

Appendix A  
Educational Background, Research, and Related Business Experience  
J. Randall Woolridge

J. Randall Woolridge is a Professor of Finance and the Goldman, Sachs & Co. and Frank P. Smeal Endowed Faculty Fellow in Business Administration in the College of Business Administration of the Pennsylvania State University in University Park, PA. In addition, Professor Woolridge is Director of the Smeal College Trading Room and President and CEO of the Nittany Lion Fund, LLC.

Professor Woolridge received a Bachelor of Arts degree in Economics from the University of North Carolina, a Master of Business Administration degree from the Pennsylvania State University, and a Doctor of Philosophy degree in Business Administration (major area-finance, minor area-statistics) from the University of Iowa. He has taught Finance courses including corporation finance, commercial and investment banking, and investments at the undergraduate, graduate, and executive MBA levels.

Professor Woolridge's research has centered on empirical issues in corporation finance and financial markets. He has published over 35 articles in the best academic and professional journals in the field, including the *Journal of Finance*, the *Journal of Financial Economics*, and the *Harvard Business Review*. His research has been cited extensively in the business press. His work has been featured in the *New York Times*, *Forbes*, *Fortune*, *The Economist*, *Barron's*, *Wall Street Journal*, *Business Week*, *Investors' Business Daily*, *USA Today*, and other publications. In addition, Dr. Woolridge has appeared as a guest to discuss the implications of his research on CNN's *Money Line*, CNBC's *Morning Call* and *Business Today*, and Bloomberg's *Morning Call*.

Professor Woolridge's stock valuation book, *The StreetSmart Guide to Valuing a Stock* (McGraw-Hill, 2003), was released in its second edition. He has also co-authored *Spinoffs and Equity Carve-Outs: Achieving Faster Growth and Better Performance* (Financial Executives Research Foundation, 1999) as well as a textbook entitled *Basic Principles of Finance* (Kendall Hunt, 2011).

Professor Woolridge has also consulted with corporations, financial institutions, and government agencies. In addition, he has directed and participated in university- and company-sponsored professional development programs for executives in 25 countries in North and South America, Europe, Asia, and Africa.

Over the past twenty-five years Dr. Woolridge has prepared testimony and/or provided consultation services in regulatory rate cases in the rate of return area in following states: Alaska, Arizona, California, Colorado, Connecticut, Delaware, Florida, Hawaii, Indiana, Kansas, Kentucky, Massachusetts, Missouri, Nebraska, New Jersey, New York, Ohio, Oklahoma, Pennsylvania, South Carolina, Texas, Utah, Vermont, Washington, and Washington, D.C. He has also prepared testimony which was submitted to the Federal Energy Regulatory Commission.

### **Research**

Dr. Woolridge has published over 35 articles in the best academic and professional journals in the field, including the *Journal of Finance*, the *Journal of Financial Economics*, and the *Harvard Business Review*.

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1           Most of the attention given to the accuracy of analysts' EPS forecasts comes  
2 from media coverage of companies' quarterly earnings announcements. When  
3 companies' announced earnings beat Wall Street's EPS estimates ("a positive  
4 surprise"), their stock prices usually go up. When a company's EPS figure misses or  
5 is below Wall Street's forecasted EPS ("a negative surprise"), their stock price  
6 usually declines, sometimes precipitously so. Wall Street's estimate is the  
7 consensus forecast for quarterly EPS made by analysts who follow the stock as of  
8 the announcement date. And so Wall Street's so-called "estimate" is analysts'  
9 consensus quarterly EPS forecast made in the days leading up to the EPS  
10 announcement.

