<b>I. INTRODUCTION AND PURPOSE OF TESTIMONY .....</b>	<b>1</b>
<b>II. ENERGY EFFICIENCY PROGRAM .....</b>	<b>3</b>
<b>III. CONCLUSION .....</b>	<b>28</b>

Attachment:

TJD-1 – Updated Appendix A

## I. INTRODUCTION

1 **Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A. My name is Timothy J. Duff. My business address is 400 South Tryon Street,  
3 Charlotte, North Carolina 28202.

4 **Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

5 A. I am employed by Duke Energy Business Services LLC (DEBS), an affiliate of  
6 Duke Energy Kentucky, Inc., (Duke Energy Kentucky, or Company) as General  
7 Manager, Customer Solutions Regulatory Strategy & Evaluation. DEBS provides  
8 various administrative and other services to Duke Energy Kentucky and other  
9 affiliated companies of Duke Energy Corporation (Duke Energy).

10 **Q. PLEASE SUMMARIZE YOUR EDUCATION AND PROFESSIONAL**  
11 **EXPERIENCE.**

12 A. I graduated from Michigan State University with a Bachelor of Arts in Political  
13 Economics and a Bachelor of Arts in Business Administration, and received a  
14 Master of Business Administration degree from the Stephen M. Ross School of  
15 Business at the University of Michigan. I started my career with Ford Motor  
16 Company and worked in a variety of roles within the company's financial  
17 organization, including Operations Financial Analyst and Budget Rent-A-Car  
18 Account Controller. After five years at Ford Motor Company, I started working  
19 with Cinergy in 2001, providing business and financial support to plant operating  
20 staff. Eighteen months later, I joined Cinergy's Rates Department, where I  
21 provided revenue requirement analytics and general rate support for the  
22 company's transfer of three generating plants. After my time in the Rates

1 Department, I spent a short period in the Environmental Strategy Department, and  
2 then I joined Cinergy's Regulatory and Legislative Strategy Department. After  
3 Cinergy merged with Duke Energy in 2006, I was employed as Managing  
4 Director, Federal Regulatory Policy. In this role, I was primarily responsible for  
5 developing and advocating Duke Energy's policy positions with the Federal  
6 Energy Regulatory Commission. I became General Manager, Energy Efficiency  
7 & Smart Grid Policy and Collaboration in 2010, was named General Manager,  
8 Retail Customer and Regulatory Strategy in 2011, and assumed my current  
9 position of General Manager, Customer Regulatory Strategy and Evaluation in  
10 2013.

11 **Q. PLEASE DESCRIBE YOUR RESPONSIBILITIES AS GENERAL**  
12 **MANAGER, CUSTOMER REGULATORY STRATEGY & ANALYTICS.**

13 A. As General Manager, Customer Solutions Regulatory Strategy & Evaluation, I am  
14 responsible for the development of strategies and policies related to energy  
15 efficiency (EE) and other retail products and services. I also oversee the analytics  
16 functions associated with evaluating and tracking the performance of Duke  
17 Energy's retail products and services.

18 **Q. HAVE YOU PREVIOUSLY TESTIFIED BEFORE THE PUBLIC**  
19 **UTILITIES COMMISSION OF KENTUCKY?**

20 A. Yes. I have provided testimony in the Company's application that established its  
21 energy efficiency cost recovery mechanism and portfolio of programs in Case No  
22 2012-00085.

1 **Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS**  
2 **PROCEEDING?**

3 A. The purpose of my testimony in this proceeding is respond to the Commission's  
4 February 14, 2018 Order directing the Company to suspend its demand side  
5 management (DSM) programs except for Low Income Services and  
6 Neighborhood Programs until the Commission is able to determine that ratepayer  
7 benefits exceed ratepayer costs. In doing so, I support the validity, cost-  
8 effectiveness, and reasonableness of the Company's EE and DSM programs. I  
9 briefly describe the history of these programs; identify the portfolio of programs  
10 the Company offers and how both customers and the Company use them. I  
11 describe how the Company's cost recovery of its DSM programs through Rider  
12 DSM is reasonable and why the Commission should reconsider its directive that  
13 the Company essentially cease offering these programs to customers.

## **II. ENERGY EFFICIENCY PROGRAM**

14 **Q. PLEASE BRIEFLY SUMMARIZE THE HISTORY OF DUKE ENERGY**  
15 **KENTUCKY'S DSM PROGRAM AND PORTFOLIO.**

16 A. The Company's offering of DSM programs dates back close to two decades where  
17 the Commission approved a Joint application made between the Company (f/k/a  
18 Union Light Heat and Power Company,) and multiple stakeholders that included,

1 among others, the Office of the Kentucky Attorney General (AG), and the Northern  
2 Kentucky Citizens Action Commission.<sup>1</sup> Among other things, the Commission's  
3 Order approved specific programs, a collaborative process with stakeholders that  
4 included customers to consider and develop additional DSM programs and tariffs  
5 that enabled the Company to recover its DSM program and administrative costs,  
6 lost revenues and an incentive. This basic structure remains in place today.  
7 Throughout the years, the Company has offered many enhancements to its portfolio  
8 with the purpose of increasing participation and providing customers new and  
9 innovative opportunities to control their consumption and affect their utility bill.

10 The portfolio of programs in place during the fiscal year ending June 30,  
11 2017 and that is the subject of this proceeding was approved by the Commission's  
12 June 29, 2012 Order in Case No. 2012-00085. That Order approved continuation of  
13 all programs through December 31, 2016. The Company requested and received  
14 approval to continue the approved portfolio beyond December 31, 2016.<sup>2</sup> In Duke  
15 Energy Kentucky's 2012 DSM cost recovery Order, Case No. 2012-00495, the  
16 Commission ordered that any new program evaluations, program expansions or  
17 new programs be filed by August 15<sup>th</sup> each year. Duke Energy Kentucky has been

---

<sup>1</sup> See *In the Matter of the Joint Application Pursuant to 1994 House Bill No. 501 For the Approval of Principles of Agreement, Demand Side Management, The Union Light Heat and Power Company, and for Authority for the Union Light Heat and Power Company to Implement Various Tariffs and Receive Incentives Associated the Demand Side Management Programs*, Order, Case No. 95-00312, (Ky. P.S.C. Dec. 1, 1995).

<sup>2</sup> See Order, Case No. 2015-00277

1 filing this amendment filing since 2013<sup>3</sup> to enhance the DSM portfolio and react to  
2 market changes and customer needs. This filing has given Duke Energy Kentucky  
3 the opportunity to refresh the portfolio on an annual basis.

4 **Q. PLEASE BRIEFLY EXPLAIN HOW THE COMPANY'S RIDER DSM**  
5 **OPERATES.**

6 A. Rider DSM enables the Company to develop and offer a variety of energy  
7 efficiency and demand response programs that incentivize and facilitate  
8 customers to implement cost-effective measures in a manner that does not  
9 penalize the Company or erode its earnings in an unreasonable manner. Such a  
10 structure is necessary because under basic tenets of ratemaking, a utility's base  
11 rates are designed to enable it to recover its reasonable costs of providing service  
12 and an opportunity to earn a reasonable return on its invested capital. The sale of  
13 electricity as a charge per kilowatt-hour (kWh) to customers is how the Company  
14 is able to recover its costs, earn a reasonable return on its capital invested and  
15 fund its operations. This creates what is known as a "through put" incentive for  
16 utilities to sell more electricity, not less. Programs such as the Company's Rider  
17 DSM help to align the utility's interest in selling more electricity with the  
18 customer's desire to use less. The Rider DSM mechanism allows the Company to  
19 recover its costs of providing these EE/DSM programs to customers, provide

---

<sup>3</sup> The Commission's December 19, 2013 Order in Case No. 2013-00313 approved residential Heat Pump Water Heaters, Energy Efficiency Pool Pumps, Single Family and Multi-Family Water Measures, and updated the measures available within the Smart Saver® Prescriptive Program. The Commission's January 28, 2015 Order in Case No. 2014-00280 approved adding additional lighting options to the Smart Saver® Residential Program, offer the My Home Energy Report as an online channel, and approved a new Non-Residential Small Business Energy Saver program. Additional program changes were filed in Case No. 2015-00277. In Case No. 2016-00289 Duke Energy Kentucky received approval to include Power Manager® for Apartments, Power Manager® for Business and additional program changes to existing programs. Pending Case No. 2017-00324 requested additional funding for the Smart Saver Custom program.

1 some insulation from lost margins due to the reduction in sales of electricity, and  
2 provide a small incentive to offer these programs. The load reductions achieved  
3 have the benefit of reducing the Company's overall load obligation that in turn,  
4 creates the potential to allow the Company to delay its investment in expensive  
5 generating resources. These reductions also enable the Company to maximize the  
6 potential of its existing generation through potential sales of any excess into the  
7 wholesale markets. As Company witness Mr. Verderame explains, the majority of  
8 the net proceeds of off-system sales are shared directly with customers through a  
9 bill credit enabled by the Profit Sharing Mechanism (Rider PSM).

10 **Q. PLEASE BRIEFLY DESCRIBE DUKE ENERGY KENTUCKY'S**  
11 **CURRENT PORTFOLIO OF DSM PROGRAMS.**

12 A. Duke Energy Kentucky offers its customers multiple regulated EE and DSM  
13 related services and products, as well as low-income assistance programs within  
14 the Commonwealth of Kentucky. The various programs are vetted through the  
15 collaborative process whereby it gets feedback from a wide array of stakeholders  
16 before being submitted to the Commission for review and approval. Duke  
17 Energy Kentucky recovers its costs and receives compensation for these services  
18 pursuant to its Commission-approved DSM tariff riders. The current suite of  
19 programs include the following: 1) Residential Smart Saver<sup>®</sup>; 2) Residential  
20 Energy Assessments; 3) Energy Efficiency Education Program for Schools; 4)  
21 Low Income Services; 5) The Payment Plus program; 6) Residential Direct Load  
22 Control- Power Manager;<sup>®</sup> 7) My Home Energy Report; 8) Low Income  
23 Neighborhood Program; 9) Smart Saver<sup>®</sup> Prescriptive; 10) Smart Saver<sup>®</sup> Custom;

1 11) Smart \$aver<sup>®</sup> Energy Assessments; 12) Small Business Energy Saver; and 13)  
2 Power Share<sup>®</sup>.

3 The Commission has approved each of these programs and reviews the costs  
4 and results of these programs on an annual basis.

5 **Q. PLEASE BRIEFLY DESCRIBE THE RESIDENTIAL SMARTSAVER<sup>®</sup>**  
6 **PROGRAM.**

7 A. The purpose of the Residential Smart \$aver<sup>®</sup> Program is to offer customers a  
8 variety of energy conservation measures designed to increase energy efficiency in  
9 their homes. The program utilizes a network of contractors to encourage the  
10 installation of high efficiency equipment and the implementation of energy  
11 efficient home improvements. Equipment and services to be incentivized include:  
12 1) installation of high efficiency air conditioning (AC) and heat pump (HP)  
13 systems; 2) performance of AC and HP tune-up maintenance services; 3)  
14 implementation of attic insulation and air sealing services; 4) implementation of  
15 duct sealing and insulation services; and 5) installation of efficient heat pump  
16 water heaters. Additional measures in this program include high efficiency  
17 lighting including property manager lighting, high efficiency water measures for  
18 single and multi-family residences, and pool pumps.

19 **Q. PLEASE BRIEFLY DESCRIBE THE RESIDENTIAL ENERGY**  
20 **ASSESSMENTS PROGRAM.**

21 A. This program is offered to Duke Energy Kentucky residential customers that  
22 own a single family home with at least four months usage history and have an  
23 electric water heater and/or electric heat, or central air. The primary goal is to

1 empower customers so they can better manage energy usage and cost. Duke  
2 Energy Kentucky partners with several key vendors to administer the program  
3 in which an energy specialist completes a 60 to 90 minute walk through  
4 assessment of the home and analyzes energy usage to identify energy savings  
5 opportunities. The customer receives an audit report that focuses on the  
6 building envelope improvements as well as low-cost and no-cost improvements  
7 to save energy. At the time of the home audit, the customer also receives a free  
8 efficiency kit containing a variety of energy saving measures such as energy  
9 efficient lighting, a low flow showerhead, low flow faucet aerators,  
10 outlet/switch gaskets and weather stripping. The auditors will install these  
11 measures, if approved by the customer, so the customer can begin saving  
12 immediately, and to help insure proper installation and use. The installation of  
13 additional high efficiency lighting options is also available.

14 **Q. PLEASE BRIEFLY DESCRIBE THE ENERGY EFFICIENCY**  
15 **EDUCATION PROGRAM FOR SCHOOLS PROGRAM.**

16 A. The Energy Efficiency Education Program for Schools offers two educational  
17 interactions: 1) an in-depth classroom curriculum through the National Energy  
18 Education Development (NEED) project; and 2) a live theatrical production by  
19 The National Theatre for Children (NTC).

20 The NEED project provides educators with an engaging and exciting  
21 energy curriculum for students in classrooms. The NEED project is designed to  
22 teach energy concepts of force, motion, light, sound, heat, electricity, magnetism,  
23 energy transformations, and energy efficiency. Energy curriculum, based upon

1 state standards, and hands-on kits, are provided to teachers for use in their  
2 classrooms. Energy workshops are designed to provide educators (teaching grades  
3 K-12) with the content knowledge and process skills to return to their classrooms  
4 and communities, energize and educate their students, provide outreach to  
5 families and conduct energy education programs that assist families in  
6 implementing behavioral changes that reduce energy consumption. Teachers can  
7 utilize the classroom energy kits and curriculum over many years. In addition,  
8 Duke Energy Home Energy Efficiency Kits are delivered to the classrooms to  
9 teach students and families how to install energy efficiency measures in their  
10 homes and to record energy savings.

