LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 1

Responding Witness: David S. Sinclair

Q-1.   Reference the Company's response to AG DR 1-137(c):

   a. Explain if interruptible load associated with the Curtailable Service Rider ("CSR") is assumed to be uncurtailed during every hour of the forecasted test year; i.e., hourly class loads include load that could be subject to interruption under the CSR; and,

   b. Explain if the 141 MW of CSR-related load treated as a supply-side resource is treated the same as a generation resource and whether it is available every hour of the year.

A-1.

   a. Forecasted loads are not reduced for potential CSR-related load reductions.

   b. For economic dispatch purposes, CSR curtailments are only available after all of the tariff criteria for utilization have been met. Therefore it is not available every hour of the year. Because the LOLP calculation does not depend on economic dispatch, CSR curtailments are treated the same as generation resources and are effectively available every hour of the year.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 2

Responding Witness: David S. Sinclair

Q-2.   Reference the Company's response to AG DR 1-137(d), Attachment 1, define the various class codes shown in column b of the various tabs.

A-2.   Class Orders in AG DR 1-137(d), Attachment 1, match those in AG DR 1-137(d), Attachments 3 and 4.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 3

Responding Witness: David S. Sinclair

Q-3.   Reference the Company's confidential response to AG DR 1-139(a). Explain if the rows in Table 1 of the confidential attachment represent hypothetical hours, if not, explain what the rows in Table 1 represent.

A-3.   The rows in Table 1 represent possible generation output levels and corresponding probabilities for each generation unit's availability.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 4

Responding Witness: David S. Sinclair

Q-4.   Reference the Company's confidential response to AG DR 1-139(a). Provide the Company's actual amounts utilized within its LOLP analysis for this case associated with Tables 1, 2, and 3 of the confidential attachment.

A-4.   See the attachment in response to AG 1-141(e) for Table 1. See attached for Table 2 and 3.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 5

Responding Witness: David S. Sinclair

Q-5.   Reference the Company's confidential response to AG DR 1-139(a) as well as its
         overall LOLP analyses by hour. Provide a detailed explanation and all
         calculations supporting the assumed availability and outage rates for each
         generating unit.

A-5.   The Companies develop availability and outage rates as a two-step process. First,
         the Companies calculate an equivalent forced outage rate ("EFOR") and
         maintenance outage rate ("MOR") for each unit using annual historical
         Generating Availability Data Systems ("GADS") data over the previous ten
         years. The Companies look at trends in how these metrics are changing over
         time, and evaluate similar units as a group to reduce the impact of outliers in
         historical data. Trimble County 2 and Cane Run 7 are each modeled individually
         and have less historical data on which to create an availability forecast; therefore,
         the Companies focused on more recent data and removed outliers to develop
         those forecasts. The EFOR and MOR components are summed to create an
         equivalent unplanned outage rate ("EUOR") for each unit.

         Second, the EUOR is distributed across common availability states to account for
         unit derates based on further analysis of GADS data. For example, in the first
         step, Ghent 1 was assigned an EUOR of 7.4%. In the second step, historical
         analysis indicated that Ghent 1 is sometimes available at maximum capacity,
         sometimes not available at all, and sometimes partially available at levels
         between maximum capacity and zero. The Companies' process allocates the
         EUOR across these availability states to reflect varying levels of unit availability.
         In total, the prorated, or equivalent, unavailability of Ghent 1 is consistent with
         the EUOR of 7.4%. See attached for the calculations supporting the assumed
         availability and outage rates for each generating unit.

The attachments are being provided in separate files in Excel format.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 6

Responding Witness: David S. Sinclair

Q-6.   Reference the Company's response to AG DR 1-140. Explain if the assumed level of 558 MW of Purchased Power is available each and every hour of the year and if it is treated as a supply resource identical to any other generation (power supply) resource.

A-6.   In the LOLP analysis, the 558 MW of potential purchased power was treated the same as other supply resources that can be called upon to avoid a loss of load and is assumed to be available every hour of the year. See also the response to PSC 3-23.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 7

Responding Witness: David S. Sinclair

Q-7.   Reference the Company's response to AG DR 1-140. Provide the forecasted
outage rates for each generating unit reflected in the Company's LOLP analysis.

A-7.   See the attachments in responses to Question No. 5 and AG 1-141(e).

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 8

Responding Witness: David S. Sinclair

Q-8.   Reference the Company's response to AG DR 1-141(e) Attachment 1. Provide:

a. an explanation of what columns C through I represent, note the narrative response indicates maximum capacity in the outage rate table varies by month but this table only includes seven columns; and,

b. an explanation and all calculations showing the availability for each unit during the forecasted test year.

A-8.
a. Columns C through I represent possible generation output levels and the corresponding probabilities for each generation unit's availability.   For example, Brown 1's generation output level will be 0 MW for 6.5% of the time, 74 MW for 3.3% of the time, and 107 MW for 84.8% of the time. Attachment 2 to AG 1-141(e) provides the varying maximum capacity levels that are applicable to the maximum generation output levels shown in Attachment 1.

b. See the response to Question No. 5.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 9

Responding Witness: William Steven Seelye

Q-9.   Explain if and how Mr. Seelye's class cost of service study ("CCOSS"), utilizing the LOLP methodology, grouped calculated hours into on-peak, off-peak, and shoulder periods.

A-9.   Weighted LOLP factors for fixed production costs were developed for each hour of the year. Fixed production costs were not grouped into on-peak, off-peak and shoulder periods. However, the information included in the Excel file used to develop the hourly LOLP factors could be used to perform such a grouping if desired.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 10

Responding Witness: William Steven Seelye

Q-10.   Explain if and how Mr. Seelye's CCOSS utilizing the LOLP methodology assigned specific generating unit costs to on-peak, off-peak, and shoulder periods based on individual generating unit operating costs.

A-10.   The LOLP methodology did not assign individual generating assets.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 11

Responding Witness: William Steven Seelye / David S. Sinclair

Q-11.   Reference the Company's response to AG DR 1-141(a) and its attachment. Explain what "Expected Unserved Energy (MWh)" represents and how (or if) it is specifically used within Mr. Seelye's development of production allocation factors within his LOLP CCOSS.

A-11.   Expected Unserved Energy (MWh) was provided for information only. It represents the amount of loss of load energy that is expected in each hour. It is not used for Mr. Seelye's development of production allocation factors.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 12

Responding Witness: David S. Sinclair

Q-12.   Reference the Company's response to AG DR 1-141(a) and its attachment. Explain and provide all calculations, tables, etc. showing the development of the following hour's "LOLP" and "Expected Unserved Energy (MWh)":

a. 8/28/19 at 1600 hours (annual system peak);

b. 1/7/20 at 800 hours (winter system peak);

c. 1/23/20 at 1100 hours; and,

d. 7/23/19 at 2100 hours.

A-12.
a. The Companies do not have access to PROSYM's calculation of LOLP and EUE, as it is a proprietary calculation that is performed internally in the software. PROSYM does not show the calculations and tables that lead to LOLP and EUE results.

b. See the response to part a.

c. See the response to part a.

d. See the response to part a.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 13

Responding Witness: William Steven Seelye / David S. Sinclair

Q-13.　Reference the Company's response to Staff 2-18 and responses to AG DR 1-139: the Company responded in Staff DR 2-18 that there are no differences between the LOLP methodology that was used to provide the LOLP CCOSS filed in 2016 compared to the methodology prepared in this proceeding; the Company responded in AG DR 1-139(b) that: hourly generation outputs are not produced by the LOLP analysis. However, in the 2016 case, the Company provided hourly generation outputs by unit in response to AG DR 1-292(b). In these regards, provide:

　　a.　an explanation and reconciliation of this apparent discrepancy; and,

　　b.　forecasted hourly generation output by unit for each hour of the forecasted test year, whether used or not used within the LOLP analysis.

A-13.

　　a.　There are no differences between the LOLP methodology that was used in 2016 and the methodology used in this proceeding. Hourly generation outputs are not produced as a result of the LOLP analysis. In the 2016 rate case, hourly generation outputs were provided from the Companies' business plan results, not from the LOLP analysis.

　　b.　See attachment being provided in Excel format.

The attachment is being provided in a separate file in Excel format.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 14

Responding Witness: David S. Sinclair

Q-14.　　Reference the Companies' response to AG DR 1-16.

　　　　a.　Explain how the Companies calculate their target reserve margin.

A-14.

　　　　a.　See attached. Certain information requested is confidential and proprietary and is being provided under seal pursuant to a petition for confidential protection.

2018 IRP Reserve Margin Analysis

PPL companies

Generation Planning & Analysis

September 2018

Table of Contents

1   Executive Summary

The reliable supply of electricity is vital to Kentucky's economy and public safety, and customers expect it to be available at all times and in all weather conditions. As a result, Louisville Gas and Electric Company ("LG&E") and Kentucky Utilities Company ("KU") (collectively, "the Companies") have developed a portfolio of generation and demand-side management ("DSM") resources with the operational capabilities and attributes needed to reliably serve customers' year-round energy needs at a reasonable cost. In addition to the ability to serve load during the annual system peak hour, the generation fleet must have the ability to produce low-cost baseload energy, the ability to respond to unit outages and follow load, and the ability to instantaneously produce power when customers want it. While the results of this analysis are generally communicated in the context of a summer peak reserve margin, the mathematics – like past reserve margin analyses – assess the Companies' ability to reliably serve customers in all hours.

Using the same methodology as the 2014 IRP, the 2018 IRP reserve margin analysis evaluates (a) annual capacity costs and (b) annual reliability and generation production costs for 2021 over a wide range of summer peak reserve margins to identify the optimal generation mix for customers. With the Companies' existing resources, the forecasted summer peak reserve margin in 2021 is 23.5 percent in the base energy requirements forecast scenario. To evaluate operating at lower reserve margins with less reliability, the Companies compared the reliability and production cost benefits for their marginal baseload and peaking resources to the savings that would be realized from retiring these resources. Specifically, the Companies evaluated the retirement of their small-frame simple-cycle combustion turbines ("SCCTs"), the Demand Conservation Program ("DCP"), one or more Brown 11N2 SCCTs, and Brown 3.[1] Similarly, to determine if adding resources would cost-effectively improve reliability, the Companies compared the costs and benefits of adding new SCCT capacity to the generation portfolio.

The results of this analysis show that the Companies' existing resources are economically optimal for meeting system reliability needs in 2021. In other words, it is not cost-effective to alter annual or summer peak hour reliability by either retiring existing resources or adding new resources. With the exception of the DCP, the reliability and generation production cost benefit for each of the Companies' marginal resources clearly exceeds the costs that would be saved by retiring these units. Consistent with the analysis supporting the Companies' December 2017 DSM filing, the DCP is only marginally favorable. However, given uncertainties moving forward related to load and environmental regulations, and considering physical reliability guidelines, the DCP should be continued at least in the near-term.

The target summer reserve margin range established in the 2014 IRP Reserve Margin analysis was 16 to 21 percent. In that analysis, the high end of the range (21 percent) was the reserve margin required to meet the 1-in-10 loss-of-load event ("1-in-10 LOLE") physical reliability guideline. Based on the Companies' current load forecast and resources, the reserve margin required to meet this guideline is approximately 25 percent.[2] To determine the minimum of the target reserve margin range, the Companies estimated the increase in load that would result in the addition of generation resources. All

---

[1] The Brown 11N2 SCCTs comprise Brown 5, Brown 8, Brown 9, Brown 10, and Brown 11.

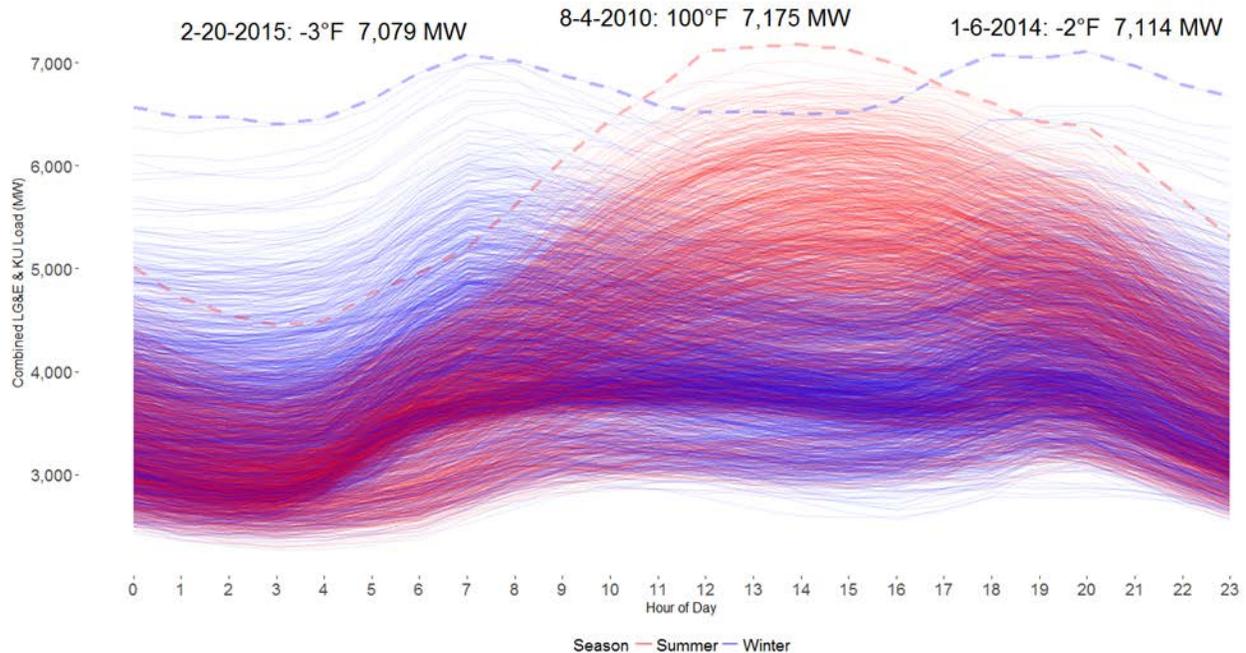
[2] The increase from 21 percent to 25 percent is driven primarily by an increase in the assumed variability of winter peak demands. The reserve margin analysis for the 2014 IRP was completed in 2013 and did not consider the possibility of the winter peak demands exceeding 7,000 MW (as experienced in 2014 and 2015).

other things equal, if the Companies' load increases by 300 to 400 MW, the reliability and production cost benefits from adding new SCCT capacity would more than offset the cost of the capacity. With this load increase, the Companies' reserve margin would end up being 16 to 18 percent. Therefore, based on reliability guidelines and the cost of new capacity, the Companies will target a reserve margin range of 17 to 25 percent for resource planning.

2   Introduction

An understanding of the way customers use electricity is critical for planning a generation, transmission, and distribution system that can reliably serve customers in every moment. Temperatures in Kentucky can range from below zero degrees Fahrenheit to above 100 degrees Fahrenheit. Because of the potential for cold winter temperatures and the increasing penetration of electric heating, the Companies are somewhat unique in the fact that annual peak demands can occur in summer and winter months. The Companies' highest hourly demand occurred in the summer of 2010 (7,175 MW in August 2010). Since then, the Companies have experienced two annual peak demands in excess of 7,000 MW and both occurred during winter months (7,114 MW in January 2014 and 7,079 MW in February 2015).

Figure 1 contains the Companies' hourly load profiles for every day over the past ten years. Hourly demands can vary by as much as 600 MW from one hour to the next and by over 3,000 MW in a single day. Summer peak demands typically occur in the afternoons, while winter peaks typically occur in the mornings or evenings during nighttime hours.

Figure 1: Hourly Load Profiles, 2008-2017


System demands from one moment to the next can be almost as volatile as average demands from one hour to the next. Figure 2 contains a plot of four-second demands from 5:00 PM to 7:00 PM on January 6, 2014 during the polar vortex event. The average demand from 6:00 PM to 7:00 PM was 7,114 MW but the maximum 4-second demand was more than 150 MW higher. To serve customers in every moment, the Companies must have a portfolio of generation resources that can produce power when customers want it.

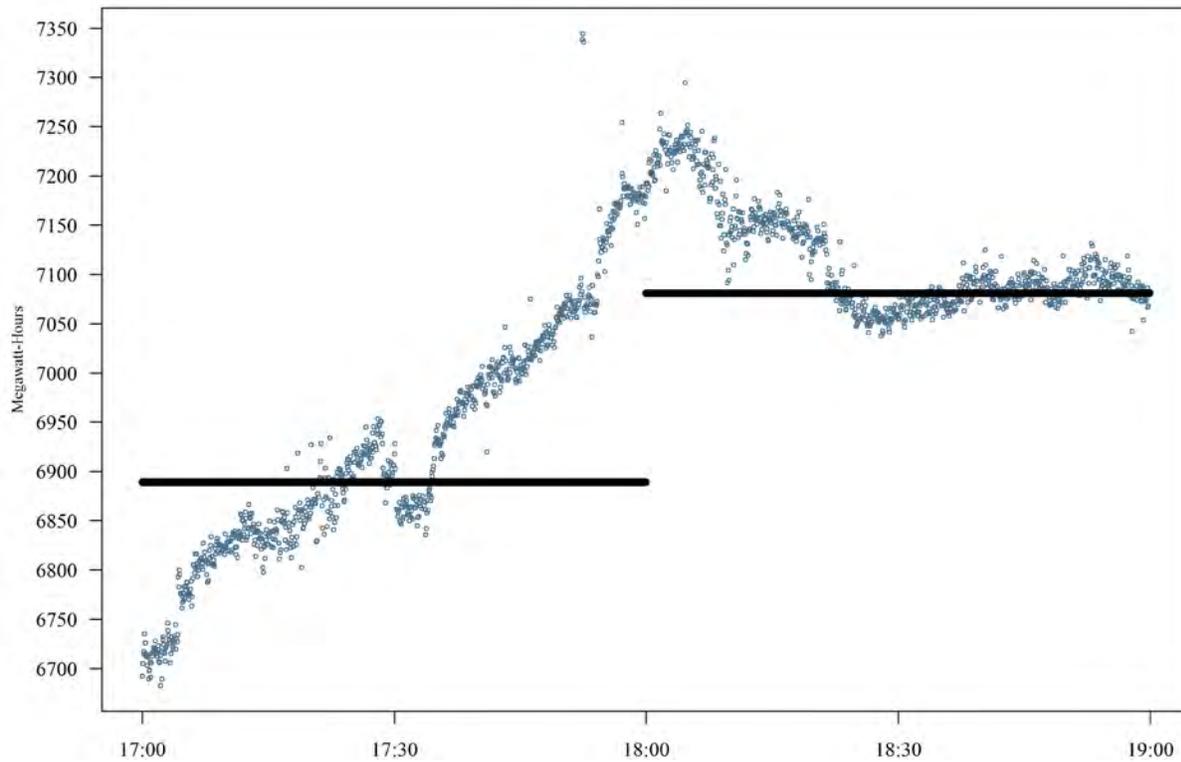
Figure 2: Four-Second Demands, 5:00-7:00 PM on January 6, 2014


Table 1 contains the Companies' reserve margin forecast with planned retirements in the base energy requirements forecast scenario. Summer peak demand decreases from 2018 to 2019 primarily due to the departure of eight municipal customers. Load reductions associated with the Companies' DSM programs reflect changes to DSM programs approved in the Companies' recent DSM filing in Kentucky.[3] The Companies' generation capacity decreases by 437 MW in 2019 due to the planned retirement of Brown 1 and 2 (272 MW) and the expiration of the Bluegrass Agreement (165 MW), and by 14 MW in 2021 due to the planned retirement of Zorn 1, which is expected to occur within the next three years. Beginning in 2021, the forecasted reserve margin for the base energy requirements scenario ranges from 23 percent to 24 percent.

Different types of generation resources play different roles in serving customers. The Companies' coal units have real-time load-following capabilities and can be brought on-line with less than a day's notice to serve load. With higher ramp rates and shorter start times, the Companies' natural gas combined-cycle ("NGCC") unit and large-frame SCCTs can respond to significant load swings and can be committed with little notice in response to forced outages. The Companies' small-frame SCCTs and demand-side resources have no load-following capabilities; while they can be committed in response to forced outages they require more notice than large-frame SCCTs or NGCC units and their small size and high cost limit their usefulness in dealing with forced outages. Finally, the Companies' renewable resources have little to no fuel or emissions costs, but they have no load-following capabilities and their availability during peak load conditions is uncertain due to their intermittent fuel source. The Companies' resource planning decisions must ensure their generation portfolio has the full range of operational capabilities and attributes needed to serve customers in every moment.

The following sections summarize the Companies' reserve margin analysis. Section 3 discusses the analysis framework. Section 4 provides a summary of key inputs and uncertainties in the analysis. Finally, Section 5 provides a summary of the analysis results.

[4] Existing capability is shown excluding small-frame SCCTs, CSR, Bluegrass, and OVEC and including 1 MW derates on each of the E.W. Brown Units 8, 9, and 11, which are planned to be resolved by 2024.
[5] OVEC's capacity reflects the 152 MW that is expected to be available to the Companies at the time of the summer peak, not its rating of 172 MW.

3   Analysis Framework

Figure 3 illustrates the costs and benefits of adding capacity to a generation portfolio.[6] As capacity is added, reliability and generation production costs decrease (i.e., the generation portfolio becomes more reliable) but fixed capacity costs increase. In their reserve margin analysis, the Companies' evaluate these costs and benefits over a range of reserve margins. The reserve margin at which the sum of (a) capacity costs and (b) reliability and generation production costs ("total cost") is minimized is the economic reserve margin.

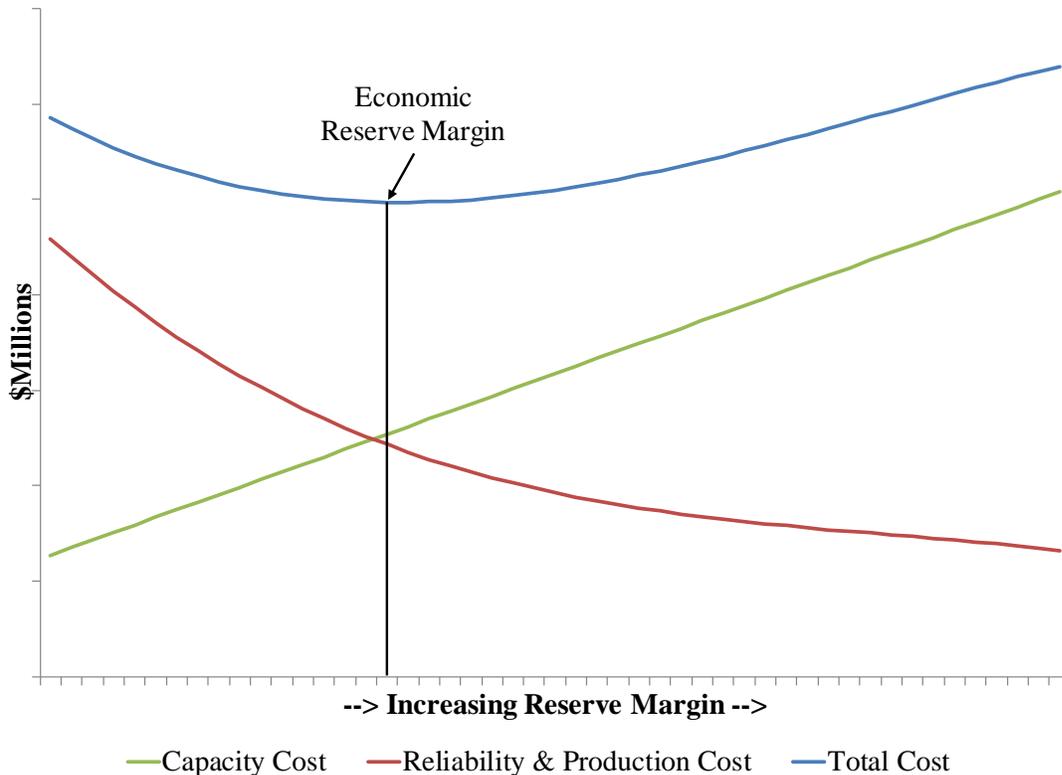
Figure 3: Costs and Benefits of Generation Capacity (Illustrative)


Figure 4 includes an alternative capacity cost scenario (dashed green line) for capacity with the same dispatch cost and reliability characteristics. The large dots mark the minimum of the range of reserve margins that is being evaluated. In this scenario, reliability and generation production costs are unchanged but total costs (dashed blue line) are lower and the economic reserve margin is higher. This result is not surprising; in an extreme case where the cost of capacity is zero, the Companies would add capacity until the value of adding capacity reduced to zero.[7]

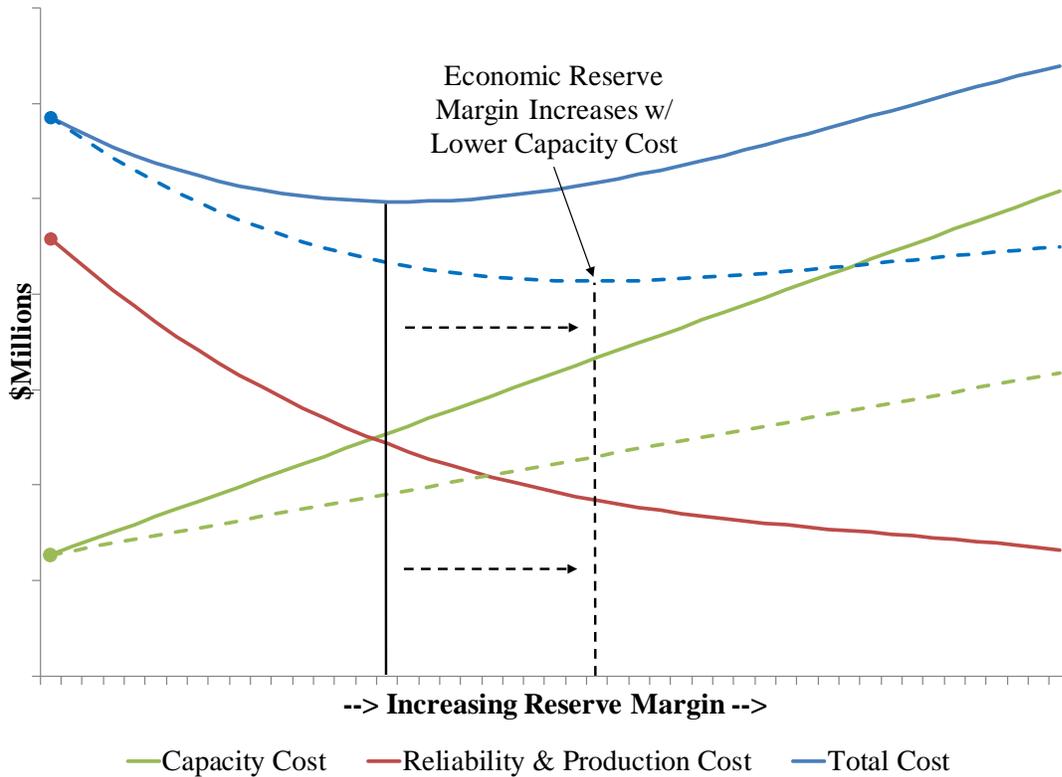
---

[6] As mentioned previously, different types of generation resources play different roles in serving customers; not all resources provide the same reliability and generation production cost benefit.

[7] In Figure 4, as more capacity is added to the generation portfolio, the value of adding the capacity decreases (i.e., the slope of the reliability and production cost line is flatter at higher reserve margins).

Figure 4: Economic Reserve Margin and Capacity Cost (Illustrative)


For new capacity, the capacity cost includes the fixed costs required to operate and maintain the unit as well as the revenue requirements associated with constructing the unit. When a portion of the evaluated reserve margin range falls below the Companies' forecasted reserve margin, the Companies must consider the costs and benefits of retiring their existing marginal resources to evaluate this portion of the range. When contemplating the retirement of an existing resource, any unrecovered revenue requirements associated with the construction of the unit are considered sunk; the savings from retiring a unit includes only the unit's ongoing fixed operating and maintenance costs. An existing unit's ongoing fixed operating and maintenance costs are its stay-open costs.

The Companies evaluated reserve margins ranging from 12 to 24 percent in their 2014 IRP Reserve Margin Analysis. As this analysis was being developed, the Companies were evaluating the addition of Green River 5 (670 MW) at the Green River Generating Station. Without Green River 5, the Companies' reserve margin in 2018 was forecast to be 12 percent. Therefore, their reserve margin analysis evaluated only the costs and benefits of adding new capacity to their generation portfolio.

In the 2018 IRP base energy requirements forecast, the Companies' forecasted reserve margin in 2021 is 23.5 percent. Therefore, to evaluate a similar range of reserve margins using the same methodology, the Companies evaluated the retirement of existing marginal resources as well as the addition of new resources. The cost of continuing to operate each of the Companies' marginal resources is currently less than the cost of adding and operating new resources.

In North America, the most commonly used physical reliability guideline is the 1-in-10 LOLE guideline. Systems that adhere to this guideline are designed such that the probability of a loss-of-load event is one event in ten years. In addition to the economic reserve margin, this analysis considers the resources needed to meet this guideline. The reserve margin that meets the 1-in-10 LOLE guideline does not necessarily coincide with the economically optimal reserve margin.

The Companies used the Equivalent Load Duration Curve Model ("ELDCM") and Strategic Energy Risk Valuation Model ("SERVM") to estimate reliability and generation production costs as well as the expected number of loss-of-load events in ten years ("LOLE") over a range of reserve margin levels. ELDCM estimates LOLE and reliability and generation production costs based on an equivalent load duration curve.[8] SERVM is a simulation-based model and was used to complete the reserve margin studies for the 2011 and 2014 IRPs. SERVM models the availability of generating units in more detail than ELDCM but ELDCM's simplified approach is able to consider a more complete range of unit availability scenarios. Given the differences between the models, their results should be consistent but not identical.

Key inputs to SERVM and ELDCM include load, unit availability, the ability to import power from neighboring regions, and other factors. SERVM separately models the ability to import power from each of the Companies' neighboring regions based on the availability of generation resources and transmission capacity in each region. In ELDCM, the Companies' ability to import power from neighboring regions is modeled as a single "market" resource where the availability of the resource is determined by the sum of available transmission capacity in all regions. Key analysis inputs and uncertainties are discussed in the following section.

4   Key Inputs and Uncertainties

Several factors beyond the Companies' control impact the Companies' planning reserve margin and their ability to reliably serve customers' energy needs. The key inputs and uncertainties considered in the Companies' reserve margin analysis are discussed in the following sections.

4.1   Study Year

The study year for this analysis is 2021. The municipal departure, the end of the Bluegrass Agreement, and the retirements of Brown 1 and Brown 2 are planned to occur in 2019. Zorn 1 is assumed to retire on January 1, 2021. 2021 is the first full year after these events.

4.2   Neighboring Regions

The vast majority of the Companies' off-system purchase transactions are made with counterparties in MISO, PJM, or TVA. SERVM models load and the availability of excess capacity from the portions of the MISO, PJM, and TVA control areas that are adjacent to the Companies' service territory.[9] These portions of MISO, PJM, and TVA are referred to as "neighboring regions." The following neighboring regions are modeled:

---

[8] See https://www-pub.iaea.org/MTCD/Publications/PDF/TRS1/TRS241_Web.pdf beginning at page 219 for the modeling framework employed by ELDCM.

[9] As discussed previously, the ability to import power from neighboring regions is modeled as a single "market" resource in ELDCM.

- MISO-Indiana – includes service territories for all utilities in Indiana as well as Big Rivers Electric Corporation in Kentucky.
- PJM-West – refers to the portion of the PJM-West market region including American Electric Power ("AEP"), Dayton Power & Light, Duke Ohio/Kentucky, and East Kentucky Power Cooperative service territories.
- TVA – TVA service territory.

Moving forward, uncertainty exists regarding the Companies' ability to rely on neighboring regions' markets to serve load. Approximately 20 GW of capacity was retired over the past five years in PJM and an additional 3 GW of retirements have been announced for the next five years. For the purpose of developing a target reserve margin range for long-term resource planning, reserve margins in neighboring regions are assumed to be at their target levels of 17.1% (MISO[10]), 15.8% (PJM[11]), and 15% (TVA[10]).[12]

4.3   Generation Resources

The unit availability and economic dispatch characteristics of the Companies' generating units are modeled in SERVM and ELDCM. SERVM also models the generating units in neighboring regions.

4.3.1   Unit Availability Inputs

Uncertainty related to the performance and availability of generating units is a key consideration in resource planning. Table 2 contains a summary of the Companies' generating resources along with their assumed equivalent forced outage rates ("EFORs"). The availability of units in neighboring regions was assumed to be consistent with the availability of units in the Companies' generating portfolio and not materially different from the availability of neighboring regions' units today.

4.3.3   Interruptible Contracts

Load reductions associated with the Companies' Curtailable Service Rider ("CSR") are modeled as generation resources. Table 5 lists the Companies' CSR customers and their assumed load reductions. The Companies can curtail each CSR customer up to 100 hours per year.[14] However, because the Companies can curtail CSR customers only in hours when more than 10 of the Companies' large-frame SCCTs are being dispatched, the ability to utilize this program is limited to at most a handful of hours each year, and then the magnitude of load reductions depends on participating customers' load during the hours when they are called upon. The total assumed capacity of the CSR program is 141 MW.

4.4   Available Transmission Capacity

Available transmission capacity ("ATC") determines the amount of power that can be imported from neighboring regions to serve the Companies' load and is a function of the import capability of the Companies' transmission system as well as the export capability of the system from which the power is purchased. For example, to purchase 50 MW from PJM, the Companies' transmission system must have at least 50 MW of available import capability and PJM must have at least 50 MW of available export capability. If PJM only has 25 MW of export capability, total ATC is 25 MW.

The Companies' import capability is assumed to be negatively correlated with load. Furthermore, because weather systems impact the Companies' service territories and neighboring regions similarly, the export capability from neighboring regions is oftentimes also limited when the Companies' load is high. Table 6 summarizes the sum of daily ATC between the Companies' system and neighboring regions on weekdays during the summer months of 2016 and 2017 and the winter months of 2017 and 2018. Based on the daily ATC data, the Companies' ATC for importing power from neighboring regions is zero 45% of the time.

---

[15] These customers have expressed interest in the CSR but have not yet begun service under this rider.

Table 6: Daily ATC

Daily ATC Range	Count of Days	% of Total
0	95	45%
1 – 199	31	15%
200 - 399	5	2%
400 - 599	4	2%
600 - 799	10	5%
800 - 999	21	10%
>= 1,000	45	21%
Total	211	

During peak hours when ATC is most likely needed to ensure reliable supply, ATC in ELDCM and SERVM is assumed to be approximately 500 MW two-thirds of the time and zero MW one-third of the time. Alternative ATC scenarios are also considered to understand the impact of this input assumption on the analysis.

4.5   Load Modeling

Uncertainty in the amount and timing of customers' utilization of electricity is a key consideration in resource planning. Uncertainty in the Companies' load is modeled in SERVM and ELDCM. SERVM also models load uncertainty in neighboring regions. Table 7 summarizes the peak demand forecast for the Companies' service territories and neighboring regions in 2021. The Companies' peak demand is taken from the base energy requirements forecast scenario and reflects the impact of the Companies' DSM programs. The forecasts of peak demands for MISO-Indiana, PJM-West, and TVA were taken from RTO forecasts and NERC Electricity Supply and Demand data.

Table 7: Peak Load Forecasts for 2021

	LG&E/KU	MISO-Indiana	PJM-West	TVA
Peak Load	6,350	19,302	36,121	29,811
Target Reserve Margin	N/A	17.1%	15.8%	15%

The Companies develop their long-term energy requirements forecast with the assumption that weather will be average or "normal" in each month of every year. In a given month, weather on the peak day is assumed to be the average of weather on the peak day over the past 20 years. While this is a reasonable assumption for long-term resource planning, weather from one month and year to the next is never the same. The frequency and duration of severe weather events within a year have a significant impact on load shape and reliability and generation production costs. For this reason, the Companies produced 45 hourly demand forecasts for 2021 based on actual weather in each of the last 45 years.

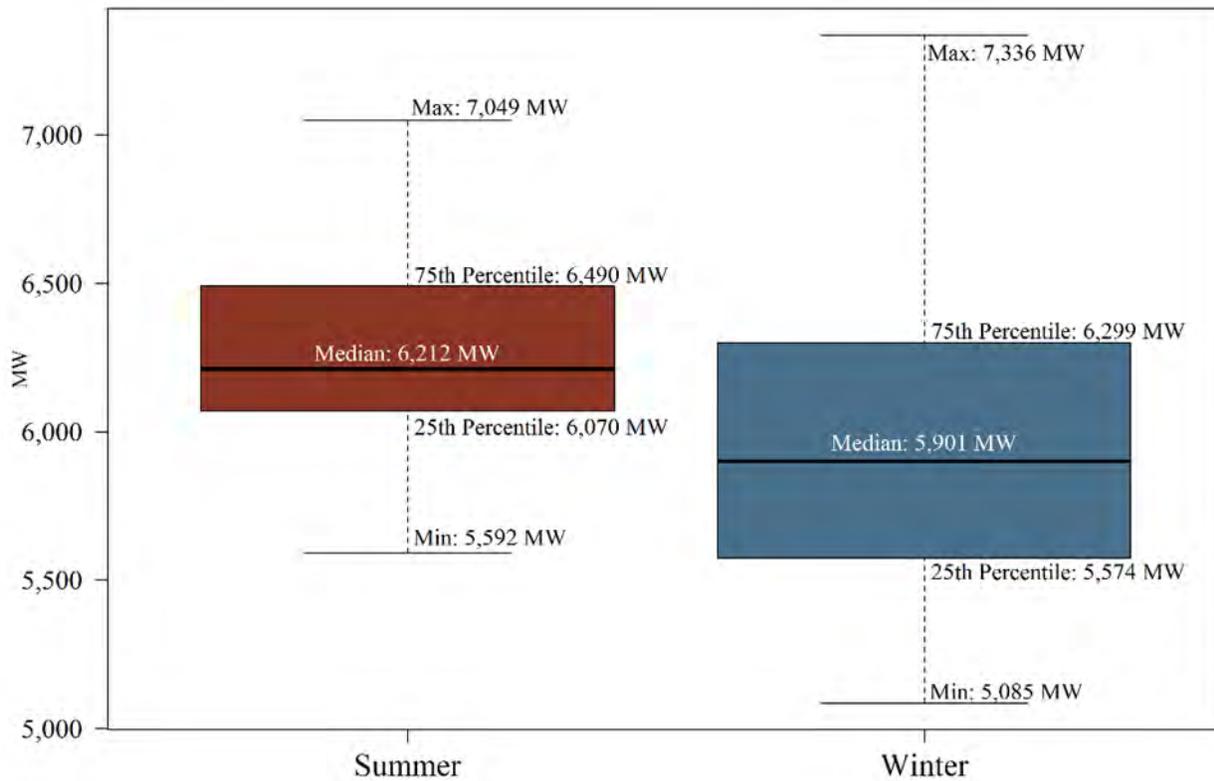
Table 8 summarizes the distributions of summer and winter peak demands for the Companies' service territory and coincident demands in the neighboring regions. Because each set of coincident peak demands is based on weather from the same weather year, SERVM captures weather-driven covariation in loads between the Companies' service territories and neighboring regions to the extent weather is correlated.

Table 8: Summer and Winter Peak Demand Forecasts

LG&E/ KU Load	Summer					Winter				
	Weather Year	LG&E/KU	Coincident Peak Demand in Neighboring Regions			Weather Year	LG&E/KU	Coincident Peak Demand in Neighboring Regions		
			MISO-Indiana	PJM-West	TVA			MISO-Indiana	PJM-West	TVA
Max	1983	7,049	19,880	36,987	30,648	1985	7,336	16,322	38,359	33,450
75th %-ile	2017	6,490	18,933	33,786	30,024	1986	6,299	15,840	33,667	32,181
Median	2001	6,212	17,665	32,985	27,743	2010	5,901	16,049	32,913	31,003
25th %-ile	1996	6,070	17,610	33,631	27,472	1991	5,574	15,967	34,649	26,357
Min	1974	5,592	17,509	31,742	25,109	1990	5,085	14,886	34,004	25,936

Because the ability to purchase power from neighboring regions oftentimes depends entirely on the availability of transmission capacity, load uncertainty in the Companies' service territories has a much larger impact on resource planning decisions than load uncertainty in neighboring regions. Figure 5 plots the distributions of summer and winter peak demands in the Companies' service territories. The Companies' median peak demand is higher in the summer, but the variability in peak demands – as experienced over the past five years – is much higher in the winter.[16] This is largely due to the fact that electric heating systems with heat pumps consume significantly more energy during extreme cold weather when the need for backup resistance heating is triggered.

[16] The distributions in Table 8 do not reflect load reductions associated with the Companies' Curtailable Service Rider ("CSR") because this program is modeled as a generation resource; CSR load reductions are forecast to be 141 MW in 2021. The maximum winter peak demand (7,336 MW) is forecasted based on the weather from January 20, 1985 when the average temperature was -8 degrees Fahrenheit and the low temperature was -16 degrees Fahrenheit. For comparison, the Companies' peak demand on January 6, 2014 during the polar vortex event was 7,114 MW and the average temperature was 8 degrees Fahrenheit and the low temperature was -3 degrees Fahrenheit. CSR customers were curtailed during this hour and the departing municipals' load was 285 MW.

Figure 5: LG&E and KU Peak Demands, 2021


4.6 Marginal Resource Costs

In the base energy requirements forecast, the Companies' forecasted reserve margin in 2021 is 23.5 percent. To evaluate reliability and cost at lower and higher reserve margins, the Companies evaluated the retirement of existing marginal resources as well as the addition of new resources. Furthermore, because different types of resources have different operating capabilities, the Companies separately evaluated the retirement of marginal baseload and marginal peaking resources.

Table 9 contains stay-open costs (i.e., ongoing fixed operating and maintenance costs) and average energy costs for the Companies' baseload generation units that are 40 or more years old, the Companies' peaking units that are 15 or more years old, and the Companies' Demand Conservation Programs ("DCP").[17] The Companies' peaking units include large-frame and small-frame SCCTs; small-frame SCCTs include Haefling 1 and 2, Paddy's Run 11 and 12, and Cane Run 11. The stay-open costs in Table 9 are presented in 2021 dollars and are computed based on stay-open costs over an eight-year

---

[17] The Demand Conservation Programs include the Residential and Non-Residential Demand Conservation Programs. These programs are the Companies' only dispatchable demand-side management programs. The Companies did not evaluate the Curtailable Service Rider because the elimination of this rider would have no impact on total revenue requirements.

maintenance cycle from 2020 to 2027.[18] Similar peaking units (e.g., Brown 5, 8, 9, 10, & 11) are grouped together. Average energy costs are computed based on the base fuel prices in Section 4.3.2.

Table 9: Marginal Resource Costs (2021 Dollars)

	Resource	Stay-Open Cost ($/kW-year)	Average Energy Cost ($/MWh)	Stay-Open Costs + Average Energy Costs ($/MWh)
Baseload	Brown 3	87.3	34	84
	Ghent 1	84.1	24	41
	Ghent 2	65.1	22	32
	Mill Creek 1	71.3	23	35
	Mill Creek 2	81.0	23	37
	Mill Creek 3	78.0	24	37
	OVEC	92.3	25	47
Peaking	Brown 5, 8, 9, 10, & 11	11.5	41	79
	Brown 6 & 7	20.5	31	66
	Paddy's Run 13	16.3	30	52
	Trimble County 5 & 6	29.7	30	64
	Small-Frame SCCTs	3.4	80	406
DSM	Demand Conservation Programs ("DCP")	25.6	145	460

To evaluate reserve margins less than 23.5 percent, the sum of stay-open and average energy costs in Table 9 was used to determine the order in which certain baseload and peaking resources would be considered for retirement. For example, based on these costs, the Companies assumed that the DCP would be retired first and the small-frame SCCTs would be retired second. The annual stay-open costs for these resources (expressed on a $/kW-year basis) are not as high as other resources, but the sums of stay-open and average energy costs (expressed on a $/MWh basis) are much higher due to their high dispatch cost which results in limited utilization. In addition, customer participation in the DCP is expected to decline moving forward and the small-frame SCCTs are far more likely to experience a catastrophic failure because of their age.[19] It would not be prudent to retire another unit with the assumption that these resources could be more heavily utilized.

Based on the sum of stay-open and average energy costs in Table 9, Brown 3 ("BR3") and OVEC are the Companies' marginal baseload units and, besides the small-frame SCCTs, Brown 5, 8, 9, 10, and 11 ("BR5, BR8, BR9, BR10, and BR11") are the Companies' marginal peaking units. The stay-open cost for Brown 3 is consistent with other baseload units but its average generation cost is higher primarily due to

---

[18] An example of this calculation is included in Appendix A: Stay-Open Cost Example.

[19] The Companies do not plan for major maintenance on their small-frame SCCTs. These units range between 48 and 50 years old, have relatively inefficient heat rates compared to large-frame SCCTs, and are only operated on a limited basis.

the high cost of rail transportation for coal delivered to the Brown station. Despite this fact, the ability to shift generation to Brown 3 from other coal units is a valuable alternative for controlling fleet-wide emissions.[20]

To evaluate reserve margins greater than 23.5 percent, the analysis weighed the costs and benefits of adding new SCCT capacity. The cost of new SCCT capacity is taken from the 2018 IRP Resource Screening Analysis and is summarized in Table 10 in 2021 dollars. Not surprisingly, the carrying charge for new SCCT capacity ($123/kW-year) is higher than the stay-open costs for existing capacity ($3-92/kW-year) since their construction cost is considered sunk.

Table 10: SCCT Cost (2021 Dollars)[21]

Input Assumption	Value
Capital Cost ($/kW)	964.5
Fixed Charge Rate	9.0%
Fixed O&M ($/kW-yr)	13.3
Firm Gas Transport ($/kW-yr)	23.6
Carrying Charge ($/kW-yr)	123.3

4.7   Cost of Unserved Energy (Value of Lost Load)

The impacts of unserved energy on business and residential customers include the loss of productivity, interruption of a manufacturing process, lost product, potential damage to electrical services, and inconvenience or discomfort due to loss of cooling, heating, or lighting.

For this study, unserved energy costs were derived based on information from four publicly available studies.[22] All studies split customers into residential, commercial, and industrial classes which is a typical breakdown of customers in the electric industry. After escalating the costs from each study to 2021 dollars and weighting the cost based on LG&E and KU customer class weightings across all four studies, the cost of unserved energy was calculated to be $18.30/kWh.

---

[20] Brown 3 has been retrofitted with flue-gas desulfurization equipment designed to remove 98% of the unit's sulfur dioxide emissions, selective catalytic reduction designed to remove 90% of the unit's emissions of nitrogen oxides, a fabric filter baghouse designed to remove 99.5% of the unit's particulate matter, and an overall air quality control system designed to achieve 89% mercury removal.

[21] Source: NREL's 2018 ATB (https://atb.nrel.gov/). The Companies inflated NREL's cost forecasts, which were provided in real 2016 dollars, to nominal dollars at 2% annually.

[22] "Estimated Value of Service Reliability for Electric Utility Customers in the Unites States," Ernest Orlando Lawrence Berkeley National Laboratory, June 2009;

"Assessment of Other Factors: Benefit-Cost Analysis of Transmission Expansion Plans," Christensen Associates Energy Consulting, August 15, 2005;

"A Framework and Review of Customer Outage Costs: Integration and Analysis of Electric Utility Outage Cost Surveys," Ernest Orlando Lawrence Berkeley National Laboratory, November 2003;

"Value of Lost Load," University of Maryland, February 14, 2000.

Table 11 shows how the numbers were derived. The range for residential customers varied from $1.40/kWh to $3.50/kWh. The range for commercial customers varied from $24.70/kWh to $36.60/kWh while industrial customers varied from $12.80/kWh to $29.70/kWh. Not surprisingly, commercial and industrial customers place a much higher value on reliability given the impact of lost production and/or product. The range of system cost across the four studies is approximately $7.50/kWh.

Table 11: Cost of Unserved Energy (2021 Dollars)

	Customer Class Mix	2003 DOE Study $/kWh	2009 DOE Study $/kWh	Christian Associates Study $/kWh	Billinton and Wacker Study $/kWh
Residential	34%	1.60	1.40	3.50	3.00
Commercial	36%	36.60	33.30	24.70	25.70
Industrial	30%	21.10	29.70	12.80	25.70
System Cost of Unserved Energy		20.10	21.40	13.90	18.00

Average System Cost of Unserved Energy		18.30			

4.8   Spinning Reserves

Based on the Companies' existing resources, they are assumed to carry 251 MW of spinning reserves to meet their reserve sharing obligation and comply with NERC standards. The reserve margin analysis assumes the Companies would shed firm load in order to maintain their spinning reserve requirements.

4.9   Reserve Margin Accounting

The following formula is used to compute reserve margin:

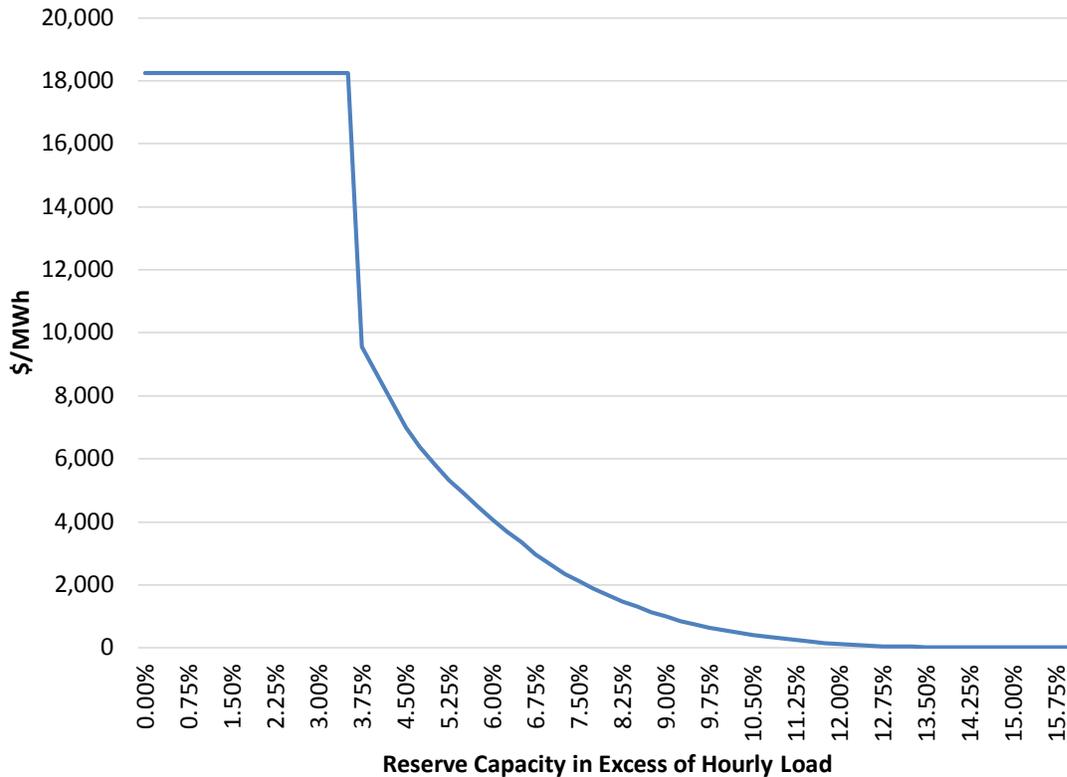
Reserve Margin = Total Supply/Peak Demand Forecast – 1

Total supply includes the Companies' generating resources and interruptible contracts. The peak demand forecast is the forecast of peak demand under normal weather conditions. The impact of the Companies' DSM programs is reflected in the Companies' peak demand forecast. While the Companies are assumed to carry 251 MW of spinning reserves to meet their reserve sharing obligation, this obligation is not included in the peak demand forecast nor as a reduction in generation resources for the purpose of computing reserve margin.

4.10 Scarcity Pricing

As resources become scarce, the price for market power begins to exceed the marginal cost of supply. The scarcity price is the difference between market power prices and the marginal cost of supply. Figure 6 plots the scarcity pricing assumptions in SERVM. The scarcity price is a function of reserve capacity in

a given hour and is added to the marginal cost of supply to determine the price of purchased power. The Companies' assumed spinning reserve requirement (251 MW) is approximately 3.5% of the forecasted summer peak demand in 2021 (6,350 MW). At reserve capacities less than 3.5% of the hourly load, the scarcity price is equal to the Companies' value of unserved energy ($18,250/MWh; see Section 4.7). The remainder of the curve is estimated based on market purchase data.

Figure 6: Scarcity Price Curve


The scarcity price impacts reliability and generation production costs only when generation reserves become scarce and market power is available. In ELDCM, the scarcity price is specified as a single value and is approximately $55/MWh. Because the scarcity price is difficult to specify, the analysis considered scarcity price sensitivities.

4.11 Summary of Scenarios

Reliability costs and loss-of-load events occur when loads are high or when supply is limited. To properly capture the cost of high-impact, low-probability events, the Companies evaluate thousands of scenarios that encompass a wide range of weather, load, and unit availability scenarios.

5   Analysis Results

5.1   Economic Reserve Margin and 1-in-10 LOLE Guideline

The Companies' forecasted reserve margin in 2021 is 23.5 percent in the base energy requirements forecast. Consistent with the methodology used in the 2014 IRP reserve margin analysis, the Companies estimated the sum of (a) annual capacity costs and (b) annual reliability and generation production costs

over reserve margins ranging from 13 percent to 26 percent to identify the optimal generation mix for customers. To evaluate operating at lower reserve margins with less reliability, the Companies evaluated the retirement of its existing baseload and peaking resources. To determine if adding resources would cost-effectively improve reliability, the Companies evaluated the addition of new SCCT capacity. The generation portfolios evaluated in this analysis are described in Table 12. As discussed previously, the DCP and small-frame SCCTs are always assumed to be retired before other resources.

Table 12: Generation Portfolios Considered in Reserve Margin Analysis

Generation Portfolio	Portfolio Abbreviation	Reserve Margin
Add 140 MW of SCCT capacity to Existing portfolio	Add SCCT2	25.7%
Add 70 MW of SCCT capacity to Existing portfolio	Add SCCT1	24.6%
Existing (includes retirements of Brown 1, Brown 2, and Zorn 1)	Existing	23.5%
Retire DCP	Ret DCP	21.7%
Retire DCP, small-frame SCCTs	Ret DCP_SF	20.6%
Retire DCP, small-frame SCCTs, Brown 8	Ret B8*	18.7%
Retire DCP, small-frame SCCTS, Brown 8-9	Ret B8-9*	16.9%
Retire DCP, small-frame SCCTS, Brown 8-10	Ret B8-10*	15.0%
Retire DCP, small-frame SCCTS, Brown 8-11	Ret B8-11*	13.1%
Retire DCP, small-frame SCCTS, Brown 3	Ret B3*	14.2%

*Portfolio also includes retirement of DCP and small-frame SCCTs.

LOLE as well as reliability and generation production costs were evaluated in SERVM and ELDCM for each generation portfolio in Table 12 over 45 weather year scenarios and hundreds of unit availability scenarios. Table 13 contains for each portfolio the average LOLE from ELDCM as well as the annual sum of (a) capacity costs and (b) reliability and generation production costs ("total cost"). The same results from SERVM are summarized in Table 14. Portfolios with LOLE greater than five (i.e., five times the 1-in-10 LOLE physical reliability guideline) are highlighted in gray. These portfolios are not considered viable based on their poor reliability. Capacity costs for each generation portfolio are presented as the difference between the portfolio's capacity cost and the capacity cost for the Ret B3* portfolio. Total costs are estimated based on average ("Avg") reliability and generation production costs as well as the 85th and 90th percentiles ("%-ile") of the reliability and generation production cost distribution.

Table 13: Reserve Margin Analysis Results (ELDC Model, 2021 Dollars)

Generation Portfolio	2021 Reserve Margin	LOLE	[A] Capacity Cost ($M/year)	Reliability and Generation Production Costs ($M/year)			Total Cost: Capacity Costs + Reliability and Generation Production Costs ($M/year)		
				[B] Avg	[C] 85th %-ile	[D] 90th %-ile	[A]+[B] Avg	[A]+[C] 85th %-ile	[A]+[D] 90th %-ile
Add SCCT2	25.7%	0.9	55.7	765	781	790	821	837	846

Ret B3*	14.2%	8.3	0.0	791	837	843	791	837	843

*Portfolio also include retirement of DCP and small-frame SCCTs.

The results from ELDCM and SERVM are entirely consistent. The ranking of portfolios based on LOLE is the same in both models. Based on ELDCM, the reserve margin required to meet the 1-in-10 LOLE physical reliability guideline is between 24.6 percent and 25.7 percent. Based on SERVM, this guideline is met with a 24.6 percent reserve margin. Considering the portfolios with LOLE less than five, when reliability and generation production costs are evaluated based on the average, 85th percentile, or 90th percentile of the distribution, the Existing and Ret DCP portfolios have the lowest total cost.

Beginning in 2019, the Companies will operate the Demand Conservation Programs in "maintenance" mode, allowing new participants to enroll in the program only to the extent existing devices are available to deploy. In addition, the Companies will reduce the annual incentive to $5 and pay participating customers only in years in which a Load Control Event is called. This analysis assumes customer participation will decline by almost 30 percent by 2021 as a result of these changes, but any actual change in customer participation is uncertain.

Additionally, the Companies face other uncertainties that impact resource planning decisions:

- Three of the Companies' coal units are not retrofitted with selective catalytic reduction ("SCR") so future changes to National Ambient Air Quality Standards may require one or more of the following actions in the next three to seven years: investment to further reduce emissions of nitrogen oxides ("NO_x"), changes in plant operations during ozone season, unit retirements, and acquisition of new generation.
- The U.S. Environmental Protection Agency ("EPA") recently proposed the Affordable Clean Energy Rule ("ACE Rule") which would establish guidelines for states to regulate carbon dioxide ("CO_2") emissions from existing fossil fuel-based electric generating units.[23] At a minimum, due to the regulatory timeline, fleet-specific and unit-specific planning for the ACE Rule is uncertain for the next two to four years.
- Lastly, as discussed in Section 5.(3) of Volume I, upside and downside uncertainty exists in the Companies' energy requirements forecast.

Given these uncertainties and the small differences in total costs between the Existing and Retire DCP portfolios, the Companies are not proposing to discontinue the DCP at this time. Instead, they will continue to the monitor participation in the DCP program and other regulatory and load developments to more holistically consider potentially broader changes to their generation mix in the future.

Consistent with the 2014 IRP reserve margin analysis, the Companies estimated total costs based on the 85th and 90th percentiles of the reliability and generation production cost distribution to consider the potential volatility in total costs for customers. For example, compared to the Existing portfolio and considering the results from both models, average annual reliability and generation production costs for the Ret B3* portfolio are $17 million to $20 million higher, but the Companies would expect these costs to be $39 million to $45 million higher once in ten years (90th percentile of distribution). With Brown 3 in the generation portfolio, the portfolio is far more reliable and reliability and generation production costs are significantly less volatile.

---

[23] EPA is proposing to exempt SCCT and NGCC units from the ACE Rule, subject to public comments.

5.2   Target Reserve Margin Range

The target reserve margin range established in the 2014 IRP Reserve Margin Analysis was 16 to 21 percent. In that analysis, the high end of the range (21 percent) was the reserve margin required to meet the 1-in-10 LOLE physical reliability guideline. Based on the Companies' current load forecast and resource mix, the reserve margin required to meet the 1-in-10 physical reliability guideline is approximately 25 percent (see Table 13 and Table 14). This increase is explained primarily by changes in the load forecast, which – consistent with recent history – assumes greater variability in winter peak demands (see Figure 5). The reserve margin analysis for the 2014 IRP was completed in 2013 and did not consider the possibility of the winter peak demands exceeding 7,000 MW (as experienced in 2014 and 2015). The increased variability in winter peak demands is primarily the result of increasing penetrations of electric heating in the Companies' service territories.

For the minimum of the target reserve margin range, the Companies estimated the change in load that would require the addition of generation resources. Specifically, the Companies estimated the load increase that would cause the Add SCCT1 portfolio to be less costly than the Existing portfolio. The reserve margin associated with this increase is the minimum of the reserve margin range. Below this range, the Companies should seek to acquire additional resources to avoid reliability falling to levels that would likely be unacceptable to customers.

Because significant near-term load increases are most likely to be the result of the addition of one or more large industrial customers, the analysis evaluated the addition of large, high load factor loads.[24] The results of this analysis from ELDCM and SERVM are summarized in Table 15 and Table 16, respectively. Consistent with the 2014 IRP reserve margin analysis, this analysis is focused on total costs that are estimated based on the 85th and 90th percentiles of the reliability and generation production cost distribution for the purpose of reducing volatility for customers. With no change in the load, total costs for the Existing and Add SCCT1 portfolios are the same as in Table 13 and Table 14. Based on ELDCM and assuming all other things equal, if the Companies' load increases by 300 to 400 MW (i.e., reserve margin decreases to 16 to 18 percent), the reliability and production cost benefits from adding new SCCT capacity would more than offset the cost of the capacity. The results from SERVM are very similar.

---

[24] Not all industrial loads have high load factors. In practice, significant load changes would have to be evaluated on a case-by-case basis to ensure reliable supply.

Table 15: Minimum of Target Reserve Margin Range (ELDC Model)

Load Change	Reserve Margin for Existing Portfolio	Total Cost w/ 85th %-ile Reliability and Production Costs ($M/year)			Total Cost w/ 90th %-ile Reliability and Production Costs ($M/year)		
		Existing	Add SCCT1	Diff: Add SCCT1 less Existing	Existing	Add SCCT1	Diff: Add SCCT1 less Existing
0	23.5%	821	829	8	831	838	7

300	17.9%	907	908	1	914	918	3
350	17.0%	925	925	(1)	931	933	2
400	16.2%	943	942	(1)	949	949	0

Table 16: Minimum of Target Reserve Margin Range (SERVM)

Load Change	Reserve Margin for Existing Portfolio	Total Cost w/ 85th %-ile Reliability and Production Costs ($M/year)			Total Cost w/ 90th %-ile Reliability and Production Costs ($M/year)		
		Existing	Add SCCT1	Diff: Add SCCT1 less Existing	Existing	Add SCCT1	Diff: Add SCCT1 less Existing
0	23.5%	827	840	13	836	844	8
50	22.5%	840	847	7	851	855	4
100	21.6%	852	863	11	864	869	4
150	20.6%	866	875	8	879	882	3
200	19.7%	883	886	4	896	897	1
250	18.8%	900	899	0	913	913	0
300	17.9%	914	918	4	925	930	6
350	17.0%	932	934	2	947	945	(3)
400	16.2%	955	950	(5)	964	963	(1)

5.3 Sensitivity Analysis

The inputs to the reserve margin analysis are detailed in Section 4. Because several of these inputs are uncertain, the Companies evaluated several sensitivities to the base case inputs. Table 17 lists the least-cost generation portfolios for each sensitivity, considering portfolios with LOLE less than five. As demonstrated in Section 5.1, the total cost of the Retire DCP portfolio is slightly lower than the total cost of the Existing portfolio in the base case scenario. The Companies used ELDCM to evaluate sensitivities to the cost of unserved energy, scarcity prices, EFOR, and ATC.

