PUBLIC SERVICE COMMISSION

RE: <u>Kentucky Power Company – Electric Distribution Utility Annual Reliability</u> <u>Report</u>

Dear Mr. Chaney:

Enclosed please find Kentucky Power Company's filing in response to the Commission's October 26, 2006 Order in Case No. 2006-00494.

ery truly

vours,

Please do not hesitate to contact me if you have any questions.,

cc: L.P. Munsey R.K. Wohnhas

RESPONSES TO COMMISSION ORDER DATED OCTOBER 26, 2007

April 1, 2011

KENTUCKY PUBLIC SERVICE COMMISSION

Electric Distribution Utility Annual Reliability Report

SECTION 1: CONTACT INFORMATION

UTILITY NAME	1.1	Kentucky Power Company
REPORT PREPARED BY	1.2	Everett G. Phillips
E-MAIL ADDRESS OF PREPARER	1.3	egphillips@aep.com
PHONE NUMBER OF PREPARER	1.4	606-929-1463
FILONE NOMBER OF FREEMLER	1.55	000-323-1403

SECTION 2: REPORT YEAR

CALENDAR YEAR OF REPORT 2.1 2010

SECTION 3: MAJOR EVENT DAYS

T _{MED}	
FIRST DATE USED TO DETERMINE T _{MED}	
LAST DATE USED TO DETERMINE T_{MED}	
NUMBER OF MED IN REPORT YEAR	

 3.1
 26.855

 3.2
 1-Jan-06

 3.3
 31-Dec-10

 3.4
 4 days

NOTE: Per IEEE 1366 T_{MED} should be calculated using the daily SAIDI values for the five prior years. If five years of data are not available, then utilities should use what is available until five years are accumulated.

<u>SECTION 4: SYSTI</u> Exc	<u>EM REL</u> luding N	IABILITY RESULTS /IED
SAIDI	4.1 4.2	418.4
CAIDI	4.3	169.4
Including	g MED (Optional)
SAIDI	4.4	572.5
SAIFI	4.5	2.751
CAIDI	4.6	208.1

Notes:

- 1) All duration indices (SAIDI, CAIDI) are to be reported in units of minutes.
- 2) Reports are due on the first business day of April of each year
- 3) Reports cover the calendar year ending in the December before the reports are due.
- 4) IEEE 1366 (latest version) is used to define SAIDI, SAIFI, CAIDI, and T_{MED}

- 2010 KPCo WPC Analysis and Plans_Hazard District.doc
- 2010 KPCo WPC Analysis and Plans_Pikeville District.doc

2011 Kentucky Power Distribution Vegetation Management Plan

The 2011 Vegetation Management Plan will focus on Full-Circuit Reclearing. Reclearing work will be prioritized and scheduled based on past tree-related reliability performance, field inspection of the right-of-way conditions, and the number of customers impacted. Some reclearing will be performed on selected Feeder Breaker Zones and Recloser/Sectionalizer Zones that impact large numbers of customers. Mitigating tree-caused outages in these areas will provide the optimum impact on reducing SAIFI. Some line segments that have experienced repeated tree-caused outages in 2010 will also be included in the 2011 Plan. Approximately \$1,591,670 will be earmarked to address reactive reliability issues that develop throughout the year. This Unscheduled/Reactive funding represents about eight percent of the total Vegetation Management Budget.

Judicious use of herbicides is an important component of Kentucky Power's Vegetation Management Plan. ULV (Ultra Low Volume), high-volume foliar, basal, cut-surface, and aerial application techniques will be utilized depending on the brush conditions. The goal is to treat 2,006 acres of brush in 2011.

The 2011 Kentucky Power Distribution Management Plan projection for the three districts in its service territory is:

AREA	PLANNED MILES	PLANNED SPRAY ACRES	FORESTRY CAPITAL FUNDING	UNSCHEDULE D REACTIVE O&M FUNDING	SCHEDULED O&M FUNDING	TOTAL O&M FUNDING	TOTAL VMP FUNDING

(Excluding Major Events as defined by IEEE Std 1366)

Kentucky Power Company 2010 WORST PERFORMING CIRCUITS Analysis of Causes/Corrective Actions

Ashland District

10th Street - 6th Street 12kV Circuit (3002101 - SAIFI #4, SAIDI #9)

Over 96% of the Customers Interrupted (SAIFI) can be accounted for by three breaker outages and two station transformer outages.

