections indicate it may take 10 years to recover to pre-recession levels. Nonmanufacturing employment will rise by 390,000 jobs. Regional population will grow from approximately 3.6 million people in 2010 to 4.2 million people in 2030, an average growth of 0.8 percent per year.
- 4. From 2010 through 2030, approximately 78 percent of all new homes, those constructed within the last five years, will have electric heat. Eighty-seven percent of all new households will have electric water heating. Nearly all new homes will have electric air conditioning, either central or room.
- 5. Over the forecast period, naturally occurring appliance efficiency improvements will decrease residential retail sales. In addition to lighting, appliances particularly affected are heating, cooling and water heating.

- 6. Residential customer growth and local area economic activity will be the major determinants of small commercial growth.
- 7. Forecasted load growth is based on the assumption of normal weather, as defined by the National Oceanic and Atmospheric Administration, occurring over the next 20 years. Seven different stations are used depending on geographic location of the member system.

#### 3.3 Discussion of Service Area

In EKPC's service area, electricity is the primary method for water heating and home heating. Around 87 percent of all homes have electric water heating, and about 60 percent have electric heat. In 2009, 59 percent of EKPC's member retail sales were to the residential class and residential customer use averaged 1,178 kWh per month. As shown in Figure 3-1, appliance efficiency improvements, the economy, and the increasing electricity prices in the forecast period are having a negative impact on future use per customer.

Figure 3-1
Historical Load Forecast Studies
Average Monthly Use Per Residential Customer

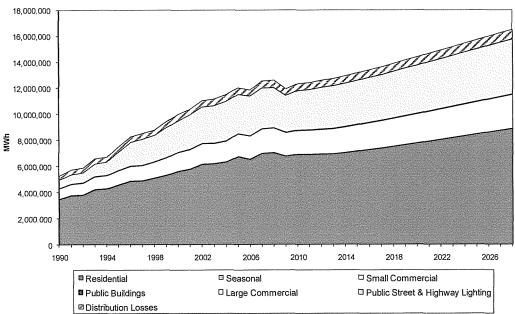

While EKPC's load is primarily residential in nature, Figure 3-2 illustrates that commercial/industrial customers make up an increasingly larger share of total retail sales.

Figure 3-2

EKPC 2010 Load Forecast

Allocation of Total Sales to Members

The economy of EKPC's service area is quite varied. Areas around Lexington and Louisville have a significant amount of manufacturing industry, although that has declined in recent years due to the recession. The region around Cincinnati contains a growing number of retail trade and service jobs while the eastern and southeastern portions of EKPC's service area are dominated by the mining industry. Tourism is an important aspect of EKPC's southern and southwestern service area, with Lake Cumberland and Mammoth Cave National Park contributing to jobs in the service and retail trade industries. This area has also suffered during the recession.

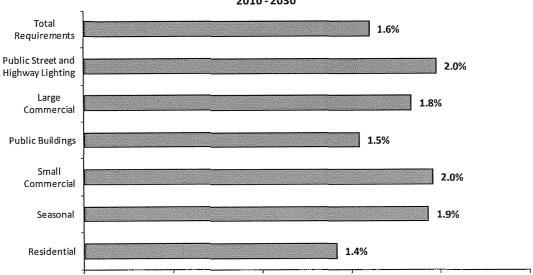

#### 3.4 Summary of Results

The forecast indicates that for the period 2010 through 2030, total energy requirements will increase by 1.6 percent per year. Winter and summer net peak demand will increase by 2.0 percent and 1.4 percent, respectively. Annual load factor is projected to remain relatively flat at around 50 percent. Sales to the residential class are projected to increase by 1.4 percent per year, total commercial sales are projected to increase by 2.3 percent per year. Table 3-1 summarizes demand and total requirements. Figure 3-3 summarizes class growth rates.

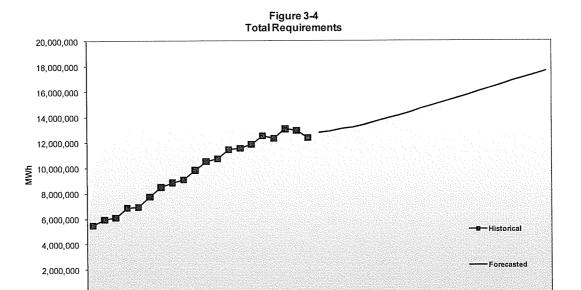

Table 3-1
Projected Energy and Peak Demand Growth
Compound Annual Rates of Change

	Histor	ical Growth	Rates	2010 Forecast Growth Rates			
	2004-2009	1999-2009	1989-2009	2010-2015	2010-2020	2010-2030

Net Summer							
Peak Demand	1.3%	1.8%	3.7%	0.2%	0.9%	1.4%	

Figure 3-3 Average Annual Growth in Sales 2010 - 2030

The resulting load forecast is for annual energy requirements to increase from 12,781,011 MWh in 2010 to 17,464,640 MWh in 2030. Annual net winter peak demand increases from 3,006 MW to 4,053 MW for the forecast period. Figures 3-4, 3-5, and 3-6 illustrate actual and projected total energy requirements, seasonal peak demands, and annual load factor for the years 1990 through 2030.

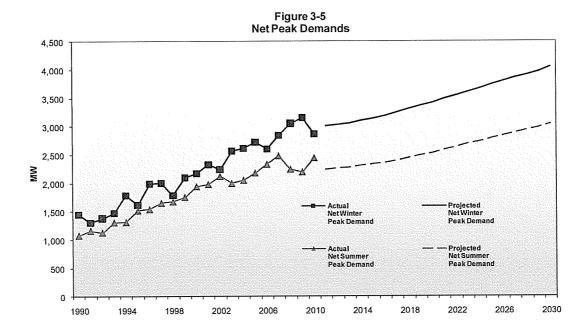

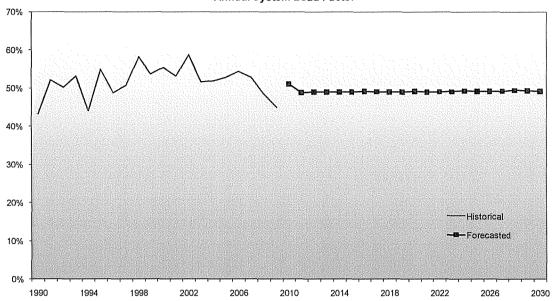

Figure 3-6 Annual System Load Factor

Customer class growth rates, 5, 10, and 20-year average annual energy growth rates, are reported in Tables 3-2, 3-3 and 3-4. Forecasted monthly sales for the first two years of the forecast are presented by class in Table 3-5. Figure 3-7 reports the growth in the winter peak for each member system.

#### 3.5 Major Differences Between EKPC's 2010 and 2008 Load Forecasts

The significant changes include the following:

- 1.) Economy: EKPC purchases county level projections of economic and demographic variables from IHS Global Insight, a consulting firm with expertise in economic modeling. In 2007, when the 2008 forecast was developed, the majority of the member systems had begun to see declines in housing starts and development in their service. The 2010 load forecast does have the full impacts of the recession. Most notably, unemployment reached an all time high and is not expected to reach prerecession levels for nearly 10 years. Related, personal income levels are also projected to be lower than the previous assumptions. Therefore, the 20 year projections developed in 2010 for customer growth and energy usage are lower than those in 2008. Lastly, the automotive industry experienced sharp declines in response to (1) the national economic downturn and (2) in Kentucky due to various Toyota recalls which resulted in lower sales and interruptions in manufacturing the automobiles. EKPC member systems' serve many satellite industrial and commercial customers that produce parts for Toyota, and as a result of the aforementioned circumstances, were negatively impacted.
- 2.) Price: The load forecast does incorporate future electricity prices and customers response to fluctuations in price. The forecast uses the most recent Board approved Twenty-year Financial Forecast. The 2010 long term projections are significantly higher than the ones used in the 2008. These increases are due to costs to build a scrubber on Cooper 2, assumptions about future environmental issues such as carbon legislation, and future supply resources.
- 3.) EKPC attains data regarding future appliance efficiency improvements from the Department of Energy (DOE) Energy Information Administration (EIA). According to the 2009 update, there are more improvements in HVAC and water heating than previously assumed. These efficiency improvements will result in lower sales as consumers replace older less efficient appliances with newer ones. This impact will occur gradually over time. In addition, there are new lighting standards to take effect in 2012.
- 4.) The 2008 and 2010 load forecasts do incorporate the impacts of a direct load control program that began implementation in 2008. The program is a voluntary

program whereby customers agree to have their water heater(s) and/or air conditioner(s) controlled during peak hours. The goal is to clip 15 MW off the winter peak and 60 MW off the summer peak.