Table 17: Sensitivity Analysis (Least-Cost Generation Portfolio)

Case	85th Percentile	90th Percentile
Base Case	Ret DCP	Ret DCP
Cost of Unserved Energy		
25% Higher Cost of Unserved Energy ($22,800/MWh)	Ret DCP	Ret DCP
25% Lower Cost of Unserved Energy ($13,700/MWh)	Ret DCP	Ret DCP
Scarcity Prices		
25% Higher Scarcity Prices	Ret DCP	Ret DCP
25% Lower Scarcity Prices	Ret DCP	Ret DCP
Unit Availability		
Increase EFOR by 1.5 Points	Existing	Ret DCP
Decrease EFOR by 1.0 Points	Ret DCP	Ret DCP
Available Transmission Capacity		
No Access to Neighboring Markets	Ret DCP	Existing
High ATC (1,000 MW of ATC During Peak Hours)	Ret DCP	Ret DCP

5.4   Final Recommendation

All other things equal, if the Companies' load increases by 300 to 400 MW (i.e., reserve margin decreases to 16 to 18 percent), the reliability and production cost benefits from adding new SCCT capacity would more than offset the cost of the capacity. Furthermore, the reserve margin required to meet the 1-in-10 LOLE physical reliability guideline is approximately 25 percent. Therefore, based on reliability guidelines and the cost of new capacity, the Companies will target a reserve margin range of 17 to 25 percent for resource planning.

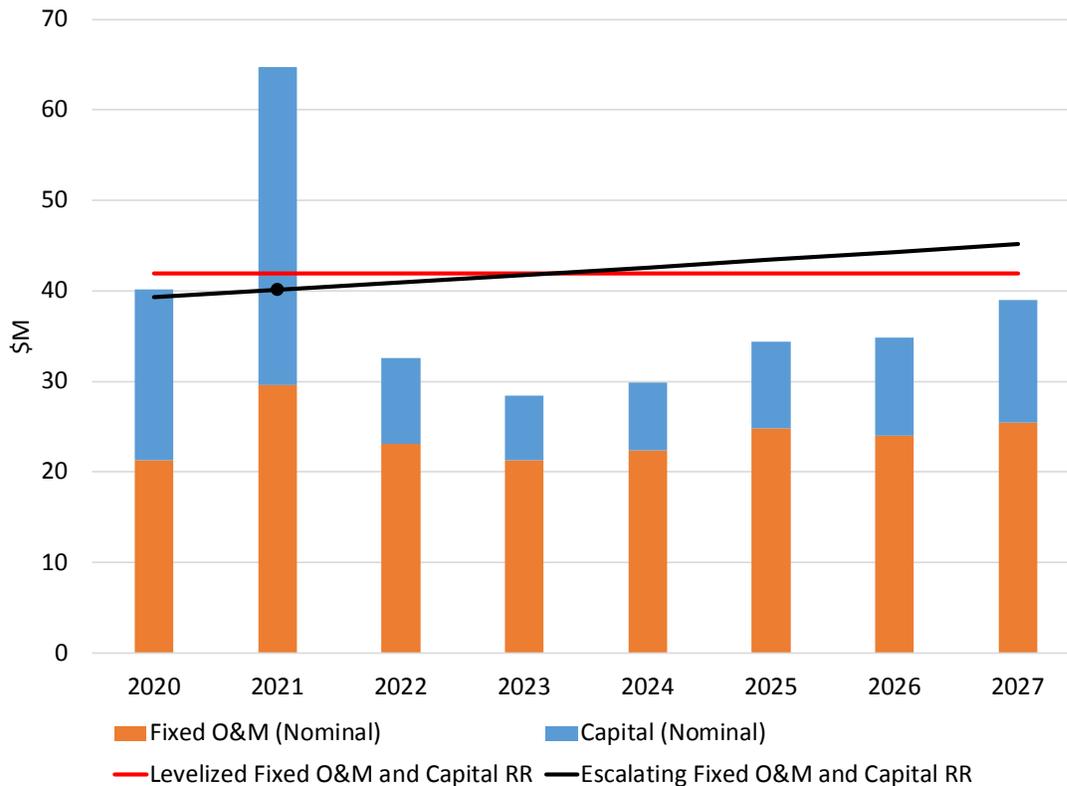
6   Appendix A: Stay-Open Cost Example

Table 18 contains capital and fixed O&M expenses for Ghent 1 over a typical 8-year maintenance cycle. With the exception of 2021 when the unit is scheduled for a turbine overhaul, fixed O&M is fairly consistent; several components of fixed O&M are assumed to grow at constant escalation rates. Capital costs are also highest in 2021 and more consistent in other years.

Table 18: Ghent 1 Capital and Fixed O&M (Nominal $M)

	2020	**2021**	**2022**	**2023**	**2024**	**2025**	**2026**	**2027**
Capital	18.8	35.1	9.5	7.1	7.5	9.6	10.8	13.6
Fixed O&M	21.3	29.6	23.1	21.3	22.3	24.9	24.0	25.4

To compute a stay-open cost for each marginal unit in 2021 dollars, the Companies levelized each unit's capital and fixed O&M expenses over the unit's maintenance cycle and adjusted the levelized capital cost to reflect the cost's impact on annual revenue requirements. Then, they converted the levelized cost stream into an escalating stream over the same period such that the levelized and escalating streams have the same present value of revenue requirements. In the escalating stream, costs are assumed to escalate at two percent per year. Figure 8 plots the result of this process for Ghent 1. The levelized cost is $41.9 million. The escalating cost is $40.1 million in 2021 and increases from $39.3 million in 2020 to $45.2 million in 2027.

Figure 7: Ghent 1 Stay-Open Costs


LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 15

Responding Witness: David S. Sinclair

Q-15.   Reference the response to AG DR 1-147.

    a. In recent history, has the Cane Run unit 7 ordinarily had a lower dispatch order than Trimble County 2?

    b. Are there any particular reasons why through November of 2018, Cane Run unit 7 has a higher dispatch cost rate than Trimble 2?

    c. Provide the projected retirement dates for the Zorn 1 and Haefling CT units.

    d. Provide the expected retirement date for Brown units 1 and 2. Explain how the retirement of Brown units 1 and 2 will impact and affect the order of economic dispatch of the Companies' generating fleet.

    e. Explain whether the abundant rainfall in and around the Ohio Valley through 2018 has increased the dispatch rate for the Ohio Falls and Dix Dam hydro units.

    f. Has the dispatch rate for the Ohio Falls and Dix Dam units during 2018 YTD exceeded the average dispatch rate for these units over the past five (5) years?

A-15.

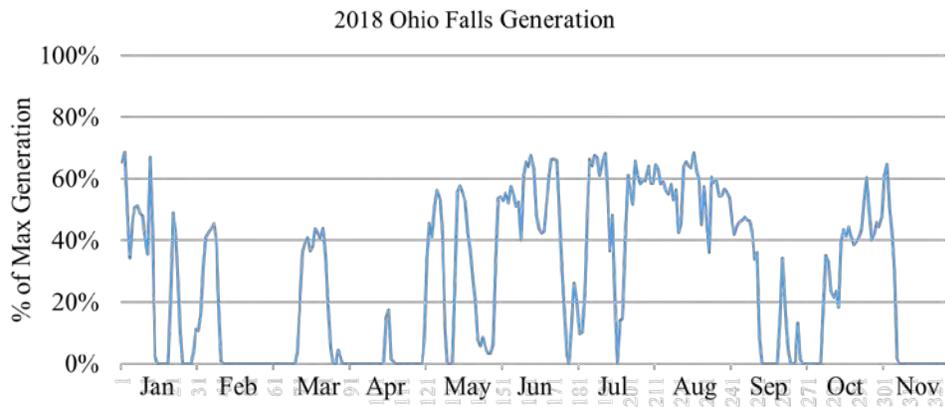
    a. Through November 2018, Cane Run 7 has had a lower dispatch order than TC2 in 7 of the 11 months in 2018.

    b. The primary determinant for the dispatch order of Cane Run 7 relative to Trimble 2 is the cost of natural gas. For November 2018, the expected average delivered price of natural gas was $3.00 per MMBtu, while earlier in the year the monthly expected average delivered price was as low as $2.66/MMBtu.

c. Zorn 1 is projected to retire by the end of 2021. The Haefling CT units do not have a projected retirement date. See the testimony of Mr. Sinclair at page 29, lines 4-8.

d. As indicated at page 11 of Mr. Bellar's Testimony, Brown units 1 and 2 are expected to retire at the end of February 2019. The retirement of these units is not expected to impact the relative economic dispatch order of the remaining units in the fleet.

e. The abundant rainfall in and around the Ohio Valley in 2018 has resulted in increased generation for Dix Dam, but reduced generation for Ohio Falls. The U.S. Army Corps of Engineers controls the Ohio River's flow to manage the navigable waterway. Operation of Ohio Falls generation requires water levels within a certain range, among other conditions.   The heavy rainfall experienced in the spring of 2018 resulted in conditions where the Ohio Falls units were often unable to be dispatched. Furthermore, high water levels often result in significant floating debris in the river, impeding opportunities to operate the hydro generation. The following chart shows the variability in 2018 of the generation produced by the Ohio Falls station.

2018 Ohio Falls Generation


f. The 2018 YTD generation for Dix Dam is above the average for these units over the past 5 years, while the 2018 YTD generation for Ohio Falls is below the average for these units over the past 5 years.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 16

Responding Witness: Christopher M. Garrett

Q-16. Explain the purpose of an allowance for cash working capital in rate base.

A-16. The purpose of an allowance for cash working capital in rate base is to compensate investors for providing the funds necessary to meet the daily operational requirements of the utility. The cash working capital component of rate base represents the additional investor capital required to bridge the gap between when cash is paid for expenditures necessary to provide service and when cash is received from customers for that service.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 17

Responding Witness: Christopher M. Garrett

Q-17.   If the Companies are authorized to earn a return on their total capitalization, as opposed to rate base, explain why the addition of an allowance for cash working capital does not constitute double recovery.

A-17.   The allowance for cash working capital is a rate base component. Capitalization does not include the addition of an allowance for cash working capital component; therefore, there is no double recovery.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 18

Responding Witness: Christopher M. Garrett

Q-18.   Reference the Attachment in response to AG DR 1-58. Except for the ECR mechanism, explain why the Companies did not remove expenses recovered outside base rates (column D) from cash working capital.

A-18.   Cash working capital requirements associated with rate mechanisms other than the ECR mechanism are recovered through base rates consistent with previous base rate cases.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 19

Responding Witness: Daniel K. Arbough

Q-19.   Refer to the Companies' response to AG DR 1-63(a). Assuming no holidays and an ordinary work-week, if the Companies were to receive customer payments at the hours of 1:00, 12:00, 17:00, and 23:00 on a Monday, at what time would they have access to each of the customer payments on the following Tuesday?

A-19.   Per the conditions stated above, customer checks received by the Company on a Monday at 1:00 (Eastern Standard Time) approximately two-thirds would be available to the Company on Tuesday morning with the remaining 1/3 available Wednesday morning. Although the banks could not provide a specific time, the funds are typically available by 8:00. Customer checks received by the Company at 12:00, 17:00, and 23:00 would be available to the Company on Wednesday morning also around 8:00. Checks received that have an exception (e.g. illegible, inaccurate account number, missing account number etc.) would be delayed an additional day.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 20

Responding Witness: William Steven Seelye

Q-20.   Refer to Att_[Company]_PSC_1-65 [Company] Cash Working Capital 12ME Dec 2017 Final and the Companies' response to AG DR 1-63(b). Regarding the invoice sample used to develop the Other O&M expense lead, respond to the following items:

   a.   For each line item, indicate the method of cash disbursement (e.g., check, ACH, etc.).

   b.   For the top five invoices paid via check, provide the date of the check issuance and a copy of the check.

   c.   For the top five invoices paid via ACH, provide the date the ACH was initiated.

A-20.   It should be noted that the Company's population of Other O&M expenses was analyzed at a more granular level than invoice level in order to represent the various types of expenses (e.g., Safety Supplies, Third Party Labor, and Travel) incurred and their respective expense amount regardless of the total invoice amount, which could include various expense types, when billed to the Company by the vendor/supplier. Therefore, the responses to parts b and c below provide the top five Other O&M expense amounts (rather than invoice amounts) included in the Company's lead/lag day analysis.

   a.   See attachment being provided in Excel format.

   b.   See attached copies of checks for the following:

Rank	Item #	Vendor	Expense Amount	Date Issued	Check #	
1	195	GE INTERNATIONAL INC	$ 270,000.00	08/08/2017	432474	
2	161	GLOBAL GEAR AND MACHINE CO INC	$ 149,850.00	11/30/2017	437657	
3	119	ROSEN USA	$ 147,724.50	07/21/2017	431742	
4	127	S D MYERS INC	$ 136,254.00	01/30/2017	424444	
5	191	WHITEHEAD CONSTRUCTION INC	$ 109,583.14	04/25/2017	427890	(a)

(a)   Check amount includes payment for other expenses included on same invoice.

c.

Rank	Item #	Vendor	Expense Amount	Date Initiated
1	183	MECHANICAL DYNAMICS AND ANALYSIS LLC	$ 1,070,877.00	12/01/2017
2	185	MECHANICAL DYNAMICS AND ANALYSIS LLC	$ 848,708.75	12/20/2017
3	137	PRECISION SERVICES INC	$ 356,686.70	05/12/2017
4	168	RIVERSIDE GROUP LLC	$ 348,360.00	10/19/2017
5	68	NALCO COMPANY	$ 316,044.90	07/28/2017

The attachment is being provided in a separate file in Excel format.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 21

Responding Witness: Christopher M. Garrett / William Steven Seelye

Q-21.   Reference the Companies' response to AG DR 1-64(a). The response states, "The intention of including an expense lead of 0 for the referenced items as shown on Exhibit WSS-36 is to exclude these items from cash working capital."

   a.   Explain the theoretical basis for why the items with an expense lead of 0 (e.g., Pension, OPEB, Depreciation, and Amortization, etc.) are excluded from cash working capital.

   b.   Explain why the following component (provisions)/requirements should not be removed from the calculated allowance on Schedule B-5.2.

CASH WORKING CAPITAL COMPONENTS
FORECAST PERIOD FOR THE 12 MONTHS ENDED APRIL 30, 2020

	Expense (Lead)/Lag	Working Capital (Provided)/Required		
		KU	LG&E-E	LG&E-G
No-Notice Storage Injections and Withdrawals	-			(147,640)
Pension Expense	-	(214,820)	(95,286)	(37,570)
OPEB Expense	-	49,558	176,073	74,540
Depreciation and Amortization	-	41,549,335	26,415,000	4,805,169
Regulatory Debits	-	1,051,265	184,403	-
Amortization of Regulatory Assets	-	823,067	734,123	31,264
Amortization of Regulatory Liabilities	-	(393,968)	(36,934)	-
Deferred: Federal and State (Including ITC)	-	4,188,150	1,723,108	517,597
		47,052,586	29,100,488	5,243,359

Source: Schedules B-5.2

A-21.

   a.   The expense items referenced are intentionally excluded from the calculation of cash working capital from an expense standpoint because they do not have a current cash outlay when the expense is recorded.   The revenue requirements for these expense items included in revenue do however have a revenue lag due to the time it takes to recover the expenses from customers.

   b.   See the response to part a.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 22

Responding Witness: Christopher M. Garrett

Q-22.   Describe the items that comprise Materials & Supplies in Schedule B-5.1. As Materials & Supplies are deployed in operations, are they expensed or capitalized?

A-22.   The Materials and Supplies balance is comprised of physical inventory and undistributed stores expense accounts. Materials and supplies accounts contain inventory relevant to gas and electric transmission and distribution, substation and generation operations. Examples of the inventory covered in this account are wood poles, breakers, reclosers, wire and cable for transmission and distribution and motors, pumps, gearboxes, and valves to support generation. Stores expense undistributed accounts include the cost of supervision, labor and expenses incurred in the operation of general storerooms including purchasing, storage, handling and distribution of materials and supplies.

Items consumed from Material and Supplies inventory may be expensed or capitalized depending on the nature of the work being performed.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 23

Responding Witness: Christopher M. Garrett

Q-23.   Describe the items that comprise Prepayments in Schedule B-5.1. As Prepayments are spent in operations, are they expensed or capitalized?

A-23.   Prepayments are made up of agreements paid in advance of the Company receiving the related goods or services. Prepaid costs over $50,000 are recorded on the balance sheet at the time of payment and included as part of capitalization. With the exception of EPRI, the amortization of these prepaid costs over the life of the agreement are expensed to the appropriate FERC operating account. A small portion of the EPRI agreement related to engineering studies for Effluent Limitations Guidelines is capitalized.

Prepayments include maintenance contracts related to Information Technology systems, insurance contracts, industry membership dues such as EEI, EPRI and AGA, maintenance contracts for power plant control systems and other miscellaneous contracts meeting the policy thresholds.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 24

Responding Witness: Christopher M. Garrett

Q-24.   Reference the Companies' response to AG DR 1-50(a). The response states, "Yes, the Company recovers income taxes assessed on CIAC in base rates."

      a. What is the revenue requirement in connection with income taxes assessed on CIAC and Customer Advances?

      b. Where is the amount provided in response to subpart (a), above, reflected in the filing in this proceeding?

      c. Demonstrate and describe in detail how the revenue requirement for income taxes assessed on CIAC and Customer Advances is determined. For example, are the income taxes assessed simply flowed through operating income, or are they capitalized and reflected in rate base with corresponding depreciation in operating expense?

      d. If the income taxes assessed are capitalized and depreciated for ratemaking, provide the monthly balances reflected in rate base and monthly depreciation expense for the base period and the forecasted period.

A-24.

      a. The pro rata ADIT asset balance for CIAC and Customer Advances in the forecasted test year is estimated to be $21.9 million. $21.9 million times the grossed-up required rate of return of 9.45%, plus approximately $0.2 million of deficient (as opposed to excess) deferred tax expense results in a revenue requirement impact of $2.3 million.

      b. The pro rata ADIT asset balance is reflected in the ADIT balance per Section 16(8)(b) - Schedule B-6 in Tab 55 of the Filing Requirements. The deficient ADIT amounts are shown on Section 16(8)(b) - Schedule E-1 in Tab 58 of the Filing Requirements.

      c. See response to (a) on how the revenue requirement for income taxes assessed on CIAC and Customer Advances is determined. The accumulated deferred income tax (ADIT) resulting from CIAC and Customer Advances are

included with the other ADIT balances in the rate base calculation. Additionally, the KPSC issued a final order in Administration Case No. 313 - *The Effects of the Tax Reform Act of 1986 on Contributions in Aid of Construction and Customer Advances*, dated 8/1/1990, whereby the Commission disallows utilities from "grossing-up" CIAC and Customer Advances collected from customers.

d. Income taxes assessed on CIAC and Customer Advances are not capitalized and depreciated for ratemaking.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 25

Responding Witness: David S. Sinclair

Q-25.   Reference the Companies' response to AG DR 1-4.

a. Provide the Companies calculation for "Market Economy" prices for the Base and Test periods.

b. Given the Companies' response to subpart (c) to AG DR 1-4, explain under what circumstances purchasing energy from OVEC would be considered uneconomic, assuming the Inter-Company Power Agreement stays in place through 2040.

A-25.

a. In the response to AG 1-4(c), the Companies' calculation for market economy unit cost in the Base and Test periods included additional transmission and RTO cost components that did not allow for an appropriate comparison to historical costs for market economy energy only. The table below reflects the revised costs:

Market Economy	Purchase Cost ($)[1]	Purchase Volumes (MWh)	Unit Cost ($/MWh)
Base Period	24,089	782	30.82
Test Period	566,501	16,996	33.33

b. The Companies evaluate unit commitment, decommitment, and energy costs when determining whether any generator should be online. The decision to purchase energy from OVEC is no different. The Companies attempt to commit the most economic units at all times. Therefore, the Companies do not anticipate any circumstances in which it would purchase energy from OVEC that would be considered uneconomic when commitment and decommitment costs are properly considered.

---

[1] These values differ from those provided in the KU's response to PSC 2-45(a) and LG&E's response to PSC 2-54(a) in that the values presented in AG 2-25(a) exclude automatic reserve sharing purchases, imbalance purchases, and SQF/LQF purchases, which are not considered to be market economy purchases.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 26

Responding Witness: David S. Sinclair

Q-26.   Reference the Companies' response to AG DR 1-4. Explain why Market Economy $/MWh has been significantly less than OVEC Energy Only for 2015–2017, but the Base Period and Test Period $/MWh for the Market Economy is significantly higher than OVEC Energy Only.

A-26.   In 2015-2017, the Companies were able to procure energy in certain hours at atypically low rates, in some instances at negative prices. Such low prices have occurred infrequently, and have skewed the weighted average prices due to a limited volume of higher cost purchases during those periods.

The Companies' market price forecast for the Base Period and Test Period is based on average historical hourly price volatility and therefore has a narrower distribution of hourly prices and does not include any negative prices. Also, forecasted purchases in the Base Period and Test Period contain a more balanced proportion of higher cost purchases relative to 2015-2017. The Companies participate in the hourly spot energy market every hour of the year and will continue to procure available hourly energy when it is economic relative to the Companies' generating resources.

The Market Economy $/MWh is not directly comparable to OVEC Energy Only, in that Market Economy reflects a limited subset of hours where market conditions warranted the Companies to make purchases on a non-firm basis. By definition, the Companies only make hourly market purchases when it is cheaper than their own marginal cost of generation. In contrast, the price of OVEC reflects an average price of all hours of the year, and the Companies maintain firm transmission rights to ensure the availability of its energy. A more appropriate comparison to OVEC Energy Only would be the average market prices. In the table below, these values have been appended to the table provided in the Companies' response to AG 1-4. The Market Economy Purchases for the Base and Test period have also been updated as noted in the Companies' response to Question No. 25(a).

$/MWh	OVEC Energy and Demand	OVEC Energy Only	Market Economy Purchases	Average Market Prices
2015	62.69	28.49	20.27	29.87
2016	55.77	26.91	12.62	27.11
2017	60.41	24.62	16.99	27.84
Base Period	62.59	23.78	30.82	32.02
Test Period	75.31	24.86	33.33	27.12

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 27

Responding Witness: Christopher M. Garrett / David S. Sinclair

Q-27.   Reference the response to AG DR 1-4. Confirm that in FERC docket ER18-459-004, OVEC filed proposed tariff revisions reflecting reduced federal corporate income tax in its stated transmission service rates.

   a.   Confirm that OVEC has requested an effective date of December 1, 2018 for these new rates.

   b.   State whether OVEC's new filing will reduce the rates OVEC charges to the Companies, and if so, provide the amount of the reduction, including any reduction in the revenue requirement. State also whether the reduction will be in energy charges, demand charges or both.

   c.   State whether OVEC is subject to state tax regulation in each of Indiana, Ohio and Kentucky. If so, state whether OVEC intends to pass on any state tax savings brought about as a result of the TCJA.

A-27.
   a.   The Companies can confirm from the publicly available filing that PJM and OVEC jointly requested that this filing be made effective as of December 1, 2018, coincident to OVEC's approved integration into the PJM markets.

   b.   Because OVEC deducts the revenues from the transmission charges from the OVEC demand charges for all OVEC facilities each month, the net effect to the Companies of any changes to OVEC's transmission rates is zero. See section 5.03(b) of the Inter-Company Power Agreement, which was provided as an attachment to the response to SC 1-1.

   c.   The Companies expect any tax savings to be minimal, if any, given OVEC's tax position. See the response to AG 1-5(h). As noted in OVEC's publicly available 2017 Annual Report, OVEC files income tax returns with the Internal Revenue Service and the states of Ohio, Indiana, and the Commonwealth of Kentucky. Note 7 to the financial statements describes OVEC's income taxes.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 28

Responding Witness: David S. Sinclair

Q-28.   Reference the Company's response to AG DR 1-5.

a.   Confirm that within the past few weeks, OVEC has officially been fully integrated into PJM. State whether this integration is expected to reduce any of OVEC's costs.

b.   With regard to the response to subpart (m), will the Companies agree to provide updates on OVEC's appeal to the U.S. Sixth Circuit Court of Appeals?

A-28.

a.   OVEC joined PJM on December 1, 2018. OVEC estimated a net initial financial benefit to OVEC of $1.9 million per year. This savings excludes approximately $0.4 million per year of PJM administrative charges that will be shared by OVEC sponsors and one-time charges in 2018 of $0.2 million.

b.   The Companies are not parties to those consolidated appeals that are pending before the U.S. Sixth Circuit Court of Appeals as case numbers 18-3787, 18-3788, 18-4095 and 18-4097 (collectively, the "Consolidated Appeals"). The pleadings filed in the Consolidated Appeals are publicly available and may be accessed by the Attorney General's Office through the Sixth Circuit's cm/ecf system with a valid PACER account. A link to the log in page for the Sixth Circuit's cm/ecf system follows: https://ecf.ca6.uscourts.gov/.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 29

Responding Witness: Robert M. Conroy

Q-29.   Reference the Companies' response to AG DR 1-9.

a. Confirm that the Commission's orders approving the settlement agreements
in Case Nos. 2008-00251 & 2008-00252 cited by the Companies only refer
to costs incurred and not ongoing costs related to the Companies' exit from
MISO.

b. Provide a specific citations to the portions of the Commission's orders
approving the settlement agreements in Case Nos. 2008-00251 & 2008-00252
cited by the Companies that discusses or evidences the Commission's consent
to ongoing transmission costs as a result of the Companies' exit from MISO.

c. The Company's response to subpart (e) to AG DR 1-9, that "the Companies
will address the effect on the revenue requirement" should FERC grant the
"request during the pendency of the proceeding" was not responsive. Explain
what effect on retail rates FERC's approval of the Companies' request will
have. The Company's response should include what adjustments to the test
period would be necessary and to what accounts those adjustments would be
made.

A-29.

a. Not confirmed. The Commission demonstrated its awareness of ongoing
transmission-related costs resulting from MISO exit in its May 31, 2006 final
order approving the Companies' withdrawal from MISO:

> The Dissenting Opinion also cites to the recent FERC decision
> imposing hold harmless conditions in conjunction with the
> LG&E and KU withdrawal from MISO. However, it is clear
> from that FERC opinion that the hold harmless conditions were
> imposed only in those circumstances where they had been
> expressly agreed to by LG&E and KU as part of their contractual
> agreement to join MISO. FERC actually rejected proposals that
> LG&E and KU should hold harmless future customers who are
> not currently served under an existing contract with a fixed rate,

stating that, "The TO [Transmission Owners] Agreement plainly states that the hold harmless provision applies only to *existing* service, not *future* service, and only for the remaining term of the contract for existing service." *Louisville Gas and Electric Company*, 114 FERC ¶ 61, 282, para. 49 (emphasis in original). In Kentucky, LG&E and KU have no contractual agreements to hold any retail customers harmless, and none of their customers are served under contracts with rates that are not subject to change by the Commission. In previously approving the request by Kentucky Power Company to join PJM, the Commission did not impose a hold harmless requirement in the event that the costs of membership in that RTO exceed the value of the benefits received.[2]

The dissent to which the majority was responding in that order was equally clear about understanding the nature of ongoing transmission-related costs resulting from MISO exit.[3]

The referenced orders in Case Nos. 2008-00251 and 2008-00252 addressed costs related to transmission service provided to East Kentucky Power Cooperative, Inc. ("EKPC") resulting from the same FERC hold-harmless (depancaking) requirement to which the Commission referred in its Case No. 2003-00266 final order.[4] The record of the 2008 proceedings was clear that the transmission-cost settlement agreement between the Companies and EKPC related to MISO exit and gave rise to the Companies' requested regulatory asset.[5] In short, it is clear the Commission understood in its February 2009 final orders in the Companies' 2008 rate cases that the Companies had incurred and were continuing to incur transmission-related costs resulting from MISO exit, which was fully consistent with the Commission's recognition of the issue when it approved MISO exit in 2006.

b. See the response to part a. above and the citations provided in response to AG 1-9.

c. The Company reiterates its response to AG 1-9(e), which is responsive to the question asked; the timing and substance of FERC's final order regarding the Companies' requested elimination of MMD charges will dictate whether the

---

[2] Case No. 2003-00266, Order at 23-24 (May 31, 2006).

[3] *Id.* at 35-37.

[4] Case No. 2008-00251, Order at 8-9 and 11 (Feb. 5, 2009); Case No. 2008-00252, Order at 9 and 12 (Feb. 5, 2009).

[5] *See, e.g.*, Case No. 2008-00251, Application at 5-6 (July 29, 2008); Case No. 2008-00251, Testimony of Valerie L. Scott at 5-6 (July 29, 2008); Case No. 2008-00251, Testimony of Lonnie E. Bellar at 8-9 (July 29, 2008); Case No. 2008-00251, KU responses to PSC 2-109(c) and (f) (Sept. 11, 2008); Case No. 2008-00252, Application at 6 (July 29, 2008); Case No. 2008-00252, Testimony of Valerie L. Scott at 5-6 (July 29, 2008); Case No. 2008-00252, Testimony of Lonnie E. Bellar at 12 (July 29, 2008).

order will have any effect on the retail rates proposed in this proceeding. That aside, if FERC issued a final order granting all relief the Companies requested while the effect thereof could be accounted for in this proceeding, the effects would be an adjustment to decrease Account 566 Misc. Transmission Expenses by $8,977,509.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 30

Responding Witness: Daniel K. Arbough / Robert M. Conroy

Q-30.   Reference the direct testimony of Kent W. Blake, page 11, lines 1–2.

a. Provide the calculations that derived the projected revenue requirement increase of $8 million for KU and $5 million for LG&E due to the MMD.

b. What is the current status of the FERC proceeding?

A-30.
a. See attached.

b. LG&E and KU filed their application at FERC [under Sections 203 and 205 of the Federal Power Act to remove Merger Mitigation Depancaking] on August 3, 2018. Since then, numerous intervenors have filed protests of the FERC filing, to which the Companies filed answers. Subsequent replies and sur-replies have been and are continuing to be filed by the parties, which filings are allowed only if FERC grants leave. FERC is anticipated to issue an order on LG&E and KU's application on or before January 30, 2019. Such order could be a substantive determination of the issues, solely procedural (resulting in a deferral of a FERC decision or ordering settlement and hearing procedures), or some combination.

Depancaking cost per last rate case filing versus forecasted test period 4/30/20.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 31

Responding Witness: Robert M. Conroy / Christopher M. Garrett

Q-31.   Reference the Companies' response to AG DR 1-42.

    a. Are the Companies aware if the Kentucky Public Service Commission has ever approved outcomes resulting from the use of the Department of Energy's Interruption Cost Estimator as a basis for approving utility capital projects? If so, provide citation(s) to same.

    b. By using Capitalization as the basis for return instead of rate base, do the Companies earn a return on spare parts, as described in the previous request and response, that they otherwise would not if using rate base?

A-31.

    a. No.

    b. The Companies earn a return regardless of whether capitalization or rate base is used for valuation purposes for spare parts recorded to inventory or capital for accounting purposes. This is consistent with the methodology the Commission has relied upon in past cases to determine rate base.[6]

_____

[6] *See, e.g.*, *In the Matter of: Application of East Kentucky Power Cooperative, Inc. for Approval of an Environmental Compliance Plan and Authority to Implement an Environmental Surcharge*, Case No. 2004-00321, Order at 6 (Ky. PSC Mar. 17, 2005); *In the Matter of: The Application of Kentucky Utilities Company for Approval of an Amended Compliance Plan for Purposes of Recovering the Costs of New and Additional Pollution Control Facilities and to Amend Its Environmental Surcharge Tariff*, Case No. 2000-00439, Order at Appendix B (Ky. PSC Apr. 18, 2001).

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 32

Responding Witness: Lonnie E. Bellar

Q-32.   Reference the response to AG DR 1-197. For all capitalization projects identified in the response to AG DR 1-196, identify those projects in which the Companies elected to pursue options that were not the least-cost option, and the reason(s) supporting the Companies' election. Provide also a page number for each such project depicting where the project can be found in the 651-page response to AG DR 1-196.

A-32.   The companies evaluate projects thoroughly to determine the optimal solution from a safety, reliability, and an operational perspective. Projects are selected to mitigate the identified problem and risks at least reasonable cost. The following are projects in which the selected alternative had a higher cost than another but was selected as the lowest reasonable cost option that also acceptably mitigated the identified problem. The reason(s) supporting the Companies' election are described in the investment proposals submitted in response to AG DR 1-196. Projects for which the "do nothing" option is the only lower cost alternative to the one selected are not included as they do not solve the identified problem or have unacceptable risks or both.

Project	Page Number
Tyrone Controls	11
HARDIN CO SMITH 345KV P2	43
SR 2017 Earlington No-Nebo	146
Mill Creek 4533 Brk Rpl	231
PR Leitchfield 138kV Tap*	477

*There was an immaterial difference between the two least cost alternatives on this project. The recommended alternative involved replacing structures with steel instead of wood as steel is better over the long term for reliability and resilience to weather.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 33

Responding Witness: Daniel K. Arbough / Robert M. Conroy

Q-33.   Confirm that, based on a recent report in the publication Morningstar, from 2018-2022 PPL plans to invest in excess of $15 billion in infrastructure projects.

   a.   If so confirmed, how much of that investment will be made by LG&E-KU? Provide a description of the those projects, together with cost estimates.

   b.   Provide copies of any and all cost-benefit analyses not already of record pertaining to these projects.

   c.   State whether LG&E-KU intend to file applications for CPCNs regarding any such projects, and if so, provide an estimated date for the filing of all such applications.

A-33.

   a.   It is confirmed that in a recent PPL presentation noted that the capital plan for 2018-2022 reflected over $15 billion of spend which is based on the 2018 Business Plan. LG&E and KU expected to spend approximately $5 billion (LG&E $2.3 billion and KU $2.6 billion) which includes AMS and all mechanism spend. This projection is based on the 2018 Business Plan while this filing in this case is based on the 2019 Business Plan. See attached for a listing of projects with estimated costs.

   b.   See attached for the analysis completed for projects that 1) have spend in the future, 2) have been approved by the Investment Committee ("IC"), and 3) have not been provided previously in this proceeding. Projects with spend in excess of $2 million must be presented to the IC. The attachment does not include AMS or mechanism projects as these are not included in this proceeding. Many projects that are included in the $5 billion amount mentioned in a. above commence well into the future and are not far enough along to have been presented to the IC. Certain information requested is confidential and proprietary and is being provided under seal pursuant to a petition for confidential protection.

   c.   See the response to PSC 2-58.

Investment Proposal for Investment Committee Meeting on: December 20, 2017

Project Name: PC Tech Refresh

Total Expenditures: $2,976k

Project Number(s): IT0287B

Business Unit/Line of Business: IT

Prepared/Presented By: Jeff Smith / Priya Mukundan

Executive Summary

LGE KU Energy (LKE) implemented a program in 2002 to replace desktops and laptops on a three-year cycle. The program was reevaluated in 2005 and it was determined then that the refresh cycle could be extended to four years for desktop computers. In 2017, the decision was made to begin refreshing Notebook computers on the same four year cycle due to advancements in technology, improved reliability and better warranties. The replacement cycle is consistent with industry norms as confirmed by Gartner, an American research and advisory firm that provides technology related insights to businesses.

The refresh process has continued to evolve over the years through various means. The 2014 Technology Refresh budget was reduced from its original budgeted amount by $230k, with the savings attributed to additional deferred replacements and from the implementation of a thin client software solution on repurposed older desktop machines. That reduction became the new baseline for Technology Refresh in subsequent years as LKE continues to deploy thin client technology, either a software solution or a hardware solution, where possible for desktop replacements. Thin client technology reduces the cost of desktop hardware equipment by 50% and extends the rotation cycle to an estimated 6 years. During the Tech Refresh process, devices are assessed for possible conversion. LKE currently has more than 500 thin clients deployed, including an additional 35 conversions in 2017.

In addition to the desktop and laptop refreshment, LKE also refreshes Toughbooks on a 4 year rotation. These are devices placed into service in 2014 and earlier for Electric and Gas Operations business. In 2018, some of these devices will be refreshed as part of the normal process while others will begin transitioning to iPad or other lower cost devices. This project is included in the 2018BP for $2,976k.

Background

This project is the continuation of current IT policy to provide upgrades to the Workstation infrastructure and will include implementation of the new Windows 10 operating system and deployment throughout the organization. The project will provide the rotation of approximately 1,200 new desktops, laptops and Toughbooks into the environment in 2018. The project maximizes operating efficiency for our knowledge workers and keeps IT support costs from increasing due to unplanned hardware maintenance.

- **Alternatives Considered**

  Recommendation for 2018 Refresh Project   NPVRR: $3,212k
  - Positive impact on business operations for 2018
  - Windows 10 will be deployed on most devices
  - Keep pace with advancing technology
  - Minimize risk to O&M budgets for repairs
  - Ability to rollout new applications required by the lines of business

  Alternative 1 "Do Nothing"
  - Negative impact on business operations for 2018   NPVRR: N/A
  - Not keeping pace with advancing technology
  - Risk to O&M budgets for repairs
  - Inability to rollout Windows 10 and other new applications required by the lines of business
  - This is not considered a viable long-term option because it poses productivity and down-time risks to operational areas dependent on the technology being updated.

  Alternative 2 "Defer Project"   NPVRR: N/A
  - Same as Alternative 1 "Do Nothing" and not considered a viable alternative
  - Schedule impact for rollout of new applications to lines of business

  Alternative 3 "Replace only failed equipment"   NPVRR: N/A
  - Same as Alternative 1 "Do Nothing" and not considered a viable alternative
  - Adverse effects to rolling out new applications required by the lines of business
  - Productivity impact and "down-time" for clients when equipment fails

  Alternative 4 "Extend rotation period to 5 years"   NPVRR: N/A
  - Same as Alternative 1 "Do Nothing" and not considered a viable alternative
  - Productivity impact and "down-time" for clients when equipment fails
  - Extended rotation cycle is not consistent with Gartner recommendation

Project Description

- **Project Scope and Timeline**

This project will evaluate and replace four year old desktops and laptops in 2018 before the workstations experience hardware problems that will cause out of warranty repair and client down time. The project will be completed by 12/31/2018. All LKE desktops, laptops, and Toughbooks that were purchased in 2014 will be evaluated for replacement. Where possible, thin clients will be used for replacements. The replacement schedule will be determined by site and will be reported monthly through departmental status reports. The project is budgeted and there are no incremental O&M expenditures or savings related to the project. There are avoided costs associated with this project including improved reliability, reduced downtime for clients, and out of warranty repair costs, etc.

Economic Analysis and Risks

- **Bid Summary**

The hardware for this project will be purchased under the PC Hardware and Peripherals Contract to ▉▉. In 2016, PPL and LKE issued a joint bid seeking a larger volume discount and synchronized the PA and KY contracts. ▉▉ was awarded the supplier contract for both PPL and LKE through a competitive bid process that included Minority-Owned and Woman-Owned businesses. ▉▉ was awarded the hardware contract for both PPL and LKE, and both companies will purchase the ▉ hardware through the ▉▉ supplier contract.

Net Capital Expenditure:	$2,976

- **Assumptions**
  - Workstations will be available and delivered in 14 business days or less after order.
  - Cost per workstation will not shift dramatically during the year.
  - Contract labor will be available and no reduction of internal labor will occur.

- **Environmental**
  No environmental impact.

- **Risks**
  If the project is not approved, the main risk would include aging hardware that could fail that would create disruptions to individuals and processes. Hardware replacement after failure would be expected to be more costly than replacing prior to failure, along with the negative productivity impact to employees that experience unplanned hardware failure.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the 2018 PC Tech Refresh project for $2,976k to ensure that our workstation environment meets the needs of the operational areas who are dependent upon the tools and technology to do their job.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: September 27, 2017

Project Name: ARM Work Management System Upgrade

Total Expenditures: $2,500k (Including $227k of contingency)

Project Number(s): ITO300B

Business Unit/Line of Business: IT/ Electric Distribution Operations (EDO) / Gas Distribution Operations (GDO)

Prepared/Presented By: Joseph Justice, Steve Woodworth, Tom Rieth

Executive Summary

EDO and GDO request funding authorization to upgrade their work management system, ███'s Asset and Resource Management (ARM) software. ARM is a critical system used to manage many facets of daily work and resources, including capital construction, distribution system maintenance, and regulatory required inspections.

Since implementing ARM in 2012, LKE has not upgraded the software. The existing version, v.1.4.2, is no longer covered by ███'s standard support. Therefore, LKE is paying a premium on software support and maintenance through 2018 with ███willing to renegotiate beyond 2018 if desired. In addition to vendor support, timing of this project is influenced by other major initiatives. The ARM Upgrade schedule was originally set to avoid overlap with several large information technology projects, including Distribution Automation (DA), Advanced Metering System (AMS), and the Geographic Information System (GIS) replacement. With the recent delay of AMS and GIS, now is the opportune time to upgrade ARM. Otherwise, the upgrade window would move to 2021+ impacting support costs as well as critical system patches / upgrades.

The latest release of the ARM software upgrades the Work Manager to HTML5 with a state-of-the-art web user interface, enhancing usability and productivity improvements. Many of the enhancement requests from the LKE ARM User Group are baseline functionality in the latest version. Examples include changes for the display configuration and implementing advanced query functions.

EDO and GDO recommend that the Investment Committee approve the proposed project for the capital cost of $2,500k, including a $227k contingency. There is no incremental on-going O&M, and an actual reduction in O&M of $41k during 2018. The 2017BP includes allocation of $2,350k for the project, of which $300k is in 2017. The 2018BP includes $2,350k in 2018.

Background

■■■s Asset and Resource Management (ARM) solution replaced STORMS WMS in 2012, for managing work and resources in EDO and GDO. The current ARM solution is version 1.4.2, and has not been upgraded since the implementation. This version is outside of the vendor's standard support window, so LKE is paying a premium on a year-by-year support contract. In addition to the cost of support, LKE's ability to implement enhancements to support business processes is limited.

LKE Electric and Gas Distribution utilize multiple work management systems. GDO currently uses both Maximo and ARM, but recognizes the benefit of consolidating into a single work management application. This upgrade will position GDO to migrate Maximo users to ARM in the future. EDO currently uses ARM and Cascade, a system used by Substation Construction and Maintenance. The proposed upgrade will also provide EDO with an option to consolidate all work management into one system in the future. However, replacement of Cascade was not included in the scope of the proposed upgrade due to time constraints and associated project complexities.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $2,526
     Implement the ARM Upgrade along with four system enhancements to meet business needs.

     These enhancements include the ability to export surveyed facilities results into Excel, incorporate the Facility Type and Facility ID as a concatenated field in Asset Manager, add an "Executed By" option to the query functionality in Asset Manager, and ability to include Work Request Owner when duplicating a work request.

  2. Alternative #1:   NPVRR: ($000s) $3,779
     Implement the ARM Upgrade and convert Gas Maximo to ARM Asset Manager

     This option is not recommended as it would increase the duration of this project by five months. Keeping Maximo will not adversely impact the business since it has the functionality to meet the critical needs of GDO.

     Distribution is implementing this upgrade to maximize available business and technical resources prior to other large-scale initiatives starting within the 2018 BP. For LKE to meet that timeframe, it will not be able to add the complexity to this project.

  3. Alternative #2:   NPVRR: ($000s) $4,297
     Delay upgrade until 2021+

     This option is not recommended as it would mean the ARM upgrade would not take place until 2021+. Waiting 10 years to apply system patches on a critical LOB system can pose risks that include incompatibility with interfacing systems, security

vulnerabilities, and break-fix complexities of a system not being maintained by though vendor.

Additionally, extended support is negotiated annually and continued increases in premium support costs should be expected as the vendor pushes for LKE to move to its standard supported version.

Finally, there are several other projects and programs in the 2018BP that would benefit from this initiative and delaying this upgrade to 2021 would prevent that.

Project Description

- **Project Scope and Timeline**

The scope of this project is to:

- Upgrade the current ARM version 1.4.2 to most current ARM version
- Include four critical business enhancements at a cost of $120k (developed by ████)

Milestones for this project are:

Milestone Number	Payment Milestone Description	Percent of Total Fixed Fee	Target Invoice Date
1	**Fully Executed Contract**	10	Dec 17
2	**Installation at LG&E and KU Complete**	15	Apr 18
3	**Complete Impact Analysis**	15	May 18
4	**Complete Design Document**	15	Jun 18
5	**Report and Solution Configuration Complete**	15	Jul 18
7	**User Acceptance Testing Complete**	10	Aug 18
8	**Deliver End User Training Materials**	10	Sep 18
9	**Go-live and Post Go-Live Support Complete**	10	Oct 18

- **Project Cost**

Total cost of the project is $2,500k, including $227k of contingency.

Economic Analysis and Risks

- **Bid Summary – sole sourced (Incumbent vendor)**

  ██████ quote for professional services is ████████ to assist in the implementation of this project. ████ is the Company standard for EDO and GDO work management. It was chosen through a competitive bid process in 2012.

  ██████ s bid for the professional services is ████ to perform performance testing for all lines of business in this project. ██████ was chosen to develop the LKE Testing Center of Excellence in IT

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	230	2,270	-	-	2,500
2. Cost of Removal Proposed	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	230	2,270	-	-	2,500
4. Capital Investment 2017 BP	300	1,300	750	-	2,350
5. Cost of Removal 2017 BP	-	-	-	-	-
6. Total Capital and Removal 2017 BP (4+5)	300	1,300	750	-	2,350
7. Capital Investment variance to BP (4-1)	70	(970)	750	-	(150)
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	70	(970)	750	-	(150)

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed	300	271	279	583	1,433
2. Project O&M 2017 BP	300	312	285	598	1,495
3. Total Project O&M variance to BP (2-1)	-	41	6	15	62

The proposed 2018 BP includes $2,350k in 2018, so with this amount and the amount expected to be spent in 2017 the BP amounts are sufficient to cover the total cost of the project.

Financial Summary ($000s):

Discount Rate:	6.32%
Capital Breakdown:	
Labor:	$350
Contract Labor:	$1,890
Materials:	$33
Local Engineering:	$0
Burdens:	$0
Contingency:	$227
Reimbursements:	($0)
Net Capital Expenditure:	$2,500

- **Assumptions**

  o ARM 2.2 will be setup in the Citrix XenApp 7.x environment and the current ARM 1.4.2 production environment will not be migrated from Citrix XenApp 6.5.
  o Minimal data migration efforts for LGE and KU since this task will be handled by ▮▮▮.
  o Current Work Manager Reports will continue working without any modifications. Asset Manager Reports may need updates to conform to the new database.
  o Current interfaces will continue working without modifications.
  o LKE resources will be available as needed to support the scope and schedule of the program.

- **Environmental**
  There are no known environmental concerns related to this proposal.

- **Risks**

  o The latest ARM offering consists of a new user interface which will be a change to the end users. Failure to complete this upgrade in a timely manner could result in too much change to the business given the other proposed initiatives identified in the business plan (AMS, DA, GIS).

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the project for the capital cost of $2,500k, including a $227k contingency. There is no incremental on-going O&M and a reduction of $41k in 2018.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake	Paul W. Thompson
Chief Financial Officer	President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: 7/26/2017

Project Name: Barton Substation Upgrade Project

Total Expenditures: $4,781k   (Including $656k of contingency)

Project Number(s): Distribution-154504, Substation-154118, Transmission-154511

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Tim Smith/Kevin Patterson/Daniel Hawk

Executive Summary
Electric Distribution Operations (EDO) – Electrical Engineering and Planning seeks funding authority to build a new 22.4MVA, 69kV/12kV distribution substation with two 12,470 volt feeder circuits and to make the associated system improvements to support new load growth in the Bardstown, Kentucky area in Nelson County. This funding request includes costs to convert the Barton 4kV (8281) system to 12kV. The existing Barton 4kV Substation (7MVA capacity) is expected to continue to exceed its summer rating due to operations and facility expansions by the two largest customers served, Barton Distillery and the City of Bardstown. This New Business project provides for substation improvements necessary to serve the expected new loads, provides for future growth and makes provisions for future substation expansion. Upon completion of the proposed 22.4MVA, 69/12kV substation on the new greenfield site, the existing Barton 4kV Substation, located on distillery property, will be razed and the associated substation lot easement rights reverted to the Barton Distillery.

Approval is requested in the amount of $4,781k to construct the Barton 22.4MVA, 69/12kV Substation. This project was not included in EDO's 2017 Business Plan (BP) because the notice from Barton Distillery on the new load was received after the 2017 BP was finalized. The 2017 funding was approved through the Corporate RAC process and the 2018 funding is included in EDO's proposed 2018 BP.

Background
Barton 4kV Substation is a single transformer substation built on a 60' by 60' easement on the Barton Distillery property at ▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮ in Bardstown, Kentucky. The existing substation transformer is a 7MVA, General Electric LTC 67kV/4.360kV (4kV system) transformer manufactured in 1962 and installed at its present location in 1969. The current summer forecast for Barton 4kV is 106% of top name plate (the summer rating is 100% of top name plate). The Barton 4kV system is a summer peaking system and the substation transformer had an actual 2016 summer peak of 7.6MVA (109%).

There are two 4kV distribution circuits served from the current Barton 4kV Substation. Circuit #2201 serves the City of Bardstown Municipality. The City of Bardstown has requested to serve

an additional 1.1MVA of capacity on this circuit. The second circuit out of the Barton 4kV Although Substation, circuit #2202 serves the Barton Distillery and three residential customers. Barton Distillery is adding a new dryer house facility with an expected increased demand of 1.9MVA.

The anticipated summer demand for the Barton 4kV Substation will be 10.6MVA (151%) when all customer requests and the plant expansions are completed and fully operational. This would result in the substation transformer exceeding its summer emergency rating of 120% (likely to occur in the summer of 2018, if no remediation steps are taken). The City of Bardstown has agreed to transfer load presently served from the Barton 4kV Substation to another municipal substation during the construction to relieve the forecasted overload.

The existing substation site has several limiting factors that make it undesirable for expansion. The 60' by 60' substation easement site is too small for a standard designed substation and cannot accommodate a second transformer for future load growth or N1DT contingency considerations. In order to make the property suitable for an upgraded transformer, additional land would need to be acquired and major property improvements would be required. These improvements include adding large amounts of fill material and a significant retaining wall due to the severe slope of the property outside the existing substation fence. In addition, the substation's very close proximity to the distillery's storage tank facility would make working on the site difficult.

EDO requests $4,781k in funding to resolve the current and forecasted overload condition at Barton 4kV Substation. EDO proposes construction of a new substation on a 150' by 150' greenfield site on Barton Distillery property, south of the existing Barton 4kV site off Cathedral Manor Road. Funding is requested to install a new 22.4MVA, 69/13.09kV transformer, a 69kV transmission extension to the new substation and two 397kCM ACSR exit circuits. An operating voltage conversion from 4kV to 12kV is also proposed to enhance the distribution feeders and to promote future contingency ties to other 12kV substations in the surrounding Nelson County area. The Barton system is well positioned for a 4kV to 12kV conversion as there are only about 6 distribution line transformers on the Barton Distribution system that are not already dual voltage transformers (capable of conversion to 12kV).

A Transmission Service System Impact Study for a new service point has been submitted and no additional transmission improvements are expected to be identified beyond the cost to serve the new station.

- **Alternatives Considered**
    1. Recommendation Option: NPVRR: ($000s) $5,560k
       The recommended option is to design and build a new 12kV substation on Barton Distillery property with a 22.4MVA LTC Transformer. The project includes site preparation, four breakers, a control house, 69kV transmission extension to serve a new delivery point, two 12kV exit circuits and easement costs for this new substation site at ▮▮▮▮▮▮▮▮▮▮▮▮ in Bardstown, Kentucky. The cost also includes the demolition and removal of the existing Barton 4kV substation. The cost of the recommended option is $4,781k.

2. Do Nothing Option: NPVRR: ($000s) N/A
   KU has an obligation to serve the customers and associated load within the service area. The "do nothing" option is not considered an acceptable option because Barton 4kV would exceed Distribution Planning's operation limits for a 7MVA distribution substation power transformer. This practice reduces the life of the substation transformer and elevates the risk of failure of a high value, critical asset.

3. Alternative 1:   NPVRR: ($000s) $5,755k
   Design and build a one transformer substation on the existing Barton 4kV Substation site with a 22.4MVA LTC transformer. This option includes four breakers, a control house, a 69kV transmission tap, two exit circuits, easement costs, installation of the portable substation and site remediation. This option is not recommended for several reasons. The existing facility sits on top of a knoll and to expand the site would require additional property, a large amount of fill material, and a significant retaining wall. The site is very close to Barton Distillery's tank storage facility, limiting the amount of available space to the rear of the substation, making expansion difficult. This option would require the installation of a portable substation during construction and suitable space is very limited. Expansion of the existing site would not accommodate a second transformer for future load growth or N1DT contingency considerations. The cost of this option is $4,935k.

Project Description

- **Project Scope and Timeline**
  Transmission Project # 154511: Est. cost: $514k (2018-$514k)
  Install transmission poles and lines for a tap at the end of the existing 69kV transmission line for a new 69kV delivery point off ███████████████.

  Substation Project # 154118: Est. cost: $4,167k (2017-$1,402k, 2018-$2,366k, 2019-$399k)
  Perform a geotechnical survey, site prep, and service road construction needed for the development of the greenfield site between two existing warehouses on Barton Distillery property. Install substation steel structure, one 22.4MVA, 69/13.09kV substation transformer, circuit breakers and the associated substation equipment.

  Distribution Project # 154504: Est. cost: $100k (2017-$75k, 2018-$25k)
  Replace the 4kV distribution transformers, insulators, lightning arrestors and required pole replacements to convert the Barton 4kV distribution system to 12kV. Install two 397kCM ACSR overhead exit circuits and a 550' 397kCM ACSR line extension to tie to the existing distribution circuit.

Timeline

May 2017:	Site survey.
July 2017:	Open project.
July 2017-Dec. 2017:	Complete transmission, substation and distribution engineering design. Complete material and equipment orders.
Jan. 2018-May 2018:	Install service road, site prep, install fence footers & enclosure, concrete piers. Transmission tap construction. Distribution circuit construction.
May 2018 Sept. 2018:	Steel structure delivery and construction. Transformer and breaker delivery and installation. Installation of communications and control house.
Sept. 2018-Nov. 2018:	Site cleanup and landscaping. Substation in service.
Nov. 2018-March 2019	Equipment removal and demolition of Barton 4kV substation.

- **Project Cost**
  The total estimated cost of the project is $4,781k. Cost estimates are consistent with the "Conceptual Level 1" engineering design designation. Due to some uncertainty in the raze/removal cost of the existing 4kV substation, there is an estimated 16% contingency ($656k) incorporated into the project cost estimates.

Economic Analysis and Risks

- **Bid Summary**
  - o The substation transformer and breakers will be ordered using existing contracts following established Supply Chain practices. Bids for other substation materials, transmission materials, and labor will be prepared as necessary following established Supply Chain practices.
  - o Transmission and Distribution Lines will use existing material and labor contracts and follow established Supply Chain procedures.
- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	1,477	2,894	-	-	4,371
2. Cost of Removal Proposed	-	10	400	-	410
3. Total Capital and Removal Proposed (1+2)	1,477	2,904	400	-	4,781
4. Capital Investment 2017 BP	-	-	-	-	-
5. Cost of Removal 2017 BP	-	-	-	-	-
6. Total Capital and Removal 2017 BP (4+5)	-	-	-	-	-
7. Capital Investment variance to BP (4-1)	(1,477)	(2,894)	-	-	(4,371)
8. Cost of Removal variance to BP (5-2)	-	(10)	(400)	-	(410)
9. Total Capital and Removal variance to BP (6-3)	(1,477)	(2,904)	(400)	-	(4,781)

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2017 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

This project was not incorporated into the 2017 BP. The 2017 funding has been approved through the Corporate RAC process. The 2018 and 2019 amounts are incorporated in the proposed 2018 BP as New Business.

Financial Summary ($000s):

Discount Rate:	6.32%
Capital Breakdown:	
Labor:	$ 243
Contract Labor:	$ 2,533
Materials:	$ 674
Local Engineering:	$ 412
Burdens:	$ 263
Contingency:	$ 656
Reimbursements:	($ 0)
Net Capital Expenditure:	$ 4,781

- **Assumptions**
    - Projected load growth at Barton Distillery and the City of Bardstown will be as expected.
    - The City of Bardstown (municipal) will complete the conversion of 4kV loads to alternative sources on a temporary basis and complete a 4kV to 12kV conversion within 18 months. This eliminates the need for a portable substation to be installed.
    - No adverse findings will be revealed from the site and geotechnical surveys of the new substation property.
    - An AT&T line that crosses a portion of the proposed substation site can be relocated as estimated.
    - The project unknowns will not exceed the estimated contingency amounts.

- **Environmental**
There are no known environmental issues at this time

- **Risks**
A deferment of this project will result in significant (above emergency) overloading of the existing 7MVA substation transformer. This overload will result in a loss of life for the transformer and could result in the failure and unplanned replacement of a high cost asset. A failure of the transformer would result in an extended outage (+24 hours) for two large customers in Nelson County, Kentucky.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Barton Substation Upgrade Project for $4,781k to serve existing load and proposed customer expansions in Nelson County, Kentucky.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: December 19, 2018

Project Name: BR3 HP-IP Blading

Total Expenditures: $ 3,585k (Including $179k of contingency)

Project Number(s): 144722

Business Unit/Line of Business: Generation

Prepared/Presented By: Mark Brackett

Executive Summary
The execution of this project will replace a substantial portion of the blading on the HP-IP turbine on BR3 (reference illustration in Appendix A). The prior turbine dismantle and overhaul was performed in 2012. During this inspection, it was recommended that IP turbine 3rd and 4th stage of rotating and stationary blading (rows R13, R14 and 13C, 14C) be replaced due to SPE (Solid Particle Erosion). Due to the extensive amount of reheater work performed since the last inspection, it is highly recommended to replace the 1st and 2nd stage (rows R11, R12, 11C and 12C) of rotating and stationary blading as well. It was also recommended on the HP turbine that stages 1st through 4th (rows R1, R2, R3, R4) be replaced due to blade untwist and FOD (Foreign Object Damage) and (rows 1C, 2C) be replaced due to FOD. This work can only be performed with the turbine disassembled. The first opportunity to perform this work is the Fall of 2019. The next opportunity will be in 2026. Due to possible blade failure causing extensive damage to the turbine and reduced unit reliability, it is highly recommended to replace the blading in 2019. This project was budgeted for $3,433k in the 2019 BP with all spend to occur in 2019. The total project cost is now estimated to be $3,585k, with $550k being spent in 2018, and the remaining $3,035k in 2019. The cost added to 2018 was funded by the RAC in the 8+4 forecast.

Background
E.W. Brown Unit 3 turbine/generator was disassembled and inspected during the last major outage in 2012. Condition based assessments recommended the following turbine blade rows for replacement during the next turbine/generator overhaul.

IP Blade Rows R11, R12, R13, R14, 11C, 12C, 13C and 14C Indications noted solid particle erosion on the trailing edge of the 3rd and 4th stage blades. Although the 1st and 2nd stage blades were replaced during the 2012 outage, they will need to be replaced again due to the extensive amount of reheater work performed since the last turbine overhaul. The reheater work was performed on an emergent basis due to the boiler tube leaks incurred during operation of the unit. The repairs performed on the reheater result in the liberation of oxide layers from the ID of the boiler tubes that become entrained in steam flow going to the IP turbine resulting in accelerated wear on the blading. Modifications to the reheater to address the recurrent boiler tube failures will be performed during the maintenance outage planned for the Fall of "19". Due to decreased

unit reliability and possible blade failure, it is highly recommended to replace the 1st, 2nd, 3rd through 4th stage blading in 2019.

HP Blade Rows R1, R2, R3, R4, 1C and 2C Indications noted the 1st through the 4th stages of rotating blades (R1, R2, R3 and R4) be replaced to preclude failure due the blade untwist and FOD. Indications also note the 1st and 2nd stage of stationary blades (1C and 2C) be replaced to preclude failure due to FOD.

By replacing these blades, reliability will increase by reducing the possibility of blade failure in this area of the turbine. This will be beneficial to both the company and the customer by improving BR3 reliability and allowing generation fleet to be dispatched in the most cost effective manner.

Alternatives Considered
1. Recommendation: NPVRR: ($000s) $3,980
2. Alternative #1:   NPVRR: ($000s) $4,121
3. Alternative #2:   NPVRR: ($000s) $5,127

Recommendation-Replace HP-IP Turbine Blading in 2019 Major Outage
Purchase and install the HP-IP in kind turbine blading in the Fall outage of 2019. This plan will be the most cost effective over the life of the project. It will decrease the potential of loss generation and extensive turbine damage due to the possibility of blade failure. The NPVRR for this alternative is $3,980k.

Alternative #1: Replace at Next Outage
We would need to open and inspect the blading at least once between each major outage to reduce the risk of blade failure and severe damage to the machine. During this inspection weld repairs on the blading would likely be required. This alternative is not recommended due to the incremental outage time and labor resources required. The NPVRR for this alternative is $4,121k.

Alternative #2: Do Nothing
The Do Nothing alternative is not recommended due to a continued potential of loss generation and a very high risk of blade failure causing severe damage to the machine. We would need to inspect the blading at least once between each major outage. This inspection would take 4 weeks to perform. If nothing is done and the blades are not replaced, it is highly likely at some point there will be a blade failure causing extensive damage to the turbine/generator set. This damage would cause approximately 12 weeks of unavailability. The total amount of lost generation, high labor cost for inspections and risks to the machine makes this alternative very unfavorable. The NPVRR for this alternative is $5,127k.

Project Description

- **Project Scope and Timeline**
  This project will replace in kind (14) rows of HP-IP turbine blades. (8) IP blade rows: R11, R12, R13, R14, 11C, 12C, 13C and 14C. (6) HP blade rows: R1, R2, R3, R4, 1C and 2C. The blading will be purchased from ▮▮▮▮▮▮▮▮ the OEM of the turbine/generator. The turbine will have to be opened up, old blades removed and new blades installed. Due to the labor resource requirements, the project execution timeline will be approximately (8) weeks. Blades will be ordered in 2018 for availability in December of 2019. A milestone payment will be made in December of 2018.

- **Project Cost**
  The total estimated cost of this project is $3,585k. This includes purchase of materials, cost of removal and installation. The total contingency of $179k (5%) is also included for unexpected issues of removal and installation during outage. There will be a total capital burden cost of $529k (20% stores burden on material purchased and the capital burdens).

Economic Analysis and Risks

- **Bid Summary**
  Labor and materials were competitively bid under the Turbine/Generator Major Outage Fleet wide initiative. Bids were solicited from ▮▮, and ▮▮▮▮▮▮ ▮▮▮▮▮▮▮▮▮. ▮▮▮ is expected to be awarded a contract for the material supply at a cost of ▮▮▮▮. ▮▮▮▮▮ is the preferred contractor for installation of the blades which is estimated at ▮▮▮.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total

Financial Summary ($000s):   **Arbough**

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$0
Contract Labor:	$583
Materials:	$2,294
Local Engineering:	$0
Burdens:	$529
Contingency:	$179
Reimbursements:	($0)
Net Capital Expenditure:	$3,585

- **Assumptions**

  This projects assumes that the replacement of the HP-IP turbine blades will increase unit reliability by avoiding the possibility of turbine damage and loss of generation due to blade failure. Completing this project in 2019 will eliminate the extensive labor cost and 4 weeks of unit unavailability created by opening and inspecting the blading between the 2019 and 2026 major outages. The Replace at Next Outage and Do Nothing alternatives both assume escalation of three percent per year.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit?	
	a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit?	
	a. Provide frequency or when equipment or component in question was last repaired or replaced. (7 – 30 years depending upon component)	Yes
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment?	
	a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

- **Risks**
The primary risk of not completing this project in 2019 is blade failure resulting in extensive damage to the turbine rotor and casing. By completing this project in 2019 it would restore the unit reliability by greatly reducing the possibility of blade failure. It would also eliminate the need to open the turbine and inspect the blades between major outages. This inspection takes an estimated 4 weeks to complete resulting in high labor cost and unit unavailability. Also completing this project in 2019 would be the most cost effective because it keeps the unit in the generation fleet for dispatch benefiting both the company and the customer.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the BR3 HP-IP Blading project for $3,585k to restore the unit reliability by greatly reducing the possibility of loss generation and turbine damage due to blade failure.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Combined Investment Proposal for Investment Committee Meeting on: <u>August 30th, 2017</u>

Project Name: <u>BRCT11 C-inspection</u>

Total Capital Expenditures: **$9,700k** (including $315k (3%) contingency)

Total Contract Expenditures (Sole Source): ███████

Project Number: Capital: <u>147949</u>

Business Unit/Line of Business: <u>Generation - EW Brown Plant</u>

Prepared/Presented By: <u>Greg Wilson</u>

Executive Summary

This proposal seeks approval for the capital required to perform a C-inspection on Brown Combustion Turbine Unit 11 (BRCT11), along with approval for a sole source award to ██████ ██████████ a business unit of ██████████████ for the purchase of parts and materials prior to the outage. The aforementioned scope of work will be performed under project 147949.

