I. INTRODUCTION, QUALIFICATIONS, PURPOSE, AND PREVIEW .....3

II. AMS BENEFIT PROJECTIONS ARE SIGNIFICANTLY OVERSTATED.....9

- A 21-year benefit period is inappropriate
- Assumptions used to determine ePortal benefits are incorrect
- Assumptions used to determine non-technical loss recovery benefits are aggressive
- Cost projections do not include profit and carrying costs on stranded assets

III. THE COMPANIES CAN TAKE ACTIONS TO IMPROVE CUSTOMER BENEFITS.....24

- Default application of the Peak Time Rebate rate feature; PJM/MISO membership?
- High Bill Alert program

IV. ACTIONS THE COMPANIES MIGHT TAKE WILL NOT LIKELY BE SUFFICIENT TO DELIVER BENEFITS IN EXCESS OF COSTS .....34

V. IN THE EVENT IT APPROVES THE AMS PROPOSAL, THE COMMISSION CAN TAKE ACTION TO REDUCE ECONOMIC RISKS TO CUSTOMERS .....37

- Implement a benefit guarantee mechanism
- Limit customers' cost overrun risk
- Prohibit profit and carrying costs on assets stranded by AMS
- Require customer satisfaction features: AMS Opt-Out tariff and "Connect My Data"

VI. SUMMARY AND CONCLUSION.....51

APPENDIX A: CURRICULUM VITAE OF PAUL ALVAREZ.....53

**DIRECT TESTIMONY OF PAUL ALVAREZ**

**I. INTRODUCTION, QUALIFICATIONS, PURPOSE, AND PREVIEW**

**Q. Please state your name and business address.**

A. My name is Paul Alvarez. My business address is Wired Group, PO Box 150963, Lakewood, CO 80215.

**Q. What is your occupation?**

A. I am the President of the Wired Group, a consultancy specializing in the optimization of distribution utility businesses and operations as they relate to grid modernization (including smart meters), demand response, energy efficiency, and renewable generation.

**Q. On whose behalf are you submitting testimony?**

A. I am testifying on behalf of the Kentucky Office of the Attorney General (AG).

**Q. Please describe your work experience and educational background.**

1 A. My career began in 1984 in a series of finance and marketing roles of progressive  
2 responsibility for large corporations, including Motorola’s Communications Division  
3 (now Android/Google), Baxter Healthcare, Searle Pharmaceuticals (now owned by  
4 Pfizer), and Option Care (now owned by Walgreens). My combined aptitude for  
5 finance and marketing were well suited for innovation and product development,  
6 leading to my first job in the utility industry in 2001 with Xcel Energy, one of the  
7 largest investor-owned utilities in the U.S.

8 At Xcel Energy I served as product development manager, overseeing the  
9 development of new energy efficiency and demand response programs for  
10 residential, commercial, and industrial customers, as well as programs in support of  
11 voluntary renewable energy purchases and renewable portfolio standard compliance  
12 (including distributed solar incentive program design and metering policies). There I  
13 learned the economics of traditional monopoly ratemaking and associated utility  
14 economic incentives, as well as the impact of self-generation, energy efficiency, and  
15 demand response on utility shareholders and management decisions. I also learned a  
16 great deal about utility program impact measurement and verification (M & V).

17 I left Xcel Energy to lead the utility practice for sustainability consulting firm  
18 MetaVu in 2008. At MetaVu I employed my M & V experience to lead two  
19 comprehensive, unbiased evaluations of smart grid deployment performance. To my  
20 knowledge these are the only two comprehensive, unbiased evaluations of smart grid  
21 post-deployment performance completed to date. The results of both were part of  
22 regulatory proceedings in the public domain and include an evaluation of the

1 SmartGridCity™ deployment in Boulder, Colorado for Xcel Energy in 2010,<sup>1</sup> and an  
2 evaluation of Duke Energy’s Cincinnati-area deployment for the Ohio Public  
3 Utilities Commission in 2011.<sup>2</sup>

4 In 2012 I started the Wired Group to focus exclusively on distribution utility  
5 businesses and operations as they relate to grid modernization, demand response,  
6 energy efficiency, and renewable generation. Wired Group clients include utilities,  
7 regulators, consumer and environmental advocates, and industry associations. In  
8 addition, I serve as an adjunct professor at the University of Colorado’s Global  
9 Energy Management Program, where I teach an elective graduate course on electric  
10 technologies, markets, and policy. I have also taught at Michigan State University’s  
11 Institute for Public Utilities, where I’ve educated new regulators and staff on grid  
12 modernization and distribution utility performance measurement.

13 Finally, I am the author of Smart Grid Hype & Reality: A Systems Approach  
14 to Maximizing Customer Return on Utility Investment, a book that helps laypersons  
15 understand smart grid capabilities, optimum designs, and post-deployment  
16 performance optimization. I received an undergraduate degree in Finance from  
17 Indiana University’s Kelley School of Business in 1983, and a master’s degree in  
18 Management from the Kellogg School at Northwestern University in 1991. Both  
19 degrees featured concentrations in Finance and Marketing.

---

<sup>1</sup> Alvarez et al, MetaVu. “SmartGridCity™ Demonstration Project Evaluation Summary”. Report submitted to the Colorado Public Utilities Commission in the testimony of Michael G. Lamb, Exhibit MGL-1, proceeding 11A-1001E. Report dated October 21, 2011; filed December 14, 2011.

<sup>2</sup> Alvarez et al, MetaVu. “Duke Energy Ohio Smart Grid Audit and Assessment”. Report to the Staff of the Public Utilities Commission of Ohio in proceeding 10-2326-GE-RDR. June 30, 2011.

1 **Q. Have you appeared before the Kentucky Public Service Commission**  
2 **previously?**

3 A. Yes. I prepared testimony in 2016-00152, Duke Energy’s Certificate of Public  
4 Convenience and Necessity (CPCN) for Smart Meters, on behalf of the AG. This  
5 Case is still pending before the Commission.

6

7 **Q. What experience do you have before other state utility regulatory commissions?**

8 A. I have testified or developed evidence in cases before state utility regulatory  
9 commissions on smart meters, associated rate designs, grid modernization, and  
10 distribution utility performance measures in California, Colorado, Kansas, Maryland,  
11 and Ohio. Brief descriptions of these proceedings, and case numbers for each, are  
12 provided in the “Regulatory Appearances” section of my Curriculum Vitae, attached  
13 as Appendix A.

14

15 **Q. What is the purpose of your testimony in this proceeding?**

16 A. I provide testimony recommending that the Commission reject the Companies’  
17 proposal to install an Advanced Metering System (AMS). This recommendation is  
18 based principally on the fact that the Companies’ benefit projections are overstated,  
19 and that AMS costs are highly likely to exceed customer benefits if the Commission  
20 approves the AMS deployment. I present several supporting arguments, and my  
21 testimony is organized as described immediately below:

- 22 • The AMS customer benefits projected by the Companies are significantly  
23 overstated, unlikely to be achieved, and unlikely to exceed customer costs.

- 1 • The Companies can take additional actions to increase customer benefits  
2 delivered by AMS.
- 3 • These additional actions will not likely be sufficient to deliver a favorable  
4 benefit-cost ratio.
- 5 • In the event it approves the AMS proposal against my recommendation, the  
6 Commission can take action to reduce economic risks to customers.

7

8 **Q. Before you present these arguments, can you please provide your overall**  
9 **impression of the state of AMS in the United States today?**

10 A. Certainly. In general, I believe AMS can deliver economic benefits to customers in  
11 excess of costs under highly specific conditions. The conditions required to deliver  
12 benefits in excess of costs include utilities highly motivated to deliver benefits,  
13 engaged customers conveniently able to take required actions, regulators who  
14 oversee post-deployment benefit delivery, and wholesale markets available for  
15 various parties to capture available economic value. Unfortunately, I have not seen  
16 all these conditions exhibited in any AMS deployment to date. Research that my  
17 teams have conducted to measure benefits from AMS post-deployment indicates  
18 high variability in the level of benefits actually delivered, resulting in unfavorable  
19 benefit-cost ratios for customers.<sup>3</sup>

20

---

<sup>3</sup> Benefit-cost ratios are typically expressed as a ratio of benefits to costs. For example, project benefits of \$20 compared to project costs of \$10 would be expressed as a 2:1 benefit-cost ratio (“favorable”, or “positive” if greater than 1); project benefits of \$5 compared to project costs of \$10 would be expressed as a 0.5:1 benefit-cost ratio (“unfavorable” or “negative” if less than 1).