# SECTION 4.0 REGIONAL ECONOMIC MODEL

Islank Pego

## Section 4.0 Regional Economic Model

Part of EKPC's load forecast methodology includes regional economic modeling. EKPC subscribes to IHS Global Insight, Inc., for analysis regarding regional economic performance. IHS Global Insight, Inc., is a widely used consulting firm with expertise in economic analyses. They collect and monitor data, provide forecasts and analyses, and offer consulting advice to clients in business, financial, and government organizations. IHS Global Insight collects historical Kentucky county level data for many economic variables, develops forecasting models based on the data, and provides the resulting forecasts to EKPC. Consistent regional forecasts are developed. County level historical and projected data provided to EKPC include:

- > Employment (NAICS)
  - Total Non-farm, Non-Manufacturing, Service Providing Private, Construction, Natural Resources and Mining, Manufacturing, Transportation, Trade & Utilities, Information, Financial Activities, Professional & Business Services, Educational & Health Services, Leisure & Hospitality, Other Services, Government, Federal Government, State & Local Government, Military
- > Unemployment Rate
- > Labor Force
- > Personal Income
- > Wage Disbursements, Total Non-farm
- > Non-wage Income
- > Average Annual Wage, Non-Farm Employment
- > Per Capita Personal Income
- > Average Household Income
- > Real Personal Income
- > Real Wage Disbursements, Total Non-farm
- > Real Non-wage Income
- > Real Per Capita Personal Income
- > Population, Total and By Age Group
- > Heads of Households, Total and By Age Group

These county level projections are combined into regional economic activity. EKPC converts IHS Global Insight's quarterly county-level projections to monthly values to use in the load forecasting models.

EKPC has divided its members' service areas into seven economic regions based on the member system service territorial boundaries. Some natural regions exist within the EKPC territory. For example, the Central Economic Region defined by EKPC fits closely within the Lexington Standard Metropolitan Statistical Area ("SMSA"). The BEA defines SMSA's as areas of interrelated economic activity that go beyond a single county's boundaries. The Northern Region includes Kentucky counties that border Cincinnati. A list of regions and counties that impact the service area is provided in Table 4-1.

						Whitley
	E					Wolfe

Economic models for these seven economic regions provide EKPC with a way of linking the electricity needs of a service area to the rest of the service area's economy in a consistent and reasonable manner. Projections of regional economic activity enhance the sales forecasting and strategic planning of EKPC because changes in regional employment and income are important

determinants of customer and sales growth. Tables 4-3 through 4-9 on pages 42 through 48 report regional economic summaries.

#### Overview of Key Variables

Changes in regional employment and income are important determinants of customer and sales growth. Population forecasts, shown in Table 4-2, are used to project residential class customers; regional household income is used to project residential sales; and regional economic activity is used to project small commercial sales. The spreadsheets with the county level data from IHS Global Insight are provided in Appendix B.

Table 4-2 Key Load Forecast Variables Annual Average Growth Rate

Year	1990-2000	2000-2010	2010-2020	2020-2030
Population	1.0%	0.8%	0.8%	0.6%
Nonfarm Employment	2.2%	-0.3%	1.5%	0.8%
Real Personal Income Per Capita	2.1%	-0.1%	2.2%	2.0%

An important variable that impacts the load forecast is regional population. Historical population grew rapidly during the seventies and slowed during the second half of the eighties. The growth increased during the late nineties and early two-thousands and presently, has slowed down. Given the decline the economy is currently exhibiting, population growth is expected to be low for the next several years.

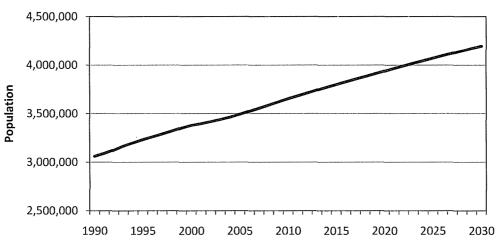

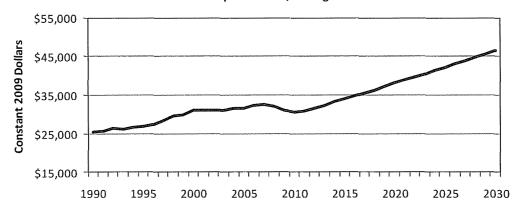

Figure 4-2 illustrates the cyclical nature of income growth, and the sensitivity to the national economy exhibited by EKPC's service area. Whenever employment levels decrease or wage levels fall, personal income will be adversely affected. EKPC's forecast of total regional income is for moderate but steady growth. This variable is important to the load forecast because of its strong effect on appliance purchases and electric usage. Per Capita Income (PCY) is defined as personal income divided by total population. In 2009, regional PCY was \$31,000. EKPC projects this to increase to \$47,000 in 2009 constant dollars by 2030.

Figure 4-2
Real Per Capita Income, All Regions

Total regional employment is tied closely to the national economy. The early eighties was a period of depressed job growth. From the mid 80s to the early 2000s, however, total employment grew strongly. During the recent economic downturn, employment fell. The unemployment rate reached an all time high, however, it is expected to recover slowly over the next decade.

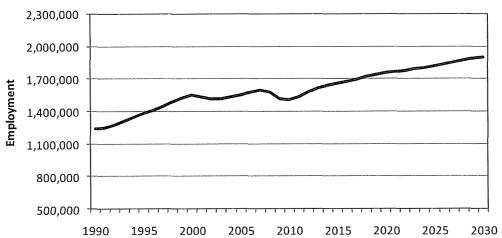

Figure 4-4 shows historical and projected households. As is shown, household growth did flatten during the recent recession but it is expected to grow moderately over the 20 year forecast period.

# SECTION 5.0 RESIDENTIAL CUSTOMER FORECAST

Blank Page

## Section 5.0 Residential Customer Forecast

#### 5.1 Introduction

Nearly 60 percent of EKPC's member system retail sales are to the residential class, therefore, the forecast of residential customers has a large impact on the overall load forecast. It is developed as follows:

- 1. Forecasts of regional households are prepared by modeling population growth and changes in household size.
- 2. Within each geographic region, there are many electric utilities that serve those customers. The portion of those customers that the member system serves is modeled in a 'share' variable. Historical values of share are calculated from data provided by the member systems. Forecasts of share are made based on historical trends and knowledge about service area development.
- 3. The regional population and household variables are combined with the share variable to represent the growth for a specific member system instead of the entire economic region.

Population Share = (Regional Population \* Share)

Regional Households =  $\frac{\text{Regional Population}}{\text{People Per Household}}$ 

Household Share = (Regional Households \* Share)

These variables are used in a regression equation to produce a forecast of residential customers for each member system. Other economic variables from EKPC's Regional Economic Model, such as total employment, or household income, may be used in the equations where appropriate.

4. The variables in the previous equations and their sources are listed below:

Variable	Historical Source	Forecast Source
Population	IHS Global Insight, Inc.	IHS Global Insight, Inc.
Household Size	IHS Global Insight, Inc., EKPC Appliance Saturation Surveys	IHS Global Insight, Inc., EKPC End-Use Surveys
Share-The percent of regional households served by Member Systems	RUS Form 7	Trend Growth

5. The EKPC system residential customer forecast is the summation of the 16 member system forecasts.

#### 5.2 Residential Customer Forecast Results

The average number of residential customers served by EKPC is expected to increase from a total of approximately 480,000 in 2009 to 636,000 in 2030. Population growth is projected to increase at lower levels than historical trends. Overall customer changes are projected to grow at slower rates in the future. A summary of the system residential customer projections is shown in Figure 5-1 and Table 5-1. Individual member system customer forecasts are reported in Appendix A. Model specifics are provided in Appendix B.

**Residential Accounts Historical and Forecasted Number of Residential Accounts** 700,000 600,000 500,000 400,000 300,000 Historical 200,000 Forecasted 100,000 1990 1995 2000 2005 2010 2015 2020 2025 2030

## SECTION 6.0 RESIDENTIAL SALES FORECAST

Blank Page

## Section 6.0 Residential Sales Forecast

#### 6.1 Methodology

EKPC uses statistically adjusted end-use (SAE) models to forecast residential sales. This method of modeling incorporates end-use forecasts and is used to separate the monthly and annual forecasts into end-use components. SAE models offer the structure of end-use models while also using the strength of time-series analysis.

This method, like end-use modeling, requires detailed information about appliance saturation, appliance use, appliance efficiencies, household characteristics, weather characteristics, and demographic and economic data. The SAE approach segments the average household use into end-use components as follows:

Each component is defined in terms of its end-use structure. For example, the cool index may be defined as a function of appliance saturation, efficiency of the appliance, and usage of the appliance. Annual end-use indices and a usage variable are constructed and used to develop a variable to be used in least squares regression in the model. These variables are constructed for heating, cooling, water heating, and an 'Other' variable, which includes lighting and other miscellaneous usages.

$$Cool_{y,m} = CoolIndex_y * CoolUse_{y,m}$$

The Cool, Heat, Water Heat, and Other variables are then used in a least squares regression which results in estimates for annual and monthly use per household.