11 Kentucky NEED manages the overall implementation for the Duke  
12 Energy Kentucky program and works with individual schools, teachers, and  
13 students to gain the maximum impact for the program. Kentucky NEED has  
14 received numerous accolades for its support of energy efficiency and conservation  
15 in local schools, for its support of ENERGY STAR's Change the World  
16 Campaign, and for the integration of a student/family approach to conservation  
17 education. To support, recognize and encourage student energy leadership,  
18 Kentucky NEED hosts the annual Kentucky NEED Youth Awards for Energy  
19 Achievement in Washington, D.C., honoring teams of students who have  
20 successfully planned and facilitated energy projects in their schools and  
21 communities. NEED held two teacher workshops in the 2016/2017 school year  
22 with 46 teachers representing 31 schools in the September training and 14  
23 teachers representing 8 schools participating in the March training.

1 **Q. PLEASE BRIEFLY DESCRIBE THE LOW INCOME SERVICES**  
2 **PROGRAM.**

3 A. The Weatherization Program portion of Low Income Services is designed to help  
4 the Company's income-qualified customers reduce their energy consumption and  
5 lower their energy cost. This program specifically focuses on LIHEAP (Low  
6 Income Home Energy Assistance Program) customers that meet the income  
7 qualification level (*i.e.*, income below 150 percent of the federal poverty level).  
8 This program uses the LIHEAP intake process as well as other community  
9 outreach initiatives to improve participation. The program provides direct  
10 installation of weatherization and energy-efficiency measures and educates Duke  
11 Energy Kentucky's income-qualified customers on their energy usage and other  
12 opportunities that can help reduce energy consumption and lower energy costs.

13 **Q. PLEASE BRIEFLY DESCRIBE THE PAYMENT PLUS PROGRAM.**

14 A. The Payment Plus portion of Low Income Services program is designed to impact  
15 participants' behavior (*e.g.*, encourages utility bill payment and reducing  
16 arrearages) and to generate energy conservation impacts. The program includes  
17 both the early participants and new participants each year.

18 The program is made up of three components: 1) Energy Education &  
19 Budget Counseling to help customers understand how to control their energy  
20 usage and how to manage their household bills using a combined  
21 education/counseling approach; 2) Weatherization Services to increase the energy  
22 efficiency in customers' homes (participants are required to have their homes  
23 weatherized as part of the normal Residential Conservation and Energy Education

1 [low-income weatherization] program unless weatherized in past program years);  
2 and 3) Bill Assistance to provide an incentive for these customers to participate in  
3 the education and weatherization; and to help them get control of their bills.  
4 Payment assistance credits are provided to each customer once they complete  
5 each aspect of the program. The credits are: \$200 for participating in the EE  
6 counseling, \$150 for participating in the budget counseling, and \$150 for  
7 participating in the Residential Conservation and Energy Education program  
8 (weatherization services). If all the requirements are completed, a household  
9 could receive up to a total of \$500 towards their arrearage. This allows  
10 approximately 200 homes to participate per year. Some customers do not  
11 complete all three steps or may have already had weatherization services  
12 completed prior to the program.

13 **Q. PLEASE BRIEFLY DESCRIBE THE RESIDENTIAL DIRECT LOAD**  
14 **CONTROL- POWER MANAGER® PROGRAM.**

15 A. The purpose of the Power Manager® program is to reduce demand by controlling  
16 residential air conditioning usage during periods of peak demand, high wholesale  
17 price conditions and/or generation emergency conditions during the summer  
18 months. It is available to residential customers with central air conditioning. Duke  
19 Energy Kentucky attaches a load control device to the outdoor unit of a  
20 customer's air conditioner. This enables Duke Energy Kentucky to cycle the  
21 customer's air conditioner off and on under appropriate conditions.

22 Customers selecting the option that moderately cycles their air  
23 conditioner, receive a \$25 credit at installation. Customers selecting the longer

1 cycling option, receive a \$35 credit at installation. Customers also receive annual  
2 credits during the months of May-September depending on the program.

3 **Q. PLEASE BRIEFLY DESCRIBE THE MY HOME ENERGY REPORT**  
4 **PROGRAM.**

5 A. The My Home Energy Report (MyHER Report) compares household electric usage  
6 to similar, neighboring homes, and provides recommendations and actionable tips to  
7 lower energy consumption. The report also informs a customer of the other energy  
8 efficiency programs available if applicable. These normative comparisons are  
9 intended to induce customers to adopt more efficient energy consumption behavior.  
10 The MyHER Report will be delivered in printed or online form to targeted  
11 customers with desirable characteristics who are likely to respond to the information.  
12 The printed reports are distributed up to 12 times per year; however, delivery may  
13 be interrupted during the off-peak energy usage months in the fall and spring.  
14 Currently to qualify to receive the MyHER Report, customers must be living in a  
15 single metered, single family home with 13 months usage history.

16 The MyHER program is an opt-out program and the Company provides  
17 information on every report as to how a customer may request to stop receiving  
18 the reports.

19 **Q. PLEASE BRIEFLY DESCRIBE THE LOW INCOME NEIGHBORHOOD**  
20 **PROGRAM.**

21 A. The Duke Energy Kentucky Residential Neighborhood Program takes a non-  
22 traditional approach to serving income-qualified areas of the Duke Energy Kentucky  
23 service territory by directly installing energy efficiency measures in customer

1 homes. The program engages targeted customers with personal interaction in a  
2 familiar setting while ultimately reducing energy consumption by installing energy  
3 efficient measures and educating customers on ways to manage and lower their  
4 energy bills. Examples of direct installed measures include energy efficient bulbs,  
5 water heater and pipe wrap, low flow shower heads/faucet aerators, window and  
6 door air sealing and a year supply of HVAC filter replacements. Targeted low-  
7 income neighborhoods qualify for the program if at least 50 percent of the  
8 households are at or below 200 percent of the federal poverty guidelines. Duke  
9 Energy Kentucky analyzes census and internal data to select and prioritize  
10 neighborhoods that have the greatest need and propensity to participate. While the  
11 goal is to serve neighborhoods where the majority of residents are low income, the  
12 program is available to all Duke Energy Kentucky customers within the selected  
13 boundary. This program is available to both homeowners and renters occupying  
14 single family and multi-family dwellings in the target neighborhoods that have  
15 electric service provided by Duke Energy Kentucky.

16 **Q. PLEASE BRIEFLY DESCRIBE THE SMART SAVER<sup>®</sup> PRESCRIPTIVE**  
17 **PROGRAM.**

18 A. The Smart Saver<sup>®</sup> Non-residential Prescriptive Incentive Program provides  
19 incentives to commercial and industrial consumers for installation of high  
20 efficiency equipment in applications involving new construction, retrofit, and  
21 replacement of failed equipment. The program also uses incentives to encourage  
22 maintenance of existing equipment in order to reduce energy usage. Incentives are

1 provided based on Duke Energy Kentucky's cost effectiveness modeling to assure  
2 cost effectiveness over the life of the measure.

3 **Q. PLEASE BRIEFLY DESCRIBE THE SMART SAVER<sup>®</sup> CUSTOM**  
4 **PROGRAM.**

5 A. The purpose of this program is to encourage the installation of high efficiency  
6 equipment in new and existing nonresidential establishments. The program  
7 provides incentive payments to offset a portion of the higher cost of energy  
8 efficient equipment. Duke Energy Kentucky contracts with a third party to  
9 perform technical review of applications as part of implementation of this  
10 program. This program is jointly implemented with the Duke Energy Indiana,  
11 Duke Energy Ohio, and Duke Energy Carolinas territories to reduce  
12 administrative costs and leverage promotion.

13 **Q. PLEASE BRIEFLY DESCRIBE THE SMART SAVER<sup>®</sup> ENERGY**  
14 **ASSESSMENTS PROGRAM.**

15 A. The purpose of this program is to assist customers with the evaluation of energy  
16 usage within a specific building(s) and to provide recommendations for energy  
17 savings projects. The program may provide up to a 50 percent subsidy for an  
18 energy efficiency audit completed in partnership with Duke Energy contracted  
19 professional engineering organization or a third-party engineering firm of the  
20 customer's choice. This program is jointly implemented within the Duke Energy  
21 Indiana, Duke Energy Ohio, and Duke Energy Carolinas territories to reduce  
22 administrative costs and leverage resources.

1 **Q. PLEASE BRIEFLY DESCRIBE THE SMALL BUSINESS ENERGY**  
2 **SAVER (SBES) PROGRAM.**

3 A. The purpose of Duke Energy's Small Business Energy Saver program (SBES  
4 Program) is to reduce energy usage through the direct installation of energy  
5 efficiency measures within qualifying small non-residential Duke Energy  
6 Kentucky customer facilities. All aspects of the SBES Program are administered  
7 by a single Company-authorized vendor. The SBES Program measures address  
8 major end-uses in lighting, refrigeration, and HVAC applications.

9 The SBES Program participants receive a free, no-obligation energy  
10 assessment of their facility followed by a recommendation of energy efficiency  
11 measures to be installed in their facility along with the projected energy savings,  
12 costs of all materials and installation, and up-front incentive amount from Duke  
13 Energy Kentucky. Upon receiving the results of the energy assessment, if the  
14 customer decides to move forward with the proposed energy efficiency project,  
15 the customer makes the final determination of which measures will be installed.  
16 The energy efficiency measure installation is then scheduled at a convenient time  
17 for the customer and the measures are installed by electrical subcontractors of the  
18 Duke Energy-authorized vendor.

19 **Q. PLEASE BRIEFLY DESCRIBE THE POWERSHARE® PROGRAM.**

20 A. PowerShare® is the brand name given to Duke Energy Kentucky's Peak Load  
21 Management Program (Rider PLM, Peak Load Management Program KY P.S.C.  
22 Electric No. 2, Sheet No. 77). Rider PLM was approved pursuant as part of the  
23 settlement agreement in Case No. 2006-00172. In the Commission's Order in

1 Case No. 2006-00426, approval was given to include the PowerShare<sup>®</sup> program  
2 within the DSM programs. The PLM program is voluntary and offers customers  
3 the opportunity to reduce their electric costs by managing their electric usage  
4 during the Company's peak load periods. Customers and the Company will enter  
5 into a service agreement under Rider PLM, specifying the terms and conditions  
6 under which the customer agrees to reduce usage. There are two product options  
7 offered for PowerShare<sup>®</sup> - CallOption<sup>®</sup> and QuoteOption<sup>®</sup>:

8 • CallOption<sup>®</sup>:

9 A customer served under a CallOption<sup>®</sup> product agrees, upon notification  
10 by the Company, to reduce its demand by a contracted amount. Each time the  
11 Company exercises its option under the agreement, the Company will provide the  
12 customer a credit for the energy reduced. Additionally, emergency events may be  
13 implemented due to reliability concerns. Participants are required to curtail during  
14 emergency events. In addition to the energy credit, customers on the CallOption<sup>®</sup>  
15 will receive an option premium credit. For the 2018-19 Delivery Year, customers  
16 had three CallOption<sup>®</sup> participation program choices: "Limited Summer",  
17 "Summer Only" and "Annual". Limited Summer has rules that reflect the PJM  
18 Limited Demand Response Program, Summer Only rules are similar to Base  
19 Capacity and Annual is designed to reflect Capacity Performance.

20 • QuoteOption<sup>®</sup>:

21 Under the QuoteOption<sup>®</sup> products, the customer and the Company agree  
22 that when the average wholesale market price for energy during the notification  
23 period is greater than a pre-determined strike price, the Company may notify the

1 customer of a QuoteOption<sup>®</sup> event and provide a price quote to the customer for  
2 each event hour. The customer will decide whether to reduce demand during the  
3 event period. If they decide to do so, the customer will notify the Company and  
4 provide an estimate of the customer's projected load reduction. Each time the  
5 Company exercises the option, the Company will provide the participating  
6 customer who reduces load an energy credit. There is no option premium for the  
7 QuoteOption<sup>®</sup> product since customer load reductions are voluntary. Only  
8 customers able to provide a minimum of 100 kW load response qualify for  
9 QuoteOption<sup>®</sup>.

10 **Q. PLEASE EXPLAIN HOW THESE PROGRAMS ARE BENEFICIAL TO**  
11 **BOTH CUSTOMERS AND THE COMPANY.**

12 A. These programs provide numerous benefits to both customers and the Company.  
13 First, for customers, these programs offer an opportunity to reduce energy  
14 consumption and control their monthly electric and gas bills. Many of these  
15 programs also provide incentives to customers that are used to either directly  
16 lower their bill or to help fund the installation of cost-effective measures that will  
17 also lower their consumption once implemented. As I previously mentioned, to  
18 the extent these EE/DSM programs effectively reduce the Company's load  
19 obligation, any excess existing generation (energy and capacity) can potentially  
20 be sold into the wholesale markets, the net proceeds of which flow back to  
21 customers through the Company's Rider PSM.

22 The DSM programs also have a direct impact on the Company's  
23 participation in PJM Interconnection LLC (PJM). As more fully explained by Mr.