1 **Q. Tens of millions of AMS meters have been installed in the U.S. in the past few**  
2 **years at a cost in the trillions of dollars. Are you suggesting this investment was**  
3 **wasted?**

4 A. No. There is certainly potential to secure benefits in excess of costs for AMS  
5 systems that have been installed. I simply suggest that the highly specific conditions  
6 required to do so have not yet existed. Investor-owned utilities (IOUs) are highly  
7 motivated to invest capital in their distribution grids, including AMS, and to recover  
8 associated costs and profits as permitted through monopoly regulation. This is  
9 particularly true today; competitive wholesale markets have revealed excess  
10 generation capacity, virtually eliminating utilities' generation investment and profit  
11 opportunities. As IOUs' ability to invest in generation falls, interest in investing in  
12 distribution (and AMS) increases. Other parties stand to gain from AMS investment  
13 as well, from information technology consultants and equipment manufacturers to  
14 governments hoping to stimulate jobs. However, there is no similar economic  
15 motivation for IOUs to secure post-deployment benefits from AMS. The throughput  
16 incentive discourages utilities from pursuing conservation; the Averch-Johnson  
17 effect<sup>4</sup> discourages utilities from avoiding new generation plant construction; and  
18 holding rate cases when costs are falling (as from an AMS deployment) transfers  
19 such benefits to customers from shareholders. Hence my skepticism of the  
20 Company's benefit projections, which I will support throughout this testimony.

21

---

<sup>4</sup> The Averch-Johnson effect, named after the authors of a 1962 paper "Behavior of the Firm Under Regulatory Constraint", describes IOU's capital investment incentive under cost-based ratemaking. To summarize, the Averch-Johnson effect relates IOUs' capital investment incentive – to grow rate bases more than may be required to deliver safe, reliable service – to the fact that IOU profits grow as the size of rate bases grow.

1           **II.   AMS BENEFIT PROJECTIONS ARE SIGNIFICANTLY OVERSTATED**

2  
3           **Q.   Please explain why you believe the Companies’ AMS benefit projections are**  
4           **significantly overstated.**

5           A.   I have carefully examined the Companies’ AMS benefit projections, including  
6           information provided in pre-filed testimony and through discovery. I find three of  
7           the Companies’ specific benefit projections and/or assumptions particularly  
8           troubling, and I will address them individually:

- 9                   •   The Companies calculate benefits assuming AMS will last 21 years,<sup>5</sup> though  
10                   almost all IOUs’ benefit calculations assume a 15-18 year useful AMS life;
- 11                   •   The Companies’ ePortal conservation benefit projections are dramatically  
12                   overstated, for three reasons to be described further below; and
- 13                   •   The Companies’ projections of non-technical loss recovery are overstated.

14  
15           **Q.   Please describe your concern regarding the Companies’ use of a 21-year AMS**  
16           **life to calculate AMS benefits.**

17           A.   It is rational to assume benefits over an asset’s useful life<sup>6</sup> when calculating benefit  
18           projections. Assuming benefits will continue beyond an asset’s useful life overstates  
19           benefits, as an asset is expected to be replaced and/or be otherwise unavailable  
20           beyond its useful life. In AMS business cases, some IOUs assume longer benefit

---

<sup>5</sup> Case Number 2016-00371, Companies’ responses to AG 1- 341-343; 345-346; and 348.

<sup>6</sup> The Financial Accounting Standards Board (FASB) defines useful life as “the period over which an asset is expected to contribute directly or indirectly to future cash flows.” Financial Accounting Standard 142.

1 periods than may be appropriate in order to increase benefit projections. Such  
2 increases are not generally warranted.

3 The generally-accepted useful life for AMS is 15 years. The table below lists  
4 the benefit periods of a number of recent AMS business cases with publicly-  
5 available information. I know of no AMS proposal approved by a regulator in which  
6 an IOU's benefit time period is as long as the Companies'. The longest I know of is  
7 18 years.

IOU	State	Docket	Year	Benefit Years	Customers (millions)	Regulatory Approval?
Ameren	IL	12-0244	2012	18	1.22	Yes
ConEd	NY	15- E0050	2015	18	3.40	Yes
Massachusetts Electric	MA	15-120	2015	15	1.32	TBD
KU/LGE	KY	00370/1	2016	21	0.92	TBD

8

9

10 **Q. Are there other reasons to believe AMS useful life should not exceed 15 years?**

11 A. Yes. The Companies' own depreciation expert acknowledges, "The most consistent  
12 average life within the industry for new technology electric meters is 15 years, with a  
13 maximum life potential life of 25 years."<sup>7</sup>

14

15 **Q. You believe the Companies' 21-year benefit period is too long. But what other  
16 evidence do you have that 15 years is appropriate?**

---

<sup>7</sup> Case Number 2016-00371. Pre-filed direct testimony of Companies' witness John P. Spanos. Page 15, line 7.  
Nov. 23, 2016.

1 A. Actually, there is evidence that a 15-year life for AMS is *too long*. In discovery, the  
2 Companies reported that of the 1,677 AMS meters installed for the Companies’  
3 Responsive Pricing/Smart Meter Pilot from 2007-2009, only 376 are still in service  
4 as of December 31, 2016.<sup>8</sup> This yields a 7-9 year survival rate of only 22.4%. The  
5 Companies explain in discovery that most AMS meters were replaced due to an LCD  
6 display failure. While the AMS meter manufacturer has likely corrected such an  
7 issue by now, the issue is indicative of the more complex and sensitive nature of  
8 electronic meters compared to the traditional mechanical type, and why shorter  
9 useful lives are indeed appropriate and have become the industry standard.

10 As further evidence that a 15-year life for AMS may be too long, I cite AMS  
11 meter manufacturers’ standard 5-year warranty offer, which the Companies  
12 confirmed in discovery.<sup>9</sup>

13

14 **Q, By how much does the use of a 15-year life, rather than the 21-year life assumed**  
15 **by the Companies, impact the Companies’ AMS benefit projections?**

16 A. The impact on the Companies’ benefit projections is extremely significant. In  
17 discovery, the Companies were asked to recalculate benefit projections over a 15-  
18 year useful life rather than the 21-year useful life assumed. In response, the  
19 Companies provided the information used to create the table below.<sup>10</sup>

---

<sup>8</sup> Case Number 2016-00371. Response to AG DR 2-94.

<sup>9</sup> Case Number 2016-00371. Companies’ response to AG DR 1-328

<sup>10</sup> Case Number 2016-00371. Companies’ response to AG DR 1-339

	Nominal Benefits	Present Value of Benefits
15-year useful life	\$713.4 million	\$343.4 million
20-year useful life <sup>11</sup>	\$1,019.8 million	418.1 million
	(\$306.4 million)	(\$74.7 million)

1

2 **Q. Please explain why you believe the Companies' ePortal benefit projections are**  
3 **dramatically overstated.**

4 A. As the author of the paper cited by the Companies regarding ePortal benefit  
5 calculations,<sup>12</sup> I am familiar with the role of, and the research on, energy usage data  
6 feedback in energy conservation. I identify three significant errors, and one  
7 significant observation, in the Companies' ePortal benefit projections:

- 8 • The Companies' assumption regarding the rate at which customers will  
9 access the ePortal is extremely high and not supportable.
- 10 • The level of conservation benefit assumed per ePortal visitor is not supported  
11 by energy usage data feedback research.
- 12 • The Companies used customers' energy bills, rather than fuel costs, as the  
13 basis for ePortal conservation benefit projections.
- 14 • The Companies have no incentive to maximize the energy conservation  
15 potential of the ePortal benefits.

---

<sup>11</sup> Case Number 2016-00371. Exh. JPM-1, page 38.

<sup>12</sup> Smart Grid Consumer Collaborative. *Smart Grid Economic and Environmental Benefits*. Secondary research conducted by the Wired Group. October 8, 2013.

1

2 **Q. Please explain why the Companies' assumption about the rate at which**  
3 **customers will access the ePortal is extremely high and not supportable.**

4 A. The Companies assume 48% of customers will access its ePortal, and that 36% of  
5 these visitors will conserve energy through the use of the portal, yielding an effective  
6 ePortal customer access rate of 17.3% (48% x 36%). The 48% figure appears to  
7 originate from Company experience with its existing DSM-EE "AMS Customer  
8 Offering". The Company reported "My Meter Welcome Site" page views of 1,821  
9 to 2,125<sup>13</sup> (depending on how one counts) from the 4,181 customers enrolled/4,072  
10 AMS meters installed in the program,<sup>14</sup> which is roughly equivalent to 48%.  
11 However, customers participating in the AMS Customer Offering are the most  
12 engaged and interested energy consumers the Companies serve. Indeed, the 4,181  
13 customers enrolled in the program since its inception (June, 2015) amount to a  
14 participation rate of less than ½ of 1% of the Companies' customers (916,220).<sup>15</sup>  
15 This level of participation is consistent with my experience, and much closer to what  
16 an ePortal offered to all customers might experience. For the Companies to have  
17 extrapolated the ePortal access rate of the most engaged customers – the top 1/2 of  
18 1% -- to *all* Customers in the Companies' service territories is aggressive, to say the  
19 least.