#### Features of EKPC's SAE model are as follows:

- 1. Over twenty years of End-use Survey historical data are used to forecast saturation of appliances.
- 2. Appliance efficiencies due to government standards have been accounted for in the model. Indices pertaining to appliance efficiency trends and usage are used to construct energy models based on heating, cooling, water heating and other energy for the residential class. Source: Energy Information Administration Annual Energy Outlook, East South Central region representing Kentucky.
- 3. Various demographic and socioeconomic factors that affect appliance choice and appliance use are present in the methodology. These include the changing shares of urban and rural customers relative to total customers, number of people living in the household, as well as square footage of the house and the thermal integrity of the house.
- 4. Future electricity rates are based upon EKPC's 20 year financial forecast.

Model details of residential sales are provided in Table 6-1. Details by member system are provided in Appendix B.

Table 6-1
Residential Sales Forecast - Appliance Usage Projections

Dependent '	Variable: Appliance Usage
Model Inputs	Source
Residential Customers	Historical customers are taken from Form 7. Future customers are projected by EKPC and member systems.
Average Real Price of Electricity	Historical price is taken from Form 7. Future prices are projected by EKPC's Pricing Department and member systems.
Appliance Efficiency Improvements and Appliance Lifetimes	Energy Information Administration Annual Energy Outlook
Household Size (People Per Household)	IHS Global Insight, Inc., Trend Growth, EKPC End-Use Survey
Real Household Income	EKPC Regional Economic Model

#### 6.2 Appliance Saturation Projections

Every two years since 1981, EKPC has surveyed the member systems' residential customers. The most recent survey was conducted in 2009. EKPC gathers appliance, insulation, heating and cooling, economic, and demographic data. Appliance holdings of survey respondents are analyzed in order to better understand their electricity consumption and to project future appliance saturations.

EKPC's analysis and forecast of appliance saturations and appliance usage is econometric in nature. The decision made by customers to purchase an appliance can often be understood by examining customer income levels, fuel price, and household characteristics. The choice to purchase an appliance is modeled separately from the decision to use the appliance. This is because these actions are separate and subject to different driving forces.

Residential appliance saturation projections are shown in Table 6-2.

Table 6-2

#### 6.3 Residential Class Sales Forecast Results

Sales to the Residential Class are expected to grow 1.4% over the next 20 years. Electric use per customer is decreasing. Due to the economic decline, increasing appliance efficiencies, and rising electricity prices, the projection is more modest than in the 2008 forecast as is shown in Figure 6-1.

Figure 6-1
Historical Load Forecast Studies
Average Monthly Use Per Residential Customer

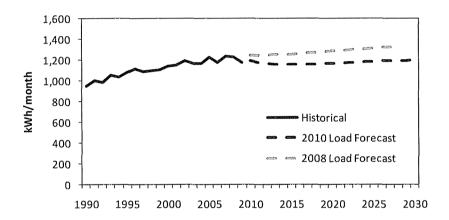

Table 6-3 reports historical and projected use per customer and class sales.

### **SECTION 7.0**

## COMMERCIAL AND OTHER SALES FORECAST

Blank Pago

## Section 7.0 Commercial and Other Sales Forecast

The small and commercial classes have been significantly impacted by the recent economic downturn. This is reflected in the last two years of actual data as well as the forecast years. The 2010 load forecast does reflect the full impact of the recession. Most notably, unemployment reached an all time high and is not expected to reach prerecession levels for nearly 10 years. The automotive industry experienced sharp declines in response to the national economic downturn and in Kentucky due to various Toyota recalls which resulted in lower sales and interruptions in manufacturing the automobiles. EKPC member systems' serve many of the satellite industrial and commercial customers that produce parts for Toyota and as a result of the aforementioned circumstances were negatively impacted.

#### 7.1 Small Commercial Sales Forecast

Member system cooperatives classify commercial and industrial accounts into two groups. Customers whose annual peak demand is less than 1 MW are classified as small commercial customers and customers whose annual peak demand is greater than or equal to 1 MW are classified as large commercial/industrial customers. Most commercial customers are accounted for in the small commercial classification. In 2009, there were more than 32,000 small commercial customers on the system. Customers are projected to grow to approximately 44,000 by 2030.

EKPC projects class sales by member system through regression analysis of historical data. Typical regressions include small commercial customers as a function of residential customers, unemployment rate, and other economic variables. The sales regression usually includes customers, electric price, and other economic measures as explanatory variables. Historical and projected small commercial sales for EKPC are reported in Table 7-1. Member system regression equations are in Appendix B.

#### 7.2 Large Commercial Sales Forecast

In 2009, there were 138 retail customers classified as large commercial customers. The total annual usage was greater than the annual usage of the small commercial class. This class experienced substantial growth from 1995 to 2004; however for the last two years, sales have

declined due to the conditions noted above. Approximately half of EKPC's large commercial customers are manufacturing plants.

The Large Commercial Class is forecasted using input from member systems as well as a modeling approach. New industrial customers that member systems expect in the next few years are explicitly input into the models. To estimate total new large loads at the system level, a regression approach is used. A probabilistic model is then used to distribute these customers among the 16 member systems. A prototype load of 1.5 MW and 60% load factor is assumed for these new loads. This methodology for forecasting new large commercial customers and energy provides a robust and defensible projection at the member system level as well as the system level. Table 7-2 reports historical and projected large commercial customers and sales. Member systems are in regular contact with large commercial customers in order to remain current with production and facility expansion plans. Member systems communicate with local industrial development groups, which keeps them aware of the status of new large commercial customers. EKPC's members are working hard to contribute to local efforts to attract industry.

One member system serves a thin-slab steel mill. This large load is on an interruptible rate and the forecast assumes 360 hours of interruption each year.

#### 7.3 Seasonal Sales Forecast

Seasonal sales are sales to customers with seasonal residences such as vacation and weekend homes. Seasonal sales are relatively small and are reported by only one of EKPC's member systems. Table 7-3 reports historical and projected seasonal sales.

#### 7.4 Public Building Sales Forecast

Public Building sales include sales to accounts such as government buildings and libraries. The sales are relatively small and are reported by only two of EKPC's member systems. Table 7-4 reports historical and projected public building sales for EKPC.

#### 7.5 Public Street and Highway Lighting Sales Forecast

Public Street and Highway Lighting sales refer mainly to street lighting. Table 7-5 reports historical and projected retail sales for this class. This class is reported by 11 member systems.

# SECTION 8.0 PEAK DEMAND FORECAST & SCENARIOS

Black Fags

# Section 8.0 Peak Demand Forecast & Scenarios

#### 8.1 Methodology

EKPC uses Metrix products for forecasting. The following illustrates the process flow:

Individual member system forecasts are summed to create an EKPC system forecast. Class energies, as well as winter and summer peak demands, are summed. This is used to create an hourly load model for each of the forecast years. The system load shape is determined from historical load data. This hourly load forecast is then calibrated to the seasonal peak demands and annual energy forecasts to build the hourly load forecast for the EKPC system. The software used is Metrix LT from ITRON.

The data used to forecast seasonal peak demands include:

- 1. Residential contributions are based on seasonal energy usages for: water heating, air conditioning, heating, and the residual load. Load factors are applied and peak demands are summed to build the class seasonal peak.
- 2. Small and Large Commercial contributions are based on aggregate class peaks.
- 3. Normal weather is used for the forecast years.
- 4. Transmission and distribution losses are accounted for in the model. Table 8-1 shows the historical transmission line losses on the seasonal peak days.

Weather Normalized Coincident Peak Demands

#### 8.3 Peak Demand and Scenario Results

In addition to the forecasted peaks, high and low cases around the base case are developed. The same methodology is used, however, the starting summary file is different. Instead of using the sum of the member system files, two new models are built: one reflecting assumptions that result in high usage and one with assumptions that result in low usage. The assumptions that are varied include:

- 1. Weather: based on historical heating and cooling degree day data, alternate weather projections were developed based upon the 90<sup>th</sup> and 10<sup>th</sup> percentile to reflect extreme and mild weather, respectively. The resulting forecasts reflect cases assuming base case HDD +/-12% and CDD +/-20%.
- 2. Electric price: The general approach is to use price forecasts that are available and use the growth rates from those forecasts to prepare the high and low growth rates around the growth patterns for the base case residential price forecast. The growth rate for the electricity rate was estimated by relying on high and low case forecasts for the producer price index (PPI) for electricity which were developed by IHS Global Insight.

