3. Actual and weather-normalized monthly coincident peak demands for the just completed calendar year. Demands should be disaggregated into (a) native load demand (firm and non-firm) and (b) off-system demand (firm and non-firm).

Response:

See Table 3, which shows the actual and weather-normalized native Louisville Gas & Electric Company (“LG&E”) peak demands. The normalized native LG&E stand-alone peak demands are available only on a seasonal (summer/winter) basis.

**Table 3 – LG&E Native and Off-System Demands for 2021 (MW)**

Time of Monthly Native Peak	Actual			Normal Weather (Seasonal)	Off-System <sup>1</sup>		
	Native Peak	Non-Firm	Firm	Native Peak	Firm	Non-Firm	Total
1/29/2021 8:00	1,640	0	1,640	1,751	0	0	0

**ITEM NO. 7**

**RESPONDENT: Michael Sebourn**

7. The target reserve margin currently used for planning purposes, stated as a percentage of demand. If changed from what was in use in 2001, include a detailed explanation for the change.

Response:

As part of the 2021 Integrated Resource Plan (“2021 IRP”), the Companies established an optimal summer reserve margin range of 17% to 24% and winter reserve margin range of 26% to 35%. The range provides an optimum level of reliability through various system operating conditions. The 2021 IRP was filed with the Commission in October 2021.<sup>2</sup>

A detailed explanation of the current target reserve margin is documented in the report titled, “2021 IRP Reserve Margin Analysis,” included in Volume III of the Companies’ 2021 IRP.

**ITEM NO. 8**

**RESPONDENT: Michael Sebourn**

8. Projected reserve margins stated in megawatts and as a percentage of demand for the current year and the following 4 years. Identify projected deficits and current plans for addressing these. For each year identify the level of firm capacity purchases projected to meet native load demand.

Response:

See Tables 8a and 8b for the combined Companies. These tables show for each peak season the total reserve margin, which includes all resources using an expected contribution at the time of peak, and the dispatchable reserve margin, which excludes non-dispatchable intermittent resources (solar and Ohio Falls run-of-river hydro). No reserve margin deficits are projected. The Companies will monitor load requirements and evaluate supply alternatives to address future capacity deficits.

**Table 8a: Summer Peak Demand and Resource Summary (MW)**

	2022	2023	2024	2025	2026
Gross Peak Load	6,522	6,500	6,485	6,594	6,678
Non-Dispatchable DSM	-294	-300	-305	-311	-311
Net Peak Load	6,229	6,201	6,179	6,283	6,367

**RESPONDENT: Michael Sebourn**

12. Identify all planned base load or peaking capacity additions to meet native load requirements over the next 10 years. Show the expected in-service date, size and site for all planned additions. Include additions planned by the utility, as well as those by affiliates, if constructed in Kentucky or intended to meet load in Kentucky.

Response:

The Companies jointly plan their generation portfolio. Based on the planned retirement of Mill Creek Unit 1 in 2024 and the assumed retirements of Mill Creek Unit 2 and E.W. Brown Unit 3 in 2028, the Companies anticipate a capacity and energy need in 2028. The Companies do not currently have a firm plan for new capacity. In the 2021 Integrated Resource Plan (“IRP”) and subsequent requests for information, the Companies identified a range of potential future capacity additions based on various scenarios for load, fuel prices, CO<sub>2</sub> emissions prices, and assumptions for future technology options. The planning process is constantly evolving and may be revised as conditions change and as new information becomes available. Before embarking on a particular course of action, the Companies will evaluate market-available alternatives for providing reliable energy while complying with all regulations in a least-cost manner, including the recently proposed Federal Implementation Plan to help meet the EPA’s “good neighbor” requirements for reducing ozone-forming emissions of Nitrogen oxides. Such actions will be supported by specific analyses and will be subject to the appropriate regulatory approval processes.

The Companies plan to purchase the energy output of the following two solar facilities in Kentucky. Each project’s development is ongoing with milestones to clear before completion.

- 100 MW in Hardin County anticipated to be in service in 2023.
- 125 MW in McCracken County anticipated to be in service in 2025.

---

**ITEM NO. 13**

**RESPONDENT: Ashley Vinson**

13. The following transmission energy data for the just completed calendar year and the forecast for the current year and the following four years:
- a. Total energy received from all interconnections and generation sources connected to the transmission system.
  - b. Total energy delivered to all interconnections on the transmission system.
  - c. Peak load capacity of the transmission system.
  - d. Peak demand for summer and winter seasons on the transmission system.

Response:

Data exists for 2021. The Company does not forecast this type of data; therefore, no forecast exists for 2022-2026.