1 Verderame, the Company has specific obligations with respect to serving  
2 customer load as a member of PJM. The existence of these programs, and  
3 particularly the various load control programs, enable the Company to meet these  
4 requirements in a cost-effective manner without having to invest in more  
5 generating resources by direct investment or through a bilateral purchase.

6 **Q. PLEASE FURTHER EXPLAIN HOW THE COMPANY CAN USE THESE**  
7 **EE/DSM PROGRAMS TO MEET ITS PJM REQUIREMENTS.**

8 A. Based on the program design of its different programs and the on-going dynamic  
9 nature of PJM's capacity market, Duke Energy Kentucky relies upon a number of  
10 different strategies in addition to its owned generation resources, to meet its fixed  
11 resource requirement (FRR) capacity plan. The Company's EE/DSM programs  
12 further provide customers an opportunity to participate in PJM's EE/DSM  
13 markets through a Company tariff in a manner consistent with the Commission's  
14 Order approving the Company's joining PJM in Case No. 2010-00203.<sup>4</sup> Mr.  
15 Verderame further explains the Company's FRR plan and compliance strategies  
16 in his testimony and how the Company relies upon its EE/DSM programs as part  
17 of that compliance strategy both now and in the future.

18 For example, in the current June 2018 through May 2019 planning year,  
19 the Company submitted about 90% of the Power Manager® program peak  
20 capability to PJM for the final 2018-2019 FRR capacity plan. The contracted

---

<sup>4</sup> *In the Matter of the Application of Duke Energy Kentucky, Inc., for Approval to Transfer Functional Control of its Transmission Assets from the Midwest Independent Transmission System Operator to the PJM Interconnection Regional Transmission Organization and Request for Expedited Treatment, Order, Case No. 2010-00203 (Ky. P.S.C. Dec. 20, 2010); "No customer should be allowed to participate directly or through a third party in any PJM demand-response program until that customer has entered into a special contract with Duke Kentucky which has been filed with, and approved by, the Commission, or until Duke Energy Kentucky has an approved tariff authorizing customer participation." Emphasis added.*

1 Power Manger® capacity has the capability to meet the requirements of PJM's  
2 Limited Demand Response program (maximum 10 emergency events, of a  
3 maximum of 6-hours in length, summer weekdays between noon and 8 pm).

4 Looking forward, during the 2019-2020 Delivery Year, PJM's summer  
5 program will be classified as "Base Capacity Demand Response." The  
6 Company's initial FRR plans for this future Delivery Year, based upon historic  
7 participation levels, will continue to include the anticipated Power Manager®  
8 capacity that will be secured by contract to meet the Company's FRR capacity  
9 obligation. Since the Base Capacity Demand Response events can be called by  
10 PJM for up to 10 hours in length and can be called on weekends and holidays, the  
11 Company is planning on rotating participant groups (in an effort to not fatigue  
12 customers during a long event), so only about 40% of the program capability is  
13 being submitted as part of the FRR for that year. Starting in the 2020-2021  
14 Delivery Year, PJM requires all capacity in the FRR Plan to meet the "Capacity  
15 Performance" standard, which requires annual capability. The Company will need  
16 to either modify the structure of Power Manager® to include a winter component  
17 or pair it with some other program/resource in the Company's EE/DSM portfolio  
18 that together, can meet Winter demand concerns and qualify as an eligible  
19 Capacity Performance resource.

20 Similarly, the Company's Power-Share® CallOption® program is also  
21 included in the FRR Capacity plan for the 2018-2019 Delivery Year.  
22 Approximately 85% of the CallOption® capability is being relied upon in the  
23 Company's 2018-2019 FRR Plan. A similar percentage is being used for 2019-

1 2020 Delivery Year, while reflecting a reduction in over capability due to the  
2 removal of "Limited DR" as a program option and recognizing that some  
3 Commercial/Industrial customers won't be willing to sign up for a program with  
4 maximum number of events. Starting in the 2020-2021 Delivery Year, only  
5 agreements that meet the terms for Capacity Performance will be used in the FRR  
6 commitment.

7 **Q. DOES DUKE ENERGY KENTUCKY SIGN MULTI-YEAR  
8 POWERSHARE® OR POWER MANAGER® PROGRAM CONTRACTS  
9 WITH CUSTOMERS?**

10 A. No. The Company enters into these contracts on an annual basis, for the  
11 upcoming Delivery Year, in advance of the submittal of the final FRR Plan. The  
12 Company bases future FRR Plan capacity estimates based upon prior customer  
13 participation. It is important to note that if the Company were to terminate the  
14 Power Manager®, it would likely incur costs in excess of \$1 million to remove  
15 the control devices from customers' homes, while the cost to maintain the annual  
16 resource associated with the program is less \$300 thousand per year.

17 **Q. DO CUSTOMERS ACTUALLY PARTICIPATE IN AND RELY UPON  
18 THE COMPANY'S EE/DSM PROGRAMS?**

19 A. Yes, Duke Energy Kentucky customers do participate in and rely on the  
20 Company's EE/DSM programs to undertake energy efficient behavior and make  
21 investments in energy efficient measures. In fact, the Company has actually seen  
22 customer participation increase over the past few years along with the measured  
23 and verified kWh savings achieved through the programs also increasing

1 substantially. Beyond the fact that the Company continues to see increased  
2 customer participation, the Company's independent Evaluation, Measurement and  
3 Verification (EM&V) determines free ridership, or the percentage of the energy  
4 efficiency savings that would have been achieved even if the Company had not  
5 offered the incentives through its programs.

6 **Q. WHAT IS THE AGGREGATE FREE RIDERSHIP FOR THE CURRENT**  
7 **PORTFOLIO AND WHAT DOES THAT INDICATE?**

8 A. The aggregate free ridership across all programs in the portfolio during its most  
9 recent vintage (2017-2018) was 13 percent. The fact that 87 percent of the  
10 impacts were found through the EM&V process to have occurred directly because  
11 of the Company's program rather than other factors is clear indication that these  
12 programs are not only relied upon by customers but are justifiable.

13 **Q. HOW DOES DUKE ENERGY KENTUCKY MEASURE THE COST-**  
14 **EFFECTIVENESS OF ITS DSM PROGRAMS?**

15 A. Duke Energy Kentucky evaluates the cost-effectiveness of energy efficiency  
16 programs using the four tests specified in the California Standard Practice Manual  
17 (SPM). These tests are recognized throughout the industry and have historically  
18 been accepted by the Kentucky Public Service Commission in the Company's  
19 annual EE/DSM filings. The tests utilize estimates of the net present value of the  
20 financial stream of costs versus benefits, *i.e.*, the cost to implement the measure is  
21 valued against the savings or avoided costs. Put another way, the stream of costs  
22 to implement the measures are valued against the stream of savings or avoided  
23 costs over the life of the measure or program.

1 **Q. PLEASE DESCRIBE THESE COST EFFECTIVENESS TESTS.**

2 A. The cost-effectiveness tests utilized are the Participant Cost Test (PCT), the  
3 Utility Cost Test (UCT), the Total Resource Cost (TRC), and the Ratepayer  
4 Impact Measure (RIM) Test.

- 5 • The PCT is designed evaluate cost effectiveness from the  
6 perspective of the customer participating in the program. It  
7 compares the benefits to the participant through bill savings and  
8 incentives from the utility, relative to the costs to the participant  
9 for implementing the energy efficiency measure. The costs a  
10 customer may incur can include incremental equipment and  
11 installation costs, as well as increased annual operating cost, if  
12 applicable.
- 13 • The UCT is designed to compare a utility's investment in EE/DSM  
14 versus traditional supply side investment as it compares utility  
15 benefits (avoided energy, transmission and distribution capacity  
16 and generation capacity related costs) to utility costs incurred to  
17 implement the program such as marketing, customer incentives,  
18 and implementation costs, and does not consider other benefits  
19 such as participant savings or societal impacts.
- 20 • The TRC Test compares the total benefits to the utility and to  
21 participants relative to the costs to the utility to implement the  
22 program plus the incremental costs to the participant. The benefits  
23 to the utility are the same as those computed under the UCT. The

1 benefits to the participant are the same as those computed under  
2 the PCT; however, customer incentives are considered a pass-  
3 through benefit to customers. As such, incentives or rebates to the  
4 customer are not included in the TRC.

- 5 • The RIM Test is a more theoretical test designed to indicate if rates  
6 are expected to increase or decrease over the long run because of  
7 implementing the program. It compares the benefits to the utility,  
8 the same benefits as included in the UCT, to the costs required to  
9 implement a program including lost revenues.

10 While the Company has traditionally viewed the UCT as the optimal test to  
11 evaluate the operation of its portfolio of programs versus investing in more  
12 tradition supply-side investments, Duke Energy Kentucky believes that evaluating  
13 the programs through the lens of multiple tests helps to ensure the development of  
14 a reasonable set of EE/DSM programs. It should also be noted that none of the  
15 tests described above include external benefits to participants and non-participants  
16 that can also offset the costs of the programs.

17 **Q. ARE THE COMPANY'S EE/DSM PROGRAMS COST EFFECTIVE?**

18 A. Yes, the programs in the Company's portfolio, as approved by the Commission in  
19 Case No. 2016-00382, that were offered to its customers, prior to the  
20 Commission's February 14, 2018 Order had an overall UCT of well above 3.0, as  
21 well as a scores greater than 1.0 on the other three cost effectiveness tests.

22 **Q. IN THE COMPANY'S RESPONSE TO ITEMS 1 AND 2 OF STAFF'S**  
23 **SECOND INFORMATION REQUEST IN THIS PROCEEDING, THE**

1           **COMPANY INDICATED THAT ITS ENERGY AND CAPACITY COST**  
2           **EFFECTIVENESS INPUTS ARE BASED ON 2011 DATA, PLEASE**  
3           **EXPLAIN WHY YOU STILL BELIEVE THE COMPANY'S DSM**  
4           **PROGRAMS REMAIN COST EFFECTIVE?**

5    A.    The Company response to Items 1 and 2 of the Staff's Second Information  
6           Request was based on the cost effectiveness analysis of the Programs being  
7           offered July 2016 through June 2017, as approved by Commission in Case No.  
8           2016-00382 on March 27, 2017. The Company filed updated cost effectiveness  
9           scores with its application in this case. The Company believes that its response is  
10          appropriate because the programs that were being offered at the time on the  
11          Commission's February 14, 2018 Order suspending them were approved based on  
12          the avoided cost analysis that utilized escalated 2011 avoided costs.

13   **Q.    HAS THE COMPANY UPDATED ITS COST EFFECTIVENESS**  
14           **CALACULATIONS FOR ITS PROGRAMS IN THIS PROCEEDING?**

15    A.    Yes, while the Appendix A that was shown in the Company's Application in Case  
16           No. 2017-00427 was based on avoided cost inputs from 2011, in its application  
17           the Company had updated the avoided costs inputs that were used to evaluate the  
18           projected July 2018 thru June 2019 portfolio to reflect escalated 2016 avoided  
19           costs.

20   **Q.    AFTER UPDATNG THE AVOIDED COST INPUTS UNDERLYING THE**  
21           **PROJECTED JULY 2018 THRU JUNE 2019 PROGRAMS AS INCLUDED**  
22           **IN THE COMPANY APPLICATION IN CASE NO 2017-00427, ARE THE**  
23           **PROGRAMS COST EFFECTIVE?**

1 A. Yes, As shown on Page 1 of Attachment TJD-1, the overall portfolio UCT is  
2 nearly 2.0.

3 **Q. HAS THE COMPANY CALCULATED THE COST EFFECTIVENESS OF**  
4 **ITS DSM PROGRAMS EXCLUDING AVOIDED CAPACITY COSTS??**

5 A. Yes. Despite the fact that Duke Energy Kentucky believes that it has  
6 appropriately analyzed the cost effectiveness of its programs by considering the  
7 avoided capacity values in the analysis, it has also performed the analysis  
8 excluding the avoided capacity costs.

9 **Q. DO THESE PROGRAMS REMAIN COST EFFECTIVE EXCLUSIVE OF**  
10 **AVOIDED CAPACITY?**

11 A. Yes, as indicated on Page 17, of the Company's March 2, 2018 Petition for  
12 Rehearing in Case No 2017-00427, even if the Company removed the avoided  
13 capacity values from the additional cost effectiveness analysis performed on its  
14 portfolio of programs reflected in Appendix A (programs offered July 2016-June  
15 2017), the portfolio would remain cost effective with an overall UCT of 2.8. The  
16 Company also performed a similar cost effectiveness analysis of the projected  
17 July 2018 thru June 2019 portfolio excluding avoided capacity costs. After  
18 performing this analysis the portfolio is cost effective with an overall UCT of  
19 over 1.4, as shown Attachment TJD-1 Page 2.

20 **Q. DO YOU BELIEVE THAT THE COMMISSION SHOULD ALLOW THE**  
21 **COMPANY TO CONTINUE ITS EXISTING LEVEL OF EE/DSM**  
22 **PROGRAMS FOR CUSTOMERS?**

1 A. Yes, Duke Energy Kentucky believes that its cost effective portfolio of programs  
2 should continue to be offered. The programs enable customers to become  
3 educated, engaged and empowered to be more energy efficient and take control of  
4 their energy bills. Additionally, the offering of the portfolio of programs allows  
5 the Company to satisfy capacity supply obligations associated with its  
6 membership in PJM.