---

<sup>13</sup> Case Number 2014-0003. "Advanced Metering Systems 2016 Annual Report". January 31, 2017. Page 4.

<sup>14</sup> Ibid, page 3

<sup>15</sup> Case Number 2016-00371. Companies' response to AG DR1-329c.

1 In addition, the Welcome Site page view counts are much higher than the  
2 page views of all the other available “My Meter” applications with true conservation  
3 potential:<sup>16</sup>

“My Meter” page	Page views	Unique Page views
“Charts View”	59	56
“Data View”	50	47
“Notifications”	48	42
“Profile”	44	41

4  
5 Considering that a single participant could likely access all four of these  
6 pages in a single My Meter visit, it’s certainly possible that as few as 60 customers  
7 have ever used My Meter portal functions out of more than 900,000 customers  
8 served by the Companies.

9  
10 **Q. Please explain why the Companies’ conservation benefit per ePortal visitor is**  
11 **not supported by energy usage data feedback research.**

12 A. The secondary research report I authored for the Smart Grid Consumer Collaborative  
13 cited research indicating that conservation levels (energy use reductions) of 5% to  
14 15% are available from energy usage data feedback.<sup>17</sup> These particular levels of  
15 conservation were recorded in research of electric and gas customers with access to

---

<sup>16</sup> Case Number 2014-0003. “Advanced Metering Systems 2016 Annual Report”. January 31, 2017. Page 4.

<sup>17</sup> Darby, S. “Literature review for the Energy Demand Research Project.” Environmental Change Institute, University of Oxford. In Home Displays, pages 13-19.

1 in-home energy displays, which conveniently, continuously, and conspicuously  
2 advised participants of their energy use in real time. The Companies' propose no  
3 such displays as part of their AMS or ePortal offering, and thus cannot claim  
4 significant conservation benefits from ePortal visitors.<sup>18</sup>

5 To their credit, the Companies assume only a 3% level of conservation  
6 benefit among those customers who access their energy usage data from a portal.<sup>19</sup>  
7 However, I know of no well-controlled study which indicates that accessing energy  
8 usage data via an internet-based portal delivers any statistically significant  
9 conservation benefits at all.

10  
11 **Q. Please explain why the use of customer bills, rather than fuel costs, as the basis**  
12 **for ePortal conservation benefits projections overstates those projections.**

13 A. I note that the Companies base conservation benefits from the ePortal on the size of  
14 an average customer's bill.<sup>20</sup> While this approach may be appropriate in calculating  
15 conservation benefits for any individual customer in the short term, this approach is  
16 incorrect for calculating customer-wide benefits in the long term.

17  
18 **Q. Please explain.**

---

<sup>18</sup> An in-home display is a device which can be placed in a conspicuous location in a customer's home. Energy usage is displayed prominently, continuously, and in near real-time. Contrast this to a website, which requires customers to 1) consider visiting the site; 2) sit down at a computer (which not all customers own); 3) register (to link their computer securely to their meter's data) and, finally, 4) examine usage data (which, quite importantly, is only available on a one-day lag in most AMS deployments). The difference in usage impact between an in-home display and a portal is readily apparent.

<sup>19</sup> Case Number 2016-00371. Exh. JPM-1, page 157.

<sup>20</sup> Ibid, page 157.

1 A. The Companies base their conservation benefit assumptions on an average  
2 customer's bill.<sup>21</sup> By extension, this means the Companies assume a 3%  
3 conservation effect will deliver economic benefits to customers equal to 3% of the  
4 Companies' costs.

5 In reality, however, electric conservation only reduces the Companies' fuel  
6 costs. Conservation does not reduce any other costs. As fuel costs are passed along  
7 to customers on a dollar-for-dollar basis in Kentucky, reductions in Company fuel  
8 costs directly benefit customers in the short term and the long term. However, since  
9 conservation does not reduce the Companies' fixed costs, nor any other costs  
10 recovered through a rate assessed per kWh sold, the Companies' assumption that a  
11 3% conservation effect will result in a 3% bill reduction is only correct in the short  
12 term, until the next rate case. At that point, after rates are adjusted for changes in the  
13 volume of kWh sold, the only conservation benefits customers will continue to enjoy  
14 are fuel cost reductions. As fuel costs are the only actual cost reductions from  
15 conservation, only fuel costs should be included in the Companies' ePortal  
16 conservation benefit projections.

17  
18 **Q. Thank you for describing the three errors in the Companies' ePortal benefit**  
19 **calculations. Please explain your significant observation.**

20 A. My significant observation is that ePortal conservation is not in the Companies' best  
21 economic interest, as it will result in decreased sales. As difficult as achieving the  
22 ePortal benefits projected by the Companies will be, due to the challenges I describe

---

<sup>21</sup> Case Number 2016-00371. Exh. JPM-1. Page 157.

1 above, the Companies have no economic interest in overcoming these challenges.  
2 With no incentive and significant challenges, there is little hope the Companies will  
3 secure tens of millions of dollars in associated conservation benefits.  
4

5 **Q. Thank you for explaining the four deficiencies you perceive in the Companies’**  
6 **ePortal benefit projections. Is the impact of these deficiencies on the**  
7 **Companies’ benefit projections significant?**

8 A. Yes, they are very significant. In discovery, I asked the Companies to calculate  
9 ePortal benefit projections using assumptions I believe are more appropriate.  
10 Despite my hesitance to attribute any benefit at all to online usage data availability,  
11 but giving the Companies the benefit of doubt, I requested nominal and present value  
12 benefit projections on three sets of ePortal assumptions. The benefit projections  
13 calculated by the Companies for my scenarios,<sup>22</sup> along with the ePortal benefits  
14 originally projected by the Companies,<sup>23</sup> are presented in the table below.  
15  
16  
17  
18  
19

---

<sup>22</sup> Case Number 2016-00371. Companies’ response to AG2-99a, 99b, and 99c.

<sup>23</sup> Case Number 2016-00371. Exh. JPM-1. Page 38.

Scenario	Description	Nominal Benefit	Present Value Benefit
Alvarez Likely	2% portal access, 3% conservation effect, fuel cost benefit only	\$5.5 million	\$2.2 million
Alvarez Stretch Goal	5% portal access, 3% conservation effect, fuel cost benefit only	\$13.8 million	\$5.5 million
Alvarez Highly Unlikely	5% portal access, 5% conservation effect, fuel cost benefit only	\$23.0 million	\$9.2 million
Companies' Original	17% portal access, 3% conservation effect, full bill benefit	\$166.3 million	\$66.6 million

Reduction, Highly Unlikely vs. Companies' Original: (\$143.3 million) (\$57.4 million)

1

2 **Q. Please describe the concept of non-technical loss.**

3 **A.** Non-technical loss, also known as unaccounted-for energy, is energy that is not  
4 billed. Theft and meter malfunction are the largest sources of non-technical loss.<sup>24</sup>

5

6 **Q. Please describe your concerns regarding the Companies' non-technical loss  
7 recovery benefit projections.**

8 **A.** In the AMS business cases I have reviewed, the benefit projections for non-technical  
9 loss (NTL) recovery are among the most variable of any AMS capability. However,  
10 of all the AMS business cases I have ever reviewed, the Companies' non-technical

<sup>24</sup> Case Number 2016-00317. Exh. JPM-1. Page 35.

1 loss recovery benefit projections are among the most aggressive. The Companies  
 2 assume both a high level of non-technical losses to begin with (2%), as well as a high  
 3 loss recovery rate (36%).<sup>25</sup> In the table below I have summarized the non-technical  
 4 loss and recovery rate assumptions of recent AMS business cases with publicly-  
 5 available information.

	State	Docket	Year	Stated Theft & Recovery Assumptions	PV of NTL Recovery (millions)	Recent Year 12 months' electric revenues (billions) <sup>26</sup>
Ameren	IL	12-0244	2012	Theft = 1%; recovery = 25%	19.8	1.683
ConEd	NY	15-E0050	2015	Theft = 1%; recovery = 25%	870.0	8.172
Mass Electric	MA	15-120	2015	Theft = 1.5% Res, 1.0% Comm'l; recovery n/a	168.7	2.522
KU/LG&E	KY	2016-00370/371	2016	NTL = 2%; recovery = 36%	195.3 <sup>27</sup>	2.438 <sup>28</sup>

6  
 7 Also of significant interest on this issue is a presentation provided by the  
 8 Companies in discovery to the Association for Community Ministries. This

<sup>25</sup> Case Number 2016-00371. Exh. JPM-1. Page 158.