On July 12 and July 21, breaker outages were coded as Weather – Unknown. Lines were patrolled and nothing was found on the distribution lines. A few days after the second outage crews were sent to do a pole by pole inspection on the circuit and nothing was found. Two sets of fault indicators were installed to help determine the cause of any future occurrences.

On August 14, the station transformer failed at 10th Street and the 6th Street Circuit was out for nearly 11 hours. Since this area is summer peaking, load was carefully transferred over to other sources and circuits as the mobile transformer was put into service.

On October 26, while customers were transferred over to Bellefonte station – due to the prior transformer failure, one of the breakers at Bellefonte failed to open during a fault and took out Bellefonte station transformer.

On October 30, Tenth Street mobile transformer locked out as the instantaneous relay on the mobile transformer miscoordinated with one of the distribution breakers at Tenth Street.

Corrective Actions

Since the transformer failure, inspections were completed on the enclosed breaker, and it was determined that the 10th Street/6th Street breaker had taken a lightning strike. Repairs have been made, and additional lightning arresters have been added on the underground circuit exit. At this time no further action is recommended.

Hayward Station - Haldeman 12kV Circuit (3000801 - SAIFI #6)

Over 80% of the Customers Interrupted (SAIFI) can be accounted for by five feeder breaker outages due to station equipment.

On March 4, 2010 DGA levels on our existing station transformer were at such a high level that a mobile transformer was installed. Due to safety concerns and spacing, the station department requested a station outage to close in the mobile transformer rather than parallel the two transformers.

On March 31, the mobile transformer's secondary service transformer failed and had to be replaced. The load was transferred back over to the station transformer until repairs could be completed.

Later in the afternoon on March 31, customers were interrupted and put back on the mobile transformer.

On May 24, after the manufacturer's recommended maintenance work had been completed on the station transformer, an outage was necessary to remove the mobile transformer and put customers back on the station transformer.

On August 20, there was a relay mis-operation when a tree fell on the Hayward Lawton circuit close to the station and opened up the transrupters, or vacuum circuit switches, on the primary side of the transformers. Relays were replaced in 2005, and this setting was overlooked on the primary side causing the mis-operation.

The other 1.141 of Customers Interrupted (SAIFI) were accounted for by outages on the 110 plus circuit miles of distribution line.

<u>Corrective Actions</u> At this time no further action is recommended.

Kentucky Power Company 2010 WORST PERFORMING CIRCUITS Analysis of Causes/Corrective Actions

Hazard District

Leslie Station - Hyden 34.5kV Circuit (3303901 - SAIFI #1, SAIDI #4)

Leslie Hyden appears on both the top 10 worst performing circuits lists by SAIFI and SAIDI in 2010. This circuit had experienced seven station related outages. These outages alone contributed to 39% of the total customer minutes interrupted on the Leslie Hyden circuit.

Interruption Start Date	Major-Minor Cause	Clearing Device	Outage Duration (min)	Total Customers Affected	Total Customer Minutes
2/22/2010	EQUIPMENT FAILURE	Station	248	982	123,242
2/22/2010	EQUIPMENT FAILURE	Station	100	982	98,200
3/1/2010	SCHEDULED COMPANY	Station	14	978	13,692
5/16/2010	TREE OUT OF ROW	Station	194	973	188,762
12/16/2010	EQUIPMENT FAILURE	Station	49	967	47,383
12/16/2010	EQUIPMENT FAILURE	Station	413	967	304,958
5/16/2010	TREE OUT OF ROW	Station	10	958	9,580

Below is a table summarizing the seven outages that occurred at the station.

Of the outages listed above, two were caused by trees taking out the transmission line and two are attributed to a transformer failure in the station itself.