7 **Q. DOES THE COMPANY TAKE PROACTIVE STEPS TO MONITOR ITS  
8 DSM PROGRAM COSTS AND TO MANAGE ITS BUDGETS?**

9 A. Yes. The Company does proactively monitor its EE/DSM programs and provides  
10 regular status updates to the Commission. The Company believes that customer  
11 interest and natural demand to participate in cost- effective EE/DSM programs  
12 should not be artificially constrained by an estimated budget, particularly when  
13 these programs are available and paid for by all customers, the Company has long  
14 been, and continues to be, strongly focused on managing the overall costs of its  
15 programs. The Company reviews program costs on a monthly basis, and  
16 continually looks for opportunities to reduce costs. These opportunities include  
17 leveraging efficiencies that can be gained through program management between  
18 multiple jurisdictions to enable better unit pricing from vendors. In addition,  
19 consistent with the Commission's Order in Case No. 2015-00368, Duke Energy  
20 Kentucky informs the Commission when a program reaches 95 percent of its  
21 forecasted budget for the fiscal year. The Company also informs the Commission  
22 if a program will exceed its budget by 25 percent during the fiscal year.

1 Q. GIVEN THE COMMISSION'S CONCERN WITH THE COSTS OF DSM  
2 PROGRGAMS IN RELATION TO THE BENEFITS TO CUSTOMERS, IS  
3 THE COMPANY WILLING TO IMPLEMENT ANY FURTHER ACTION  
4 TO CONTINUE TO MANAGE ITS COSTS OF EE/DSM PROGRAMS?

5 A. Yes. While the Company is hesitant to implement actions that would stifle  
6 customer participation in cost effective EE/DSM programs that deliver more  
7 system benefits than they cost, Duke Energy Kentucky is willing to implement  
8 changes to better manage EE/DSM costs. One potential modification the  
9 Company could employ in order to gain greater transparency into customer  
10 participation levels and costs would be a reservation system. Particularly, with  
11 respect to non-residential customers, the Company could employ a system  
12 whereby customers must essentially reserve a spot in a queue to be eligible to  
13 receive an incentive thru a program during a fiscal year. If a program was  
14 exceeding its budget in a fiscal year, the Company could, if directed to so by the  
15 Commission, then use this queue to potentially defer or carry over customer  
16 incentives from one fiscal year into the next in order to assist in managing the  
17 annual costs recovered through the rider. By employing this type of system, the  
18 Company will be able to forecast excess program spending in a more timely  
19 manner and manage customer expectations regarding their ability to receive an  
20 incentive should the Commission decide that spending in excess of the original  
21 budget needs to be constrained.

**III. CONCLUSION**

1 Q. **DOES THIS CONCLUDE YOUR TESTIMONY?**

2 A. Yes, it does.

<b>V. CONCLUSION .....</b>	<b>39</b>

**I. INTRODUCTION AND PURPOSE**

1 **Q. STATE YOUR NAME AND BUSINESS ADDRESS.**

2 A. My name is John A. Verderame, and my business address is 526 S. South Church  
3 Street, Charlotte, North Carolina 28202.

4 **Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?**

5 A. I am employed by Duke Energy Progress, Inc. (Duke Energy Progress) as  
6 Managing Director, Power Trading and Dispatch. Duke Energy Progress is the  
7 utility formerly known as Progress Energy Inc., (Progress Energy) located in  
8 North and South Carolina. As part of the merger integration process, Duke Energy  
9 Progress now provides various administrative and other services to the regulated  
10 affiliated companies within Duke Energy Corporation (Duke Energy Corp.),  
11 including Duke Energy Kentucky, Inc., (Duke Energy Kentucky or the  
12 Company).

13 **Q. PLEASE DESCRIBE BRIEFLY YOUR EDUCATION AND**  
14 **PROFESSIONAL EXPERIENCE.**

15 A. I received a Bachelor of Arts degree in Economics from the University of  
16 Rochester in 1983, and a Master's in Business Administration in Finance from  
17 Rutgers University in 1985. I have worked in the energy industry for 17 years.  
18 Prior to that, from 1986 to 2001, I was a Vice President in the United States (US)  
19 Government Bond Trading Groups at the Chase Manhattan Bank and Cantor  
20 Fitzgerald. My responsibilities as a US Government Securities Trader included  
21 acting as the Firm's market maker in US Government Treasury securities. I joined  
22 Progress Energy, in 2001, as a Real-Time Energy Trader. My responsibilities as a

1 Real-Time Energy Trader included managing the real-time energy position of the  
2 Progress Energy regulated utilities. In 2005, I was promoted to Manager of the  
3 Power Trading group. My role as manager included responsibility for the short-  
4 term capacity and energy position of the Progress Energy regulated utilities in the  
5 Carolinas and Florida.

6 In 2012, upon consummation of the merger between Duke Energy Corp.  
7 and Progress Energy, Progress Energy became Duke Energy Progress and I was  
8 promoted to my current position.

9 **Q. HAVE YOU EVER TESTIFIED BEFORE THE KENTUCKY PUBLIC**  
10 **SERVICE COMMISSION?**

11 A. Yes. I have previously testified in the Company's Fuel Adjustment Clause (FAC)  
12 proceedings and most recently, in Case No. 2017-00321, regarding the  
13 Company's application to establish new base electric rates. I have also testified in  
14 other cases that have involved the Company's participation in energy and capacity  
15 markets.

16 **Q. PLEASE SUMMARIZE YOUR DUTIES AS MANAGING DIRECTOR,**  
17 **POWER TRADING AND DISPATCH.**

18 A. As Managing Director, Power Trading and Dispatch of Duke Energy Progress, I  
19 am responsible for Power Trading and Generation Dispatch on behalf of Duke  
20 Energy's regulated utilities in the Carolinas, Florida, Indiana, Ohio, and  
21 Kentucky. I am primarily responsible for Duke Energy Kentucky's generation  
22 dispatch, unit commitment, 24-hour real-time operations, and plant  
23 communications related to short-term generating maintenance planning. I lead the

1 team responsible for managing the Company's capacity position with respect to  
2 meeting its Fixed Resource Requirement (FRR) obligation as a member of PJM  
3 Interconnection, L.L.C. (PJM), for the submission of the Company's supply offers  
4 and demand bids in PJM's day-ahead and real-time electric energy (collectively  
5 Energy Markets) and ancillary services markets (ASM), as well as managing the  
6 Company's short-term and long-term supply position to ensure that the Company  
7 has adequate economic resources committed to serve its retail customers'  
8 electricity needs. In that respect, my teams are also responsible for any financial  
9 hedging done to mitigate exposure to short-term energy prices and congestion  
10 risks.

11 **Q. WHAT IS THE PURPOSE OF YOUR DIRECT TESTIMONY?**

12 A. The purpose of my testimony is to support the Company's desire to continue  
13 offering cost-effective energy efficiency (EE) and demand side management  
14 (DSM) programs to its customers, and specifically to describe how these  
15 programs are relied upon by the Company to meet its load obligations in PJM. In  
16 doing so, I provide a brief overview of the Company's generating resources to  
17 meet its customer load obligations and provide safe, reliable and adequate service.  
18 I then briefly describe Duke Energy Kentucky's resource planning process that is  
19 used to ensure it continues to meet its Kentucky customers' load requirements. I  
20 then discuss the Company's participation in PJM as it pertains to the capacity  
21 markets and discuss the customer benefits that the Company's PJM membership  
22 provides. I then describe how the Company must meet its load requirement,

1 including reserves as required by PJM and how energy efficiency and demand  
2 response play a key role in the Company's ability to meet these obligations.

**II. OVERVIEW OF DUKE ENERGY'S  
CURRENT GENERATING RESOURCES**

3 **Q. PLEASE PROVIDE A BRIEF OVERVIEW OF HOW DUKE ENERGY**  
4 **KENTUCKY MEETS ITS KENTUCKY LOAD OBLIGATIONS.**

5 A. Duke Energy Kentucky currently owns and operates approximately 1,062 net  
6 installed megawatts (MW) of generating capacity, provided by two assets.

7 Base load requirements are met by the East Bend Unit 2 Generating  
8 Station (East Bend). East Bend is a 648 megawatt (MW) (nameplate rating) 600  
9 megawatt (net rating) coal-fired base load unit located along the Ohio River in  
10 Boone County, Kentucky. East Bend was commissioned in 1981 and the  
11 Company now owns 100 percent of the station, having completed the purchase of  
12 the Dayton Power and Light Company's 31 percent interest in the station in 2014.

13 The Company's peaking requirements are met with the Woodsdale  
14 Generating Station (Woodsdale). Woodsdale is a six-unit natural gas-fired  
15 combustion turbine (CT) with approximately 462 MW (net summer rating)  
16 located in Trenton, Ohio.

17 In addition, the Company recently completed construction of two small  
18 solar facilities representing a total of 6.8 MWs of capacity that went into service  
19 in late 2017.

20 These assets are dispatched into PJM, which maintains functional control  
21 of the transmission system within its footprint including the Duke Energy  
22 Ohio/Kentucky system.

1 **Q. PLEASE EXPLAIN THE TERMS “NAMEPLATE” AND “NET RATING”**  
2 **AND WHY THEY ARE DIFFERENT.**

3 A. The nameplate ratings, or installed capacity ratings, are the ratings provided by  
4 the manufacturer of the generating equipment and these ratings are actually  
5 engraved on a nameplate that is affixed to the equipment. This number represents  
6 the total number of MWs that are possible to be generated from the station.

7 Conversely, the net ratings represent the net amount of power that can be  
8 dispatched from the plants after some portion of the gross power output is used to  
9 power the plant machinery.

10 The two terms have different uses and meanings. The nameplate rating is  
11 typically used when discussing long-term resource planning and is useful for  
12 analysis of determining the size of a generator that must be constructed or  
13 acquired to meet future load. The net rating is what is typically used for actual  
14 day-to-day dispatch for meeting actual customer load, assuming there are no de-  
15 rates or other limitations on the availability of capacity.

16 For long term planning, utilities typically target a reserve margin that is  
17 calculated on an installed capacity basis. For purposes of a reserve margin as  
18 determined by PJM, an entirely different metric, based upon a calculated unforced  
19 capacity rating, is used.

1 **Q. DESCRIBE THE DIFFERENCE BETWEEN INSTALLED CAPACITY**  
2 **AND UNFORCED CAPACITY.**

3 A. Installed Capacity (ICAP) is a MW value based on the summer net dependable  
4 capability of a generation unit; specifically, the name plate rating of the unit  
5 minus the required auxiliary load. Further, ICAP cannot exceed the capacity  
6 interconnection right limits of the bus to which it is connected. The ICAP of a  
7 unit does not generally change unless the unit experiences permanent performance  
8 degradation or modifications that increase generating output.

9           Unforced Capacity (UCAP) is the MW value of a capacity resource in the  
10 PJM Capacity Market. It is determined annually by PJM based on the  
11 methodology mathematically expressed as:

12            $UCAP = ICAP * (1 - EFORD)$  where:

13           EFORD is the equivalent demand forced outage rate.

14 **Q. PLEASE EXPLAIN THE TERM “EFORD.”**

15 A. EFORD is an industry standard measure based on historical performance meant to  
16 represent the probability that a generating unit will not be available due to a  
17 forced outage or forced derating when called upon to generate. As example, if a  
18 600 MW unit such as East Bend were to have an EFORD of 10percent during the  
19 annual year-long pre-delivery year evaluation period; Duke Energy Kentucky  
20 would be credited 540 MWs in the PJM capacity market for the following  
21 capacity year. The distinction is significant in that for purposes of meeting  
22 capacity obligations in PJM, an entirely different analysis must be performed  
23 compared to what is used for traditional integrated resource planning (IRP).

### **III. DUKE ENERGY KENTUCKY'S RESOURCE PLANNING**

1 **Q. PLEASE GENERALLY DESCRIBE DUKE ENERGY KENTUCKY'S IRP**  
2 **PLANNING PROCESS.**

3 A. The IRP planning process assesses various supply-side, demand-side and  
4 emission compliance alternatives to develop a long-term, cost-effective portfolio  
5 to provide customers with reliable service at reasonable costs. The IRP planning  
6 process involves various assumptions such as future energy prices, future  
7 environmental compliance requirements and reliability constraints.

8 Duke Energy's load forecasting group develops the load forecast by: (1)  
9 obtaining service area economic forecasts primarily from Moody's Analytics; (2)  
10 preparing an energy forecast by applying statistical analysis to certain variables  
11 such as number of customers, economic measures, energy prices, weather  
12 conditions, *etc.*; and (3) developing monthly peak demand forecasts by  
13 statistically analyzing weather data. The Company updates the load forecasts on a  
14 regular basis and the updated load forecasts are used for all modeling analysis. It  
15 is important to note that while Duke Energy Kentucky develops internal load  
16 forecasts for system planning purposes, the actual load forecast and the Duke  
17 Energy Kentucky PJM load obligation, which includes peak coincidence factors  
18 and system reserve requirements, is calculated by PJM, and can differ from the  
19 Company's internal forecast.

20 **Q. WHAT ARE THE COMPANY'S LOAD REQUIREMENTS?**

21 A. The chart below depicts the shape of the Company's monthly load obligations for  
22 the twelve months ended December 2017. The "DEK System Peak" line reflects

1 actual peak energy demand from customers in each month. The “WN Peak” line  
 2 reflects a “weather normal” peak demand, adjusted to reflect typical weather  
 3 conditions at the time of the peak in each month.