Therefore, the high scenario for the residential price forecast is constructed to have a 4.3% compound annual growth rate, while the low scenario is constructed to have a 2.7% compound annual growth rate. The adjustments to growth rate are applied to the base case on an annual basis.

3. Residential customers: In the EKPC base case load forecast for 2010 through 2030, the projected number of residential customers increases at a growth rate of 1.4%. The basic approach to preparing high and low case scenarios for the future number of residential customers is to determine the magnitude of variation in the past between long term average growth rates and higher or lower growth rates during shorter periods of time.

First, the data on the historic monthly household counts for the period from 1986 through 2009 was prepared. Next, the compound annual growth rate for households was calculated for each rolling ten year period beginning. Maximum and minimum values were determined. The highest growth was used to prepare the high case scenario, while the 10 year period that experienced the lowest growth was used to prepare the low case scenario.

These resulting adjustments were applied to the 20 year compound annual growth rate in the base case customer count forecast (that value is 1.4%) to produce the high case (1.9%) and low case (0.9%) compound annual growth rate forecast scenarios. This relationship was preserved in preparing the monthly customer counts for the high and low case scenarios.

Small and Large Commercial customer and energy - Small commercial 4. customer growth is correlated to residential customer growth and the relationship was maintained when developing the high and low cases. Therefore, based upon the resulting high and low residential customer forecasts, the small commercial customers were impacted accordingly. For the large class, given year to year customer change is small, the low case was based upon no new customers for the forecast period. The high case was based on the residential growth. For energy, small and large commercial usage is not as weather sensitive as residential usage, however, price does impact usage. Therefore, the low case assumes the higher prices while the high case assumes the lower prices. Additionally, given the steel mill, which is a non-weather sensitive load, is interruptible, there are no additional impacts on winter or summer peak scenarios. The low case does assume this large load is 50% of the base case assumption to illustrate a poor economic condition assumption.

Adjusting these assumptions leads to different customer forecasts which in turn results in different energy forecasts. The results are shown in Table 8-3 and Figures 8-2 through 8-4 for the following cases:

Low Case - Pessimistic economic assumptions with mild weather causing lower loads

Base Case - Most probable economics assumptions with normal weather (Base Case pre DSM)

High Case - Optimistic economic assumptions with severe weather causing higher loads.

Additionally, a DSM Case was developed based upon most probable economic assumptions with demand and energy decreased due to demand-side management programs. Details are given beginning on page 85.

Table 8-3
Scenarios

# **Peak Demands and Total Requirements**

#### **Demand-Side Management Case**

For over 20 years, EKPC and its 16 member systems have promoted the cost-effective use of energy by offering conservation and other marketing programs to the retail customer. These programs were designed to meet the needs of the customer, and to delay the need for additional generating capacity.

These programs are implemented and administered by the member distribution systems. EKPC supports the member systems with analysis, promotional material, incentives, and other services. EKPC considers the programs as part of its overall supply portfolio, with the understanding that the programs benefit EKPC indirectly, through its member systems.

To incorporate into the 2010 long term load forecast, a demand side management plan was developed. The plan includes programs that are currently in existence and offered by EKPC's member systems to its customers as well as new programs.

#### Existing programs include:

- Electric Thermal Storage Incentive Program
- Tune-Up HVAC Maintenance Program
- Button-up Weatherization Program
- Touchstone Energy Home Program
- Touchstone Energy Manufactured Home Program
- Compact Fluorescent Lighting Program
- Commercial Advanced Lighting
- Interruptible rates for industrial customers

#### New Programs include:

- Button-up Weatherization with Air Sealing Program
- Air Source Heat Pump replacing resistance heat
- Dual Fuel
- Industrial Compressed Air
- Direct Load Control of Air Conditioners and Water Heaters

Estimated demand and energy impacts are shown in Table 8-4, Figures 8-5 and 8-6. Descriptions of the programs are shown on the following pages.

## **Program Descriptions**

- Electric Thermal Storage Incentive Program: Provides retail members with a cost-efficient means of using electricity for space heating. A discounted rate for ETS energy encourages retail members to use electricity for heating during off peak hours. This improves the utility's load factor, reduces energy costs for the retail member, and delays the need for new peak load capacity expenses.
- Tune-Up HVAC Maintenance Program: This program offers cleaning indoor and outdoor heat exchanger coils, checking filters, measuring the temperature differential across the indoor coil to determine proper compressor operation, checking the thermostat to verify operation and proper staging, measuring air flow to ensure proper conditioned air distribution, sealing the ductwork, either through traditional mastic sealers or with the Aeroseal duct-sealing program. Duct losses are to be reduced to 10% or less.
- Button-Up Weatherization Program / Button-Up Weatherization with Air Sealing Program: The program requires the installation of insulation materials or the use of other weatherization techniques to reduce heat loss in the home. Any retail member who resides in a stick-built or manufactured home that is at least two years old and uses electricity as the primary source for space heat is eligible. In addition to the current program, EKPC is adding an option to also seal the envelope of the home.
- Touchstone New Construction Program (Heat Pump and Geothermal): This program builds upon the existing Touchstone Energy Home program by introducing new measures and approaches. If implemented, this program would replace the existing Touchstone Energy Home program. The enhancements include thermal sealing/thermal bypass, and R-38 attic insulation. The program is designed to encourage new homes to be built to higher standards for thermal integrity and equipment efficiency, as well as to choose geothermal or an air source heat pump (SEER 13 HSPF 8.0) rather than less efficient forms of heating. The program is modeled after the ENERGY STAR for New Homes program. Homes built to Touchstone Energy Home Standards typically use 30% less energy than the same home built to typical construction standards.
- Touchstone Energy Manufactured Home: The Touchstone Energy Manufactured Home is an all-electric manufactured home that is built to Energy Star® specifications. A manufactured home that is built to these standards typically uses 30% less energy. The Touchstone Energy Home includes a sealed duct system, energy efficient double-pane windows, added insulation in the roof and wall, and an improved gasket that seals the halves of the home together.
- Compact Fluorescent Lighting Program: This program provides compact fluorescent bulbs to retail members at the annual meetings held by the distribution cooperatives every year. Each registered member receives a two-pack of compact fluorescent bulbs that replace 2 incandescent light bulbs.

- Commercial Advanced Lighting including LED Program: This program offers incentives to commercial and industrial customers to install high efficiency lamps and ballasts in their facilities. LED exit signs, T-5 fluorescent fixtures, and advanced controls are examples of eligible technologies. This program is designed as an enhanced version of the existing commercial lighting program that will replace that program when implemented.
- Interruptible Rates for Industrial Customers: Industrial customers may agree to accept a lesser rate upon agreement to allow EKPC to interrupt load during peak hours.
- Air Source Heat Pump Program (Replacing resistance heat -10 years or older): This program provides incentives for residential customers to install a high efficiency air source heat pump instead of an electric resistance furnace and/or central air conditioner in the home. The furnace must be 10 years or older to qualify for incentives.
- Dual Fuel: This program will provide incentives for residential customers to replace an existing resistance heat furnace with a combination heat pump/gas heat furnace (Dual Fuel). This program will provided added energy savings while allowing fuel switching to gas at temperatures less than 30 degrees.
- Industrial Compressed Air Program: This program is designed to reduce electricity consumption through a comprehensive approach to efficient production and delivery of compressed air in industrial facilities. The program includes (1) training of plant staff; (2) a detailed system assessment of the plant's compressed air system including written findings and recommendations, and (3) incentives for capital-intensive improvements.
- Direct Load Control of Residential Air Conditioners and Water Heaters Program: This program is currently being implemented. The objective of the program is to reduce peak demand and energy usage through the installation of load control devices on residential air conditioners and electric water heaters. Peak demand reduction is accomplished by cycling equipment on and off according to a predetermined control strategy. Central air conditioning and heat pump units are cycled on and off, while water heater loads are curtailed. Participating customers receive an annual bill credit incentive.

#### Summary

East Kentucky Power Cooperative Inc. (EKPC) is a generation and transmission electric cooperative headquartered in Winchester, Kentucky. It serves 16 member distribution cooperatives, who in 2010 served approximately 520,000 retail customers in 87 of the state's 120 counties. EKPC's all time peak demand of 3,152 MW occurred on January 16, 2009. Member distribution cooperatives currently served by EKPC are listed below:

Big Sandy RECC Jackson Energy Cooperative

Blue Grass Energy Coop. Corp. Licking Valley RECC

Clark Energy Cooperative, Inc. Nolin RECC

Cumberland Valley Electric Owen Electric Cooperative, Inc.
Farmers RECC Salt River Electric Cooperative

Fleming-Mason Energy Cooperative, Inc. Shelby Energy Cooperative, Inc.