A C-inspection is performed when the equivalent operating hours (EOH) of an ████ combustion turbine unit reaches 24,000. EOH is used to estimate the material degradation of a unit's hot gas path parts and are accumulated on a per start basis. One start of the unit registers 20 EOH, and every operating hour accumulates one additional EOH. Trips and other events accumulate more EOH representing more stress placed on the machine during those occurrences.

BRCT11 is currently 23,099 EOH into its 24,000 EOH maintenance cycle and is the remaining ██████ unit at the site needing its first C-inspection. BRCT8, 9, & 10 combustion turbines installed in the mid 1990's have all undergone C-inspections in 2006, 2013, and 2015 respectively.

The total capital project is budgeted for $10,710k in the 2017 BP for $2,550k and $8,160k in 2017 and 2018, respectively. Through efforts to find third party providers for parts associated with the outage and through recent negotiations with ████████████ the plan is to reduce the 2018 spend to $7,150k making the total estimated project $9,700k.

The sole source procurement value requested for parts and materials from ████████████ to support the outage is ██████████.

Background

Material degradation of gas turbine parts can be attributed to two main factors, creep & thermal cycle fatigue. Creep is attributed to long term exposure to the high temperatures created in the combustion process whereas thermal cycle fatigue is caused by continual on/off cycling of the unit creating component thermal stress. In both cases, degradation of parts is very predictable and exceeding the manufacturer's replacement recommendation significantly increases the risk of failure.

The hot gas path components, which include; blades, vanes, liners, burners, and casings are replaced during a C-inspection. This replacement process is completed in order to meet the manufacturer's recommendation to maintain unit reliability and reduce risk of failure.

This is the first C-inspection for BRCT11. BRCT5 is scheduled for overhaul in the fall of 2017 where the majority of the hot gas path components will be taken out of service and replaced. The components that are capable of being refurbished for another cycle will be reconditioned and placed in service on BRCT11. Likewise, the parts that are removed from BRCT11 that can be refurbished will be placed in service on BRCT8 during its overhaul. The hot gas path component's proximity to the combustion process typically determines how many maintenance cycles a part can remain in service, and once it is taken out of service, whether it can be reconditioned or will need to be purchased new.

The scope of this project is to recondition the following components for installation in BRCT11. These assets are currently assigned to BRCT5, and will need to be transferred to in-service assets on BRCT11 after project completion.
- Row 1,2, & 3 vanes
- Row 1 & 2 blades
- Entry segments A & B
- Hot gas casing (HGC)
- Lower Combustor Insert (LCI)

- **Alternatives Considered**

  There are two possible options for continued operation of the unit. Both options are summarized below and evaluated in the attached CEM.

  1. Recommendation: NPVRR: ($000s) <u>$10,854</u>
     Perform the C-inspection as recommended by the OEM: 50 Day planned outage

  2. Alternative #1: NPVRR: ($000s) <u>$18,382</u>
     Do nothing and continue to operate without performing an inspection. This is not a viable option as it will only lead to a catastrophic failure for the unit. Long term exposure to creep and cyclic fatigue will inevitably lead to a failure of parts. Any failure of a component in the rotating section of the machine would lead to significant collateral damage that would escalate repair costs tremendously. The cost of returning the unit to service after such an event would be double the cost of a C-inspection and take a year to complete. The capital evaluation model assumes a 90% probability this will occur in 2021.

Project Description

- **Project Scope and Timeline**
  Capital Project 147949 (BRCT11 C-inspection) includes the materials and labor needed to complete a C-inspection. Included in ▮▮▮▮▮▮s scope are the following parts and services:

  - Labor to open the unit, replace / repair all components associated with a C-inspection, and to close the unit.
    - o Significant parts to be replaced are as follows:
      - Row 1, 2, & 3 blades
      - Row 1, 2, & 3 vanes
      - Hot gas casing (HGC)
      - Entry segment heat shields and carrier
      - Lower combustor insert

  - Perform applicable field service instructions (FSIs) to address reliability or maintenance issues.

  O&M Project BR11CIN (C-inspection) includes materials and labor needed to perform the following

  - Generator and rotor inspections.
  - Miscellaneous painting and maintenance correctives
  - Non-destructive testing of parts that are to remain for another maintenance cycle to ensure the part's integrity.

  An 8-week outage is currently scheduled for the fall of 2018 in the Power Generation outage plan to perform the outage.

  Significant Milestones associated with this project are as follows:

Aug 2017:	Seek Investment Committee approval
Sept 2017:	Place order to ▮▮▮▮▮▮ for parts associated with C-inspection
Jan 2018:	Enter into contract with ▮▮▮▮▮▮▮▮ for field services
Fall 2018:	Perform a C-inspection on BRCT11 (8 week outage)

- **Project Cost**
  The total cost for this project is expected to be $9,700K.

$000k	2017	2018	Totals
C-inspection 147949:	$2,550	$7,150	$9,700
Totals Capital requested:			**$9,700**
Totals (2017 BP):	$2,550	$8,160	$10,710

Economic Analysis and Risks

- **Sole Source Justification**
  Parts and materials needed to support the outage will be purchased from ██████████ under a sole source contract. The value of this contract is ██████. ████████████████████
  ██
  ██
  ██
  ██████

  These parts will be purchased with a series of standard purchase orders referencing a previously negotiated GSA that includes commercial terms. Terms will be added to the purchase order referencing liquidated damages if parts are not delivered on time. The table below summarizes the expenditures regarding the sole source.

Description	Costs ($000s)
Base scope C-inspection parts (new blades, vanes, carriers, heat shields…):	█████
Reconditioned parts from Unit 5 (blades, vanes, casing, liners, heat shields):	█████
Open and close parts for the unit to support the outage:	█████
FSI parts for miscellaneous improvements and upgrades:	█████
Total:	█████

  The current plan is to competitively bid the outage labor portion of the project at the beginning of next year.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total

2. Project O&M 2017 BP		343			343
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.3%
Capital Breakdown:	
Labor:	$90
Contract Labor:	$1,550
Materials:	$6,649
Local Engineering:	$328
Stores Burden & Taxes:	$768
Contingency:	$315
Net Capital Expenditure:	$9,700

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	NO
#2	Does the project involve equipment that is part of a regulated air emission unit?	YES
	a. Is change a like-kind or functionally equivalent replacement?	a. YES
#3	Does the project increase through-put with any of the material handling systems?	NO
#4	Will the project affect the dispatch order or utilization of the unit?	NO
#5	Does the project increase the emissions unit's maximum hourly heat input?	NO
#6	Does the project increase the emissions unit's electrical output (gross MW)?	NO
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	YES (See background section)
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	YES

Environmental Affairs has reviewed the project and has no issues from an NSR perspective.

- **Risks**

Risks associated with executing the project would include the possible requirement for additional funding to correct any unforeseen issues internal to the unit. Recent inspections have not indicated such problems, but with limited internal access the possibility exists. In the event that additional work or parts are required above the allowed approval level, Brown Plant will seek approval from the Investment Committee before granting authorization to proceed.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the BRCT11 C-inspection project for $9,700k (Capital) to ensure the reliability and dependability of the generating asset going forward, along with the sole source award to ▆▆▆▆▆▆▆ for parts and materials of ▆▆▆▆.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

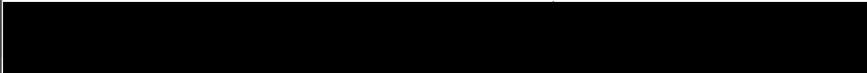
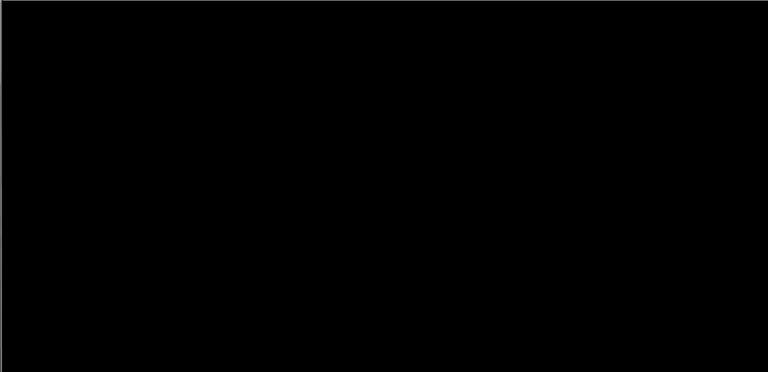
Authorized Investment Proposal for Investment Meeting on: October 26, 2016

Project Name: Environmental Protection Agency's (EPA's) Coal Combustion Residual (CCR) Rule Compliance Program




Mill Creek Gypsum Dewatering: $73,303k

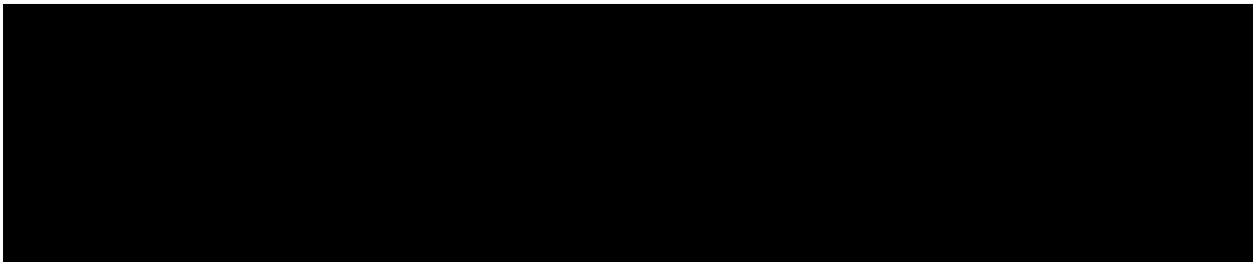
Total Sanction Request: $918,853k (net)/$970,071k (gross)
Project Numbers: See list of project numbers on page 5

Business Unit/Line of Business: Project Engineering

Prepared/Presented By: Scott Straight/Jeff Heun/Jeff Oeswein/Joe Strickland

Executive Summary

This revised Authorized Investment Proposal (AIP) is seeking full project authorization, under the 2016 ECR Filing, to continue compliance construction and closure activities associated with the project development, conceptual and final design, permitting, closure and construction activities to comply with the EPA's CCR Rule. The final CCR Rule was published on April 17, 2015 and became effective on October 19, 2015.

---


[1] CCR Rule Capital is for new construction activities, not including the Process Water systems that will remain in place and serve the Plants generation needs after compliance with the CCR Rule. An example is new process ponds.

█████ This document also seeks approval for the Mill Creek Gypsum Dewatering project spend for $73,303k. The total amount seeking approval for the CCR Rule Compliance Program and the Mill Creek Gypsum Dewatering is $918,853k (net).

An AIP for $8,500k was submitted on June 30, 2015 to allow engineering, preliminary studies, and compliance construction activities to start in support of the 2016 ECR filing. A revised AIP for $77,462k (net) was approved on February 24, 2016 to provide funding through 2016, prior to approval of the 2016 ECR filing. This requested $918,853k sanction approval is for the total program included in the 2017 BP.

The overall scope of this project includes the design, permitting and final closures of all CCR impoundments at the stations listed above. ████████████████████████████████ ███ ███ ███ ███ While Ghent, Brown and Trimble County stations have new landfill projects which include CCR Treatment (CCRT) scopes for the dewatering and dry handling of CCR, Mill Creek does not. This program also includes the CCRT scopes for Mill Creek consisting of a new gypsum dewatering facility, a new bottom ash dewatering system, and the dry fly ash transport systems that are similar to the CCRT programs at the other stations. ████████████████ ███ ███ ███

Background

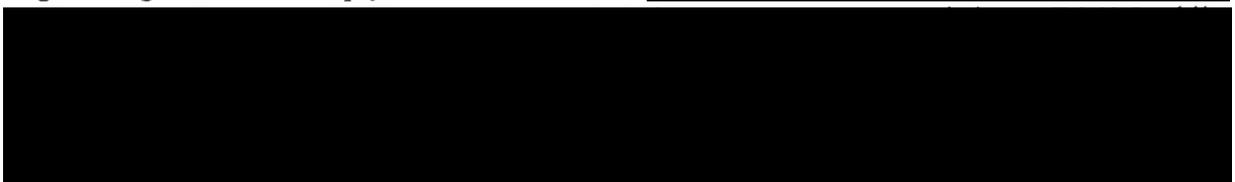
As a result of Tennessee Valley Authority's (TVA's) Kingston ash pond failure in 2008, the EPA issued a DRAFT CCR Rule in 2010 to address CCR impoundments. On April 17, 2015, the EPA published the final CCR Rule. The final CCR Rule is based on Subtitle "D" requirements and contained significant changes to the draft CCR Rule. The final CCR Rule requires all CCR storage facilities undergo structural stability, safety factor, and design flood assessments and corrective action by October 17, 2016 to verify they meet minimum standards, as set forth in the rule. In addition, groundwater monitoring must be implemented, and a minimum of eight samples taken within 30 months of the rule being published.

The intent of the CCR Rule is to close all wet CCR Impoundments and move towards dry storage in landfills, which is in line with LG&E and KU's (the "Companies") current long term CCR Storage plans. It is anticipated that closure of Companies CCR storage facilities will be triggered by groundwater monitoring, and would require the facilities to stop receiving CCR 6-months after and to be closed within five years of a groundwater exceedance. It is assumed that closure must start by the first quarter of 2019, based on a groundwater exceedance.

This request is seeking approval of $918,853k for project development, conceptual and final design, permitting, and compliance construction activities. Project development includes the structural stability, safety factor, and design flood assessments for each facility under the CCR Rule. The conceptual design will build on the work completed to date to identify the preferred plan to comply with the CCR Rule and develop a scope of work for final design. Final design will build upon the results of the conceptual design and will allow the Companies to submit the necessary state permits as well as develop construction drawings and specifications for closure activities.

Procurement & Schedule

The structural stability, safety factor and design flood assessment assessments for facilities with potential data gaps (Ghent, Mill Creek, and Trimble County) were completed in 2015, while the remainder of the assessments were completed in 2016. Issues identified during the assessments lead by Generation Engineering were handed off to Project Engineering to implement. The assessments and construction to address the issues must be in progress by October 17, 2016.

Project Engineering has reviewed proposals for the conceptual design, final design, and owner's engineering service to comply with the CCR Rule.


Project Cost

The overall cost to comply with the EPA's CCR Rule utilizing CCR Beneficial Use is $918,853k (net) per the 2017 BP (Table 2), and $73,303k for Mill Creek's gypsum dewatering facility. This revised approval seeks full authorization for project development, conceptual/final design, permitting, and construction activities. Requested authorization per station/project is shown in Table 1.

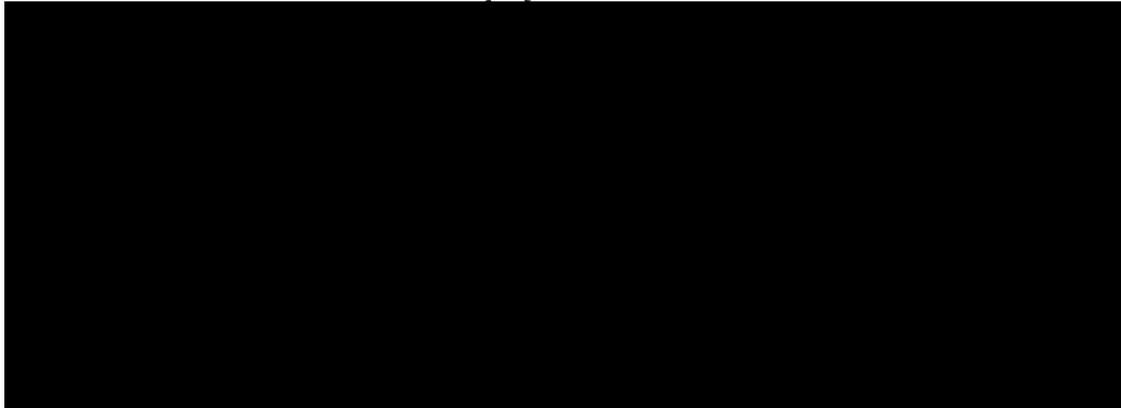
Other Alternatives Considered

For project development, no alternatives were considered. To meet the regulatory deadlines related to structural stability, safety factor, and design flood assessments, initial studies were

3

completed by the second quarter of 2016 to allow adequate time to implement corrective action by October 17, 2016, or the facility will be forced to begin the closure process.

- **Alternatives Considered (1 –Recommendation, 2 –Do nothing, 3 –Next Best Alt)**

Below are the alternatives considered for the projects:


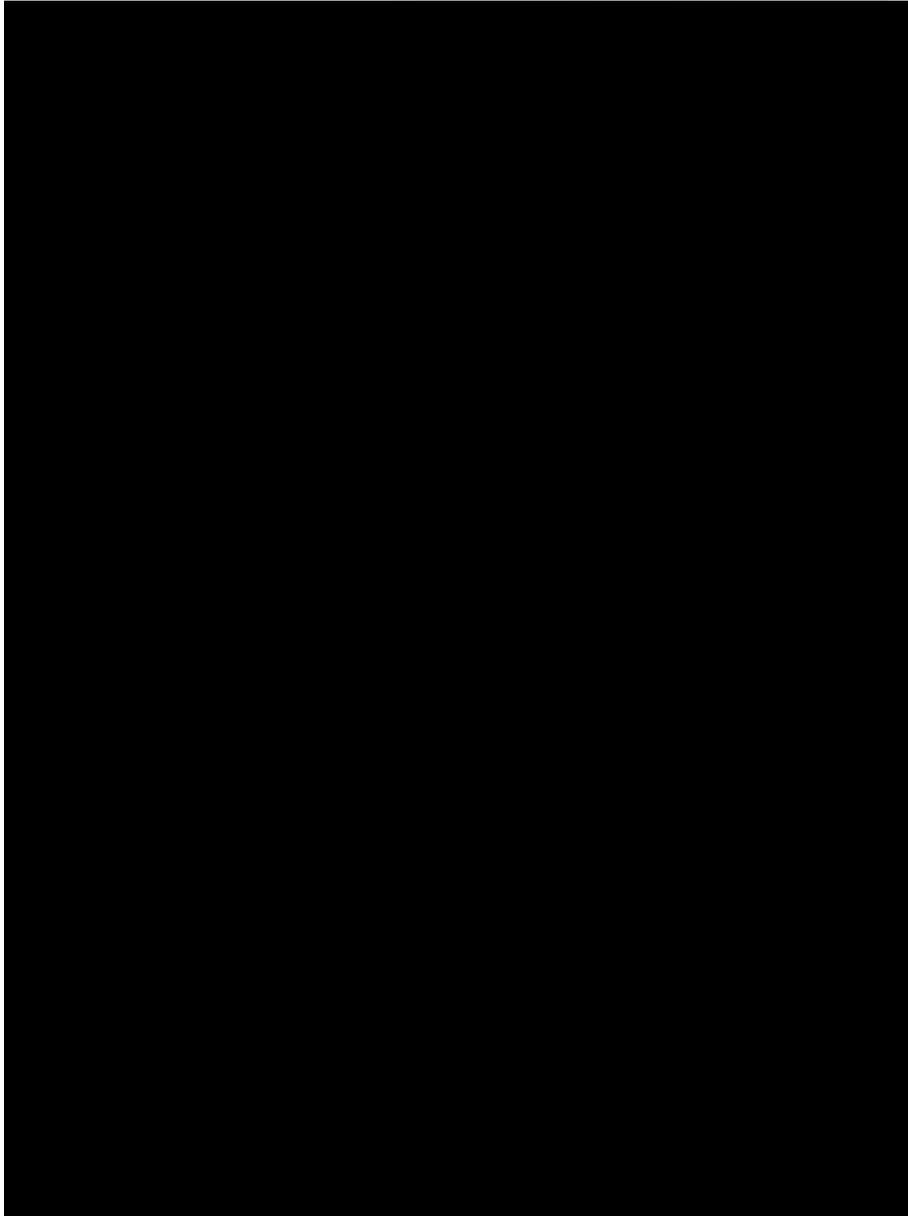
Below are the alternatives considered for the Mill Creek Gypsum Dewatering projects:
1. Recommendation: Mill Creek Gypsum Dewatering   NPVRR: $86,634k
2. Do Nothing: NPVRR: $0

Table 1 below shows a breakout of cost by station and project number for the current authorization request and does not reflect previous authorization request. Cost associated with the previous request will be reallocated to the corresponding new projects:

---

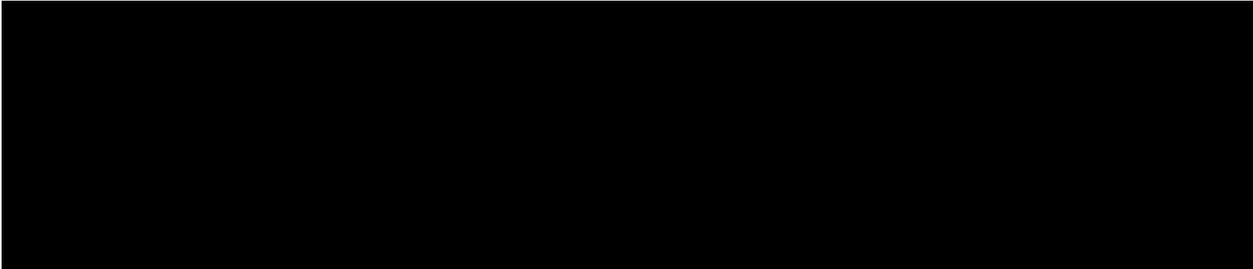
[3] CCR Rule Capital is for new construction activities, excluding process water systems, which will remain in place and serve the plants generation needs after compliance with the CCR Rule. An example is new process ponds.
[4] A Do Nothing alternative is not a viable option as this project is a regulatory requirement from the EPA.

4

Table 1[5]


Location	Project #	2017 BP (000's)	2016 ECR Filing (000's)
MC Gypsum Dewatering	152330	$73,303	$0

Table 2 below shows the 2017 Business Plan and 2016 ECR filing costs broken out by year (net):

5


The amounts incurred in Table 2 prior to approval of the 2016 ECR filing were recorded as non-mechanism, all future changes will be mechanism under the approved 2016 ECR filing. Table 3 below shows the 2017 Business Plan and 2016 ECR filing costs broken out by year for the Mill Creek Gypsum Dewatering:

Table 3

$Millions	2016	2017	2018	2019	2020	2021	2022	2023	Totals

	MC Gypsum Dewatering	0.0%	9.6%	9.4%	9.2%	9.6%	9.9%

Environmental Risks:

There are no environmental risks related to New Source Review associated with this project.

Conclusions and Recommendation

It is recommended that this revised Authorized Investment Proposal be approved to provide full funding, per the 2017 BP and in concert with the 2016 ECR Filing, in the amount of $918,853k (net) as outlined in the 2017 BP. Work under this authorization includes, Project Development, Conceptual and final design, permitting and construction activities for the EPA's CCR Rule compliance program impoundment closure activities, new CCR Rule related process water systems, and Mill Creek's gypsum dewatering, bottom ash and dry fly ash handling systems.

Investment Proposal for Investment Committee Meeting on: 1/31/2018

Project Name : East End Reinforcement (Aiken Road HP Distribution Pipeline)

Total Approved Expenditures: $2,044k (Approved on 06/28/2017 for preliminary design)

Total Revised Expenditures: $8,176k (Including $743k in contingency)

Project Number(s): 152546

Business Unit/Line of Business: GDO/Gas Operations

Prepared/Presented By: Brian Lenhart/Tom Rieth

Executive Summary

The Crestwood/Simpsonville medium pressure gas distribution system currently operates at 55 psig, has a maximum allowable operating pressure (MAOP) of 60 and covers the mid-eastern portion of Jefferson County, including Anchorage, Crestwood, Eastwood, Simpsonville, and Pewee Valley, as well as portions of Oldham County and Shelby County. The system is constrained by small diameter trunk lines, location barriers such as Floyd's Fork and Interstate 64, lack of additional gas supply points, and consistent residential growth away from the only sources of gas supply. The system has already experienced growth away from the sources of gas supply, and the existing infrastructure is no longer conducive to supporting new development. In order to serve its current and future loads, it has been determined that reinforcements are necessary. This project will improve reliability for existing customers as well as support future growth in the area by installing a new 8-inch steel high pressure distribution pipeline which will add a new supply of gas to the most constrained portion of the system.

The project was previously authorized for $2,044k in June 2017 for survey, engineering, and design activities necessary to develop construction bid documents as well as real estate and right-of-way activities necessary for construction of the new pipeline and completing a 3,480-foot section of pipeline cojointly with the installation of 6-inch plastic extension to serve the new "Villas of Floyd's Fork" development. 2017 actual spend was $1,189k. The lower spend was attributed to timing for survey, engineering, and right-of-way activities, which also impacted the amount of the 3,480-foot of construction completed. The project team is now requesting approval for the full project, at $8,176k. An additional $6,132k of authorization is requested to complete final engineering and design efforts, real estate and right-of-way acquisition, material purchasing, and pipeline construction labor necessary to complete installation of the new pipeline.

The 2018 Business Plan (BP) included $5,148k in 2018, which was based on the June 2017 authorization of $2,044k for 2017. Based the actual 2017 spend and estimated increase

additional 2018 funding of $1,839k was approved through the Corporate RAC process in February 2018.

Background

The Crestwood/Simpsonville medium pressure gas distribution system covers the mid-eastern portion of Jefferson County, including Anchorage, Crestwood, Eastwood, Simpsonville, and Pewee Valley, as well as portions of Oldham County and Shelby County, is primarily supplied by eight regulator facilities from both the Eastern Kentucky and Crestwood high pressure distribution pipelines. The area has been experiencing consistent residential growth away from any strong sources of gas supply, particularly in Norton Commons, Flat Rock Ridge, and Brookfield. The neighborhoods of Polo Fields and Persimmon Ridge represent the bulk of the existing constrained system, and currently have the lowest pressure points in the Crestwood/Simpsonville distribution system.

Gas Engineering has investigated several pipeline routes and connection locations in order to determine the most efficient and cost effective solution for reinforcement to this system. Routes evaluated include:

1. Installation of 3.0 miles of 8-inch high pressure gas main from the existing Eastern Kentucky high pressure distribution pipeline along Aiken Road, starting at the intersection of Old Henry Road and Bush Farm Road and continuing to the intersection of Aiken Road and Flat Rock Road, where the pipeline will terminate at a new medium pressure regulator facility. An additional new medium pressure regulator facility will be installed near the intersection of Aiken Road and Johnson Road to support new development off Johnson Road.

2. Installation of 3.2 miles of 4-inch high pressure gas main from the existing Crestwood high pressure distribution pipeline along Floydsburg Road, starting near the intersection of Abbott Lane and Myers Ave and continuing to the intersection of Floydsburg Road and Aiken Road, where it will terminate at a new medium pressure regulator facility.

   This reinforcement option requires the installation of 1.3 miles of 6-inch medium pressure pipeline along Johnson Road, starting at the intersection of Flat Rock Road and Aiken Road and ending at the intersection of Johnson Road and Aiken Road.

3. Installation of 3.2 miles of 4-inch high pressure gas main from the existing Crestwood high pressure distribution pipeline along Floydsburg Road, starting near the intersection of Abbott Lane and Myers Ave and continuing to the intersection of Floydsburg Road and Aiken Road, where it will terminate at a new medium pressure regulator facility.

   This reinforcement option requires the installation of two additional pipelines, the first of which includes 4.7 miles of 6-inch medium pressure pipeline along Long Run Road, starting at the intersection of Floydsburg Road and Aiken Road and ending at the intersection of Long Run Road and Shelbyville Road. The second pipeline includes

extending the existing 8-inch high pressure distribution pipeline at Connor Station through Colt Run Road 2.8 miles to Long Run Road, where it will terminate at a new medium pressure regulator facility.

Following completion of this project, the gas system will have the available capacity to continue to reliably serve customers on the Crestwood/Simpsonville system and provide additional supply for future residential growth.

Alternatives Considered

- Recommendation: NPVRR: $10,127k

    Install 3.0 miles of 8" high pressure distribution pipeline along Aiken Road.

    This option provides the benefit of improving reliability of the existing Crestwood/Simpsonville medium pressure distribution as well as providing additional gas supply to serve future residential growth. The estimated capital cost is $8,176k.

- Alternative #1:   NPVRR: $10,890k
    Install 3.2 miles 4" high pressure distribution pipeline along Floydsburg Road and a new 1.3 mile, 6" medium pressure distribution pipeline along Johnson Road.

    The route from the Crestwood high pressure distribution pipeline does not provide additional benefits to the recommendation and requires the installation of additional medium pressure distribution facilities. Additionally, detailed engineering and design efforts to identify project risks have not been completed for this alternative. As such, this alternative is not recommended. The estimated capital cost is $8,799k.

- Alternative #2:   NPVRR: $13,213k

    Install 3.2 miles of 4" high pressure distribution pipeline along Floydsburg Road, as well as extending the existing 8" high pressure distribution pipeline at Connor Station and Colt Run Road 2.8 miles to Long Run Road and a new 4.7 mile, 6" medium pressure pipeline along Long Run Road.

    The route from the Crestwood high pressure distribution pipeline does not provide additional benefits to the recommendation and requires the installation of additional high pressure distribution and medium pressure distribution facilities. Additionally, detailed engineering and design efforts to identify project risks have not been completed for this alternative. As such, this alternative is not recommended. The estimated capital cost is $10,696k.

Compliance

The materials and construction activities will be done in a manner compliant with State and Federal Regulations, and Company procedures and construction standards. Materials not

ordered on the current pipe, valve and fitting supplier will be specified to meet requirements of **Although** 49 CFR 192. Operator Qualification (OQ) tasks for the project will be specified in RFP documents for contractor construction work on the project. Applicable company procedures will be communicated to (accessible by) the contractor via hardcopy and regular progress update meetings. Recommended contractors will maintain an OQ plan approved by the Gas Safety and Technical Training department and will use the ████████████████████████ system to document on-going compliance.

Project Description

- **Project Scope and Timeline**
  The scope of this project includes installing approximately 3 miles of 8-inch, epoxy coated, steel pipeline with an MAOP of 200 psig from the Eastern Kentucky Pipeline near the intersection of Old Henry Road and Bush Farm Road to the intersection of Aiken Road and Flat Rock Road. Two new regulation facilities will be required to reduce the line pressure to the MAOP of the existing Crestwood/Simpsonville medium pressure distribution system; one at the intersection of Aiken Road and Johnson Road, and the second at the termination of the new high pressure distribution pipeline near the intersection of Aiken Road and Flat Rock Road. The proposed pipeline route will primarily follow Aiken Road. The project team has identified this route as the most cost efficient reinforcement option for the medium pressure system. The detailed engineering, survey, right-of-way activities, and other preliminary work requested in this proposal will allow Gas Engineering to prepare detailed construction and easement drawings necessary for the project.

  As project efforts have progressed, the project team has identified the need to complete the Floyd's Fork horizontal directional drill (HDD) prior to the completion of detailed engineering and design efforts necessary to competitively bid the pipeline construction labor necessary to complete the project. The Floyd's Fork HDD is approximately 3,822 feet long, and requires a large temporary staging area immediately at the entrance to the new "Villas of Floyd's Fork" development. Currently, the site is under development, with grading, utility installation, and roadway work being completed. The property developer, Elite Homes, has expressed a concern that the temporary staging area will impact their ability to market and sell homes in the development, as well as delay greenspace work necessary to be completed as part of the development's Conservation Subdivision on file with the Louisville Metro Planning Commission.

  Because detailed engineering and design efforts have not yet produced an Issue for Bid set of plans, the project team has requested a lump sum price from ████████████████████████ to complete this work in February/March. ██████████████ was identified as the low bidder on the Paddy's Run Pipeline Project in 2016 and the Transmission Modernization Program in 2017. The project team intends to competitively bid the remainder of the project in the 1st Quarter of 2018 and to start construction on the remainder of the project late in the 2nd Quarter of 2018.

  The project team is requesting total project authorization for $8,176k to complete final engineering and design efforts, real estate and right-of-way acquisition, material purchasing,

and bid pipeline construction labor necessary to complete installation of the new pipeline. Although Detailed engineering and design work, along with right of way efforts that have been completed to date, have allowed Gas Engineering to further quantify the project estimate.

The following describes the project timeline:

- 2nd Qtr. 2017: Bid engineering design and survey work.
- 2nd Qtr. 2017: Engineering design, survey, and right of way activities begin.
- 4th Qtr. 2017: Purchase material to complete installation of 3,480 foot segment of pipeline to the "Villas of Floyd's Fork" and the 3,822' Floyd's Fork HDD
- 4th Qtr. 2017: Begin installation of 3,480 foot segment of pipeline to "the Villas of Floyd's Fork"
- 4th Qtr. 2017: Pipe and NDT inspection bid.
- 1st Qtr. 2018: Request full project approval from the Investment Committee.
- 1st Qtr. 2018: Complete installation of the Floyd's Fork HDD.
- 1st Qtr. 2018: Detailed engineering design completed.
- 1st Qtr. 2018: Pipeline construction labor bid.
- 1st Qtr. 2018: Pipeline material bid for the balance of project materials.
- 2nd Qtr. 2018: Right-of-way acquisition process completed.
- 2nd Qtr. 2018: Award project contracts.
- Late 2nd Qtr. 2018: Pre-construction meeting with successful contractors.
- Late 2nd Qtr. 2018: Begin pipeline construction.
- 4th Qtr. 2018: Complete pipeline construction.

- **Project Cost**
  The project team estimates expenditures of $8,176k to complete the engineering, design, right-of-way activities, bid pipeline labor construction, and complete regulator facility installation project. This includes purchasing all easements necessary and establishing temporary lease agreements to complete this project. The requested funding includes contingency of 10%, or $743k, primarily for the remaining sections of the project, which have not been bid yet.

Economic Analysis and Risks

- **Bid Summary**
  The engineering and survey work requested in this paper has been sent to firms that have recently been awarded EPCM contracts with LG&E to provide Not to Exceed estimates to complete the provided scope of work.

The engineering scope of work includes support to finalize the pipeline route, engineering and design work to develop pipeline construction bid documents along with post-bid engineering and design, as-built drawings and other support functions.

The surveying scope of work includes the work required to support the successful engineering and design firm's development of pipeline construction bids. This work was included in the scope of work for engineering and design.

Bids were requested from the following two (2) successful EPCM contract firms:

██████████████

████████████████████

The contract has been awarded to ███████████████ taking into consideration the firm's Not to Exceed estimate as well as the firm's availability to meet the project schedule. The total value of the EPCM contract, including Phase I survey activities, is ████████

- **Budget Comparison and Financial Summary**

Financial Detail by Year – Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	1,189	6,987	-	-	8,176
2. Cost of Removal Proposed	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	1,189	6,987	-	-	8,176
4. Capital Investment 2018 BP	2,020	5,148	-	-	7,168
5. Cost of Removal 2018 BP	-	-	-	-	-
6. Total Capital and Removal 2018 BP (4+5)	2,020	5,148	-	-	7,168
7. Capital Investment variance to BP (4-1)	831	(1,839)	-	-	(1,008)
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	831	(1,839)	-	-	(1,008)

Financial Detail by Year – O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2018 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The incremental funding needed in 2018 was approved through the Corporate RAC process in January. The net $1,008k increase compared to the 2018 BP is primarily due to higher estimated cost for HDDs based on current estimated pricing.

Financial Summary ($000s):

Discount Rate: 6.58%

Capital Breakdown:

Labor:	$ 148
Contract Labor:	$ 5,216
Right-of-way Acquisition:	$ 506
Permitting:	$ 10
Materials:	$ 686
Local Engineering:	$ 654
Burdens:	$ 213
Contingency:	$ 743
Reimbursements:	($ 0)
Net Capital Expenditure:	$ 8,176

- **Assumptions** Arbough
  - Easement acquisition and right-of-way issues can be resolved prior to construction kick off in 2nd Qtr. 2018.
  - Costs for services included in the request are comparable to estimates provided by outside vendors.
  - Vendors complete project milestones according to project schedule.
  - Required permits can be obtained.

- **Environmental**
  - Applicable permits include KY Division of Water (KYDOW) Section 401 Water Quality Certification, KYDOW Permit for Hydro test Water Discharges, KYDOW Construction Storm Water, KYDOW Stream Crossing, KY Heritage Council, KY Dept. of Fish and Wildlife, USACE Nationwide Permit No 12 and Section 10.
  - There are no known environmental issues regarding air, lead and asbestos. The permits previously listed address requirements for water.
  - KPSC notification of construction.

- **Risks**
The primary risk of not completing this project by the desired date is the existing Crestwood/Simpsonville gas system will not be able to adequately support new residential development without potentially decreasing reliability to existing customers. Risks to the overall project costs are primarily based on the pipeline construction costs. These costs may vary depending on the pipeline construction company's availability and route characteristics such as number/length of HDDs and amount of rock that has to be removed during pipeline installation. Note that all alternatives considered have risks associated with their costs due to the issues listed.

This route will require many new easements as well. Any delays in easement acquisition could delay the commencement of construction activities.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the East End Reinforcement (Aiken Road HP Distribution Pipeline) project for $8,176k to improve the reliability of the system for current customers and support residential growth in the area.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake Date	Paul W. Thompson Date
Chief Financial Officer	President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: June 28, 2017

Project Name : East End Reinforcement (Aiken Road HP Distribution Pipeline)

Total Expenditures Current Request: $2,044k

Total Pending Project Estimate: $7,255k (Including $946k in contingency, balance to be requested in late 2017/early 2018)

Project Number(s): 152546

Business Unit/Line of Business: GDO/Gas Operations

Prepared/Presented By: Brian Lenhart/Tom Rieth

Executive Summary

The Crestwood/Simpsonville medium pressure gas distribution system currently operates at 45 psig and has a maximum allowable operating pressure (MAOP) of 50 psig (this system is currently being uprated to operate at 55 psig) and covers the mid-eastern portion of Jefferson County, including Anchorage, Crestwood, Eastwood, Simpsonville, and Pewee Valley, as well as portions of Oldham County and Shelby County. The system suffers from small diameter trunk lines, location barriers such as Floyd's Fork and Interstate 64, and consistent residential growth. The system has already experienced growth away from any strong sources of gas supply, and the existing infrastructure is no longer conducive to supporting new development. In order to serve its current and future loads, it has been determined that reinforcements are necessary. This project will improve reliability for existing customers as well as support future growth in the area by installing a new 8" steel high pressure distribution pipeline which will add a new supply of gas to the most constrained portion of the system.

The team is requesting $2,044k to complete survey, engineering, regulatory compliance strategy and design activities necessary to develop construction bid documents as well as to complete all real estate and right-of-way activities necessary for construction of the new pipeline. Once these activities have been completed, the team will return to the Investment Committee to request full funding for the project, including pipeline construction labor, later in 2017 or early 2018. Of the $2,044k, $452k is included for survey, engineering and design, real estate and right-of-way, material purchases, and pipeline construction costs necessary to complete installation of approximately 3,480' of the pipeline conjointly with the installation of the 6" medium pressure plastic pipeline extension necessary to serve the new "Meadows of Floyd's Fork" development.

The project was opened for $465k for the engineering contract only, but no actual costs were recorded through the end of April. The 2017 Business Plan included $500k in 2017 and $6,000k

in 2018, for a total of $6,500k. Additional funding for 2017 was approved in the June Anborough RAC process. 2018 funding will be addressed by request in the proposed 2018 Business Plan.

Background

The Crestwood/Simpsonville medium pressure gas distribution system covers the mid-eastern portion of Jefferson County, including Anchorage, Crestwood, Eastwood, Simpsonville, and Pewee Valley, as well as portions of Oldham County and Shelby County, is primarily fed from eight regulator facilities from both the Eastern Kentucky and Crestwood high pressure distribution pipelines. The area has been experiencing consistent residential growth away from any strong sources of gas supply, particularly in Norton Commons, Flat Rock Ridge, and Brookfield. The neighborhoods of Polo Fields and Persimmon Ridge represent the bulk of the existing constrained system, and currently have the lowest pressure points in the Crestwood/Simpsonville distribution system.

Gas Engineering has investigated several pipeline routes and tie in locations in order to determine the most efficient and cost effective solution for reinforcement to this system. Routes evaluated include:

1. Installation of 3.0 miles of 8" high pressure gas main from the existing Eastern Kentucky high pressure distribution pipeline along Aiken Road, starting at the intersection of Old Henry Road and Bush Farm Road and continuing to the intersection of Aiken Road and Flat Rock Road, where the pipeline will terminate at a new medium pressure regulator facility.

2. Installation of 3.2 miles of 4" high pressure gas main from the existing Crestwood high pressure distribution pipeline along Floydsburg Road, starting near the intersection of Abbott Lane and Myers Ave and continuing to the intersection of Floydsburg Road and Aiken Road, where it will terminate at a new medium pressure regulator facility.

   This reinforcement option requires the installation of 1.3 miles of 6" medium pressure pipeline along Johnson Road, starting at the intersection of Flat Rock Road and Aiken Road and ending at the intersection of Johnson Road and Aiken Road.

3. Installation of 3.2 miles of 4" high pressure gas main from the existing Crestwood high pressure distribution pipeline along Floydsburg Road, starting near the intersection of Abbott Lane and Myers Ave and continuing to the intersection of Floydsburg Road and Aiken Road, where it will terminate at a new medium pressure regulator facility.

   This reinforcement option requires the installation of two additional pipelines, the first of which includes 4.7 miles of 6" medium pressure pipeline along Long Run Road, starting at the intersection of Floydsburg Road and Aiken Road and ending at the intersection of Long Run Road and Shelbyville Road. The second pipeline includes extending the existing 8" high pressure distribution pipeline at Connor Station and Colt Run Road 2.8 miles to Long Run Road, where it will terminate at a new medium pressure regulator facility.

Following completion of this project, the gas system would have the available capacity to continue to reliably serve customers on the Crestwood/Simpsonville system and provide additional supply for future residential growth.

Alternatives Considered

- Recommendation: NPVRR: <u>$9,312k</u>

    Complete survey, engineering, and design activities necessary to develop construction bid documents as well as to complete all real estate and right-of-way activities necessary for construction of a new 3.0 mile 8" high pressure distribution pipeline along Aiken Road.

    This option provides the benefit of improving reliability of the existing Crestwood/Simpsonville medium pressure distribution as well as providing additional gas supply to serve future residential growth. The estimated capital cost is $7,255k.

- Alternative #1:   NPVRR: <u>$9,404k</u>

    Complete survey, engineering, and design activities necessary to develop construction bid documents as well as to complete all real estate and right-of-way activities necessary for construction of a new 3.2 mile 4" high pressure distribution pipeline along Floydsburg Road and a new 1.3 mile, 6" medium pressure distribution pipeline along Johnson Road.

    The route from the Crestwood high pressure distribution pipeline does not provide additional benefits to the recommendation and requires the installation of additional medium pressure distribution facilities. As such, this alternative is not recommended. The estimated capital cost is $7,374k.

- Alternative #2:   NPVRR: <u>$13,631k</u>

    Complete survey, engineering, and design activities necessary to develop construction bid documents as well as to complete all real estate and right-of-way activities necessary for construction of a new 3.2 mile 4" high pressure distribution pipeline along Floydsburg Road, as well as extending the existing 8" high pressure distribution pipeline at Connor Station and Colt Run Road 2.8 miles to Long Run Road and a new 4.7 mile, 6" medium pressure pipeline along Long Run Road.

    The route from the Crestwood high pressure distribution pipeline does not provide additional benefits to the recommendation and requires the installation of additional high pressure distribution and medium pressure distribution facilities. As such, this alternative is not recommended. The estimated capital cost is $10,696k.

Project Description

- **Project Scope and Timeline**
  The scope of this project includes installing approximately 3 miles of 8-inch, epoxy coated, steel pipeline with an MAOP of 200 psig from the Eastern Kentucky Pipeline near the intersection of Old Henry Road and Bush Farm Road to the intersection of Aiken Road and Flat Rock Road. A new regulation facility will be required at the termination of the new high pressure distribution pipeline to reduce the line pressure to the MAOP of the existing Crestwood/Simpsonville medium pressure distribution system. The proposed pipeline route will primarily follow Aiken Road. The project team has identified this route as the most cost efficient reinforcement option for the medium pressure system. The detailed engineering, survey, right-of-way activities, and other preliminary work requested in this proposal will allow Gas Engineering to finalize the route and prepare detailed construction and easement drawings necessary for the project.

  The project team is requesting authorization for $2,044k to perform engineering, design, and right-of-way work in order to competitively bid the pipeline construction labor required to complete this project. Further quantification of pipeline construction costs, along with right-of-way acquisition costs, will allow the project team to come back to the Investment Committee with final project costs including project contingency.

  The following describes the expected project timeline:

  - 2nd Qtr. 2017: Bid engineering design and survey work.
  - 2nd Qtr. 2017: Engineering design, survey, and right of way activities begin.
  - 3rd Qtr. 2017: Detailed engineering design completed.
  - 3rd Qtr. 2017: Purchase material and complete installation of 3,480' segment of pipeline to the "Meadows of Floyd's Fork."
  - 3rd Qtr. 2017: Pipeline construction labor bid.
  - 4th Qtr. 2017/early 2018: Request full project approval from the Investment Committee.
  - 4th Qtr. 2017: Pipeline material bid.
  - 4th Qtr. 2017: Pipe and NDT inspection bid.
  - 4th Qtr. 2017: Right-of-way acquisition process completed.
  - 4th Qtr. 2017: Award project contracts.
  - 1st Qtr. 2018: Pre-construction meeting with successful contractors.
  - 2nd Qtr. 2018: Begin pipeline construction.
  - 4th Qtr. 2018: Complete pipeline construction.

- **Project Cost**
  The project team estimates expenditures of $2,044k to complete the engineering, design, right-of-way activities, and other preliminary work required to develop a construction bid for this project. This work will include purchasing easements necessary to complete this project. The requested funding does not include any contingency for the engineering, design, surveying and right-of-way work associated with developing bid documents for the pipeline construction labor

along with right-of-way activity to acquire easements and complete permitting activity through project.

Economic Analysis and Risks

- **Bid Summary**

The engineering and survey work requested in this paper has been sent to firms that have recently been awarded EPCM contracts with LG&E to provide Not to Exceed estimates to complete the provided scope of work.

The engineering scope of work includes support to finalize the pipeline route, engineering and design work to develop pipeline construction bid documents along with post-bid engineering and design, as-built drawings and other support functions.

The surveying scope of work includes the work required to support the successful engineering and design firm's development of pipeline construction bids. This work was included in the scope of work for engineering and design. The survey scope of work does not include as built survey as the pipeline is installed, and will be awarded at a later time.

Bids were requested from the following two (2) successful EPCM contract firms:

- ▮▮▮▮▮▮
- ▮▮▮▮▮▮▮▮▮

The contract has been awarded to ▮▮▮▮▮▮▮▮▮, taking into consideration the firm's Not to Exceed estimate as well as the firm's availability to meet the project schedule. The total value of the EPCM contract, including Phase I survey activities, is ▮▮▮▮.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	2,044	5,211			7,255
2. Cost of Removal Proposed					-

4. Capital Investment 2017 BP	500	6,000			6,500
5. Cost of Removal 2017 BP					-
6. Total Capital and Removal 2017 BP (4+5)	500	6,000	-	-	6,500
7. Capital Investment variance to BP (4-1)	(1,544)	789	-	-	(755)
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	(1,544)	789	-	-	(755)

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed					-
2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The incremental funding needed in 2017 was approved through the Corporate RAC process through June. The 2018 BP will incorporate the revised amount for 2018.

The numbers in the table above, as well as the NPVRR figures in the document are based on the current estimate of the total project. The numbers in the financial summary below are for the preliminary engineering/design work and installation of the 3,400-feet of pipe in 2017 only.

Financial Summary ($000s):

Discount Rate:	6.5%
Capital Breakdown:	
Labor:	$ 21
Contract Labor:	$ 829
Right-of-way Acquisition:	$ 750
Permitting:	$ 19
Materials:	$ 164
Local Engineering:	$ 214
Burdens:	$ 47
Contingency:	$ 0
Reimbursements:	($ 0)
Net Capital Expenditure:	$2,044

- **Assumptions**
  - Easement acquisition and right-of-way issues can be resolved prior to construction kick off in the spring of 2018.
  - Costs for services included in the request are comparable to estimates provided by outside vendors.
  - Vendors complete project milestones according to project schedule.
  - Required permits can be obtained.

- **Environmental**
  - Applicable permits include KY Division of Water (KYDOW) Section 401 Water Quality Certification, KYDOW Permit for Hydro test Water Discharges, KYDOW Construction Storm Water, KYDOW Stream Crossing, KY Heritage Council, KY Dept. of Fish and Wildlife, USACE Nationwide Permit No 12 and Section 10.
  - There are no known environmental issues regarding air, lead and asbestos. The permits previously listed address requirements for water.
  - KPSC notification of construction.

- **Risks**
  The primary risks of not completing the engineering, design, surveying and other preliminary work on schedule are not completing the project by the desired date and higher cost of construction due to a compressed schedule. The primary risk of not completing this project by the desired date is the existing Crestwood/Simpsonville gas system will not be able to adequately support new residential development without potentially decreasing reliability to existing customers. Risks to the overall project costs are primarily based on the pipeline construction costs. These costs may vary depending on the pipeline construction company's

availability and route characteristics such as number/length of horizontal directional drills (HDDs) and amount of rock that has to be removed during pipeline installation. Note that all alternatives considered have risks associated with their costs due to the issues listed.

This route will require many new easements as well. Any delays in easement acquisition could delay the commencement of construction activities.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the East End Reinforcement (Aiken Road HP Distribution Pipeline) project for $2,044k for survey, engineering, and design activities necessary to develop construction bid documents to competitively bid the construction labor for this project along with all real estate and right-of-way activities to acquire easements to ultimately construct a pipeline along Aiken Road that will improve the reliability of the system for current customers and support residential growth in the area. Full project approval will be sought later in 2017/early 2018.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

Prepared/Presented By: Justin Hayes/Tom Rieth

Executive Summary

This proposal is intended to secure funding for the second year (2019) of a systematic program to reinforce areas of the Elevated Pressure (3.0 psig Max Allowable Operating Pressure (MAOP)) LG&E Gas Distribution System. The proposed funding for 2019 will support the installation of approximately 2.5 miles of new main, the uprate of approximately 1 mile of existing polyethylene main, the installation of approximately 100 new service lines, the uprate of approximately 200 existing polyethylene service lines, and the installation of one new regulator station.

Where reinforcement occurs, existing elevated pressure steel main pipelines will be replaced with polyethylene medium pressure (15 – 60.0 psig MAOP) pipelines. Likewise, existing steel service lines will be replaced with new polyethylene service lines. Existing elevated pressure polyethylene main lines and service lines will be uprated to operate at medium pressure. In some instances, existing polyethylene facilities may be replaced when the cost for replacement is less or when construction or customer considerations dictate the need for replacement.

The primary driver for the reinforcement work is to mitigate reliability risks in the elevated pressure system. These risks present in three major forms: hydraulic constraint in locations with substantial impact, uncertainty in total connected load due to unreported back-up generator installations, and the age of the system components and historical construction practices. The reinforcement work will have additional benefits including improving operational and emergency response flexibility. The majority of the current elevated pressure system is constructed of steel pipeline components, and valves are sparse in the existing system. These two characteristics result in the necessity for costly and time consuming shutdown techniques in the case of emergency or operational need. Furthermore, the relatively low operating pressure of the elevated pressure system greatly limits the ability to isolate small sections of the system. This could result in either higher customer and system impact or the necessity for a costly and time consuming by-pass installation when isolations are necessary.

The estimated cost for 2019 is $3,490k, which is included in the 2019 Business Plan (BP). Although there is an additional need for an estimated $5k in O&M funding which was not included in the 2019 BP and will be covered within GDO's 2019 forecast process.

Background

LG&E's Elevated Pressure Distribution System consists largely of three separate distribution systems within Louisville. These systems combined contain approximately 160 miles of main pipeline and 14,000 service lines. The customers consist mostly of residential, commercial, and light industrial groups. These three systems all have an operating pressure of 2.0 psig and an established MAOP of 3.0 psig. The Elevated Pressure is regulated and supplied to the distribution system by fifteen regulator facilities spread throughout the three systems.

Many parts of the elevated pressure system were designed and installed as far back as the 1950s. Over time customer load has increased and several areas of the elevated pressure system have exhibited declining operating pressures, especially during the heating season when demand is generally higher. On very cold days, it is possible for pressures in some isolated sections of the system to drop sufficiently to risk customer service outages.

In some portions of the elevated pressure system, the installation of emergency generators without information being provided to LG&E has created potentially significant undocumented transient demand on the elevated system. It is difficult to determine the effect this demand could have on the elevated pressure system if a large scale electrical disruption were to occur. If such a large scale electrical disruption were to occur it would activate all of the transient loading associated with the backup generators, which could cause the inability of the elevated pressure system to supply gas to all elevated pressure customers.

Finally, there are reliability concerns related to the age of the existing elevated pressure system. The oldest components of this system date from the early 1950s. Construction practices at the time do not conform to current standards and best practices. The elevated pressure system has a large number of mechanical couplings. Additionally, the older parts of the elevated pressure system have very few mainline or service valves. This limits our ability to quickly isolate a leak in an emergency situation, and requires more expensive and invasive isolation methods to be employed.

Therefore, the proposal outlined in this document is for the first project to mitigate reliability concerns of the elevated pressure system. The proposal is to follow the same general layout as the current elevated pressure system with only minor changes in layout as necessary. Pipeline sizes will be selected utilizing system level hydraulic modeling to account for current customer demand as well as system robustness and reliability. Existing steel main lines and service lines will be replaced with polyethylene pipe as they are encountered during the projects, while most existing polyethylene main lines and service lines will be uprated to their respective new medium pressure MAOP and operating pressure. This proposal only includes the scope for 2019, which provides reliability benefit and can be built upon by future projects on the elevated pressure system.

- **Alternatives Considered**
  1. Recommendation: NPVRR: $4,539k
  2. Do Nothing: NPVRR: N/A
     This is an option, but has considerable risk of service interruption and poor positioning for future load growth.

  3. Alternative #1: NPVRR: N/A
     Uprate the existing elevated pressure system to match surrounding medium pressure system pressures. Due to the lack of specific information on materials, installation, and design available on much of the existing elevated pressure system this is not feasible. In addition many of the components for which adequate records do exist are unsuitable for operation at the proposed higher operating pressures.

Compliance

The materials and construction activities will be done in a manner compliant with State and Federal Regulations, and Company procedures and construction standards. Materials not ordered on the current pipe, valve and fitting supplier contract will be specified to meet requirements in 49 CFR 192. Operator Qualification (OQ) tasks for the projects have been specified in contract documents for contractor construction work on the projects. Applicable company procedures have been communicated to (accessible by) the contractor. Recommended contractors will maintain an OQ plan approved by the Gas Safety and Technical Training department and will use the ███████████████████████ system to document on-going compliance.

Project Description

- **Project Scope and Timeline**

This project will consist of all activities and responsibilities necessary to achieve the following scope:

Scope Item Description	Quantity
Install new 2" Polyethylene Pipeline	2,400 Feet
Install new 4" Polyethylene Pipeline	4,400 Feet
Install new 6" Polyethylene Pipeline	4,100 Feet
Uprate Existing Polyethylene Pipeline	1,550 Feet
Install New Service (Customer and Company)	99 Services
Uprate Existing Polyethylene Service	186 Services
Install new Regulator Station	1 Regulator Station

In many ways this project will be very similar to both the Priority Main Replacement Program and the Large Scale Main Replacement Program. We have established company procedures and have built a repository of experience and knowledge in this type of work over the past 21 years. The modular nature of the proposed project plans will be a change from the structure of the other

two previous programs and is being introduced out of lessons learned from the previous Arbough projects to reduce the impacts of our work on the surrounding community.

All hydraulic analysis and material specification has been completed for this project. General pipe routes have been selected, and exact locations will be selected in the field based off in-situ conditions and existing utility locations. Preliminary right-of-way and easement research has started. Estimates of necessary man-hours and other logistics have been completed for completion of an estimate.

This project will start construction in January of 2019 and the first module is intended for completion by the end June 2019. At the completion of the first module, the second module (included in this IP scope) would immediately begin and be completed in December 2019. Both modules will follow as closely as possible the following timeline:
　　-Month 1-2: Install or uprate main lines
　　-Month 2-4: Finish installation of main lines and start and complete service lines
　　-Month 5-6: Complete restoration of all public and private assets

- **Project Cost**

  The cost of this project is $3,490k. This includes a contingency of 10% ($317k).

  Contingency is included to account for uncertainty in the estimation method used for this project's cost, specifically for uncertainty in the required man hours.

Economic Analysis and Risks

- **Bid Summary**

  Primary construction services were competitively bid when the program began in 2018 on a blended man hour rate structure. Two bidders provided proposals in response to the RFP and the work was awarded to the low bidder, ▮▮▮▮▮▮▮▮. A contract has been entered into with ▮▮▮▮▮▮ which expires in July 2021.

  All other materials and services will be supplied under existing contracts.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2019	2020	2021	Post 2021	Total
1. Capital Investment Proposed	3,390				3,390
2. Cost of Removal Proposed	100				100
3. Total Capital and Removal Proposed (1+2)	3,490	-	-	-	3,490
4. Capital Investment 2019 BP	3,166				3,166
5. Cost of Removal 2019 BP	324				324
6. Total Capital and Removal 2019 BP (4+5)	3,490	-	-	-	3,490
7. Capital Investment variance to BP (4-1)	(224)	-	-	-	(224)
8. Cost of Removal variance to BP (5-2)	224	-	-	-	224
9. Total Capital and Removal variance to BP (6-3)	-	-	-	-	-

Financial Detail by Year - O&M ($000s)	2019	2020	2021	Post 2021	Total
1. Project O&M Proposed	5				5
2. Project O&M 2019 BP	-				-
3. Total Project O&M variance to BP (2-1)	(5)	-	-	-	(5)

Proposed capital spending is included in the 2019 BP. O&M spending of $5k will be covered within GDO's 2019 forecasting process.

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$ 202
Contract Labor:	$2,051
Materials:	$ 512
Local Engineering:	$ 169
Burdens:	$ 186
Contingency:	$ 317
Miscellaneous	$ 53
Reimbursements:	($ 0)
Net Capital Expenditure:	$3,490

- **Assumptions**

  - Construction resources will be available to start construction of this project in January in sufficient numbers to complete this project on the proposed schedule.
  - No State or City permitting issues will prevent the start of construction.
  - Costs will equal the average costs of the Large Scale Main Replacement program from 2013-2017. These years were used because they represent a similar scope.
  - The project will be able to complete all work in the sequence planned.

- Winter weather will not prevent completion of all service work.   **Arbough**
- Weather will allow completion of all work without significant delay.
- Winter temperatures will be high enough to allow completion of all final paving.

- **Environmental**

There are no known environmental issues regarding air, lead or asbestos. Applicable permits will be obtained as needed.

- **Risks**

  - Poor weather could delay the completion of this project. As a result financial obligation for restoration would continue into 2020 and the social impact of the project would be extended.
  - The contractor may not have the resources available to start this project on our proposed schedule. This could slow or delay the construction and push additional work and cost into 2020.
  - Cold winter weather may discourage customers from scheduling their service change over. This will reduce the project efficiency, drive up costs, and possibly delay work and costs into 2020.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the 2019 Elevated Pressure Replacement Project for $3,490k to increase system reliability and eliminate existing system risks.

<u>Approval Confirmation for Capital Projects Greater Than $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: September 26, 2018

Project Name: Enterprise GIS

Estimated Enterprise GIS Total Expenditures: $39,404k (2017-2023)

Total Expenditures Requested at This Time: $11,468k (Including $1,300k of contingency [15% of remaining Phase 1 spend] and the 2017 License Purchase of $1,486k)

Project Number(s): IT0101B, IT0569B, IT0927B

Business Unit/Line of Business: Information Technology (IT), IT Telecommunications (Telecom), Generation Services, Electric Transmission, Gas Distribution Operations (GDO), Electric Distribution Operations (EDO)

Prepared/Presented By: Denise Simon/ Chris Talley/ Alpha Troutman

Executive Summary

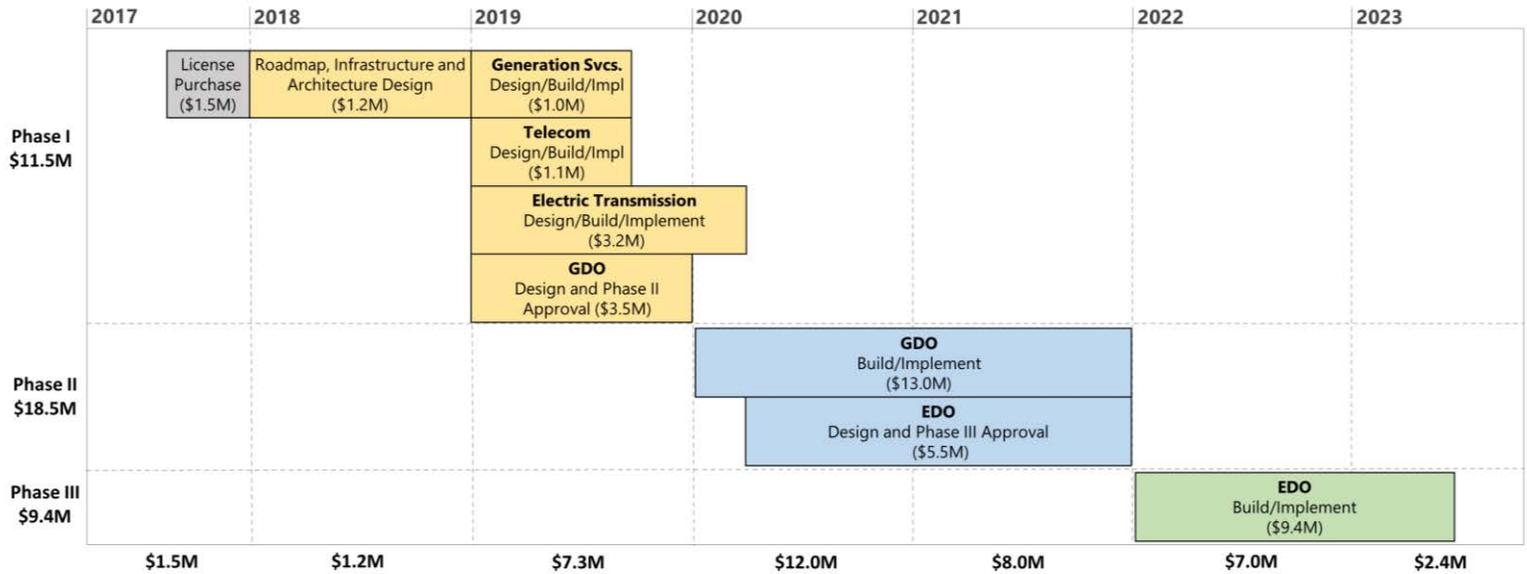
A Geographic Information System (GIS) is used by multiple lines of business at LKE to manage assets and map asset locations. The existing GIS Smallworld application will not support all of the upcoming gas regulatory requirements and the Black and Veatch (B&V) GIS data model has reached the product end-of-life. In 2017 LKE evaluated the company-wide GIS needs and made the decision to implement a single GIS platform. ▮▮▮▮ was selected as the vendor, enterprise licenses were purchased in the amount of $1,486k and the direction was set to implement in a phased approach. A System Integrator (SI) will be leveraged to assist with the overall implementation of the project. This Investment Proposal describes the Phase I Enterprise GIS project details and costs along with a summary of the subsequent phases. The initial phase includes the GIS design, build and implementation for Electric Transmission, Telecom and Generation Services, the GIS design for GDO, as well as the architecture design for all future phases. Phase I benefits include enhanced asset management and better decision making through information sharing. The total project cost is estimated at $39,404k including the $1,486k spent on licenses in 2017.