11           In recent years, it has become more common for companies to beat Wall  
12 Street's quarterly EPS estimate. A *Wall Street Journal* article summarized the results  
13 for the first quarter of 2012: "While this "positive surprise ratio" of 70% is above  
14 the 20 year average of 58% and also higher than last quarter's tally, it is just  
15 middling since the current bull market began in 2009. In the past decade, the ratio  
16 only dipped below 60% during the financial crisis. Look before 2002, though, and  
17 70% would have been literally off the chart. From 1993 through 2001, about half  
18 of companies had positive surprises."<sup>1</sup> Figure 1 below provides the record for  
19 companies beating Wall Street's EPS estimate on an annual basis over the past  
20 twenty-five years.

Figure 1  
Percent of Companies Beating Wall Street's Quarterly Estimates

A. RESEARCH ON THE ACCURACY OF ANALYSTS' NEAR-TERM EPS ESTIMATES

There is a long history of studies that evaluate how well analysts forecast near-term EPS estimates and long-term EPS growth rates. Most of these studies have evaluated the accuracy of earnings forecasts for the current quarter or year. Many of the early studies indicated that analysts make overly optimistic EPS earnings forecasts for quarter-to-quarter EPS (Stickel (1990); Brown (1997); Chopra (1998)).<sup>2</sup> More recent studies have shown that the optimistic bias tends to be larger for longer-term forecasts and smaller for forecasts made nearer to the EPS announcement date. Richardson, Teoh, and Wysocki (2004) report that the

<sup>2</sup> S. Stickel, "Predicting Individual Analyst Earnings Forecasts," *Journal of Accounting Research*, Vol. 28, 409-417, 1990. Brown, L.D., "Analyst Forecasting Errors: Additional Evidence," *Financial Analysts Journal*, Vol. 53, 81-88, 1997, and Chopra, V.K., "Why So Much Error in Analysts' Earnings Forecasts?" *Financial Analysts Journal*, Vol. 54, 30-37 (1998).

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 upward bias in earnings growth rates declines in the quarters leading up to the  
2 earnings announcement date.<sup>3</sup> They call this result the “walk-down to beatable  
3 analyst forecasts.” They hypothesize that the walk-down might be driven by the  
4 “earning-guidance game,” in which analysts give optimistic forecasts at the start  
5 of a fiscal year, then revise their estimates downwards until the firm can beat the  
6 forecasts at the earnings announcement date.

7 However, two regulatory developments over the past decade have  
8 potentially impacted analysts' EPS growth rate estimates. First, Regulation Fair  
9 Disclosure (“Reg FD”) was introduced by the Securities and Exchange  
10 Commission (“SEC”) in October of 2000. Reg FD prohibits private  
11 communication between analysts and management so as to level the information  
12 playing field in the markets. With Reg FD, analysts are less dependent on gaining  
13 access to management to obtain information and, therefore, are not as likely to  
14 make optimistic forecasts to gain access to management. Second, the conflict of  
15 interest within investment firms with investment banking and analyst operations  
16 was addressed in the Global Analysts Research Settlements (“GARS”). GARS,  
17 as agreed upon on April 23, 2003, between the SEC, NASD, NYSE and ten of the  
18 largest U.S. investment firms, includes a number of regulations that were  
19 introduced to prevent [investment bankers](#) from pressuring [analysts](#) to provide  
20 favorable projections.

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1           The previously cited *Wall Street Journal* article acknowledged the impact of  
2           the new regulatory rules in explaining the recent results:<sup>4</sup> “What changed? One  
3           potential reason is the tightening of rules governing analyst contacts with  
4           management. Analysts now must rely on publicly available guidance or, gasp,  
5           figure things out by themselves. That puts companies, with an incentive to set the  
6           bar low so that earnings are received positively, in the driver's seat. While that  
7           makes managers look good short-term, there is no lasting benefit for buy-and-hold  
8           investors.”