Grayson RECC South Kentucky RECC Inter-County Energy Coop. Corp. Taylor County RECC

This report contains a description of the load forecast process that is currently followed by EKPC and its member systems. The major steps, in general, in developing the load forecasts are:

- EKPC prepares a preliminary load forecast for each member that is based on retail sales forecasts for four classes residential, small commercial, large commercial, and other. The classifications are taken from the Rural Utilities Service (RUS) Form 7, which contains retail sales data for member systems. In instances where seasonal and public authority classes are reported, these are forecasted separately. Table 1 summarizes the forecast methodology. EKPC's sales to member systems are then determined by adding distribution losses to total retail sales, and EKPC's total requirements are estimated by adding transmission losses to sales to members. Seasonal peak demands are determined by summing individual appliance and class loadshapes based on normal EKPC peak day weather.
- > EKPC meets with each member to discuss their preliminary forecast. Member system personnel present at the meetings include the President/CEO and other

key staff members. During the meeting, preliminary projections are reviewed and, if necessary, revised as mutually agreed upon. Member systems often have access to information not available to EKPC, or member systems may elect to use assumptions different from preliminary forecast assumptions.

> EKPC then compiles its forecast, which is the summation of the 16 member system forecasts.

There is close collaboration between EKPC and its members. This working relationship is vital since both EKPC and member systems have significant input into the load forecast process. Input from member systems includes industrial development, subdivision growth, and other specific service area information. The meeting also provides an opportunity for the member system to critique assumptions used and overall results of the preliminary forecast. The resulting forecasts reflect a combination of EKPC's structured forecast methodology tempered by the judgment and experience of member system staff.

Table 1
East Kentucky Power Cooperative
Forecast Model Summary

	Methodology
Residential Sales	Sales for this class are projected as the product of residential customers and residential use per customer. Residential customers are projected by means of regression analysis. Residential use per customer is projected with a statistically-adjusted end-use model.
Small Commercial Sales	Small commercial sales are analyzed and projected with regression analysis. Independent variables include real electric price, economic activity, weather, and residential customer growth. The models vary by member system.
Large Commercial Sales	Sales for this class are projected by both the member systems and EKPC. Member systems project existing large loads. EKPC projects new large loads using a probabilistic approach that is based on historical development, the presence of industrial sites, and the economy of the service territory.
Other Sales	Other sales are projected as a function of residential customers.
Peak Demand	Seasonal peak demands are projected using peak day load factors. Residential load factors are appliance specific. Small and large commercial factors are an aggregate for the class.

## **Load Forecast Coordination and Communication**

#### Coordination with Member Systems

The 17 load forecasts that are produced within the EKPC system reflect a group effort. EKPC's philosophy of developing load forecasts is that all 17 systems are interrelated. EKPC cannot make accurate energy and peak demand projections for itself without studying the 16 member systems. As a result of this interrelation, EKPC works jointly with members to prepare load forecasts.

#### Communication with Member Systems

EKPC personnel are in constant contact with member system personnel relating to the load forecast. There is a meeting between EKPC and member systems to discuss the load forecast in order to arrive at a final set of projections. EKPC communicates with members regarding end-use surveys, substation information, billing information, demand-side management programs, marketing programs, and other miscellaneous data. Member systems communicate with EKPC regarding sensitivity analyses, substation load projections, potential industrial loads, end-use survey reports, and other miscellaneous topics.

#### Dates

EKPC generally begins work on the load forecasts in December of the previous year with planning stages occurring prior to that, as early as October. Normally, by the end of January, year-end retail sales data on customers, sales, and revenue have been collected to allow for retail sales analysis. By the middle of April, EKPC will have prepared a preliminary load forecast for each member system. Individual member system visits occur in May through July. By the end of August, an official EKPC load forecast has been prepared, and is presented to EKPC's Board of Directors, usually in September. Table 2 lists important milestones in the process. Table 3 shows the schedule. A detailed timeline is included in the appendix.

# Table 2 Load Forecast Milestones

#### May / June

Member System Visits • Member System Reports

#### July / August

Model EKPC System Hourly Load • Prepare Draft EKPC Report

#### September

Board Approval • Final EKPC Report Complete

#### Start of Process

EKPC's communication and coordination with member systems starts with a letter from EKPC to member systems. The letter serves to make member systems aware of the process, and also to request pertinent information and input into the load forecast. Specifically, member systems are asked to provide EKPC with individual large commercial customers' (both existing and planned) projected monthly sales and peak demand for three years. Information concerning demand-side management programs is collected, analyzed and used as inputs to the load forecast, specifically, expected participation. EKPC also provides a preliminary rate forecast for small commercial and residential customers. Member systems review and comment. Finally, members are asked to update their narratives for the load forecast report.

#### Meeting with Member Systems

Once a preliminary forecast is complete, EKPC visits each member system to discuss the results. The meetings take place at each member system's headquarters. Meeting attendees vary by member system and typically include the following:

Table 4

Load Forecast Meeting Attendees

Member System	President/CEO				
	Key Staff from the following departments:				
	Finance				
	Engineering / Operations				
	Member Services				
	Administrative				
EKPC	Director, Power Supply Planning				
	Load Forecasting Manager and Team Members				

#### Interaction with RUS's General Field Representative (GFR)

EKPC meets with the GFR to review the member system forecasts. After questions and comments are addressed, the GFR signs the RUS Form 341. The GFR's knowledge of RUS rules and regulations is useful to EKPC and member systems.

#### Interaction with RUS's Energy Forecasting Branch (EFB)

EKPC strives to maintain regular contact with the EFB, mainly the Senior Load Forecast Officer who has been assigned to EKPC. The EFB has served as a resource for the latest information regarding energy efficiency standards and alternative fuels prices.

#### **EKPC Personnel**

The load forecasting function is in EKPC's Load Forecasting Department in the Power Supply Business Unit. Key contributors include:

- ➤ David Crews is the Senior Vice President of Power Supply and will maintain executive authority and direction for the load forecast.
- > Julie Tucker is the Director of Power Supply Planning, and will provide strategic oversight as well as management support of load forecast development.
- ➤ Jamie Hall, Manager of Load Forecasting, will provide overall support for the 2012 Load Forecast.
- ➤ Mark Mefford, Analyst in the Load Forecasting Department, will serve as the project manager for the 2012 Load Forecast.
- Sandy Mollenkopf, Analyst in the Load Forecasting Department, will provide support for the load forecast process in areas of data collection, specifically, saturation survey data, load research data, and RUS Form 7 data. The load forecast requires input from many individuals.
- ➤ Alma Gentry, Analyst in the Load Forecasting Department, will provide support for the load forecast in areas of Demand Side Management and Direct Load Control impacts.

# **Resources and Data Management**

#### Computer Resources

EKPC currently uses personal computers for analyses and presentation of the load forecast. The following software packages are used in the process:

Microsoft EXCEL – used for spreadsheet analysis

Microsoft WORD and PowerPoint – used for preparing reports

@RISK – used for risk analysis

SAS – a statistical package used for regressions and data manipulation

MetrixLT – a program used to calibrate the monthly forecasts to hourly forecasts

MetrixND – a forecasting modeling program

#### Purchased Data Resources

#### **Economic**

EKPC uses services from IHS Global Insight, Inc., to analyze regional economic performance. The regions are based on EKPC member systems' service territories. Variables forecasted for each county include:

### □ EMPLOYMENT [NAICS] by sector

- o Total Non-farm
- o Non-Manufacturing
- Service Providing Private
- o Construction, Natural Resources, and Mining
- o Manufacturing
- o Transportation, Trade, & Utilities
- o Information
- o Financial Activities
- o Professional & Business Services
- o Educational & Health Services
- Leisure & Hospitality
- Other Services
- o Government
- o Federal Government
- o State & Local Government
- Military

#### □ NOMINAL INCOME

- o Personal Income
- Wage & Salary Disbursements
- o Non-wage Income
- o Average Annual Wage, Non-farm Employment
- o Per Capita Personal Income
- o Average Household Income

#### □ REAL INCOME

- o Real Personal Income
- o Real Wage & Salary Disbursements
- o Real Non-wage Income
- o Real Per Capita Personal Income

#### □ POPULATION

Total Resident Population and by Age group

#### □ HOUSEHOLDS

Heads of Household, Total and by Age group.

In addition, EKPC purchases forecasted information about the U.S. economy including:

- 1. A long-term economic forecast of the U.S. economy including output, price level, and interest rate projections.
- 2. Cost and price projections of generation and transmission capital equipment price escalation rates and fuel price forecasts.
- 3. Miscellaneous data searches and special requests.

The cost of the above services and data is approximately \$30,000 annually.

The extensive amount of economic data available relating to load forecasting at EKPC is a valuable resource to other departments at EKPC, as well as member systems, who often make requests for various economic data.