Through this Investment Proposal, the impacted lines of business and IT seek agreement with the overall Enterprise GIS Project as well as capital funding authority of $11,468k from the Investment Committee to enable execution of Phase I of the project. The 2018BP includes $10,800k for capital investment in 2018-2022. The proposed 2019BP includes $36,697k for capital investment in 2019-2023 including $1,486k in 2017, $1,221k in 2018, $7,297k in 2019 and $1,464k in 2020 for Phase I. Investment Proposals will be submitted for Phases II and III as business requirements and estimates are refined.

Background

Enterprise GIS Project Phases

A phased approach to implementing the Enterprise GIS is being utilized as shown below.

Capital Expenditure – Total: $39.4M


Phase I includes the following:

- Development of GIS Roadmap and infrastructure for GDO, EDO, Electric Transmission, Generation, and Telecom.
- Electric Transmission: Implementation of the on-premise ▮▮▮ GIS solution to enable future integrated mapping of confidential data such as substation and outage information with cloud hosted inspection data. Enhancements outside of this project present the opportunity for improved customer restoration decision making.
- Telecom: Implementation of the ▮▮▮ GIS system to replace the paper and Google Earth-based solution used today to allow assets to be geospatially located and managed more effectively.
- Generation Services: Replacement of the PC-based standalone GIS with the enterprise solution to allow better sharing of geotechnical and impoundment inspection data.
- GDO: Development, design and implementation of plan to replace the GDO Smallworld GIS with the Esri solution. This will allow the GIS to more comprehensively support upcoming gas regulatory requirements.

Phase II and III will include the following:
- Phase II: GDO implementation; EDO design and planning for Phase III (Est. $18.5M in 2020 – 2021)

Phase III: EDO implementation (Est $9.4M in 2022 – 2023)

History

LKE has implemented multiple GIS solutions with the original implementation of the Smallworld GIS in the 1990s. Electric Transmission and Generation Services deployed separate Esri solutions in 2015. Below is a timeline of major events:

Year	Event
1996	KU original implementation of Smallworld
1998	LG&E original implementation of Smallworld
2000-2004	Merged LG&E and KU into a single implementation of Smallworld with the B&V Energy Network Object Model (ENOM) data model
2015	Last upgrade of the Smallworld software
2015	Electric Transmission implementation of a hosted interim ▮ solution
2015	Generation Services implementation of PC-based ▮ solution

Drivers

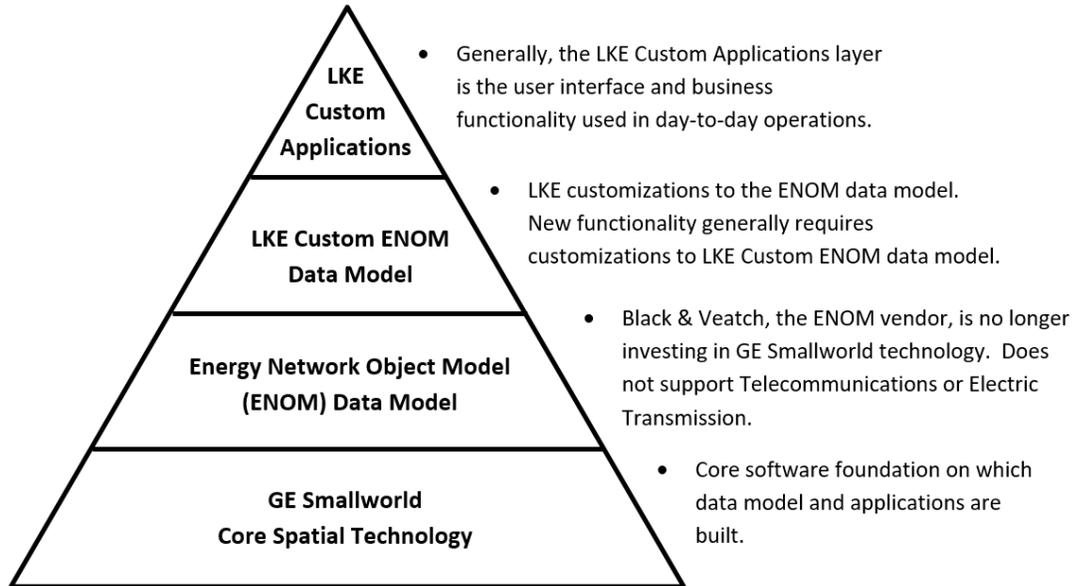
The decision to move to an Enterprise ▮ GIS platform was driven by the following:

Functionality
The current solution for EDO and GDO is GE's Smallworld utilizing the ENOM data model. All new functionality with the upgraded versions of Smallworld are based on GE's new data model. Therefore, with its existing ENOM data model, LKE cannot leverage any of the new GE solutions. In addition, LKE's current Smallworld environment lacks all of the functionality needed to meet anticipated gas regulatory requirements which will necessitate more in-depth asset records and significant customizations.

The current solution for Electric Transmission was implemented as an interim solution until an enterprise GIS is established. The interim transmission GIS functionality is limited due to being a cloud-based solution. The benefits of interfacing with internal systems such as Cascade, Transmission Outage App (TOA), and Transmission Reliability Outage Data System (TRODS) are not achievable due to security concerns.

Telecom does not currently have a GIS solution and presently stores data in various formats including Google Earth, Microsoft Visio, and paper.

Support   **Arbough**

B&V is no longer investing in the ENOM data model, and LKE is the last B&V customer still using ENOM. As shown below, the data model is an integral part of the GIS solution.


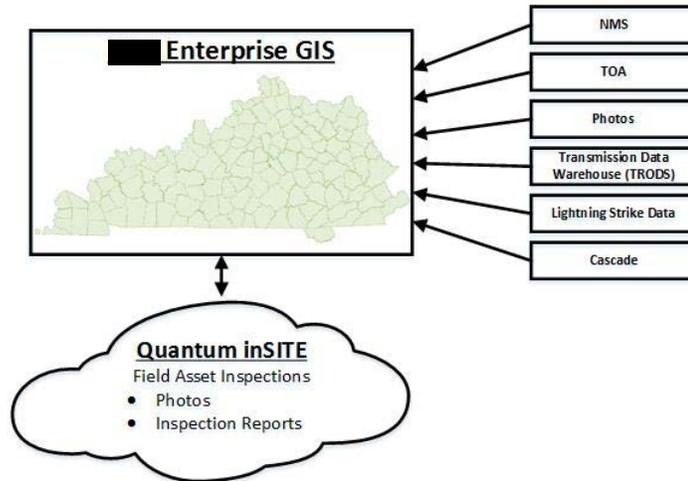
B&V no longer maintains resources on staff to support this model and relies on a third party to provide assistance.

LKE continues to pay maintenance to Smallworld to provide software support, patches and upgrades. Smallworld is developed with a toolkit called Magik which is proprietary and has few resources available within the consulting market.

Continued use of the current Smallworld GIS version could result in any or all of the following issues in coming years.

- Security patching
- Server upgrades
- Java upgrades
- Citrix upgrades
- Oracle database upgrades

Benefits of an enterprise GIS platform
An enterprise ▮▮ solution offers the on-going support and functionality required by GDO and EDO as well as providing broad access to integrated geospatial data and applications throughout the organization. Geospatial information can be integrated with other enterprise applications to geo-enable executive analysis and decision-support systems.

An on-premise GIS platform of Electric Transmission Lines asset data will allow   **Arbough** combination of data from Electric Transmission's externally hosted field inspection system with the Electric Transmission data warehouse. Field inspection data including photos could be layered visually in maps with sensitive data such as Cascade substation device work orders and recent test data, TOA outage data, lightning strike data and historical fault locations. This layered map view of the data from multiple systems could improve restoration decisions and times by providing additional near real-time assessment data of the Transmission grid. Moving to a standard Esri data model will also facilitate integration with other Electric Transmission tools such as TOA, TRODS and Cascade as shown below.


Additionally, the on-premise GIS platform will allow Transmission to leverage Esri dashboarding tools on a real-time version of our geo-spatial data. Presently this requires a two step process to create a static copy of the data set and then move it into an ArcGIS online environment. This manual process will be eliminated with the Enterprise GIS solution and allow the dashboard tools to interact with a live version of the data set.

Telecom currently uses Google Earth to map Company-owned and Partner-owned outside plant fiber cable routes. Associated documentation including fiber splice detail drawings, fiber performance test results, and 3rd Party Agreements are stored in a local database in a variety of formats including VISIO drawings, Excel files, and PDF files. Information such as electric line routes, pole ownership, pole numbers and buried gas line routes are not available with Telecom's current Google Earth solution. Also, mapping tools used by the lines of business do not identify Telecom's outside plant fiber cable. The current scenario creates engineering and design challenges for new fiber cable routes in proposed gas, electric distribution and transmission route construction and renovation projects. Also, during storm restoration efforts, identifying damaged fiber and repairing fiber is often more difficult with multiple mapping systems being utilized across the lines of business. The ▇ GIS platform will enable Telecom to more accurately identify fiber cable damage locations utilizing pole and structure numbers, and be able to provide a faster response.

An enterprise platform would allow all lines of business to readily see assets across the company layered together providing a much clearer view of potential interactions in the

various facilities for routine operations and maintenance work and, more critically, during **Although** emergency storm restoration efforts.

Alternatives Considered

Recommendation: NPVRR: ($000) $43,688
Design and implement ▮▮ Enterprise GIS with SSP Innovations as the system integrator.

The recommendation is to move forward with the design and implementation of the ▮▮ Enterprise GIS in a 3-phased approach utilizing the expertise of SSP Innovations as the SI. This recommendation meets the business requirements for an enterprise GIS. The complete Enterprise GIS project (2017-2023) was modeled in the Capital Evaluation Model (CEM).

Alternative #1:   NPVRR: ($000) $54,281
Upgrade and continue with GE Smallworld.

This alternative is unacceptable due to gaps in requirements and long term dependency on the vendor for all enhancements. Significant customization would be required along with the conversion from B&V ENOM data model to Smallworld v5 and the GE data model. In addition to Smallworld, an in-house ▮▮ platform will need to be implemented and maintained for Generation and Electric Transmission as well as additional ▮▮ interfaces to support GDO. Long term maintenance would be necessary to bridge the Smallworld and Esri platforms in order to simulate an Enterprise GIS. The complete Enterprise GIS project using ▮▮ and Smallworld was modeled in the CEM. The team does not recommend this option.

Alternative #2:   NPVRR: N/A
Do Nothing:
This alternative puts LKE at risk due to lack of Smallworld functionality required to meet upcoming gas regulations and the need to move off a data model that is currently at end of life. This option has not been modeled in the CEM due to the lack of long-term feasibility. The team does not recommend this option.

Project Description

- **Project Scope and Timeline**
  The Enterprise GIS will be implemented in a phased approach as shown below.

LOB	Roadmap, Infrastructure, and Architecture	Design	Build	Implementation
IT Telecommunications	Phase I	Phase I	Phase I	Phase I
Generation Services	Phase I	Phase I	Phase I	Phase I
Electric Transmission	Phase I	Phase I	Phase I	Phase I
Gas Distribution Operations	Phase I	Phase I	Phase II	Phase II
Electric Distribution Operations	Phase I	Phase II	Phase III	Phase III

The following is the Phase I project scope:
- Develop a roadmap, infrastructure and architecture scalable to meet future phases.
- Design, build and implement the ▮ Enterprise solution for Electric Transmission, Telecom and Generation Services.
- Develop the design for the GDO ▮ Enterprise solution.

Tentative key milestones for the complete Enterprise GIS project are as follows:

Milestone Event	Date
Develop Roadmap, Governance and Organization Change Management Plan	Q4 2018
Develop Architecture and Infrastructure Design	Q4 2018
Begin Design for Generation Services, Telecom, Electric Transmission and GDO	Q1 2019
Generation Services go live	Q2 2019
Telecom go live	Q3 2019
GDO Design complete	Q4 2019
Phase 2 Planning	Q4 2019
Electric Transmission go live	Q1 2020
GDO go live	Q4 2021
EDO Design complete	Q4 2021
Phase 3 planning	Q4 2021
EDO go live	Q4 2023

- **Project Cost for the Enterprise GIS Project by Phase.**

Capital cost ($000)	2017	2018	2019	2020	2021	2022	2023	Total
Phase I	$1,486	$1,221	$7,297	$ 1,464				$11,468
Phase II				$10,536	$8,000			$18,536
Phase III						$7,000	$2,400	$ 9,400
Total	$1,486	$1,221	$7,297	$12,000	$8,000	$7,000	$2,400	$39,404

O&M cost ($000)	2017	2018	2019	2020	2021	2022	2023	Total
Phase I		$ 260	$ 632	$ 301	$ 301	$ 301	$ 307	$ 2,102
Phase II				$ 2,350	$2,400			$ 4,750
Phase III						$2,350	$2,350	$ 4,700
Total	$ -	$ 260	$ 632	$ 2,651	$2,701	$2,651	$2,657	$11,552

Economic Analysis and Risks

Bid Summary

A Request For Proposal (RFP) was sent to four prospective bidders and following a thorough RFP process, two potential SIs were evaluated. This included presentations by each vendor, reference calls and two separate three day planning sessions to create a budget and project plan.

Bidder #1: SSP Innovations

SSP Innovations was the unanimous recommendation for the role of SI from a team including IT and representatives from each of the impacted lines of business. The decision was based on scoring criteria including favorable cost.

Bidder #2: UDC Inc.

It was decided by the core IT and business team that UDC Inc, in addition to providing a higher cost, was not the preferred SI for the project. The customer references and the proposed work plan were not optimal for this project.

RFP Vendor Scoresheet	SSP Innovations	UDC Inc.
MBE/WBE	No	No
ACA Compliance	Yes	Yes
Total Vendor Cost ($000s)	$2,904	$3,773
Total Price Score	30	23
Completeness of Proposal	10	10
Proposed Work Plan	25	25
Key Resources	15	15
References	10	0
Company Leadership	10	10
Scoresheet Criteria Total	**100**	**83**

- **Budget Comparison and Financial Summary for the complete Enterprise GIS Project**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	1,486	1,221	7,297	29,400	39,404
2. Cost of Removal Proposed	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	1,486	1,221	7,297	29,400	39,404
4. Capital Investment 2018 BP	1,486	3,000	2,000	5,800	12,286
5. Cost of Removal 2018 BP	-	-	-	-	-
6. Total Capital and Removal 2018 BP (4+5)	1,486	3,000	2,000	5,800	12,286
7. Capital Investment variance to BP (4-1)	-	1,779	(5,297)	(23,600)	(27,118)
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	-	1,779	(5,297)	(23,600)	(27,118)

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed	-	260	632	10,660	11,552
2. Project O&M 2018 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	(260)	(632)	(10,660)	(11,552)

The 2018BP was not adjusted since fully developed estimates had not been completed at the time. The 2019BP (Capital and O&M) funding includes fully developed estimates for Phase I and revised estimates for Phase II and Phase III. However, final detailed estimates for Phase II and III will be developed as business requirements are refined.

Financial Capital Summary for Phase I ($000s):	
Discount Rate:	6.59%
Capital Breakdown:	
Internal Labor:	$3,872
Contract Labor:	$3,620
License Purchase (2017)	$1,486
Other (taxes, travel, office supplies etc)	$1,190
Contingency (15% excluding licenses):	$1,300
Total Capital Expenditure:	$11,468

The capital breakdown above is for the 2017-2020 Phase I of the Enterprise GIS Project to be consistent with the capital investment approval sought in this proposal. The NPVRR calculations in the document reflect the complete Enterprise GIS Project.

Assumptions

- Phase II and Phase III of the Enterprise GIS project will be brought to the Investment Committee for approval prior to commencement of work.
- SSP Innovations is successful with Phase I implementation and earns Phase II project work.

Risks   **Arbough**

- SSP Innovations fails to earn Phase II project work resulting in renewal of vendor selection and delay of the project for GDO and EDO.
- During Phase I the System Integrator will conduct a conflation analysis to determine the degree of spatial location variation between the assets from different lines of business. If conflation work is recommended, incremental O&M funds will be required.
- Constraints on internal resources due to multiple competing projects.
- Maintaining consistent resources from the System Integrator given the length of the project.
- Technical complexity of the GIS project.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve Phase I of the Enterprise GIS Project for $11,468k to complete the GIS design, build and implementation for Electric Transmission, Telecom and Generation Services, the GIS design for GDO, as well as the architecture design for all future phases.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: 7/26/2017

Project Name: GH Barge Unloader Recert

Total Expenditures: $9,089k (Including $826k or 10% contingency)

Project Number(s): 140203

Business Unit/Line of Business: Generation

Prepared/Presented By: Steven Straight/Steven Turner

Executive Summary

This project is for the recertification of the Ghent Continuous Barge Unloader (CBU). The scope of this project includes the engineering, fabrication, procurement and construction required to replace several major structural components of the CBU, fabrication and installation of a new operator's cab and replacement-in-kind of various CBU components.

The Ghent CBU has been in service since 1973 and has begun to exhibit signs of degradation and component failures in the past several years. The CBU unloads approximately six million tons of coal per year to maintain unit operations and the station's stockpile. The CBU is the station's only means of unloading coal.

A total of $3,720k was included in the 2017BP. That amount was based on cost estimates derived in 2013. Additional inspections were performed in 2016, and an updated scope of work was developed. The project was bid as a turnkey project including the engineering, fabrication, procurement, management and construction required to complete the work. An increase in the scope drove the cost to the current proposed amount of $9,089k (See Appendix I). The 2018 proposed amounts will be requested as part of the 2018 business planning process to be completed later this year.

Background

The Ghent Station Heyl & Patterson designed CBU was constructed in the early 1970's and began operation in 1973 when the station's first generating unit began operation. Since 1973 the CBU has operated nearly continuously until the past several years when several major components have either failed or begun to exhibit signs of degradation. In the early 1990's the CBU was upgraded to accommodate the unloading of limestone in addition to coal. In 2005, structural repairs were made to address several cracks in structural members. The CBU is inspected annually and areas of concern have been noted which need to be corrected to ensure the reliable and safe operation of the CBU for the next thirty years.

All coal used to operate the Ghent Station must be unloaded from barges on the river via the CBU.

- **Alternatives Considered**

  1. Recommendation: NPVRR: ($000s) <u>$10,568</u>

  2. Alternative #1: Do Nothing   NPVRR: ($000s) <u>$26,764</u>
     [This alternative should not be chosen because the CBU has been exhibiting signs of damage for several years and poses a risk to operations and the CBU operators.]

  3. Alternative #2: Total Replacement   NPVRR: ($000s) <u>$33,092</u>
     [This alternative should not be chosen due to replacement project costs being much greater than the recommendation. Also, this alternative would delay the project several years allowing the CBU to further degrade and continue to pose a risk to operations and the CBU operators.]

Project Description

- **Project Scope and Timeline**

  The scope of this project includes the engineering, procurement and construction required to repair and replace several major structural components of the CBU, fabrication and installation of a new operator's cab and replacement-in-kind of various equipment. A scope was first developed for this project in 2013 based on annual inspections of the CBU. In 2016, an inspection focused on extending the life of the CBU was completed, and based upon this inspection the scope was revised and expanded. A list of scope items added and which were increased in 2017 can be found attached in Appendix I.

  Milestones:
  - July 2017 – Investment Committee meeting and approval
  - August 2017 – Issue purchase order
  - August 2017 – Project kick-off, begin engineering, fabrication & procurement
  - October 2017 –2017 Outage work
  - December 2017 – Finish fabrication
  - September 2018 – Begin 2018 Outage work
  - October 2018 – Complete 2018 Outage work
  - November 2018 – Complete Punchlist items

- **Project Cost**

  This project is expected to cost a total of $9,089k. The material cost is estimated to be $3,265k and the labor is estimated at $4,405k. Burdens are estimated to be $593k. Contingency (10%) is $826k and will cover any unknown conditions discovered once the work begins that would be directly related to the scope of the Project. The labor will be

awarded as lump-sum and any additional work discovered during the Project will be**Arbough** completed on a T&M basis.

Economic Analysis and Risks

- **Bid Summary**

  The project was bid as a turnkey project including the engineering, fabrication, procurement, management and construction required to complete the work. The bidders include the ████ ████████████████████████, general contractors and bulk material handling engineering and equipment companies. Proposals were received from ████████████████, ████████ ████████ and █████. The contract is still being negotiated. The table below shows the provided pricing and normalized comparison.

Engineering & Material (2017)			
Engineering Services			
Material/Equipment			
Other			
TOTAL 2017			
Installation (2018)			
Mobilization/Demobilization			
Demolition/Removal Labor			
Installation Labor			
Material/Equipment			
Other			
TOTAL 2018			
TOTAL BID			
Normalized Comparison*			

*The normalized comparison is attached as Appendix II.

Thorough review of the short list proposals from ████████████ and ████████ ████████ has generated concerns with regard to the level of confidence in the lower priced ████████ offering. While ████████████ has taken an all-encompassing approach, a close review of ████████'s proposal revealed several gaps with the potential for significant delays, large change orders or both. Multiple large cost items are included in the ████ ████████ proposal which ████████ did not include, for example the cost of a full-time tug boat during the five week outage and adequate quality controls during the fabrication of the CBU structural components. ████████████████ also proposed to execute some scope items in an unsatisfactory manner. For these reasons, award to ████████████ is being recommended. Benefits for this selection are shown as normalized adders/deducts in the attached Appendix II.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total

1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2017 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.32%
Capital Breakdown:	
Labor:	$ 0
Contract Labor:	$ 4,405
Materials:	$ 3,265
Local Engineering:	$ 130
Burdens:	$ 463
Contingency:	$ 826
Reimbursements:	($0)
Net Capital Expenditure:	$ 9,089

- **Assumptions**
  The Capital Evaluation Model contains the following assumptions:
  o An availability disimprovement of forty-eight weeks is assumed for both alternatives. This is based on a twelve week fabrication and five week installation schedule minus the station's five week coal supply then multiplied by the four units at the station.
  o Unbudgeted O&M Costs assumed for both alternatives are based on miscellaneous repairs related to the CBU.
  o Alternative #2 assumes a completely new CBU and associated conveyors and structures would cost $30,000k.
  o The potential increase in steel prices was not incorporated into either alternative.

- **Environmental**

The Army Corps of Engineers will be notified of the work on the river as required.

	New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.	
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes; See Background section
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**
If this project is not completed during the 2018 Coal Yard fall outage, continued corrosion and degradation of the Barge Unloader structure will occur which will increase the potential of having a structural failure which would affect the station's ability to supply the operating units with fuel.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the GH Barge Unloader
Recertification project for $9,089k to ensure the station can continue to safely and reliably
unload coal.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the
members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the
signatures below are also required for approval of this Capital project spending request.

Chief Financial Officer   President and Chief Operating Officer

Appendix I

- 2017 scope items not included in 2013 scope

    o New LED lighting of structure(s) *(+ at least $75k)*

    o Replace counterweight pins *(+ at least $25k)*

    o Prep and re-grout cantilever hoist drive base *(+ at least $75k)*

    o Replace operator's cab support structure *(+ at least $50k)*

    o Replace 1A Conveyor and conveyor structure *(+at least $500k)*

    o Replace the bucket wheel hood *(+ at least $70k)*

    o Replace the boom, bucket slide assembly and related supports *(+ at least $350k)*

    o Replace the bucket discharge chute *(+ at least $50k)*

    o New positioner arm and wheel *(+ at least $100k)*

    o New hydraulic power unit, cylinder and related piping *(+ at least $100k)*

    o New brakes and coat east and west barge hauls *(+ at least $50k)*

- 2017 scope items with increased scope from 2013

    o Sheave and cable replacement; $50k included for 2013 and low bid of $375k for 2017 scope

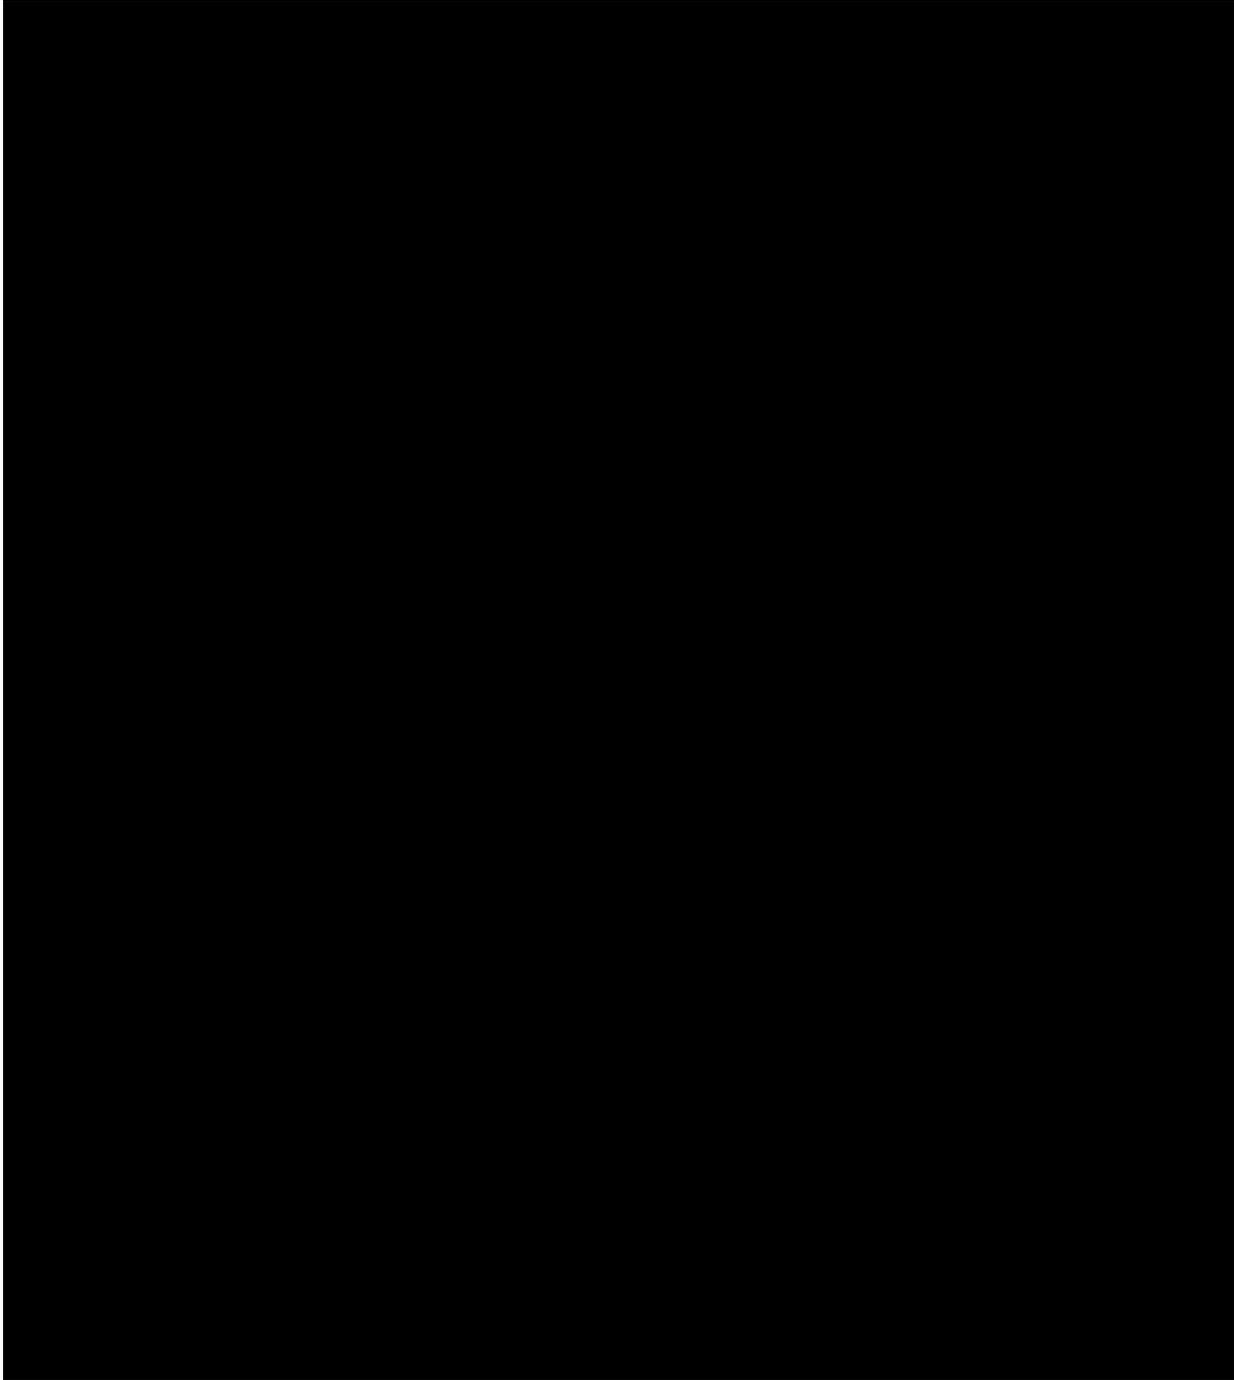
    o Service crane replacement; $100k included in 2013 and bids of $250k for 2017 scope

    o Counterweight drums, shafts, bearings and associated cables and connections; $50k estimate in 2013 and low bid of $531k for 2017 scope

    o New cantilever hoist motor, brakes, drum, gear reducer and VFD; $125k estimate in 2013 and bids of $460k for 2017 scope

    o Cantilever hoist cables and sheaves; $25k estimate in 2013 and bids of $225k for 2017 scope

    o Cantilever box girder replacement scope significantly increased to include the entire cantilever assembly rather than only replacing sections of the box girder due to safety and installation concerns; approximately $425k increase in cost from 2013 scope to 2017 scope

Appendix II


Investment Proposal for Investment Committee Meeting on: May 30, 2017

Project Name: GH1 SCR Catalyst L3 New

Total Expenditures: $2,493k (including $227k (10%) contingency)

Project Number(s): 144326

Business Unit/Line of Business: Power Generation/ Ghent 1

Prepared/Presented By: Dara Griggs

Executive Summary

The scope of this project includes the purchase and installation of new plate type catalyst for the GH1 Selective Catalytic Reduction (SCR) layer 3. The removed layer 3 catalyst will be mechanically cleaned and recycled. If the catalyst is not installed, the SCR performance will degrade below the target 90% removal rate and additional NO_x allowances will be surrendered by KU. As the SCR catalyst deactivates, the higher ammonia slip through the SCR will increase the risk of an unplanned outage due to air heater pluggage.

The total GH1 project cost is $2,493k. The project materials including the catalyst material and installation labor have been competitively bid in a fleetwide bid process. The catalyst will be ordered in Q3 of 2017. Bolt-on style doors will be added to this SCR layer based on positive results with this feature on Layer 1. Cleaning labor will be bid by the plant in January 2018. The current 2017BP includes approximately $832k for 2017 and $1,661k for 2018. It is recommended that the project be approved in order to meet the target NO_x emissions.

Background

The GH1 SCR was placed in service in March 2004 and is designed to hold three catalyst layers. The two top layers were loaded initially, and the third bottom-most layer of catalyst was loaded in 2006. During the February 2011 outage the top layer (layer 1) was replaced with new catalyst. The new layer 1 was low SO_2 to SO_3 conversion type catalyst. Consequently, the SCR had a shorter active life and a catalyst change out was required in 2012. In February 2012, the layer 1 (low SO_2 conversion) catalyst was moved to layer 3 and the regenerated original catalyst from layer 1 was reinstalled in layer 1. In 2014, catalyst activity declined and a new catalyst, Hitachi CM, was installed in layer 2. In 2016, the activity levels in layer 1 and layer 3 required that they be replaced with a regenerated Trimble County layer and the regenerated original catalyst from layer 3, respectively. Due to the decline of the regenerated catalyst activity in layer 3, a new catalyst layer is required in 2018 to meet the requirements of the Cross-State Air Pollution Rule (CSAPR) that have lowered ozone season limits beginning in May 2017.

- **Alternatives Considered**
    1. Recommendation: Replace GH1 SCR L3 with new catalyst
       NPVRR ($000s): $3,179
    2. Alternative #1: Delay Project Until 2019   \
       NPVRR ($000s):$3,898
    3. Alternative #2: Do Nothing
       NPVRR ($000s): $6,436

The alternatives to this project are to *delay the project until 2019* or to *do nothing.* The *do nothing* alternative can be eliminated based upon the NPVRR and increased NO_x emissions that would occur. Delaying the project until 2019 is undesireable as well due to the potential for increased ammonia slip leading to an increase in forced unit outages to wash air heaters. Additionally, KU will have to surrender additional NO_x emissions allowances during ozone seasons to meet recent CSAPR regulations.

Project Description

- **Project Scope and Timeline**
  The scope of this project includes the purchase and installation of new plate type catalyst for the GH1 SCR layer 3. The new catalyst will be installed in layer 3 and the old layer 3 catalyst will be mechanically cleaned and recycled.

>   February 2017- Bid for Removal/Installation Labor
>   March 2017- Bid for New Catalyst Layer
>   May 2017 – Investment Committee meeting and approval
>   July 2017 – Issue purchase order for catalyst
>   November 2017- Issue purchase order for bolt-on style doors
>   January 2018- Bid for Catalyst Cleaning
>   January 2018- Issue purchase order for seals
>   April 1, 2018 – Catalyst delivery to Ghent
>   April 15, 2018 – Install new catalyst in layer 3
>   May 2018- Tune U1 SCR
>   May 2018- Mechanically clean and recycle used layer 3

- **Project Cost**
  The total project cost, material and labor, is $2,493k with $832k in 2017 and $1,661k in 2018. A total contingency of $227k (10%) is included in the project cost. The contingency level is based on past catalyst projects at the plant. The project material costs include catalyst, seals, bolt-on style doors, and miscellaneous materials for installation that are subject to change as material costs change.

  The cost estimate for catalyst material is based on bids received in March 2017 from a fleetwide RFQ. Installation costs have been bid in a fleetwide contract and have been awarded to ███.

Tuning labor costs have been bid in a fleetwide contract and have been awarded t▮▮▮▮▮▮ Cleaning labor and other labor will be awarded in 2018.

Reimbursements:	($0)
Net Capital Expenditure:	$2,493

- **Assumptions**

  Recommendation
    - o This option allows the unit to continue operating as normal.
    - o No cost savings or incremental costs are incurred.
    - o Capital spend occurs only in 2017 and 2018.
      - ▪ Cost estimates are based on catalyst bids and historical costs for similar projects completed.

  Alternative 1: Delay until 2019
    - o The project cost increases 2.5% per year due to inflation.
    - o There will be four unplanned outages in 2018 and one in 2019 to clean air heater baskets.
    - o The probability of outages in 2018 and 2019 is 50% and 60% respectively.
    - o The cost of a three-day outage is $256k per the corporate capital evaluation model standard calculation of lost availability for Ghent 1.
    - o O&M cost of an air heater cleaning is $25k.
    - o Cost of additional NOx credits that would likely be required to meet emissions targets was not included in evaluation.

  Alternative 2: Do Nothing
    - o There will be four unplanned outages per year to clean air heater baskets.
    - o The probability for forced outages starts at 50% in 2018 and increases by 10% each year as the catalyst becomes more deactivated. The probability reaches a maximum of 90% in 2022.
    - o The cost of a three-day outage is $256k per the corporate capital evaluation model standard calculation of lost availability for Ghent 1.
    - o O&M cost of an air heater cleaning is $25k.
    - o Cost of additional NOx credits that would likely be required to meet emissions targets was not included in evaluation.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes, layers 1 and 3 were replaced with regenerated layers in 2016
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

The Ghent Environmental Coordinator has signed off on this project.

- **Risks**

The risks of *not completing* this project include:

- o Forced NO_x Credit Purchase: Failure to meet NO_x reduction rates will require the company to purchase NO_x credits at the current market price. The risk associated with this is significant volatility in the NO_x credit pricing.
- o Non-Compliance with Cross-State Air Polution Rule: Beginning in May 2017, all units will be required to lower emissions during the ozone season.
- o Unplanned Outages: Without the replacement of the catalyst layer in GH1 SCR, the level of un-reacted ammonia will increase. This ammonia will be available to form ammonium bisulfate in the air heater. This sticky deposit will build up over time and require a unit outage for air heater cleaning; it is also corrosive and can add

significant O&M repair costs over time. This cost is included in the capital expenditure though
model (CEM).

The risks associated with *completion* of this project outside the optimal window:

- o Catalyst Performance: While past experience at other units has proven catalyst reliable, catalyst formulas are customized for the unit needs and there is a small risk that the formula will not perform as guaranteed.
- o Schedule: The catalyst will be installed during a planned maintenance outage of the unit. Any delay in the project will extend the outage, impacting the outage rate of the unit and potentially increasing the cost of the project.
- o Increased NOx emissions. The SCR will be required to operate at reduced efficiency in order to limit ammonia slip. As the NOx removal efficiency decreases the NOx emissions will increase and the company could be required to purchase NOx credits for compliance.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the GH1 SCR Catalyst L3 New project for $2,493k to allow the SCR to operate at the target efficiency.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

Investment Proposal for Investment Committee Meeting on: June 28, 2017

Project Name: GH2 4kv Switchgear Replacement

Total Expenditures: $7,495k (Including $681k (10%) contingency)

Project Number(s): 144302

Business Unit/Line of Business: Generation

Prepared/Presented By: Ritchie Chambless

Executive Summary

The scope of this project is to replace the Ghent Unit 2 (GH2) forty year old Federal Pacific 4kv switchgear during the 2019 eight week major outage to improve safety and increase the short circuit rating of the switchgear. New replacement switchgear lead time is approximately 24 months.

The existing switchgear design requires the Operator to be inside the switchgear cubicle when racking the breaker with a manual lever. Operators are required to wear a 100 calorie arc flash suit when racking the breakers, but they can still be severely injured when an arc flash occurs because they are so close to the arc flash energy. The new arc resistant switchgear will include bus differential protection and a reliable closed door remote racking system that significantly reduces Operator exposure to an arc flash incident. In the event that an arc flash occurs, the arc resistant switchgear will exhaust the arc flash energy to the outside of the building away from the Operator.

In 2013, during the design phase of the GH2 Bag House Project, it was discovered that the close and latch rating of the existing feeder breakers will be exceeded by approximately 23% if Unit 1 Reserve Auxiliary Transformer (RAT1) is used to start-up Unit 2 in the event Unit 2 Reserve Auxiliary Transformer (RAT2) fails. The short circuit close and latch rating of the new switchgear feeder breakers will be increased to 130 kilo-amperes (130ka) to ensure Unit 1 RAT1 can safely be used to start-up Unit 2 in the event RAT2 fails.

This project was included in the 2017BP at $8,007k through 2019. The timing change has resulted in higher spend projected in 2017 and lower spend in 2018 and 2019. Funding for the 2017 variance amount of $1,500k was approved by RAC in 3+9 forecast. Spending in 2018 and 2019 will be adjusted as part of the 2018 Business Planning process.

Background

The existing GH2 Federal Pacific (FPE) 4kv switchgear was installed in 1977 and consists of two buses labeled 2A and 2B with each bus consisting of one 3000A main breaker, one 3000A reserve breaker and eighteen 1200A feeder breakers. NFPA 70E requires our Operators to wear an arc flash suit rated a minimum of 100 calories when racking breakers due to the available short circuit fault current. The existing switchgear design requires the operator to be inside the switchgear cubicle when racking the breaker with a manual lever. If an arc flash incident occurs when lever racking a breaker, the Operator could be severely injured by being so close to the arc flash energy. Such an incident was experienced at Ghent Station in the 1990's when an Operator was severely injured while racking a GH2 4kv breaker. There are no safe and reliable remote racking systems on the market available for our FPE switchgear.

The GH2 FPE switchgear was retrofitted with replacement breakers in 1997, 2006, and 2010 to improve reliability. In 2013, during the design phase of the GH2 Bag House Project, it was discovered that the close and latch rating of the existing feeder breakers will be exceeded by approximately 23% if RAT1 is used to start-up Unit 2 in the event RAT2 fails. Project Engineering has worked with KBR to reduce the new RAT2 short circuit capability so the close and latch rating of GH2 4kv switchgear feeder breakers would be adequate during normal operation and start-up. The Ghent Bag House project team concluded the best solution was to replace the GH2 4kv switchgear at the earliest opportunity in order to safely use RAT1 as a backup for RAT2.

- **Alternatives Considered**
    1. Recommendation: NPVRR: $8,683k
    2. Alternative 1 – Do Nothing: NPVRR: N/A
       We will continue to place Operators in an unsafe situation when lever racking 4kv breakers. This is not considered a viable option given the Company's commitment to safety and meeting the operational performance metrics with the station.
    3. Alternative 2 – Retro-fill Exiting Switchgear   NPVRR: $8,864k
       This alternative requires replacing all the internal components in the existing switchgear cubicles which would increase the unit outage approximately two weeks. Operator arc flash exposure would be increased because existing switchgear cannot be converted to arc resistant switchgear. Retro-fill switchgear assembled on site would not be as high a quality as new switchgear assembled and tested at the factory.

Project Description

- **Project Scope and Timeline**

    The existing 4kv switchgear will be replaced with new arc resistant switchgear with matching footprint design, closed door remote racking system, bus differential protection, new electronic protection relays and on-line thermal monitoring for main bus, breaker line and load bus and feeder cable connections.

Plans are to replace the existing switchgear during an eight week unit outage that is currently scheduled to start September 30, 2019. Timeline milestones for the project are:

June 2017 – Project Approved
July 2017 – EPC Contract Awarded
Dec 2017 – Engineering and design 80% Complete
June 2018 – Switchgear Placed on Order
July 2019 – Factory Acceptance Testing Complete
Aug 2019 – Switchgear Delivered to Ghent Station
Sept 2019 – Switchgear Training Complete
Oct 2019 – Installation Begins
Nov 2019 – Installation & Commissioning Complete

- **Project Cost**

  Total estimated cost of the project is $7,495k with 10% contingency for labor and material included.

Economic Analysis and Risks

- **Bid Summary**

  Competitive bids were solicited from four firms with specialty expertise deemed capable of designing a workable replacement for the unusual 24 inch width Unit 2 switchgear. Three bidders submitted proposals, among which, two (▮▮▮▮▮▮▮▮▮▮▮▮▮▮) were short listed as being the best technically evaluated and/or lowest cost. Both short list proposals utilize the same Powell equipment so the differentiation between the two proposals, aside from pricing, lies largely in design expertise, experience, execution plan, and KU experience. After clarifications, both bidders were allowed to submit "best and final" offerings, which are represented in the table below. Although the bids show ▮▮▮▮▮ to be slightly lower cost than ▮▮▮, the normalized bid evaluation showed ▮▮▮ to have the lowest normalized cost. This is largely due to the number of engineering and start-up/commissioning hours allotted to the project by ▮▮▮. In summary, the evaluation team recognized a strong advantage to ▮▮▮ in terms of engineering expertise.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	1,650	2,311	3,274	-	7,235
2. Cost of Removal Proposed	-	-	260	-	260
3. Total Capital and Removal Proposed (1+2)	1,650	2,311	3,534	-	7,495
4. Capital Investment 2017 BP	150	4,177	3,420	-	7,747
5. Cost of Removal 2017 BP	-	-	260	-	260
6. Total Capital and Removal 2017 BP (4+5)	150	4,177	3,680	-	8,007
7. Capital Investment variance to BP (4-1)	(1,500)	1,866	146	-	512
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	(1,500)	1,866	146	-	512

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2017 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.49%
Capital Breakdown:	
Labor:	$ 305
Contract Labor:	$2,300
Materials:	$3,275
Local Engineering:	$ 83
Burdens:	$ 851
Contingency (10%):	$ 681
Reimbursements:	($0)
Net Capital Expenditure:	$7,495

RAC will provide the $1,500k additional funding in 2017. Spending in 2018 and 2019 will be adjusted in the 2018BP.

- **Assumptions**
    1. Alternative 2 – Retro-fill Existing Switchgear
        a. Budget Estimate = $6,600k
        b. Would need to add two weeks to the GH2 2019 major outage.

- **Environmental**

There are no local, state, or federal environmental requirements for permitting, notification, reporting, etc., regarding these repairs.

There are no known environmental isuses regarding this project.

	New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.	
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	No
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes, breakers have been replaced in 1997, 2006, and 2010.
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**

We risk severe injury and possible death to Operators if an arc flash incident occurs when lever racking a breaker. We will also risk a feeder breaker catastrophic failure if RAT1 is used to start-up GH2 in the event RAT2 fails.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the GH2 4kv Switchgear
Replacement project for $7,495k to improve safety and reliability.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:</u>

The Capital project spending included in this Investment Proposal has been approved by the
members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the
signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: _May 30, 2017_

Project Name: _GH3 Burner Replacement_

Total Expenditures: $8,532k (Including 10% contingency of $775k)

Project Number(s): _133515_

Business Unit/Line of Business: _Generation__133515_

Prepared/Presented By: _Christina Schwind / Steve Turner_

Executive Summary

This project is to replace the existing Low NOx Burner Assemblies on Ghent Unit 3 with functionally equivalent new Low NOx Burner technology. Existing Overfire Air and Underfire Air Systems will be evaluated as part of the project as well. The existing Burner Assemblies have reached the end of their useful lives. These outdated Burner Assemblies are the source of a significant loss of operational control over the unit's firing system. This project consists of replacing all 24 existing Burner Assemblies with a new Low NOx Burner System.

A total of $2,400k was budgeted for 2024 and $6,100k in 2025 for this project in the 2017BP. Ghent Unit 3 will experience significant losses in operational control and an inability to manage the changing fuels projected for the future if the existing firing system is not replaced before 2025. The Corporate RAC approved $3,000k for 2017 in the 3+9 forecast. The $5,532k in 2018 will be reallocated from 2024/2025 as part of the 2018BP process.

Background

The existing Ghent Unit 3 ABT Opti-Flow Low NOx Burner Assemblies were installed in 1999 as part of a Low NOx Burner Upgrade project. Due to the design of the existing Burner Assemblies, the Secondary Air Damper and Swirl Vane linkages are prone to bind and break during normal operation. As a result there is significant loss of operational control within 48 hours of startup after a planned outage. During the fall 2016 outage it was discovered that four of the Burner Air Registers were internally damaged beyond repair. Severe damage was also found on 7 of the 24 coal nozzles at that time. After the fall 2016 outage, all Secondary Air Dampers and Swirl Vanes were placed in an optimum open position and remain in these positions throughout the range of operation. This action ensures that the dampers and swirls will not get stuck in light-off positions and cause further damage to the Burner Assemblies, but significantly limits ability to control combustion. The new burner design will allow for individual burner control across the load range, improving combustion management, emissions control, and better management of the burning of a broader spectrum of fuels. Replacing all 24

existing Burner Assemblies is necessary to regain operational control and continue to operate the Although generating unit safely and reliably.

- **Alternatives Considered**
  1. Replace all 24 existing Burner Assemblies on Ghent Unit 3 with functionally equivalent new low NOx burner technology.
       This is the best (recommended) option as it is the only option that is guaranteed to address all the current issues with the existing firing system.
       NPVRR: ($000s) $9,935k

  2. Do nothing.
       A quarter of the firing system on Ghent Unit 3 has been found to be severely damaged. Due to the design of the existing Burner Assemblies, the unit is currently being operated with limited combustion control. If these issues are not addressed, the unit will experience catastrophic damage to the firing system.
       NPVRR: ($000s) $14,924k

  3. Replace all 24 existing Burner Assemblies on Ghent Unit 3 with functionally equivalent new low NOx burner technology in 2025 as scheduled.
     a. This option does not address current issues with damaged air registers and will require significant maintenance above the current budgeted O&M.
     b. The risk of a windbox fire remains until the project is executed.
     c. Challenges with managing variable fuels remains until the project is executed
       NPVRR: ($000s) $11,916k

Project Description

- **Project Scope and Timeline**
  The scope of this project includes the engineering, procurement and construction required to replace the existing ABT Opti-Flow Low NOx Burner Assemblies on Ghent Unit 3 with functionally equivalent new low NOx Burner technology. The project also includes evaluating the existing Overfire Air and Underfire Air Systems for improvement or replacement. This project is similar to the GH4 Burner Replacement project in 2014. All four Vendors that were invited to bid the material supply for this project have experience designing and supplying similar technology on comparable generating units. Current unit drawings and operating parameters are being provided to the Vendors to ensure that the new system is sized and designed properly. Due to the duration of the Fall 2017 (3 weeks) and Fall 2018 (8 weeks) outages, only eight burners will be replaced in 2017 with the remainder in 2018.

  - April 18, 2017 – Formal bid specification issued to Vendors
  - May 16, 2017 – Bids due back for evaluation
  - May 30, 2017 – Investment Committee meeting and approval; Issue purchase order
  - June 2017 – Project kick-off, begin engineering and procurement

- October 2017 – Receive 8 Burner Assemblies and install during the fall planned outage
- November 2017 – Complete installation and commissioning of 8 Burner Assemblies
- December 2017 – Receive remaining 16 Burner Assemblies
- Spring/Summer 2018 – Bid fall 2018 installation labor
- Fall 2018 – Complete installation of 16 Burner Assemblies
- November 2018 – Begin commissioning and performance testing of new Burner System
- December 2018 – Project complete

- **Project Cost**
  The total cost of the project is $8,532k and includes 5% burdens and 10% contingency. The contingency amount was determined based upon the risk associated with the project and common contingency levels of projects of a similar size. The material supply for the project was bid as a lump sum. The supplemental labor contractor will perform the installation labor for the fall 2017 outage. The installation labor for the fall 2018 outage will be bid as a lump sum.

Economic Analysis and Risks

- **Bid Summary**
  Four Vendors ██
  were invited to bid the material supply for the project. Bid proposals are due Tuesday, May 16th. The installation labor for the fall 2018 outage will be issued for bid in 2018.

  Due to time constraints associated with receiving the installation drawings from the material supply Vendor, the supplemental labor contractor ██████████████ will be utilized for the fall 2017 installation. ██████████████ is familiar with the existing firing system on Ghent Unit 3 and has experienced personnel that were involved in the GH4 Burner Replacement project in 2014 and the Trimble County 2 Burner replacement.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	A Post through 2019	Total

Financial Summary ($000s):

Discount Rate: 6.49%

Capital Breakdown:

Labor:	$160
Contract Labor:	$2,408
Materials:	$4,820
Local Engineering:	$0
Burdens:	$369
Contingency:	$775
Reimbursements:	($0)
Net Capital Expenditure:	$8,532

- **Assumptions**

  o Recommendation – Replace 24 Burner Assemblies
    The capital evaluation model assumes that we will purchase all 24 Burner Assemblies and complete installation of 8 Burner Assemblies in 2017. The model assumes that installation of the remaining 16 Burner Assemblies and commissioning of the new firing system will be completed in 2018.

  o Alternate #1 – Do Nothing
    The capital evaluation model assumes $200k/yr in unbudgeted OPEX to repair or replace the Burner Assemblies and outages based on burner damage and windbox fires. Improvements to the Overfire Air System were also not considered. Challenges burning future fuels was not taken into consideration. This alternative assumes a catastrophic failure in 2027 requiring an extensive capital investment.

o Alternate #2 – Replace 24 Burner Assemblies in 2025

The capital evaluation model assumes executing the project in 2025. The model assumes $200k/yr in unbudgeted OPEX to repair or replace the Burner Assemblies and outages based on burner damage and windbox fires until the project is completed. The pricing for the project in 2025 assumes 3% inflation rate.

• **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit?	Yes
	a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit?	Yes
	a. Provide frequency or when equipment or component in question was last repaired or replaced.	All 24 Burner Assemblies were modified to a hybrid design as part of a low NOx retrofit project in 1999.
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment?	No
	a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

• **Risks**

All Four material supply Vendors have experience designing and supplying comparable generating units with similar technology with good results. Improved combustion, reliability and operational control are expected with a high degree of certainty.

If this project is not completed the unit will experience significant loss of operational control of the firing system resulting in severe damage to equipment and increased derates and outages. As fuel supplies change over time there will be a reduced ability to deal with related combustion issues.

Conclusions and Recommendation Arbough

It is recommended that the Investment Committee approve the GH3 Burner Replacement project for $8,532k to regain operational control and continue to operate Ghent Unit 3 safely and reliably.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

Combined Investment Proposal for Investment Committee Meeting on: 11/28/2017

Project Name: GH3 Cooling Tower Complete Rebuild

Total Project Expenditures: $12,605k   (Including $600k or 5% contingency)

Contract Total Seeking IC Approval: ███████
Total Contract Expenditures: ██████

Project Number(s): 194GH

Business Unit/Line of Business: Generation

Prepared/Presented By: Steven Straight/Steven Turner

Executive Summary

The fourteen cell Ghent Unit 3 cooling tower began operation in 1981. Cells 9 through 14 were rebuilt with wooden structures from 2002-2004 and the remaining 8 cells were replaced with polyester fiberglass structures from 2005-2009. Following the collapse of cells 2 and 3 in the Ghent Unit 4 cooling tower during the summer of 2016, thorough inspections of all cooling towers were conducted. The inspections revealed several failed columns in Units 1, 3 and 4. Unit 3 had over fifty structural columns which had failed throughout the 8 fiberglass cells on the cooling tower. The excessive failures caused the replacement strategy to be revised to a complete rebuild rather than the previous cell-by-cell replacement strategy which was in the 2017BP.

This project is for the complete rebuild of the Ghent Unit 3 cooling tower. The scope of this project includes the engineering, fabrication, procurement, demolition, construction and testing required to replace the entire Unit 3 cooling tower. In addition to the full replacement of the tower, the circulating water distribution piping will be re-located from the top of the cooling tower to the ground, which decreases the weight the structure is required to support.

The 2018BP includes $10,929k and reflects the change from a cell-by-cell rebuild strategy to the complete tower rebuild. The project was bid as a turnkey project including the engineering, demolition, fabrication, procurement, management, construction and testing required to complete the work. The lowest bid, which is the recommended proposal plus a 5% contingency, requires the current proposed amounts of $1,260k in 2017 and $11,345k in 2018. Funding for this project in 2017 was requested from the Resource Allocation Committee (RAC) and submitted as part of the 2017 9+3 forecast. $10,929k of the $11,345k amount for 2018 has been requested as part of the proposed 2018 Business Plan. The $416k incremental spend in 2018 will be funded internally from other Ghent projects.

Background

The fourteen cell Ghent Unit 3 cooling tower began operation in 1981. The original tower was a 14 cell wooden tower designed and constructed by Ecodyne. Starting in 2002 and continuing through 2003, cells 9 through 14 were rebuilt with wooden structures. The remaining 8 cells were replaced with polyester fiberglass structures between 2005 and 2009.

The cooling tower is inspected annually and areas of concern are noted and corrected to ensure the reliable operation of the cooling tower for the next year. Typically the cooling tower fill material, which occupies nearly all of the internal volume of the tower, is not removed and the inspection focuses on the external and mechanical areas. Following the collapse of cells 2 and 3 in the Ghent Unit 4 cooling tower during the summer of 2016, a thorough inspection of the Unit 3 cooling tower was conducted which required the removal of portions of the fill. The inspection revealed 54 structural columns that had split at the corners and failed throughout the 8 fiberglass cells.

Since the collapse of several cells on the Unit 4 cooling tower, the plant has conducted a thorough inspection and removed fill material from cells in order to inspect the columns which typically cannot be seen. The thorough inspections have identified several split columns and helped to revise the station's cooling tower replacement strategy from individual cell replacements to more comprehensive rebuild projects which include the mechanical and piping components.

This project includes demolition of the entire existing cooling tower, installation of a new cooling tower structure, new mechanical equipment, moving the large distribution piping from the top of the structure to the ground, new electrical and control cables, variable frequency drives for the fan motors and third party testing of the new tower's thermal performance. A comprehensive rebuild project, such as this project for Ghent 3, will help prevent future failures resulting in forced outages, and ensure plant personnel remain safe while on or in the cooling tower.

- **Alternatives Considered**

    1. Recommendation: Complete Rebuild   NPVRR: ($000s) $14,334

    2. Alternative #1: Do Nothing   NPVRR: ($000s) $16,907
       [This alternative should not be chosen because the Unit 3 cooling tower has exhibited signs of damage throughout the structure and poses a risk to operations and personnel safety.]

    3. Alternative #2: Rebuild Cell-by-Cell   NPVRR: ($000s) $14,719
       [This alternative should not be chosen due to project costs greater than the recommendation. In addition, this option does not provide the benefit of relocating the distribution piping to grade. Also, this alternative would delay the completion of the replacement several years allowing the Unit 3 cooling tower to further degrade and continue to pose a risk to operations and personnel safety.]

Project Description

- **Project Scope and Timeline**

  The scope of this project includes the engineering, demolition, procurement, management, construction and testing required to replace the entire Unit 3 cooling tower and the engineering, procurement and installation required to install the circulating water distribution piping at grade.

  Milestones:
  - November 2017 – Investment Committee meeting; Project approval
  - December 2017 – Issue purchase order; Project kick-off
  - May 2018 – Fabrication and procurement
  - June 2018 – Mobilize to site
  - September 2018 – Begin 2018 Outage work
  - November 2018 –Complete 2018 Outage work; Mechanical Completion
  - December 2018 – Complete Punchlist items; Final Completion
  - July 2019 – Performance Testing Completion

- **Project Cost**

  This project is expected to cost a total of $12,605k. The material cost is estimated to be $6,489k and the labor is estimated at $4,198k. Burdens are estimated to be $1,318k. Contingency (5%) is $600k and is reasonable given the current level of inspection and engineering work. The base scope will be awarded as lump sum and any additional work discovered during the project will be completed on a lump sum, unit price, or time and material basis.

- **Contract Description**

  The total value of this firm, fixed contract is ▮▮▮▮▮▮ including ▮▮▮▮ of contingency. All installation work is scheduled to be completed by November 17, 2018. Contract provisions include performance guarantees supported by liquidated damages, liquidated damages for schedule delay, a parent guarantee by ▮▮▮▮▮▮▮▮, and a final milestone retention payment. All Work will be governed by a negotiated General Commercial Agreement between LG&E and KU Services Company and ▮▮▮▮▮▮▮.

Economic Analysis and Risks

- **Bid Summary**

The request for proposal (RFP) was issued to two contractors specializing in this type of work: ▮▮▮▮▮▮▮▮▮▮▮▮▮▮ and ▮▮▮▮▮▮▮▮. A pre-bid meeting was conducted on August 8, 2017. Both solicited bidders returned a bid by the due date, September 7, 2017.

In addition to pricing, proposals were evaluated based on technical approach, proposed warranty and liquidated damages, conformity to the scope of work, proposed material suitability, experience, commercial terms, and safety. Overall, ████████ was found to have the preferable bid (see Bid Pricing Comparison below) based on input from the Commercial, Maintenance, Operations, and Planning Departments. The ████████ proposal is fully compliant with both the scope and schedule. It includes significant schedule liquidated damages, a make right performance guarantee to be verified by third party performance testing, as well as a 10 year material and workmanship warranty on the structure and a five year material and workmanship warranty on the mechanical equipment.

Net Capital Expenditure:	$12,605

- **Assumptions**

The Capital Evaluation Model contains the following assumptions:
  - o An availability disimprovement of one week per cooling tower cell failure is assumed for Alternative #1 and increases by a quarter of a week each subsequent year. This is based on previous cell failures at the station and schedule information received with the bids.
  - o An availability disimprovement of one week per cooling tower cell failure is assumed for Alternative #2 and increases by a quarter of a week each subsequent year until half of the tower is rebuilt, then it decreases by a quarter week until the entire tower is rebuilt. This is based on previous cell failures at the station.
  - o Unbudgeted O&M Costs assumed for both alternatives are based on previous repairs related to the cooling tower structure and mechanical equipment.

o Alternative #2 assumes the cooling tower cells will be replaced cell-by-cell over a through years, as was the case in previous business plans. Costs for new mechanical equipment have been added.

o Alternative #2 does not include costs to re-route the circulating water, install variable frequency drives for the fan motors, install new power cabling, install vibration monitoring equipment or perform third party performance testing.

- **Environmental**

Kentucky State Demolition Permit will be submitted.

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes; See Background section
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**

If this project is not completed during the 2018 Unit 3 fall outage, continued degradation of the cooling tower structure will occur which will increase the potential risk of having a structural failure which would affect the unit's ability to produce energy. The 2018 Unit 3 outage is a major turbine overhaul, which gives enough time for the proposed work. Ghent 3 does not currently have another outage of sufficient duration planned until 2025.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the GH3 Cooling Tower Rebuild
project for $12,605k and the GH3 Cooling Tower Rebuild contract to ███████████ for
███████ to ensure long term relability and safety of the Ghent 3 cooling tower.

**<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million and
Contract Authority Greater Than or Equal to $10 million bid, or $2 million sole sourced</u>:**

The Capital project spending and contract authority requests included in this Investment Proposal
have been approved by the members of the LKE Investment Committee. Pursuant to the LKE
Authority Limit Matrix, the signatures below are also required for approval of this Capital
project spending and contract authority request.

Project Name: <u>GH3 Primary SH Tube Repl</u>

Total Expenditures: <u>$4,047k (Including $368k, or 10% contingency)</u>

Project Number(s): <u>131980</u>

Business Unit/Line of Business: <u>Ghent Generating Station / Power Generation</u>

Prepared/Presented By: <u>Stephen Nix / Steve Turner</u>

Executive Summary

This project is for replacement of the Primary Superheater in the furnace backpass of Ghent Unit 3. The scope of this project includes the design and supply of new assemblies and removal and installation during the fall 2018 outage. This boiler section is planned to be replaced simultaneously with both the Upper Economizer Upper Bank (Project 144311) which is situated directly below in the same boiler gas backpass and the Vertical Reheater (Project 155008) which is situated directly above. Materials for all three projects will be designed and fabricated by the same supplier with installation by the same contractor. The Primary Superheater is original tubing. There are design issues with tube support connections (solid ties) which have caused numerous leaks over the past two decades. This condition will continue to get worse with age of the assemblies. This project is being recommended in accordance with the Ghent Boiler Reliability Plan.

Tubing material supply for this project has been sourced using an aggregated competitive bid strategy with the two other large boiler projects mentioned above. The contract for erection is being awarded under the Boiler Craft Labor 2017-2018 contract initiative. ██████████ is the selected bidder for material and ████████████████████ for installation labor.