9           These comments on the impact of regulatory developments on the  
10          accuracy of short-term EPS estimates were addressed in a study by Hovakimian  
11          and Saenyasiri (2010).<sup>5</sup> The authors investigate analysts’ forecasts of annual  
12          earnings for the following time periods: (1) the time prior to Reg FD (1984-2000);  
13          (2) the time period after Reg FD but prior to GARS (2000-2002);<sup>6</sup> and (3) the  
14          time period after GARS (2002-2006). For the pre-Reg FD period, Hovakimian  
15          and Saenyasiri find that analysts generally make overly optimistic forecasts of  
16          annual earnings. The forecast bias is higher for early forecasts and steadily  
17          declines in the months leading up to the earnings announcement. The results are  
18          similar for the time period after Reg FD but prior to GARS. However, the bias is  
19          lower in the later forecasts (the forecasts made just prior to the announcement).

<sup>5</sup> A. Hovakimian and E. Saenyasiri, “Conflicts of Interest and Analysts Behavior: Evidence from Recent Changes in Regulation,” *Financial Analysts Journal* (July-August, 2010), pp. 96-107.

<sup>6</sup> Whereas the GARS settlement was signed in 2003, rules addressing analysts’ conflict of interest by separating the research and investment banking activities of analysts went into effect with the passage of NYSE and NASD rules in July of 2002.

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 For the time period after GARS, the average forecasts declined significantly, but a  
2 positive bias remains. In sum, Hovakimian and Saenyasiri find that: (1) analysts  
3 make overly optimistic short-term forecasts of annual earnings; (2) Reg FD had  
4 no effect on this bias; and (3) GARS did result in a significant reduction in the  
5 bias, but analysts' short-term forecasts of annual earnings still have a small  
6 positive bias.

**B. RESEARCH ON THE ACCURACY OF ANALYSTS'  
LONG-TERM EPS GROWTH RATE FORECASTS**

7  
8  
9  
10 There have been very few studies regarding the accuracy of analysts' long-  
11 term EPS growth rate forecasts. Cragg and Malkiel (1968) studied analysts' long-  
12 term EPS growth rate forecasts made in 1962 and 1963 by five brokerage houses  
13 for 185 firms. They concluded that analysts' long-term earnings growth forecasts  
14 are on the whole no more accurate than naive forecasts based on past earnings  
15 growth. Harris (1999) evaluated the accuracy of analysts' long-term EPS  
16 forecasts over the 1982-1997 time period using a sample of 7,002 firm-year  
17 observations.<sup>7</sup> He concluded the following: (1) the accuracy of analysts' long-  
18 term EPS forecasts is very low; (2) a superior long-run method to forecast long-  
19 term EPS growth is to assume that all companies will have an earnings growth  
20 rate equal to historic GDP growth; and (3) analysts' long-term EPS forecasts are  
21 significantly upwardly biased, with forecasted earnings growth exceeding actual  
22 earnings growth by seven percent per annum. Subsequent studies by DeChow, P.,  
23 A. Hutton, and R. Sloan (2000), and Chan, Karceski, and Lakonishok (2003) also

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 conclude that analysts' long-term EPS growth rate forecasts are overly optimistic  
2 and upwardly biased.<sup>8</sup> The Chan, Karceski, and Lakonishok (2003) study  
3 evaluated the accuracy of analysts' long-term EPS growth rate forecasts over the  
4 1982-98 time period. They reported a median IBES growth forecast of 14.5%,  
5 versus a median realized five-year growth rate of about 9%. They also found the  
6 IBES forecasts of EPS beyond two years are not accurate. They concluded the  
7 following: "Over long horizons, however, there is little forecastability in earnings,  
8 and analysts' estimates tend to be overly optimistic."