#### Demographic

EKPC uses forecasts prepared by the Urban Studies Institute, a University of Louisville organization that is the state's official demographer. They prepare forecasts of population and households and disseminate Census Bureau data. EKPC uses these to maintain a Kentucky perspective on how Kentucky is expected to grow.

#### Weather

EKPC subscribes to a service provided by Telvent DTN (formerly WeatherBank), which provides actual weather data including monthly high and low temperatures, hourly temperatures, humidity, sunshine minutes, wind chill and other variables. EKPC currently maintains seven weather databases for different regions of the state of Kentucky. Each member system's model uses the weather station that most closely reflects the local weather. This service costs \$1,500 annually.

#### Loadshapes

Specific hourly load research data is used when available. EKPC's load research to date includes a sample in the small commercial sector (0-50 kW), a sample of the medium commercial sector (51-350 kW) and a census for the large power sector (>350 kW). The load forecast also uses residential load research data for appliance usage estimation.

#### Data Management

EKPC deals with a tremendous amount of economic, weather, demographic, retail sales, and end-use data. Maintaining all of this information is challenging. The data is stored on EKPC's network in numerous datasets. Housing the data on a network allows multiple users to be working on this project simultaneously. Most regression analyses are performed in SAS or MetrixND. The resulting regression coefficients are used in developing the load forecasts.

# Report Writing

#### Member System Reports

Once final projections have been calculated following the load forecast meeting at the member system, EKPC prepares a report for each of its member systems. Just as member systems work jointly with EKPC on the preparation of the load forecast, they also contribute to the report's development by providing the narrative for the report.

#### EKPC Report

EKPC's report consists of a summary report and supporting appendices. The summary report essentially finalizes the load forecast process by combining the 16 individual member system forecasts. Key assumptions and member system growth rates are presented. The forecast methodology is described briefly with energy projections provided for the individual classes of consumers. Seasonal peak demands, load factors, and high and low forecasts are presented. Table 6 summarizes the table of contents from EKPC's Load Forecast report.

Table 6

Load Forecast Report Table of Contents

Section 1.0	Executive Summary			
Section 2.0	Load Forecast Methodology			
Section 3.0	Load Forecast Discussion			
Section 4.0	Regional Economic Model			
Section 5.0	Residential Customer Forecast			
Section 6.0	Residential Sales Forecast			
Section 7.0	Commercial and Other Sales Forecast			
Section 8.0	Peak Demand Forecast and			
	High and Low Case Scenarios			

# Report Appendices

A description of data included in the appendices is in Table 7.

<u> </u>		Results
		Class Model Statistics for each Member System

## **Model Description**

#### Regional Economic Forecasts

An important part of the load forecast is the regional economic outlook. EKPC has divided its members' service area into seven economic regions based on the member system service territorial boundaries. As stated above, Global Insight collects the historical data, models the data, and provides forecast data to EKPC. Variables include: population, income, employment levels, wages, labor force, and unemployment rate. Consistent regional forecasts for population, income, and employment are developed. Population forecasts are used to project residential class customers; regional household income is used to project residential sales; and regional economic activity is used to project small commercial sales.

Projections of regional economic activity can greatly impact the sales forecasting and strategic planning of EKPC. Changes in regional employment and income are important determinants of customer and sales growth.

Regions are based on natural regions that exist within the EKPC territory. For example, the Central region defined by EKPC fits closely within the Lexington Metropolitan Statistical Area (MSA). The BEA defines MSAs as areas of interrelated economic activity that go beyond a single county's boundaries. The coal mining industry dominates EKPC's East region. The North region includes Kentucky counties that border Cincinnati. The South region is influenced by tourism. The Louisville metropolitan area influences the West Central region. Finally, services and retail trade dominate the North East region.

A list of regions and counties is provided in Table 8. Models for these regions provide EKPC with a way of linking the electricity needs of a service area to the rest of the economy in a consistent and reasonable manner.

Table 8

#### Customer Model

Residential customers are analyzed by means of regression analysis with resulting coefficients used to prepare customer projections. Regressions for residential customers are typically a function of regional economic and demographic variables. Different explanatory variables are used for member systems in order to account for regional differences in local economies.

Two variables that are very significant for these regressions are the numbers of households by county in each member system's economic region and the percent of total households served by the member system. The number of households by county is forecast by Global Insight. The percent of total households served by the member system is based on RUS Form 7 data and projected by trend growth.

Table 9 provides details of regressions for residential customers.

Table 9

Residential Customer Forecast

Model Inputs	Source				
	Historical Source	Forecast Source			
Population	Global Insight database	Global Insight model results

Share – The percent of the region's households served by member system	RUS Form 7	Trend Growth			
Employment - Regional employment levels by SIC Code	Global Insight database	Global Insight model results			
Income – Regional income levels	Global Insight database	Global Insight model results			
Model Outputs	Use of				
Residential Customers	Residential customers are input into the residential sales model. They are also used to complete RUS Form 341.				

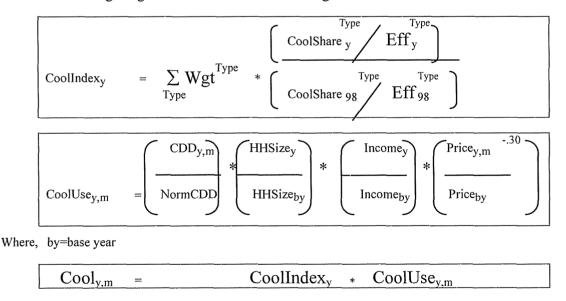

Note: Model inputs vary by member system. Member system equations do not contain every model input listed above.

#### Residential Sales Model

EKPC uses statistically adjusted end-use (SAE) models to forecast residential sales. This method of modeling incorporates end-use forecasts in the background and can be used to decompose the monthly and annual forecasts into end-use components. SAE models offer the structure of end-use models while also utilizing the strength of time-series analysis.

This method, like end-use modeling, requires detailed information about appliance saturation, appliance use, appliance efficiencies, household characteristics, weather characteristics, and demographic and economic information. The SAE approach segments the average household use into end-use components as follows:

Each component is defined in terms of its end-use structure. For example, the cool index may be defined as a function of appliance saturation, efficiency of the appliance, and usage of the appliance. Annual end-use indices and a usage variable are constructed and used to develop a variable to be used in least squares regression in the model. These variables are constructed for heating, cooling, water heating, and an 'Other' variable, which includes lighting and other miscellaneous usages.

The Cool, Heat, Water Heat, and Other variables are then used in a least squares regression which results in estimates for annual and monthly use per household.

#### Features of EKPC's SAE model are as follows:

- 1. Over 20 years of End-use Survey historical data are used to forecast saturation of appliances.
- 2. Appliance efficiencies due to government regulation have been accounted for in the model using a standard roll-in method, where new households and existing households in the market for new appliances encounter more efficient units. Indices pertaining to appliance efficiency trends and usage are used to construct energy models based on heating, cooling, water heating and other energy for the residential class. Source: Energy Information Administration Annual Energy Outlook, East South Central region representing Kentucky.
- 3. Various demographic and socioeconomic factors that affect appliance choice and appliance use are present in the methodology. These include the changing shares of urban and rural customers relative to total customers, number of people living in the household, as well as square footage of the house and the thermal integrity of the house.

Every two years since 1981, EKPC has surveyed the member systems' residential customers. The most recent survey was conducted in September and October 2011. EKPC gathers appliance, heating and cooling, economic, and demographic data. Appliance holdings of survey respondents are analyzed in order to project future appliance saturations and to better understand their electricity consumption.

EKPC's analysis and forecast of appliance saturations and appliance usage is econometric in nature. The decision made by customers to purchase an appliance can often be understood by examining customer income levels, fuel price, and household characteristics. The choice to purchase an appliance is modeled separately from the decision to use the appliance. This is because these actions are separate and subject to different driving forces.

Tables 10 and 11 provide modeling details of residential sales.

Table 10 Residential Sales Forecast - Appliance Usage Projections

Dependent Variable: Appliance Saturation				
Model Inputs	Source			
Residential Customers	Historical number of customers is taken from Form 7 data. Future number of customers is projected by EKPC and member systems.			
Average Real Price of Electricity	Historical price is taken from Form 7. Future prices are projected by EKPC's Rates Department and member systems.			
Cooling Degree Days & Heating Degree Days	Historical data come from Telvent DTN. Regional weather stations are used to account for the geographical diversity of member systems. Future values are historical averages.

Model Outputs	Use of		
Appliance Usage Levels	The forecast of appliance usages is combined with the forecast of appliance saturations in order to forecast total residential sales.		