Of the 95 different outages experienced by the Leslie Hyden circuit, 57 outages where caused by tree related issues (including the two transmission line outages). These tree related outages contribute 60% percent of the total customer minutes interrupted. The second largest contributing factor to the customer minutes interrupted (CMI) has been equipment failure which accounts for 16% of the total CMI.

Corrective Actions

In order to reduce the tree issues, several problem areas on this circuit have already been patrolled by vegetation management. In the summer of 2010, these problem areas were cleared of many trees that could cause an outage. Also, in December of 2010, a

Hazard District

large section of line was also taken care of by cutting down several trees that had a potential of falling across the lines.

In the fall of 2010, a large section of line was rebuilt. This line was composed of old copper conductor that was beginning to deteriorate and cause problems. During this line rebuild, several deteriorated poles were also replaced.

In 2011, a larger station transformer will be installed and the station regulators will be replaced with larger ones. This will increase the capacity of the Leslie station and will reduce the likelihood of another transformer failure in the near future.

Also in 2011, an infrared camera will be used to inspect devices within the first breaker zone of the Leslie Hyden circuit. Hot spots will be identified on switches, fuses, and other equipment that may be located within the first breaker zone. The infrared camera will also be used during the recloser, capacitor, and regulator inspections to check for hot spots on such equipment.

Leslie Station - Wooton 34.5kV Circuit (3303902 - SAIFI #3)

Leslie Wooton is a large circuit serving 1,827 customers. The Wooton Circuit, like the Hyden Circuit, has been affected by several station outages. Out of the seven station outages, two were caused by trees taking out the transmission line, one is attributed to a transformer failure in the station itself, one was scheduled by the company in order to place a mobile transformer unit at the station in order to correct out of phase switching, and one was caused by a coordination issue with a recloser and the installed mobile unit at the Leslie Station.

Out of the 131 outages experienced on the Leslie Wooton circuit, 45 outages were caused by trees inside the right of way (about 34%), and 25 were caused by equipment failure (about 19%).

Corrective Actions

The station transformer and the station regulators will be replaced with larger units in 2011. This will increase the capacity of the Leslie station and will reduce the likelihood of another transformer failure in the near future.

In 2011, four miles of right of way is planned for reclearing which includes the breaker zone and a targeted trouble area. This right of way maintenance work will reduce the number of outages caused by trees inside the right of way experienced by the Leslie Wooton Circuit.

Also in 2011, an infrared camera will be used to inspect devices within the first breaker zone of the Leslie Wooton circuit. Hot spots will be identified on switches, fuses, and other equipment that may be located within the first breaker zone. The infrared camera will also be used during the recloser, capacitor, and regulator inspections to check for hot spots on such equipment.

Stinnett Station - Beechfork 34KV Circuit (3311102- SAIDI # 5)

Stinnett Beechfork is a dedicated circuit serving only a few customers. Any outage involving the station for any significant amount of time will greatly add to the SAIDI.

The table below lists all the outages that occurred on the Stinnett Station.

Minor Cause Name	Occurrences	Total Gustomer Minutes of Interruption
SCHEDULED COMPANY	1	472
TREE OUT OF ROW	1	680
SCHEDULED COMPANY	1	1,000
EQUIPMENT FAILURE	1	4,590

This circuit made it on the top ten worst performing circuits list because of one outage in particular. Equipment failure occurred in the station which resulted in transmission structure damage. Due to the long repair time, this outage accounts for 4,590 customer minutes of interruption or 68% of the total customer minutes of interruption experienced by the Stinnett Beechfork circuit.

Corrective Actions

Due to the rarity of the outage mentioned above, no corrective action is needed for this circuit.

Chavies Station -- Chavies 12KV Circuit (3301101 -- SAIDI # 8)

A little over 69% of the total customer minutes of interruption on the Chavies Chavies circuit were caused by trees inside or trees outside of the ROW.

The largest outage based on customer minutes interrupted occurred in April when a forest fire ignited one of our power poles. This outage contributed 106,106 minutes (about 10%) of the customer minutes interrupted. An outage of this nature is rare and is unlikely to occur again in the near future.