4 Based on the most recent demand forecast, the base case demand and energy  
 5 forecasts and high case demand and energy forecasts for the current year and the  
 6 next four years are projected as follows:

Duke Energy Kentucky – Native Load Forecast				
	Demand – MW		Energy - GWH	
	Base	High	Base	High
2018	847	932	4,025	4,378
2019	852	938	4,043	4,414
2020	857	944	4,065	4,446
2021	862	949	4,084	4,473
2022	867	954	4,084	4,473

7 **Q. PLEASE DESCRIBE DUKE ENERGY KENTUCKY’S PLANNING**  
 8 **RESERVE MARGIN FOR IRP PURPOSES AND HOW IT IS**  
 9 **CALCULATED.**

1 A. As I previously stated, the IRP models are for long-term resource planning and  
2 thus utilize the full net summer capacity of the unit ratings to perform dispatch, so  
3 the reserve margin needs to be developed on an installed capacity, or ICAP,  
4 rating.

5 The planning reserve margin target (*i.e.*, minimum amount required) the  
6 Company used for 2018 resource planning is 14.5 percent. Duke Energy  
7 Kentucky plans for a prudent long-term target reserve margin (typically in the  
8 13%-17% range). Its actual projected reserves based upon the Company's  
9 installed capacity (*i.e.*, nameplate minus auxiliary load) using its most recent  
10 forecast is stated below. Again, it must be understood that the installed capacity  
11 value is not the actual amount of capacity that is available to serve customers or  
12 utilized to meet PJM obligations. In addition, this version of reserves and reserve  
13 margin does not account for the load obligation imputed by PJM or factor in  
14 capacity de-rates due to forced outages.

15 For purposes of being clear projected reserve margins for IRP planning are  
16 calculated as follows:

- 17 • Reserve Margin (MW) = Generating Capacity – Peak Demand – Demand  
18 Response
- 19 • Reserve Margin (%) = (Generating Capacity / (Peak Demand – Demand  
20 Response)) - 1

21 This metric produces the following reserve margins for Duke Energy Kentucky  
22 for purposes of traditional IRP planning on a total installed capacity basis.

Year	Projected Reserves (MW)	Projected Reserve Margin (%)
2018	254	31%
2019	250	30%
2020	233	27%
2021	228	27%
2022	223	26%

1                    However, as a participant in PJM, Duke Energy Kentucky must also  
2                    satisfy a separate PJM prescribed reserve margin requirement as part of its near-  
3                    term Regional Transmission Organization (RTO) wide capacity planning. These  
4                    two requirements while similar in name and concept are not the same metric nor  
5                    are they calculated the same way.

6    **Q.    DOES DUKE ENERGY KENTUCKY CURRENTLY HAVE SUFFICIENT**  
7                    **CAPACITY TO MEET ITS KENTUCKY CUSTOMER LOAD**  
8                    **OBLIGATIONS?**

9    A.    Duke Energy Kentucky currently has sufficient capacity to meet its load  
10                    obligations; however, due to short term variations in load forecasts and generation  
11                    performance, short-term capacity purchases may be necessary in order to maintain  
12                    sufficient reserves to meet its capacity obligations in PJM. Currently, there are no  
13                    planned base load or peaking capacity additions needed to meet native load  
14                    requirements over the next ten years. Likewise, there are no planned unit  
15                    retirements to occur in the next ten years.

16   **Q.    PLEASE EXPLAIN HOW PJM CALCULATES THE COMPANY'S**  
17                    **SYSTEM RESERVE REQUIREMENTS.**

1 A. Duke Energy Kentucky's PJM FRR capacity obligation reflects both the  
2 forecasted load of Duke Energy Kentucky's customers as calculated by PJM and  
3 the reserve requirement mandated by PJM. When PJM assesses the amount of  
4 capacity a load-serving entity is required to commit during the three-year  
5 planning horizon as part of its FRR capacity plan (FRR Plan), it defines the  
6 obligation quantity in terms of "unforced capacity" value (UCAP). As described  
7 above, UCAP is the MW value of a capacity resource in the PJM Capacity  
8 Market. UCAP refers to the electric generation capacity that is actually available  
9 as a resource to PJM at any given time after discounting for historical facility  
10 unavailability due to outages or derating to determine minimum requirements. For  
11 demand resources and energy efficiency resources, the unforced capacity value is  
12 equal to demand reduction multiplied by the Forecast Pool Requirement.

13 **Q. WHY IS THIS DIFFERENT FROM HOW THE COMPANY**  
14 **CALCULATES ITS RESERVE FOR IRP PLANNING PURPOSES?**

15 A. The primary difference between the IRP view of reserve requirement and the PJM  
16 view of reserve requirement is the planning horizon. Other less impactful  
17 differences include load forecast modeling differences and PJM's consideration of  
18 how the Duke Energy Kentucky load conforms to the broader PJM planning  
19 region. Duke Energy Kentucky plans to meet customer requirements over the long  
20 term. PJM plans to meet requirements for just the next three years. As such, Duke  
21 Energy Kentucky plans for a long-term forced outage expectation while PJM  
22 translates recent unit performance directly into capacity capability through the  
23 UCAP methodology. Generation station performance naturally varies over time

1 and Duke Energy Kentucky must plan to be able to meet the PJM requirement  
2 during both low EFORd and higher EFORd years.

**IV. DUKE ENERGY KENTUCKY'S PARTICIPATION IN PJM**

**A. OVERVIEW OF PJM**

3 **Q. PLEASE GENERALLY DESCRIBE PJM.**

4 A. Duke Energy Kentucky has been a member of PJM since January 1, 2012. PJM is  
5 the nation's first fully functioning RTO and manages the power grid and  
6 wholesale electric market for all or parts of thirteen states and the District of  
7 Columbia. The PJM markets consist of energy, capacity, ancillary services  
8 markets, and a financial transmission rights market. PJM's operation is governed  
9 by agreements approved by the Federal Energy Regulatory Commission (FERC),  
10 including the Operating Agreement, Open Access Transmission Tariff (OATT),  
11 and the Reliability Assurance Agreement (RAA). As a member of PJM, Duke  
12 Energy Kentucky is subject to these agreements, which among other things  
13 require Duke Energy Kentucky to offer all its available generation to PJM and to  
14 purchase its customer energy load requirements from the PJM Day-Ahead or  
15 Real-Time Energy Markets. The Day-Ahead and Real-Time Energy Markets are  
16 collectively referred to as the PJM Energy Market for the remainder of my  
17 testimony.

**B. PJM'S ENERGY MARKET**

18 **Q. PLEASE BRIEFLY DESCRIBE THE PJM ENERGY MARKET.**

19 A. PJM administers its Energy Markets utilizing locational marginal pricing (LMP).  
20 LMP can be broadly defined as the value of one additional megawatt of energy at

1 a specific point on the electric grid. In PJM, LMP is composed of three  
2 components: the system marginal energy price; the transmission marginal  
3 congestion price; and the marginal loss price. Both the Day-Ahead and Real-Time  
4 Energy Markets are based on supply offers and demand bids submitted to PJM by  
5 market participants or actual customer demand, including both generator owners  
6 (as sellers) and load serving entities (as buyers).

7 The Day-Ahead Energy Market provides a means for market participants  
8 to mitigate their exposure to price risk in the Real-Time Energy Market. The Day-  
9 Ahead Energy Market also provides meaningful information to PJM regarding  
10 expected real-time operating conditions for the next day, which enhances PJM's  
11 ability to ensure reliable operation of the transmission system and economically  
12 serve customer demand. The Real-Time Energy Market functions as a balancing  
13 market between generation and load in real-time. Through the PJM Energy  
14 Markets and the LMP price signals, PJM provides a market-based solution to  
15 value and thus manage energy production, transmission congestion, and marginal  
16 losses in the PJM region to meet demand in the most cost-effective way.

17 **Q. PLEASE EXPLAIN HOW PJM DISPATCHES GENERATING**  
18 **RESOURCES TO MEET DEMAND IN THE ENERGY MARKET.**

19 A. PJM performs a security constrained economic commitment and least-cost  
20 security constrained economic dispatch process that simultaneously optimizes  
21 energy and reserves for all generation in its footprint in determining which assets  
22 to commit and dispatch. This process takes into account the various, unique  
23 challenges faced in reliably and economically supplying energy to all loads across

1 its footprint, most significantly aligning the production of energy simultaneously  
2 with the volatility in demand within the capability of the transmission network.  
3 PJM must continually act to account for the fact that customer demand is dynamic  
4 in nature, fluctuating over the course of a day, week, and season, while analyzing  
5 factors such as costs and operating characteristics of generation from different  
6 types of units within its entire footprint and expected and unexpected conditions  
7 on the transmission network that affect which generation units can be used to  
8 serve load economically and reliably given the numerous constraints that must be  
9 considered. Because of these challenges, PJM's dispatch process "is designed to  
10 be an optimization process so that a reliable supply of electricity at the lowest cost  
11 possible under the conditions prevailing in each dispatch time interval can be  
12 delivered."<sup>1</sup>

13           Importantly, PJM's decisions as to which generating units should be  
14 dispatched are not made exclusively based on the individual unit's cost. Although  
15 the price of energy at a generating unit is certainly important, PJM's dispatch  
16 process must take into account a number of factors, including system-wide  
17 reliability, transmission grid congestion and losses, and numerous operational  
18 conditions and constraints. PJM has access to complete information regarding the  
19 operation of its Day-Ahead and Real-Time Energy Markets in making the  
20 determination to commit and dispatch a unit. Because of the efficient and  
21 informed nature of PJM's dispatch methodology, a utility's energy purchases in  
22 PJM's Day-Ahead and Real-Time Energy Markets are the most efficient and

---

<sup>1</sup> FERC Docket AD05-13-000, *Report on Security Constrained Economic Dispatch by the Joint Board of PJM/MISO Region*, Attachment 1, at pg. 5 (May 24, 2006).

1 economic means available to satisfy customer load. Stated another way, energy  
2 acquired by all load serving entities (LSEs) from PJM are necessarily and by  
3 definition purchased on an economic dispatch basis.

4 **Q. PLEASE EXPLAIN HOW THE COMPANY MEETS ITS ENERGY**  
5 **NEEDS THROUGH THE PJM ENERGY MARKET.**

6 A. Consistent with its PJM membership, the Company meets its energy needs  
7 through the PJM Energy Market and does not currently purchase any energy  
8 outside of PJM. Through PJM's Day-Ahead Market, market participants can  
9 mitigate their exposure to real-time price risk by selling available generation and  
10 purchasing forecasted demand in the Day-Ahead Energy Market. Duke Energy  
11 Kentucky submits demand bids and supply offers as both LSE and a generator  
12 owner, respectively. Thus, the Company simultaneously functions as both a buyer  
13 and seller to serve its retail electric customers.

14 **Q. PLEASE BRIEFLY EXPLAIN HOW DUKE ENERGY KENTUCKY'S**  
15 **CURRENT GENERATION PORTFOLIO PARTICIPATES AND IS**  
16 **DISPATCHED IN THE DAY-AHEAD AND REAL-TIME ENERGY**  
17 **MARKETS.**

18 A. Under the terms of PJM's RAA, as a FRR entity and generation owner in PJM,  
19 Duke Energy Kentucky is under a must-offer requirement to offer all its  
20 generation committed to the FRR plan into the Day-Ahead Energy Market.

21 In making the decision regarding an individual unit's offer status, the  
22 Company considers various factors such as unit availability, forecasted locational  
23 marginal prices, unit generation production cost, PJM impacts (Day-Ahead

1 Operating Reserve credits, balancing operating reserve changes, *etc.*), and the  
2 capability, risk, and economic impact from cycling the generating unit off-line  
3 and/or on-line. Before making any generation unit offer, Company personnel  
4 engage in a daily planning process designed to minimize the total customer cost  
5 by maximizing each unit's economic value.

6 Each generating unit is offered hourly with a segmented incremental  
7 energy price pair quantity and ancillary service offer curve across the unit's  
8 operational range as well as a start-up cost, no-load cost, and operating  
9 parameters. The hourly offers are based on numerous factors, including but not  
10 limited to, the daily fuel cost, unit efficiency, emissions and variable operations  
11 and maintenance (O&M) costs, maximum and minimum loadings, and plant  
12 output availability and physical characteristics. Unit commitment status is  
13 determined based upon unit availability, marginal energy costs, expected impact  
14 of certain PJM charges and credits, and anticipated market-clearing prices.

15 Day-ahead generation unit offers are submitted to PJM by 10:30 Eastern  
16 Prevailing Time the day prior to energy flow. Generally, by 13:30 Eastern  
17 Prevailing Time that day, following execution of a security constrained unit  
18 commitment model, PJM posts energy and ancillary services awards for the  
19 following day. These awards are financially binding on both Duke Energy  
20 Kentucky and PJM.

21 In real-time, Duke Energy Kentucky makes hourly updates to the energy  
22 and ancillary service offers, primarily with respect to unit availability, but also  
23 taking into account the unit's operating parameters. The Duke Energy Kentucky

1 generation dispatchers follow PJM generation dispatch signal instructions and  
2 relay necessary instructions to the generation stations.

3 It is possible that in real-time, despite receiving a day-ahead energy award,  
4 PJM dispatch signals will instruct Duke Energy Kentucky units to move to  
5 generation loadings other than their day-ahead award level. These instructions are  
6 based on the real-time energy and ancillary services needs of the overall system as  
7 manifested through LMP price signals at the generator bus. If the real-time LMP  
8 is below a unit's marginal cost of energy, PJM will likely reduce output, or  
9 possibly delay or cancel a unit startup. Conversely, if system conditions have  
10 changed from day-ahead results, PJM may direct a Duke Energy Kentucky unit to  
11 start up even without a day-ahead energy award. Duke Energy Kentucky has an  
12 obligation and financial incentive to follow PJM dispatch instructions.