#### Small Commercial Sales Model

In 2010, there were over 32,000 total small commercial customers in the EKPC system, with an average annual use per customer of approximately 60 MWh. This class is analyzed by means of regression analysis, and the resulting coefficients are used to prepare sales and customer forecasts. Each member system has two regression equations, which requires 32 regression equations in order to analyze and forecast preliminary small commercial sales. The first regression consists of total small commercial sales as a function of price, weather, and some measure of the local or national economy. The second regression consists of small commercial customers as a function of residential customers, the unemployment rate, or time. Different explanatory variables are used for member systems in order to account for regional differences in local area economies. For example, small commercial sales in some territories are heavily influenced by the oil and gas industry, while other areas are more affected by retail stores.

This class has experienced a fair amount of reclassification over the years.

Reclassifications can certainly be accounted for in the regression analysis, but the breaks in the data tend to lower the overall robustness of the regressions. Small commercial analysis and forecasting represent a challenge due to reclassifications and the relative heterogeneity of the data. Customers in this class include small mines, quarries, churches, schools, retail stores, large farm operations, and others, who each respond in different ways to different factors. The tables below provides regression modeling details of the small commercial class.

Table 12
Small Commercial Customer Forecast

Total Small Commercial Sales	This retail class is combined with other retail class forecasts in order to project member system purchases and EKPC total requirements.			

Note: Model inputs vary by member system. Member system equations do not contain every model input listed above.

#### Large Commercial Sales Model

In 2010, there was an average of 125 customers in this class with an annual average use per customer of over 20,000 MWh. Unlike the small commercial class, no member system regression equations are used in the analysis and forecast of large commercial sales. Since there are so few large commercial customers, use of regression to study the history would reflect individual plant production decisions and not necessarily responses to economic conditions. EKPC and its members have a two-part method for making projections in this class. First, existing customer forecasts are made, and second, forecasts of new customers are prepared.

# Forecasts of Existing Customers

These projections are made directly by member systems since they are in regular contact with the customers. Each member system prepares a three-year projection of each one of their customers whose monthly demand exceeds 1 MW. Load forecasts beyond the three-year horizon for existing large commercial customers are either fixed at the third year level or are adjusted based on information shared at the load forecast meeting.

#### Forecasts of New Customers

In the short-term, usually for a two or three-year period, both EKPC and member systems are aware of planned large load additions. Due to normal construction lead times, the ability to predict additions in the near term is strong. The only exception to this is with respect to coal mine loads. Coal mine operations can move equipment from place to place in a relatively short time period, making a forecast of their location difficult.

Over the long-term, a regression technique is used to forecast new large commercial customers. Because there are so few customers in this class, analysis is initially done at the EKPC level to forecast total new customers. These new customers are then allocated to the member systems using a probabilistic model which provides an analytical basis for locating large loads on the EKPC system. The model is spreadsheet based using @RISK. The model probabilistically distributes the new large commercial customers to member systems based on their regional economic outlook, share of county served and historical success in attracting new customers.

Once the number of new large commercial customers is determined, energy projections are based on the assumption that all new unknown large commercial customers have the same characteristics as the average of all existing large commercial customers, for example, a peak load of 1.8 MW with a 70 percent load factor. This methodology for forecasting new large commercial customers and energy provides a robust and defensible projection at the member system level.

Table 14

**Existing Large Commercial Customer Sales Forecast** 

Model Inputs	Source
Use per Customer	Historical data are taken from Form 7. Projections are made by member systems based on current trends, and based on knowledge of customer's intentions.
Model Outputs	Use of
Large Commercial Sales – Existing Customers	This segment of large commercial sales is combined with new customer sales. The large commercial retail class is combined with other retail class forecasts in order to project member system purchases and EKPC total requirements.

Model Outputs	Use of
Large Commercial Sales - New Customers, Long-Term	This segment of large commercial sales is combined with new customer sales. The large commercial retail class is combined with other retail class forecasts in order to project member system purchases and EKPC total requirements.

#### Other Sales Models

Other retail sales vary by member system. Some members do not report consumers in this category. Some members report seasonal sales, street light sales and sales to public authorities. EKPC's approach to this class is the same for each member system. Member system regression equations are developed with resulting coefficients used to forecast the class.

Table 17

#### **Other Sales Forecast**

Model Inputs	Source
Residential Customers	Historical customers are taken from Form 7. Future customers are projected by EKPC and member systems.
Model Outputs	Use of
Other Sales	This retail class is combined with other retail class forecasts in order to project member system purchases and EKPC total requirements.

#### Peak Model

EKPC's peak demand forecast is a bottom-up approach, meaning the member system peaks are summed to determine the EKPC peak. Model inputs include annual energy by end-use for the residential class and total energy use for small and large commercial. Model outputs are hourly demand for winter peak day and hourly demand for summer peak day. Weather sensitive appliance demands reflect typical peak day temperature profiles for winter and summer. The resulting peaks are explicitly linked to energy projections. Load factor is an input to the forecast. The load factors used are derived from data collected in the EKPC Load Research Program. The table below lists model inputs and model outputs.

Table 18

#### **Peak Demand Forecast**

Model Inputs	Source

Summer Peak Day Load Profile	member system peak demand
	forecasts.

#### Loss Calculations

Transmission and distribution losses make up approximately eight percent of total energy requirements on the EKPC system. For this reason, EKPC analyzes distribution and transmission losses carefully in order to accurately project future values. While there is no formal modeling process in loss analysis, member systems provide excellent input into future distribution loss determination using several decision rules including:

- 1. Comprehensive right-of-way programs tend to reduce losses.
- 2. Direct-served large commercial customers, customers with no distribution line, reduce overall distribution losses.

In addition to energy losses, demand losses are also developed. Winter peak day losses are assumed to be one percent greater than average energy losses and summer peak day losses are two percent higher than average energy losses.

#### Hourly Load Model

EKPC develops a 20 year hourly load forecast using ITRON's MetrixLT program. This program is PC based and runs in a Windows environment. It calculates hourly demands given input load shapes, energies and peak demands. In addition, the model accounts for transmission and distribution losses and allows for reconciliation to an external forecast.

EKPC generates 8,760 hourly demands from annual energy for each year of the 20 year load forecast for the EKPC system. Hourly forecasts for member systems are developed as requested.

# **Uncertainty Analysis**

## Probabilistic Forecasting

EKPC brackets its base load forecast with high and low projections by analyzing probability distributions of significant variables that impact the forecast allowing the capture and study of a model's inherent uncertainty. The software @RISK is used for this. For example, price, income, number of customers are all variables that impact residential sales. Each of these can be expressed as a probability distribution. A probabilistic forecast of residential sales for each year in the forecast involves many passes through the residential sales forecasting model with different values of the above variables randomly selected from their corresponding probability distributions. The net result is a distribution of possible outcomes for residential sales for each year. EKPC uses the 50/50 value of the probability distribution as the base case whereas the high and low case represent the 90 percent bounds.

#### Scenario Forecasting

Scenario forecasts are different from the probabilistic forecasts described above. In scenario forecasting, certain events are modeled in order to examine the effect on the forecast. Consider, for example, the occurrence of an economic depression. Because the chances of such an event are remote, a probabilistic load forecast will not contain the results of such a catastrophe. In scenario forecasting, however, one can assume that an economic depression occurs, without explicit regard to the probability of such an occurrence, in order to study the effects of such an event on the load forecast. Both scenario forecasting and probabilistic forecasting are common techniques in uncertainty analysis.

High and low scenarios are developed using the same methodology as with the base case, however, the starting summary file is different. Instead of using the sum of the member system files, two new models are built: one reflecting assumptions that result in high

usage and one with assumptions that result in low usage. A summary of the assumptions for each case is listed below:

Low Case – Pessimistic economic assumptions with mild weather causing lower loads

Base Case - Most probable economics assumptions with normal weather (Base Case pre DSM)

High Case – Optimistic economic assumptions with severe weather causing higher loads

The assumptions that are varied include:

- 1. Weather: based on historical heating and cooling degree day data, alternate weather projections are developed based upon the 90<sup>th</sup> and 10<sup>th</sup> percentile to reflect extreme and mild weather, respectively.
- 2. Electric price: The general approach is to use price forecasts that are available and use the growth rates from those forecasts to prepare the high and low growth rates around the growth patterns for the base case residential price forecast. The manner in which the price of electricity will change in the future is primarily a function of how prices change for the underlying fixed and variable components of electricity rates.
- 3. Residential customers: The basic approach to preparing high and low case scenarios for the future number of residential customers is to determine the magnitude of variation in the past between long term average growth rates and higher or lower growth rates during shorter periods of time.

First, the data on the historic monthly household counts for the previous 20 year period is prepared. Next, the compound annual growth rate in households is calculated for each rolling ten year. This produced a set of twelve compound annual growth rate values each representing a unique ten year span. Maximum and minimum values are determined. The highest growth is used to prepare the high case scenario, while the 10 year period that experienced the lowest growth is used to prepare the low case scenario.