9 Lacina, Lee, and Xu (2011) evaluated the accuracy of analysts' long-term  
10 earnings growth rate forecasts over the 1983-2003 time period.<sup>9</sup> The study  
11 included 27,081 firm year observations, and compared the accuracy of analysts'  
12 EPS forecasts to those produced by two naïve forecasting models: (1) a random  
13 walk model ("RW") where the long-term EPS (t+5) is simply equal to last year's  
14 EPS figure (t-1); and (2) a RW model with drift ("RWGDP"), where the drift or  
15 growth rate is GDP growth for period t-1. In this model, long-term EPS (t+5) is  
16 simply equal to last year's EPS figure (t-1) times (1 + GDP growth (t-1)). The  
17 authors conclude that using the RW model to forecast EPS in the next 3-5 years  
18 proved to be just as accurate as using the EPS estimates from analysts' long-term  
19 earnings growth rate forecasts. They find that the RWGDP model performs better

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 than the pure RW model, and that both models perform as well as analysts in  
2 forecasting long-term EPS. They also discover an optimistic bias in analysts'  
3 long-term EPS forecasts. In the authors' opinion, these results indicate that  
4 analysts' long-term earnings growth rate forecasts should be used with caution as  
5 inputs for valuation and cost of capital purposes.

**C. ISSUES REGARDING THE SUPERIORITY OF  
ANALYSTS' EPS FORECASTS OVER HISTORIC AND  
TIME-SERIES ESTIMATES OF LONG-TERM EPS GROWTH**

6  
7  
8  
9  
10 As highlighted by the classic study by Brown and Rozeff (1976) and the  
11 other studies that followed, analysts' forecasts of quarterly earnings estimates are  
12 superior to the estimates derived from historic and time-series analyses.<sup>10</sup> This is  
13 often attributed to the information and timing advantage that analysts have over  
14 historic and time-series analyses. These studies relate to analysts' forecasts of  
15 quarterly and/or annual forecasts, and not to long-term EPS growth rate forecasts.  
16 The previously cited studies by Harris (1999), Chan, Karceski, and Lakonishok  
17 (2003), and Lacina, Lee, and Xu (2011) all conclude that analysts' forecasts are  
18 no better than time-series models and historic growth rates in forecasting long-  
19 term EPS. Harris (1999) and Lacina, Lee, and Xu (2011) concluded that historic  
20 GDP growth was superior to analysts' forecasts for long run earnings growth.  
21 These overall results are similar to the findings by Bradshaw, Drake, Myers, and  
22 Myers (2009) that discovered that time-series estimates of annual earnings are  
23 more accurate over longer horizons than analysts' forecasts of earnings. As the

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 authors state, “These findings suggest an incomplete and misleading  
2 generalization about the superiority of analysts’ forecasts over even simple time-  
3 series-based earnings forecasts.”<sup>11</sup>

**D. STUDY OF THE ACCURACY OF ANALYSTS’  
LONG-TERM EARNINGS GROWTH RATES**

4  
5  
6  
7 To evaluate the accuracy of analysts’ EPS forecasts, I have compared  
8 actual 3-5 year EPS growth rates with forecasted EPS growth rates on a quarterly  
9 basis over the past 20 years for all companies covered by the I/B/E/S data base.  
10 In Panel A of page 1 of Exhibit JRW-B1, I show the average analysts’ forecasted  
11 3-5 year EPS growth rate with the average actual 3-5 year EPS growth rate for the  
12 past twenty years.

13 The following example shows how the results can be interpreted. For the  
14 3-5 year period ending the first quarter of 1999, analysts had projected an EPS  
15 growth rate of 15.13%, but companies only generated an average annual EPS  
16 growth rate over the 3-5 years of 9.37%. This projected EPS growth rate figure  
17 represented the average projected growth rate for over 1,510 companies, with an  
18 average of 4.88 analysts’ forecasts per company. For the entire twenty-year  
19 period of the study, for each quarter there were on average 5.6 analysts’ EPS  
20 projections for 1,281 companies. Overall, my findings indicate that forecast errors  
21 for long-term estimates are predominantly positive, which indicates an upward  
22 bias in growth rate estimates. The mean and median forecast errors over the  
23 observation period are 143.06% and 75.08%, respectively. The forecasting errors

---

<sup>11</sup> M. Bradshaw, M. Drake, J. Myers, and L. Myers, “A Re-examination of Analysts’ Superiority Over Time-Series Forecasts,” Working paper, (1999), <http://ssrn.com/abstract=1528987>.