<sup>26</sup> SEC Forms 10-K unless otherwise noted. Ameren 2015; Consolidated Edison 2015.

<sup>27</sup> Case Number 2016-00371. Exh. JPM-1. Page 38.

<sup>28</sup> Case Number 2016-00371. Companies' response to PSC DR 1-54 for KU + LG&E, tab "SCH C-1".

1 presentation appears to be the final product of a work team, assisted by Accenture  
2 Consulting, assigned to develop a business case for smart meters/grid for E-On/US,  
3 former owners of KU/LG&E. Dated May 6, 2009, the report estimates the 25-year  
4 present value of combined “system losses” and “revenue protection” benefits to be  
5 only \$28 million.<sup>29</sup> It is notable that just a few years ago, a team investigating the  
6 net technical loss recovery benefits from AMS for KU/LG&E found those benefits to  
7 be less than 15% of the benefits cited by the Companies in the current AMS business  
8 case. I should also point out that “system losses” could mean technical (as opposed  
9 to non-technical) losses, making the AMS non-technical loss recovery benefit appear  
10 even more aggressive relative to the 2009 E-On/US estimate.

11  
12 **Q. How great an overstatement do you believe is included in the Companies’ non-**  
13 **technical loss recovery benefit projection?**

14 A. It is difficult to say. Both the amount of non-technical losses and the ability to  
15 recover them are true unknowns, not just for the Companies but for the entire  
16 industry. The research cited by the Companies in their non-technical loss recovery  
17 benefit indicates that non-technical losses probably range between 1.65% and 2.15%  
18 among U.S. electric utilities.<sup>30</sup> A simple average of this range is 1.9% in non-  
19 technical losses to be recovered, which is only slightly below the Company’s  
20 assumption of 2% (though 1.9% is well above the 1% to 1.5% cited in recent AMS  
21 business cases, as indicated in the chart above). In addition, it seems that a 25% non-

---

<sup>29</sup> Case Number 2016-00371. Companies’ response to ACM DR 1-33. Page 14.

<sup>30</sup> 2008, EPRI, “Advanced Metering Infrastructure Technology: Limiting Non-Technical Distribution Losses In The Future” p. 1-18.

1 technical loss recovery rate is more typical among IOUs than the 36% assumed by  
 2 the Companies; so splitting the difference with a 30% recovery rate seems  
 3 appropriate. Using these more conservative assumptions, I compare the nominal and  
 4 present values I estimated to the Companies' estimates in the table below.

5

	Nominal Value	Present Value
Projections using more conservative assumptions (1.9% theft, 30% recovery)	\$362.9 million	\$182.9 million
Companies' Benefit Projection (2.0% theft, 36% recovery)	\$488.5 million	\$195.3 million
Reductions from Companies' benefit projections	(\$125.6 million)	(\$12.4 million)

6

7

8 **Q. Have you found other AMS benefits projected by the Companies to be**  
 9 **overstated?**

10 A. No. Given my experience, I believe the other AMS benefit projections are  
 11 reasonable. However I point out that certain AMS benefits, such as operating  
 12 expense reductions and the afore-mentioned non-technical loss recovery, will not  
 13 result in reduced customer rates without a rate case in which full benefits are  
 14 reflected in test year accounting records. The Companies can manipulate this  
 15 opportunity to shareholder advantage and customer detriment. I will return to this

1 issue later in my testimony, as it has significant potential to negatively impact  
2 customer benefits from an AMS deployment.

3  
4 **Q. What about the Companies' cost projections? Do you believe those are**  
5 **reasonable?**

6 A. Yes. Given my experience, I believe the Companies' AMS cost projections to be  
7 reasonable, with one fairly significant exception. The Companies do not appear to  
8 have included profits and other carrying costs on in-service meters which will be  
9 retired prematurely in the event of an AMS deployment. Absent a Commission  
10 ruling prohibiting the collection of profits and other carrying costs on these stranded  
11 assets, the Companies will attempt to recover associated carrying costs and profits in  
12 some future rate case. My estimate, based on information provided by the Company  
13 in discovery,<sup>31</sup> is that carrying costs and profits on these assets will be \$26.3 million  
14 on a nominal basis and \$15.4 million on a present value basis. I believe these costs  
15 should be included in the Companies' AMS cost projections, and I believe the  
16 Commission should prohibit recovery of profits and carrying costs on stranded assets  
17 if it approves the Companies' AMS proposal against my recommendation. I will  
18 return to this issue later in my testimony. The table below summarizes the  
19 adjustment to the Companies' benefit-cost analysis:

20  
21  

---

<sup>31</sup> PSC 2016-00371. Companies' response to AG DR-2, Q 70. Attachment Tab "Outputs-Recommendations".

	Nominal Value	Present Value
Stranded Asset Carrying Cost Estimate	\$26.3 million	\$15.4 million
Stranded Asset Carrying Costs Estimated by the Companies	\$0.0 million	\$0.0 million
Increase in the Companies' cost projections	\$26.3 million	\$15.4 million

1

2

3

4

5

6

7

8

I have one more concern related to the Companies' cost projections. While the cost projections appear reasonable based on my experience, I have observed that actual AMS deployment costs frequently, if not usually, exceed budgets. I have also observed that regulators almost never disallow recovery of AMS cost overruns. I will also return to this issue later in my testimony, as it has the potential to negatively impact customer benefit-cost ratios.

1                   **III. THE COMPANIES CAN TAKE ACTIONS TO IMPROVE**  
2   **CUSTOMER BENEFITS**  
3

4 **Q. Are there actions the Companies can take to improve the benefits delivered by**  
5 **an AMS deployment?**

6 A. Yes. I believe there are two valuable programs the Companies could implement  
7 which provide an opportunity to increase the benefits delivered from an AMS  
8 deployment by a significant, but highly variable, amount. I list them below, and will  
9 address each individually:

- 10                   • Make “Peak Time Rebate” a default rate feature available to all residential  
11                   and small commercial customers and rates, along with performance  
12                   measures;
- 13                   • Require a High Bill Alert program, denoted in \$, along with performance  
14                   measures.

15  
16 **Q. What is a “Peak Time Rebate” rate feature?**

17 A. A Peak Time Rebate is a rate feature that rewards customers for reducing energy use  
18 during peak demand periods. I recommend Peak Time Rebates be made available to  
19 all residential and small commercial customers without any kind of special  
20 registration or enrollment; that way, any customer can choose to reduce energy use  
21 during peak demand periods, and get paid for doing so, without any requirements or

1 inhibitors. The Maryland PSC ordered just such an approach in Maryland,<sup>32</sup> and the  
2 Massachusetts DPU is currently considering such an approach for IOUs in that state  
3 as part of smart meter proceedings. Though the details can vary by utility, here is the  
4 general framework for such a rate feature:

- 5 1. A peak period (typically 3-6 pm or 4-8 pm weekdays, depending on the  
6 characteristics of a system's peak) is established by the Companies.
- 7 2. Using hourly smart meter usage data, a baseline for energy use during a  
8 representative hot day is established for each customer every few weeks from  
9 June through September for the peak period hours.
- 10 3. On a limited number of days each summer, generally 10 to 12, the  
11 Companies may call a "peak demand event" the day before abnormally high  
12 loads or supply shortages are anticipated by the Companies. Mass media and  
13 social media are used to alert the communities served by the Companies that  
14 the next day will be a peak demand event. Customers who register can also  
15 receive a text message, e-mail, or automated phone call notification, though  
16 such registration should not be required to qualify for rebates on  
17 demonstrated usage reductions during peak demand events.
- 18 4. By comparing a customer's usage during the peak demand event hours to a  
19 customer's most recent representative hot day baseline, the Companies  
20 quantify any statistically significant reductions using algorithms. For  
21 customers whose billing periods incorporate more than one peak demand

---

<sup>32</sup> As an example, see Baltimore Gas & Electric's website at  
<https://www.bge.com/WaystoSave/ForYourHome/Pages/EnergySavingsDays.aspx>

1 event, an average can be employed to improve the accuracy of the reductions  
2 quantified by the algorithms.

3 5. For quantified reductions, measured in kWh reduced, the customer is paid a  
4 rebate per kWh via a line item bill credit. This rebate rate per kWh is set at a  
5 fairly high amount to reflect the high capacity value of energy reductions  
6 during peak demand events. As one might expect, the higher the reward, the  
7 greater the response customers will collectively exhibit during a peak demand  
8 event. Most research indicates a rebate rate per kWh that is 7-10 multiples of  
9 the routine rate per kWh will elicit the intended customer response without  
10 skewering the benefit-cost ratio of the program,<sup>33</sup> though the right balance is  
11 unique to each IOU and customer population.