### **C. PJM'S CAPACITY MARKET**

13 **Q. PLEASE DESCRIBE THE PJM CAPACITY MARKET.**

14 **A.** PJM's capacity market is called RPM, which is an acronym for Reliability Pricing  
15 Model. The purpose of RPM is to provide a market construct that enables PJM to  
16 secure adequate generation resources to meet the reliability needs of the RTO.  
17 The RPM construct and the associated rules regarding how PJM members  
18 participate in the PJM capacity market is described within the PJM OATT and RAA.  
19 The PJM capacity market operates on a planning period that spans twelve months  
20 beginning June 1<sup>st</sup> and ending May 31<sup>st</sup> of each subsequent year (Delivery Year).  
21 In PJM, the capacity market structure is intended to provide transparent forward  
22 market signals that support generation and infrastructure investment. There are

1 two ways for a PJM member to participate in the RPM capacity structure: 1)  
2 through the RPM baseline procurement auctions; or 2) as a self-supply FRR  
3 entity. The baseline procurement auction is called a base residual auction (BRA).  
4 BRAs are conducted three years in advance of the actual Delivery Year to allow  
5 bidders to complete construction of projects that clear the BRA. The PJM  
6 capacity market is designed to provide incentives for the development of  
7 generation, demand response, energy efficiency, and transmission solutions  
8 through capacity market payments.

9 Another important component of RPM is that price signals are locational  
10 and designed to recognize and quantify the geographical value of capacity. PJM  
11 divides the RTO into multiple sub-regions called locational delivery areas (LDAs)  
12 in order to model the locational value of generation.

13 **Q. PLEASE EXPLAIN HOW DUKE ENERGY KENTUCKY CURRENTLY**  
14 **PARTICIPATES IN THE PJM CAPACITY CONSTRUCT.**

15 **A.** Consistent with the Commission's Order in Case No. 2010-00203, Duke Energy  
16 Kentucky is an FRR Entity in PJM. As a condition of Duke Energy Kentucky  
17 becoming a member of PJM, the Commission required the Company to  
18 participate in PJM as an FRR entity until such time as it received Commission  
19 approval to participate in the PJM capacity auctions. To date, the Company has  
20 not requested such permission, but continues to evaluate the merits of exiting the  
21 FRR obligation and becoming a full RPM auction participant.

22 **Q. PLEASE BRIEFLY EXPLAIN PJM'S FRR PROCESS.**

1 A. The PJM OATT and RAA specify the obligations and compensation to LSEs for  
2 supplying capacity. The FRR process is an alternative means for a PJM LSE such  
3 as Duke Energy Kentucky to satisfy its customer capacity obligation under the  
4 PJM RAA. Under the FRR construct, an LSE must annually submit a preliminary  
5 three-year forward, and a final current year FRR capacity plan that meets a PJM  
6 defined customer capacity obligation. The FRR Plan must identify the unit-  
7 specific generating or demand response resources that will be providing the MWs  
8 of capacity that will fulfill the LSE's customer obligation. FRR allows the LSE to  
9 match its customer reliability requirement to its own generation, demand  
10 response, energy efficiency and/or transmission resources, while still being  
11 permitted to sell some or all of its excess supply into RPM. Duke Energy  
12 Kentucky would face severe penalties and limitations on its ability to choose the  
13 FRR option if PJM were to deem either its initial or final FRR plans to be  
14 insufficient or its generation otherwise non-compliant with PJM requirements.

15 **Q. PLEASE EXPLAIN WHAT BEING AN FRR ENTITY MEANS FOR DUKE**  
16 **ENERGY KENTUCKY.**

17 A. As an FRR entity, Duke Energy Kentucky must secure and commit unit-specific  
18 generation resources to meet the full load capacity requirements for all of its  
19 customers in advance of the PJM BRA through its FRR Plan. The FRR Plan is  
20 forward-looking in that it covers the Delivery Year three years into the future. For  
21 example, as part of its most recent FRR plan submitted in 2018, Duke Energy  
22 Kentucky must own or contract and commit the unit specific generation resources  
23 to satisfy its forecasted load requirements for the period from June 1, 2021,

1 through May 31, 2022. Presently, the load requirements include both the  
2 forecasted load of Duke Energy Kentucky's customers, as well as the reserve  
3 requirement mandated by PJM.

4 **Q. PLEASE EXPLAIN WHAT YOU MEAN BY THE PHRASE UNIT-**  
5 **SPECIFIC GENERATION RESOURCES.**

6 A. A unit-specific generation resource, as the phrase implies, simply means a  
7 specific generating resource that meets the eligibility requirements defined by  
8 PJM. PJM eligible resources include both physical and demand-side management  
9 resources. Duke Energy Kentucky must identify the specific generation resources  
10 it owns or has contracted for to provide capacity to meet its entire Delivery Year  
11 FRR obligation. Unit-specific capacity is distinguishable from the more "generic"  
12 buy-bid capacity that may be purchased through the BRA or incremental auctions  
13 of PJM. The capacity product available for purchase in those auctions is not  
14 directly tied to a specific generator, so it cannot, in itself, be used to satisfy an  
15 FRR plan obligation. While sellers in the BRA identify the generation resource  
16 offered into the auction, the end product is not so specific. The entire generator  
17 performance obligation in the BRA is to PJM, not the purchaser of the buy-bid  
18 capacity. From the purchaser's perspective, buy-bid capacity has guaranteed  
19 deliverability and performance by PJM. This is distinguishable from the FRR  
20 entity where the performance obligation of generation committed to FRR plans is  
21 the responsibility of the FRR entity.

22 As such, Duke Energy Kentucky has similar performance risk to RPM  
23 entities, but less flexibility to adjust its plan to account for changes in its resource

1 requirements between the BRA and the Delivery Year than an RPM participant  
2 who can simply buy and sell capacity to meet its needs through the BRA.

3 **Q. HOW DOES DUKE ENERGY KENTUCKY CURRENTLY MEET ITS**  
4 **FRR CAPACITY OBLIGATION IN PJM?**

5 A. Presently, the Company's PJM capacity obligations as an FRR Entity reflect both  
6 the forecasted load of Duke Energy Kentucky's customers as determined by PJM,  
7 as well as the reserve requirement mandated by PJM. First, PJM performs a load  
8 forecast for the Company and applies an approximate 15 percent reserve to that  
9 load obligation. To satisfy this load obligation, Duke Energy Kentucky relies  
10 heavily upon the unit-specific capacity of its East Bend and Woodsdale  
11 generating stations to serve the PJM-forecasted load obligation and thus fulfill its  
12 FRR capacity plan. The newly in-service 6.8 MW solar facilities will provide  
13 some additional capacity to provide a buffer for the Company in meeting FRR  
14 obligations. Directly, the capacity value of solar resources is limited in the PJM  
15 capacity market. Indirectly, however, over time and to the extent that the solar  
16 generation is online during peak periods, the load forecast will reflect the full  
17 reduction in peak load requirements.

18 East Bend and Woodsdale stations alone are not always sufficient to  
19 satisfy 100 percent of the Company's total FRR obligation. As a result, the  
20 Company relies upon the availability of its DSM programs to both manage energy  
21 requirements by reducing or temporally shifting customer load, and for capacity  
22 purposes through demand response programs, which are includable in its FRR  
23 plan as capacity resources.

1 **Q. PLEASE EXPLAIN HOW DUKE ENERGY KENTUCKY RELIES UPON**  
2 **DEMAND RESPONSE AND ENERGY EFFICIENCY PROGRAMS IN ITS**  
3 **DSM PORTFOLIO TO MEET ITS FRR PLAN.**

4 A. Duke Energy Kentucky has already executed contracts under its PowerShare®  
5 program where customers commit to load curtailment, if needed, during the  
6 Company's peak operating periods. These demand response load management  
7 programs are includable in the Company's FRR plan and enable the Company's  
8 customers to have an opportunity to participate, albeit through the Company's  
9 own DSM programs, in the PJM markets.

10 The tables below demonstrate the Company's historic and future FRR  
11 position and reserve, as determined by PJM, both with and without the inclusion  
12 of Duke Energy Kentucky's demand response programs offered as part of its  
13 DSM portfolio of programs. Table 1 below illustrates the Company's FRR Plan  
14 reserve margins with and without Demand Response resources based on planning  
15 parameters in place at the time that the initial FRR plans were submitted to PJM.  
16 It is important to note again that UCAP is directly impacted by the forced outage  
17 value applied. A higher forced outage value inversely affects the capacity that  
18 Duke Energy Kentucky can utilize in its FRR plan. In the initial FRR plan, the  
19 Company must apply either the previous year's actual outage rate or the average  
20 of the previous five years outage rates, at its discretion. The final FRR plan  
21 however, must utilize the actual previous years forced outage rate. PJM's  
22 approval of the initial FRR plan is the most significant milestone in the three-year  
23 FRR planning process timeline. Table 1 clearly shows that absent additional

1 capacity purchases, PJM could have deemed Duke Energy Kentucky's FRR plan  
 2 deficient during three Planning Years. Failure to secure PJM's approval of the  
 3 FRR Plan results in significant penalties on the shortfall, further additional reserve  
 4 margin penalties on the entire load forecast, and forced exit from the FRR  
 5 construct.

**TABLE 1:**

<b>DEK Initial FRR Position</b>									
Planning Year	EFORD		Total UCAP MW		PJM Load Obligation	FRR Position		Excess Based on Load	
	East Bend	Woodsdale	Gen	DR		w/ DR	w/o DR	w/ DR	w/o DR
2011/2012	4.4%	10.0%	947.6	42.3	(930.5)	59.4	17.1	6.4%	1.8%
2012/2013	5.4%	5.1%	980.6	42.4	(959.2)	63.8	21.4	6.7%	2.2%
2013/2014	1.7%	3.0%	1005.7	38.3	(986.5)	57.5	19.2	5.8%	1.9%
2014/2015	3.4%	4.4%	992.7	36.6	(1004.9)	24.4	(12.2)	2.4%	-1.2%
2015/2016	4.2%	3.2%	994.9	45.1	(979.9)	60.1	15.0	6.1%	1.5%
2016/2017	4.9%	6.5%	967.7	44.8	(996.1)	16.4	(28.4)	1.6%	-2.9%
2017/2018	6.8%	4.6%	964.8	31	(1006.5)	4.3	(41.7)	0.4%	-4.1%
2018/2019	9.3%	3.2%	991.6	31.9	(981.4)	42.1	10.2	4.3%	1.0%
2019/2020	3.5%	2.8%	1028.5	16.3	(944.4)	100.4	84.1	10.6%	8.9%
2020/2021	9.8%	6.2%	974.7	10.9	(974.7)	10.9	0.0	1.1%	0.0%

6 This table clearly shows that absent the Company's demand response programs in  
 7 its DSM portfolio, the Company's Initial FRR Plan would have been deficient in  
 8 the current delivery year and two of the last three prior years requiring bilateral  
 9 purchases of capacity from the market.

1                    While the initial FRR plan is based on forecasted loads and forecasted  
 2                    forced outage rates, Table 2 below illustrates Duke Energy Kentucky’s capacity  
 3                    position at the time that the Final FRR plan was submitted to PJM.<sup>2</sup> This table  
 4                    utilizes final actual PJM load obligations and unit performance metrics through  
 5                    the 2018/ 2019 planning year.

**TABLE 2:**

<b>DEK Final FRR Position</b>									
Planning Year	EFORD		Total UCAP MW		PJM Load Obligation	FRR Position		Excess Based on Load	
	East Bend	Woodsdale	Gen	DR		w/ DR	w/o DR	w/ DR	w/o DR
2011/2012	4.4%	10.0%	947.6	42.3	(930.5)	59.4	17.1	6.4%	1.8%
2012/2013	5.4%	5.1%	980.6	42.4	(925.0)	98.0	55.6	10.6%	6.0%
2013/2014	7.7%	12.4%	908.1	35.4	(943.3)	40.2	4.8	4.3%	0.5%
2014/2015	14.8%	5.7%	921.8	27	(972.4)	30.4	3.4	3.1%	0.3%
2015/2016	15.6%	7.9%	931.7	36.2	(955.5)	15.8	(20.4)	1.7%	-2.1%
2016/2017	3.5%	3.8%	1023.7	28.7	(918.7)	133.7	105.0	14.6%	11.4%
2017/2018	9.8%	3.2%	988.4	27	(970.5)	11.9	(15.1)	1.2%	-1.6%
2018/2019	7.2%	9.4%	975.6	15	(969.5)	21.1	6.1	2.2%	0.6%
2019/2020	9.9%	7.9%	966.4	16.3	(944.4)	38.3	22.0	4.1%	2.3%
2020/2021	9.9%	7.9%	966.4	10.9	(974.7)	2.6	(8.3)	0.3%	-0.9%

6                    For the 2019/2020 and 2020/2021 delivery years, the Company used the  
 7                    lower of EFORD and EFORD-5YR in its initial FRR Plan. PJM’s tariff provides  
 8                    this flexibility for determining the initial FRR Plan. However, the Final FRR Plan  
 9                    rules do not provide such flexibility and thus the Company has used the EFORD-  
 10                    5YR to better reflect our FRR position.