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 are negative for only eleven of the eighty quarterly time periods: five consecutive  
2 quarters starting at the end of 1995 and six consecutive quarters starting in 2006.  
3 As shown in Panel A of page 1 of Exhibit JRW-B1, the quarters with negative  
4 forecast errors were for the 3-5 year periods following earnings declines  
5 associated with the 1991 and 2001 economic recessions in the U.S. Thus, there is  
6 evidence of a persistent upward bias in long-term EPS growth forecasts.

7 The average 3-5 year EPS growth rate projections for all companies  
8 provided in the I/B/E/S database on a quarterly basis from 1988 to 2008 are  
9 shown in Panel B of page 1 of Exhibit JRW-B1. In this graph, no comparison to  
10 actual EPS growth rates is made, and hence, there is no follow-up period.  
11 Therefore, since companies are not lost from the sample due to a lack of follow-  
12 up EPS data, these results are for a larger sample of firms. The average projected  
13 growth rate increased to the 18.0% range in 2004, and has since decreased to  
14 about 14.0%.

15 The upward bias in analysts' long-term EPS growth rate forecasts appears to  
16 be known in the markets. Page 2 of Exhibit JRW-B1 provides an article published  
17 in the *Wall Street Journal*, dated March 21, 2008, that discusses the upward bias in  
18 analysts' EPS growth rate forecasts.<sup>12</sup> In addition, a recent *Bloomberg*  
19 *Businessweek* article also highlighted the upward bias in analysts' EPS forecasts,

<sup>12</sup> Andrew Edwards, "Study Suggests Bias in Analysts' Rosy Forecasts," *Wall Street Journal* (March 21, 2008), p. C6.

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1 citing a study by McKinsey Associates. This article is provided on pages 3 and 4 of  
2 Exhibit JRW-B1. The article concludes with the following:<sup>13</sup>

3 ***The bottom line:** Despite reforms intended to improve Wall Street research, stock*  
4 *analysts seem to be promoting an overly rosy view of profit prospects.*

5  
6 **E. REGULATORY DEVELOPMENTS AND THE ACCURACY**  
7 **OF ANALYSTS' LONG-TERM EARNINGS GROWTH RATES FORECASTS**  
8

9  
10 Whereas Hovakimian and Saenyasiri evaluated the impact of regulations  
11 on analysts' short-term EPS estimates, there is little research on the impact of Reg  
12 FD and GARS on the long-term EPS forecasts of Wall Street analysts. My study  
13 with Patrick Cusatis did find that the long-term EPS growth rate forecasts of  
14 analysts did not decline significantly and have continued to be overly optimistic in  
15 the post-Reg FD and GARS period.<sup>14</sup> Analysts' long-term EPS growth rate  
16 forecasts before and after GARS are about two times the level of historic GDP  
17 growth. These observations are supported by a *Wall Street Journal* article entitled  
18 "Analysts Still Coming Up Rosy – Over-Optimism on Growth Rates is Rampant –  
19 and the Estimates Help to Buoy the Market's Valuation." The following quote  
20 provides insight into the continuing bias in analysts' forecasts:

21 Hope springs eternal, says Mark Donovan, who manages  
22 Boston Partners Large Cap Value Fund. "You would have  
23 thought that, given what happened in the last three years,  
24 people would have given up the ghost. But in large measure  
25 they have not.  
26

<sup>13</sup> Roben Farzad, "For Analysts, Things are Always Looking Up," *Bloomberg Businessweek* (June 14, 2010), pp. 39-40.

<sup>14</sup> P. Cusatis and J. R. Woolridge, "The Accuracy of Analysts' Long-Term EPS Growth Rate Forecasts," Working Paper (July 2008).