12

13 **Q. Why will the default application of a Peak Time Rebate (PTR) rate feature**  
14 **improve the AMS benefit-cost ratio for customers?**

15 A. Reducing energy use during peak demand periods offers a significant amount of  
16 value to all customers, including those who do not conserve during peak demand  
17 events, in terms of avoided capacity costs. Research indicates there may also be  
18 other sources of value to all customers, including a limited conservation effect (as  
19 customers “learn” that energy use can be modified”),<sup>34</sup> and a reduction in the market

---

<sup>33</sup> Faruqui et al. *Time-Varying and Dynamic Rate Design*. Paper prepared for the Regulatory Assistance Project. Figure 3, “Pilot Impact versus Price Ratio (without Enabling Technology)”. July, 2012. Page 29.

1 price of capacity (the so-called “demand reduction-induced price effect, or  
2 DRIPE).<sup>35</sup>

3

4 **Q. What is the potential impact of a default application of a PTR rate feature to**  
5 **the benefit projections of an AMS deployment?**

6 A. The economic benefits to customers of a default application of a PTR rate feature are  
7 potentially large, but highly variable. There are several determinants of PTR rate  
8 feature benefit, including the number of customers aware of a peak demand event,  
9 the number of those who choose to reduce energy usage during the event, the size of  
10 the average usage reduction, and the value the market places on avoided capacity.  
11 However, I have completed some informal estimates to provide a rough idea of the  
12 potential economic benefit available from the default application of a PTR rate  
13 feature under different scenarios, and summarized those estimates in the table below.  
14 Note that the assumptions following the table are key drivers of benefit size as well.  
15 Also note that my estimates include no estimates of any energy efficiency or DRIPE  
16 impacts that might be available from the default application of a PTR rate feature.

Scenario	Customers Reducing	Size of Reduction	Nominal Value, 15 yrs.	Present Value, 15 yrs.
Best Case	20%	20%	\$164.1 million	\$97.5 million
Likely Case	15%	15%	\$70.0 million	\$40.9 million
Worst Case	10%	10%	\$2.8 million	\$0.5 million

17 Assumptions common to each scenario:

---

<sup>35</sup> U.S. Department of Energy. Benefits of Demand Response in Electricity Markets and Recommendations for Achieving Them. Report to the U.S. Congress. February, 2006.

1

Assumption	Value	Source
Avoided Capacity (per kW-year)	[REDACTED]	Companies' DSM & IRP
Discount Rate for PV (WACC)	[REDACTED]	Companies' GRC
Annual Benefit Escalation	[REDACTED]	Companies' AMS business case
Launch yr. (3) mktg./admin cost	[REDACTED]	OAG
Subsequent yr. mktg./admin cost	[REDACTED]	OAG
Launch yr. (3) % of ann. benefit	[REDACTED]	OAG
First 2 years' benefit/cost	[REDACTED]	OAG
Benefit Period (years)	[REDACTED]	OAG

2

3 **Q. Are there ways for the Companies to increase the size of default PTR benefits?**

4 A. Possibly. As noted above, the value that can be captured for each kW of capacity  
5 avoided is a critical determinant of default PTR benefit size. In the PTR benefit  
6 estimates calculated above, I utilized the avoided capacity determined by the  
7 Company for its Integrated Resource Planning least-cost analyses and Demand-Side  
8 Management program benefit-cost analyses (\$99.92 per kW-year).<sup>36</sup> Ideally, the  
9 value of avoided capacity is something that could, and perhaps should, be  
10 determined by an open market rather than the Companies' own analyses. In  
11 addition, the market might value capacity more highly than the Companies do,  
12 though this is difficult to determine with certainty.

13 I understand the Companies' service territories border both the PJM and  
14 MISO Regional Transmission Organization ("RTO")s' market operating areas. I  
15 believe a study to quantify the potential customer benefits to the Companies'  
16 membership in one or the other of these markets is warranted. It is my understanding

---

<sup>36</sup> Case Number 2016-00317. Companies' response to AG DR 2-79a and 79b.

1           that OAG witness Larry Holloway in his testimony calls for the Commission to  
2           require the Companies to conduct a study on whether it would be cost feasible for the  
3           Companies to join an RTO. I recommend that this study also include the issue of  
4           what market value an RTO would ascribe to the avoided capacity the Companies  
5           could achieve by instituting a PTR rate feature for all customers without registration  
6           or enrollment.

7

8   **Q.    Is there a relationship between the Companies' Demand Response programs**  
9   **and PTR?**

10  A.    Yes. Demand response (DR) is a means to help customers automate the operation of  
11       their electric loads, thereby maximizing the benefits from PTR rate features. My  
12       understanding is that the Companies have achieved significant levels of DR by  
13       offering various programs for residential and commercial customers. For example,  
14       residential customers can subscribe to direct load control programs through which  
15       the Companies can cycle (turn on and off) customers' air conditioners, electric water  
16       heaters, and/or pool pumps at times of system peaks in order to reduce such peaks.  
17       On a combined company basis, 58.4% of residential customers are enrolled in at  
18       least one of these DR programs.<sup>37</sup> In addition, the companies make load management

---

<sup>37</sup> See Case No. 2014-0003, *Joint Application Of Louisville Gas & Electric Co. and Kentucky Utilities Co. for Review, Modification, and Continuation of Existing, And Addition of New, Demand-Side Management and Energy-Efficiency Programs*, Cadmus Study attached as Exhibit MEH-2, and KEMA Study, attached as Exhibit DEH-1.

1 programs available to commercial customers.<sup>38</sup> These significant levels of DR  
2 penetration represent value to the company and its ratepayers.

3 In the event the Commission approves the AMS meter CPCN, the companies  
4 will be able to *objectively verify* which customers are responding to the need to  
5 reduce load, and the amounts of energy savings. This important capability of AMS  
6 meters enables the Companies to sell capacity made available through DR into  
7 regional transmission organization (“RTO”) capacity markets. Many utilities and  
8 third-party aggregating firms are in fact selling DR capacity into RTO markets today.  
9 My understanding is that LG&E-KU are not members of an RTO such as MISO or  
10 PJM, hence the companies would not, by themselves, be able to sell their DR into an  
11 RTO capacity market.

12 As part of the aforementioned PJM/MISO membership study recommended  
13 by OAG witness Larry W. Holloway, I recommend that such a study also consider  
14 the potential to sell the combined Companies’ substantial DR savings into capacity  
15 markets. Additionally, that study should consider as an alternative whether it would  
16 be possible for the Companies to utilize the services of third-party aggregating  
17 companies, which in turn could sell DR-related capacity into an RTO capacity  
18 market even if Companies’ membership in an RTO does not come to pass.

19

20 **Q. Do you have other recommendations for the default application of the PTR rate**  
21 **feature?**

---

<sup>38</sup> *Ibid.*

1 A. Yes. I believe the default application of the PTR rate feature should be accompanied  
2 by outcomes-based performance measures, such as kWh reduced during peak  
3 demand events. This single measure incorporates how well the Companies would  
4 promote the PTR opportunity, advertise peak demand events, educate customers on  
5 peak demand event savings opportunities and action steps, and facilitate demand  
6 response. Performance measurement is particularly important for PTR programs, as  
7 the Companies have no economic incentive for strong PTR performance.

8 A few other performance measures of interest might be warranted. For  
9 example, I would be interested in knowing “annual marketing/admin spend per  
10 MWh conserved” during peak demand events as a measure of marketing/admin  
11 effectiveness. I would also be interested in an annual cost benefit analysis which  
12 compares program spending (including rebates, marketing, and administrative  
13 spending) to the value of capacity avoided.

14

15 **Q. Please describe a High Bill Alert Program**

16 A. A High Bill Alert Program is a customer program designed to help customers  
17 manage their electric bills and encourage conservation. Duke Energy Kentucky  
18 proposed such a program in its smart meter CPCN,<sup>39</sup> and Southern California  
19 Edison’s popular “Budget Assistant” is an excellent example already in service.<sup>40</sup>  
20 “Budget Assistant” applies algorithms to customers’ AMS meter data throughout a  
21 month to predict each customer’s next bill. These projections are compared to the

---

<sup>39</sup> Case Number 2016-00152. Direct Pre-filed Testimony of Alexander J. Weintraub, page 10, line 6.

<sup>40</sup> From SCE.com home page, select “Your Home” > “My Account Benefits” > “Budget Assistant”.

1 monthly electric bill budget (in \$) set by the customer. When a customer's bill  
2 projection amount approaches the customer's electric bill budget, an exception notice  
3 is issued to the customer via text, e-mail, or automated phone call (as specified by  
4 the customer during registration).