Corrective Actions

Most of the right of way issues for this circuit were addressed in 2010. In mid 2010, the right of way in the first breaker zone was re-cleared. In November of 2010, a targeted trouble area was also re-cleared. Since this was the source of most tree related outages, the right of way maintenance work on these sections of line should greatly reduce the future tree related outages on the Chavies Chavies circuit.

The Chavies Chavies circuit is also part of Hazard's distribution automation plan for the Buckhorn area. In this plan the Haddix Canoe circuit will be able to automatically, with the aid of precise electronic devices, pick up load from the Chavies Chavies circuit in the event that power is lost in particular areas (and vice versa). This quick restoration process will help to reduce the customer minutes interrupted and thus will also reduce the SAIDI for this circuit.

Kentucky Power Company 2010 WORST PERFORMING CIRCUITS

Analysis of Causes/Corrective Actions

Pikeville District

Spring Fork Station - Single Phase 12kV Circuit (3404002 - SAIDI #1, SAIFI #7)

The Spring Fork Distribution circuit is on both the SAIDI and SAIFI worst performing circuits list. This circuit serves 29 customers. There were only seven outages on this circuit in 2010, each having a different cause. Six of these outages affected all customers on the circuit. Five of the outages involved problems on the transmission line and account for 94% of the CMI and 83% of the total number of customers interrupted.

Due to the nature of the transmission outages (insulator failure, brush fire, trees outside of right-of-way (ROW), scheduled outage to replace deteriorated poles and lightning) very few corrective actions are being recommended.

Corrective Actions

- 1. The LEAD equipment (a tool which detects electromagnetic interference generally associated with arcing or tracking and thereby enables us to find failing equipment) and infrared (FLIR) camera (used to detect components which are heating up and subject to imminent failure) will be used to inspect the distribution circuit and portions of the radial transmission line serving this station.
- 2. We will work with the transmission organization to ensure that adequate lightning protection is in place on the transmission equipment.

Sprigg Station -- Matewan 34kV Circuit (2150105 - SAIDI #2)

The major contributor to outages for this circuit is trees outside of ROW. This cause contributed 90% of the total Customer Minutes Interrupted (CMI) related to this circuit during 2010.

- 1. In 2011, the Station Zone on this circuit will be re-cleared, including hazard trees outside of ROW. This plan will greatly aid in the prevention of some of the tree related outages that have occurred in the feeder breaker zone.
- 2. Also in 2011, the LEAD survey tool and FLIR will be utilized to identify deteriorating equipment for replacement.

3. A tie-line with the Barrenshe-Pounding Mill Circuit will be constructed in 2011. This will help reduce the length of outages for many customers since we will be able to transfer them to another power source during outage situations.

Draffin Station - Yellow Hill 12kV Circuit (3400702 - SAIDI #3)

The major contributors to outages for this circuit are Weather-flood/slide and Equipment Failure. These two causes have contributed 84% of the total Customer Minutes Interrupted (CMI) on this circuit during 2010.

There were four separate outages that occurred on this circuit in the aftermath of flooding that contributed almost 62% of the total CMI in 2010. Some of these outages took a longer time to restore due to the severity of weather conditions and access problems.

Corrective Actions

Although the Company cannot prevent future flooding, we do plan to make these adjustments to improve reliability on this circuit:

- 1. In 2011, the LEAD survey tool and FLIR will be utilized to identify deteriorating equipment for replacement.
- 2. Improve sectionalizing to limit outages to as few customers as possible.
- 3. The Forestry Department has scheduled to do a full circuit re-clearing which began in 2010 and will be completed in 2011.

Feds Creek Station – Feds Creek 12kV Circuit (3409401 - SAIDI #6)

Two outages on this circuit accounted for 91% of the total Customer Minutes of Interruption (CMI). These outages were due to equipment failure on the transmission line and a vehicle accident. The rarity of these two outages indicates no need for corrective actions to prevent future occurrences.