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1           These overly optimistic growth estimates also show that,  
2           even with all the regulatory focus on too-bullish analysts  
3           allegedly influenced by their firms' investment-banking  
4           relationships, a lot of things haven't changed. Research  
5           remains rosy and many believe it always will.<sup>15</sup>

6  
7           These observations are echoed in a recent McKinsey study entitled  
8           “Equity Analysts: Still Too Bullish” which involved a study of the accuracy on  
9           analysts long-term EPS growth rate forecasts. The authors conclude that after a  
10          decade of stricter regulation, analysts’ long-term earnings forecasts continue to be  
11          excessively optimistic. They made the following observation (emphasis added):

12          <sup>16</sup>

13           Alas, a recently completed update of our work only reinforces this view—  
14           despite a series of rules and regulations, dating to the last decade, that  
15           were intended to improve the quality of the analysts’ long-term earnings  
16           forecasts, restore investor confidence in them, and prevent conflicts of  
17           interest. For executives, many of whom go to great lengths to satisfy Wall  
18           Street’s expectations in their financial reporting and long-term strategic  
19           moves, this is a cautionary tale worth remembering. This pattern confirms  
20           our earlier findings that analysts typically lag behind events in revising  
21           their forecasts to reflect new economic conditions. When economic  
22           growth accelerates, the size of the forecast error declines; when economic  
23           growth slows, it increases. So as economic growth cycles up and down,  
24           the actual earnings S&P 500 companies report occasionally coincide with  
25           the analysts’ forecasts, as they did, for example, in 1988, from 1994 to  
26           1997, and from 2003 to 2006. Moreover, analysts have been persistently  
27           overoptimistic for the past 25 years, with estimates ranging from 10 to 12  
28           percent a year, compared with actual earnings growth of 6 percent. Over  
29           this time frame, actual earnings growth surpassed forecasts in only two  
30           instances, both during the earnings recovery following a recession. On  
31           average, analysts’ forecasts have been almost 100 percent too high.

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1           To evaluate whether analysts' EPS growth rate forecasts are upwardly  
2           biased for utility companies, I conducted a study similar to the one described  
3           above using a group of electric utility and gas distribution companies. The results  
4           are shown on Panels A and B of page 5 of Exhibit JRW-B1. The projected EPS  
5           growth rates for electric utilities have been in the 4% to 6% range over the last  
6           twenty years, with the recent figures at approximately 5%. As shown, the  
7           achieved EPS growth rates have been volatile and, on average, below the  
8           projected growth rates. Over the entire period, the average quarterly 3-5 year  
9           projected and actual EPS growth rates are 4.59% and 2.90%, respectively.

10           For gas distribution companies, the projected EPS growth rates have  
11           declined from about 6% in the 1990s to about 5% in the 2000s. The achieved  
12           EPS growth rates have been volatile. Over the entire period, the average quarterly  
13           3-5 year projected and actual EPS growth rates are 5.15% and 4.53%,  
14           respectively.

15           Overall, the upward bias in EPS growth rate projections for electric utility  
16           and gas distribution companies is not as pronounced as it is for all companies.  
17           Nonetheless, the results here are consistent with the results for companies in  
18           general -- analysts' projected EPS growth rate forecasts are upwardly biased for  
19           utility companies.

20           **G. VALUE LINE'S LONG-TERM EPS GROWTH RATE FORECASTS**

21           To assess *Value Line's* earnings growth rate forecasts, I used the *Value*  
22           *Line Investment Analyzer*. The results are summarized in Panel A of Page 6 of  
23           Exhibit JRW-B1. I initially filtered the database and found that *Value Line* has 3-

Appendix B  
The Research on Analysts' Long-Term EPS Growth Rate Forecasts

1           5 year EPS growth rate forecasts for 2,333 firms. The average projected EPS  
2           growth rate was 14.70%. This is high given that the average historical EPS  
3           growth rate in the U.S. is about 7%. A major factor seems to be that *Value Line*  
4           only predicts negative EPS growth for 43 companies. This is less than two  
5           percent of the companies covered by *Value Line*. Given the ups and downs of  
6           corporate earnings, this is unreasonable.