5

6 **Q. Isn't it true that the Companies current AMS Customer Program offers such a**  
7 **service?**

8 A. Yes and No. The Companies' "My Meter" website, available to AMS Customer  
9 Program participants, does offer a usage notification feature, with alert limits chosen  
10 by the customer (daily, weekly, or monthly) denoted in kWh. In other words, a  
11 customer can register to be notified when his or her kWh threshold is reached. This  
12 approach lacks both the bill prediction capability of the Southern California Edison  
13 program and the bill amount (in dollars) denomination feature. Without bill  
14 prediction and dollar denomination, the Companies' existing usage notification  
15 feature has very little customer satisfaction or energy conservation value.

16

17 **Q. Do you have other suggestions for a High Bill Alert service?**

18 A. Yes. Like the default application of a PTR rate feature, the Companies have no  
19 economic incentive to maximize the conservation effects of a High Bill Alert service.  
20 Accordingly, I think performance measures around customer enrollment and  
21 marketing effectiveness, similar to those I recommended above for the PTR rate  
22 feature, should be part of any High Bill Alert program the Commission might order

1 in the event the Commission approves the Companies' AMS proposal for  
2 implementation.

3

4 **Q. What is the potential economic benefit of a High Bill Alert service to customers?**

5 A. I hesitate to develop a benefit estimate based on the conservation value of a High Bill  
6 Alert service. To my knowledge there have been no controlled studies measuring the  
7 conservation effect of a High Bill Alert program. However, I believe such a program  
8 would make the achievement of the "Alvarez Highly Unlikely" conservation benefit  
9 estimated in the discussion of ePortal benefits above to be much more likely. One  
10 could think of the High Bill Alert service as an insurance policy to help secure the  
11 benefits estimated in the "Alvarez Highly Unlikely" ePortal benefit estimate  
12 scenario.<sup>41</sup>

13

14

---

<sup>41</sup> See supra, p. 16.

1           **IV.   ACTIONS THE COMPANIES MIGHT TAKE WILL NOT LIKELY BE**  
2                                   **SUFFICIENT TO DELIVER BENEFITS IN EXCESS OF COSTS**

3

4   **Q.    Can you summarize your testimony to this point?**

5   A.    So far I have provided support for my assertion that the Companies' benefit  
6           projections are overstated, including overstatements due to the benefit period time  
7           frame (21 years, or about 6 years too long given the useful lives of AMS meters);  
8           aggressive ePortal conservation benefit assumptions; and aggressive non-technical  
9           loss recovery assumptions. I have also provided support indicating that the  
10          Companies' cost projections should be increased by the carrying costs and profits the  
11          Companies are likely to request on assets stranded by AMS deployment in future rate  
12          cases. Finally, I suggest that the benefits from the proposed AMS deployment could  
13          be improved significantly through the default application of a Peak Time Rebate rate  
14          feature available to all customers, ideally without any special registration or  
15          enrollment requirements.

16

17   **Q.    Please present these adjustments in tabular format.**

18   A.    A table which summarizes these adjustments to the Companies' present value  
19          benefit-cost analysis is presented in Appendix B to this testimony.

20

1 **Q. Appendix B only includes adjustments to the Companies' present value benefit-**  
2 **cost ratios. Why have you not addressed the Companies' nominal benefit-cost**  
3 **analyses?**

4 A. The deployment of AMS meters is characterized by large, up-front costs (\$350  
5 million in the first five years in this instance)<sup>42</sup> and small economic benefits that  
6 accrue over longer periods of time (15 years as I recommend, or 21 years as the  
7 Companies recommend in their business case). Nominal value analyses do not  
8 adjust for changes in the value of money over time. Just as a dollar in hand today is  
9 worth more than a dollar 15 years from now, a benefit received 15 years from now  
10 should be valued at a much smaller amount than a benefit received today. Assigning  
11 nominal value (today's dollars) to benefits which won't be realized for years into the  
12 future is yet another way to artificially improve the results of a benefit-cost analysis.

13 By contrast, present value analyses adjust the value of money over time;  
14 present value analyses reflect the reality that a benefit received 15 years from now is  
15 worth far less than a benefit received today. As a result, present value analyses are  
16 more appropriate and relevant for any investment with large up-front expenditures  
17 and smaller benefits that accrue over time, which is precisely the situation with AMS  
18 deployments.

19  
20 **Q. So what do you conclude about the Companies' AMS proposal?**

---

<sup>42</sup> Case Number 2016-00371. Exh. JPM-1. Page 39.

1 A. Even if the Company were to take the actions recommended in the preceding section  
2 of my testimony, including the default application of PTR rate features, I do not  
3 think it is likely the AMS deployment will deliver benefits to customers in excess of  
4 costs. On this basis, I recommend the Commission reject the Companies' request to  
5 deploy AMS.

6

7

1 an AMS deployment. I will discuss each of the following conditions, recommended  
2 in the event the Commission approves the AMS proposal, in the final section of my  
3 testimony:

- 4 • A mechanism which guarantees benefits will be reflected in Customer rates  
5 to the extents and within timeframes projected by Companies in the AMS  
6 business case;
- 7 • A mechanism which limits the recovery of any cost overruns from customers;
- 8 • A prohibition against the recovery of carrying costs and profits on assets  
9 removed from service to make way for AMS assets;
- 10 • A requirement that AMS-related customer satisfaction programs be  
11 implemented, including tariffed, cost-based AMS meter opt-out fees and  
12 Green Button’s “Connect My Data” standard.

13  
14 **Q. Why do you feel AMS approval should be conditioned on benefit guarantees?**

15 A. I have made it clear throughout this testimony that several of the Companies’ benefit  
16 projections will be almost impossible to achieve. I have also pointed out that,  
17 contrary to capital investment, the Companies have no incentive to overcome  
18 challenges to secure projected benefits. I believe these issues easily justify the need  
19 for performance guarantees in the event the Commission approves the AMS  
20 deployment.

1 **Q. Please describe a mechanism which would guarantee that benefits will be**  
2 **reflected in Customer rates to the extents and within timeframes projected by**  
3 **the Companies in their AMS business case.**

4 A. Some of the largest benefits the Companies project in their AMS business case will  
5 not find their way into customers' pockets unless a rate case is conducted, using a  
6 test year in which such benefits are reflected in accounting records. Since the  
7 Companies are in charge of both the timing of benefit delivery and the timing of rate  
8 cases, the Companies can "time" both to the benefit of shareholders and the  
9 detriment of customers.

10

11 **Q. Please explain.**

12 A. When it comes to operating expense reductions, a utility can simply avoid laying off  
13 employees or cancelling contract work until after a test year. When it comes to non-  
14 technical loss recovery, a utility can simply wait to implement theft detection or  
15 metering error detection processes until after a test year. By delaying such actions,  
16 the old, "pre-deployment" circumstances and costs are included in test year  
17 accounting records and reflected in customer rates determined via that test year's  
18 data. However, once rates are set, and recovery of these costs from ratepayers is  
19 assured, the utility can simply execute the cost-reduction and non-technical loss  
20 recovery plans *after* the test year. In this manner shareholders, not customers, reap  
21 the operating expense reduction and non-technical loss recovery benefits of the AMS  
22 investments (not to mention associated profits) for which customers are paying in  
23 rates.

1 To be sure, this situation is rectified in some future rate case, when a test year  
2 which reflects lower levels of operating expenses and higher sales volumes from  
3 AMS-related capabilities is used to calculate new customer rates. Unfortunately,  
4 absent a PSC order, the Companies determine rate case timing. When costs are  
5 increasing/revenues decreasing, utilities file a rate case, adjusting rates higher to  
6 compensate. When costs are decreasing/revenues increasing, for example from an  
7 AMS deployment, utilities will delay filing a rate case. That's because to do so  
8 would convert economic benefits enjoyed by shareholders into economic benefits  
9 enjoyed by ratepayers via rate reductions. If that future rate case were delayed for 10  
10 years, customers would fail to receive these benefits in the form of rate reductions  
11 for 10 years. During this period, shareholders win at customers' expense. This  
12 opportunity to "time" AMS benefit delivery and rate cases is not a reasonable  
13 proposition, and I recommend the Commission consider some type of mechanism  
14 designed to return, on a timelier basis, the economic benefits of any AMS proposal  
15 the Commission might approve.

16  
17 **Q. Can you provide a hypothetical example to illustrate?**

18 A. Yes. Assume for purposes of illustration the Companies process a rate case in AMS  
19 year 4 as the test year. In AMS year 4, assume that the massive capital investment in  
20 AMS meters and systems is complete, but that the non-technical loss recovery  
21 capabilities have yet to be implemented. The rates calculated using such a test year  
22 would reflect capital cost recovery, and a rate of return on capital, but not the  
23 revenue benefits associated with non-technical loss recovery.