Tree in the ROW and Failed Equipment accounted for only 7.6% of the CMI however they did contribute 75% of the total number of outages.

- 1. In 2011, the LEAD survey tool and FLIR will be utilized to identify deteriorating equipment for replacement.
- 2. Feds Creek- Feds Creek circuit is also in the Pikeville District Forestry Work Plan. Full circuit re-clearing began in 2010, and is scheduled to be completed in 2011. These actions should prevent tree related outages on this circuit in the coming year.

Feds Creek Station - Lick Creek 12kV Circuit (3409402 - SAIDI #7)

Equipment Failure, Trees Outside of ROW, and Trees Inside ROW contributed 99.7% of the CMI for the Lick Creek circuit in 2010.

Corrective Actions

- 1. In 2011, the LEAD survey tool and FLIR will be utilized to identify deteriorating equipment for replacement.
- 2. Late in 2010, the Forestry group completed re-clearing of the Lick Creek circuit. This 2010 work should prevent trees from being a problem in 2011.

Barrenshe Station - Pounding Mill 12kV Circuit (3200204 - SAIDI #10, SAIFI #2)

The Barrenshe-Pounding Mill Circuit made the worst performing list for SAIDI and SAIFI due to tree-related and equipment failure outages. These two outage causes accounted for 77% of the CMI and 76% of the SAIFI.

Corrective Actions

- 1. In 2011, the LEAD survey tool and FLIR will be utilized to identify deteriorating equipment for replacement.
- 2. The entire circuit will be evaluated for additional sectionalizing to minimize the number of customers affected by any one outage.
- 3. Hotspot tree trimming work was performed on Peter Fork near McCarr to resolve a Repeat Outage issue that occurred on this circuit in 2010. Review of this circuit indicates that no other vegetation management work is required at this time.

Garrett Station - Lackey 12kV Circuit (3413402 - SAIFI #5)

Four transmission-related outages caused 67% of the SAIFI for this circuit. Two of these outages were due to lightning and one was due to fire.

- 1. Continue to use LEAD survey tool and FLIR to identify and replace any deteriorated equipment.
- 2. Transmission has been requested to investigate the lightning outages and take appropriate action to correct any problems found.

Pikeville District

Garrett Station - Garrett 12kV Circuit (3413401 - SAIFI #8)

Four transmission-related outages caused 59% of the SAIFI for this circuit. Two of these outages were due to lightning and one was due to fire.

Corrective Actions

- 1. Continue to use LEAD survey tool and FLIR to identify and replace any deteriorated equipment.
- 2. Transmission is being requested to investigate the lightning outages and take appropriate action to correct any problems found.

Draffin Station - Belcher 12kV Circuit (3400701 - SAIFI #9)

Trees inside and outside of ROW account for 45% of the total customers affected in 2010. In addition, equipment failure accounted for 18% of customers affected.

Corrective Actions

- 1. In 2011, the LEAD survey tool and FLIR will be utilized to identify and replace deteriorated equipment.
- 2. Hotspot tree trimming work was completed on Harless Creek and Jimmies Creek in 2010.
- 3. This circuit will be evaluated for additional sectionalizing work in 2011.

Coleman Station - Peter Creek 34kV Circuit (3408303 - SAIFI #10)

Tree related outages were the major cause for this circuit being on the SAIFI worst performing list. There were 43 tree related outage cases which affected 3,722 customers and contributed 37% of the total customers affected on this circuit in 2010. There were also 26 equipment failure outage cases which contributed 31% of the total customers affected.

- 1. In 2010, vegetation management was performed on 44 miles of this circuit and another 28 miles are planned for re-clearing in 2011.
- 2. Use the LEAD survey tool and FLIR to identify and replace deteriorating equipment.
- 3. A portion of this circuit was rebuilt in 2010 as part of a plan to serve a new large customer. In addition to this rebuild, we plan to install a second 34.5 kV breaker in Coleman Station and split the distribution circuit into two circuits. This will reduce the exposure of the 1,723 customers served by this circuit and should improve overall reliability.