7                        To put this figure in perspective, I screened the *Value Line* companies to  
8           see what percent of companies covered by *Value Line* had experienced negative  
9           EPS growth rates over the past five years. *Value Line* reported a five-year historic  
10          growth rate for 2,219 companies. The results are shown in Panel B of page 6 of  
11          Exhibit JRW-B1 and indicate that the average 5-year historic growth rate was  
12          3.90%, and *Value Line* reported negative historic growth for 844 firms which  
13          represents 38.0% of these companies.

14                      These results indicate that *Value Line*'s EPS forecasts are excessive and  
15          unrealistic. It appears that the analysts at *Value Line* are similar to their Wall  
16          Street brethren in that they are reluctant to forecast negative earnings growth.

Appendix C  
Building Blocks Equity Risk Premium

**A. THE BUILDING BLOCKS MODEL**

Ibbotson and Chen (2003) evaluate the ex post historical mean stock and bond returns in what is called the Building Blocks approach.<sup>1</sup> They use 75 years of data and relate the compounded historical returns to the different fundamental variables employed by different researchers in building ex ante expected equity risk premiums. Among the variables included were inflation, real EPS and DPS growth, ROE and book value growth, and price-earnings (“P/E”) ratios. By relating the fundamental factors to the ex post historical returns, the methodology bridges the gap between the ex post and ex ante equity risk premiums. Ilmanen (2003) illustrates this approach using the geometric returns and five fundamental variables – inflation (“CPI”), dividend yield (“D/P”), real earnings growth (“RG”), repricing gains (“PEGAIN”), and return interaction/reinvestment (“INT”).<sup>2</sup> This is shown on page 1 of Exhibit JRW-C1. The first column breaks down the 1926-2000 geometric mean stock return of 10.7% into the different return components demanded by investors: the historical U.S. Treasury bond return (5.2%), the excess equity return (5.2%), and a small interaction term (0.3%). This 10.7% annual stock return over the 1926-2000 period can then be broken down into the following fundamental elements: inflation (3.1%), dividend yield (4.3%), real earnings growth (1.8%), repricing gains (1.3%) associated with higher P/E ratios, and a small interaction term (0.2%).

Appendix C  
Building Blocks Equity Risk Premium

1                   The third column in the graph on page 1 of Exhibit JRW-C1 shows current  
2 inputs to estimate an ex ante expected market return. These inputs include the  
3 following:

4                   CPI – To assess expected inflation, I have employed expectations of the short-  
5 term and long-term inflation rate. Long-term inflation forecasts are available in  
6 the Federal Reserve Bank of Philadelphia’s publication entitled *Survey of*  
7 *Professional Forecasters*. While this survey is published quarterly, only the first  
8 quarter survey includes long-term forecasts of gross domestic product (“GDP”)  
9 growth, inflation, and market returns. In the first quarter 2015 survey, published  
10 on February 13, 2015, the median long-term (10-year) expected inflation rate as  
11 measured by the CPI was 2.1% (see Panel A of page 2 of Exhibit JRW-C1).

12                   The University of Michigan’s Survey Research Center surveys consumers  
13 on their short-term (one-year) inflation expectations on a monthly basis. As  
14 shown on page 3 of Exhibit JRW-C1, the current short-term expected inflation  
15 rate is 2.8%.

16                   As a measure of expected inflation, I will use the average of the long-term  
17 (2.1%) and short-term (2.8%) inflation rate measures, or 2.50%.

18  
19                   D/P – As shown on page 4 of Exhibit JRW-C1, the dividend yield on the S&P  
20 500 has fluctuated from the approximate range of 1.0% to 3.5% from 2000-2014.  
21 Ibbotson and Chen (2003) report that the long-term average dividend yield of the

Appendix C  
Building Blocks Equity Risk Premium

1 S&P 500 is 4.3%.<sup>3</sup> Dividend yields over the past two years have averaged about  
2 2.0%. As of February 2015, the indicated S&P 500 dividend yield was 2.0%. I  
3 will use this figure in my ex ante risk premium analysis.