- a. LG&E and KU operate as a single NERC Balancing Area that contains several generators not owned by LG&E and KU, which are also included as sources below:

Tie Lines Received (MWH)	20,088,205
Net Generation-LG&E (MWH)	13,008,477
Net Generation-KU (MWH)	20,325,236
Net Generation-KMPA (MWH)	43,581
Net Generation-EKPC (MWH)	<u>177,015</u>
Total Sources (MWH)	53,642,514

- b. LG&E and KU operate as a single Balancing Area; the amount of energy delivered at the interconnections of the single Balancing Area was 18,159,445 MWH(s).

- c. There is no set number for peak load capacity for the transmission system. The system is built to support Network Service and long-term firm Point-to-Point customers in accordance with the LG&E/KU Transmission Planning Guidelines. Actual transmission capacity available for Network Customers, import, export, or thru flow will vary depending on which facilities (generation, load or transmission) in the interconnected transmission system of the eastern interconnect are connected and operating at any given time.
- d. The maximum summer peak transmission load for the combined LG&E/KU transmission system was 7,239 MW for the peak hour of 8/12/2021 at 4:00 p.m.

The maximum winter peak transmission load for the combined LG&E/KU transmission system was 6,521 MW for the peak hour of 2/17/2021 at 9:00 a.m.

**Discussion Regarding the Consideration Given to Price Elasticity in the  
Forecasted Demand, Energy and Reserve Margin Information  
Provided with Annual Resource Assessment Filings  
2022**

**RESPONDENT: Tim Jones**

Price elasticity of demand is a direct input into the Louisville Gas and Electric Company and Kentucky Utilities Company (collectively “the Companies”) Residential and General Service (small commercial) forecast models. These models use Itron’s Statistically Adjusted End Use (“SAE”) Models. The elasticity coefficients used in the SAE models are applicable to shorter-term forecasting (up to 10 years). Over the longer-term, the implied elasticity estimate increases (in absolute value) in the SAE models due to assumed improvements in the efficiencies and saturations of appliances and other equipment to appropriately adjust demand.

In developing the elasticity coefficients, the Companies have consulted multiple sources to better understand how customers respond to electricity prices. While Itron remains the primary source of price elasticity coefficients, the Companies have also reviewed available studies to assess the reasonableness of the price elasticity coefficients used in the forecast models.<sup>1</sup> The Companies’ price elasticity of demand coefficients are consistent with the ranges cited in the studies.

Currently, the Companies use an elasticity coefficient of -0.1 for the Residential forecast. Below, the residential price elasticity of demand is applied in a simple example to determine the impact on customer usage for a hypothetical customer, price, and price increase.

Inputs

Electricity Price: \$0.08/kWh

Monthly customer usage: 1,000 kWh

Price increase: 5%

Price Elasticity of demand: -0.1

Formula

(price elasticity of demand) = (% change in quantity demanded) / (% change in price)

Restated as:

(% change in quantity demanded) = (% change in price) x (price elasticity of demand)

---

<sup>1</sup> “Price Elasticity for Energy Use in Buildings in the United States”, Energy Information Administration (2021); “Regional Differences in the Price-Elasticity of Demand for Energy” by M.A. Bernstein and J. Griffin, RAND Corporation for NREL (2006); “Price Responsiveness in the AEO2003 NEMS Residential and Commercial Buildings Sector Models” by S. Wade, Energy Information Administration (2005); “Price Elasticity of Demand for Electricity: A Primer and Synthesis” by B. Neenan, EPRI (2007) ; “Trends in Regional U.S. Electricity and Natural Gas Price Elasticity” by V. Niemyer, EPRI (2010); “A Global Survey of Electricity Demand Elasticities” by C. Dahl was presented at the 34th IAEE International Conference: Institutions, Efficiency, and Evolving Energy Technologies in June 2011 at the Stockholm School of Economics in Sweden.

Results

Completing the equation based on the inputs above:

$$(\% \text{ change in quantity demanded}) = (.05) \times (-0.1) = -0.005 = -0.5\%$$

Therefore, the revised monthly customer usage is 0.5% less than 1,000 kWh, or 995 kWh per month.

The Companies currently use a price elasticity of demand of -0.15 for small commercial customers. The Companies' forecasts for Large Commercial and Industrial customers also consider how customers respond to energy prices, but these forecasts do not use the SAE models to incorporate explicit price elasticity of demand coefficients. Instead, the Companies' forecast the largest customers' energy and demand on an individual basis and use specific industry indices for others. Recognizing that customers may respond to price through efficiency measures or other operational changes, these individual forecasts and indices inherently reflect the expected changes in customers' energy use due to economic inputs, including the price of electricity. The Companies recognize that larger commercial and industrial customers may not display a smooth reduction in usage as prices rise. Over the longer-term, in extreme cases, some large energy intensive customers may even cease operations or relocate upon reaching certain energy price points.
