

PATTERSON & DEWAR ENGINEERS, INC.

Norcross, Georgia

PRIMARY ANALYSIS – ELECTRIC DISTRIBUTION

Output Legend

LINE SECT	Indicates substation, circuit or line section
+	Denotes adjacent line section and portion of distribution line is operating at the voltage level of 14.4/24.94 kV. All other lines are operating at the nominal voltage level of 12.5kV unless otherwise indicated.
PRIOR SECT	Denotes parent line or line section that feeds the line section indicated to the left.
MILES	Indicates the total accumulated distance from the substation or power source to the end of the line section at the far left.
CONS	Indicates the total number of consumers being served from the source end of the line section to the end of the circuit including all branches.
PHS	Number of primary phases
WIRE CONSTR-N	The conductor wire size or designation for line section or “NODE” section containing capacitor (CAP), or voltage regulator (REGU). Node line sections are used for substation circuit or feeder designations, and for locations of possible sectionalizing devices.

Output Legend (Continued)

MX 3P FAULT	Denotes maximum three-phase fault in amperes at the load end of the indicated line section or substation bus.
MX LLG FAULT	Denotes maximum phase to phase to ground (LLG) fault in amperes at the end of the indicated line section or substation bus. It is provided because typically LLF faults are the worst/maximum conditions at the substation bus.
MX LG FAULT	Denotes maximum phase to ground fault in amperes at the end of the indicated line section or substation bus.
MN LG FAULT	Denotes minimum phase to ground fault in amperes at the end of the indicated line section or substation bus assuming a 40 ohm high resistive (R) ground fault condition for overhead lines and 15 ohm resistance for underground lines, unless otherwise indicated.
TOTAL kW	Denotes the total calculated peak demand in kilowatts being served by and through the indicated substation, circuit or line section as the case may be.
EQUIV AMPS	Equivalent line amperes for total peak kilowatts shown for line section based on estimated power factor.
% CAP	Percent of conductor current loading in line section of its maximum published rating based on quoted ambient temperature and wind condition.
LINE DROP	Denotes the calculated voltage drop within the line section based on the total load down-line of the line section plus 50% of the load within the line section.
TOTAL DROP	Denotes the total accumulated voltage drop from the substation bus to the load-end of the line section and/or circuit.

Output Legend (Continued)

LINE LOSS Denotes the calculated primary line losses in dollars per year (\$/yr) for the line section indicated. The total losses for each circuit, substation and total system are also shown at the end of each location.

Power Factor Denotes the average power factor estimated for the load period and for the substation area during the system peak conditions.

Load Factor Indicates the calculated system annual load factor (ALF) for the calendar year that the consumer billing data was obtained. It was calculated from operating report data using the following equation:

$$ALF = (\text{Total kwh's purchased}) / (8760 \text{ hours per year})(\text{kW peak demand})$$

Loss Factor A number that is calculated using the annual load factor (ALF) per the following equation from RUS bulletins:

$$\text{Loss Factor} = 0.84(ALF)^2 + 0.16(ALF)$$

COST The calculated average cost per kilowatt-hour of energy based on the total annual power cost divided by the total kilowatt-hours (kwh's) purchased. Facility charges are also included where appropriate.

The POWER FACTOR, LOAD FACTOR, LOSS FACTOR and COST are listed at the bottom of each page printout.