This project is in the 2017 BP for $3,661k. The incremental 2017 funding was from internal reallocations. The incremental 2018 funding will be requested as part of the 2018 business planning process to be completed later this year.

Background

The Primary Superheater has been in service since startup in 1981. The Primary Superheater is constructed mostly of low alloy carbon steel tubing. Harsh operating conditions in the superheat front backpass have caused tube leaks due to flyash erosion and failures with the tube assembly alignment system. Alignment system failures and related support lug disengagements have led

to fatigue cracking at solid tube ties causing most of more than thirty leaks since 1995. Although original stainless steel alignment system was eventually replaced with a modified design.

The goal of this project is to replace the Primary Superheater and to use an improved design for better alignment and support. The improved design will keep tubes aligned and support lugs engaged to avoid fatigue cracking at solid tube ties. Proposed support systems will reduce or eliminate the use of solid ties in favor of other support mechanisms. Tube shields will be installed to protect from flyash and sootblower erosion. The result of these improvements will be fewer forced outages from tube failures. Also, reduction in the number of different material grades and wall thickness in the primary superheater will be considered to save on fabrication costs and plant tube inventory.

- **Alternatives Considered**

    1. Recommendation: NPVRR: ($000s) $ 4,598
       Execute this project by replacing the Primary Superheater in 2018.

    2. Alternative #1:   NPVRR: ($000s) $ 7,139
       Delay replacement until the next major outage in 2025.
       Forced outages to be expected until implemented. Manage the risk of forced outages with more inspections, tube shielding, dutchmen, pad welding and repairs. Mobilization and unit access costs will be higher for this project and for the Upper Economizer Upper Bank replacement (Project 144311) if not performed during the same outage.

    3. Do Nothing: NPVRR: ($000s) $10,949
       Continue operation and maintenance without replacement.
       Forced outages to be expected to continue. Manage the risk of forced outages with more inspections, tube shielding, dutchmen, pad welding and repairs. Mobilization and unit access costs will be higher for Upper Economizer Upper Bank replacement (Project 144311).

The project cost evaluation shows it is more beneficial to replace the Primary Superheater in 2018 than it is to either delay replacement until the next major outage in 2025 or to Do Nothing and continue operation and maintenance without replacement while risking forced outage leak repairs.

Project Description

- **Project Scope and Timeline**

The Primary Superheater replacement will take place during the fall 2018 outage. The installation work was included in the Boiler Craft Labor 2017-2018 contract initiative. Installation bids were solicited from ten contractors in July 2016. ▆▆▆ is being awarded installation work for the Ghent 2018 outage. Bids for materials were solicited from seven boiler

pressure part suppliers in late January 2017, six of which submitted bids. ███████ is being although awarded the material supply for this project.

Operational and maintenance issues with the existing assemblies have been shared with the bidders to get more focused proposals. An improved design for the support and alignment system with a higher temperature grade of stainless steel and Inconel alignment straps has been specified. The specification has requirements for the location and gauge of tube shields and details for attachment to the tubes. Tube cut points have been selected to facilitate erection. The base bid was for in-kind tube materials. Bidders were permitted to offer alternate materials to consolidate the supply into fewer material changes and fewer shop welds. Various material changes will be implemented with the award to ██████████.

Milestones:
- July 2017 – Investment Committee meeting and approval
- July 2017 – Issue material purchase order
- August 13, 2018 – Material received
- September 24, 2018 – Outage Start Date
- November 18, 2018 – Complete Outage work

- **Project Cost**

    The cost for this project is $4,047k which includes 10% contingency for KU purchased materials and installation labor.

Economic Analysis and Risks

- **Bid Summary**

    Bid Summary (Installation): ██████████████ will be awarded the installation for the firm price of $1,737k based on prior approval on the Boiler Craft Labor 2017-2018 contract initiative.

    Bid Summary (Material Supply): Material for this project will be awarded to ██████████. The tubing material was sourced using an aggregated competitive bidding strategy, illustrated by the table below.

2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.32%
Capital Breakdown:	
Labor:	$ 23
Contract Labor:	$ 2,410
Contract Materials:	$ 985
Burdens:	$ 261
Contingency:	$ 368
Reimbursements:	($0)
Net Capital Expenditure:	$ 4,047

- **Assumptions**

The Capital Evaluation Model contains the following assumptions:
  - 10% contingency and burdens have been included in capital investment costs.
  - Availability Disimprovement (AD) probability is based on 3 forced outages per year and progressively becoming more frequent. Forced outages last 1.5 days each. AD probability is based on historical leaks with age factored.
  - Reduced incremental cost is based on $19k to fix leaks, $130k unit startup cost and $50k preventive maintenance (PM) on assemblies per year. Forced outage maintenance and startup costs are factored based on the AD probability above.
  - 3% inflation assumed per year.
  - Alternative #1 is to delay the project 7 years until the next major outage in 2025.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes Annual
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	Yes

8a.   GADS data shows leaks on 5/24/2012, 1/25/2014 and 7/1/2016.

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**

Choosing one of the alternatives such as not implementing the tube replacement project or delaying the work until the next major outage will lead to forced outages and will have a negative commercial availability impact.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the GH3 Primary Superheater Tube Replacement project for $4,047k to avoid forced outages and to maintain the reliability of Ghent Unit 3.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

_____   _____
Kent W. Blake   Paul W. Thompson
Chief Financial Officer   President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: <u>July 26, 2017</u>

Project Name: <u>GH3 Partial Vertical RH Repl - 2018</u>

Total Expenditures: <u>$3,553k</u>   (Including $323k, or 10% contingency)

Project Number(s): <u>155008</u>

Business Unit/Line of Business: <u>Power Generation</u>

Prepared/Presented By: <u>Ben Zeigler</u>

Executive Summary
The project scope includes the purchase and installation of nineteen vertical reheater tube assemblies for the Ghent Unit 3 boiler. This component has experienced three boiler tube failures in recent years and the rate of failure is expected to increase if repairs are not made. This project will eliminate the sections of tubing that are most affected by corrosive attack. The corrosion is a derivative of high tube temperatures and elevated chlorine content in fuel.

The new reheater assemblies will replace the front and rear portions of the vertical reheater and include all support loops that extend into the penthouse. All assemblies will be fabricated with 304H stainless steel tube material to combat the advanced corrosion. This design will mirror existing elements in this area that are not showing signs of degradation. This change in material selection will not alter the geometry and will have no effect on the overall boiler heat input or combustion process.

This component was replaced in 2003 with additional surface area as an attempt to balance steam temperatures at the time of a selective catalytic reduction equipment addition, burner replacement, and waterwall refractory removal. After experiencing the first tube failure in June of 2015, increased inspection efforts and localized repairs were made to extend the life of this component until a larger scale project could be planned. In order to mitigate future risk of tube failures in this component, it is recommended to replace nineteen assemblies during the fall 2018 outage. This project is being recommended in accordance with the Ghent Boiler Reliability Plan.

Tubing material supply and labor for this project has been sourced using an aggregated competitive bid strategy with two other large boiler projects scheduled for fall 2018 outage.

The project was not included in the 2017 business plan, but is being recommended as a result of recent tube failures and inspections. Funding for this project in 2017 was authorized by the Resource Allocation Committee (RAC) as part of the 2017 5+7 forecast. The 2018 proposed amounts will be requested as part of the 2018 business planning process to be completed later this year.

Background

When this component was replaced in 2003, twenty-four assemblies were made of stainless steel material. These were strategically placed in two separate zones of the boiler that were known to operate at higher temperatures. The other thirty-nine assemblies were made of low alloy carbon steel tubing. The areas just outside of these stainless zones are now experiencing coal ash corrosion due to high tube temperatures and chlorine content. In conjunction with a separate project for the fall 2017 outage, the overall project scope includes twenty-nine new stainless assemblies, leaving ten alloy assemblies in the center of the unit. These are known to operate with cooler tube metal temperatures and current material condition does not warrant replacement.

This project is necessary to address the worst areas of corrosion attack. The existing tubing material is SA-213 T22 and has a chromium (Cr) content of 2.25%. The new assemblies will be fabricated with SA-213 TP304H, which contains up to 20% Cr that will better withstand the operating environment. Extensive inspections and repairs have been made to address this issue. One forced outage occurred due to a tube failure on this component in 2015 and two occurred in 2016. During the fall 2016 outage, twenty-one tubes were replaced in the worst areas, and more were pad welded as an effort to address the immediate need. Upgrading the tube material to stainless in this area will deliver long term protection against high tube temperatures and coal ash corrosion.

- **Alternatives Considered**
  1. Recommended replacement of 19 assemblies   NPVRR: ($000s) $4,022

  2. Defer project 5 years to 2023   NPVRR: ($000s) $6,401

  3. Do nothing. Repair leaks on O&M.   NPVRR: ($000s) $8,058

The recommended option is to replace nineteen assemblies during the fall 2018 outage. This is in conjunction with a separate project to replace an additional ten assemblies during the fall 2017 outage. Alternatively, deferring the project five years to 2023 was also considered. The observed material condition of the tubing provides confidence that the tubing will not last until 2023 without a significant EFOR impact. The risk of tube failures and continued O&M spend will increase substantially if no major replacement is made.

Project Description   **Arbough**

- **Project Scope and Timeline**
  The scope of this project includes a material upgrade to combat high tube temperatures and coal ash corrosion.

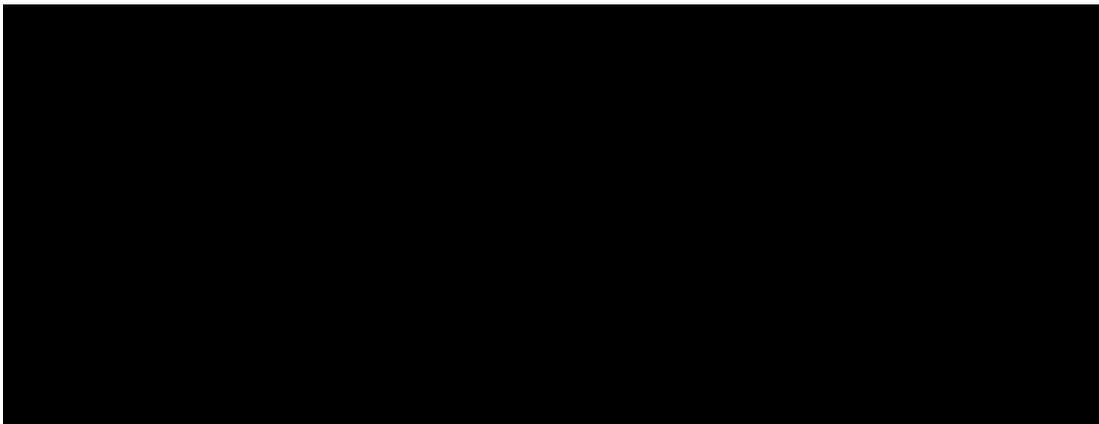
  - 07/26/2017   Project presented for approval before the IC
  - 08/03/2017   Issue purchase order for material
  - 08/03/2017   Issue purchase order for labor
  - 08/13/2018   Material delivered to Ghent for 2018 install
  - 11/16/2018   2018 Outage work complete

- **Project Cost**
  Total cost of the 2018 project is estimated to be $3,553k.

  There is a 10% contingency included with this estimate for both material and labor. Contingency considerations are for additional boiler inspection findings and rigging complication.

Economic Analysis and Risks

- **Labor Bid Summary**
  Labor for this project will be awarded to ████████████████ This project is a negotiated lump sum addition to the competitively bid boiler craft labor package that was issued during the fall of 2016. Two other major projects are being done simultaneously in the same area of the boiler. Due to restrictions and safety concerns, it is necessary for the same mechanical contractor to execute all scopes of work.

- **Material Bid Summary**
  Material for this project will be awarded to ████████ The tubing material was sourced using an aggregated competitive bidding strategy, illustrated by the table below.


- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	135	2,956	-	-	3,091
2. Cost of Removal Proposed	-	462	-	-	462

2. Project O&M 2017 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Note: This project has been included with the 2018 BP.

Financial Summary ($000s):

Discount Rate: 6.32%

Capital Breakdown:
Labor: $ 10
Contract Labor: $ 2,347
Materials: $ 681
Local Engineering: $ 32
Burdens: $ 160
Contingency: $ 323
Reimbursements: ($0)
Net Capital Expenditure: $ 3,553

- **Assumptions**
    1. Availability "disimprovement" was determined to be two three day (0.43 weeks) outages caused by boiler tube failures. An incremental increase in probability is assumed.
    2. Deferring the project to 2023 (alternative #2) assumes a 3% inflation rate and $168k spend is included in 2022 for a material procurement.
    3. Incremental costs are based on $130k for unit start up and $28k for tube failure repair. These costs are multiplied by the probability of disimprovement.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes 2003
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	*Yes

8a. GADS data shows leaks on 06-15-2015, 03-08-2016, and 09-22-2016.

The Ghent Environmental Supervisor and Environmental Affairs has reviewed and approved this project.

- **Risks**
  1. The most significant risks to this project are related to the project schedule. The location of these boiler components require complex rigging and difficult welds to be made.
  2. If this project is delayed, a significant EFOR impact may be realized.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the GH3 Partial Vertical Reheater Replacement - 2018 project for $3,553k to prevent future forced outages and maintain availability.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake	Paul W. Thompson
Chief Financial Officer	President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: 06/27/2018

Project Name: GH3 Waterwall Panel Replacement 2019

Total Expenditures: $2,127k   (Including $178k of contingency)

Project Number(s): 151366

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Benjamin Zeigler/Brad Pabian/Steve Turner

Executive Summary

The project scope includes the purchase and installation of shop fabricated waterwall panels with weld metal overlay for the Ghent 3 boiler furnace. This unit is of Foster Wheeler design with all burners located on the front and rear walls. These new panels will be installed near the combustion zone from the bottom burner elevation extending up above the overfire air elevation for a total height of 44 feet. The scope of this project includes a total of 144 tubes furnished in 20' and 24' panels for a total area of 3,048 sq ft. The new waterwall panels will include Inconel 622 weld metal overlay to increase corrosion resistance while burning Illinois basin coals that have increasing chlorine and sulfur content with a low NOx firing system. The installation of these panels is to be completed during the planned Ghent 3 fall outage in 2019. This project is being recommended in accordance with the Ghent Boiler Reliability Plan.

Competitive bids for tubing material have been solicited. The material order is ready to be awarded upon project approval. Mechanical installation labor will be sourced later this year.

The total project cost is estimated to be $2,127k. A total of $1,934k was included with the 2018BP. Due to changes in burden rates, a total of $1,927k was included with the proposed 2019BP. The additional $200k has been internally funded within the Ghent capital budget.

Background

The goal of this project is to prevent forced outages due to waterwall tubing corrosion that is accelerated by rising chlorine and sulfur content in fuels. The wall fired GH3 boiler has not historically been prone to fireside waterwall wastage, but based upon fleet and industry findings in the post wet flue gas desulfurization and low NOx era, increased efforts have been initiated to monitor the condition of waterwall boiler tubing. Historical tube failures on GH3 have been caused by mechanisms that were initiated from the internal surface of the tube. These issues have largely been addressed with smaller scale repairs, cycle chemistry adjustments, and chemically cleaning the unit. Beginning in 2011, inspections have revealed the tube wall thickness to be wasting away from the fire side of the tube and is now below the minimum wall thickness in some areas. Material thickness readings have indicated that the tubing targeted for replacement has lost approximately 30% of the original wall thickness.

The recent data has shown that large scale replacement projects need to be implemented in a phased approach to address the current (and predicted) condition of the furnace wall tubing. The material wastage rate is expected to increase proportionally with chlorine levels in fuels such as those from the Illinois #6 seam. As a company, we have targeted 25% of non-Powder River Basin burn to come from this seam. Our fleet as well as our industry has seen chlorine levels rise from 800-1200 ppm to 2000-2500 ppm and in some cases over 3000 ppm. This is the main driver for wall wastage rates as high as 0.050" to 0.080" per year.

The recommended weld metal overlay has a negligible effect on heat transfer and will not affect boiler efficiency. This project will not impact the dispatch order or the utilization of the unit. Completion of this project will support the reliable operation and prevent waterwall tube failures due to fireside corrosion.

- **Alternatives Considered**
  1. Recommended 2019 panel replacement   NPVRR: ($000s) $2,383k

  2. Field applied overlay of existing panels   NPVRR: ($000s) $2,451k

  3. Do Nothing   NPVRR: ($000s) $6,476k

The recommended option is to replace 3,048 square feet of furnace wall tubing surface during the 2019 fall outage. This is based on current tubing material condition as measured over the last several years to be below the minimum wall thickness. Two other options were considered as alternatives. The first of which was to apply weld metal overlay to the existing furnace wall in the field. This requires extensive surface preparation via grit blasting and eliminates the possibility of other work in the gas path. In addition to this, the field application process requires a minimum existing tube wall thickness prior to field applying weld metal overlay. There are likely several areas that are approaching this limit, which would require complete tube replacements. Lastly, if field applied weld overlay is selected, the potential safety and reliability benefits of replacing existing tubing with other defects will not be realized. As reflected in the capital evaluation model, doing nothing has a significant impact on EFOR.

Project Description

- **Project Scope and Timeline**
  The scope of this project includes the purchase and installation of furnace waterwall panels with weld metal overlay in zones of fireside corrosion.

  - 04/13/2018   Material bids received
  - 06/27/2018   Project presented to the Investment Committee for approval
  - 11/01/2018   Installation labor secured (as part of aggregated fleet bidding effort)
  - 10/04/2019   Panels due on site
  - 11/04/2019   Outage work begins
  - 11/27/2019   Project complete

- **Project Cost**   **Arbough**
  Total cost of the project is estimated to be $2,127k. There is an 8% contingency included with this estimate for labor. The labor estimate for this project is based on other projects of similar nature and budgetary estimates from craft labor contractors. Also included in this project estimate is funding for scaffold access to the waterwalls. The total cost of this boiler scaffolding will be shared with funds in the O&M outage budget due to the need for normal inspection access. These costs were estimated from previous work of the same scope. Material and labor will be secured via a firm fixed price contract.

Economic Analysis and Risks

- **Labor Bid Summary**
  Budgetary labor estimates have been received for project development. Labor for this project will be sourced later this year.

- **Material Bid Summary**
  Material for this project will be awarded upon approval of the project. Competitive bids have been solicited from 7 suppliers and 5 were received on 04/13/2018. Due to long lead times, potential impacts of tariff changes, and anticipated increases in nickel prices, expedited procurement is attractive.

Reimbursements:	($0)
Net Capital Expenditure:	$2,127

- **Assumptions**

1. For all future costs, a 3% inflation rate was used.
2. The availability disimprovement was determined to be a three day (0.43 weeks) outage caused by a boiler tube failure. An incremental increase in probability is assumed.
3. The alternative case for applying weld metal overlay in the field includes a 20% probability of a tube failure for the first two years after the project is completed. This is based on the assumption that the welding process applied to the large area on the existing furnace wall will add risk in the short term. This process can create defects in the existing tube material that may not be detected due to the inability to perform a hydro test.
4. For the "do nothing" alternative, the duration of the availability disimprovement is increased in future years to reflect multiple boiler tube failures.
5. Incremental costs are based on $130k for unit start up, $28k for tube failure repair, and $15k for boiler deslag. These costs are multiplied by the probability of disimprovement.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit?	Yes 1990's*

	a.	Provide frequency or when equipment or component in question was last repaired or replaced. * Replacement panels from the early to mid-1990's were driven by internal corrosion issues. The scope of this project addresses an external damage mechanism in different areas.	**Arbough**
#8		Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project. * 6/13/2015 – Waterwall tube leak	Yes

The Ghent environment supervisor has reviewed and approved this project.

- **Risks**
  1. If this project is delayed, there will be an increased EFOR risk.
  2. This project is targeted to replace known areas of corrosion. There are likely areas outside of these zones that will need to be addressed with similar projects in the future. Such projects are included with the proposed 2019BP for 2022 and 2025.
  3. The timeline for this project is limited. There is a risk that complications with the material delivery or mechanical installation can extend the length of the planned 2019 outage. This risk will be addressed with firm contractual milestones and associated liquidated damages. Also, the mechanical contractor bidder list for this project has been qualified using metrics for quality, safety, and recent projects of similar scope.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the GH3 Waterwall Panel Replacement project for $2,127k to prevent future forced outages and maintain availability.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: August 29, 2018

Project Name: GH4 PJFF Bag Replacement 19

Total Expenditures: $2,337k   (Including $212k of contingency)

Project Number(s): 135284

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Jen Price / Brad Pabian / Steve Turner

Executive Summary

The project scope includes the purchase and installation of fabric filter bags for the Ghent Unit 4 (GH4) pulse jet fabric filter (PJFF), which contains 17,280 bags. The scope also includes the removal and disposal of used bags, inspection of various pulse air components, replacement of all top hatch door gaskets, and a fluorescent powder leak test to verify proper installation. The proposed work is to be completed during the 2019 GH4 planned spring outage.

In order to continue to meet particulate matter (PM) emissions limits set forth by the Environmental Protection Agency (EPA), it is recommended to replace the fabric filter bags in 2019 before bags begin to fail. Once bag failure occurs, it will continue at an exponential rate and ultimately cause forced outages due to not being able to maintain PM compliance.

If bags are not replaced during the 2019 spring outage, the unit runs the risk of forced outages. If the project is continuously delayed, the probability of forced outages increases each year. The option to change bags in select compartments upon failure not only jeopardizes unit reliability, but also decreases the life of new bags due to the majority of the gas flow going through the new, more permeable bags.

Competitive bids for the above scope have been received. Upon project approval and a detailed bid evaluation, the work will be awarded and material ordered as soon as possible due to a twenty (20) week lead time on the filter bags. The total project cost is estimated to be $2,337k. A total of $2,706k is proposed in the 2019BP. This project was originally proposed in the 2018BP to be completed in 2020, however, bag test results indicated the need to complete the project in 2019. The lower project cost estimate compared to the proposed 2019BP is a result of established bids and eliminating the purchase of new cages after conducting a thorough investigation on the condition of the current cages.

Background   Arbough

The Mercury and Air Toxics Standard (MATS) rule, published in 2012 by the EPA, established emission limits and requirements reflective of maximum achievable control technologies (MACT) for toxic air emissions. In order to assure continuous compliance with the standards set forth within the rule, additional technologies were implemented at each coal-fired generating station within the Louisville Gas & Electric and Kentucky Utilities (LG&E-KU) fleet to allow further flexibility beyond what was currently in place. This included the addition of PJFFs on all four (4) units at Ghent for filterable particulate control.

The Ghent Unit 4 PJFF, designed by Clyde Bergemann Power Group, has been in service since December 2014. The PJFF is comprised of two casings (4-1 and 4-2) each containing ten compartments. Each compartment holds 864 filter bags, totaling 8,640 bags per casing, and 17,280 bags for the entire system. The filter bags, which are woven fiberglass finished with an acid resistant polytetrafluoroethylene (PTFE) membrane, serve as the filtering medium for the boiler flue gas. Each bag is 6" in diameter and 26'-9" in length.

Beginning in the spring of 2016, in-service bags have been sampled from Ghent 4 during unit outages. Third party testing has been performed in order to establish and monitor the bag life cycle; twenty-eight (28) bags have been analyzed to date. In addition to sending off bags for analysis, a leak test utilizing fluorescent powder (identical to the original equipment startup activities) was conducted during the spring 2018 outage to identify bag failures. Although no failed bags were identified during the leak test, bag analysis results have shown lower than expected endurance/durability values which has increased concern regarding remaining bag life.

Since the condition of the cages has been a concern since the start of the bag testing program, an analysis was conducted on the carbon steel cages, which are inserted into each bag for structural support, in order to determine if the original condition of the cages was contributing to bag degradation. During the spring 2018 outage, four (4) cage samples were sent off for analysis, including two (2) used cage samples from the Unit 4 PJFF and two (2) original cage samples from the warehouse. Examination of the used cage samples revealed no evidence of any significant service-induced damage. In particular, there were no signs of measurable corrosion attack nor had any of the joints between the wires and rings separated. The metallurgical condition of the used cage samples was identical to that of the original cage samples. Based on the findings, the cage material (both as-received and service-exposed) would not be expected to affect the long-term performance of the bag material.

In order to ensure continued reliability of the unit, it is recommended to replace the filter bags during the next scheduled 2019 spring outage, while re-using the current cages. At that time, the bags will have been in service for 4 ½ years, reaching the expected 5-year life span. Installation of new bags will allow the unit to continue operating as necessary to comply with PM emissions limits.

- **Alternatives Considered**

  1. Recommendation: Purchase/Install New Bags   NPVRR: ($000s) $2,733
  2. Alternative #1: Delay Project One (1) Year   NPVRR: ($000s) $2,881
  3. Alternative #2: Do Nothing   NPVRR: ($000s) $11,447

  Recommendation – Purchase/Install New Bags
  The purchase and installation of new bags in 2019 is the recommended option. This plan is least cost over the life of the project, avoids the probability of unit outages, and ensures PM emissions compliance.

  Alternative #1 – Delay Project One (1) Year
  Delaying the project one (1) year to the next planned unit outage presents multiple risks. These risks include decreased PM removal efficiency and risk of unit outages due to inability to maintain environmental compliance. As bags start to fail, the failure will accelerate exponentially leading to PM compliance issues and potentially multiple unit outages to replace failed filter bags. This alternative is not recommended due to the above risks and unfavorable NPVRR.

  Alternative #2 – Do Nothing
  This alternative is not recommended as this would yield a high probability of forced unit outages and would be unfavorable to unit operations.

Project Description

- **Project Scope and Timeline**

  Ghent Unit 4 work is scheduled to be performed during the spring 2019 outage. At the earliest, the PJFF can be accessed beginning on March 4, 2019. All work, including the leak test and final inspections, is to be complete by March 29, 2019. The below scope items have been competitively bid as a turnkey project; a single bidder will be awarded both the bag purchase and installation services.

  The project scope includes the following:
  - New filter bag fabrication
  - Inspection of pulse air components including pulse air piping, headers, and j-pipes
  - Removal of existing bags and cages
  - Disposal of used bags
  - Installation of new bags and existing cages
  - Replacement of top hatch door gaskets (labor only, not material)
  - Leak test with fluorescent powder to ensure proper installation
  - Optional bag pre-coat if contractor deems hydrated lime is not acceptable

The expected project milestones are as follows:

- o June 2018   RFQ released
- o July 2018   Bids received
- o September 2018   Award contract, place order for new bags
- o January 2019   Delivery of new bags
- o February 2019   Pre-outage mobilization activities
- o March 2019   Outage starts, work begins, work complete

- **Project Cost**

The total project cost is $2,337k, including $212k of contingency. The total cost is based on received bids for labor, material, and equipment. The dollar amount from the highest bidder was used as the basis for the estimated project cost, as a conservative approach since bid evaluation is ongoing. Also included in the cost is funding for top hatch gasket material (provided by KU) and estimated KU labor throughout the duration of the project.

Economic Analysis and Risks

- **Bid Summary**

MBE/WBE	
Removal Labor	
Installation Labor	
Removal Equipment	
Installation Equipment	
Material	
Other Pricing	
Total ($000s)	

███ was the only bidder to include other pricing. This price is a combination of equipment and labor for both removal and installation activities. Specifically, it is the cost of a vacuum truck, labor to handle the equipment, and labor to inspect clean up. This scope was included in the RFQ requirements, and other bidders included the cost in their base offering.

- **Budget Comparison and Financial Summary**

3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$6
Contract Labor:	$575
Materials:	$1,347
Equipment	$102
Other Pricing:	$70
Burdens:	$25
Contingency:	$212
Reimbursements:	($0)
Net Capital Expenditure:	$2,337

- **Assumptions**

For the recommended project, the following assumptions were made:
   o Capital spend only occurring in 2019
   o All fabric filter bags will be supplied by the contractor
   o 10% contingency on total project cost

For alternative #1, delay the project one (1) year, the following assumptions were made:
   o Capital spend occurring in 2019 and 2020
   o 10% milestone payment on the fabric filter bags in 2019 based off the material cost
   o 2% inflation rate
   o 25% probability of a four (4) day forced outage due to replacing failed bags

o   Incremental costs include labor and material for replacing bags in two (2) through compartments if a failure occurred; labor rates from the highest bidder were used as well as assuming the bags will be checked out of Ghent's warehouse at the current burden rate of 20%

For alternative #2, do nothing, the following assumptions were made:
o   25% probability of a four (4) day forced outage starting in 2019 and increasing by 25% each year; the probability would be 100% by 2022
o   Incremental costs for 2019-2022 are the same as alternative #1, including 2% inflation each year
o   100% probability of a one (1) week forced outage starting in 2023 and occurring indefinitely
o   Incremental costs for 2023 and beyond include labor and material for replacing bags in four (4) total compartments, including 2% inflation each year

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit?	Yes
	a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	No
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

The Ghent Environmental Supervisor has reviewed and approved this project.

- **Risks**

Failure to meet particulate emissions limit: If the filter bags are not replaced there is a risk that particulate emissions will increase and pose a risk to the unit's reliability.

Forced outages: If the bags are not replaced there is a risk that the particulate emissions will not meet compliance regulations and the unit will be forced to take outages to replace sections of broken bags.

Changing bags online: The bags could be changed one compartment at a time while the Unit remains online, however, the life expectancy of the new bags would be greatly affected due to gas flow taking the path of least resistance through the new, clean bags. Also, changing the bags online constitutes a higher risk in safety.

Limited timeline: The timeline for this project is limited due to material lead time. There is a risk that if an order for the material is not submitted in the 3rd quarter of 2018, the filter bags may not be delivered in time for the spring outage. This could result in an extended outage or a one (1) year delay in the project.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the GH4 PJFF Bag Replacement project for $2,337k to continue to meet particulate matter emission limits and avoid forced unit outages.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: October 31, 2018

Project Name: GH4 Primary SH Repl

Total Expenditures: $3,826k   (Including $217k of contingency)

Project Number(s): 137474

Business Unit/Line of Business: <u>Ghent Generating Station / Power Generation</u>

Prepared/Presented By: <u>Stephen Nix / Steve Turner</u>

Executive Summary

This project is for replacement of the Primary Superheater in the furnace backpass of Ghent Unit 4. A similar project is being completed on Ghent Unit 3 during the fall 2018 outage as the result of numerous tube failures. The scope of this project includes the design and supply of new assemblies with installation during the spring 2020 outage. This boiler section is planned to be replaced simultaneously with both the Upper Economizer Upper Bank (Project 137244) which is situated directly below in the same boiler gas backpass and the Vertical Reheater (Project 155017) which is situated directly above. Materials for all three projects will be designed and fabricated by the same supplier with installation by the same contractor. The Unit 4 Primary Superheater is original to the unit. There are design issues with tube support connections (solid ties) which have caused numerous leaks over the past two decades. This condition will continue to get worse with age of the assemblies. As Unit 3 is three years older than Unit 4, the degraded condition and failures were first seen on that unit. Proactive maintenance has helped mitigate tube leaks on Unit 4 to this point, but as wear continues deeper in the tube banks, failures are anticipated to mirror that of Unit 3. This project is being recommended in accordance with the Ghent Boiler Reliability Plan.

Tubing material supply for this project and the two other large boiler projects mentioned above is being sole sourced to ▮▮▮▮▮▮ using the aggregated competitive bid strategy performed for Unit 3 as the basis. This approach is providing cost savings on engineering and will maintain the same design that was provided for the identical project scope on Ghent Unit 3. The contract for erection is being competitively bid and awarded under the Boiler Craft Labor 2019-2020 contract initiative.

This project was first submitted in the 2013 BP, is approved for $4,243k in the 2018BP, and was proposed for $4,169k in the 2019BP. Although labor bids are still being negotiated, preliminary bid information was utilized to develop the installation cost. In the 2018 8+4 forecast, the Resource Allocation Committee (RAC) approved $312k to be spent in 2018. These funds will be pulled forward from 2019 and will allow for initial milestone payments on materials. The funds for this project in the 2018 RAC approved forecast and 2019BP which are in excess of the

requested amount will be used in part to offset funding needs for other Ghent boiler projects. Although associated with this outage.

Background

The Unit 4 Primary Superheater has been in service since startup in 1984. The Primary Superheater is constructed mostly of low alloy carbon steel tubing. Normal operating conditions and years of service in the superheat front backpass have caused tube leaks due to flyash erosion and failures with the tube assembly alignment system. Alignment system failures and related support lug disengagements will lead to fatigue cracking at solid tube ties. More than thirty leaks have occurred on the identical Foster Wheeler assemblies in Unit 3. There have been three leaks in these assemblies on Unit 4 in the last 5 years.

The goal of this project is to replace the Primary Superheater and to use the improved design being installed on Unit 3 for better alignment and support. The improved design will keep tubes aligned and support lugs engaged. Solid tube ties will be eliminated. Tube shields will be installed to protect from flyash and sootblower erosion. The result of these improvements will be fewer forced outages from tube failures. Also, a reduction in the number of different material grades and wall thickness in the primary superheater will save on fabrication costs and plant tube inventory.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $4,055
     Execute this project by replacing the Primary Superheater in 2020.

  2. Delay project to 2027 (next major outage)   NPVRR: ($000s) $5,990
     Forced outages to be expected until implemented. Manage the risk of forced outages with more inspections, tube shielding, dutchmen, pad welding and repairs. Mobilization and unit access costs will be higher for this project and for the Upper Economizer Upper Bank replacement (Project 137244) if not performed during the same outage.

  3. Do nothing. Repair leaks on O&M   NPVRR: ($000s) $9,134
     Continue operation and maintenance without replacement. Forced outages have a high probability to increase. Manage the risk of forced outages with more inspections, tube shielding, dutchmen, pad welding and repairs.

The project cost evaluation shows it is more beneficial to replace the Primary Superheater in 2020 than it is to either delay replacement until the next major outage in 2027 or to Do Nothing and continue operation and maintenance without replacement while risking forced outage leak repairs.

Project Description

- **Project Scope and Timeline**

The Primary Superheater replacement will take place during the spring 2020 outage. The Arbough installation work was included in the Boiler Craft Labor 2019-2020 contract initiative. Installation bids were solicited from multiple contractors in July 2018 and are being evaluated. Tubing material supply for this project is being sole sourced using the January 2017 Unit 3 competitive bid as a basis. Those bids for materials were solicited from seven boiler pressure part suppliers. This strategy will maintain a consistent design between Units 3 and 4 as well as offering savings on engineering costs.

The goal for the new Unit 3 design was to resolve operational and maintenance issues with the existing assemblies. Additional alignment straps made of temperature resistant Inconel material will be added to enable the elimination of solid ties in favor of tube saddles. Tube shields will be added in the sootblowing lanes. Tube cut points have been selected to facilitate erection. Tube material changes are being reduced so there will be fewer shop welds.

Milestones:
- October 2018 – Investment Committee meeting and approval
- November 2018 – Issue material purchase order
- February 2020 – Material received
- March 2020 – Outage Start
- May 2020 – Complete Outage work

- **Project Cost**

  Total cost of the 2020 project is estimated to be $3,826k.

  There is a 5% contingency for material and a 7% contingency for installation. Contingency considerations are included during the execution of the material contract in 2019 and 2020 and for installation during the outage in 2020.

Economic Analysis and Risks

- **Bid Summary**

Bid Summary (Installation): Bids for these projects were received under the Boiler Craft Labor 2019-2020 contract initiative and are being reviewed. Although labor bids are still being negotiated, preliminary bid information was utilized to develop the installation cost. A labor contract will be presented to the Investment Committee at a later date.

Bid Summary (Material Supply): Material for this project is proposed to be sole sourced to ▮▮ ▮▮▮▮ for $1,413k. Nearly the same scope of supply was competitively bid for Ghent Unit 3 along with two other large boiler projects in 2017. ▮▮▮▮▮▮ was the successful bidder. Utilizing ▮▮▮▮▮▮ reduces engineering costs and maintains the same component design on Ghent 3 and 4.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total
1. Capital Investment Proposed	261	901	1,931		3,093

2. Project O&M 2018 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$22
Contract Labor:	$1,865
Materials:	$1,426
Local Engineering:	$0
Burdens:	$296
Contingency:	$217
Reimbursements:	($0)
Net Capital Expenditure:	$3,826

- **Assumptions**

The Capital Evaluation Model contains the following assumptions:
- o 5% contingency on boiler tube material supply and 7% contingency on installation plus burdens have been included in capital investment costs.
- o Availability Disimprovement (AD) for Unit 4 was calculated based on Unit 3 forced outage data. Unit 3 has been in service three years longer. Failures will likely parallel Unit 3 and be in eroded areas deeper in the tube bank which are inaccessible to boiler inspectors.
- o Availability Disimprovement (AD) probability is based on three forced outages per year and progressively becoming more frequent. Forced outages last 1.5 days each. AD probability is based on historical leaks with age factored.

- o Incremental cost is based on $19k to fix leaks, $130k unit startup cost and $50k **Arbough** preventive maintenance (PM) on assemblies per year. After project implementation, annual PM costs are zero. PM costs increase with age. Forced outage maintenance and startup costs are factored based on the AD probability above.
- o 3% inflation assumed per year for Incremental Costs and delayed Capital Investment project.
- o Alternative #1 is to delay the project 7 years to the next major outage in 2027.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit?	Yes
	a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit?	Yes
	a. Provide frequency or when equipment or component in question was last repaired or replaced.	Annual
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment?	Yes
	a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	

8a. GADS data shows leaks on 10/14/2013, 5/3/2017 and 7/15/2017.

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**

Choosing one of the alternatives such as not implementing the tube replacement project or delaying the work until the next major outage will lead to forced outages and will have a negative commercial impact.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the GH4 Primary SH Repl project for $3,826k to avoid forced outages and to maintain the reliability of Ghent Unit 4.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: October 31, 2018

Project Name: GH4 Upper Econ Repl

Total Expenditures: $2,783k   (Including $175k of contingency)

Project Number(s): 137244

Business Unit/Line of Business: <u>Ghent Generating Station / Power Generation</u>

Prepared/Presented By: <u>Stephen Nix / Steve Turner</u>

Executive Summary

This project is for replacement of the Upper Economizer Upper Bank in the furnace backpass of Ghent Unit 4. A similar project is being completed on Ghent Unit 3 during the fall 2018 outage as the result of numerous tube failures. The scope of this project includes the design and supply of new assemblies with installation during the spring 2020 outage. This boiler section is planned to be replaced simultaneously with both the Primary Superheater (Project 137474) which is situated above in the same boiler gas backpass and the Vertical Reheater (Project 155017) which is situated directly above the Primary Superheater. Materials for all three projects will be designed and fabricated by the same supplier with installation by the same contractor. The Unit 4 Upper Economizer Upper Bank is original tubing to the unit. There are design issues related to tube support disengagement and areas subject to fly ash and sootblower erosion. These conditions will continue to get worse with age of the assemblies. As Unit 3 is three years older than Unit 4, the degraded condition and failures were first seen on that unit. Proactive maintenance has helped mitigate tube leaks on Unit 4 to this point, but as wear develops out of reach of boiler inspectors deeper in the tube banks, failures are anticipated to mirror that of Unit 3. This project is being recommended in accordance with the Ghent Boiler Reliability Plan.

Tubing material supply for this project and the two other large boiler projects mentioned above is being sole sourced to ▇▇▇▇▇ using the aggregated competitive bid strategy performed for Unit 3 as the basis. This approach is providing cost savings on engineering and will maintain the same design that was provided for the identical project scope on Ghent Unit 3. The contract for erection is being competitively bid and awarded under the Boiler Craft Labor 2019-2020 contract initiative.

This project was first submitted in the 2013 BP, is approved for $1,816k in the 2018BP, and $1,707k was proposed in the 2019BP. The increased cost is due to increased material costs and higher than expected installation labor costs. Although labor bids are still being negotiated, preliminary bid information was utilized to develop the installation cost. In the 2018 8+4 forecast, the Resource Allocation Committee (RAC) approved $162k to be spent in 2018. These funds will be pulled forward from 2019 and will allow for initial milestone payments on

materials. The incremental costs in each year of spend on this project will be funded internally through within the Ghent Capital Budget.

Background

The Unit 4 Upper Economizer Upper Bank has been in service since startup in 1984. The Upper Economizer Upper Bank is constructed from carbon steel tubing. Operating conditions in the backpass have caused tube leaks due to flyash and sootblower erosion. Misalignment and support lug disengagement also increases stress in the assemblies. Erosion caused a tube leak in 2016.

This bank of tubing will be replaced before forced outages begin to happen regularly as they did on the identical Foster Wheeler assemblies on Unit 3 where erosion has caused four leaks from 2011 to 2015. Since 2012, forty-six dutchmen tube sections have been installed across thirty-three assemblies during scheduled outages. Many tubes replaced during the scheduled outages were below 50% minimum wall thickness. The actions taken between 2012-2015 were critical in keeping this component from becoming a major EFOR contributor.

The goal of this project is to replace the Upper Economizer Upper Bank with a combination of thicker tube, weld overlay and tube shields in targeted high risk areas. The improved design will provide better resistance to erosion and reduced maintenance in the long term. Tube shields will be located in sootblower lanes to protect from erosion. The result of these improvements will be fewer forced outages from tube failures.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $2,937
     Execute this project by replacing the Upper Economizer Upper Bank in 2020.

  2. Delay project to 2027 (next major)   NPVRR: ($000s) $4,822
     Forced outages to be expected until implemented. Manage the risk of forced outages with more inspections, tube shielding, dutchmen, pad welding and repairs. Mobilization and unit access costs will be higher for this project and for the Primary Superheater replacement (Project 137474) if not performed during the same outage.

  3. Do nothing. Repair leaks on O&M   NPVRR: ($000s) $8,257
     Continue operation and maintenance without replacement.
     Forced outages have a high probability to increase. Manage the risk of forced outages with more inspections, tube shielding, dutchmen, pad welding and repairs.

The project cost evaluation shows it is more beneficial to replace the Upper Economizer Upper Bank in 2020 than it is to either delay replacement until the next major outage in 2027 or to Do Nothing and continue operation and maintenance without replacement while risking forced outage leak repairs.

Project Description

- **Project Scope and Timeline**

The Upper Economizer Upper Bank replacement will take place during the spring 2020 outage. The installation work was included in the Boiler Craft Labor 2019-2020 contract initiative. Installation bids were solicited from multiple contractors in July 2018 and are being evaluated. Tubing material supply for this project is being sole sourced using the January 2017 Unit 3 competitive bid as a basis. Those bids for materials were solicited from seven boiler pressure part suppliers. This strategy will maintain a consistent design between Units 3 and 4 as well as offering savings on engineering costs.

The goal for Unit 4 assemblies is to use the same design as on Unit 3. This design will resolve operational and maintenance issues with the existing assemblies. An improved design with a combination of thicker tube, weld overlay and tube shields on bends and fully shielded end assemblies has been specified. Tube cut points have been selected to facilitate erection. Tube shields will be added in the sootblowing lanes. Tube material changes are being reduced so there will be fewer shop welds.

Milestones:
- October 2018 – Investment Committee meeting and approval
- November 2018 – Issue material purchase order
- February 2020 – Material received
- March 2020 – Outage Start
- May 2020 – Complete Outage work

- **Project Cost**

Total cost of the 2020 project is estimated to be $2,783k.

There is a 5% contingency for material and an 8% contingency for installation. Contingency considerations are included during the execution of the material contract in 2019 and 2020 and for installation during the outage in 2020.

Economic Analysis and Risks

- **Bid Summary**

Bid Summary (Installation): Bids for these projects were received under the Boiler Craft Labor 2019-2020 contract initiative and are being reviewed. Although labor bids are still being negotiated, preliminary bid information was utilized to develop the installation cost. A labor contract will be presented to the Investment Committee at a later date.

Bid Summary (Material Supply): Material for this project is proposed to be sole sourced to ▉▉ ▉▉▉▉ for $884k. Nearly the same scope of supply was competitively bid for Ghent Unit 3 along with two other large boiler projects in 2017. ▉▉▉▉▉▉ was the successful bidder. Utilizing ▉▉▉▉▉▉ reduces engineering costs and maintains the same component design on Ghent 3 and 4.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total
1. Capital Investment Proposed	163	567	1,453		2,183
2. Cost of Removal Proposed			600		600
3. Total Capital and Removal Proposed (1+2)	163	567	2,052	-	2,783
4. Capital Investment 2018 BP		573	1,087		1,660
5. Cost of Removal 2018 BP			155		155
6. Total Capital and Removal 2018 BP (4+5)	-	573	1,243	-	1,816
7. Capital Investment variance to BP (4-1)	(163)	6	(365)	-	(523)
8. Cost of Removal variance to BP (5-2)	-	-	(444)	-	(444)
9. Total Capital and Removal variance to BP (6-3)	(163)	6	(810)	-	(967)

Financial Detail by Year - O&M ($000s)	2018	2019	2020	Post 2020	Total
1. Project O&M Proposed					-
2. Project O&M 2018 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$15
Contract Labor:	$1,502
Materials:	$895
Local Engineering:	$0
Burdens:	$196
Contingency:	$175
Reimbursements:	($0)
Net Capital Expenditure:	$2,783

- **Assumptions**

The Capital Evaluation Model contains the following assumptions:
  - 5% contingency on boiler tube material supply and 8% contingency on installation plus burdens have been included in capital investment costs.
  - Availability Disimprovement (AD) for Unit 4 was calculated based on Unit 3 forced outage data. Unit 3 has been in service 3 years longer. Failures will likely parallel Unit 3 and be in eroded areas deeper in the tube bank which are inaccessible to boiler inspectors.
  - Availability Disimprovement (AD) probability is based on three forced outages per year and progressively becoming more frequent. Forced outages last 1.5 days each. AD probability is based on historical leaks with age factored.
  - Incremental cost is based on $19k to fix leaks, $130k unit startup cost and $50k preventive maintenance (PM) on assemblies per year. After project implementation

annual PM costs are zero. PM costs increase with age. Forced outage maintenance though Arbrough startup costs are factored based on the AD probability above.

o 3% inflation assumed per year for Incremental Costs and delayed Capital Investment project.

o Alternative #1 is to delay the project 7 years to the next major outage in 2027.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit?	Yes
	a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit?	Yes
	a. Provide frequency or when equipment or component in question was last repaired or replaced.	Annual
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment?	Yes
	a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	

8a. GADS data shows leaks 3/14/16.

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**

Choosing one of the alternatives such as not implementing the tube replacement project or delaying the work until the next major outage will lead to forced outages and will have a negative commercial impact.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the GH4 Upper Econ Repl project for $2,783k to avoid forced outages and to maintain the reliability of Ghent Unit 4.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: October 31, 2018

Project Name: GH4 Vertical RH Partial Repl

Total Expenditures: $4,041k   (Including $244k of contingency)

Project Number(s): 155017

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Ben Zeigler/Steve Turner

Executive Summary

This project scope includes the purchase and installation of twenty-nine vertical reheater tube assemblies for the Ghent Unit 4 boiler. A similar project was completed on Ghent Unit 3 during the fall 2018 outage as the result of several tube failures driven by corrosive attack from various fuel constituents, primarily chlorine. Inspection data shows that tube failures on Ghent 4 are expected if repairs are not made. The scope of this project includes the front and rear portions of the vertical reheater and includes all support loops that extend into the penthouse. All assemblies will be fabricated with 304H stainless steel tube material to combat the advanced corrosion. This design will mirror existing elements in this area that are not showing signs of degradation. This change in material selection will not alter the geometry and will have no effect on the overall boiler heat input or combustion process. This boiler section is planned to be replaced simultaneously with both the Upper Economizer Upper Bank (Project 137244) and the Primary Superheater (Project 137474) which are situated directly below the front vertical reheat.

This component was replaced in 2002 with additional surface area as an attempt to balance steam temperatures at the time of a selective catalytic reduction equipment addition, burner replacement, and waterwall refractory removal. After discovering advanced corrosion occurring in this same component on Ghent 3, increased inspection efforts and localized repairs were made to extend the life of the component until a larger scale project could be planned. In order to mitigate future risk of tube failures in this component, it is recommended to replace twenty-nine assemblies during the spring 2020 outage. This project is being recommended in accordance with the Ghent Boiler Reliability Plan.

Tubing material supply for this project and the two other large boiler projects mentioned above is being sole sourced to ▓▓▓▓▓▓ using the aggregated competitive bid strategy performed for Unit 3 as the basis. This approach is providing cost savings on engineering and will maintain the same design that was provided for the identical project scope on Ghent Unit 3. The contract for erection is being competitively bid and awarded under the Boiler Craft Labor 2019-2020 contract initiative.

A total of $5,116k was included in the 2018BP and $5,104k is included in the proposed 2019BP. Although This project is currently estimated to cost $4,041k. Although labor bids are still being negotiated, preliminary bid information was utilized to develop the installation cost. The funds for this project in the 2019BP which are in excess of the requested amount will be used in part to offset funding needs for other Ghent boiler projects associated with this outage. In the 2018 8+4 forecast, the Resource Allocation Committee (RAC) approved $126k to be spent in 2018. These funds will be pulled forward from 2019 and will allow for initial milestone payments on materials. Incremental costs in 2018 and 2019 over the BP amount will be funded within the Ghent Capital Budget.

Background

When this component was replaced in 2002, twenty-four of sixty-three assemblies were made of stainless steel material. These were strategically placed in two separate zones of the boiler that were known to operate at higher temperatures. The other thirty-nine assemblies were made of low alloy carbon steel tubing. The areas just outside of these stainless zones are now experiencing coal ash corrosion due to high tube temperatures and elevated chlorine content in fuel. The project scope includes twenty-nine new stainless assemblies, leaving ten alloy assemblies in the center of the unit. These are known to operate with cooler tube metal temperatures and current material condition does not warrant replacement. The project scope does include the replacement of the single most damaged circuit in these ten assemblies that will remain.

This project is necessary to address the worst areas of corrosion attack. The existing tubing material is SA-213 T22 and has a chromium (Cr) content of 2.25%. The new assemblies will be fabricated with SA-213 TP304H, which contains up to 20% Cr that will better withstand the operating environment. Extensive inspections and repairs have been made to address this issue. During the spring 2017 outage, seven individual tubes were replaced to address immediate reliability risk. The same damage mechanism was found on Ghent Unit 3 and has caused three tube failures. While there has not yet been any tube failures on Ghent Unit 4 due to this issue, this project is necessary to prevent them. Upgrading the tube material to stainless in this area will deliver long term protection against high tube temperatures and coal ash corrosion.

- **Alternatives Considered**
    1. Recommended replacement of 29 assemblies   NPVRR: ($000s) $4,466

    2. Defer project 7 years to 2027   NPVRR: ($000s) $6,094

    3. Do nothing. Repair leaks on O&M   NPVRR: ($000s) $6,178

The recommended option is to replace twenty-nine assemblies during the spring 2020 outage. Alternatively, deferring the project seven years to 2027 was also considered. The observed material condition of the tubing provides confidence that the tubing will not last until 2027 without a significant EFOR impact. The risk of tube failures and continued O&M spend will increase substantially if no major replacement is made.

Project Description   **Arbough**

- **Project Scope and Timeline**
  The scope of this project includes a material upgrade to combat high tube temperatures and coal ash corrosion.
  - October 2018   IC meeting and approval
  - November 2018   Issue purchase order for material
  - February 2020   Material delivered to Ghent for 2020 install
  - March 2020   Outage start
  - May 2020   Complete outage work

- **Project Cost**
  Total cost of the 2020 project is estimated to be $4,041k.

  There is a 5% contingency for material and an 8% contingency for labor. Contingency considerations are for additional boiler inspection findings and rigging complication.

Economic Analysis and Risks

- **Bid Summary**

Bid Summary (Installation): Bids for these projects were received under the Boiler Craft Labor 2019-2020 contract initiative and are being reviewed. Although labor bids are still being negotiated, preliminary bid information was utilized to develop the installation cost. A labor contract will be presented to the Investment Committee at a later date.

Bid Summary (Material Supply): Material for this project is proposed to be sole-sourced to ▮▮ ▮▮▮ for $1,196k. The same scope of supply was competitively bid for Ghent Unit 3 along with two other large boiler projects in 2017. ▮▮▮▮▮ was the successful bidder. Utilizing ▮▮▮▮ reduces engineering costs and maintains the same component design on Ghent 3 and 4.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total
1. Capital Investment Proposed	221	618	2,236		3,075

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$40
Contract Labor:	$2,249
Materials:	$1,219
Local Engineering:	$0
Burdens:	$289
Contingency:	$244
Reimbursements:	($0)
Net Capital Expenditure:	$4,041

- **Assumptions**
  - Discount rate of 6.59% was obtained from the current CEM model
  - Availability "disimprovement" was determined to be two three day (0.43 weeks) outages caused by boiler tube failures. An incremental increase in probability is assumed.
  - Deferring the project to 2027 (alternative #2) assumes a 3% inflation rate. Spending is included in 2025 and 2026 for material procurement.
  - Incremental costs are based on, $130k for unit start up, and $28k for tube failure repair. These costs are multiplied by the probability of disimprovement.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes 2002
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment?	No

	a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	**Arbough**

The Ghent Environmental Supervisor and Environmental Affairs has reviewed and approved this project.

- **Risks**
  - The most significant risks to this project are related to the project schedule. The location of these boiler components require complex rigging and difficult welds to be made.
  - If this project is delayed a significant EFOR impact will be realized.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the GH4 Vertical RH Partial Repl project for $4,041k to avoid future forced outages and to maintain the reliability of Ghent Unit 4.

Approval Confirmation for Capital Projects Greater Than $2 million:

Investment Proposal for Investment Committee Meeting on: December 19, 2016

Project Name: Ghent 138kv Switchyard Reconfiguration

Total Expenditures: $4,647k (Including $371k of Contingency)

Project Number(s): Substation Construction – 131355, P&C – 150644

Business Unit/Line of Business: Generation

Prepared/Presented By: Ritchie Chambless – Project Manager, Generation
                       Chris Talley – Manager, Transmission Substation Construction

---

Executive Summary

Generation and Transmission recommend reconfiguring the Ghent 138kv switchyard as described below to eliminate a single point of failure for the Ghent Unit 1 generator, improve the ability to perform switchyard maintenance and improve switchyard reliability.

- Install tie-breaker between 716 & 754 breakers for connecting Unit 1 generator to either the south bus or north bus.
- Install tie-breaker between 724 & 764 breakers and separate the existing common bus and protection system so it can be operated as a two bus system.
- Install protection relaying for normal breaker and a half operation as in our 345kv switchyard.
- Disconnect the T-389 345kv/138kv tie transformer from the south bus and reconnect to the north bus.

The 2011 Fleet Single Point of Failure Analysis identified a single point of failure in the Ghent 138kv switchyard for GH1 generator. The GH1 generator is connected to the north 138kv bus through a single circuit breaker and an isolation disconnect switch. A breaker failure, disconnect switch failure or a 138kv bus outage will force Unit 1 generator off line.

The project estimated cost is $4,647k, with $624k in 2016, $3,694k in 2017 and $329k in 2018. This project was included in Power Generation's 2016 BP (project 137024). Since the project involves Transmission assets, the BP was moved from Power Generation to Transmission in the 2017 BP. Transmission's 2017 BP for the project is $4,210k with $599k in 2016, $3,101 in 2017 and $510k in 2018.

The cost estimate was revised after the BP submittal based on further development of the scope as part of the engineering effort. The increased cost ($437k) between the 2017 BP and the estimated cost is primarily due to the need to expand the control building.The 2016 spending was approved by the RAC in the 10+2 forecast to complete the design to obtain firm pricing. The 2017 variance will be addressed through the allocation of funds through the RAC during 2017.

The 138kv switchyard is comprised of a north bus and a south bus that are operated as one common bus via a normally closed tie switch. The following issues arise when a bus fault occurs with our existing common bus configuration. Transmission loses network connectivity of the 138kv lines leaving the switchyard. Ghent Station loses GH1 and GH3 25kv reserve power system, one of the Coal Combustion Residual (CCR) power sources, one ammonia farm power source and one limestone prep power source. As a result GH1 is forced into an uncontrolled shutdown which presents severe risks to the boiler and potential catastrophic damage to the turbine-generator. Separating the two buses and providing separate protection for each bus will insure one bus will be in operation when there is a fault on the other bus. The existing 138kV switchyard configuration as well as the recommended single line is shown in Appendix 1.

The 138kv switchyard is connected to the Ghent 345kv system through two different 345kv/138kv autotransformers. Both autotransformers are connected to the south 138kv bus. GH1 generator is connected to the north 138kv bus. An outage on the south bus will force a load limit on GH1 generator because the capability of GH1 generator is greater than the two 138kv transmission lines connected to the north bus.

Background
The existing Ghent 138kv switchyard was designed and built over 40 years ago and does not provide the level of redundancy and reliability required by today's operating standards. The 2011 Fleet Single Point of Failure Analysis identified a single point of failure in the Ghent 138kv switchyard for GH1 generator. Failure of the 716 breaker or a 138kv bus fault forces a GH1 generator outage.

When GH1 and the GH1/GH3 25kv reserve system trip during a 138kv bus fault, GH1 comes off line uncontrolled, meaning without auxiliary power to the unit. Consequently, the unit must rely on emergency backup systems to ensure proper cooling and lubrication via DC pumps and battery backup. The intent of these systems are to protect the unit in the most extreme circumstances such as a major transmission failure, not a bus fault. Additionally, without auxiliary power, major systems such as the boiler feed pumps will trip without backup, resulting in a dry boiler and related overheating issues and extended startup time waiting for drum metal temperatures to stabilize. An emergency quench system will initiate to protect the scrubber mist eliminators. The baghouse will go into bypass to prevent overheating and catching fire. DC motors will put the turbine on turning gear to prevent bowing of the rotor. DC lube oil and seal oil pumps will come on to protect the turbine generator bearings and ensure generator seals continue to contain hydrogen. Failure of the UPS system and any of these systems can result in extended outage times and major financial impact. An uncontrolled unit shutdown presents severe risks to the boiler and potential catastrophic damage to the turbine-generator. The estimated cost to rebuild a turbine-generator set after a catastrophic failure is $135M in 2016 dollars with the unit offline 24 to 36 months. There have been similar units in the industry retired after a catastrophic failure.

An uncontrolled unit shutdown with loss of auxiliary power also causes the limestone and Arbough gypsum sumps to overflow potentially resulting in limestone and gypsum slurry releases into the Ohio River through storm drains.

A 138kv bus fault also trips the GH3 25kv reserve system which prevents a GH3 controlled shutdown or start-up if required at the time of the bus fault.

In addition to addressing operational concerns at the plant, this proposed project presents the following benefits to Transmission:
- An outage to the bus in the existing configuration results in the loss of (2) 450 MVA, 345/138kV transformers as well as (6) 138kV lines on a radial feed from the remote end.   Upon completion of this project, a bus outage will lead to the loss of a 345/138kV transformer and a single 138kV line on a radial feed.
- Outages to complete routine maintenance of equipment will be less problematic due to operational flexibility offered by reconfiguring the switchyard.
- Protection schemes will be upgraded from electromechanical schemes to microprocessor based relays. This will also include establishing a redundant protection scheme for both the bus and lines.

Listed below are incidents on record that have caused forced outage time on GH1 generator. A 138kv bus outage also occurred during the 11/13/15 and 6/14/07 incidents.
- 11-18-2015 – 5.73 hours of GH1 forced outage. Disconnect switch 703 failed which forced Unit 1 off line at 2124 hours. The disconnect switch was repaired and Unit 1 was placed back on line 11-19-2015 at 0308 hours.
- 11-13-2015 – 54.25 hours of GH1 forced outage. Disconnect switch 716B failed which caused 716 breaker to fail. GH1 tripped at 2223 hours. The disconnect switch and breaker were replaced and GH1 was placed back on line 11-16-2015 at 0438 hours.
- 6-14-2007 – 10.42 hours of GH1 forced outage. North bus 'C' phase potential transformer faulted to ground at 0637 causing a 138kv bus lockout which tripped GH1. The potential transformer failure was isolated and GH1 was placed back on line at 1702 the same day.

Listed below are other incidents Mr. David Payne, retired KU Manager of Transmission Substation and Protection, remembers that have caused forced outages on GH1 generator and the Ghent 138kv switchyard bus during the early years of operation.
- GH1 generator had to be taken off line due to overheating disconnects on breaker 716.
- GH1 generator could not be put on line because of a mechanism failure on breaker 716.
- A bus fault occurred when an oil circuit breaker on the south bus had an internal failure attempting to reclose into a transmission line fault.
- A bus fault occurred when a lineman caused a conductor to fall across the south bus during GH2 construction.
- A bus fault occurred when a transmission line conductor fell across the south bus due to a mechanical failure.
- A bus fault occurred due to a tornado related event.

Alternatives Considered (1 –Recommendation, 2 –Do nothing, 3 –Next Best Alt)   Arbough
  Alternative 1 - Recommendation – NPVRR: ($000s) $5,202k
    These reconfiguration changes to the 138kv switchyard are recommended and will eliminate a single point of failure for the GH1 generator, minimize Ghent 138kv switchyard forced outages, minimize uncontrolled Unit 1 shutdowns and improve the ability to perform switchyard maintenance.

  Alternative 2 - Do Nothing – NPVRR: ($000s) $147,103k
    We will continue to have a single point of failure for Unit 1, severe risks to the boiler and potential catastrophic damage to the turbine-generator. The cost of this alternative assumes that a switchyard 138kv bus fault occurs in 2017 which then causes the Turbine Generator (T-G) back-up DC lube oil pump system to fail as a result. The resulting implications assumed in this alternative are described in the Assumptions section. The NPVRR for this alternative was calculated using a separate CEM for the Power Generation line of business and the Steam Production depreciation category since the T-G and related costs are not transmission assets.

  Alternative 3 - Next Best Alternative – NPVRR: ($000s) $5,986k
    Complete all work noted in the recommended alternative along with the addition of a breaker between the Fairview and Gallatin lines making the station layout a true breaker and a half configuration from a Transmission perspective.

Project Description

- **Project Scope and Timeline**
  The scope of this project involves separating the existing 138kV bus into two separate sections and moving one of the 345/138kV transformers from the north bus to the south bus. This includes the addition of the following equipment:
    - (2) 138kV breakers
    - (5) 138kV disconnect switches
    - Miscellaneous equipment such as instrument transformers and bus work.

  The Protection and Control scheme will be revised as follows:
    - Control Building:
      The control building will be expanded to contain the new redundant protection relay panels.
    - Relay Panels:
      All electromechanical relays will be replaced with microprocessor relays for all transmission assets. This includes the removal of (8) electromechanical panels and the installation of (11) microprocessor protection panels. Currently, only the 165-714 line protection panel provides redundancy. After the completion of the project, all line and bus protection will be redundant. In addition, breaker failure will be implemented on all breakers.
    - Cable:

Install 92,100 feet of various cables between Panel to panel, panel to substation Arbough equipment, and panel to generation plant. Cables will be installed to incorporate redundancy with trip coils and CT circuits where applicable.

- Batteries:
Existing batteries are under sized for proposed substation layout and additional required equipment. The DC systems (battery banks, charges and DC panels) will be replaced to sufficiently provide required amp-hour ratings and DC circuit isolation.

Description	Date
Preliminary Engineering Project Approval	April, 2016
Physical Engineering Completed	October, 2016
Full Project Approval	December, 2016
Protection and Control Work Begins	February, 2017
Subs Construction Below Grade Work Begins	April, 2017
Protection and Control Engineering Completed	June, 2017
Subs Construction Below Grade Work Completed	July, 2017
Subs Construction Above Grade Work Begins	September, 2017
Subs Construction Above Grade Work Completed	December, 2017
Protection and Control Work Completed	March, 2018
Unit Outage Work	March, 2018
Project Complete	April, 2018

- **Project Cost**
The project estimated cost is $4,647k, with $624k in 2016, $3,694k in 2017 and $329k in 2018. The estimate includes an 8% contingency. This contingency is reasonable based on the level of detailed engineering performed in 2016 and is expected to cover uncertainty with the contract labor costs based upon variances that have been observed on past similar projects.