These resulting adjustments are applied to the 20 year compound annual growth rate in the base case customer count forecast to produce the high case and low case compound annual growth rate forecast scenarios. This relationship is preserved when preparing the monthly customer counts for the high and low case scenarios.

Adjusting these assumptions leads to different customer forecasts which in turn results in different energy forecasts.

# **Interaction with Other Areas of EKPC**

#### Load Research

Due of the end-use nature of EKPC's residential sales and peak demand forecast methodology, the load forecast relies on data collected by traditional load research techniques. The information used includes:

- 1. Winter and summer load factors for the large and small commercial classes.
- 2. Load factors for winter and summer for the residential class for heating, cooling, water heating, and residual load.

# Marketing

More and more, EKPC's load forecasting analysis is becoming a study of why customers choose electricity and in what amounts. Load forecasts are the result of econometric models that attempt to simulate customer behavior regarding energy consumption. Traditional marketing efforts are likewise concerned with understanding customer wants and needs and then responding to unmet conditions. Since both groups at EKPC are interested in similar customer characteristics, there are frequent exchanges of customer data and ideas. Additionally, the Marketing Department is the home of the demand-side management participation data which is needed to account for usage impacts in the forecast. Over the past year, EKPC and the state of Kentucky has become more interested and active in DSM.

#### Transmission Planning

EKPC provides Transmission Planning with aggregate load forecasts and peak demand forecasts at the substation level.

### Resource Planning

An important use of the load forecast is as input into the Integrated Resource Plan (IRP). Every three years, EKPC must file an IRP with the Kentucky Public Service Commission. EKPC's load forecast becomes more detailed as needed to support the IRP. The Commission's order requires a detailed reporting of the load forecast used in developing the IRP. For the sake of consistency, EKPC's load forecast report also doubles as its load forecast contribution to the IRP report.

#### Rates

EKPC's resource planning cycle functions in the following manner: (1) after a new load forecast is completed, integrated resource planning provides updated information on future capacity needs as well as production cost forecasts, (2) the Rates Department then uses the load forecast to calculate revenue and prepares wholesale power cost forecasts, (3) the resulting rates forecast then becomes an input to the next load forecast, and (4) the cycle repeats.

#### Finance

The load forecast is provided to the Finance Department to be used in the budget process.

# Surveys

EKPC has conducted a residential end-use mail survey every two years since 1981. Questions asked in the survey relate to heating and cooling methods, appliance holdings, and farm equipment. In addition to end-use questions, data on lifestyle, age, demographics, and income are collected. In 2011, 800 surveys per member system were mailed for a total of 12,800. EKPC measures sampled customer kWh usage with population customer kWh usage to determine whether the sample has been a true representation of the population. In general, the sample has been very close to the population.

The end-use survey is the cornerstone of EKPC's residential sales forecasting. The survey provides historical appliance saturation levels and is also used to forecast future appliance saturation levels.

In addition, the end-use survey provides a picture of the retail customer's electricity use, which is extremely important in marketing, DSM, and other applications at EKPC and at the member system.

# **APPENDIX**

# 2012 EKPC Load forecast

# Tasks and Time Line

Task	Projected Completion Date	Julie Tucker David Crews	Jamie Hall	Mark Mefford	Sandy Mollenkopf	Alma Gentry
Take Load Forecast Work Plan to EKPC Board as information item	10/11/2011	х				
Request EKPC Board approval of Load Forecast Work Plan	11/7/2011	х				
Industrial Customer Worksheet - existing customers > 1 MW - provide Mark with 2 years history, KW and kWh, in spreadsheet	11/30/2011				х	
Load Factors - annual, winter, summer - by class - by member system	11/30/2011			x		
Appliance Efficiency data - evaluate and update data from Energy Forecasting Group	11/30/2011			x		
Parameters - analyze current values and update - update models	12/2/2011			х		!
Rate Worksheet - set up - Member system provide rates to Mark	12/15/2011			x		
Review NCP winter and summer factors - evaluate by member system	12/15/2011			х		
Economic Model Results	12/31/2011			х		
Economic Data - update database - update models	12/31/2011			х		
Demand Factors - evaluate existing demand factors - update models as necessary	12/31/2011			х		
Member Appliance Saturation Survey - forecast saturations - by member system - EKPC system - heating, cooling, water heating, and other	12/31/2011			х		
Member Appliance Survey Results - by member system, EKPC system - spreadsheet	1/15/2012				х	

Task	Projected Completion Date	Julie Tucker David Crews	Jamie Hall	Mark Mefford	Sandy Mollenkopf	Alma Gentry
Rate Worksheet - send initial set up to member systems - receive and enter data from member systems	1/15/2012			х		
Industrial Customer Worksheet - prepare data from Sandy for existing customers - send to member systems requesting forecast of existing customers and knowledge of new loads coming in next couple of years - receive and enter data	1/15/2012			х	x	
Actual and Forecasted Price - by class - by member system	1/31/2012			х		
Large Commercial - add new loads to spreadsheet - system run to determine # of new > 1 MW loads - @Risk model to allocate new large loads among member systems	2/28/2012			х		
Member System Narratives - prepare for visits	2/28/2012			х		
Board Resolutions - prepare draft to be taken to meetings	2/28/2012			х		
Weather - update database - update models - update normals	2/28/2012			x		
Prices - update database - update models	2/28/2012			х		
Form 7 Data - use and customers	3/31/2012			х		
Form 7 Data - update ForecastManager - update models	3/31/2012			х		

Task	Projected Completion Date	Julie Tucker David Crews	Jamie Hall	Mark Mefford	Sandy Mollenkopf	Alma Gentry
Presentation Materials - economic model results - RUS Form 5, RUS Form 736 data - rate forecast sheet - customer and sales forecast results - comparisons of current and past forecasts - appliance saturation projections - seasonal peak demand forecast	4/30/2012			Х		
Usage Models - by member system - by class	4/30/2012		х	х		
Peak Models - by member system - monthly and hourly forecasts	4/30/2012		x	х		
Schedule meetings - with member systems - coordinate with RUS	5/31/2012			х		
Member System Visits	6/30/2012		×	x		
Make necessary adjustments to models based on member system input	7/31/2012			х		
Member System Board Approval	7/31/2012					
DSM/DLC Impacts - Total hourly impacts of all programs for the forecast period - DLC and DSM impacts reported separately	7/31/2012					х
EKPC System Forecast - Energy - Peak	7/31/2012		х	х		
Take Final Load Forecast to EKPC Board as information item	8/14/2012	х				
Prepare Board Agenda item	8/31/2012			×	46	
EKPC Board approval	9/11/2012	x				
Reports - Member System and EKPC System - copy and bind - distribute to appropriate parties	9/30/2012			x		
Reports - member system specific - EKPC total	9/30/2012			x		

Task	Projected Completion Date	Julie Tucker David Crews	Jamie Hall	Mark Mefford	Sandy Mollenkopf	Alma Gentry
Substation Forecasts - analyze results - prepare preliminary reports for meetings - make changes per member system - send 'final' reports to member systems and internal customers	9/30/2012			x		

# FROM THE MINUTE BOOK OF PROCEEDINGS OF THE BOARD OF DIRECTORS OF EAST KENTUCKY POWER COOPERATIVE, INC.

At a regular meeting of the Board of Directors of East Kentucky Power Cooperative, Inc. held at the Headquarters Building, 4775 Lexington Road, located in Winchester, Kentucky, on Tuesday, December 6, 2011 at 9:30 a.m., EST, the following business was transacted:

Request for Approval of the Load Forecast Work Plan

After review of the applicable information, a motion to approve the Load Forecast Work Plan was made by Strategic Issues Committee Chairman Lonnie Vice and passed by the full Board to approve the following:

Whereas, The Rural Utilities Service requires East Kentucky Power Cooperative, Inc., ("EKPC") to prepare a Load Forecast Work Plan ("Plan") every two years, and requires that this Plan be approved by the EKPC Board of Directors ("Board");

Whereas, EKPC has prepared a Plan which is attached to the Executive Summary and which describes the methodology to be used in the preparation of the 2012 Load Forecast and corresponding report for EKPC and its 16 member systems; and

Whereas, EKPC Management and the Board's Strategic Issues Committee have recommended approval of this Plan by the Board; now, therefore, be it

Resolved, That the EKPC Board hereby approves the 2011 Load Forecast Work Plan.

The foregoing is a true and exact copy of a resolution passed at a meeting called pursuant to proper notice at which a quorum was present and which now appears in the Minute Book of Proceedings of the Board of Directors of the Cooperative, and said resolution has not been rescinded or modified.

Witness my hand and seal this 6th day of December 2011.

A. L. Rosenberger, Secretary

Corporate Seal