1                    Now assume the non-technical loss recovery plans are implemented in year 5,  
2 after the test year. Assume the Companies increase their recovery of non-technical  
3 losses in the amounts and years described below:

AMS Plan Year	NTL Recovery Improvement
1	\$0
2	0
3	0
4	0
5	3,000,000
6	3,250,000
7	3,500,000
8	3,750,000
9	4,000,000
10	4,250,000
11	4,500,000
12	4,750,000
13	5,000,000

4  
5                    Assuming no rate cases are processed from year 5 through year 13, the Companies’  
6 shareholders will secure \$36 million in profits above and beyond the rate of return  
7 authorized by the Commission in the year 4 rate case. If a rate case is held in year  
8 14, customers will finally begin receiving the benefits promised to them in the IOU’s  
9 AMS business case. However, this is not the end of the story. What if the  
10 Companies’ AMS business case indicated they would deliver \$6,500,000 in non-  
11 technical loss recovery benefits in year 13 of their AMS plan? In this hypothetical  
12 example, customers will have missed out of 9 years’ worth of benefits due to rate  
13 case timing, but are still short \$1,500,000 in benefits anticipated in the Companies’  
14 AMS business case but not delivered.

15

16 **Q. Do you offer any related recommendation?**

1 A. Yes. To address both the rate case timing issue and the failure to deliver on AMS  
 2 business case benefits, regulators in Oklahoma<sup>43</sup> and Ohio<sup>44</sup> specified that revenue  
 3 requirements be reduced by the amount of the benefits projected by the IOUs in their  
 4 AMS their benefit-cost analyses:

AMS Plan Year	Projected Benefit	Revenue Requirement Adjustment
1	\$0	\$0
2	0	0
3	4,000,000	(4,000,000)
4	4,250,000	(4,250,000)
5	4,500,000	(4,500,000)
6	4,750,000	(4,750,000)
7	5,000,000	(5,000,000)
8	5,250,000	(5,250,000)
9	5,500,000	(5,500,000)
10	5,750,000	(5,750,000)
11	6,000,000	(6,000,000)
12	6,250,000	(6,250,000)
13	6,500,000	(6,500,000)

5  
 6 I've found this approach delivers several benefits to customers. First, it  
 7 delivers economic benefits to customers – benefits which they are paying to obtain  
 8 through the AMS-related rate increases – without having to wait for a rate case to  
 9 recognize benefits in rates. Second, it holds the Companies accountable for  
 10 delivering the size of benefits it projects in its benefit cost-analysis. Third, it holds  
 11 the Companies accountable for the speed at which benefits are to be delivered. And  
 12 finally, it provides an economic incentive for the Companies to secure economic  
 13 benefits of the size and speed indicated in their AMS business case, as described  
 14 below.

<sup>44</sup> Public Utilities Commission of Ohio. Stipulation and Recommendation in Case 10-2326-GE-RDR. Section II. February 24, 2012. Pages 5-10.

1

2 **Q. Please explain how this mechanism provides the Companies with an economic**  
3 **incentive to secure the benefits projected in the AMS business case.**

4 A. In my experience, it can be difficult for an IOU to secure benefits from AMS-related  
5 investments. Operating policies and processes must be changed, employees must be  
6 trained, and policy and process changes must be enforced. In some cases,  
7 organizational changes are required. Innovation is required to identify opportunities  
8 to employ newly-available data in ways that improve service or reduce costs. If  
9 there is no motivation to maximize benefits, and no oversight to ensure projected  
10 benefits are secured, it is entirely possible that organizational and operational  
11 challenges can prevent projected benefits from being maximized or secured.

12 Therefore, I believe “IOU motivation” to be another benefit associated with  
13 the implementation of the mechanism described above. If the Companies secure  
14 benefits greater than projected, or secure them earlier than projected, shareholders  
15 benefit; if the Companies fail to secure the size of benefits projected, or fail to secure  
16 them in the timeframes projected, shareholders pay. I believe the recommended  
17 mechanism therefore provides the necessary incentives for the Companies to  
18 overcome the organizational and operational challenges associated with securing  
19 AMS-related benefits for operating expense reductions and NTL recovery  
20 improvements. In addition, I believe post-deployment benefit measurement is  
21 another tool the Commission should use in the event it approves the Companies’  
22 AMS proposal.

23

1 **Q. Why do you believe post-deployment benefit measurement should be used in**  
2 **addition to your recommended rate-case timing mechanism?**

3 A. The recommended mechanism is only intended to secure for customers those AMS-  
4 related economic benefits that would not be reflected in rate reductions without a rate  
5 case. As described above, these are operating expense reduction and NTL recovery  
6 improvement benefits. Other AMS-related benefits, such as PTR rate features or  
7 High Bill Alert conservation, are reflected on customers' bills without a rate case.  
8 Benefit assurances cannot readily be delivered using accounting mechanisms for  
9 these types of AMS-related benefits; accordingly, the post-deployment  
10 measurements described in the PTR and High Bill Alert discussions above are  
11 suggested.

12  
13 **Q. Have you prepared a schedule of recommended revenue requirement**  
14 **adjustments by year, assuming the Commission agrees with your assessment of**  
15 **the need for a benefit assurance mechanism?**

16 A. Yes. Confidential Appendix C offers a schedule of recommended revenue  
17 requirement adjustments by year based on the Companies' confidential business case  
18 provided in discovery. If the Commission were to authorize the revenue requirement  
19 adjustments in this schedule, shareholders, and not ratepayers, would bear the risk of  
20 any AMS business case benefit projections not achieved by the Companies.

21  
22 **Q. Why do you feel AMS approval should be conditioned on cost overrun recovery**  
23 **limits?**

1 A. In my experience, grid modernization cost overruns are much more likely than  
2 under-budget performance. In the only two independent evaluations of smart meter  
3 deployment costs of which I am aware, including one evaluation I led,<sup>45</sup> and one led  
4 by the California Office of Ratepayer Advocacy,<sup>46</sup> both demonstrated significantly  
5 higher capital and operating costs than anticipated. I've noted several reactions in  
6 response to cost overruns:

- 7 • Capabilities or deployment scope are curtailed (generally resulting in lower  
8 benefits for customers);
- 9 • Customer rates are increased by an amount greater than originally approved;
- 10 • Cost overruns are disallowed by a regulator.

11 Cost overrun disallowance by a regulator is rare in cases of grid modernization. I  
12 know of only one case in which recovery of grid modernization cost overruns from  
13 customers was denied.<sup>47</sup> It is difficult to make a showing that cost overruns  
14 associated with CPCN investments were imprudent based on what a reasonable  
15 individual knew or should have known. In my experience cost overruns are much  
16 more likely to result in customer benefit reductions, unanticipated rate increases, or  
17 both, rather than disallowances. As a result, ratepayers are essentially “on the hook”  
18 for 100% of the risk of cost overruns.

19

<sup>45</sup> Alvarez et al. *SmartGridCity™ Demonstration Project Evaluation Summary*. Colorado PUC11A-1001E. Exhibit MGL-1. Filed December 14, 2011.

<sup>46</sup> Hieta, Kao, and Roberts. *Case Study of Smart Meter System Deployment*. California Office of Ratepayer Advocacy. March, 2012.

<sup>47</sup> Colorado Public Utilities Commission. Decision R13-0096 in Proceeding 11A-1001E.

1 **Q. Do you offer any related recommendation?**

2 A. Yes. I think some sort of cost risk-sharing mechanism is appropriate in the event the  
3 Commission approves the Companies' AMS proposal. One simple and effective  
4 mechanism would be to limit the Companies' recovery of any overruns in excess of  
5 projected costs to 50% of such amounts. In this way cost overrun risk is split 50:50  
6 between customers and shareholders.

7

8 **Q. Has this recommendation been implemented in any other AMS projects?**

9 A. I am not aware of any other AMS projects in which regulators have implemented  
10 such a condition. However, this does not indicate such a condition is inappropriate.

11

12 **Q. Please explain why you feel a prohibition against the recovery of carrying costs  
13 and profits on undepreciated assets removed from service to make way for  
14 AMS is appropriate**

15 A. The Companies are proposing \$320 million in capital investment in their AMS plan,  
16 on which they will earn hundreds of millions of dollars in profit over the next 15  
17 years. As described earlier, in addition to the \$39 million in meter book value to be  
18 written off as existing meters are replaced, the Companies will likely request costs  
19 and profits on these stranded assets amounting to \$26 million (\$15 million in present  
20 value). The rate increases associated with the AMS proposal and stranded cost  
21 recovery will be difficult for many customers to pay, particularly considering the  
22 challenges to securing benefits described throughout this testimony.