<sup>2</sup> Table 2 does not depict the capacity purchases and sales that occurred during certain delivery years to meet the Company’s FRR Plan. The purchases and sales however, are included in the calculation of the “excess based on load” percentages in the final columns. The Company had the following capacity transactions in specific delivery years: purchased 40 MWs of capacity in 2013/2014; purchased 54 MWs in 2014/2015, purchased 3.4 MWs in 2015/2016, and sold 33 MWs in 2017/2018.

1           As is clearly indicated, even with demand response programs, the  
2           Company's actual operating capacity position in PJM is razor thin at best. Absent  
3           demand response, the Company's FRR Plan would be deficient in the current  
4           delivery year and potentially future years.

5   **Q.   WHAT DOES THE LOSS OF DEMAND RESPONSE PROGRAMS LIKE**  
6   **POWERSHARE<sup>®</sup> AND POWER MANAGER<sup>®</sup> MEAN TO DUKE ENERGY**  
7   **KENTUCKY?**

8   A.   Duke Energy Kentucky currently has approximately 18MWs of PowerShare<sup>®</sup>  
9           capacity under contract for the 2018/2019 delivery year in addition to 14MWs  
10          from Power Manager<sup>®</sup>, which is embedded in the demand response component of  
11          its FRR Plan. Loss of these MWs of capacity in the short and long term will mean  
12          the Company will have to find other unit-specific capacity resources that have not  
13          otherwise been committed in a base residual auction to fill the void in the FRR  
14          Plan. Suspension and elimination of the PowerShare<sup>®</sup> and Power Manager<sup>®</sup>  
15          program that is offered as part of the Company's DSM portfolio will have a  
16          substantial impact on the Company's ability to satisfy its obligations in PJM.

17   **Q.   PLEASE EXPLAIN THE POTENTIAL PENALTIES THE COMPANY**  
18   **COULD FACE IF IT DOES NOT HAVE SUFFICIENT RESOURCES TO**  
19   **MEET ITS FRR OBLIGATION.**

20   A.   The easiest way to explain is through a specific example. If Duke Kentucky had  
21          been unable to utilize its demand response resources for the 2017/2018 Planning  
22          Year and could not purchase unit specific capacity to include in its initial FRR  
23          plan for a delivery year, it would have been subject to a penalty of two times the

1 Planning Year Cost of New Entry (CONE) on the 41.7 MW deficiency plus an  
2 additional three percent of the load obligation penalty of 30.2 MWs.

3 Specifically: (Plan Deficiency + 3% of load) \* (DEOK CONE in \$/MW  
4 Year) \* 2. Or:  $(41.7 + 30.2) * \$143,670 * 2 = \$20,298,847$ .

5 Should the Company immediately lose the ability to recognize its DSM  
6 programs (and their resulting demand-response capacity benefits) as part of the  
7 Company's FRR Plan, it will come dangerously close to falling short of its PJM  
8 capacity obligations and be required to purchase unit-specific capacity from the  
9 market at a premium calculated at PJM's tariffed shortfall penalty of a multiple of  
10 the base residual auction clearing price.

11 While the plan deficiencies shift and the penalty impact is less severe once  
12 the Company submits its final FRR plan, (1.2 times the base residual auction  
13 clearing price for the year), as demonstrated in Table 2, there remains three  
14 planning years where Duke Energy Kentucky would not have enough resources to  
15 meet its PJM obligation absent the ability to rely upon demand response  
16 programs.

17 **Q. IS DUKE ENERGY KENTUCKY ABLE TO PURCHASE CAPACITY IN**  
18 **PJM AS AN FRR ENTITY?**

19 **A.** As an FRR entity, the Company is limited to the bilateral capacity market in PJM  
20 to meet any capacity shortfalls. The Company cannot purchase capacity through  
21 the BRA to meet its FRR Plan obligations. This limitation exists because the  
22 capacity product in the BRA does not meet the unit specificity requirements for  
23 an FRR Plan. While the Company can theoretically purchase capacity from

1 outside the PJM footprint, deliverability constraints of imports significantly limit  
2 this option. The Company is effectively limited to its own internal capacity  
3 resources, including demand response, and the PJM bilateral market to meet its  
4 FRR capacity plan obligations. I describe further below, additional limitations on  
5 bilateral capacity during delivery years where the Duke Energy Ohio/Kentucky  
6 (DEOK) delivery zone “separates” from the more generic RTO zone.

7 The bilateral markets characteristically lack liquidity as uncommitted unit-  
8 specific capacity resources, that would be required to meet any FRR plan  
9 deficiencies are scarce in the short-term. This is because the only unit-specific  
10 capacity available in the bilateral market is capacity that did not otherwise clear  
11 and is not committed in the BRA for that delivery year.

12 **Q. HAVE THERE BEEN ANY RECENT SHIFTS IN DUKE ENERGY**  
13 **KENTUCKY’S ACCESS TO UNIT-SPECIFIC GENERATION**  
14 **RESOURCES THROUGH THE BILATERAL CAPACITY MARKET IN**  
15 **PJM?**

16 **A.** Yes. In the most recently conducted PJM Base Residual Auction, for the  
17 2020/2021 Delivery Year, capacity in the DEOK zone cleared with a LDA adder  
18 of \$53.47/ MW-day to the \$76.53/ MW-day general clearing price known as  
19 “Rest of RTO.” I explain the operational mechanics of this separation later in my  
20 testimony; but the total clearing price for the DEOK zone was \$130/ MW-day.  
21 While there is no guarantee that DEOK zone capacity will continue to clear at a  
22 premium to the more generic capacity in the RTO, this zonal “separation” does

1 create the potential that Duke Energy Kentucky's access to unit-specific capacity  
2 could be constrained, priced at a premium, or be unavailable at any price.

3 During constrained delivery years, if the Company must purchase capacity  
4 from the bilateral market to meet its FRR obligation, Duke Energy Kentucky  
5 would be limited, and thus required, to purchase any capacity to meet its FRR  
6 obligation from generation resources deliverable to the DEOK zone. In general,  
7 resources located in a constrained LDA can serve as replacement capacity for a  
8 generation resource located in a less constrained parent LDA. Based on the  
9 2020/2021 BRA results, only resources in 5 of the 14 LDAs can be used for  
10 replacement capacity resources in DEOK zone, effectively diminishing the pool  
11 of eligible replacement resources for DEOK zone. If Duke Energy Kentucky  
12 needs to purchase capacity in the bilateral market, it is limited to resources in the  
13 following LDAs: 1) EMAAC; 2) PS; 3) PSNORTH; 4) DPLSOUTH; and 5)  
14 COMED. From a practical perspective, the fact that these resources are  
15 deliverable to DEOK means that they cleared at a higher price and excess  
16 capacity is even more scarce than the limited availability in the DEOK zone. PJM  
17 also sets annual minimum requirements of generation physically located within a  
18 zone that must be adhered to, potentially limiting the ability to include higher  
19 clearing generation from other constrained zones.

20 This loss of liquidity exists regardless of whether Duke Energy Kentucky  
21 remains an FRR entity or moves at some point to full RPM participation for as  
22 long as the zonal separation exists. Absent a change in PJM's rules and tariffs, the  
23 same would hold true for any delivery year in the future in which the DEOK zone

1 separates from the rest of PJM. This situation presents a serious risk and concern  
2 to the Company if it cannot rely upon or use any demand response or other  
3 qualifying EE or DSM programs as part of its FRR plan.

4 Because Duke Energy Kentucky's resources generally match expected  
5 load obligation for the planning period, continued investment in the Company's  
6 existing generating assets for dedicated use in its FRR plan is a crucial piece of  
7 the Company's strategy to serve customers. Reliance upon demand response is a  
8 crucial strategy for the Company to meet its obligations in the short- and long-  
9 term. As such, deviations from the plan driven by either change to load  
10 requirements, resource capability or resource unforced capacity could affect costs,  
11 and potentially drive deficiencies in FRR Plans.

12 **Q. PLEASE PROVIDE AN ANALYSIS OF THE COMPANY'S ABILITY**  
13 **AND ESTIMATED COSTS TO SECURE, BY BILATERAL CONTRACTS**  
14 **OR OTHER MEANS, ANY CAPACITY AND ENERGY THAT MAY BE**  
15 **NEEDED IN THE FUTURE DUE TO THE TERMINATION OF NON-**  
16 **INCOME BASED DSM PROGRAMS.**

17 A. As I have stated elsewhere in my testimony, recent developments in the PJM  
18 capacity construct and marketplace have both limited liquidity and complicated  
19 bilateral capacity transactions. The requirements regarding unit performance  
20 complicate contractual terms and conditions, particularly at lower capacity prices.  
21 Sellers of excess capacity are understandably unwilling to accept contractual  
22 responsibility for PJM Capacity Performance (CP) non-performance assessment

1 risks that can dwarf revenues; and buyers of CP are understandably cautious about  
2 buying capacity with no assurance of performance from the seller.

3 The separation of the DEOK delivery zone further complicates bilateral  
4 transactions by limiting to pool of potential resources that meet constrained LDA  
5 deliverability criterion. Given the forward nature of a potential need to purchase  
6 capacity and the unknown impact of the variables that would drive a shortage,  
7 capacity purchase planning remains fluid and responsive to short term  
8 requirements. That does not mean, however, that the Company does not remain  
9 active in the markets and mindful of options should that need occur. There are  
10 other factors that drive the supply side of the capacity balance equation, most  
11 notably unit performance of East Bend and Woodsdale; but also including  
12 changes in load forecast or other requirements from PJM. Assuming no step  
13 change those other variables, if Duke Energy Kentucky were to lose access to its  
14 DSM programs, it is likely that the potential shortage would likely be in the 20  
15 MW range. That small quantity limits reasonable options to bilateral transactions.  
16 It would not be prudent to build such a small generator or partner with another  
17 utility or merchant generator to build a larger facility. Consequently, the  
18 Company must estimate the potential costs of capacity from market sources. The  
19 energy market is relatively transparent for the short term future. Current prices  
20 remain flat for the next three or four years. The capacity market, however, is less  
21 transparent and participants generally need to interpret market signals more. For  
22 small amounts of capacity, the Company feels that past auction results provide a  
23 reasonable proxy for potential costs. Recent BRA results at unconstrained

1 delivery zones have ranged from roughly \$75/MW day to \$150/MW day. As  
2 example, with those bookends, 20 MWs of replacement capacity would be valued  
3 between roughly \$500,000 and \$1,000,000. Complicating the analysis for Duke  
4 Energy Kentucky, is the potential that the DEOK zone remains constrained  
5 beyond the 2020/2021 Delivery Year. Constrained zones can clear up to the net  
6 CONE (NET CONE), which can approach \$300/MW day.

7 **Q. DOES THE COMPANY HAVE ANY OTHER ALTERNATIVES TO**  
8 **MEETING CAPACITY REQUIREMENTS IN PJM?**

9 A. Yes, the Company could contract for the purchase of generation either built or  
10 planned to be built or it could build its own new generation. Additionally, the  
11 Company could leave the FRR self-supply construct and purchase any capacity  
12 shortfall from PJM directly through the RPM capacity auctions. Given the  
13 generally small amount of anticipated new generation needs and the potential  
14 risks of leaving the FRR, the Company does not believe these options to be either  
15 cost effective or in the best interests of our customers.

16 **Q. DO DSM PROGRAMS PROVIDE ANY VALUE IN ADDITION TO**  
17 **CAPACITY VALUE?**

18 A. Yes, in addition to the explicit capacity value of DSM programs in meeting the  
19 FRR plan requirements, these programs, specifically the load control and load  
20 modification programs PowerShare<sup>®</sup> and Power Manager<sup>®</sup> provide benefits in the  
21 energy markets. Mr. Duff explains these programs in his testimony. Programs  
22 such as these provide additional benefits by shifting customer energy demand and  
23 usage away from extreme peak periods, which are highly correlated to high

1 energy price periods. These programs create opportunities to either displace  
2 higher priced generation that would otherwise be allocated to serve native load  
3 requirements, or create headroom for non-native energy sales to PJM. These  
4 reductions in demand, even if they are simply temporal shifts of usage create  
5 direct savings to customers through reduced purchased power costs or through  
6 non- native margins, the large majority of which flow to customers through the  
7 Company's profit sharing mechanism, (Rider PSM). To the extent the Company  
8 is able to achieve off-system sales (energy, capacity, ancillary services, etc.,) the  
9 net margins are shared with customers as a credit on their bills.

10 **Q. IS ALL CAPACITY VALUED THE SAME IN PJM?**

11 A. No, one of the fundamental properties of the PJM energy market is the concept of  
12 locational pricing. Simply put, generation in PJM is compensated based on the  
13 value it provides to the grid at its specific physical location. In the energy markets  
14 that value typically manifests itself as either positive prices for generation that  
15 relieve broader transmission constraints or punitively through low or even  
16 negative prices for generation that contributes to or creates constrains on the PJM  
17 system. The capacity market construct is analogous. As noted earlier in my  
18 testimony, PJM has defined sub regions generally delineated by the stand alone  
19 transmission system footprints of the pre PJM systems. The DEOK zone is an  
20 example.