4 RG – To measure expected real growth in earnings, I use the historical real  
5 earnings growth rate S&P 500 and the expected real GDP growth rate. The S&P  
6 500 was created in 1960 and includes 500 companies which come from ten  
7 different sectors of the economy. On page 5 of Exhibit JRW-C1, real EPS growth  
8 is computed using the CPI as a measure of inflation. The real growth figure over  
9 1960-2014 period for the S&P 500 is 2.9%.

10 The second input for expected real earnings growth is expected real GDP  
11 growth. The rationale is that over the long-term, corporate profits have averaged  
12 5.50% of U.S. GDP.<sup>4</sup> Expected real GDP growth, according to the Federal  
13 Reserve Bank of Philadelphia's *Survey of Professional Forecasters*, is 2.51% (see  
14 Panel B of page 2 of Exhibit JRW-C1, Mean =2.51%).

15 Given these results, I will use 2.75%, for real earnings growth.

16 PEGAIN – PEGAIN is the repricing gain associated with an increase in the P/E  
17 ratio. It accounted for 1.3% of the 10.7% annual stock return in the 1926-2000  
18 period. In estimating an ex ante expected stock market return, one issue is  
19 whether investors expect P/E ratios to increase from their current levels. The P/E  
20 ratios for the S&P 500 over the past 25 years are shown on page 4 of Exhibit

Appendix C  
Building Blocks Equity Risk Premium

1 JRW-C1. The run-up and eventual peak in P/Es in the year 2001 is very evident in  
2 the chart. The average P/E declined until late 2006, and then increased to higher  
3 high levels, primarily due to the decline in EPS as a result of the financial crisis  
4 and the recession. As of February, 2015, the average P/E for the S&P 500 was  
5 17.35X, which is above the historic average.<sup>5</sup> Since the current figure is above  
6 the historic average, a PEGAIN would not be appropriate in estimating an ex ante  
7 expected stock market return.

8 Expected Return from Building Blocks Approach - The current expected  
9 market return is represented by the last column on the right in the graph entitled  
10 “Decomposing Equity Market Returns: The Building Blocks Methodology” set  
11 forth on page 1 of Exhibit JRW-C1. As shown, the expected market return of  
12 7.25% is composed of 2.50% expected inflation, 2.0% dividend yield, and 2.75%  
13 real earnings growth rate.

14 This expected return of 7.25% is consistent with other expected return  
15 forecasts.

- 16 1. In the first quarter 2015 *Survey of Financial Forecasters*, published on  
17 February 13, 2015 by the Federal Reserve Bank of Philadelphia, the  
18 mean long-term expected return on the S&P 500 was 5.79% (see Panel  
19 D of page 2 of Exhibit JRW-C1).
- 20 2. John Graham and Campbell Harvey of Duke University conduct a  
21 quarterly survey of corporate CFOs. The survey is a joint project of

Appendix C  
Building Blocks Equity Risk Premium

1 Duke University and *CFO Magazine*. In the March, 2015 survey, the  
2 mean expected return on the S&P 500 over the next ten years was  
3 7.4%.<sup>6</sup>

4 **B. THE BUILDING BLOCKS EQUITY RISK PREMIUM**

5  
6 The current 30-year U.S. Treasury yield is about 2.50%. This ex ante  
7 equity risk premium is simply the expected market return from the Building  
8 Blocks methodology minus this risk-free rate:

9  
10 Ex Ante Equity Risk Premium = 7.25% - 2.50% = 4.75%

11  
12 This is only one estimate of the equity risk premium. As shown on page 6  
13 of Exhibit JRW-11, I am also using the results of many other studies and surveys  
14 to determine an equity risk premium for my CAPM.

---

<sup>6</sup> The survey results are available at [www.cfosurvey.org](http://www.cfosurvey.org).