1           Recalling my earlier testimony regarding the shorter useful life of AMS  
2 meters, it is conceivable that the companies' customers will be paying for as many as  
3 three or four meters at once: 1.) the retired meters still being written off; 2.) AMS  
4 meters; and 3.) replacements for AMS meters that fail before the end of the 21-year  
5 useful life assumed by the Companies. In addition, LG&E gas customers will be  
6 paying for 54,000 new gas meters<sup>48</sup> and 322,000 automated gas meter-reading  
7 indices. To ask customers to pay for profits and carrying costs on what could  
8 amount to three or even four meters simultaneously is unfair, unjust, and  
9 unreasonable.

10  
11 **Q. Do you have any related recommendation?**

12 A. Yes. I recommend the Commission expressly prohibit the recovery of profits and  
13 carrying costs on all assets stranded by any AMS deployment the Commission may  
14 approve. In addition, to mitigate ratepayer bill shock, and to comport with the  
15 principle of gradualism, I recommend the write-down of this regulatory asset should  
16 be conducted over 15 years per PSC precedent rather than the 5 years requested by  
17 the Companies. And finally, I suggest these issues be resolved now, in this case,  
18 rather than waiting for some future rate case as the Companies are likely to suggest.  
19 Resolving these stranded asset issues now provides more certainty and more  
20 complete information for making a decision on the Companies' AMS proposal.

21  
22 **Q. Please describe the approval conditions you would recommend for AMS-related**  
23 **customer satisfaction programs.**

---

<sup>48</sup> Case Number 2016-00317. Direct Pre-filed testimony of John P. Malloy. Page 16.

1 A. Should the Commission elect to approve the Companies' AMS proposal, I believe it  
2 is reasonable to require a few customer satisfaction accommodations which should  
3 entail little cost: AMS meter opt-out with tariffed AMS meter opt-out fees, and  
4 compliance with the Green Button Connect My Data standard.

5  
6 **Q. Please explain why you believe customers deserve an AMS meter opt-out**  
7 **alternative.**

8 A. While many of us cannot conceive of a world without cell phones, wireless data  
9 networks, and microwave ovens, there is a subset of the population who actively  
10 avoid these electro-magnetic frequency-emitting devices. These people legitimately  
11 fear the health impacts of such emissions, and it is not inconceivable that hyper-  
12 sensitivity to such emissions exist in a very small percentage of the general  
13 population. Other consumers have concerns about wireless data security and  
14 privacy. For people in these situations, who are willing and able to pay for the  
15 incremental cost of a meter which does not communicate wirelessly, it seems  
16 reasonable that such an option be made available.

17 I am not suggesting that the option be subsidized by other ratepayers, and  
18 agree that cost-based fees, both initial and ongoing, are appropriate. But to not offer  
19 any alternative to AMS meters does not seem reasonable. If the Commission  
20 approves the Companies' AMS proposal, I recommend a condition be established  
21 which mandates a tariffed, cost-based, fee schedule for customers who elect not to  
22 have a wireless-communicating AMS meter attached to their residence.

23

1 **Q. Please explain the need for compliance with the Green Button Connect My Data**  
2 **Standard.**

3 A. The Green Button “Download My Data” standard harmonizes how consumers  
4 download energy usage data in the same format from utility to utility. It’s a good  
5 start, and dozens of large US IOUs, from Pacific Gas & Electric to Baltimore Gas &  
6 Electric, offer it to their customers.<sup>49</sup> Increasingly, the Green Button standard is the  
7 link to a growing ecosystem of application developers and service providers who  
8 wish to make money by helping consumers save money on their energy bills. These  
9 may be reasons enough for the Commission to require Green Button Download My  
10 Data compliance from the Companies as an AMS approval condition, but even more  
11 power is available from the Green Button’s “Connect My Data” standard.<sup>50</sup>

12 The Connect My Data standard was developed to allow a customer to specify  
13 the service providers to which the customer wishes to authorize ongoing access to his  
14 or her energy usage data without manual intervention. This is a big advance from  
15 the Companies’ “My Meter” portal or even the Green Button Download My Data  
16 standard. Connect My Data also addresses the protocols by which authorized service  
17 providers can access their customers’ energy use data in a secure, automated manner  
18 from IOUs, and this is important for high-volume execution. In a future with PTR  
19 rate features and other sorts of dynamic pricing, Connect My Data compliance is  
20 likely to enlarge peak demand event participation, simplify peak demand event usage  
21 reductions for customers, and increase PTR-related value creation and AMS benefits.

---

<sup>49</sup> A list of US utilities which offer, or which have committed to implement, the Green Button Download My Data standard can be found at <https://energy.gov/data/green-button>.

<sup>50</sup> Green Button Connect My Data standard. Available from the Green Button Alliance. [www.greenbuttonalliance.org](http://www.greenbuttonalliance.org).

1           The Connect My Data standard lays the foundation for third-party participation in  
2           energy management. As such, it is not something the Companies are likely to pursue  
3           voluntarily, and is therefore a worthwhile approval condition for the Companies'  
4           AMS proposal.

5

6

1 **VI. SUMMARY AND CONCLUSION**

2

3 **Q. Would you care to summarize your testimony?**

4 A. I recommend the Commission reject the Companies' proposal to deploy AMS. The  
5 benefit-cost ratio is unlikely to be favorable for customers, and therefore  
6 unreasonable, due to multiple business case issues, including

- 7 • Use of a 21-year benefit period when useful meter life is 15 years;
- 8 • Multiple ePortal benefit assumptions are erroneous;
- 9 • Non-technical loss recovery benefit assumptions are overly-aggressive;
- 10 • Profit and carrying costs on stranded assets are not included.

11

12 The Companies can take action to increase benefits, including:

- 13 • Default application of the peak time rebate rate feature;
- 14 • Consideration of PJM or MISO membership;
- 15 • Development of a High Bill Alert program

16

17 Unfortunately, these actions are unlikely to deliver a favorable benefit-cost ratio for  
18 customers. Considering all of the above, I estimate about \$0.80 in benefit for every  
19 \$1 in spending, resulting in my recommendation to reject the Companies' AMS  
20 proposal.

21

1 If it elects to approve the Companies' AMS proposal despite these issues, the  
2 Commission can take action to reduce the economic risks faced by customers,  
3 including:

- 4 • Instituting a benefit guarantee mechanism
- 5 • Limiting customer exposure to cost overrun risk
- 6 • Prohibiting profits and carrying charges on assets stranded by AMS
- 7 • Requiring customer satisfaction efforts such as a tariffed AMS opt-out rate  
8 and "Connect My Data" compliance (secure, ongoing third party usage data  
9 access).

10  
11 **Q. Do you have any concluding thoughts?**

12 A. Yes. As discussed in my introduction to this testimony, I believe AMS deployments  
13 have the potential to deliver a favorable, or at least break-even, benefit-cost ratio for  
14 customers. However, I also believe a demanding combination of utility motivations,  
15 customer engagement, situational characteristics, and regulatory oversight is required  
16 to deliver this outcome. The Companies' business plan does not convince me that  
17 this demanding combination is sufficiently present to provide a break-even or better  
18 outcome for customers. I hope the Commission appreciates my sobering and  
19 pragmatic perspective, and I thank the Commission in advance for considering this  
20 testimony.

21  
22 **Q. Does this conclude your testimony?**

23 A. Yes, it does.

## APPENDIX A: CURRICULUM VITAE OF PAUL ALVAREZ

### Curriculum Vitae -- Paul J. Alvarez MM, NPDP

---

Wired Group, PO Box 150963, Lakewood, CO 80215 [palvarez@wiredgroup.net](mailto:palvarez@wiredgroup.net) 720.308.2407

#### Profile

---

After 15 years in Fortune 500 product development and product management, including P&L responsibility, Mr. Alvarez entered the utility industry by way of demand-side management rate and program development, marketing, and impact measurement in 2001. He has since designed renewable portfolio standard compliance and distributed generation rates and incentive programs. These experiences led to unique projects involving the measurement of grid modernization costs and benefits (energy, capacity, operating savings, revenue capture, reliability, environmental, and customer experience), which revealed the limitations of current utility regulatory and governance models. Mr. Alvarez currently serves as the President of the Wired Group, a boutique consultancy serving consumer and environmental advocates, regulators, associations, and suppliers.

#### Research Projects, Thought Leadership, Regulatory Appearances

NECESSITY )

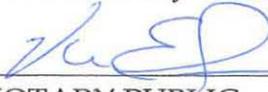

AFFIDAVIT OF Paul Alvarez

State of Colorado )  
County of Jefferson )

Paul Alvarez, being first duly sworn, states the following: The prepared Pre-Filed Direct Testimony and the Schedules attached thereto constitute the direct testimony of Affiant in the above-styled case. Affiant states that he would give the answers set forth in the Pre-Filed Direct Testimony if asked the questions propounded therein. Affiant further states that, to the best of his knowledge, his statements made are true and correct. Further affiant saith not.