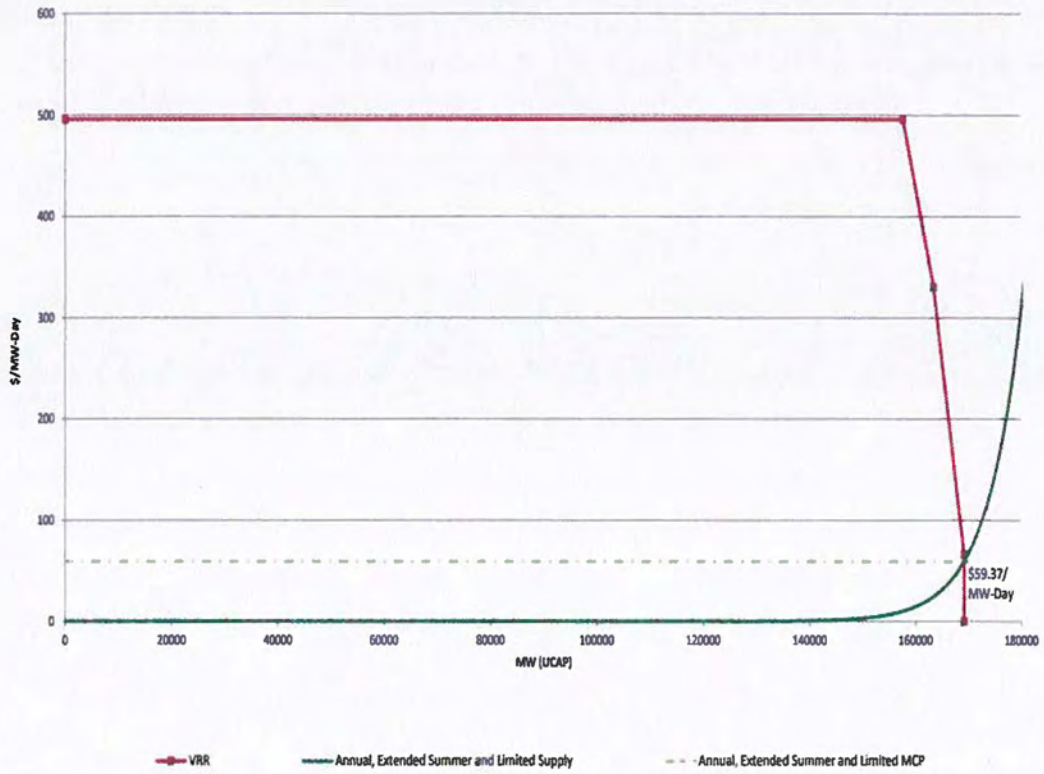

21 As part of the pre delivery year BRA process, PJM analyzes capacity  
22 requirements in each of the zones as well calculated import and export limits into  
23 and out of the zones. These LDAs are used to recognize and quantify the

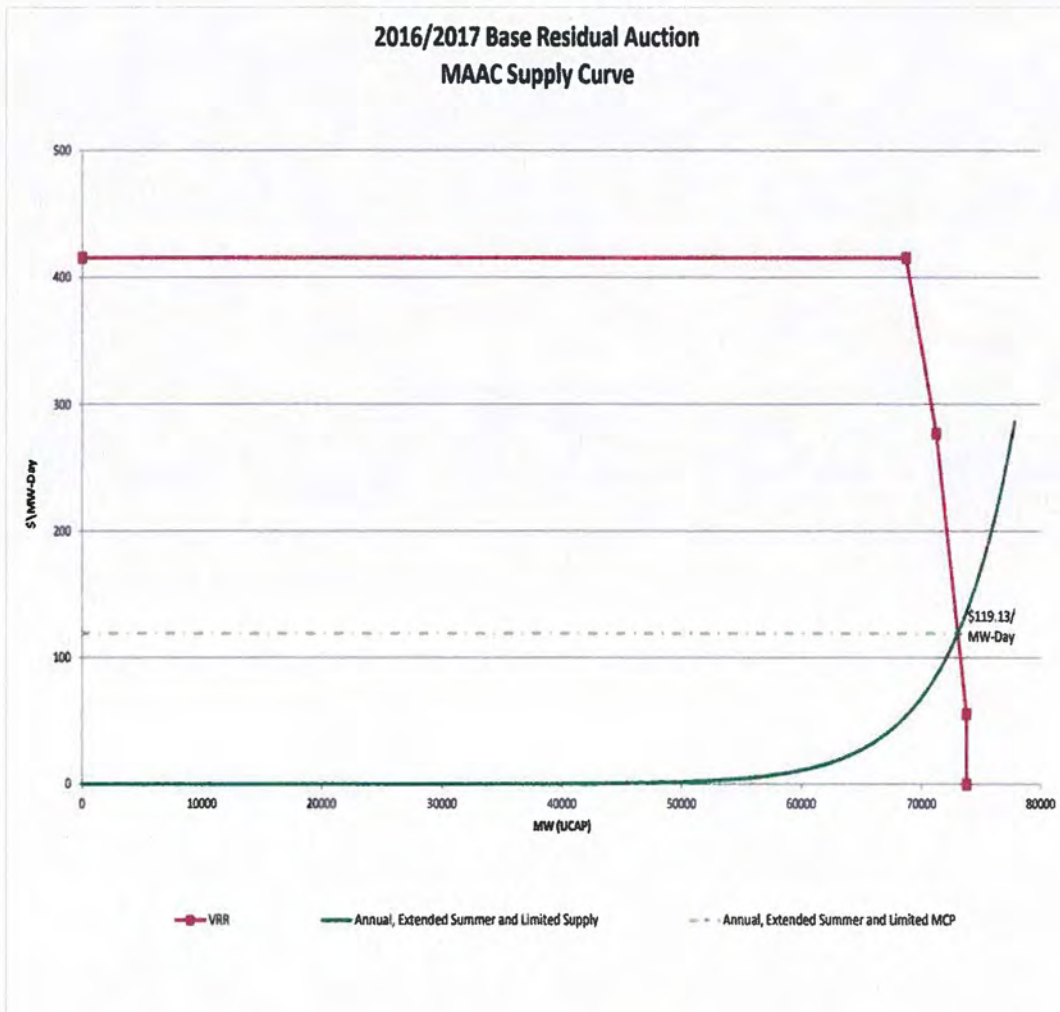

1 locational value of capacity within the PJM region. The import limit into an LDA  
2 is known as the Capacity Emergency Transfer Limit (CETL). The LDA capacity  
3 requirement is known as the Capacity Emergency Transfer Objective (CETO). If  
4 the comparison of these two metrics reveals a shortfall the LDA separates from  
5 the broader RTO. As a constrained LDA, an auction is cleared for that specific  
6 zone. The solution, or clearing price, is specific to those LDAs requirements.  
7 Supply that is procured in the RPM multi-auction clearing ensures that sufficient  
8 resources are committed to meet the total footprint reliability requirement. The  
9 graphs below illustrate the auction solutions for the 2016/2017 Base Residual  
10 Auctions for the broad RTO zone and the constrained MAAC zone. Each zone  
11 has defined supply and demand curves.<sup>3</sup> The point that these curves intersect  
12 represents the clearing price for that zone.

2016/2017 Base Residual Auction  
RTO Supply Curve

- 1 For comparison purposes, the chart below highlights significant zonal separations
- 2 in PJM Base Residual Auctions since the 2007/2008 delivery year.<sup>4</sup>

<sup>4</sup> <https://www.pjm.com/~media/markets-ops/rpm/rpm-auction-info/2020-2021-base-residual-auction-report.ashx>

1 **Q. HAS CAPACITY PERFORMANCE IMPACTED THE BILATERAL**  
 2 **MARKET OR THE ABILITY TO CONTRACT FOR CAPACITY IN THE**  
 3 **BILATER MARKET?**

4 A. Yes. While Duke Energy Kentucky has not had the need to purchase Capacity  
 5 Performance capacity to date, it expects that given the significant performance  
 6 requirements and consequent non-performance assessments inherent in the  
 7 Capacity Performance construct, assigning contractual responsibility for unit  
 8 performance in a bilateral capacity agreement will be complicated at best. At  
 9 worst, with potentially limited liquidity and limited alternatives, the Company's  
 10 bargaining position in such negotiations could be compromised.

11 **Q. DO RENEWABLE RESOURCES CURRENTLY GET NAMEPLATE**  
 12 **CAPACITY VALUE IN PJM?**

13 A. Not currently. In general, the capacity value for a wind or solar resource  
 14 represents that amount of generating capacity, expressed in megawatts that it can  
 15 reliably contribute during summer peak hours and which can be offered as

1 unforced capacity into the PJM capacity markets. The “Capacity Factor” for a  
2 wind or solar capacity resource is a factor based on historical operating data  
3 and/or the Class Average Capacity Factor. The capacity factor applied to solar  
4 resources is typically 38%, meaning that for every 100 MW of solar energy, 38  
5 MW are eligible to meet capacity requirements.

6 **Q. ARE THERE ANY INITIATIVES IN PJM THAT WOULD MAKE**  
7 **SUMMER ONLY DSM PRODUCTS MORE VALUABLE AS CAPACITY?**

8 A. Yes, in late February, PJM chartered the Summer-Only Demand Response Senior  
9 Task Force (SODRSTF). The Task force charter includes recommending ways to  
10 better integrate Demand Response into the PJM Capacity Performance construct;  
11 specifically resources that cannot currently fully participate due to seasonal  
12 limitations. PJM expects the task force to have recommendations by fourth  
13 quarter of 2018. Modifications to current rules could increase the value of current  
14 programs as capacity resources if more of the seasonal DSM products can be  
15 directly utilized as capacity resources. Duke Energy Kentucky will monitor and  
16 participate in the task force discussions.

17 **Q. CAN THE COMPANY JUST LEAVE ITS FRR STATUS AND BECOME A**  
18 **FULL RPM PARTICIPANT?**

19 A. No. Duke Energy Kentucky regularly evaluates the merits and risks of full  
20 participation in the RPM capacity construct. To date, the Company has not  
21 determined full RPM participation to be in customers’ best interests. Nonetheless,  
22 assuming the Company was to determine such a change to be beneficial to the  
23 Company and its customers, even a voluntary move cannot and should not happen

1 overnight. Indeed, even if the Company were in a position to exit the FRR  
2 participation and enter into the PJM Base Residual Auction construct, the earliest  
3 the Company could make such a transition would be June 1, 2022.

4 This is because the BRA construct is for three years in the future. The  
5 capacity procurement auctions for the 2018/2019, 2019/2020, 2020/2021 have  
6 already occurred. The auction for the 2021/2022 delivery year is about to occur in  
7 May, 2018, and the Company has missed its opportunity to declare it would  
8 participate in that auction. As a result, the earliest the Company could transition to  
9 a full BRA participant would be for the 2022/2023 delivery year, the auction to  
10 occur in May 2019.

11 **Q. DOES BECOMING A FULL RPM PARTICIPANT PRESENT ANY**  
12 **ADDITIONAL RISKS ON DUKE ENERGY KENTUCKY?**

13 A. Recent litigation at the DC Circuit Court of Appeals regarding PJM's capacity  
14 market and specifically the Minimum Offer Price Rule (MOPR) introduce  
15 significantly more risk to Duke Energy Kentucky and its customers if it were  
16 forced into full participation in the base residual auction construct. This litigation  
17 effectively eliminated the self-supply exemption from the MOPR. If the  
18 suspension of these programs and the resulting impact to the Company's FRR  
19 Plan necessitates the Company leaving the FRR obligation and transitioning to the  
20 PJM base residual auction process where all capacity is purchased from PJM  
21 Duke Energy Kentucky's customers may be adversely impacted.

22 In the RPM construct, LSE's are required to purchase all capacity from the  
23 market, and all owned generation must be offered into the capacity market. Under

1 the MOPR, new generation that enters the RPM must be priced at NET ASSET  
2 CLASS CONE until it clears the BRA. This means that Duke Energy Kentucky's  
3 Woodsdale stations would be subject to the MOPR and would have to be priced in  
4 the BRA at NET CONE. If the BRA clears at a price below the ASSET CLASS  
5 NET CONE, the Company's stations would not clear the auction and the  
6 Company would have to be a 100 percent purchaser of capacity without any  
7 offsetting sales. With the potential price restrictions of the MOPR, Duke Energy  
8 Kentucky's customers could potentially face the situation of being forced to  
9 purchase capacity in the market with no offsetting benefit of the revenues from  
10 generating resources that are able to clear the auction.

11 While maintaining the capacity value of the demand response programs  
12 may not guarantee that Duke Energy Kentucky will never have to leave the FRR  
13 construct, losing the ability to rely upon these assets to meet our FRR plan  
14 obligations does increase the risk of an untimely FRR exit. A poorly timed or  
15 forced exit from FRR that exposes Duke Energy Kentucky's customers to full  
16 MOPR price mitigation could have a significant impact to customers. For  
17 example, if customers were fully exposed to an average PJM capacity clearing  
18 price of \$100/ MW Day, while being forced to offer its generation capacity at a  
19 level above that which did not clear the market, the resulting cost/revenue  
20 mismatch would be roughly \$17 Million per year.

## V. CONCLUSION

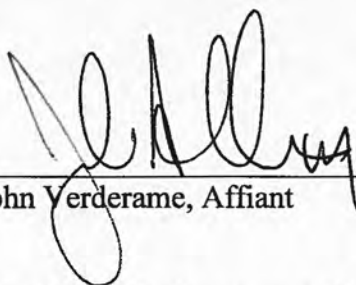

21 **Q. DOES THIS CONCLUDE YOUR PRE-FILED DIRECT TESTIMONY?**

22 **A. Yes.**

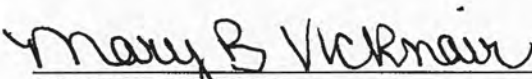

VERIFICATION

STATE OF NORTH CAROLINA        )  
  )