Economic Analysis and Risks

- **Bid Summary**
Physical Work:
Bids for the below grade and above grade work have been received and evaluated. The bid prices were used as part of the cost estimate reflected in this Investment Proposal. Material prices for major components are firm while estimated costs were used for minor material.

- **Assumptions**

Alternative 1 - Recommendation
  o Project engineering is completed in 2016.
  o Construction starts in 2017 and completed in 2018 in conjunction with the planned Unit #1 outage in the spring.

Alternative 2 - Do Nothing
  o Switchyard 138kv bus fault occurs in 2017 and T-G back-up DC lube oil pump system assumed to fail resulting in the following:
  o Risk of failure is 0.1%
  o T-G repairs estimated at $135,000k
  o Forced outage time estimated at 24 months
  o T-G bearing journal damage
  o T-G structural foundation damage
  o Turbine blade tips destroyed
  o Turbine rotor bowing and hard spots
  o Turbine stationary components extensive damage
  o Generator field and stator rewind
  o Generator exciter extensive damage

Alternative 3 – Next Best Alternative
  o Project engineering is completed in 2016.
  o Construction starts in 2017 and completed in 2018 in conjunction with the planned Unit #1 outage in the spring.

- **Environmental**
This project does not require permitting and there are no known issues regarding air, water, waste, lead, or asbestos.

- **Risks**
If the project is not completed, we will continue to experience 138kv switchyard forced outages and uncontrolled Unit 1 shutdowns which present severe risks to the boiler and potential catastrophic damage to the turbine-generator.

Conclusions and Recommendation Arbough

It is recommended that the Investment Committee approve the Ghent 138kv Switchyard Reconfiguration project for $4,647k to enhance the reliability of the transmission system and minimize the risk of potential catastrophic damage to GH1 turbine-generator.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $1 million:</u>

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

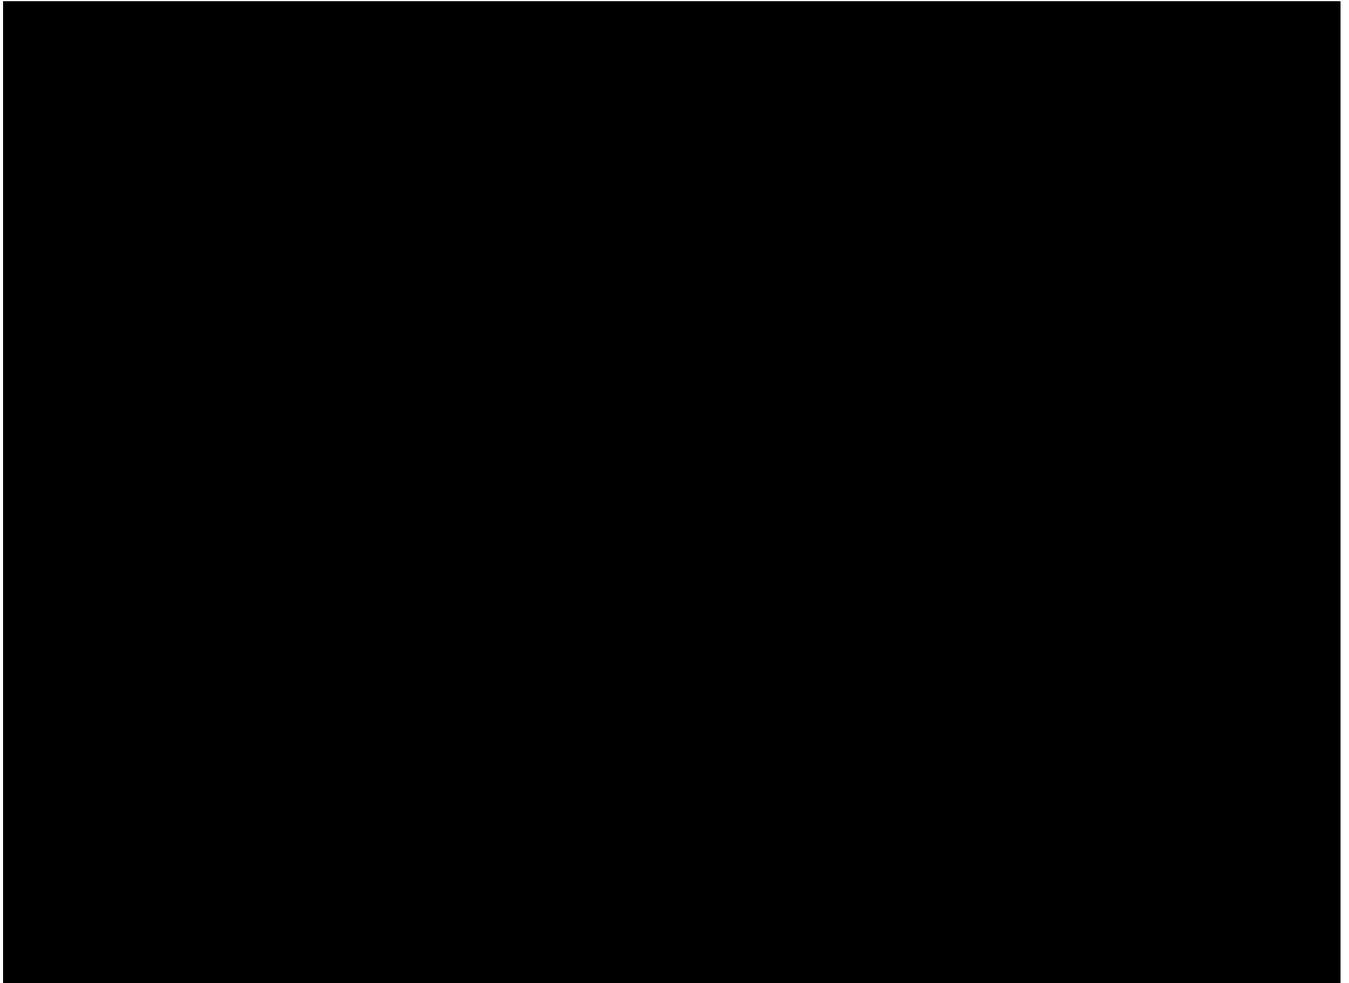
Proposed Layout:


Investment Proposal for Investment Committee Meeting on: <u>25 April 2018</u>

Project Name: <u>GH CY Transfer Point Upgrade</u>

Total Expenditures: <u>$3,713k (Including $338k of contingency)</u>

Project Number(s): <u>152862</u>

Business Unit/Line of Business: <u>Generation</u>

Prepared/Presented By: <u>Christina Schwind/Steve Turner</u>

Executive Summary

This project is to replace the existing transfer point load zones and skirt boxes in the Ghent Coal Handling System with functionally equivalent upgraded equipment. The existing transfer point load zones and skirt boxes have reached the end of their useful lives. These original pieces of equipment require frequent repair, cause significant amounts of coal spillage and create operational issues. Ghent's entire 2,000 MW output requires a reliable Coal Handling System to supply fuel to each of the four coal-fired generating units. The outdated transfer points jeopardize the reliability of this critical system. This project consists of replacing all existing transfer point load zones and skirt boxes, except those located in the Sample House and 10,000 ton silo, with updated equipment. Since the transfer points in the Sample House are newer and the equipment is dissimilar, the Sample House is not included in this project. The transfer points in the 10,000 ton silo will be executed with a future project to optimally manage the scheduling of work with coal yard operations.

A total of $3,257k for this project in 2018 was included in the 2018 BP. The additional $456k necessary to complete this project will be funded by the plant. Ghent's Coal Handling System will continue to experience decreased reliability and increased operations and maintenance costs until the transfer points are upgraded.

Background

The four units at Ghent Generating Station can burn more than 20,000 tons of coal a day. All coal is supplied to the units via Ghent's Coal Handling System. The existing coal transfer points within this system are original and require frequent repairs in order to meet the station's fuel handling needs. As well as the increase in repair requirements, coal spillage, chute plugging and premature belt wear can also be attributed to the age and design of the current transfer points. These outdated pieces of equipment also create problems downstream of the conveyor system. Detached components can travel through the system and cause plugging in a unit's gravimetric coal feeders and pulverizers. Note that the design of the new transfer points will allow for a more centered load on the conveyor belts, reducing coal spillage, chute plugging and premature

belt wear. More durable material has been selected for the new design, increasing the life of the components and reducing the frequency of repairs. In addition, the new design allows for repairs to be made from the exterior of the transfer point which reduces maintenance hours and the need for confined space entry. Replacing the transfer points in Ghent's Coal Handling System with upgraded equipment is necessary to regain operational reliability and decrease maintenance and cleaning costs.

- **Alternatives Considered**
    1. Replace the identified coal transfer points with functionally equivalent upgraded equipment.
        a. This is the best (recommended) option because it addresses the current issues with the existing transfer points and has the lowest NPVRR.
        NPVRR: ($000s) $2,039k
    2. Defer project until 2025.
        a. This option will address the current issues with the existing transfer points but will require the plant to continue to experience incremental maintenance costs and decreased system reliability until the project is completed in 2025.
        NPVRR: ($000s) $2,118k
    3. Do nothing.
        a. The existing transfer points are at the end of their useful lives. The age and design of the existing components cause operational and maintenance issues. If the equipment is not replaced, the system will continue to experience decreased reliability and increased maintenance costs.
        NPVRR: ($000s) $3,636k

Project Description

- **Project Scope and Timeline**
    The scope of this project includes the engineering, procurement and construction required to replace the existing coal transfer points at Ghent Station. This project is similar to smaller projects that have been implemented at other stations in the fleet. All Vendors that were invited to bid the material supply and construction for this project have experience in the industry. Current system drawings and operating parameters have been provided to the Vendors to ensure that the new equipment is sized, designed and installed properly.

    - April 25, 2018 – Investment Committee meeting and approval
    - May 1, 2018 – Bid award date; Issue contract
    - May 2018 – Project kick-off, begin engineering and procurement
    - June 2018 – Begin construction
    - September 1, 2018 – All outside (coal yard) construction and testing complete
    - November 30, 2018 – Units 1-4 coal rooms construction and testing complete
    - December 2018 – Project complete

- **Project Cost**

The total cost of the project is $3,713k and includes 10% contingency. The contingency amount was determined based upon the risk associated with the project and common contingency levels of projects of similar size. The material supply and construction package was bid as a lump sum.

Economic Analysis and Risks

- **Bid Summary**

The request for proposal (RFP) was issued to four (4) contractors specializing in this type of work: ███████████████████████████ A pre-bid meeting was conducted on February 5, 2018. Three (3) of the four (4) solicited bidders returned a bid by the due date, February 21, 2018. Additional pricing for Scope of Work (SOW) modifications was requested from ████ and will be provided by April 20, 2018.

Competing Bids			
Co. 1	Co. 2	Co. 3	Co. 4
███████	███████	████████	███████
████	██████	█████	

In addition to pricing, proposals were evaluated based on technical approach, proposed warranty and liquidated damages, conformity to the scope of work, proposed material suitability, experience, commercial terms, and safety. Overall, ██████ was found to have the preferable bid (see Attachment 1 - Bid Pricing Comparison) based on input from the Commercial, Engineering, and Operations departments. The ██████ proposal is fully compliant with both the scope and schedule. It includes schedule liquidated damages and a performance guarantee, as well as a 10 year material and workmanship warranty on the ceramic liners and a one year material and workmanship warranty on all other upgrades.

- **Budget Comparison and Financial Summary**

Financial Summary ($000s): Arbough

Discount Rate: 6.58%

Capital Breakdown:

Labor:	$21
Contract Labor:	$1,804
Materials:	$1,530
Local Engineering:	$0
Burdens:	$20
Contingency:	$338
Reimbursements:	($0)
Net Capital Expenditure:	$3,713

- **Assumptions**
  - Recommendation – Replace the identified transfer points with upgraded equipment
    The capital evaluation model assumes that the project will be complete by the end of 2018. A savings in maintenance and cleaning costs of $20k in 2018 and $112k per year after 2018 is assumed. The model assumes 3% inflation.

  - Alternate #1 – Defer project until 2025
    The capital evaluation model assumes that the project will be complete by the end of 2025. Until the project is completed in 2025, the model assumes a 5% probability of Ghent 1 being unavailable for 2 days in the event that a repair requires the coal conveyor to be taken out of service. The model also assumes an incremental maintenance cost of $10k per year through 2025. After 2025, a savings of $138k each year in maintenance and cleaning costs is assumed. The model assumes 3% inflation.

  - Alternate #2 – Do nothing
    The capital evaluation model assumes a capital expenditure every third year to replace a conveyor belt due to premature wear. The model assumes a 5% probability of Ghent 1 being unavailable for 2 days in the event that a repair requires the coal conveyor to be taken out of service. The coal conveyor system that feeds Ghent 1 has less redundancy than Ghent 2, 3 and 4. An incremental maintenance cost of $10k per year is assumed. The model assumes 3% inflation.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	No
#3	Does the project increase through-put with any of the material handling systems?	No

#4	Will the project affect the dispatch order or utilization of the unit?	Although / No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes Repaired on a yearly basis
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

The Ghent Environmental Supervisor has reviewed this project.

- **Risks**
  The recommended Vendor is familiar with the maintenance and operation of the Coal Handling System at Ghent Station and has experience supplying comparable systems with similar technology with good results. Improved reliability and reductions in maintenance and cleaning costs are expected with a high degree of certainty. Risks to the proposed project schedule include weather impacts and scheduling conveyor downtime without interfering with plant operations. If the project is not completed, Ghent Station will continue to experience higher maintenance, cleaning and operations costs associated with the aged transfer points in the fuel handling system.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the GH CY Transfer Point Upgrade project for $3,713k to reduce maintenance costs and improve operability of Ghent's Coal Handling System.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Arbough

Investment Proposal for Investment Committee Meeting on: <u>6/27/2018</u>

Project Name: <u>GH Stacker Reclaimer Recert</u>

Total Expenditures: $9,223k   (Including $310k of contingency)

Project Number(s): 140202

Business Unit/Line of Business: Generation

Prepared/Presented By: <u>Stephen Nix/Steven Turner</u>

Executive Summary

This project is for the recertification of the Ghent Bucketwheel Stacker Reclaimer (BSR). The scope of this project includes the engineering, fabrication, procurement and construction required to refurbish, replace or upgrade BSR components. Completion of this project will help ensure reliability of the Ghent coal handling system well into the future.

Six million tons of coal is burned each year at Ghent Station and the BSR handles all coal that is placed on the coal pile. The BSR has been in service since 1973 and has begun to exhibit signs of degradation and component failures in the past several years. During BSR outages, coal is loaded to the Ghent units either from the coal silo, two reclaim coal yard hoppers or is conveyed directly to the Ghent units from the Continuous Barge Unloader. These methods of coal loading are less efficient than using the BSR, and could ultimately result in unavailability of a Ghent Unit. Replacement with a new BSR and "Do Nothing" with continued maintenance of the existing BSR were alternatives considered.

A total of $7,225k was included in the 2018BP for recertification of the BSR based on initial estimates of the scope. An updated scope of work was developed after a detailed condition assessment was performed in January 2018. The project was bid as a turnkey project including the engineering, fabrication, procurement, management and construction required to complete the work. A competitive bidding effort of the work identified by the condition assessment led to the current proposed project cost of $9,223k. The additional funding is proposed in 2018, and has been requested and approved by the Resource Allocation Committee.

Background

The Ghent Station Heyl & Patterson designed BSR was constructed in the early 1970's and began operation in 1973 with the station's first generating unit. The BSR receives coal from the Continuous Barge Unloader via a series of conveyor belts and discharges (stacks) onto the coal pile. This equipment can remove (reclaim) coal from the stacked pile with its rotating bucketwheel which deposits coal back onto the BSR's reversible conveyor. This reclaimed coal

is routed to the four Ghent units. The BSR must be in service for coal to be stacked on the coal **Although** pile for storage at Ghent Station.

The BSR has operated reliably with various repairs, replacements and upgrades to keep this equipment in good working condition. The BSR is inspected annually and areas of concern have been noted and corrected as needed to ensure the reliable and safe operation. Over the years, coal accumulation on structural members has caused heavy rusting and severe deterioration in certain areas and other areas have moderate rusting that must be addressed. Gradual deterioration of the coal conveyors on the BSR has caused increased spillage, which piles coal on walkway grating, structural members, cable tray and other components, creating a personnel and fire hazard.

Well managed fuel handling with highly reliable equipment is necessary to unload, store, and reclaim coal to operate the Ghent units under full load conditions. At best, while operating with four units at full load for an extended period of time, coal pile inventory will be reduced even with highly reliable and efficient operations of the BSR. Up until now, the BSR has been able to support the four Ghent units averaging 85% of full load and also slowly build coal pile inventory, when necessary, to compensate for coal yard outages when coal cannot be unloaded and stacked. However, corrosion and wear on the 45 year-old BSR's basic structure and components continue to deteriorate it to the point where lower reliability in the future will cause the coal pile to be diminished and affect availability of the coal generating units.

The most recent Heyl & Patterson Evaluation Findings Report from the January 2018 inspection provided recommendations for the BSR recertification to extend serviceable life for the next thirty years.

- **Alternatives Considered**

In addition to the recommended work, two additional cases are considered in the CEM. "Do Nothing" is an alternative that continues to maintain the equipment as done in the past but equipment reliability further declines since the required repairs are much more involved than an O&M program can provide. Replacing with a new BSR was also evaluated but has a longer installation time and higher cost.

1. Recommendation: NPVRR: ($000s) <u>10,470</u>

2. Alternative #1: Do Nothing   NPVRR: ($000s) <u>11,873</u>

   [This alternative should not be chosen because the BSR has been exhibiting signs of damage for several years and poses a risk to operations and the BSR operators.]

3. Alternative #2: Total Replacement   NPVRR: ($000s) <u>16,334</u>

   [This alternative should not be chosen due to project costs much greater than the recommendation. Also, this alternative would delay the project at least one year

allowing the BSR to further degrade and continue to pose a risk to operations **Although** BSR operators.]

Project Description

- **Project Scope and Timeline**

The scope of this project includes the engineering, procurement, fabrication and construction to refurbish, replace or upgrade BSR components. The scope is as recommended in a January 2018 condition assessment report.

Replacements that have been identified for the BSR include major structural components including travel trucks, trailing structure and boom. Other replacements include an operator's cab upgrade, electrical house, PLC and controls, wiring and conduit, cables and trays, hydraulic piping, fire protection piping, sensors, lighting, walkways, certain wear components, and outdated and obsolete equipment. All motors will be reconditioned or replaced.

Engineering and fabrication will begin in the latter half of 2018 with removal and installation in early spring 2019.

Milestones:
- June 2018 – Investment Committee meeting requesting approval
- July 2018 – Issue contract
- July 2018 – Project kick-off, begin engineering, fabrication & procurement
- January 2019 – Midpoint fabrication
- April 2019 – Complete fabrication; Site deliveries
- May 2019 – Begin 2019 Removal/Installation work
- July 2019 – Complete installation

- **Project Cost**

The total project cost is $9,223k, based on a firm price turn-key contract. The fabrication cost is $4,307k and the contractor installation cost is $4,419k. Miscellaneous expenses are estimated to be $187k. A contingency of 5% of 2019 cost ($310k) will cover any unknown conditions discovered once the work begins that would be directly related to the scope of the Project. Any additional work discovered during the Project will be completed on a Firm Price or T&M basis.

Economic Analysis and Risks

- **Bid Summary**

The project was bid as a turnkey project including the engineering, fabrication, procurement, management and construction required to complete the work. Proposals were solicited from companies that supply and refurbish this line of equipment which included ▮▮▮▮▮▮▮▮▮

�no . These companies were represented at the prebid Although
meeting. ▮▮▮▮ declined to bid days later, preferring to furnish new equipment in lieu of
a rebuild. Late in the bidding schedule, ▮▮▮ requested a six week bid extension that was
denied by KU in order to maintain project schedule. It should be noted that ▮▮▮ had been
the high bidder on the recent similarly scoped Continuous Barge Unloader Recertification
project. After attending the prebid, ▮▮▮▮▮ was not responsive and did not submit a bid.
Negotiations with ▮▮▮▮▮▮ have successfully concluded with a base bid price of
▮▮▮▮ .

- **Budget Comparison and Financial Summary**

Net Capital Expenditure:	$9,223

- **Assumptions**

  The CEM is based on unavailability of the Ghent units due to degrading BSR reliability.

  Availability Disimprovement in Weeks:
  As the condition of the BSR degrades and reliability decreases, an annual decrease in coal pile inventory at the normal burn rate would eventually cause a one week/year shortage of coal supply to the four units.

  Probability %:
  A rate of decrease in current BSR reliability was assumed that after twenty-five years would cause the one week of Ghent plant Availability Disimprovement.

  The CEM model uses Ghent Unit 3 unavailability (highest dispatch cost) x four units. Note that the equivalent value for # of weeks x probability (i.e.: 4 weeks x 1.0 = 8 weeks x 0.5) is used in the CEM model at twenty-five years.

  Unbudgeted O&M Costs assumed for both alternatives are based on miscellaneous repairs related to the BSR which are assumed to increase in scope 3% per year.

  Alternative #2 assumes a completely new BSR and associated conveyors and structures would cost $13,000k.

  Inflation is not considered in the alternatives since they are not included in the CEM model's built-in unit annual availability improvement $000s.

  Additional information regarding the CEM assumptions is contained in Appendix A

- **Environmental**

  Lead abatement is included in the contractors work scope for this project.

  Items suspected of containing asbestos will be tested and abated as required. EPA rules requiring 10 day notification for demolition of load-supporting structural members is not considered relevant as this is a piece of equipment and not a facility.

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit?	Yes
	a. Is change a like-kind or functionally equivalent replacement?	Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	

		Arnough
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes see below
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

Item #7a.

Previous upgrades:	Cost
2016/2017 Hydraulic System	$133k
2015 Project 140031 GH S/R MCC Repl	$226k
2013 Project 142811 GH S/R Elevating Conv Chute Repl	$67k

The Ghent Environmental Supervisor and Environmental Affairs have reviewed and approved this project.

- **Risks**

If this project is not completed, continued corrosion and degradation of the BSR will occur which will increase frequency of repairs and downtime. If not addressed, downtime of the BSR will increase to the point that coal pile inventory will be diminished and unit availability will be affected.

In the event a critical structural failure occurs, it will likely happen when under stress from loaded operating conveyors. In this scenario, the momentum of the moving belts could cause multiple failures in a chain reaction. Repairs will be much more extensive and costly.

The degraded condition of coal transfer points and skirting causes coal spillage onto equipment, cable tray, walkways and stairs. This creates corrosive conditions for equipment and fire hazards. This is also a safety concern for personnel walking on surfaces or working on the equipment.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the <u>GH Stacker Reclaimer Recertification</u> project for $9,223k to safely and reliably supply coal to the four units at Ghent.

<u>Approval Confirmation for Capital Projects Greater Than $2 million:</u>

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Appendix A
Ghent Bucketwheel Stacker-Reclaimer (Stacker) CEM Analysis
Project 140202

Basic Operations Assumptions:

4 units at full load require 21,120 tons/day
Barge size is 1500 tons
The 2019 unit outage schedule is assumed every year
The coal inventory analysis starts January 1, 2019 with 600,000 tons in storage

CEM Recommendation Scenario (Normal burn rate, Stacker out of service 2 in 10 days)

In the recommended scenario, it is assumed that the condition of the Stacker reaches a point such that maintenance requires it to be out of service 20% of the time. When the Stacker is out of service, all coal from the barge unloader goes directly to the unit bunkers but coal unloading is reduced 50% due to the complexity of directly loading available coal bunkers on the units. The balance of coal to load bunkers is reclaimed from the pile using earth-moving equipment. The barge unloader would need to average 14.4 barges/day, when the Stacker is available, to keep up with this normal burn rate scenario, however, this is more than the 14 that can be maintained over an extended period of time and the end of year coal pile inventory is reduced by 130k tons. After the summer 2019 run, coal pile storage dips under 180k tons (8.5 days) which means after the summer run in 2020 with the Stacker in this condition dips under 40k tons (2 days). Coal inventory is 0 after the third quarter of 2021 and no coal can go to the unit during the final week of the barge unloader outage. This one week occurrence with no units on line repeats every year. This theoretical case of no available coal supply could actually be exacerbated by external factors such as river conditions or barge delivery issues.

The Capital Evaluation Model is based on the following calculations and assumptions:

o   Almost six million tons of coal burned per year (four units each at 85% of full load for 331.75 days/year)
o   Barge unloader unavailability (3 days/month plus 3 weeks/year during coal yard outage)
o   Barge unloading rate
    o   14.1 barges per day with BSR in service
    o   7 barges per day during periods with BSR out of service
o   Stacker Reclaimer calculations that result in coal shortage
    o   BSR out of service 20% of the time will cause 1 week/year without coal starting in 2021.
o   Stacker Reclaimer unavailability
    o   Unavailability currently at 1 day out of service per month increasing at a constant rate to 3 days out of service per month in 10 years. In 25 years the BSR will reach the point of being out of service 20% of the time.
o   The Do Nothing case utilizes a fractional probability of an 8 week plant-wide outage in the CEM in order to allow for the increasing duration of time without coal without exceeding 100% probability.
o   Unbudgeted O&M Costs assumed for both alternatives are based on $50k miscellaneous BSR repairs/year which are assumed to increase in scope 3% per year.

Investment Proposal for Investment Committee Meeting on: <u>December 19, 2016</u>

Project Name: <u>Hume Road Transformer Addition</u>

Total Expenditures: <u>$6,925k (includes $630k contingency)</u>

Project Number(s): <u>Substation-144909, Distribution-152840, Transmission-137754</u>

Business Unit/Line of Business: <u>Electric Distribution Operations</u>

Prepared/Presented By: <u>Jim Burns/Beth McFarland</u>

Executive Summary

Electric Distribution Operations (EDO) Electric Engineering and Planning (EEP) seeks funding authority to complete the necessary substation, transmission line, and distribution circuit improvements to meet the aggressively growing electrical service needs of customers in the Hamburg Area located on the east side of Lexington in Fayette County. The existing Hume Road 12kV substation serves 2,169 commercial and residential customers and the substation transformer is projected to exceed Distribution Planning's winter loading limit of 120% of the 22.4 MVA top nameplate during winter 2018/2019. The Hamburg area in Lexington is a fast growing and highly visible commercial and residential area with substantial land available for development and an active development plan. This area is expected to continue to grow at an above average pace well into the future. This Investment Proposal provides for the addition of a new transformer in the Hume Road substation, transmission protection enhancements, upgrade of an existing distribution feeder circuit and construction of a new feeder circuit to meet the long term load growth in the area. This construction also removes the Hume Road and Liberty Road substations from the Distribution Substation Transformer Contingency Program (N1DT) list (transformers that cannot be fully backed up for a failure of a substation transformer during high load periods) and provides distribution and transmission reliability enhancements for this substation. Project completion is expected by the end of 2018.

Funding is requested in the amount of $6,925k to complete the system enhancements for the Hume Road substation. This project is in the 2017 Business Plan (BP) for $6,927k. $5,878k is in the 2017 EDO BP ($2,001k-2017, $3,877k-2018) and $1,049k is in the 2017 Transmission BP ($148k-2017, $901k-2018).

Background

The Hume Road 12kV substation serves 2,169 customers and consists of a 22.4 MVA, 69-12kV transformer and four feeder breakers. It is located on the east side of Lexington on Winchester Road east of I75 in Fayette County. The Hume Road substation transformer reached 117% of its 22.4MVA top nameplate rating during the extreme cold of the winter 2014/2015, and is

forecasted to reach 124% during Winter 2018/2019 under normal winter loading conditions. Although Distribution Planning winter loading limit for substation power transformers is 120%. This area of Lexington, commonly referred to as the Hamburg area, has grown aggressively over the last two decades, causing continued construction of new substation and circuit facilities at area substations including Bryant Road, Lakeshore, and Hume Road substations. As a result of the rapid growth, two area substations, Hume Rd. and Liberty substations are currently on EDO's N1DT list.

A majority of the land that is available for development of additional commercial and residential load in this area will be served by the Hume Road substation. The most active recent growth, as well as expected immediate future growth, is on Hume road circuit 193, which carried 60% of conductor capacity during the winter 2015/2016. In addition to providing more transformer capacity at Hume Road, this forward-looking plan includes more circuit capacity to feed future heavy development and provides loading relief for circuit 193. The capacity addition and circuit improvements will remove Hume Rd. and Liberty substations from EDO's N1DT list. Transmission improvements associated with this project will provide enhanced reliability for the Loudon Ave. to Winchester 69kV line by replacing existing 69kV motor operated disconnects (MODs) with ring bus configured breaker protection.

The recommendation of this investment proposal is to expand the existing Hume Road Substation by adding a new 69-12kV, 37.3 MVA transformer and associated switchgear in the Hume Road substation. This will eliminate all overload conditions, provide full contingency for the loss of a transformer at both Liberty Road and Hume Road substations and provide distribution and transmission reliability improvements.

A Transmission Service Request for a new service point at the Hume Road substation will be submitted to TranServ International. Other than the planned transmission costs to connect the new service point no additional costs are expected for transmission improvements.

- **Alternatives Considered**

1. Recommended Option**:**   NPVRR: ($000s) $7,942
   EEP's recommended option is to install a 69-12kV, 37.3 MVA transformer in the Hume Road substation, install three 69kV breakers and complete the previously planned 69kV ring bus (the existing substation was designed for a future ring bus configuration), install new 12kV switchgear with one 2000 amp main breaker and three 1200 amp line breakers. Also recommended is the upgrade of 2,900 feet of 1/0 Copper overhead circuit to 795kCM Aluminum and construction of 9,600 feet of a new 795kCM Aluminum feeder circuit. This project provides adequate capacity for new growth, distribution and transmission reliability improvements and full year contingency capacity for both the Liberty Road and Hume Road substations. These substations are currently on EDO's N1DT list where a portion of customers would remain without service for up to 36 hours in the event of a transformer failure or outage. The estimated total cost of this option is $6,925k.

2. Do Nothing Option: NPVRR: ($000s) N/A
   KU has an obligation to serve all customers and associated load. The "do nothing" option is not considered an acceptable option because it exceeds Distribution Planning's operating

limits for distribution substation power transformers, and this practice reduces the life of the substation transformer and elevates the risk of failure of a high value, critical asset. Although

3. Upgrade Hume Road 549-1 transformer to 37.3 MVA.   NPVRR: ($000s) $12,758
This alternative proposes to replace the existing 22.4 MVA transformer at Hume Road with a 37.3 MVA unit to address transformer overloading. The same distribution circuit and substation feeder work described in the preferred option is recommended in this option to adequately meet future load growth. This option is not equivalent to the recommended option because it does not provide the same level of new capacity (14.9 MVA verses 37.3 MVA), the full improvements in distribution or transmission reliability, or remove the Hume Road transformer from EDO's N1DT list. Failure of the existing Hume Road transformer would result in an extended outage of up to 36 hours until a new transformer or mobile transformer could be installed. While the loss of an entire substation is a relatively low probability event in any given year, planning studies indicate an outage of the Hume Road substation at peak would cause as much as 16,300 kW to go unserved until the station is restored. Using the corporate "Cost of Unserved Energy" ($17.2/kWh) with estimated loads going unserved at peak for 24 hours, the minimum Cost of Unserved Energy would be $6,729k. The estimated annualized Cost of Unserved Energy based on an annual 5% probability of an outage is $336k. The estimated total capital cost for this option is $5,345k.

Project Description
- **Project Scope and Timeline**

  o Substation project #144909: Install a 37.3 MVA 69-12kV LTC transformer, new 12kV switchgear with 2000A main breaker and three 1200A line breakers. Install three 69kV breakers and tube bus to complete a ring bus substation configuration. This estimate includes funds for labor, primary equipment, protection and control, material, and wildlife protection for a 37.3 MVA transformer. The total estimated substation cost is $4,300k.
    - Mar-Dec 2017: Complete engineering and design. Specify and order all material and equipment. Receive material and equipment. Begin site preparation and foundations.
    - Jan-Dec 2018: Complete foundations and install transformer, switchgear/breakers, 69kV tube bus and all associated materials and equipment. Complete all secondary and protection and control work. Commission and energize the station.
  o Distribution project #152840: Replace 2,900 feet of 1/0 Copper conductor on an existing circuit with 795kCM Aluminum and construct a new 9,600' 795kCM Aluminum circuit. Install four manholes and three new exit circuits. The total estimated distribution cost is $1,576k.
    - Jan-Dec 1, 2018: Design and complete all distribution circuit construction.
  o Transmission project #137754: Rework existing self-supporting tap pole for an in-and-out 69kV circuit configuration. Remove two motor operated switches. Install tap for new delivery point and upgrade 3,900 feet of transmission line along Winchester Road to allow new double circuit distribution under build. The total estimated transmission cost is $1,049k.

- Oct-Dec 2017: Order poles, conductor and materials.   **Arbough**
- Jan-Mar 2018: Complete construction.

- **Project Cost**
  The total estimated cost to complete the Hume Road Transformer Addition project is $6,925k. The transmission, substation and distribution cost estimates are consistent with the "Conceptual Level 1" engineering design designation. There is an estimated 10% of contingency ($630k) incorporated into the project cost estimates.

Economic Analysis and Risks

- **Bid Summary**
  Transmission, Substation, and Distribution will use existing material and labor contracts and follow established Supply Chain procedures. KU Company crews will be utilized based on availability at the time of work.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	2,148	4,656			6,804
2. Cost of Removal Proposed	-	121			121
3. Total Capital and Removal Proposed (1+2)	2,148	4,777	-	-	6,925
4. Capital Investment 2017 BP	2,149	4,778			6,927
5. Cost of Removal 2017 BP	-	-			-
6. Total Capital and Removal 2017 BP (4+5)	2,149	4,778	-	-	6,927
7. Capital Investment variance to BP (4-1)	1	122	-	-	123
8. Cost of Removal variance to BP (5-2)	-	(121)	-	-	(121)
9. Total Capital and Removal variance to BP (6-3)	1	1	-	-	2

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed					-
2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate: 6.5%

Capital Breakdown:

Labor:	$ 238
Contract Labor:	$ 2,610
Materials:	$ 2,530
Local Engineering:	$ 592
Burdens:	$ 288
Contingency:	$ 630
Transportation:	$ 37
Reimbursements:	($ 0)
Net Capital Expenditure:	$ 6,925

- **Assumptions**
  - The project unknowns will not exceed the estimated contingency amounts.
  - The project will be completed in time to meet load demands.
  - No significant unknown costs for transmission improvements will be associated with the addition of a new service point.

- **Environmental**
  - There are no known environmental issues at this time.

- **Risks**

  Failure to complete this project before winter 2018/2019 will result in substation transformer loading above normal operating limits and escalate the potential for failure of the existing Hume Road substation transformer, resulting in an extended outage for up to 2,169 customers.

Conclusions and Recommendation

EDO EEP recommends that the Investment Committee approve the Hume Road Transformer Addition project for $6,925k to prevent the overloading of the Hume Road transformer, improve distribution and transmission reliability, ensure adequate capacity for future load growth in the Hamburg area of Lexington and remove Hume Road and Liberty Road substations from EDO's N1DT list.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $1 million</u>:

Investment Proposal for Investment Committee Meeting on: December 18, 2015

Project Name: Kentucky Wired Fiber Make-Ready Project

Total Expenditures: $4,000k ($2,000k net of reimbursement)

Project Number(s): KU: 150218,150221, LG&E 150220,150222

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Robby Trimble

Executive Summary

KU and LG&E Electric Distribution proposes to invest up to a combined total of $4,000k on make-ready work associated with KentuckyWired, the Commonwealth's fiber optic cable installation project that will interconnect every county in the state. The $4,000k investment will be split into two investment work types: reimbursable and non-reimbursable work. KU/LG&E will invest up to $2,000k (non-reimbursable) on the replacement of poles determined to be in a pre-existing defective or pre-existing overloaded condition; in addition, KU/LG&E will invest up to $2,000k on fully reimbursable work tasks.

The Commonwealth has scheduled the KentuckyWired infrastructure installation for November 2015 through December 2018. Installing the new fiber optic cable on an existing route requires "make-ready" work: this work consists of all engineering, design, and construction necessary to prepare and make space on LG&E/KU poles for the new third party (KentuckyWired) pole attachments; this work ranges from raising a neutral conductor to complete pole replacement.

The $2,000k non-reimbursable investment is considered the maximum out-of-pocket capital expenditure borne by the Company to replace pre-existing priority defective poles and poles found to be in a pre-fiber overload condition. Pole integrity will be determined by Ledcor, a technical infrastructure consortium that includes Black & Veatch (B&V); B&V will perform load analysis and submit the results to KU/LG&E for verification and agreement.

The $2,000k reimbursable investment is for the recovery of chargeable employee and Company contractor time and materials. Labor charges are expected for, but not limited to, engineering design and review including survey work, asset management and administration, inspection services, dispatching services, procurement, and associated overheads. Additionally, the Company will be reimbursed for labor and material charges for any make-ready or transfer work performed by the Company's resources that does not fall under the agreement in regards to Company-owned pre-existing priority defective and overloaded poles. The Tax Department's belief is that this reimbursement will not be taxable, because this project should qualify as being for the public good since it is driven by the state.

To minimize the impact to Company resources, an agreement with KentuckyWired allows the Although third party attachee to operate under "turn-key" provisions (engineering/construction) with Company oversight; the necessary make-ready work will be executed by direct-hired electrical contractors from a list of those contractor companies approved to work on Company facilities.

LG&E/KU have agreed to waive typical pole attachment fees in exchange for 12 strands of dark fiber installed continuously across the entire "backbone" network and where needed on laterals (LG&E/KU will work with KentuckyWired to determine which laterals LG&E/KU will utilize; LG&E/KU will use all dark fiber received solely for internal use). In this agreement, dark fiber refers to fibers within KyWired's communication cable that are reserved for the exclusive use of LKE. The estimated value of the dark fibers in terms of avoided capital and O&M costs for the Company in the five year business plan (2016-2020) is $2.7M ($988k O&M and $1,688k Capital) compared to the estimated $196k annual cost of the pole attachment fees. See attachment for analysis of value. These values are subject to change based on changes in scope and schedule for the KyWired project. This portion of the agreement is taxable.

This project was not included in the 2016 Business Plan (BP) and the incremental funding will be approved through the Corporate RAC process in 2016 ($1.2M for 2016 spending). 2017 and 2018 spending will be incorporated into the 2017 BP.

Background

KU and LG&E have entered into an agreement with the Commonwealth of Kentucky allowing the state and its representatives to affix fiber optic cable to Company facilities. The mixed public/private project, KentuckyWired, also known as the Next Generation Kentucky Information Highway (NG-KIH), is a Commonwealth initiative to spur high speed internet access to underserved areas and will provide high speed internet access to the Commonwealth's governmental facilities, to public universities, and to school districts in every county throughout Kentucky. The project consists of building a 3,209 mile "middle-mile" fiber network that is designed to provide a cost-efficient solution for third parties to build the "last mile" to customers and businesses in these underserved areas.

The KentuckyWired network consists of a "backbone" network made up of 6 rings stretching across Kentucky. "Laterals" will extend off the "backbone" and eventually reach every county seat. Pre-construction design has already begun in earnest with construction in the Lexington area desired within the 4th quarter of 2015. The first two rings to be built connect 1) Louisville, Lexington, and Cincinnati, and 2) Lexington, Morehead, Ashland, Prestonsburg, Hazard, London, Somerset, and Richmond. These two rings are targeted for completion by April 2016, with the entire network to be complete by the end of 2018. In order to meet the Commonwealth's target dates for completing the network, LKE is stepping outside the typical third party pole attachment process allowing the Commonwealth to self-perform engineering and make-ready construction using certified resources.

The KentuckyWired network will attach to an estimated 27,126 poles in the LKE service territory (22,846 in KU and 4,280 in LG&E) covering about 1,100 linear miles of pole route. It is unknown how many of these poles will be determined to be pre-existing priority defective

poles; external utility pole failure rates range typically from 2 – 3%. KentuckyWired's total project buildout on all Kentucky service territories is for 3,209 miles of fiber optic cable, with an estimated 85% aerial and 15% underground.

The Commonwealth's budget for the completed project is $274.8M. The project rollout should be completed by the end of 2018.

Progression of Company responsibilities related to this project include:

- KU Stone Road will perform a thorough engineering review of the first phase of the KentuckyWired project as it commences since Lexington is the prime hub for the fiber.
- Reviews will be ongoing; the initial review will help determine the future level of involvement needed as the project rolls out to the other service areas.
- Future reviews are envisioned to be undertaken at a much higher level as the Company gains trust in the third-party's process competency.
- KU-Lexington will closely monitor construction in the first phase and formulate a best-practices review to share throughout LKE.
- Initial engineering reviews will be executed by existing KU resources; ensuing review workload will be handled by a mix of KU/LG&E Company and Contract personnel.
- All contractor crews must be passported.
- Company-hired contract inspectors will perform ongoing and post-construction installation quality management to ensure all modifications meet standards and code compliance.
- These third-party pole attachment/make ready inspectors will be sourced via a new Distribution Inspectors Contract.
- Safety will be closely monitored at every stage.
- Any poles identified as being in a pre-existing priority defective or overloaded condition along the route will be reviewed by Company engineering for accurate determination and replaced at no cost to KentuckyWired, up to a total cost of $2.0M.

Additional KentuckyWired responsibilities/general information include:

- B&V will perform make-ready design and pole integrity analysis.
- B&V has setup and will maintain a SharePoint site to post the pole attachment packets for review and approval.
- B&V estimates that 30% of all poles touched will require some make-ready activity.
- KentuckyWired will be responsible for maintaining an inventory/warehouse of material that meets Company standards. Company will provide material list and facilitate relationship with Company suppliers.
- KentuckyWired will provide all necessary documentation required by Company to evaluate and assess the project, including but not limited to as-built drawings and installed material inventory; such submissions will be in format required by LG&E/KU for GIS entry and Property Accounting ease of use.

Benefits of this project include:

- Meeting the Commonwealth's objective.
- Rehabilitation of distribution system.
- Acquisition of dark fibers for Company use.

Alternatives Considered (1-Recommendation, 2-Do Nothing, 3-Next Best Alt)

1. Recommended option: NPVRR: ($000s) $5,351
   Cooperate with the Commonwealth's KentuckyWired project by investing up to $4,000k,
   of which the non-reimbursable amount will not exceed $2,000k.
2. Do nothing option:
   Choose not to cooperate with KentuckyWired's goals. This alternative is not consistent
   with the Company's vision of promoting economic vitality or with the Public Service
   Commission's vision of avoiding duplicity of infrastructure.
3. Participate at other levels of funding; either to exceed the $2,000k threshold or to reduce
   the Company's investment. Work tasks that are considered reimbursable or non-
   reimbursable could be modified from agreement; this alternative is not suggested to avoid
   conflict with the working agreement with KentuckyWired.

Project Description

- **Project Scope and Timeline**

  Scope:
  - Design review, engineering work, miscellaneous administrative charges, and
    construction-related expenditures - including labor and materials – for third-party
    make-ready work on 3,209 aerial miles of distribution circuitry throughout the
    KU/LG&E territory to create space for the attachment of new fiber optic cable.

  Timeline:
  - May 2015: KentuckyWired Kick Off event.
  - August 2015: B&V began compiling pole review data and submitting pole
    attachment review requests.
  - October 2015: KU begins approving first application attachment packages.
  - November 16, 2015: Bowlin Electric to begin make-ready work on KU facilities at
    KentuckyWired's direct expense.
  - January 2016: LKE-funded make-ready to begin; work flow will begin in the
    Lexington area but will migrate to Louisville by June 2016 and to all of the KU
    territory over the course of the 3-year project.
  - Project begins with core ring segments that connect Lexington-Louisville-Northern
    KY and Lexington-Somerset-Hazard-Ashland in 2016. Additional core rings will tie
    northeastern KY, southeastern KY, and Western KY in 2017. Radial (non-core)
    routes into each county will be interspersed throughout the project duration.

- **Project Cost**

	2016	2017	2018	Total
Inspection failure, Pole replacement - KU	$1,000k	$520k	$80k	$1,600k
Inspection failure, Pole replacement - LG&E	$200k	$180k	$20k	$400k
Reimbursable Company charges - KU	$1,000k	$440k	$160k	$1,600k
Reimbursable Company charges - LG&E	$200k	$160k	$40k	$400k
Reimbursement	-$1,200k	-$600k	-$200k	-$2,000k
Total Projected Cost	**$1,200k**	**$700k**	**$100k**	**$2,000k**

Economic Analysis and Risks

- **Bid Summary**

  - Both reimbursable and non-reimbursable Company make-ready work will be executed using Company personnel, or contracted workers under existing contracts, and will follow established Supply Chain procedures.
  - Bids for reimbursable labor related to inspection services and some design review services will be prepared following established Supply Chain procedures.

- **Budget Comparison and Financial Summary**

Financial Detail by Year ($000s)	2016	2017	2018	Post 2018	Total
1. Capital Investment Proposed	2,160	1,260	180	-	3,600
2. Cost of Removal Proposed	240	140	20	-	400
3. Total Capital and Removal Proposed (1+2)	2,400	1,400	200	-	4,000
4. Capital Investment 2016 BP	-	-	-	-	-
5. Cost of Removal 2016 BP	-	-	-	-	-
6. Total Capital and Removal 2016 BP (4+5)	-	-	-	-	-
7. Capital Investment variance to BP (4-1)	(2,160)	(1,260)	(180)	-	(3,600)
8. Cost of Removal variance to BP (5-2)	(240)	(140)	(20)	-	(400)
9. Total Capital and Removal variance to BP (6-3)	(2,400)	(1,400)	(200)	-	(4,000)

Financial Detail by Year - O&M ($000s)	2016	2017	2018	Post 2018	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2016 BP	-	-	-	-	-

This project was not included in the 2016 BP. The net capital expenditures, after reimbursement through from KentuckyWired, is $2.0M ($1.2M in 2016, $0.7M in 2017 and $0.1M in 2018). The 2016 incremental funding will be approved through the Corporate RAC process in January 2016.

Financial Summary ($000s):

Discount Rate:	6.5%
Capital Breakdown:	
Labor:	$398
Contract Labor:	$2,410
Materials:	$312
Local Engineering:	$360
Burdens:	$457
Transportation:	$63
Contingency:	$ 0
Reimbursements:	($2,000)
Net Capital Expenditure:	$2,000

Financial Analysis - Project Summary ($000)	2016	2017	2018	2019	2020	Life of Project
Project Net Income	($64)	$56	$75	$177	$200	$2,808
Project ROE	-10.30%	3.60%	3.90%	9.50%	11.30%	10.20%

- **Assumptions**

  - The estimated number of pole failures (2.33%) will be consistent with the % reported to LKE as typical in scope and are reasonably accurate.
  - The estimated split in pole ownership is 65%/35% between LKE and Joint Use Partners.
  - The estimated costs to replace a pole is consistent with historic PITP pole replacement costs: $4,673 for LG&E and KU.

- **Environmental**

  There are no known environmental issues at this time.

- **Risks**

  - The cost to perform pole inspection failure remediation work will exceed the budget; this risk is mitigated by the Company placing a contractual ceiling ($2,000k) on the total investment to be made performing this work. Risk is shifted from financial risk to relationship/political risk should an excessive number of replacement poles be found.
  - Potential unavailability of quality contractor resources to perform inspection work. The variability in inspection work forecasted over different monthly periods by B&V (ranging from 1100 poles requiring make-ready in the peak month to fewer than 400

only 3 months later) suggests difficulties in keeping contractor inspection resources at a level that is consistent with quality assurance and reasonable workload.

- Safety and quality may be found lacking in the contractor/sub-contractor workforce employed by KentuckyWired requiring LKE to shutdown make-ready operations. To avert such a shutdown, KentuckyWired proactively monitors all work for compliance through their Quality Assurance Plan.
- Schedule KentuckyWired program dates are adjusted or delayed causing a change in budget amounts from year to year.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the identified KentuckyWired Fiber Make-Ready Project for KU and LG&E for $4,000k ($2,000k net of reimbursement) to support and accommodate the Commonwealth of Kentucky's fiber optic cable build-out project.

Investment Proposal for Investment Committee Meeting on: <u>June 28, 2017</u>

Project Name: <u>KU Portable Transformer</u>

Total Expenditures: <u>$3,390k (Including $442k of contingency)</u>

Project Number(s): <u>141885</u>

Business Unit/Line of Business: <u>Electric Distribution Operations</u>

Prepared/Presented By: <u>Jude Beyerle</u>

Executive Summary

Electric Distribution Operations (EDO) proposes to secure funding to purchase a portable transformer to support both planned and unplanned transformer outages in the KU Lexington and Danville substation service areas. This purchase will complete an overall strategy to enhance portable transformer capability at KU and LG&E. A portable was purchased for LG&E in 2014, and two KU units are on order as part of the N1DT program.

KU currently utilizes two portable transformers (7.5MVA and 30MVA) both normally stored in the Lexington area when not in use. Two additional KU portable transformers are on order, one will be stored in Pineville and one in Earlington, and will be primarily dedicated to supporting those respective areas as part of the N1DT strategy. The existing portable transformers are utilized frequently for planned maintenance outages, and are also called upon for rapid deployment in the event of a transformer failure or emergency maintenance. It is not uncommon to have both portables in service at the same time for maintenance outages and unavailable for transformer failures. An additional portable will benefit Substation Construction & Maintenance in providing more flexibility to support maintenance outages while still maintaining preparedness to address an unexpected transformer failure.

This proposed project provides for enhancements to the portable transformer plan for the KU service territory for maintenance, emergency and unplanned transformer outages. Specifically, this project includes the purchase of a 30 MVA 138x69:13.09kV LTC portable transformer and cable trailer. The cable trailer is purchased as a separate unit for easier transport and to lessen the overall length of the portable, allowing for more positioning and maneuvering flexibility in difficult to access stations.

The 2017 Business Plan (BP) included $2,252k in 2019 and $308k in 2020 for the purchase of a KU portable transformer. This project is now planned for 2017 and 2018. The 2017 funding was approved by the Corporate RAC in April. Funding for 2018 will be handled through the 2018 BP and the 2019/2020 amounts will be eliminated.

Background

The 7.5 MVA and 30 MVA KU portable transformers are not interchangeable due to MVA capacity limits and voltage ratings. In addition, they are not interchangeable with LG&E portables due to differences in standard winding configurations.

Between 2012 and 2016, the 7.5 MVA portable was in use an average of 150 days per year, or 41% of the time. During this same time period, the 30 MVA portable was in use, on average, 102 days per year or 28% of the time. For 46 days per year, or 13% of the time, both portables were in service at the same time.

An additional 30 MVA portable provides two primary benefits:

- An additional option for maintenance and construction outages. 74% of KU transformers are without full N1DT redundancy, so a portable install is often necessary to complete some routine and emergency maintenance and construction tasks, including transformer and load tap changer diagnostic maintenance and internal inspections and construction necessitating transformer clearance. A portable is a much lower cost option to deploy and set up than moving a spare unit into position by crane and completing temporary facilities.

- An additional option for emergency outages. As noted, the 30 MVA portable is historically in service 28% of the time, and there is no backup portable option. There have been occasions when the portable was removed from service at a maintenance location and moved to a new location to restore service for a failed transformer. In addition, due to limited options, past practice has often favored moving a spare into place for a failed transformer over using a portable. A large spare transformer, (base 12 MVA and greater) requires extensive logistics and coordination with contract partners to move into position, remove the failed transformer, set the new unit with a crane, install radiators, complete connections, commissioning and energization. A portable philosophy is consistent with more rapid customer restoration at those locations lacking N1DT redundancy.

There are 528 3-phase substation transformers in service on the KU system. This portable will be sized and configured to provide backup capability for 228 3-phase transformers, representing over 75% of system transformer capacity, including 136 base 12 MVA 69:12kV and larger units throughout all of KU; seven base 5 through 10 MVA 138:12kV units; and 85 Lexington and Danville area base 10 MVA 69kV:12kV units.

The remaining 300 3-phase units are 10 MVA and smaller, primarily in the Pineville or Western KY areas, and these will be supported by the existing 7.5MVA portable, and the two portable units now on order under a separate N1DT project.

- **Alternatives Considered (1 –Recommendation, 2 –Do nothing, 3 –Next Best Alt)**

1. Recommendation: NPVRR: ($000s) $4,106k
   Purchase a new 30 MVA 138x69:13.09kV LTC portable transformer and a cable trailer. This portable will provide additional coverage during the average 102 days per year the

existing 30 MVA unit is in service for scheduled maintenance or emergency response. Although estimated total cost of this option is $3,390k.

2. Do Nothing: NPVRR: ($000s) $8,556k
   The Do Nothing option would result in a continued insufficient number of adequately sized portable transformers to consistently respond to planned maintenance and construction outages and emergency restoration related to in service substation transformer failures. Transformers are typically long life assets but KU's transformer fleet continues to grow older. The average age of KU Substation transformers is 40 years old, and the risk of transformer failure grows with increasing age.

   KU averages just over 3 transformer failures per year in the Lexington and Danville areas. Sixty percent (60%) of transformers in the Lexington and Danville areas cannot be fully backed up during high loading conditions.

   It is likely that one failure per year cannot be backed up, and a portable or spare install is necessary. This was experienced during failures in 2016 at Munfordville and E-town 3 substations.

   If a spare transformer is utilized instead of a portable transformer, which is a likely case 28% of the time, this assumes an average of four hours extra time to energize a spare compared to energizing a portable. This delay is primarily a result of prepping the spare unit for shipment and set up/teardown of the crane. A four hour or more improvement in service restoration, especially in extreme weather conditions (heat or cold), when customers typically need power the most, will have a positive impact on customer experience, the community, and also the Company's reputation. It should be noted that many substation transformer failures occur in non-storm situations (blue sky days) when customers are considerably less tolerant than they would be in storm situations. Assuming the failed unit is a base 12 MVA fully loaded near peak conditions:

   The calculation of the cost of unserved energy yields:
   (1.0 Failure) X (.28) X (22000 KVA) X (4 Hours) X ($17.20/kW-Hr) = $424k per year.

   Additional handling, crane and set up costs for a spare unit install for an emergency mobilization are in the order of $25,000:
   (1.0 Failure) X (.28) X ($25k) = $7k per year.

3. Next Best Alternative(s):   NPVRR: ($000s) N/A
   No other alternative to a portable transformer is seen as viable or cost effective. KU maintains adequate spares for emergency replacement of all size transformers of concern. However as noted, timeliness, mobility and installation cost concerns are not addressed with additional spares.

Project Description

- **Project Scope and Timeline**

8/4/2017	Purchase one (1) 30 MVA, 138x69:13.09 kV LTC portable transformer and one cable trailer
7/1/2018	Receive cable trailer
8/1/2018	Receive portable transformer

- **Project Cost**

  The estimated project cost for 2017-2018 is $3,390k; $3,000k to be incurred in 2017, and $390k in 2018.

  This project is estimated with 15% contingency ($442k), as the budgetary pricing estimates for the portable includes a +/- 15% variance.

Economic Analysis and Risks

- **Bid Summary**

  Competitive bids will be solicited from qualified portable manufacturers following standard Supply Chain procedures.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	3,000	390	-	-	3,390
2. Cost of Removal Proposed	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	3,000	390	-	-	3,390
4. Capital Investment 2017 BP	-	-	2,252	308	2,560
5. Cost of Removal 2017 BP		-	-	-	-
6. Total Capital and Removal 2017 BP (4+5)	-	-	2,252	308	2,560
7. Capital Investment variance to BP (4-1)	(3,000)	(390)	2,252	308	(830)
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	(3,000)	(390)	2,252	308	(830)

Financial Detail by Year - O&M ($000s)	2016	2017	2018	Post 2018	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2017 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The 2017 BP anticipated this project in 2019 and 2020. The project is now planned for 2017 and 2018. The Corporate RAC approved the 2017 amount in April. The 2018 BP will reflect the updated information for 2018-2020.

Financial Summary ($000s):

Discount Rate:	6.5%
Capital Breakdown:	
Labor:	$ 9
Contract Labor:	$ 6
Materials:	$2,555
Transportation:	$ 2
Local Engineering:	$ 331
Burdens:	$ 45
Contingency:	$ 442
Reimbursements:	($ 0)
Net Capital Expenditure:	$ 3,390

- **Assumptions**

Project costs are based upon budgetary price estimates provided by a qualified portable transformer supplier and cable trailer prices are adjusted from a 2016 purchase. The budgetary price estimates included a +/- 15% variance, thus a 15% contingency was chosen for this project.

KU's installed transformer base will continue to age and failure rates will continue at current rates or possibly increase, requiring an adequate portable transformer fleet to meet customer commitments. The useful life of a portable transformer typically exceeds 40 years.   The current average age of KU's transformers is 40 years old.

- **Environmental**

No environmental issues are known at this time.

- **Risks**

In the event of a transformer failure, the unavailability of a suitably sized portable unit could put thousands of customers at risk for a more severe extended outage, or delay response to maintenance issues that could evolve into a larger failure.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the KU Portable Transformer project for $3,390k to enhance our ability to respond to substation maintenance outages, and emergency outage response and substation restoration.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake	Paul W. Thompson
Chief Financial Officer	President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: August 28, 2013

Project Name:	Furniture for LGE Building Tenant Improvement
Total Expenditures:	$4,087K (Includes $533K for contingency)
Project Number:	Source Project #SVC141386 – Budgeted to 141389(KU) /141392(LGE)/ CAP141392
Business Unit/Line of Business:	Customer Services/Operating Services
Prepared/Presented By:	Lanny Thompson & Jerry Grant / Butch Cockerill

Executive Summary

Facility Services has previously received Investment Committee approval for the facility improvements identified under the new lease agreement in the amount of $7,521K. This project is referred to as the LG&E Building Tenant Improvement Project. This request is seeking approval to purchase the necessary furniture and ancillary products required in conjunction with the Tenant Improvement Project.

The Investment Committee is being asked to approve $4,087K for the purchase of office systems furniture and equipment that includes director level furniture, workstations for manager level employees and below, ancillary items, conference room tables and chairs, file cabinets, and appliances. The 2014 proposed Business Plan (BP) includes $4,202K for 2014-2017 for this project. A contract proposal is also being requested that identifies Kimball Office Products as the proposed supplier that will be used for the company's standard workstations for managers and below.

The only alternative to this project is to reduce the scope of the LG&E Building Tenant Improvement project and only purchase furniture for floors that don't have existing furniture and appliances. This alternative does not address the risks identified in this document.

Background

The majority of the furniture in this facility is the original furniture which is over 20 years old. A primary feature of systems furniture is its flexibility and ease of which it can be assembled and disassembled and reconfigured to meet the changing needs of the clients. Over the life of the existing furniture, Facility Services has assembled and disassembled the furniture numerous times. As such, the furniture has reached is useful and safe life expectancy. Additionally, over the years, we have purchased various types of work stations and various vintages of the same workstations. Thus, it has become increasingly difficult to acquire parts and materials for our existing workstations and the powered panels for some types of the workstations are no longer available. The powered panels provide the electrical wiring for a workstation. Therefore, it is

becoming increasingly difficult to repair existing workstations and find sufficient components to **Although** create additional workstations. Without some corrective action, we will be in a position of replacing existing workstations with a different type which may not safely connect to existing workstations and be of a different size or color; creating aesthetic issues.

- **Other Alternatives Considered**
  - o Reduce the scope of the LG&E Building Tenant Improvement project and only purchase items for floors with no systems furniture existing (3ʳᵈ Floor Furnishings cost only--$434K). However, this alternative does not address all the risks identified above.

Project Description

At the present time the rate of vacant workstations per floor is <10%; impacting departmental expansion due to lack of contiguous space. To effectively optimize existing floor space, workstation space standards must be revised. Many enhancements in office space design along with technological improvements allow revisions to workspace standards without impacting the occupant's effective use of their office space. New workstations will also address escalating issues with existing workstations purchased when the building was initially occupied.

By revising workstations & office standards, space will be maximized to address long term space requirements. Concurrently, this will address fragmented business units; requiring the purchase of modular workstations and the creation of new team space. In addition, the use of rotary filing will allow for compression space dedicated to filing.

The projected timeline and schedule for purchase of furniture and ancillary products in conjunction with the Tenant Improvement Project is as follows:

- o 2013 – Floors 6 and 14
- o 2014 – Floors 3 and 7
- o 2015 – Floors 4, 5, and 8
- o 2016 – Floors 9, 10, and 11
- o 2017 – Floors 12, 15, and 16

Economic Analysis and Risks

- **Bid Summary**

The Company has identified several potential facility projects over the next five years that will require large quantities of workstations and ancillary furniture. As a result of the large volume of furniture that will be needed should these projects move forward and the desire to establish furniture standards across the Company, a Request for Proposal (RFP) was issued. As a result of the RFP process, ▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮ was selected as the recommended vendor. Currently, this contract is being presented to the Investment Committee for approval this month. The table below shows the total costs of the bid for the two short listed companies. The pricing obtained from MBI was used to project the estimated costs for this investment proposal.

Total Costs ($000s)	▮	▮

The total number of workstations and director furniture to be replaced by year was determined based upon the timeline and schedule previously discussed. A RFP to establish a vendor for director furniture will be issued soon. The table below shows the proposed cost per year.

$000s	
2013	$ 413
2014	$ 767
2015	$ 1,249
2016	$ 1,249
2017	$ 409

The total cost to purchase all the projected furniture needs of the project has been estimated at $4,087K, including a 15% contingency of $533K. A higher than normal contingency percentage is included due to the likelihood of changes to either the above schedule or quantity of furniture needs. The total volume of furniture needs, especially the number of workstations, on each floor varies greatly and any change in the approved construction and renovation schedule, year over year, will affect the total spend and volume discount rate for that year.

- **Budget Comparison and Financial Summary**

Contract Expenses ($k)	2013	2014	2015	2016	2017	Total

  Contingency: $ 533
  Reimbursements: $ 0
  Net Capital Expenditure $4,087

Project Presented and alternatives:

Financial Analysis - Project Summary ($000)	Project Proposed	Alternative 1 (Next Best)*	Do Nothing (Not Applicable)
NPVRR	$4,762	$610	$0
NPV Cash Flows	$($331)	($26)	$0
ROE - 2013	(7.8%)	(7.8%)	0.0%
ROE - 2014	(3.9%)	(0.4%)	0.0%
ROE - 2015	(2.0%)	10.3%	0.0%
ROE - 2016	(0.4%)	10.3%	0.0%
ROE - 2017	4.7%	10.3%	0.0%
ROE - Life of Project	9.5%	10.3%	0.0%

    * This alternative does not address all the risks identified above. This project is not economically driven. The necessity to place furniture in spaces acquired at the building and replace existing furniture that is aging is the driver for the funding requested.

- **Assumptions**
  - Contract Proposal recommending ███ will be approved.
  - No changes to timeline and schedule as outlined above in the Project Description Section.

- **Environmental**
  - Not Applicable

- **Risks**
  - There is no furniture for the additional floor (3rd floor) that was just acquired in the building lease.
  - Without this project, it would impact the ability to establish work space for departmental continuity and establish space for future project teams.
  - Due to age of assets and different furniture types in use today, we are unable to obtain component parts to repair existing workstations or components needed to create additional workstations.
  - Without replacing existing furniture, we will likely need to purchase workstations on an as needed basis which may or may not properly adjoin existing workstations and will have a different appearance than existing units.
  - The current occupancy levels/space design provides very little, if any, space for departmental expansion.

Conclusions and Recommendation

It is recommended that the Investment Committee approve $4,087K of funding to purchase the necessary furnishings in order to support the completion of the Tenant Improvement Project.

Arbough

Investment Proposal for Investment Committee Meeting on: <u>November 28, 2018</u>

Project Name: <u>LG&E Center Tenant Improvement Furniture</u>

Total Approved Expenditures: <u>$4,087k</u> (Approved on 08/28/2013)

Total Revised Expenditures: <u>$4,915k</u>

Project Number(s): <u>141392, 141389, and LKS142731</u>

Business Unit/Line of Business: <u>Customer Services/Operating Services</u>

Prepared/Presented By: <u>Cheryl Bruner/Zac Conley</u>

Reason for Revision

In August 2013, the Investment Committee approved the LG&E Center Tenant Improvement Furniture project for $4,087k. This proposal is requesting approval for the revised amount of $4,915k. The original estimate used an average cost of $300k per floor for twelve floors, plus contingency. Included in this estimate was: office systems furniture and equipment, Director furniture, conference room tables, chairs, file cabinets, artwork, A/V equipment, appliances, and all ancillary equipment, such as white boards and trash receptacles. Not included originally, but purchased under this Investment Proposal, were the fitness center equipment when the second floor fitness center was constructed, and replacement/additional Officer furniture. Additionally, nine floors have exceeded the original estimate, the two remaining floors will exceed the original estimate, and two other floors were added to the original scope. Some floors required more furniture based on the final design for number of employees. The 16th floor requires an additional $100k worth of filing cabinets.

Financial Summary ($000s):	Approved	Revised
Discount Rate:	6.5%	6.59%
Capital Breakdown:		
Labor:	$ 0	$ 0
Contract Labor:	$ 464	$ 150
Materials:	$ 3,090	$ 4,653
Local Engineering:	$ 0	$ 34

The increases for 2018 have been approved through the Corporate RAC process. The increases for 2019 from the 2019 Business Plan will be covered by other Facilities projects within the Customer Service RAC. See attachment for comparison to original proposal.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the furniture for the LG&E Building Tenant Improvements project for $4,915k to complete renovations at the LG&E Building.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: <u>November 28, 2018</u>

ProjectProject Name: <u>Lime Kiln Substation</u>

Total Expenditures: <u>$11,477k (includes $1,043k of contingency)</u>

Project Number(s): <u>Distribution Substations 148885, Distribution Lines 148884, Transmission Lines 134238</u>

Business Unit/Line of Business: <u>Electric Distribution Operations</u>

Prepared/Presented By: <u>Zachary Allen-Kelly/Dan Hawk</u>

Executive Summary

LG&E Electric Distribution Operations (EDO) seeks funding authority of $11,477k to enable construction of a new distribution substation on Brownsboro Road near Lime Kiln Lane (see Attachment 1). Additional system capacity is needed in the nearby service area to meet load requirements for the new ███████████████████████████, which is scheduled to be under construction starting in 2019. Requested funding will provide for construction of a single unit 44.8kVA 69-12kV substation and 69kV ring bus, and necessary improvements to associated distribution and transmission line facilities.

Construction on the proposed substation will be completed between January 2019 and December 2020. Approximately 3,600 customers currently served out of the Taylor and Harrods Creek Substations will be connected to the new substation, once it is placed into service. Once completed, the new substation will enable EDO to remove all three existing Taylor substation transformers from its Distribution Substation Transformer Contingency Program (N1DT).

EDO allocated $10,492k (2019 - $4,578k, 2020 - $5,914) in its 2019 Business Plan for the proposed substation, based on preliminary design estimates. EDO plans to account for the increased project funding requirements in its 2020 Business Plan.

Background

Taylor Substation contains three 28 MVA transformers. The three transformers all have between 18 and 22.5 MVA of load on them in the most recent 2019 forecast, and all are on EDO's N1DT risk list. The site of the proposed new ██████████ is located roughly one mile from Taylor substation, on the opposite side of Interstate 264. There are two existing Taylor circuits that cross I-264 at US-42 and feed approximately 10 MVA of existing load. The ██████████ is expected to go online in 2022 and reach full load by 2024. The ███ has projected their load at approximately 6 MVA under normal conditions, with loads up to 10 MVA in an emergency situation. Distribution Planning has determined that the new ███load is unable to be served out

of Taylor substation as currently configured due to both distribution circuit and substation **Arbough** transformer load constraints. The ▇▇▇▇▇▇ requires a second, redundant electric feed from a separate distribution substation source as their main feed. The proposed new Lime Kiln Substation will take approximately 10 MVA of load off Taylor substation, freeing up enough circuit and transformer capacity to comfortably serve the new ▇▇▇▇▇▇ out of Taylor. Though not a primary driver of the project, the new station will also remove all three Taylor Transformers from the N1DT "risk" list as well as provide a second source to the hospital to meet their redundant capacity requirement. The distribution work associated with this redundant feed out of Lime Kiln would be paid for by the customer as part of their redundant capacity request.

- **Alternatives Considered**

1. Recommended Option: NPVRR ($000): $13,076
   The recommended option is to build a new distribution substation along US-42, including a new standard 44.8 MVA transformer, steel, and breakers (plus associated transmission and distribution line improvements). This option is expected to avoid expected overload at Taylor substation and distribution circuits from the proposed ▇▇▇▇▇▇.

2. Do Nothing Option: NPVRR ($000): N/A
   LG&E has an obligation to serve all customers and associated load. The "do nothing" option is not considered an acceptable option because it exceeds Distribution Planning's operating limits for distribution substation power transformers and distribution line conductors, and this practice reduces the life of these assets and elevates the risk of failure of a high value, critical asset.

3. Alternative 1:   NPVRR: ($000s) $14,327
   This option considers the upgrade of two of the existing Taylor transformers to 44.8 MVA and the installation of a new distribution circuit along US-42 to serve the ▇▇▇▇▇▇. Due to space constraints on the existing pole route, this circuit would need to be entirely underground and would require a long bore under the Watterson Expressway. This option meets capacity needs but is more expensive and would not provide the reliability improvements gained from a separate distribution source and reduced circuit exposure. The estimated capital cost of this alternative is $12,667k.

Project Description
Project Scope
- Substation project #148885: estimated cost $7,909k ($3,000k-2019; $4,909k-2020).
  - Install a new 44.8 MVA, 69-12 kV transformer, 69kV ring bus, breakers, steel, control house, and associated equipment in the new Lime Kiln substation.
- Distribution project #148884: estimated cost $2,674k ($1,501k-2019; $1,173k-2020).
  - Distribution work associated with the new Lime Kiln substation. Install approximately 12,867' of 795 AAC OH conductor, 5,075' of 1000MCM UG conductor, along with additional tie switches for 5 new distribution circuits. Approximately 2,100' of new conduit with manholes will need to be installed. Contingency is included to cover the uncertainty of easement costs and rock removal.

- Transmission project #134238: estimated cost $894k ($79k-2019; $815k-2020). **Arbough**
  - Install poles and conductor as needed to route the 69 kV transmission line into the Lime Kiln substation; perform other temporary work as necessary to accommodate construction.
  - A Network Integration Transmission Service (NITS) will need to be submitted for the new Lime Kiln substation.

- **Project Timeline**
  - December, 2018: Open projects.
  - January-March, 2019: Perform substation and transmission engineering design related tasks; order major equipment.
  - April-June, 2019: Perform distribution engineering design related tasks for planned 2019 work; order materials.
  - July-December, 2019: Complete distribution conductor improvements for planned 2019 work; receive major substation and transmission equipment.
  - January-April, 2020: Perform substation site preparation and foundation work; perform distribution engineering design related tasks for planned 2020 work; order materials.
  - May-August, 2020: Progress on transmission foundations and pole installation; progress on distribution conductor improvements for planned 2018 work.
  - September-November, 2020: Install substation structures and equipment; progress on distribution conductor improvements.
  - December, 2020: Complete remainder of substation, transmission, and distribution improvements; commission substation.

- **Project Cost**
  - The total estimated cost of the project is $11,477k. The substation and transmission line cost estimates are consistent with the "Conceptual Level 1" engineering design designation. The distribution cost estimate is consistent with the 'Preliminary" engineering design designation and is based on field experience from similar projects. There is an estimated 10% of contingency ($1,043k) incorporated into the project cost estimates. More detailed engineering designs will be conducted after project approval.

Economic Analysis and Risks

- **Bid Summary**
  - The substation transformer and steel package as well as transmission poles will be bid using established Supply Chain procedures.
  - For other requirements, Substation Construction and Maintenance (SC&M), Distribution Operations, and Transmission Lines will use existing material and labor contracts and follow established Supply Chain procedures.

- **Budget Comparison and Financial Summary**

2. Project O&M 2019 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

This project was identified and funded in the 2019 Business Plan at the following levels: Substation project #148885 ($2,999k-2019; $4,100k-2020); Distribution project #148884 ($1,499k-2019; $1,000k-2020); Transmission project #134238 ($79k-2019; $815k-2020). The $982k budget shortfall in 2020 will be addressed in the 2020 Business Plan.

Financial Summary ($000s):

Discount Rate: 6.59%
Capital Breakdown:
Labor: $ 278
Contract Labor: $ 4,600
Materials: $ 4,064
Local Engineering: $ 787
Burdens: $ 657
Contingency: $ 1,043
Transportation: $ 48
Reimbursements: ($ 0)
Net Capital Expenditure: $11,477

- **Assumptions**
  - The project unknowns will not exceed the estimated contingency amounts.
  - The estimated cost of the distribution improvements are consistent with similar past projects.

- **Environmental**
  - There are no known environmental issues at this time.

- **Risks**
  - The cost of the distribution portion of the project could escalate because a detailed engineering design was not conducted prior to the preparation of these cost estimates. Costs are based on similar completed work for other projects of similar scope and size.
  - Failure to complete this project in a reasonable time frame could negatively impact the company's ability to serve new loads associated with the ████. Insufficient infrastructure could result in outages and/or failure of the existing substation transformer and distribution circuits.
  - At the time of the writing of this IP, the ██ has yet to sign a contract for their projected load, so there is a risk the new hospital project could be delayed or canceled. In order to mitigate this risk, early 2019 work on the project will be limited to design work and equipment purchases that can be reassigned to other projects.

Conclusions and Recommendation   **Arbough**

Electric Distribution recommends that the Investment Committee approve the Lime Kiln Distribution Substation project for $11,477k to provide adequate distribution substation capacity for existing and future loads in Louisville, KY.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: December 20, 2017

Project Name: Lock Out/Tag Out (LOTO) Software Replacement Project

Total Expenditures: $2,875k   (Including 259k of contingency)

Project Number(s): IT0329B

Business Unit/Line of Business: Power Production

Prepared/Presented By: Paul Wright, Toby Wright, Sandi O'Banion

Executive Summary

Implemented in March 2015, the NiSoft e3 application's purpose was to augment the Company's Lock Out/Tag Out (LOTO) policy by providing an electronic method for managing Clearances and associated equipment HOLDs from creation and isolation through release and re-energization. The LOTO application is vital to Generation personnel for accurately managing Clearances and associated equipment HOLDs and is considered the system of record for Clearances and equipment HOLDs. For this reason, information regarding Clearances and HOLDs must be 100% accurate. Any inaccuracy results in a potential unsafe situation that could cause a safety incident.

The LKE production version of LOTO e3 was implemented on a custom version of NiSoft's e3 core software due to the need to make immediate code modifications to address critical defects discovered prior to and during the implementation. When using a Hand Written (Paper) Hold Card system as well as the first versions of Software for the LOTO systems, the owner would hang a separate tag on each device that was to identify that this device could not be moved or activated while that tag was in place, for each person that requested for it to be tagged. This ends up with multiple tags being placed on Switches, Breakers and Valves. At times there could be up to 100 tags placed on these individual devices. Our company as well as the industry sees that having these multiple tags placed in the field, increased the possibility and exposure to mistakes being made by misplacement or incorrect removal of tags on or from the proper device. Industry came up with the approach that the Software of our LOTO systems could manage the multiple names of people obtaining clearances on these devices and only hanging one tag on the device that is related to the clearance that multiple people can electronically sign-on to, to hold the Clearance. This is seen and sought after by our company as the next step in making our LOTO system a safer and more manageable program to use. Additionally, since LKE was the first client to utilize Hold Card Sharing, the software contained numerous defects, and work-arounds and the use of card sharing was discontinued. LKE made the decision to proceed with the implementation using a point-in-time copy of the e3 software with known defects and work-arounds, with the understanding that Hold Card Sharing would be re-engineered and re-implemented after go-live under the NiSoft e3 maintenance agreement. This approach allowed the implementation to proceed without further delays. Technical issues with NiSoft's e3, manual work arounds, and instability drives the urgency of this project.   After the implementation, the team attempted to work with NiSoft to improve quality and service. A card sharing rewrite project was planned and estimated to correct all the issues with e3 at a cost of $1,623k (business labor not included) over 19 months. The rewrite project was put on hold and a new Request for Proposal (RFP) was submitted for a completely new LOTO software to replace e3 once NiSoft stated e3 was a document management application and not a system of record which could cause misinformation for real-time clearances.

As a result of the thorough vendor evaluation process, ███████████████████████ ██████████████ is the recommended LOTO software platform for LGE/KU's long-term LOTO solution. This project will procure and implement a new LOTO system across the fleet with card sharing functionality. This scope will include the following sites: Paddy's Run, Mill Creek, Ghent, Cane Run 7, Trimble County and EW Brown, along with the hydro-units at Ohio Falls and Dix Dam. This scope will exclude Haefling and the retired assets at Cane Run and Green River.

This proposal seeks approval of $2,875k in capital expenditures (includes $259k of contingency) to procure and implement a new LOTO application. This project has a total of $2,400k included in the proposed 2018 BP ($2,000k in 2018 and $400k in 2019). An additional $475k requested for 2019 will be addressed as part of the 2019 BP planning process. There was $400k in 2017 that was provided back to the Corporate RAC.

Background

The Lock Out/Tag Out (LOTO) management system is a vital component in managing clearances for power plant equipment. Safety is the cornerstone of the LG&E/KU value system. The system manages the process in accordance with the company's comprehensive Lockout/TagOut policy. The generating station's 3,500 users have utilized the NiSoft e3 application for the last three years. Over 100,000 clearances per year are processed utilizing a database of 142,000 devices. These clearances isolate equipment to keep employees safe from energized devices within the generating plants. The software tracks the process from initial request to the final stage of removing the tags off the devices.

Five years ago when NiSoft's e3 product was selected, tasked based card sharing functionality required by LKE was not available in the Lock Out/Tag Out products that were on the market. In order to meet the card sharing requirements, NiSoft had a significant development effort to provide all the card sharing functionality. In addition, e3 was NiSoft's first web-based product and no one was using e3 with card sharing. After an extensive design, customizations, and enhancements of the card sharing functionality and implementation, significant issues arose such that the card sharing functionality used within the company was discontinued due to safety concerns.

The enhancements to e3 were written and executed outside the core product so that patches could be applied without having to release new versions of the core application. Unfortunately, this design created integrity issues within the system. Currently two sets of database tables are maintained, one which is a real-time updated database and one which is used to send information to the screens. The real time data in the database and the data displayed on the screen could get out of sync in the event that transactions failed to complete. Workarounds were created and required to maintain the data integrity, keep the data in sync and displayed properly. Due to all the issues and daily manual work arounds that exist, LKE started a new project to replace NiSoft's e3. Manual checks are currently conducted by the administrative authority to review every clearance and every device to ensure the card counts match as clearances are released and locks are not found in the system on devices as clearances are created. The current system would need to be replaced within a couple of years due to software upgrades and patches cannot be applied to NiSoft's e3. Patches and new builds from NiSoft created more issues with the product than fixes which impacts the support we can receive from NiSoft. NiSoft has since stated e3 is not a real time system of record, the product is a document control system. LKE has lost confidence in e3 and the ability to accurately track clearances and has prompted the need for a new project.

The following team of LG&E/KU stakeholders was assembled for the project:
- Production Managers and other operational staff members
- Manager, Fleet Operational Performance and Reliability

- Information Technology

This group researched LOTO vendors on the market today and prepared requirements for a new RFP. Requirements were gathered from the previous project which included the lessons learned at the end of the project, which took into consideration the issues that were encountered in production. The core team thoroughly reviewed the updated requirements to ensure consistency and clarity of the requirements across the business. The team used this opportunity to improve the existing requirements and LOTO processes with a concentration on card sharing.

The team thoroughly evaluated the top fifteen recommended vendor applications with card sharing functionality with real time updates. Preliminary demos were conducted and vendors that could not demonstrate card sharing were eliminated from consideration. The RFP was ultimately submitted to five vendors. The team reviewed the RFP responses and eliminated some of the companies due to the limited number of support staff and some due to technical concerns. ▇▇▇▇▇▇ and ▇▇▇▇▇▇ came out on top based on the RFP responses. On-site demos were conducted and extensive question and answer sessions were held. Second demos were held to further clarify outstanding concerns, as well as conducting detailed project plan reviews, timeline, and cost discussions. Vendors were asked to identify any functionality listed in our requirements that were either configuration or customizations and resubmit adjusted costs based on what was learned during our on-site discussions. The team evaluated the final responses and scored the vendors, ▇▇ and ▇▇. The scoring was evenly split between the two vendors and the final decision was ultimately based on cost.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $3,454
  2. Alternative #1: ▇▇▇▇▇   NPVRR: ($000s) $5,574
     - Although there were some O & M savings associated with the ▇▇▇▇▇ option, the higher capital cost of $6,678k could not be offset. There was no significant benefit between the solutions to justify the significant capital cost.
     Alternative #2: Do Nothing   NPVRR: ($000s) n/a
     - Staying with NiSoft and doing nothing is not a viable long-term option for the following reasons:
       - NiSoft has stated that e3 is a document management system and not a real time system of record.
       - A major upgrade of NiSoft e3 would be required and the card sharing functionality would have to be rewritten as part of any NiSoft e3 solution.
       - The software has major design flaws in these areas: Failover Recoverability, Share Counts, and Daily Clearance Reports are not accurate. In some cases, the system gets locked up.
       - Daily Manual Workarounds are required to monitor the application. There are two LKE-created reports that are run daily to ensure the system is working properly.
       - Plants are required to limit the amount of devices on a clearance because the system can't handle more than 50 devices. It is common that the business requires more than 50 devices. Once this situation causes failure, manual intervention is required to release the additional devices from the clearance. To avoid the situation, several clearances have to be created with smaller device counts.
       - NiSoft software updates tend to break other areas of the code.

Project Description

- **Project Scope and Timeline**

The ▮▮▮▮▮▮▮ software system will be implemented to support the card sharing functionality process for the fleet. Corporate Purchasing verified the size, age, and solvency of ▮▮▮. Due diligence was also performed to confirm the installation base of the product, customer referrals, and technical support infrastructure. The system will be implemented in phases across the fleet, starting with E.W. Brown. This will help ensure there are sufficient implementation resources and the lessons learned from the installation are applied to the next location.

This scope will include the following sites: Paddy's Run, Mill Creek, Ghent, Cane Run 7, Trimble County and EW Brown, along with the hydro-units at Ohio Falls and Dix Dam. This scope will exclude Haefling and the retired assets at Cane Run and Green River.

The primary objectives are:
- Implement the ▮▮▮▮▮▮▮ software system to support the LOTO process across the generating fleet with ZERO safety incidents attributable to a defect in the new process or system
- Implement the capability of card sharing into the core product
- Implement ▮▮▮▮▮▮ without any major defects in the ▮▮▮▮ product

The secondary objectives are:
- Explore the implementation of an interface to ▮▮▮▮
- Improved end-user reporting
- Implement the ▮▮▮▮▮▮ mobile application with barcoding capabilities

Major Milestones

2017 -	December	IP Presentation to Investment Committee and upon approval, Contract Award
2018 -	January	Kickoff
2018 -	May	System Design Complete
2018 -	November	System Customization & Configuration Complete
2019 -	March	User Acceptance Test (UAT) Complete
2019 -	March	Brown Training and Rollout Complete
2019 -	April	Ghent and Cane Run Unit 7 Training & Rollout Complete
2019 -	May	Mill Creek and Trimble County Training & Rollout Complete

- **Project Cost**

  The Lock Out Tag Out system being requested has a direct impact on safety, potential for serious injuries and threat to human life. This proposal seeks the approval for a total of $2,875k in capital expenditures. This includes a $259k contingency. This cost will cover procurement of the LOTO software, configurations and enhancements of the software, testing, training of the core team, and end-user training & implementation at each station across the fleet. The contract with ▮▮▮▮ is a fixed bid.

Economic Analysis and Risks

- **Bid Summary**

Four vendors submitted bids with the team eliminating two of them because they did not meet minimum support requirements. Evaluation of the remaining two are:

	Max Score		...ugh
Price of Software	10		
Price of On-Going Software	10		
Price of Professional Services	5		
Solution Requirements	45		
Proposed Work Plan/Implementation	5		
Training	5		
Experience and Stability	10		
Incident Support/Upgrades	10		
Total	100		
Total Capital Cost ($000s)			

Budget Comparison and Financial Summary

Contract Labor:	$ 566
Materials:	$ 573
Property Tax:	$ 31
Burdens:	$ 0
Contingency:	$ 259
Reimbursements:	($ 0)
Net Capital Expenditure:	$2,875

- **Assumptions** Arbough
  - o Unit outage schedules are dynamic and thus the implementation schedule will remain flexible, while still holding a completion target of June, 2019.
  - o The economic useful life of the system is a minimum of ten years.
  - o The new system is scalable and can be adapted to our changing company needs.
  - o Plant resources will be utilized to develop new or additional data for the system.
  - o The project will utilize a train-the-trainer approach. The project team will develop a schedule and plants will support the process of training affected employees and contractors.
  - o Train-the-trainer and project team training will be charged to the team members' regular O&M charge numbers.
  - o Existing network bandwidth to/from the plants is sufficient.
  - o Super Users will be identified and brought in to practice the training and review the data migration during the project.
  - o Historical clearances will be migrated.
  - o The mobile application will be available only internally.
  - o Active clearances will not be migrated in the system. The active clearances will be used on go live for training and will be entered manually.

- **Risks**
  - o This project has a long timeline and thus, team members, financial resources, and business priorities can change. **Mitigation:** Plants will provide one to two representatives to the core team to allow for flexibility in scheduling and redundancy of representation. IT will follow standard processes and maintain system documentation to allow transition of resources. If financial resources or business priorities change, the impact to the project will be assessed at that time.
  - o While changing the tool used for LOTO, each plant will be implementing a process that has new elements; some more than others. This increases the risk of human error to the safety system process. **Mitigation:**
    - ▪ Training is the key component. The Core Team will receive extensive training in the product and has worked together to define the process. The Core Team will guide delivery of train-the-trainer classes, the material and content developed for end-user training, and delivery of that training to the end users.
    - ▪ Each plant will select key individuals to receive the training early and to assist with final preparations at each site prior to launch to increase their knowledge and provide "go to" personnel on each shift.
    - ▪ Additional IT and vendor resources will be available on-site for immediate response to any issues that may arise during first implementations.
    - ▪ The team will define and deliver communications to plant personnel tailored to their needs and using regular communications channels.
  - o During the conversion from one system to another, there will be a period of possible confusion as tags from the new system are hung and tags from the old one have not been removed yet. **Mitigation:**
    - ▪ Units not in an outage or predetermined areas of the plant will be converted first, minimizing the number of individuals impacted.
    - ▪ Conversion will take place over a weekend to alleviate the amount of confusion. IT will provide onsite support during the cutover weekend as needed.
    - ▪ Advanced and on-going communication to all plant personnel via existing channels will be developed and delivered.
    - ▪ A LOTO deviation will be requested at each plant for the duration of the launch that requires Plant General Manager approval and support from all levels of the plant.

Conclusions and Recommendation Arbough

It is recommended that the Investment Committee approve the Lockout/Tagout (LOTO) System project for $2,875k to provide clearance accuracy and card sharing functionality within the application.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake Date	Paul W. Thompson Date
Chief Financial Officer	President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: <u>March 29, 2017</u>

Project Name: <u>Mill Creek Limestone Unloading Barge Replacement</u>

Total Expenditures: <u>$2,700k (including $240k in contingency)</u>

Project Number(s): <u>139717</u>

Business Unit/Line of Business: <u>Power Generation / Mill Creek Station</u>

Prepared/Presented By: <u>Jason Thompson / Joe Didelot</u>

Executive Summary

The Mill Creek limestone unloading barge was commissioned in 2000 and serves a vital role in the limestone handling process at the plant. Limestone is transferred from delivery barges via an excavator that rests on the deck of the unloading barge. The unloaded limestone is utilized in the wet flue-gas desulfurization (WFGD) systems. Due to limited space, only seven days of limestone inventory is maintained on site, making the barge a critical asset at the plant. The structural members, hull and decking surfaces have reached the end of their useful life. The risk of derates and outages increases dramatically with the probability of major barge repairs.

The scope of this project includes the purchase and installation of a new limestone unloading barge. This project is included in the 2017BP with $500k in 2017 for barge purchase milestones and $2,200k in 2018 for completion of the purchase and installation.

It is recommended that the Investment Committee approve the Mill Creek limestone unloading barge replacement project for $2,700k to avoid the risk of outages should the barge experience a catastrophic failure.

Background

The limestone unloading barge was designed in 1999 and has been in service since 2000. The barge floats directly on the Ohio River and is restrained between two vertical river cells. The barge plays a vital role in the unloading process of limestone, which is ultimately utilized in the WFGD systems. This deck barge supports the excavator, transfer hopper, feeder belt and the tail section of the main limestone conveyor. The barge has deteriorated over the course of its duty cycle and has reached the end of its useful life. Leaks exist throughout the vessel after years of running aground during low river pool conditions. Hull thinning also exists due to the constant flow of the unit 1 condenser discharge water against the barge. The existing barge framing is not robust enough to support the 200,000 lb. load of a moving excavator. Consequently, the deck and hull support frames are damaged from overloading. The south-end guide failed in 2014 and required emergency repairs to keep the barge from breaking loose. The plant maintains a seven

day stockpile of limestone, however a catastrophic barge failure places significant derate**Although** forced outage risks on the units.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $3,058
  2. Delay One Year: NPVRR: ($000s) $4,145
  3. Do Nothing: NPVRR: ($000s) $178,887

Recommendation – Replace Limestone Barge:
> The purchase and installation of a new limestone barge is the recommended option. This plan has the least cost over the life of the project and avoids the probability of outages for all four units if the barge becomes inoperable.

Alternative 1 – Delay Project One Year:
> This alternative is not recommended because of the added risk associated with delaying the project by a year and the unfavorable NPVRR. The largest associated risk is a barge failure resulting in downtime. If that downtime exceeds the stockpiled backlog of limestone, there would likely be unit outages.

Alternative 2 – Do Nothing:
> The Do Nothing alternative is not recommended because of the unfavorable NPVRR and the uncertain remaining life of the limestone barge. This option has a high probability of causing unit derates and forced outages.

Project Description

- **Project Scope and Timeline**
  The scope of this project includes the purchase and installation of a new limestone unloading barge. A contract to design, build and deliver a new unloading barge will be awarded in the second quarter of 2017. Delivery of the new barge is expected in July 2018. An installation contract will be awarded in early 2018. After completion of the installation the old barge will be scrapped. Removal of the existing barge will be handled by the installation contractor.

  The following details the expected project timeline:
  o Investment Committee presentation   March 2017
  o Award new barge construction bid   April 2017
  o Award installation contract   2nd Quarter 2018
  o New barge delivered   July 2018
  o Installation begins   3rd Quarter 2018
  o Project complete   3rd Quarter 2018

- **Project Cost**
  The total cost of the project is estimated at $2,700k. This includes the purchase of a new limestone barge and delivery, removal of the old barge and installation of the new barge. A contingency of $240k (10%) is included for unexpected costs associated with removal and installation. Project burdens of $106k (4.50% for 2017 and 2018) are included.

Economic Analysis and Risks   **Arbough**

- **Bid Summary**
  The bid summary below is for the purchase and delivery of a new barge. Installation of the new barge and removal of the existing barge will be bid in a separate initiative.

MBE/WBE	██████████████████████
Total Cost ($000s)	██████████████████████

Bids were solicited from six bidders. Five bids were received. Review meetings were conducted with three barge manufacturers ██████████████████████, and ███████ was deemed the best evaluated. ███████ is the low bidder and is able to meet the barge design specifications and equipment requirements indicated in the project scope of work.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	Total
1. Capital Investment Proposed	500	2,000	2,500
2. Cost of Removal Proposed		200	200
3. Total Capital and Removal Proposed (1+2)	500	2,200	2,700
4. Capital Investment 2017 BP	500	2,000	2,500
5. Cost of Removal 2017 BP		200	200
6. Total Capital and Removal 2017 BP (4+5)	500	2,200	2,700
7. Capital Investment variance to BP (4-1)	-	-	-
8. Cost of Removal variance to BP (5-2)	-	-	-
9. Total Capital and Removal variance to BP (6-3)	-	-	-

Financial Detail by Year - O&M ($000s)	2017	2018	Total
1. Project O&M Proposed			-
2. Project O&M 2017 BP			-
3. Total Project O&M variance to BP (2-1)	-	-	-

Financial Summary ($000s):

Discount Rate: 6.49%

Capital Breakdown:

Labor:	$0
Contract Labor:	$600
Materials:	$1,754
Local Engineering:	$0
Burdens:	$106
Contingency:	$240
Reimbursements:	($0)
Net Capital Expenditure:	$2,700

- **Assumptions**

  Cost estimates for the capital evaluation models include a 2% inflation rate, where applicable.

  The current capital burden rate as of 1/1/2017 is 4.50%. This rate was used to determine the total burden to the project.

  The capital evaluation models only take into account outages associated with Unit 4. The actual outages due to a barge issue causing an outage would likely affect all four units. The assumed barge lead time is 36 weeks.

  For the "Do Nothing" alternative, an 5% annual increase in probability of a major outage is assumed due to repairs to the limestone barge as it ages. This assumption is based on the barge already being at the end of its useful life.

  At the time of this investment proposal, scrap barges similar to the existing limestone barge are bringing around $20k in scrap value. This scrap value is netted against the removal costs to dispose of the existing barge.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	N
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	N
#3	Does the project increase through-put with any of the material handling systems?	N
#4	Will the project affect the dispatch order or utilization of the unit?	N
#5	Does the project increase the emissions unit's maximum hourly heat input?	N

#6	Does the project increase the emissions unit's electrical output (gross MW)?	Arbough N
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced. See Below*	Y
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	N

*Numerous minor repairs to the limestone barge have been made including repair of broken welds and fatigued metal. In 2014, one of the barge guides that holds the barge in place failed and the barge nearly broke free.

- **Risks**
  - <u>Forced Unit Outages</u>: Without replacement of the limestone barge, there is increasing risks for forced outages for all four units. As time passes, the chances of a major problem developing with the existing limestone barge increases.

  - <u>Additional O&M costs</u>: Without replacement of the limestone barge there will be increased O&M costs due to unplanned repairs or maintenance. The existing barge has reached the end of its useful life and the likelihood of increased repairs is significant.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the Mill Creek Limestone Unloading Barge Replacement project for $2,700k to avoid the probability of outages for all four units if the barge becomes inoperable.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

Investment Proposal for Investment Committee Meeting on: February 23, 2017

Project Name: Mill Creek Unit 2 Turbine L-0 Buckets Replacement

Total Expenditures: $2,766k (including $256k of contingency)

Project Number(s): 143635

Business Unit/Line of Business: Power Generation / Mill Creek Station

Prepared/Presented By: Nathan Romero / Joe Didelot

Executive Summary

The last stage (L-0) buckets from the Mill Creek Unit 2 (MC2) low pressure (LP) Turbine have reached the end of their useful life and are in need of replacement. The buckets will be ordered in March 2017 and delivered to the contractor ███████████████████████████) in January 2018, for installation during the outage that begins March 12, 2018. The work scope is recommended by General Electric and LGE-KU's Manager of Turbine-Generator Maintenance.

This project will include replacement of the turbine end (TE) and generator end (GE) (see diagram in the attached appendix) L-0 buckets and associated hardware. The new buckets offer improved cover design which raises the back pressure trip point from 7"Hg to 9"Hg. The new buckets offer no measurable heat rate improvements and no increase in unit capacity.

The total cost of this project is $2,766k, including $256k in contingency. A progress payment of $816k for material is required in 2017, with $1,950k projected for 2018. The project is included in the 2017 BP at $4,000k ($500k 2017, and $3,500k 2018). The additional $316k needed in 2017 will be funded within the current Mill Creek capital plan and has been approved in the 0+12 forecast by the RAC.

Background

The L-0 buckets are the original components commissioned with the MC2 GE turbine in 1972. These 30" buckets (2 rows) have an estimated service life of 30 years.

During the last detailed inspection in 2012, significant erosion was discovered at the trailing edges, near the bucket covers. Due to lead time, replacement buckets could not be obtained during the 2012 outage.

A failure of the buckets would cause damage to the turbine housing and result in a lengthy forced outage. Replacement of the L-0 buckets during the Spring 2018 planned outage will restore reliability of the unit.

- **Alternatives Considered**

  1. Recommendation: NPVRR: ($000s) $3,159
  2. Alternative #1: Delay two years   NPVRR: ($000s) $4,328
     Delaying the project until the next major outage is not recommended because of the risk of forced outage and the increase in material and labor costs.
  3. Alternative #2: Do nothing   NPVRR: ($000s) $52,088
     The do nothing option is not recommended because of the increasing risk of forced outages and lost generation.

Project Description

- **Project Scope and Timeline**

  ➤ Open, inspect, and close the LP turbine assembly.
  ➤ Remove and install new TE and GE L-0 buckets.
  ➤ Low speed balance LP assembly.
  ➤ Install new LP packing and spill strips.

  Milestones:
Project Approval	February 2017
PO issued for material	March 2017
Material Delivery	January 2018
Installation	MC2 Spring Outage (March 2018)

- **Project Cost**

  The total estimated cost of the project is $2,766k, including 10% ($256k) contingency for emergent work that may be uncovered after inspection.

Economic Analysis and Risks

- **Bid Summary**

  The MC2 turbine L-0 buckets capital work scope is included as part of the LKE 2017-18 fleet turbine-generator major outages contract, which was approved by the Investment Committee in October 2016 and awarded to ███████ in November 2016, under contract number 613001. The contract includes fixed pricing through the term of the agreement unless an outage schedule shifts.

- **Budget Comparison and Financial Summary**

Financial Summary ($000s):

Discount Rate: 6.5%
Capital Breakdown:
  Labor: $ 0
  Contract Labor: $ 673
  Materials: $1,729
  Local Engineering: $ 0
  Burdens: $ 108
  Contingency: $ 256
  Net Capital Expenditure: $2,766

- **Assumptions**

Delay Project Two Years alternative: capital costs would increase by 2% each year due to inflation; 1% probability of 36 weeks availability disimprovement starting in 2018, with probability increasing by 2% each year until project completion in 2020.

Do Nothing alternative: 1% probability of 36 weeks availability starting in 2018, with probability increasing by 2% each following year.

Estimated equipment useful life: 30 years.

- **Environmental**

There are no local, state, or federal environmental requirements for permitting, notification, reporting, etc., regarding these repairs. There are no known environmental issues regarding this project.

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	N
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	N
#3	Does the project increase through-put with any of the material handling systems?	N
#4	Will the project affect the dispatch order or utilization of the unit?	N
#5	Does the project increase the emissions unit's maximum hourly heat input?	N
#6	Does the project increase the emissions unit's electrical output (gross MW)?	N
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	N
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	N

Environmental Affairs has reviewed and approved this project.

- **Risks**

Risks associated with delaying or not completing this project include forced outages and significant damage to the turbine/generator. Material and labor costs will increase if the project is delayed.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the MC2 Turbine L-0 Buckets
Replacement project for $2,766k (inclusive of 10% contingency) to maintain turbine reliability.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the
members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the

Investment Proposal for Investment Committee Meeting on: November 28, 2017

Project Name: Mill Creek 2 Waterwall Weld Overlay

Total Expenditures: $2,600k   (Including $100k (4%) of contingency)

Project Number(s): 154561

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Rob Meadway

Executive Summary
This project is to mitigate potential boiler tube failures (BTF's) on Mill Creek 2 (MC2) waterwalls from sulfidation/corrosion. Weld overlay is a proven solution to mitigate corrosion in coal fired utility boilers industry wide. Approximately 5,000 sqft of tubing will be weld overlaid in place with a corrosion resistant alloy to restore waterwall tube thickness and prevent future degradation. The weld overlay will be applied to the existing waterwall tubes using automatic welding machines. A small number of panels will be installed to replace any tubing too thin to weld overlay.

The project was initially included in the 2017 BP as project 147055 in years 2021 and 2022 for $2,500k. Project 147055 was cancelled and the current project is included as a 2018 project in the proposed 2018 BP for $2,600k, including $100k contingency. The project was accelerated to address damage from a faster than anticipated corrosion rate. The MC2 dry bottom ash project also presented an 8-week outage opportunity to perform the work.

Background

MC2 was put into commercial operation in 1974. In 1996, it was retrofitted with low NOx burners which contributed to multiple BTFs in the subsequent years from corrosion and sulfidation in the firing zone. To mitigate wastage from corrosion and ensuing tube failures, Project 123325 was executed in 2009 to weld overlay the areas experiencing the worst corrosion. The tubing was overlaid from the top burner elevation to the bottom of the upper arch. Since 2009, bare tubing below the top burner elevation has exhibited continued wall loss due to corrosion. This project will extend weld overlay from the top to bottom burner elevations to restore existing tubing and protect from corrosion.

Shop overlaid and field installed panels were considered, but field weld overlay was chosen given good performance as demonstrated on MC2 (2009) and MC1 (2013). In addition to a good performance history, field weld overlay has been and continues to be more economical.

- **Alternatives Considered**
  1. **Recommendation:**   NPVRR: $3,121k
     Weld overlay waterwalls in place to restore tubing thickness and prevent corrosion degradation.
  2. **Next Available Outage:**   NPVRR: $3,242k
     Delaying the project until the next available outage (2020) will result in higher risk of unavailability.
  3. **Do Nothing:**   NPVRR: $3,637k
     This alternative will enable continued waterwall wastage and decrease availability.

Project Description

- **Project Scope and Timeline**
  This project will remove damaged waterwall sections which exhibit significant wall loss, restore tubing to its original design thickness, and apply a protective high nickel/chrome overlay to mitigate future corrosion degradation from a corrosive, reducing atmosphere.

  Milestones:
Project Approval	December 2017
Field Weld Overlay Application	MC2 Outage (3/10/2018 – 5/6/2018)
Boiler Hydro	April 30, 2018

- **Project Cost**
  The total project cost is estimated at $2,600k and includes a 4% contingency of $100k. The project cost includes $1,687k labor and $665k material.

Economic Analysis and Risks

- **Bid Summary**
  The project is currently in the bid evaluation stage with proposals received from ███████ ██████ and ████████████████████████ No diverse suppliers were identified that could perform this scope of work.

	███	███

1. Project O&M Proposed					-
2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The project was included in the 2017 BP as project 147055 for $2,500k with $1,200k in 2021 and $1,300k in 2022.

Financial Summary ($000s):

Discount Rate:	6.32%
Capital Breakdown:	
Labor:	$30
Contract Labor:	$1,687
Materials:	$665
Local Engineering:	$0
Burdens:	$118
Contingency:	$100
Reimbursements:	($0)
Net Capital Expenditure:	$2,600

- **Assumptions**
  1. Each BTF will last for an average of 48 hours. This duration is based on a typical leak in the waterwalls including deslag, unit isolation, repair and examination of repair before returning the unit to service.
  2. In the "Do Nothing" alternative, it is expected that there will be two BTF's in 2019 and four BTF's in subsequent years. Tubing thickness readings obtained during the Fall 2016 outage, combined with current wastage rates, support the 75% probability in 2019 and the 90% probability in subsequent years.
  3. Inflation of 2% per year.

#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	Yes

Environmental Affairs has reviewed this project.

#7: 123325 (2009)
#8: In 2013 there was one forced outage that was 33.4 hours in duration.

- **Risks**
  1. BTFs are expected to increase if this project is not completed.

Conclusions and Recommendation Arbough

It is recommended that the Investment Committee approve the MC 2 Waterwall Weld Overlay project for $2,600k to ensure continued reliable operation of the boiler.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:</u>

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake	Paul W. Thompson
Chief Financial Officer	President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: <u>June 27, 2018</u>

Project Name: Mill Creek Unit 3 Turbine L-0 Buckets Replacement

Total Expenditures: $2,780k   (Including $245k of contingency)

Project Number(s): 143637

Business Unit/Line of Business: Power Generation / Mill Creek Station

Prepared/Presented By: Nathan Romero / Joe Didelot

Executive Summary

The last stage (L-0) buckets from the Mill Creek Unit 3 (MC3) low pressure (LP) Turbine have reached the end of their useful life and are in need of replacement. The buckets will be ordered in August 2018 and delivered to the contractor, ▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮ in August 2019, for installation during the outage that begins October 7, 2019. The work scope is recommended by LGE-KU's Manager of Turbine-Generator Maintenance.

This project will include replacement of the turbine end (TE) and generator end (GE) (see diagram in the attached appendix) L-0 buckets and associated hardware. The new buckets offer improved cover design which raises the back pressure trip point from 7"Hg up to 9"Hg (inches of mercury). The new buckets offer no measurable heat rate improvements or change in unit capacity.

The total cost of this project is $2,780k, including $245k in contingency. A progress payment of $790k for material is required in 2018, with $1,990k projected for 2019. The project is fully funded in the 2018 BP and is included in the proposed 2019 BP.

Background

The existing L-0 buckets are the original components commissioned with the MC3 GE turbine in 1978. These 33.5" buckets (2 rows) have an estimated service life of 30 years. In 2019, the buckets will have over 40 years of service.

A failure of the buckets would cause damage to the turbine housing and result in a lengthy forced outage. Replacement of the L-0 buckets during the Fall 2019 planned outage will maintain reliability of the unit.

- **Alternatives Considered**   **Arbough**
    1. Recommendation: NPVRR: ($000s) <u>$3,118</u>
    2. Alternative #1: Delay two years   NPVRR: ($000s) <u>$3,868</u>
       Delaying the project until the next major outage is not recommended because of the
       risk of forced outage and the anticipated increase in material and labor costs
    3. Alternative #2: Do nothing   NPVRR: ($000s) <u>$44,852</u>
       The do nothing option is not recommended because of the increasing risk of forced
       outages and lost generation.

Project Description

- **Project Scope and Timeline**
    - Open, inspect, and close the LP turbine assembly.
    - Remove and install new TE and MD&A L-0 buckets.
    - Low speed balance LP assembly.

    <u>Milestones:</u>
Project Approval	June 2018
PO issued for material	August 2018
Material Delivery	August 2019
Installation	MC3 Fall Outage (October 2019)

- **Project Cost**
    The total estimated cost of the project is $2,780k, including 10% ($245k) contingency for
    emergent work that may be uncovered after inspection.

Economic Analysis and Risks

- **Bid Summary**
    Bids were solicited from ▮▮ and ▮▮▮▮ in March 2018 and were received in April 2018. While
    negotiations are ongoing, an award to ▮▮▮▮ is anticipated as they provided lowest priced bid.
    The award to ▮▮▮▮ includes supply of the new L-0 buckets and installation of the buckets on
    the LP rotor in ▮▮▮▮'s shop. The contract award will include fixed pricing through the term
    of the agreement unless the outage schedule shifts.

($000s)	
MBE/WBE	
L-0 Bucket Material	
Shop Labor	
Total Cost	

    The labor to open and close the MC3 LP turbine during the Fall 2019 outage was bid under a
    separate fleet inititative. Those bids are due in June 2018 and award is expected in October 2018.

Investment Proposal for Investment Committee Meeting on: May 30, 2017

Project Name: Mill Creek 4 (MC4) Condenser Retube

Total Expenditures: $3,510k (Including $295k (7.5%) of contingency)

Project Number(s): 127590

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Vince Cecil / Joe Didelot

Executive Summary

The MC4 Condenser Project involves replacing the remaining 75% of condenser tubing in the fall 2018 outage.

In 2012, a condenser inspection by TEi Engineering revealed cracking and erosion damage to the hotwell wall, at the penetrations of the high energy steam drains. In the fall of 2014, this section of wall was replaced along with 25% of the condenser tubing to provide access to the working area.

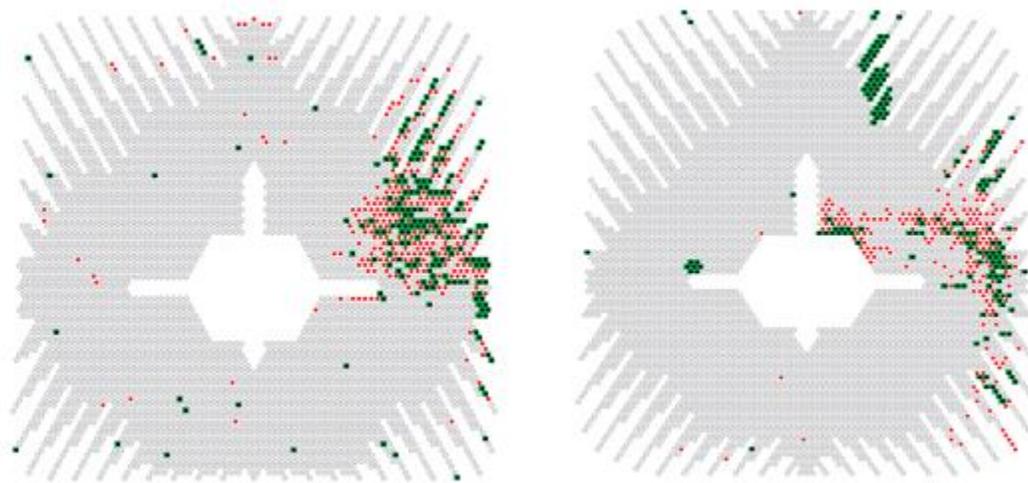
Inspections and eddy current testing performed during the fall 2014 outage indicated considerable thinning of the 27,000 remaining tubes. Since 2014, approximately 550 of the tubes have failed. The most prevalent failure mode was inlet-end erosion caused by the turbulent flow at the inlet of the tubes. The only option for returning this condenser to a reliable state is the replacement of the original tubing.

The proposed plan for the fall 2018 outage is to replace the remaining original tubing in the condenser. Repairs will also be made to the hotwell internal structures, as needed to restore the condenser and hotwell to original condition. This project was included in the 2017 BP for $6,000k. A total of $1,100k has been reallocated from 2018 to 2017 to purchase material and install two isolation valves and was approved by the RAC in the 3+9 forecast.

Background

The MC4 Condenser is a Westinghouse 268,000 ft^2 rectangular surface condenser, commissioned in 1982, with 36,336 total tubes. The existing tubes are 0.875" O.D., 0.035" wall, 90-10 copper-nickel and are 32'-6 1/4" long. The tubes are roller expanded into 2" thick Muntz metal tubesheets.

The 4A1 condenser waterbox was retubed in 2014 and the north hotwell wall was replaced. The remaining three boxes of the condenser are the original 90-10 copper-nickel tubes. The 35 year old tubes are 5 years past their expected design life, per EPRI's guideline for typical operation.

Below are the tube maps for the 4B2 upper and lower tube banks. The tubes highlighted in green **Although** were plugged before 2014, the tubes marked in red are the tubes that failed since the fall 2014 outage.


The MC4 condenser has four main 72'' butterfly isolation valves. In 2016 the 4A2 and 4B1 isolation valves were replaced. This project encompasses replacing the remaining two isolation valves (4A1 and 4B2). The new valves will minimize leakage, reduce outage time, and improve the safety of personnel in the waterboxes.

- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $4,875
       Replace the remaining MC4 condenser tubing along with the 4A1 and 4B2 condenser isolation valves during the fall 2018 outage.

    2. Alternative #1:   NPVRR: ($000s) $5,728
       This alternative postpones the project until the next available outage in 2022. This is not recommended because the delay will increase the risk for derates and forced outages. Also, the cost for labor and materials would increase due to inflation and commodity pricing fluctuation (assumed at 2%).

    3. Alternative #2:   NPVRR: ($000s) $29,003
       This alternative should not be chosen because of the increased risk for derates and forced outages.

Project Description

- **Project Scope and Timeline**
    o This project encompasses replacement of the original condenser tubing. The project also includes replacing the 4A1 and 4B2 main condenser isolation valves.

o The material, as well as the method for retubing, is well proven in the industry. Although Mill Creek Units 2 and 3 were retubed in 2012 and 2016 respectively, using a similar material and process.

Milestones:

- Project Approval   May 2017
- PO issued for material   June 2017
- Labor Awarded   Fall 2017
- Material Received   Fall 2017
- Valve Installation   Fall 2017
- Tubing installation   Fall 2018

- **Project Cost**
  This project includes $295k contingency for fluctuation in raw copper pricing as well as potential repairs identified during the outage, such as tube-sheet, water box studs, or bracing during the 2018 installation. A formal bid process will be completed in the fall of 2017.

Economic Analysis and Risks

- **Bid Summary**
  Quotes were received from five tube suppliers in March 2017. Upon an internal review of each supplier's quality control measures and work history, the recommendation is to utilize the tubing provided from ▋▋▋▋▋▋. ▋▋▋▋▋▋ provided the only domestic sourced option and is the OEM for all the Mill Creek condensers. While ▋▋▋▋▋▋ did not provide the lowest priced offering, a higher level of Quality Assurance/Quality Control would be required for other globally sourced suppliers, offsetting the additional cost (see Appendix A).

A budgetary installation quote was obtained with formal bidding of the tubing labor expected to be completed in the fall of 2017. Procurement of the valves and installation labor will be completed in the summer of 2017, to prepare for installation during the fall 2017 outage.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	2,100	1,310	-	-	3,410
2. Cost of Removal Proposed	-	100	-	-	100
3. Total Capital and Removal Proposed (1+2)	2,100	1,410	-	-	3,510
4. Capital Investment 2017 BP	1,000	4,500			5,500
5. Cost of Removal 2017 BP		500			500
6. Total Capital and Removal 2017 BP (4+5)	1,000	5,000	-	-	6,000
7. Capital Investment variance to BP (4-1)	(1,100)	3,190	-	-	2,090
8. Cost of Removal variance to BP (5-2)	-	400	-	-	400
9. Total Capital and Removal variance to BP (6-3)	(1,100)	3,590	-	-	2,490

Financial Summary ($000s):

Discount Rate: 6.5%
Capital Breakdown:
  Labor: $30
  Contract Labor: $1,310
  Materials: $2,475
  Burdens: $100
  Contingency: $295
  Salvage: ($700)
  Net Capital Expenditure: $3,510

- **Assumptions**
  1. Tube leaks currently account for a half week of lost availability per year and increase 15% yearly until the re-tube is complete.
  2. A 2% escalation is included in the 2022 alternative.
  3. The financial impact of a forced outage due to complete failure of the MC4 condenser was not considered.
  4. The estimated useful life of the re-tubed MC4 Condenser is thirty years.
  5. O&M savings (tube plugging, condensate treatment, etc.) were not included in the financial model.
  6. The CEM model maximum lost availability for derates and outages, for the "Do Nothing" case, is seven weeks.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	No
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. MC4 condenser partial retube and north wall repair in 2014.	Yes
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? See GADS data below.	Yes

Environmental Affairs is currently reviewing the project.

Mill Creek Condenser Tube Leak GADS (2012-2017)							
Event	Type	Start	End	Cause	Description	Eq Hrs	Eq MWH
35	MO	2/21/2012	2/24/2012	3110	Condenser Tube Leak	63.3	30,780
68	U1	5/1/2013	5/2/2013	3110	Condenser Tube Leak	36.1	17,228
262	U1	12/10/2014	12/13/2014	3110	Condenser Tube Leak	74.6	36,272
272	U1	12/16/2014	12/18/2014	3110	Condenser Tube Leak	50.6	24,600
95	MO	9/5/2015	9/7/2015	3110	Condenser Tube Leak	46.9	22,387
2	MO	1/9/2017	1/10/2017	3110	Condenser Tube Leak	23.4	11,356

- **Risks**
  If the project is postponed, the condenser tubes will continue to fail at a higher rate leading to reduced availability. As the percent of plugged tubes increases over 10%, the impact to performance may become more significant.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Mill Creek 4 Condenser Retube
project for $3,510k to reduce the risk of lost generation and to improve the reliability of the condenser.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

Investment Proposal for Investment Committee Meeting on: June 28, 2017

Project Name: Meter Asset Management System (MAM)

Total Approved Expenditures: $6,429k Capital (Approved on 02/16/2017)

Total Revised Expenditures: $10,500k Capital

Project Number(s): 154011, 154013, 154014, and TBD Meter Asset Project #s

Business Unit/Line of Business: Customer Services / IT

Prepared/Presented By: Joan Ferch / David Huff

Reason for Revision

The original investment proposal was approved in February 2017 for $6,429k (see Appendix A). An additional $4,071k is necessary to complete the MAM project. A breakdown of the additional costs are shown below.

$000s	
Approved Project Spend	**$6,429**
LKE Labor – Timeline Extension	$270
Reduced License Fee	($389)
System Integrator/Vendor Design Scope and Timeline Extension	$2,845
Incremental Scope:	
Meter Test Boards and Scanners	$1,045
BI Strategy and Delivery	$300
Total Adjustments	**$4,071**
Revised Total Project Spend	**$10,500**

The increase of $4,071k is incremental. The 2017 amount was approved in the June Corporate RAC meeting and the 2018 amount is in the proposed 2018 Business Plan. As originally assessed, it was thought that the Company's existing meter test boards would be compatible with the MAM system to be implemented. However, after Investment Committee approval, detailed planning and design work revealed that the test boards are not compatible with the MAM and thus would require manual test record loading, reducing much of the efficiency gained with the system. Further evaluation revealed that some of the oldest existing test boards are at 16 years of age and do not support the testing of advanced meter functionality like service switching. The Company tests almost 58,000 electric meters annually. The automation of meter testing with the replacement test boards supports realization of benefits from the MAM implementation. Due to these concerns, it is recommended that the Company replace 28 of the existing 37 test boards and field kits.

Additionally, purchases for scanners associated with new inventory controls and the inclusion of internally developed business reports in the Company's Business Intelligence (BI) platform have added scope. Incremental O&M in 2017 and 2018 is related to user training delivery.

As the Company has progressed with planning and design activities to implement the MAM it is evident that the original 9-month implementation timeline is at risk. The Company has worked diligently and prudently with the MAM vendor ▇▇▇▇ to pull the expected implementation back to October 31, 2017, but no longer feels it is possible. Challenges encountered have been numerous but primarily centered on a theme of documentation completeness, slowing the Company from progressing through design approvals (therefore adding time to this process) and ultimately allowing ▇▇▇▇ to begin development. Based on these challenges, the Company is projecting MAM implementation on March 1, 2018. This 4-month delay does not impact the ▇▇▇▇ delivery cost as it was contracted on a fixed cost basis. The time extension does result in additional cost associated with internal LKE labor as well as System Integrator (SI) labor. The Company is confident that the delivered system will meet the Company's needs and deliver multiple operational benefits. First, the MAM will unify disparate and disjointed PSC reporting systems across electric and gas meter testing. This unification ensures consistency in regulatory reporting and provides increased flexibility to meet evolving regulatory reporting needs. Additionally detailed inventory management tracking allowing improved asset procurement. Furthermore, the Company will benefit from automating existing manual processes across gas and electric assets.

Another factor in the increased cost of the MAM is the deferral of the overall AMS program, resulting in increased overhead costs attributed directly to the MAM, rather than being allocated over several applications' initiatives in the AMS full deployment scope.

Alternatives considered include the releasing of SI resources to reduce or eliminate the incremental expenditure request but evaluations based on internal labor delivery projected MAM implementation around Q4 2018. This delay would significantly impact the Company's ability to incorporate the change management aspects of the MAM into daily operations.

Financial Summary ($000s):	Approved	Revised	Explanation
Discount Rate:	6.49%	6.49%	
Capital Breakdown:			
Labor:	$690	$854	Extension through March 2018
Contract Labor:	$2,600	$5,445	SI Scope and extension through March 2018

7. Capital Investment variance to BP (4-1)	(6,520)	1,025	1,424	(4,071)
8. Cost of Removal variance to BP (5-2)	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	(6,520)	1,025	1,424	(4,071)

Financial Detail by Year - O&M ($000s)	2017	2018	Post 2018	Total
1. Project O&M Proposed	214	456	807	1,477
2. Project O&M			1,237	1,237
3. Total Project O&M Variance to BP (2-1)	(214)	(456)	430	(240)

The 2017 amount was approved by the Corporate RAC in June and the total increase will be reflected in the proposed 2018 BP and is incremental funding.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the $4,071k revision request for the MAM project for a revised total of $10,500k to ensure resource continuity, enable maximum business efficiency associated with the automation between the MAM system and test boards, and prevent further delays in schedule.

Business Unit/Line of Business: Customer Services / IT

Prepared/Presented By: Joan Ferch / David Huff

Executive Summary

LG&E and KU Energy LLC (LKE) currently uses ████████████████████████████████ to manage metering assets used to measure and bill for customer usage. ████████ was implemented in April 2009. Currently ████████ has limited functionality around inventory management, sophisticated device characteristics, and lacks advanced field-level security controls. The primary driver of this project is to implement a Meter Asset Management (MAM) system that will serve specific needs related to tracking, testing, Kentucky Public Service Commission (KPSC) reporting, and managing metering assets.

LKE's parent company PPL recently engaged in a similar project for their system utilized in Pennsylvania. PPL's competitive bid evaluation recommended ████████████████████████ LKE evaluated ██████████████████████ software capabilities and determined that it is an appropriate selection to meet LKE business and technical requirements, as well as future strategic metering initiatives.

This project will reflect savings through 2021 of $983k that consists of:
- Labor productivity gains of $450k, achieved through efficiencies and improved utilization of resources due to reduced data entry errors, reduced truck rolls, reduced efforts to locate meters, and reduced time testing electric meters.
- O&M savings of $45k, which is recognized by eliminating the annual maintenance fee for MMS2000.
- Estimated inventory reductions of $488k based on achieving a 15% efficiency factor.

The funding for this initiative was included in the 2017 BP. The amount of the overall project funding related to the MAM is $1,616k in 2017, $3,389k in 2018, and $1,424k in 2019, for a total of $6,429k compared to a total expected cost of $6,429k for 2017.

It is recommended that the investment committee approve this MAM investment proposal to support the current AMS Opt-In program meters, greater inventory control of existing meters, and automation of test boards with this management system to support regulatory reporting requests.

Background

LKE meter data is currently housed in the ███████. Prior to the implementation of ████████, each utility used a separate meter asset system. LGE used the Meter Sub System and KU used the Meter Device Inventory System. At the time of the ███████ original implementation, the functionality within ███████ was considered sufficient to meet the business requirements. Since that time, experience has proven that the ███████ functionality does not provide the full complement of features required to meet LKE's current and future needs related to inventory management, sophisticated device characteristics, and advanced field-level security controls. During the Downtown Network and AMS Opt-In projects, it was determined that Advanced Meters require additional data for meter definition and programming, and additional data to support interfacing the meters to external systems within the AMS architecture. ███████does not provide standard functionality to house and process these advanced characteristics. Additionally, ███████ does not provided standard functionality to track the inventory and deployment of these meters.

The ███████████ MAM was selected for the reasons below.

1) LKE Meter Assets currently utilizes ████████████ that will interface directly with ███████████.
2) ██████ has an established history as an industry leader.
3) LKE Meter Assets has utilized a legacy version of ███████ in a standalone environment in the past.

LKE's parent company PPL reviewed products and proposal by ██████████████ ███████████. PPL determined that ███████████ was their preferred solution. While LKE does not have access to the evaluations due to confidentiality agreements, LKE's review of ███████████ capabilities determined that it is a robust product that meets our technical requirements.

Additionally, as part of the MAM review, four products were reviewed: █████████████ █████████████████████.

Based on the assessment, LKE concluded that ██████ asset management system is indivisibly integrated with ██████ Meter Data Management System (MDMS) to enable an end-to-end ██████ exclusive AMS architecture solution. LKE is planning on implementing the ███████

MDMS. Therefore, the ██████ system is not an acceptable solution that meets LKE's **Arbough**
infrastructure requirements.

██████ suite of asset management software is structured to enable enterprise-wide asset
management of various business functions across an entire organization (i.e., generation,
transmission, distribution, supply chain, etc.). Thus surpassing LKE's requirements achievable
by a less complex, device specific asset management system. Generally, the cost is higher for an
enterprise wide system and would create redundant systems which would not be used.
Consequently, LKE did not pursue detailed evaluation of a ██████ system.

In contrast, ██████ and ██████ products are specifically designed to enable efficiencies and
functions associated with meter asset management. As mentioned previously however, LKE
successfully utilizes and operates ████████████ exclusively. In addition to enabling
seamless integration of analogous software-hardware interfaces, the potential procurement of
████████████ product gives LKE an opportunity to request or negotiate newer or
upgraded test boards. Consequently, ████████ is the most suitable solution to meet
outlined requirements and that will integrate with our existing infrastructure.

The following utilities have been identified as having the ████████ solution currently
deployed. (Note that ████████ has only been available in this enhanced form for less than
two years, although the company has offered many different versions of their software to support
the utility business for more than 20+ years.

Additionally, older versions of ██████ have been deployed at Alabama Power, National Grid,
Florida Power Light, Center Point Energy, Progress Energy, Georgia Power Mississippi Power,
and more than 30 other utilities. The ████████ basic software system is deployed at over
900 utilities.

Inventory tracking today is accomplished through a series of manual processes and spreadsheets
reconciled on an annual basis. ████████ is capable of automating the tracking and
capturing of test records for metering devices; including meters, and other metering related assets
for both electric and gas. The system retains all relevant information necessary to track an
endpoint device across its deployment lifecycle including, but not limited to, device
manufacturer, manufacturer date, installation date and location, serial number, warranty
information, geographic information system (GIS) location of service, maintenance log, and any

scanned records. The inventory tracking system also reconciles field crew handheld devices **Although** (scanners) with back-office systems and has the capability to store records scanned during any service call by field crews. These inventory management processes will enable LKE to more accurately manage inventory level. ███████████ can also support compliance and reporting with all KPSC mandated meter testing processes.

Currently, ████████ is updated manually with all test results. █████████████ will allow for automated integration of the █████████████ (Test Results). This automation will help to eliminate manual data entry errors.

█████████████ will provide the capability to interface meter characteristic data with external systems such as L+G Command Center, L+G Gridstream Meter Data Management System (MDMS), ████████ etc.

The following requirements were identified by LKE Meter Assets as the basic functionality of a MAM:

- Comply with evolving KPSC reporting requirements such as detailed test records for all meters tested and those records to be filed with quarterly reports. The MAM would ensure the data would be properly maintained which would ease scrubbing data to prepare detailed reports like requested by the KPSC
  - o Need for accurate data entry of test results. Test equipment is interfaced with MAM and automatically populates test record preventing data entry errors that occur with manual entry. MAM test records needs to be interfaced to ████████
  - o Provide checks to validate and confirm test result data before saving test record
  - o Delete test records created in error or with erroneous data
- Link photos or images to meter activity record
- Incorporate barcoding in the procurement, inventory and distribution of meter assets to facilitate locating meters
- Provide real time tracking, manufacturing and shipment status information for meter purchase orders with a direct interface with the meter manufacturer
- Provide improved reporting, test comparison, and statistics to management
- Store and track advanced device characteristics such as meter firmware, programs, networking characteristics, and linked devices
- Customize the business rules for inventory management
  - o ████████████ will allow LKE to define "logistic" rules to meter procurement, receipt, inventory, deployment and retirement by enforcing a Next-Step model.
  - o Incorporate 'Sticky Note' and 'Red Tag' technology; electronic alerts that retrieve information for future use (track meters that customer requested test to determine a potential repeatable issue with meter)
- Configure customizable business rules engine for meter test processing

- **Alternatives Considered**
  1. Recommendation: NPVRR: $7,177k

     o Implement ███████████ as proposed. PPL determined that ███████████ met their business requirements when evaluated against ███████████████, and ██████. The LKE investment in ██████ testing technologies supports a software provider for the MAM that integrates with existing infrastructure. Additionally, selecting the same provider for both PPL and LKE provides opportunities for shared support of the system across both companies.

     o ███████████ - This enterprise-wide asset management system was not fully evaluated from a financial standpoint because enterprise-wide systems are historically more expensive than the current proposal and it would provide functionality that is currently provided by other systems. Thus, the ██████ solution is not recommended.

     o ██████ - This asset management system is tightly integrated to ██████ MDMS. LKE is not utilizing the ██████ MDMS and thus integration of this system with ██████ and ███████████ MDMS is considered unacceptable.

     o ██████ - This system is comparable to the ███████████ system, however, it lacks strategic ability to integrate with existing meter testing equipment and would thus reduce planned savings from the integration of the meter test equipment with the ███████████ system. Additionally, based on responses received from the Southeast Electric Exchange (SEE) Metering Committee in regards to MAM implementations, a couple of utilities responded they had tried to implement ██████ and were forced to abandon the implementation of the product. Thus, this system is not recommended.

  2. Do Nothing: NPVRR: N/A

     This option was determined to be unacceptable due to the increasing complexity and costs of the more sophisticated meter asset inventory. As meter hardware becomes more complex, the need to track and store inventory becomes critical to the device characteristics and data integrity. Additionally, KPSC reporting requirements will likely continue to follow the level of meter sophistication. Knowledge gained during the LKE Downtown Network and AMS Opt-In projects has shown the level of data needed to support Advanced Metering appliances has become a critical requirement.

Project Description   **Arbough**

- **Project Scope and Timeline**
  The scope of this project is to implement ███████████MAM software allowing for tighter integration of Metering Assets and improved functionality around tracking, testing, KPSC reporting, and managing metering assets. This was the software selected by PPL after a thorough evaluation of the market.

  > February 2017 – Purchase hardware and software
  > February 2017 – Receive hardware and software
  > July 2017 – Complete build/programming
  > August 2017 – Complete testing
  > September 2017 – Deployment complete/Go live

- **Project Cost**
  Total cost of the project is ███████ of capital and $1,103k of ongoing O&M (compared to on-going O&M in the 2017 BP of $1,237k), for a total on-going O&M of $134k lower than the 2017 BP for the 5 year period. There is a 12% contingency in place for internal labor, vendor professional services and system integrator costs due to the complex nature of the metering assets architecture and criticality of the data integrity for the metering assets used for measuring and billing our customers.

Sole Source Authorization

The work described herein is being sole sourced to ██████████████████████ Signatures on this document will act as approval for the contract to be sole sourced to ███████ for ███████.

Economic Analysis and Risks

Investment Proposal for Investment Committee Meeting on: Presented November 29, 2016 and subsequent Email Vote February 2017

Project Name: Meter Asset Management System (MAM)

Total Expenditures: $6,429k including $464k of contingency

Total Contract Value (SSA): █████████

Project Number(s): TBD

Business Unit/Line of Business: Customer Services / IT

Prepared/Presented By: Joan Ferch / David Huff

Executive Summary

LG&E and KU Energy LLC (LKE) currently uses ████████████████████████████ to manage metering assets used to measure and bill for customer usage. ██████████ was implemented in April 2009. Currently ██████████ has limited functionality around inventory management, sophisticated device characteristics, and lacks advanced field-level security controls. The primary driver of this project is to implement a Meter Asset Management (MAM) system that will serve specific needs related to tracking, testing, Kentucky Public Service Commission (KPSC) reporting, and managing metering assets.

LKE's parent company PPL recently engaged in a similar project for their system utilized in Pennsylvania. PPL's competitive bid evaluation recommended ██████████████████████. LKE evaluated ██████████████████████ software capabilities and determined that it is an appropriate selection to meet LKE business and technical requirements, as well as future strategic metering initiatives.

This project will reflect savings through 2021 of $983k that consists of:
- Labor productivity gains of $450k, achieved through efficiencies and improved utilization of resources due to reduced data entry errors, reduced truck rolls, reduced efforts to locate meters, and reduced time testing electric meters.
- O&M savings of $45k, which is recognized by eliminating the annual maintenance fee for MMS2000.
- Estimated inventory reductions of $488k based on achieving a 15% efficiency factor.

The funding for this initiative was included in the 2017 BP. The amount of the overall project funding related to the MAM is $1,616k in 2017, $3,389k in 2018, and $1,424k in 2019, for a total of $6,429k compared to a total expected cost of $6,429k for 2017.

It is recommended that the investment committee approve this MAM investment proposal to support the current AMS Opt-In program meters, greater inventory control of existing meters, and automation of test boards with this management system to support regulatory reporting requests.

Background

LKE meter data is currently housed in the ██████. Prior to the implementation of ██████ each utility used a separate meter asset system. LGE used the Meter Sub System and KU used the Meter Device Inventory System. At the time of the ██████ original implementation, the functionality within ██████ was considered sufficient to meet the business requirements. Since that time, experience has proven that the ██████ functionality does not provide the full complement of features required to meet LKE's current and future needs related to inventory management, sophisticated device characteristics, and advanced field-level security controls. During the Downtown Network and AMS Opt-In projects, it was determined that Advanced Meters require additional data for meter definition and programming, and additional data to support interfacing the meters to external systems within the AMS architecture. ██████ does not provide standard functionality to house and process these advanced characteristics. Additionally, ██████ does not provided standard functionality to track the inventory and deployment of these meters.

The ██████ MAM was selected for the reasons below.

1) LKE Meter Assets currently utilizes ██████ that will interface directly with ██████

2) ██████ has an established history as an industry leader.
3) LKE Meter Assets has utilized a legacy version of ██████ in a standalone environment in the past.

LKE's parent company PPL reviewed products and proposal by ██████ ██████. PPL determined that ██████ was their preferred solution. While LKE does not have access to the evaluations due to confidentiality agreements, LKE's review of ██████ capabilities determined that it is a robust product that meets our technical requirements.

Additionally, as part of the MAM review, four products were reviewed: ██████ ██████

Based on the assessment, LKE concluded that ██████ asset management system is indivisibly integrated with ██████ Meter Data Management System (MDMS) to enable an end-to-end ██████ exclusive AMS architecture solution. LKE is planning on implementing the ██████

MDMS. Therefore, the ███████ system is not an acceptable solution that meets LKE's   **Arbough**
infrastructure requirements.

███████ suite of asset management software is structured to enable enterprise-wide asset
management of various business functions across an entire organization (i.e., generation,
transmission, distribution, supply chain, etc.). Thus surpassing LKE's requirements achievable
by a less complex, device specific asset management system. Generally, the cost is higher for an
enterprise wide system and would create redundant systems which would not be used.
Consequently, LKE did not pursue detailed evaluation of a ███████ system.

In contrast, ███████ and ███████ products are specifically designed to enable efficiencies and
functions associated with meter asset management. As mentioned previously however, LKE
successfully utilizes and operates ████████████ exclusively. In addition to enabling
seamless integration of analogous software-hardware interfaces, the potential procurement of
████████████ product gives LKE an opportunity to request or negotiate newer or
upgraded test boards. Consequently, ████████████ is the most suitable solution to meet
outlined requirements and that will integrate with our existing infrastructure.

The following utilities have been identified as having the ████████████ solution currently
deployed. (Note that ████████████ has only been available in this enhanced form for less than
two years, although the company has offered many different versions of their software to support
the utility business for more than 20+ years.

Additionally, older versions of ███████ have been deployed at Alabama Power, National Grid,
Florida Power Light, Center Point Energy, Progress Energy, Georgia Power Mississippi Power,
and more than 30 other utilities. The ████████████ basic software system is deployed at over
900 utilities.

Inventory tracking today is accomplished through a series of manual processes and spreadsheets
reconciled on an annual basis. ████████████ is capable of automating the tracking and
capturing of test records for metering devices; including meters, and other metering related assets
for both electric and gas. The system retains all relevant information necessary to track an
endpoint device across its deployment lifecycle including, but not limited to, device
manufacturer, manufacturer date, installation date and location, serial number, warranty
information, geographic information system (GIS) location of service, maintenance log, and any

scanned records. The inventory tracking system also reconciles field crew handheld devices ▉although (scanners) with back-office systems and has the capability to store records scanned during any service call by field crews. These inventory management processes will enable LKE to more accurately manage inventory level. ▉▉▉▉▉▉ can also support compliance and reporting with all KPSC mandated meter testing processes.

Currently, ▉▉▉▉ is updated manually with all test results. ▉▉▉▉▉▉ will allow for automated integration of the ▉▉▉▉▉▉ (Test Results). This automation will help to eliminate manual data entry errors.

▉▉▉▉▉▉ will provide the capability to interface meter characteristic data with external systems such as L+G Command Center, L+G Gridstream Meter Data Management System (MDMS), ▉▉▉▉etc.

The following requirements were identified by LKE Meter Assets as the basic functionality of a MAM:

- Comply with evolving KPSC reporting requirements such as detailed test records for all meters tested and those records to be filed with quarterly reports. The MAM would ensure the data would be properly maintained which would ease scrubbing data to prepare detailed reports like requested by the KPSC
    - o Need for accurate data entry of test results. Test equipment is interfaced with MAM and automatically populates test record preventing data entry errors that occur with manual entry. MAM test records needs to be interfaced to ▉▉▉▉▉
    - o Provide checks to validate and confirm test result data before saving test record
    - o Delete test records created in error or with erroneous data
- Link photos or images to meter activity record
- Incorporate barcoding in the procurement, inventory and distribution of meter assets to facilitate locating meters
- Provide real time tracking, manufacturing and shipment status information for meter purchase orders with a direct interface with the meter manufacturer
- Provide improved reporting, test comparison, and statistics to management
- Store and track advanced device characteristics such as meter firmware, programs, networking characteristics, and linked devices
- Customize the business rules for inventory management
    - o ▉▉▉▉▉▉ will allow LKE to define "logistic" rules to meter procurement, receipt, inventory, deployment and retirement by enforcing a Next-Step model.
    - o Incorporate 'Sticky Note' and 'Red Tag' technology; electronic alerts that retrieve information for future use (track meters that customer requested test to determine a potential repeatable issue with meter)
- Configure customizable business rules engine for meter test processing

- **Alternatives Considered**
  1. Recommendation: NPVRR: $7,177k

     o Implement ███████████ as proposed. PPL determined that███████████ met their business requirements when evaluated against ███████████ ██████ The LKE investment in ██████ testing technologies supports a software provider for the MAM that integrates with existing infrastructure. Additionally, selecting the same provider for both PPL and LKE provides opportunities for shared support of the system across both companies.

     o ███████████ - This enterprise-wide asset management system was not fully evaluated from a financial standpoint because enterprise-wide systems are historically more expensive than the current proposal and it would provide functionality that is currently provided by other systems. Thus, the ██████ solution is not recommended.

     o ██████ - This asset management system is tightly integrated to ██████ MDMS. LKE is not utilizing the ██████ MDMS and thus integration of this system with ████ and ███████ MDMS is considered unacceptable.

     o ██████ - This system is comparable to the ███████████ system, however, it lacks strategic ability to integrate with existing meter testing equipment and would thus reduce planned savings from the integration of the meter test equipment with the ███████████ system. Additionally, based on responses received from the Southeast Electric Exchange (SEE) Metering Committee in regards to MAM implementations, a couple of utilities responded they had tried to implement ██████ and were forced to abandon the implementation of the product. Thus, this system is not recommended.

  2. Do Nothing: NPVRR: N/A

     This option was determined to be unacceptable due to the increasing complexity and costs of the more sophisticated meter asset inventory. As meter hardware becomes more complex, the need to track and store inventory becomes critical to the device characteristics and data integrity. Additionally, KPSC reporting requirements will likely continue to follow the level of meter sophistication. Knowledge gained during the LKE Downtown Network and AMS Opt-In projects has shown the level of data needed to support Advanced Metering appliances has become a critical requirement.

Project Description

- **Project Scope and Timeline**
  The scope of this project is to implement ███████████ MAM software allowing for tighter integration of Metering Assets and improved functionality around tracking, testing, KPSC reporting, and managing metering assets. This was the software selected by PPL after a thorough evaluation of the market.

Investment Proposal for Investment Committee Meeting on: March 28, 2018

Project Name: Meter Asset Management System (MAM)

Total Approved Expenditures: $10,500k Capital (Approved in June 2017)

Total Revised Expenditures: $13,200k Capital

Project Number(s): 154011, 154013, 154014, 155232, 155233

Business Unit/Line of Business: AMS

Prepared/Presented By: Joan Ferch / David Huff

Reason for Revision

The original investment proposal was approved in February 2017 for $6,429k and a revision was approved in June 2017 for an additional $4,071k. Due to additional complexities and challenges, an additional $2,700k is needed to complete the project as detailed below. It is important to note that while the timeline extension (from March 2018 to December 2018) has increased the cost of the project, the Company has worked diligently to mitigate those increases through managing team resources for both internal and System Integrator (SI).

$000s	
Approved Project Spend	**$10,500**
LKE Labor – Timeline Extension	$1,995
Reduced License Fee	($674)
System Integrator/Vendor Design Scope and Timeline Extension	$1,199
Materials / Site Readiness	$137
Incremental Scope:	
Gas Sample Ticket Database / Service Suite Changes	$350
Reduced Contingency	($464)
Other	$157
Total Adjustments	**$2,700**
Revised Total Project Spend	**$13,200**

The increase of $2,700k is incremental. As the Company has progressed with the development of the MAM, several impediments have arisen that put the revised project implementation timeline at risk. Challenges encountered include resource constraints from the MAM vendor ▉▉▉▉ driving limited delivery capabilities, a more complex than anticipated gas module design, the unforeseen system architecture complexity of a multiple meter shop operation, and the work necessary to prepare approximately 40 company sites to house the MAM equipment. ▉▉▉▉

significantly underestimated the effort required to complete the project, which has contributed to delays. Complexities surrounding PSC meter testing based on legislative rules and the fact that electric functionality is not directly transferrable to the gas module design, has unavoidably increased the scope of the project.

As a result of these delays and additional scope, the project has been split into two separate delivery stages. Stage 1 will contain the bulk of the functionality and is anticipated to be complete in July 2018. Stage 2 will primarily contain PSC meter testing functionality, as well as some additional enhancements, and is scheduled to be complete in 4Q 2018. In addition, approximately 40 meter storage and distribution sites throughout the Company's service territory have needed varying degrees of work performed to make them suitable for housing the electronic MAM equipment.

The costs associated with this increase in scope and effort for internal Company labor as well as SI labor is included in this additional funding request. ████ delivery costs are also expected to increase to provide enhancements to their existing system in order to meet Company operational needs. The increases in SI and ████ costs will be covered under their existing approved contract amounts.

Alternatives considered include the releasing of SI resources to reduce or eliminate the incremental expenditure request, but evaluations based on available internal skillsets, and scheduled delivery time frames, projected the MAM implementation into 2019. This delay would significantly impact the Company's ability to incorporate the change management aspects of the MAM into daily operations.

Financial Summary ($000s):	Approved	Revised	Variance	Explanation

4. Capital Investment 2018 BP	6,136	4,364	-	10,500
5. Cost of Removal 2018 BP				-
6. Total Capital and Removal 2018 BP (4+5)	6,136	4,364	-	10,500
7. Capital Investment variance to BP (4-1)	83	(2,783)	-	(2,700)
8. Cost of Removal variance to BP (5-2)	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	83	(2,783)	-	(2,700)

Financial Detail by Year - O&M ($000s)	2017	2018	Post 2018	Total
1. Project O&M Proposed	-	192	952	1,144
2. Project O&M	-	256	1,091	1,347
3. Total Project O&M Variance to BP (2-1)	-	64	139	203

The incremental funding in 2018 was approved in the February Corporate RAC process.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the $2,700k revision request for the MAM project for a revised total of $13,200k in order to complete the project in a timely manner to facilitate the implementation of the 2018 Company business plan strategies.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: November 29, 2016

Project Name: Meter Asset Management System (MAM)

Total Expenditures: $6,429k Including $464k of contingency

Total Contract Value (SSA): ███████

Project Number(s): TBD

Business Unit/Line of Business: Customer Services / IT

Prepared/Presented By: Joan Ferch / David Huff

Executive Summary

LG&E and KU Energy LLC (LKE) currently uses ████████████████████████████ to manage metering assets used to measure and bill for customer usage. ████████ was implemented in April 2009. Currently ████████ has limited functionality around inventory management, sophisticated device characteristics, and lacks advanced field-level security controls. The primary driver of this project is to implement a Meter Asset Management (MAM) system that will serve specific needs related to tracking, testing, Kentucky Public Service Commission (KPSC) reporting, and managing metering assets.

LKE obtained the PPL RFP findings of the vendor analysis related to the PPL MAM implementation project. LKE determined that PPL's evaluation was comprehensive and conclusive to recommend the ██████████████████████ software as an appropriate selection to meet LKE business and technical requirements, as well as future strategic metering initiatives.

This project will reflect savings through 2021 of $533k that consists of:
- O&M savings of $45k, which is recognized by eliminating the annual maintenance fee for MMS2000.
- Estimated inventory reductions of $488k based on achieving a 15% efficiency factor.

Additional productivity gains are anticipated as a result of this project but have not been quantified. These benefits will be achieved through efficiencies and improved utilization of resources due to reduced data entry errors, reduced truck rolls, reduced efforts to locate meters, and reduced time testing electric meters.

The funding for this initiative was included in the 2017 BP as a component of the overall LKE AMS project. The amount of the overall AMS project funding related to the MAM is $1,616k in

2017, $3,389k in 2018, and $1,424k in 2019, for a total of $6,429k compared to a total enough cost of $6,429k for 2017.

Background

LKE meter data is currently housed in the ▮▮▮▮▮▮ Prior to the implementation of ▮▮▮▮▮▮, each utility used a separate meter asset system. LGE used the Meter Sub System and KU used the Meter Device Inventory System. At the time of the ▮▮▮▮▮▮ original implementation, the functionality within ▮▮▮▮ was thought to be sufficient to meet the business requirements. Since that time, additional experience has proven that the ▮▮▮▮▮ functionality does not provide the full complement of features required to meet LKE's current and future needs as discussed above. During the Downtown Network and AMS Opt-In projects, it was found that Advanced Meters require additional data for meter definition and programming, and additional data to support interfacing the meters to external systems within the AMS architecture. ▮▮▮ ▮▮ does not provide standard functionality to house and process these advanced characteristics. Additionally, ▮▮▮▮▮ does not provided standard functionality to track the inventory and deployment of these meters.

The ▮▮▮▮▮▮▮▮ MAM was selected as the preferred product for a variety of reasons.

1) LKE Meter Assets currently utilizes ▮▮▮▮▮▮▮▮ that will interface directly with ▮▮▮▮▮▮

2) ▮▮▮▮ has an established history as an industry leader; further validated by the Gartner Group.

3) LKE Meter Assets has utilized a legacy version of ▮▮▮▮▮ in a standalone environment in the past.

Research by parent company PPL determined that ▮▮▮▮▮▮▮ rated higher than other products reviewed by PPL. The other MAM products reviewed with vendors by PPL were ▮▮▮▮▮▮▮▮▮▮▮.

Inventory tracking today is accomplished through a series of manual processes and spreadsheets reconciled on an annual basis. ▮▮▮▮▮▮ is capable of automating the tracking and capturing of test records for metering devices; including meters, and other metering related assets for both electric and gas. The system retains all relevant information necessary to track an endpoint device across its deployment lifecycle including, but not limited to, device manufacturer, manufacturer date, installation date and location, serial number, warranty information, geographic information system (GIS) location of service, maintenance log, and any scanned records. The inventory tracking system also reconciles field crew handheld devices (scanners) with back-office systems and has the capability to store records scanned during any service call by field crews. These inventory management processes will enable LKE to more accurately manage inventory level. ▮▮▮▮▮▮ can also support compliance and reporting with all KPSC mandated meter testing processes.

Currently, ███████ is updated manually with all test results. ████████████ will allow ███████ Although automated integration of the ████████████ (Test Results). This automation will help to eliminate manual data entry errors.

████████████ will provide the capability to interface meter characteristic data with external systems such as L+G Command Center, L+G Gridstream Meter Data Management System (MDMS), ███████ etc.

The following requirements were identified by LKE Meter Assets as the basic functionality of a MAM:

- Comply with evolving KPSC reporting requirements such as detailed test records for all meters tested and those records to be filed with quarterly reports. The MAM would ensure the data would be properly maintained which would ease scrubbing data to prepare detailed reports like requested by the KPSC
  - Need for accurate data entry of test results. Test equipment is interfaced with MAM and automatically populates test record preventing data entry errors that occur with manual entry. MAM test records needs to be interfaced to ███████
  - Provide checks to validate and confirm test result data before saving test record
  - Delete test records created in error or with erroneous data
- Link photos or images to meter activity record
- Incorporate barcoding in the procurement, inventory and distribution of meter assets to facilitate locating meters
- Provide real time tracking, manufacturing and shipment status information for meter purchase orders with a direct interface with the meter manufacturer
- Provide improved reporting, test comparison, and statistics to management
- Store and track advanced device characteristics such as meter firmware, programs, networking characteristics, and linked devices
- Customize the business rules for inventory management
  - ████████████ will allow LKE to define "logistic" rules to meter procurement, receipt, inventory, deployment and retirement by enforcing a Next-Step model.
  - Incorporate 'Sticky Note' and 'Red Tag' technology; electronic alerts that retrieve information for future use (track meters that customer requested test to determine a potential repeatable issue with meter)
- Configure customizable business rules engine for meter test processing

- **Alternatives Considered**
  1. Recommendation: NPVRR: $7,666k
     Implement ████████████ as proposed. The research by parent company PPL determined that ████████████ is best of class, accompanied with the LKE investment in ███████ testing technologies limits the ability to transition to a different software provider for the MAM.

2. Do Nothing: NPVRR: N/A   **Arbough**

> This option was determined to be unacceptable due to the increasing complexity and costs of the more sophisticated meter asset inventory. As meter hardware becomes more complex, the need to track and store inventory becomes critical to the device characteristics and data integrity. Additionally, KPSC reporting requirements will likely continue to follow the level of meter sophistication.   Knowledge gained during the LKE Downtown Network and AMS Opt-In projects has shown the level of data needed to support Advanced Metering appliances has become a critical requirement.

Project Description

*   **Project Scope and Timeline**
    The scope of this project is to implement ▮▮▮▮▮▮▮▮ MAM software allowing for tighter integration of Metering Assets and improved functionality around tracking, testing, KPSC reporting, and managing metering assets. This was the software selected by PPL after a thorough evaluation of the market.

    > January 2017 – Purchase hardware and software
    > January 2017 – Receive hardware and software
    > July 2017 – Complete build/programming
    > August 2017 – Complete testing
    > September 2017 – Deployment complete/Go live

*   **Project Cost**
    Total cost of the project is $6,429k of capital and $1,103k of ongoing O&M (compared to on-going O&M in the 2017 BP of $1,237k), for a total on-going O&M of $134k lower than the 2017 BP for the 5 year period. There is a 12% contingency in place for internal labor, vendor professional services and system integrator costs due to the complex nature of the metering assets architecture and criticality of the data integrity for the metering assets used for measuring and billing our customers.

Sole Source Authorization

The work described herein is being sole sourced to ▮▮▮▮▮▮▮▮▮▮▮. Signatures on this document will act as approval for the contract to be sole sourced to ▮▮▮ for ▮▮▮▮

Economic Analysis and Risks

- **Bid Summary (N/A – This project was sole sourced based on PPL analysis)**

  LKE utilized PPL vendor analysis and reviewed their bid process and results to make a recommendation for the proposed vendor. The bid results were used in the negotiations of the vendor pricing to ensure prudency of vendor cost.

- **Budget Comparison and Financial Summary**

Financial Analysis - Project Summary ($000)	2017	2018	2019	2020	2021	Life of Project
Project Net Income	$ 469	$ 192	$ 137	$ 82	$ 27	$ 909
Project ROE	19.0%	15.1%	10.0%	10.0%	10.0%	13.2%

- **Assumptions**

  - Based on a 9 month ▮▮▮▮▮▮ implementation proposal
  - FTE's will be between 7-9, with a mix of internal labor and SI
  - ▮▮▮▮▮▮ can accommodate tracking and test data records for gas meters
  - The selection of ▮▮▮▮▮▮ as the preferred vendor will be sole sourced at LKE based on the following activities:
    - PPL utilized the competitive bid process, which was shared with, and reviewed by LKE IT and LOB resources
    - LKE evaluated the software application to ensure it sufficiently met the business requirements
  - The expected useful life is 5 years, as standard for software implementations.

- **Environmental**
  - There are no environmental issues with this project.

- **Risks**

  - If the project is not completed:

    - Data quality issues will continue to exist with meter test records.
    - Reduced efficiency to support current and any future KPSC reporting requirements.
    - Require complex modifications to ▮▮ in order to track and manage advance meter characteristics.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the Meter Asset Management System project for $6,429k and approve the contract to ███ for ███ to improve overall inventory and test results tracking of metering assets.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $1 million</u>:

Investment Proposal for Investment Committee Meeting on: December 19, 2016

Project Name: Mount Vernon South Substation

Total Expenditures: $4,440k (includes $404k contingency)

Project Number(s): Substation-148685, Distribution-152793, Transmission-137750

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Jim Burns/Beth McFarland

Executive Summary
Electric Distribution Operations (EDO) Electric Engineering and Planning (EEP) seeks funding authority to construct a new Mount Vernon South 12kV Substation to meet the electrical service needs of existing customers in Mount Vernon in Rockcastle County, Kentucky. The existing Mount Vernon 12kV substation 589-2, serves 1,912 customers and is projected to exceed Distribution Planning's normal winter transformer loading limit of 120% of the 14 MVA top nameplate rating during the winter of 2018/2019. This investment proposal provides for the construction of a new substation inside the fence of the Mount Vernon 094 69kV transmission station and construction of tie circuits to eliminate overloading and prepare for future load growth in the area. In addition to resolving the overloading of the existing Mount Vernon transformer, this project also removes the Mount Vernon 589-2 and Pine Hill 592-1 substations from EDO's Distribution Substation Transformer Contingency Program (N1DT) list (transformers that cannot be fully backed up for an outage or failure of the substation transformer during high load periods).

Funding is requested in the amount of $4,440k to complete a system enhancement project to construct the new Mount Vernon South 094-5 22.4 MVA 69/12kV substation to meet existing and future service requirements and to remove two transformers from EDO's N1DT list. Project completion is expected in November 2018.

The project is included in EDO's 2017 Business Plan (BP) as a 2017/2018 project for a total cost of $2,740k ($2,600k-distribution, $140k-transmission). The budget shortfall of $1,700k in 2018 was identified when a more detailed engineering analysis was completed. Additional funding needed in 2018 will be addressed through requested allocation from identified sources in the 2018 BP Corporate RAC process.

Background
The existing Mount Vernon 12kV (589-2) substation serves 1,912 customers and consists of a 14 MVA 69-12kV transformer and three feeder breakers and is located in the city of Mount Vernon in Rockcastle County, Kentucky. The Mount Vernon substation transformer experienced an actual load of 126% of its 14MVA top nameplate rating during the extreme cold of 2015. The

normalized load forecast projects it to reach 122% during Winter 2018/2019 under normal winter loading conditions. The Distribution Planning allowable winter loading limit for substation transformers is 120%. Pine Hill 12kV (592-1) substation is located roughly six miles from Mount Vernon substation and serves 515 customers and has a 5.25 MVA transformer and three feeder breakers and has a peak winter load of approximately 3.4 MVA. These two substations are tied by a weak distribution circuit tie that is a combination of small and large conductor. In addition to poor voltage performance, conductor and transformer capacity limitations prevent shifting any significant load from Mount Vernon to Pine Hill substation. Furthermore, System Planning studies indicate that the addition of transformer capacity near the city of Mount Vernon (load center) is the best option to resolve overloads because of voltage issues that arise due to the six mile distance to the nearest geographical substation (Pine Hill).

Alternative solutions considered to address the overload conditions included an upgrade of the existing Mount Vernon 589-2 transformer, the addition of a second transformer at the existing Mount Vernon substation or the construction of a new substation in another location. The existing Mount Vernon 589-2 distribution substation does not have adequate physical space for a second transformer and adjacent land for expansion would be difficult and costly to obtain because the substation is surrounded by residences on two sides and roads on two sides. A solution to upgrade the existing Mount Vernon 589-2 substation would include replacing the existing 14 MVA transformer with a 22.4 MVA unit but physical constraints make reconstruction of the facilities to accommodate a larger transformer and additional breaker very difficult. This option would require a temporary substation to be constructed to maintain service and require the installation of a mobile transformer for an extended period of time; tying mobile transformers up for extended periods is not recommended due to their extensive use in emergency situations. This option would also only add 8.4 MVA of new capacity to the area and would provide no improvement in distribution or transmission contingency.

EEP determined that the most feasible solution is to construct a new substation at another location. The Mount Vernon 094 69kV transmission substation is located on the southwestern edge of Mount Vernon and has ample space for a new 12kV substation with direct access to transmission. A new distribution substation at the 094 transmission substation in addition to construction of two tie circuits would add 22.4 MVA of new capacity to address area loads, require minimal transmission construction, improve transmission reliability for the radial transmission line serving Mount Vernon and would provide contingency capacity for Mount Vernon 589-2 substation and the Pine Hill substations removing them from the N1DT list. This option was determined to be superior to the construction of a new substation at a new location because it does not involve property acquisition or transmission line extension costs.

A Transmission Service Request for a new service point at the Mount Vernon 094 69kV substation will be submitted to TranServ International and no resulting transmission improvements are expected.

- **Alternatives Considered**
1. Recommended Option**:**   NPVRR: ($000s) $5,070
   EEP's recommended option is to construct a new 69-12kV 22.4 MVA distribution substation, Mount Vernon South, in the Mount Vernon 094 69kV substation, including 69kV and 12kV substation structures, two 69kV breakers, one 2000 amp 15kV main breaker and two 1200

amp line breakers. Construction of 3,100' of double circuit 397AA three phase along an borough existing overhead route is also included in this project. This will eliminate overloading of Mount Vernon, support new growth, and provide year round contingency for the existing Mount Vernon substation and also for Pine Hill 592-1 substation. While capacity enhancement is the primary driver for this project, the selected option is also consistent with the objectives of the transmission grid resiliency program by providing contingency for a transmission outage on the .5 mile radial transmission tap serving Mount Vernon substation. A long duration outage on the transmission tap, whether unplanned or planned for maintenance needs, results in an outage for the majority of customers served from Mount Vernon substation. The recommended option will reduce the duration of customer outages for longer duration transmission outages. In addition to resolving the overloading of the Mount Vernon transformer, this project also removes the Mount Vernon 589-2 and Pine Hill 592-1 substations from EDO's N1DT list. The estimated total cost of this option is $4,440k.

2. Do Nothing Option: NPVRR: ($000s) N/A
   KU has an obligation to serve all customers and associated load. The "do nothing" option is not considered an acceptable option because it exceeds Distribution Planning's operating limits for distribution substation power transformers, and this practice reduces the life of the transformer and elevates the risk of failure of a high value, critical asset.

3. Alternative 1 - Upgrade Mount Vernon substation to 22.4 MVA. NPVRR: ($000s) $8,610
   While this alternative eliminates the potential transformer overload it does not result in the same benefits as the recommended option and does not result in the lowest NPVRR when the Cost of Unserved Energy is considered. This alternative results in a less flexible and reliable system for both distribution and transmission, provides less new capacity to serve future load growth in the area (8.4 MVA vs. 22.4 MVA) and does not remove the Mount Vernon 589-2 substation from EDO's N1DT list. It also requires the long term commitment of a mobile transformer which could potentially be needed to address a transformer failure or to support planned maintenance at other area stations. Failure of the Mount Vernon transformer would result in an extended outage to a large majority of the 1,912 customers until a new transformer or mobile transformer could be installed. While the loss of an entire substation is a relatively low probability event, planning studies indicate an outage of the Mount Vernon substation at peak would cause as much as 15,600 kW to go unserved until the station is restored. Using the corporate "Cost of Unserved Energy" ($17.2/kWh) with estimated loads going unserved at peak for an incremental 22 hours (24 hours less 2 hours to switch load), the Cost of Unserved Energy would be $5,903k for a Mount Vernon outage. The estimated annualized benefit based on an annual 5% probability of an outage or failure of the Mount Vernon or Pine Hill substation is $295k. The estimated total capital cost for this option is $2,390k.

Project Description
- **Project Scope and Timeline**
  - Substation project #148685: Construct new Mount Vernon South 12kV substation with a 22.4 MVA 69-12kV LTC transformer. This estimate includes funds for labor, primary equipment, protection and control, material, and wildlife protection for a 22.4 MVA transformer, 69kV and 12kV substation structures, two 69kV breakers, one 15kV 2000A

breaker, and two 15kV 1200A line breakers. The total estimated substation cost is **Arbough** $3,900k.

- Apr-May 2017: Complete engineering and design. Order all material and equipment.
- Jun-Dec 2017: Receive material and equipment. Begin site preparation and foundations.
- Jan-Dec 2018: Complete foundations and install transformer, steel, breakers and all associated materials and equipment. Complete all secondary and protection and control work. Commission and energize the new substation.

o Distribution project #152793: Design and construct 3,100' of double circuit 397AA spacer circuit. The total estimated distribution cost is $400k.
- Mar-Aug 2018: Design and complete all distribution circuit construction.

o Transmission project #137750: Install new dead end structure, upgrade adjacent structure. The total estimated transmission cost is $140k.
- Feb-Mar 2018: Complete construction of 69kV structures.

- **Project Cost**
  The total estimated cost to complete the Mount Vernon South 094-5 12kV Substation project is $4,440k. The Transmission, Substation and Distribution cost estimates are consistent with the "Conceptual Level 1" engineering design designation. There is an estimated 10% of contingency ($404k) incorporated into the project cost estimates.

Economic Analysis and Risks

- **Bid Summary**
  Transmission, Substation, and Distribution will use existing material and labor contracts and follow established Supply Chain procedures. KU Company crews will be utilized based on availability at the time of work.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed					-
2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The 2017 BP is lower than the requested amount by $1,700k – all of which is in 2018 and will be requested for allocation from identified sources through the 2018 BP process.

Financial Summary ($000s):

Discount Rate:	6.5%
Capital Breakdown:	
Labor:	$ 261
Contract Labor:	$ 1,233
Materials:	$ 1,876
Local Engineering:	$ 380
Burdens:	$ 267
Contingency:	$ 404
Transportation:	$ 19
Reimbursements:	($ 0)
Net Capital Expenditure:	$ 4,440

- **Assumptions**
  - The project unknowns will not exceed the estimated contingency amounts.
  - No significant unknown costs for transmission improvements will be associated with the addition of a new service point.

- **Environmental**
  There are no known environmental issues at this time.

- **Risks**   **Arbough**
  Failure to complete this project before winter 2018/2019 will result in substation transformer loading above normal operating limits and escalating potential for failure of the Mount Vernon 589-2 substation transformer and an extended outage for up to 1,912 customers.

Conclusions and Recommendation   Arbough

EDO EEP recommends that the Investment Committee approve the Mount Vernon South Substation project for $4,440k to prevent overloading at Mount Vernon substation, ensure adequate capacity is available for future load growth in the Mount Vernon area, improve distribution and transmission reliability and remove the Mount Vernon 589-2 and Pine Hill 592-1 substations from EDO's N1DT list.

Investment Proposal for Investment Committee Meeting on: <u>February 28, 2018</u>

Project Name: <u>Norton Service Center/Storeroom Consolidation & Land Purchase</u>

Total Expenditures: <u>$ 4,875k (Including $288k of contingency or 6%)</u>

Project Number(s): <u>149992/156576</u>

Business Unit/Line of Business: <u>Customer Services/Electric Distribution Operations (EDO)</u>

Prepared/Presented By: <u>Zac Conley/Cheryl Bruner/Robby Trimble</u>

Executive Summary

During 2014, Facilities Services conducted a study to assess the condition of key operations and customer facilities and to facilitate development of a master facility investment and maintenance plan. This study revealed numerous functional inadequacies and space constraints at the existing Norton operations center and Business Office that cannot be remedied through renovation or expansion of the present facilities.

To address identified deficiencies, Electric Distribution Operations (EDO), Customer Services and Facilities Services seek funding authority of $4,875k to construct a new joint operations center and storeroom for the Norton, VA service territory. The requested funding shall provide for design and construction of an 18,543 square foot facility on a previously purchased 3.4 acre parcel and purchase of an adjacent 1.75 acre parcel, in a centralized and readily accessible light industrial park located 4 miles from the existing Service Center/Storeroom and 2 miles from the Norton Business Office (BO).

The new operations center will contain:
- Office space for 25 personnel from EDO, Meter Reading, Field Services, and Material Services and Logistics;
- Adequate restrooms, shower and locker rooms, break area and conference room space;
- Wellness Center with fitness equipment;
- Assembly Room of sufficient size to be used for meetings and training or as a "Storm Operations Management Room" or "War Room" during major outage events;
- Dedicated and secure IT/Telecommunications and site Fire/Security systems rooms; and
- Storage space for vehicles, materials, equipment, pole storage and transformer storage and containment.

This joint proposal will address primary Norton Business Office and service center inadequacies identified in the master facility study. Vehicle congestion and office space constraints at the Business Office will be eliminated through the relocation of 12 Distribution, Metering, and Field Services personnel to the proposed new operations center. Operational constraints associated with

land size, materials handling processes, and periodic site flooding at the existing service center will be eliminated. Co-locating all Distribution, Meter Reading, Field Services, and Materials Logistics personnel from two sites, and the pole-yard from a third site, to a single work location, will provide operational benefits and efficiencies as further described herein. Finally, the new properties will provide for a much needed area for vehicles and materials staging during significant outage events in the Norton service territory.

The approved 2018 BP includes funding of $3,107k in 2018 and $1,422k in 2019. The project is currently open for engineering and design work, and $72k has been spent to-date.

Background
The current Service Center/Storeroom facilities in Norton are approximately 50 years old and have been in use with only minor renovations to date. Over the course of time, operational needs of the Norton service area have grown beyond the capabilities of the existing facilities, therefore, Service Technicians, Engineering and Design, Forestry, Reliability, Team Leader, and Operations Manager are located at the Norton Business Office. Deficiencies of the Service Center/Storeroom site include:

- The size of the lot cannot accommodate the bulldozer and other large equipment. As a consequence, this equipment must be kept ten miles away at the pole yard in Big Stone Gap.
- The road leading to the site can only accommodate large truck traffic coming one way due to a low-level bridge. Any traffic issue on this road could and has impacted EDO in responding to outage situations.
- An employee must be present at the facility to receive deliveries and allow for garbage pickup. This presents an issue coordinating times for an available employee to be present.
- There is not a secured server room at the Service Center/Storeroom and no space is available to accommodate a server room or to provide a secured area for servers.
- The Service Center/Storeroom is not equipped with a backup generator or manual transfer switch to allow for a portable backup generator to power the facility.
- Additionally, the following operational issues have been dealt with repeatedly throughout the years:
  o The Service Center/Storeroom is not located within the city limits of Norton. Wise County does not maintain the roads leading to the Service Center/Storeroom well and is slow to remove snow during winter time. The City of Norton has better roads and is much quicker to respond to snow removal, which would result in improved access to the main roads for quicker response.
  o The Service Center/Storeroom location is in a remote area, and the fence has been compromised numerous times and equipment and wire have been stolen repeatedly throughout the years.
  o Insufficient space exists for a conference room, training room and Wellness Center;
  o Site accessibility limitations present significant challenges for material deliveries and large equipment ingress and egress;
  o No secured parking is available for Company vehicles;
  o The existing site sits adjacent to a river, and has experienced periodic flooding, and increased environmental challenges.

The Service Center/Storeroom does not have the real estate to accommodate a pole yard. The current pole yard is located ten miles away in Big Stone Gap, requiring crews to travel an average of 40 minutes roundtrip in ideal travel conditions to retrieve poles. In inclement weather, this travel time can be extended due to road conditions and reduced visibility. Co-location of the pole yard to a new facility is expected to lower vehicle fuel costs and reduce crew labor costs associated with the travel time to the pole yard, which is expected to result in improved outage response times, thereby enhancing customer satisfaction. The additional land purchase will also provide space to facilitate staging of vehicles and materials during outage events.

The construction of a new consolidated operations center is desired to provide a location that would place operations in a location suitable for the current needs of the business, resolve ongoing facility inadequacies and constraint issues, enhance operational efficiency, and allow for co-location of operations employees.

Alternatives Considered (1 – Recommendation; 2 – Do nothing)

1. Recommendation: Construct New Facility   NPVRR: $6,696k

   The recommendation is to construct a new facility which will consolidate and replace the existing Service Center/Storeroom and Pole Yard, as well as provide a new location for a number of personnel who currently report out of the Business Office location, which will alleviate the space and parking constraints at the Business Office. Because the existing Service Center/Storeroom will no longer be utilized by EDO following construction of the new facility, and only minimal maintenance will be performed to keep the facility dry and vegetation from overtaking the premises, an annual O&M savings of approximately $39k will be recognized. Co-location of the pole yard to the new facility is expected to lower vehicle fuel costs and reduce crew labor costs associated with the travel time to the pole yard (equating to capital savings of approximately $28k for labor and $5k for fuel), which is also expected to result in improved outage response times, thereby enhancing customer satisfaction.

2. Do Nothing: NPVRR: NA

   This alternative is not recommended as it will not achieve the current and future operational needs of the business. Based upon the functional adequacy evaluation conducted at these facilities in 2014, numerous facility functional needs were identified to provide for the operational needs of the occupants. Examples of these inadequacies are: material delivery vehicles cannot deliver directly to the facility and must park on the adjacent road, lack of space for secure parking within the fence for employees, contractors and visitors, facility is not equipped with a conference room, training room, "War Room" or provisions to support health and employee wellness. These issues cannot be corrected at the existing facilities due to existing property size, physical facility size and location of both operational facilities. Because of these constraints, significant capital investment into the existing facilities will not result in providing facilities that meet the functional adequacy requirements of the occupants. Facility is in a low-lying area that is prone to flooding; site is not adequate for staging materials and has limited security for storage area and employee vehicles; there is not enough land to expand the existing facilities; and the pole yard is not co-located with the Storeroom resulting in operational inefficiencies. If this option is chosen, O&M and capital expenses are expected to increase in the near, mid and long-term based on the age and condition of the facility.

Project Description   **Arbough**

This project will replace the current Service Center/Storeroom facility and provide an additional Pole Yard site through the construction of a new, consolidated facility. Design will commence in April 2018 and construction will begin in July 2018. Construction will take 12 months to complete. The new building will be operational by August 2019.

- **Project Scope and Timeline**
    The project scope includes the following:
    - Site development to prepare for new construction;
    - Design and construction of a 18,543 square foot, efficient, cross-functional facility;
        - o Office space for EDO, Meter Reading and Field Services
            - ▪ 20 EDO personnel includes Operations Manager, Office Support Personnel, Design, Reliability and Inspection, Forestry Services, along with Service/Lines Crews and Supervision
            - ▪ 4 Meter Reading and Field Services Personnel
            - ▪ 1 Storeroom Materials Clerk
        - o Staging area for EDO Operations materials and equipment
        - o Material storeroom with external storage space for poles and transformers
        - o Dedicated, secured space for telecom and security systems
        - o Adequate break room, restroom and locker room facilities for employees
        - o Wellness Center and Special Needs Room
        - o Assembly Room / Training Room / War Room
        - o Vehicles garaging and tool storage
            - ▪ Garaging for trucks and all other equipment
        - o Designed with energy efficiency lighting and HVAC systems
    - Purchase of the 1.75 acre property adjacent to the existing site

    - O&M costs include:
        - o Building Maintenance Costs:
            - ▪ HVAC
            - ▪ Lawn Care
            - ▪ Snow Removal
            - ▪ Janitorial Service/Consumables
            - ▪ Pest Control
            - ▪ Phone/Cable Service
            - ▪ Fitness Equipment Maintenance

Milestone	Start Dates:
RFP Issued	11/23/2017
Investment Committee Review	02/28/2018
Award Bid	03/21/2018
Design	04/01/2018
Construction	07/15/2018
Operational	08/01/2019

- **Project Cost**
  The projected cost is $4,875k, which includes $288k of contingency or approximately 6% of the total project. The contingency was calculated based on 7% of the construction and furnishings cost. Furniture, security and telecommunications equipment and pole racks will be purchased through preferred business partners already under contract. Capital funding of $4,591k was included in the 2018 Business Plan (BP). The property purchase will occur in 2018.

Economic Analysis and Risks

- **Bid Summary**

  Five companies were requested to submit bids for the proposed new operations center. Three of the five companies showed interest and attended the pre-bid. Three bids were ultimately received and are currently being evaluated.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2015	2016	2017	2018	2019	2020-2022	Total
1. Capital Investment Proposed	15	48	10	3,107	1,696	-	4,875
2. Cost of Removal Proposed	-	-	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	15	48	10	3,107	1,696	-	4,875
4. Capital Investment 2018 BP	15	48	-	3,107	1,422	-	4,591
5. Cost of Removal 2018 BP	-	-	-	-	-	-	-
6. Total Capital and Removal 2018 BP (4+5)	15	48	-	3,107	1,422	-	4,591
7. Capital Investment variance to BP (4-1)	-	-	(10)	-	(274)	-	(284)
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	-	-	(10)	-	(274)	-	(284)

Financial Detail by Year - O&M ($000s)	2015	2016	2017	2018	2019	2020-2022	Total
1. Project O&M Proposed	-	-	-	-	(5)	(21)	(26)
2. Project O&M 2018 BP	-	-	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	5	21	26

Capital funding of $4,591k was included in the 2018 BP. The incremental capital amount in 2019 will be handled through the 2019 BP process. O&M costs in the CEM include an incremental $5k annually (escalated) to cover additional expenses due to incremental office space square footage and property size, offset by a reduction in O&M at the existing storeroom. These incremental operating expenses will be incorporated into the 2019 BP.

Financial Summary ($000s):   **Arbough**

Discount Rate: 6.58%

Capital Breakdown:

Labor:	$ 50
Contract Labor:	$ 1,803
Contract Materials:	$ 2,476
Miscellaneous:	$ 127
Burdens:	$ 131
Contingency:	$ 288
Reimbursements:	$ 0
Net Capital Expenditure:	$ 4,875

Materials include company purchases of furniture, Data/Voice/Telecom and security equipment.

- **Assumptions**

Economic useful life is 50 years.

- **Environmental**

Environmental factors due to site soil conditions created by strip mining in the past. Soils may require remediation of existing subsurface mine spoils in order to adequately support the building foundation.

- **Risks**
  - The completion date is contingent on the weather.
  - Obtaining permits and easements.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the Norton Operations Center/Storeroom Consolidation Project for $4,875k which includes incremental land purchase of $130k. The current location of the Service Center/Storeroom is in a flood plain and does not have sufficient land to meet operational needs for additional office/storage space, company vehicle/equipment, and employee parking. Additionally, a number of personnel will relocate from the Norton Business Office, which will serve to alleviate the space and parking constraints at the Business Office, which will continue operations in downtown Norton.

Investment Proposal for Investment Committee Meeting on: September 27, 2017

Project Name: Ohio Falls Unit 7 Stator Core Restack and Rewind

Total Expenditures: $7,650k   (Including $650k in Contingency)

Project Number: 155705

Business Unit/Line of Business: Project Engineering

Prepared/Presented By: John Williams

Executive Summary

This Investment Proposal seeks Project authorization to fund the LG&E Ohio Falls (OF) Generating Station's Unit 7 stator core restack, stator core rewind, and thrust bearing replacement. It is similar to scope performed on the other seven units as part of the overall station rehabilitation project.

As background, Unit 7 was the first unit to be rehabilitated. Going into the power upgrade rehabilitation of the station, the condition of each units' stator/generator was uncertain and thus the original scope of the rehabilitation project did not include the scope requested herein. During the rehabilitation of the second unit (Unit 6) it was discovered that the condition of the stator and thrust bearing on that unit were to a point that rehabilitation of the stator and replacement of the thrust bearing was required. After reviewing operational data, it was determined that all future units that are all the same vintage were predicted to be in similar condition and that the benefits of the rehabilitation and increased generation would not be realized without performing a stator core restack and rewind, along with replacement of the thrust bearing. The increased authorization approved at the time only included refurbishment of the stator/generator and thrust bearing of the second and all future units to be rehabilitated and did not include going back into Unit 7 that was deemed marginal, yet satisfactory, at the time of its rehab.

During the operation of Unit 7 during the spring/summer of 2017 the unit has been load limited due to a deteriorating condition of the stator. As the Unit rises in load, generating additional megawatts (MW), the generator stator core temperature rises. At present, the existing 90 year old Unit 7 stator core rises too quickly and reaches alarm, thus limiting its generation output. Unit 7 consistently generates 10%-15% less MW than the other refurbished units. In addition, the trend of Unit 7 shows deterioration of its capacity; the unit's stator core is rising in temperature more quickly as time passes, resulting in incremental decreases in MW output. Similar to the stator core, the thrust bearing on Unit 7 has not been upgraded in 90 years and is also experiencing excessive temperatures. During normal operation, the Unit 7 thrust bearing is very near alarm level, indicating it has reached the end if its design life. Without this rehab of the stator, it is predicted Unit 7 will reach the point of complete failure, thus rendering the Unit idle. Performing

the scope listed herein will allow Unit 7 to generate at the new higher designed output, though placing the unit condition and equipment to similar condition as the other seven units rehabbed.

The Project authorization requested is $7,650k, inclusive of $650k in management contingency, and is included in the draft 2018 Business Plan (BP); the Corporate RAC has approved the 2017 funding. The work will be substantially performed by ████████████████████ under a change order to the existing Amended and Restated Engineering, Procurement, and Construction Agreement, as ████ is currently performing upgrades on OF Unit 8 and has performed the same stator and bearing work on the other seven (7) units.

Background

An effort began in 2004 to upgrade and refurbish the OF's eight (8) hydroelectric units, which had not seen a major overhaul since originally placed into service in the mid-1920s. OF Unit 7 was the first of the eight (8) units to undergo the refurbishment, which did not include the effort to replace the stator core, stator core windings, and thrust bearing.

The subsequent seven (7) units did receive replacement stator core, stator core windings and the thrust bearing. Those units are realizing the increased MW output as designed without operational concerns or derates due to stator temperatures. In comparison of Unit 7 to the other units in operation that received the stator and bearing upgrades, the existing 90 year old Unit 7 stator core operates at excessive temperatures. During high loads, the stator core operates at a temperature above engineering recommendations and the unit is reduced in load to protect the stator core laminates from catastrophic failure. In addition, during normal operating conditions, the thrust bearing also operates at excessive temperature and very near alarm, an indicator of an end-of-life condition. This project seeks approval to upgrade the stator and bearing of OF Unit 7 to achieve and sustain the design MW output through the refurbishment design life.

Project Description

- **Project Scope and Timeline**

  ████ is currently performing upgrades on OF Unit 8 (the last unit to be rehabilitated) and has performed the same stator and bearing work on all other units. ████ will supply the stator core windings and all necessary installation items. ████ will perform the disassembly of the generator, installation of the winding platform, restack and rewind the stator, and reassemble the unit (inclusive of the thrust bearing).

  Project Engineering will supply the thrust bearing from a third party, ████████ who has provided the other seven (7) thrust bearings. Project Engineering will also supply the laminates.

  Project Milestones
  - Procurement of raw materials   September 2017
  - Manufacturing of windings   October 2017
  - Windings, thrust bearing, and laminates delivered to site   February 2018

- Stator core restacked
- Mechanical Completion

- **Project Cost**

The Project authorization requested is $7,650k, inclusive of $650k in management contingency, and is included in the draft 2018 BP. Table 1 below expresses the project spend:

Table 1: Project Spend

EPC (Voith) Activities	$ 5,600
Balance of Plant	
Thrust Bearing	$ 330
Stator Core Laminates	$ 270
Headgate/Tailgate Work	$ 250
Stator Disassembly, Water Level Event(s), Abatement	$ 190
PE Overhead	$ 360
Contingency	$ 650
Total =	$ 7,650

Economic Analysis and Risks

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	Total
1. Capital Investment Proposed	1,564	6,086	7,650
2. Cost of Removal Proposed	-	-	-
3. Total Capital and Removal Proposed (1+2)	1,564	6,086	7,650
4. Capital Investment 2018 BP	1,564	6,086	7,650
5. Cost of Removal 2018 BP	-	-	-
6. Total Capital and Removal 2018 BP (4+5)	1,564	6,086	7,650
7. Capital Investment variance to BP (4-1)	-	-	-
8. Cost of Removal variance to BP (5-2)	-	-	-
9. Total Capital and Removal variance to BP (6-3)	-	-	-

This project was not included in the 2017 BP, but is included in the proposed 2018 BP. The 2017 funding was approved by the Corporate RAC.

NPVRR: $8,516k

- **Risks**

The OF Unit 7 stator core and thrust bearing are operating at temperatures nearing alarm setting, effectively limiting the unit's output to well below refurbishment design level. Further, the trend of the stator core temperature indicates that the core will rise in temperature more quickly as time passes, resulting in continued declination of output until an eventual catastrophic failure.

Should a catastrophic or significant failure occur, the replacement laminates, thrust bearing, and other specialized parts/equipment are long lead items.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Ohio Falls Unit 7 Stator Core Rewind and Restack project for $7,650k, inclusive of $650k in management contingency, to complete upgrades to Unit 7 to achieve and sustain the design MW output through the refurbishment design life.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

_____   _____
Kent W. Blake   Paul W. Thompson
Chief Financial Officer   President and Chief Operating Officer

Revised Investment Proposal for Investment Committee Meeting on: April 26, 2017

Investment Proposal:
Project Name: Ohio Falls Rehabilitation
Total Approved Expenditures: $136,000k
Total Revised Expenditures: $140,500k
Project Number(s): Various

Business Unit/Line of Business: Project Engineering

Prepared/Presented By: John Williams

Reason for Revision

This Amended Investment Proposal seeks authorization to increase the Ohio Falls Rehabilitation Project sanction from the February 2016 approved sanction of $136,000k, to a revised sanction of $140,500k. Attachment 1 contains the February 2016 approved Project sanction and contract authorization. There is no request to increase the contract authorization for ███████████████████████████████ ████████████ Agreement beyond the 2016 approval. This request is to account for Balance-of-Plant (BOP) issues experienced during rehabilitation of the last two units, as well as final scopes to restore the overall station site to a safe condition from impacts of the large retrofit project. Drivers of the sanction increase are: experienced and future risks of high and low water events hampering critical path activity; BOP and overhead expenses associated with EPC Excusable Events experienced since the February 2016 sanction that were not covered in the that sanction; and plant betterment and site restoration scopes performed to historical preservation standards that were not in the last sanction. Approval of this amendment is justified by existing Federal Energy Regulatory Commission (FERC) requirements and the requirement to complete mechanical refurbishment of the final hydroelectric unit at Ohio Falls (Unit 8, Sequential Unit 8). Table 1 summarizes Project sanction and contract authorization request:

Table 1: History of Project and ███████████████████

($000s)	2004	2010	2012	2016	2017
████████████████	N/A	$80,000	$83,900	$88,250	$88,250
OF Rehabilitation Project Sanction	$75,000	$130,500	$130,500	$136,000	$140,500

This project was included in the 2017 BP for $138M. Additional funding of $3.4M in 2017 was approved in the 3+9 RAC Forecast. A revised Authorized Investment Proposal will be sent for approval.

Background

An effort began in 2004 to upgrade and refurbish the Ohio Falls Generating Station's eight (8) hydroelectric units, which had not seen major overhaul since they were placed into service in the mid-1920s. Seven (7) units have undergone this work, with Unit 4 (Sequential Unit 7) receiving mechanical completion in the fourth quarter of 2016. All seven (7) units completed to date are performing very well to plan. Unit 8 (Sequential Unit 8 and the last) is currently in outage with a planned completion date of the fourth quarter of 2017.

█████████████ has performed the turbine and generator specific upgrades as the EPC prime contractor. However, excluded from ████ scope is BOP work in support of, and concert with, its upgrades. Project Engineering's staff oversees both ████ EPC scope and engineers, procures, and oversees the execution of BOP work.

All instrumentation and electrical, mechanical, hazardous materials abatement and remediation, and large equipment support are excluded from ████ Agreement. This exclusion was determined favorable after review of ████ commercial terms and conditions pertaining to subcontract oversight and procurement mark-up. In addition to the known, base scope, of BOP work, additional work is required to support ████ upon the execution of ████ Excusable Events.

The remaining BOP work spend requested in this proposal is consistent in scope executed on prior units and also includes river dredging immediately upstream of the station, as well as structural repairs to the powerhouse. River dredging of sediment and debris immediately upstream of the unit intakes is required to optimize unit performance, especially on Units 1-3. The powerhouse structural repairs will be performed in accordance with historical preservation requirements, but funding is not sought at this time for Historic Properties Management Program work. Table 2 expresses BOP work required beyond ████ EPC scope that was not captured in the February 2016 Amended Investment Proposal.

Table 2: Balance of Plant Work Not Captured in 2016 Request

($000s)	
Thrust Bearing (manufacture retrofit thrust bearing to replace existing)	$400
Combined, Smaller Work Scopes (control logic support, mechanical, concrete, gate removal, water level impacts, etc.)	$1,650
River Dredging Upstream of Ohio Falls (sediment & debris removal from unit(s) intakes to optimize performance)	$500
Building Remediation (exterior masonry, interior tile, other repairs)	$1,000
Project Engineering Management Oversight	$950
Total Balance of Plant =	$4,500

Financial Summary

This request seeks to increase sanction amount to $140,500k, a $4,500k increase from the previously approved Project Sanction, and equating to a $2,500k increase from the 2017BP budgeted amount. The table below shows financial detail by year for the full Ohio Falls Rehabilitation Project:

Financial Detail by Year - Capital ($000s)	Pre-2017	2017	2018	Total
1. Capital Investment Proposed	117.2	14.9	-	132.1
2. Cost of Removal Proposed	7.4	1.0	-	8.4
3. Total Capital and Removal Proposed (1+2)	124.6	15.9	-	140.5
4. Capital Investment 2017 BP	117.2	12.5	-	129.7
5. Cost of Removal 2017 BP	8.3	-	-	8.3
6. Total Capital and Removal 2017 BP (4+5)	125.5	12.5	-	138.0

9. Total Capital and Removal variance to BP (6-3)	0.9	(3.4)	-	(2.5)

Conclusions and Recommendation

It is recommended that the Investment Committee approve the revised Ohio Falls Rehabilitation project with an increase of $4,500k for a revised total of $140,500k to complete the rehabilitation and upgrade of the last turbine/generator unit at the Ohio Falls Station and other BOP activities required to support this rehabilitation and restore the overall station to a safe condition from impacts during the multi-year rehabilitation.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment and Revised Contract Proposal for Investment Committee Meeting on: February 24, 2016

Investment Proposal:
Project Name: Ohio Falls Rehabilitation
Total Approved Expenditures: $130,500k
Total Revised Expenditures: $136,000k
Project Number(s): Various

Contract Proposal:
Contract Name: Ohio Falls Rehabilitation
Contractor ████████████
Total Approved Contract Authorization: $83,900k
Total Revised Contract Authorization: $88,250k

Business Unit/Line of Business: Project Engineering

Prepared/Presented By: Joe Strickland and Scott Straight

Reason for Revision

This proposal seeks authorization to increase the previously approved 2010 project sanction of $130,500k to a revised project authorization of $136,000k, inclusive of a 0.3% contingency. This amount will be expended through 2017 to complete the rehabilitation of the LG&E Ohio Falls (OF) Hydroelectric Generating Station. The 2016 Business Plan (BP) has a budget of $139,000k from project inception through 2017. Approval of this revised request is supported by the need to rehabilitate the equipment, existing Federal Energy Regulatory Commission (FERC) requirements, and dam integrity issues. Table 1 below summarizes the previous and current project sanction and contract authorization requests:

Table 1 – History of Project and Voith EPC Authorization

($000s)	2004	2010	2012	2016
████████████	N/A	$80,000	$83,900	$88,250
OF Rehabilitation Project Sanction	$75,000	$130,500	$130,500	$136,000

NOTE: Project Engineering assumed responsibility for the management of the project in the 2010 sanction.

This proposal also seeks a revised contract authorization for the ████████████ ████████████████████████████████ of $88,250k, inclusive of 0% in contingency for any additional Risk Scopes. This increase is anticipated to complete the project unless an "as found" condition not experienced on previous units is realized. It also is to account for the erosion of past contingencies completely absorbed by change orders on the units completed to date (6 of 8 units), as well as the stator core change order in the amount of $8,800k that was not anticipated scope at the time of the 2010 sanction request. It should be noted that this entire sanction increase and the smaller increase in 2012 totals $8,250k, which is essentially the amount of the stator core

change order, thus showing the original sanction in 2010 was accurate for known scope ~~although~~ anticipated "as found" conditions for a rehabilitation project of this scope.

Authorization Increase Background

This EPC revised contract will complete the rehabilitation of all OF Units unless an "as found" condition occurs that is different than those experienced on past units. The amount requested in this contract authorization revision will be expended through 2017 to complete the rehabilitation of the LG&E OF Hydroelectric Generating Station. Table 2 below summarizes the portion of the project related to the ████ EPC.

Table 2

Project Costs	($000s)
████████████████	$88,250
Project – Balance of Plant	$47,750
Total Revised Sanction Request	$136,000

As-found mechanical defects were the primary reasons for the need to execute change orders for OF Units 3, 2 and 1 totaling $3,000k, which were the last three units to be rehabilitated. The total value of change orders to repair or replace items that were listed in Exhibit Z – Risk Scope section of the EPC contract totaled $2,100k. Repairs to the stator core systems and stay flange systems comprise the majority of the Risk Scope related changes. Owner related items and other as-found conditions needing attention comprised the remaining $900k spend. Of the $900k, approximately $700k were responsibility to LG&E (primarily river conditions) and $200k for spare parts not in the original contract.

The Unit 4 rehabilitation (which began in October 2015 and is in progress) exposed that the stay flange requires in-place milling to restore the head cover flatness and levelness to meet current industry specifications, identified in Exhibit Z – Risk Scope (medium risk). Unit 4 will require stator support bar milling tasks as well, with both tasks expected to cost a total $500k.

Inspections made at the ████ fabrication shop in York, Pennsylvania on the wicket gates removed from Unit 2 (the last unit rehabilitated) and intended for Unit 4 revealed that the wicket gates are unable to be rehabilitated and must be replaced to eliminate the chance of a structural failure. Unit 4's wicket gates will be rehabilitated and returned to Unit 4, which will delay the completion of that unit. Since Unit 4's wicket gates were originally going to be used in Unit 8, Unit 8 will now be without a set of wicket gates. To minimize impacts to Unit 8's schedule, a new set of wicket gates is being engineered and fabricated while Unit 4's wicket gates are rehabilitated. The new set of wicket gates will be put into Unit 8. This need to design and fabricate new wicket gates *has not* been experienced to date on the project.

Unit 8's current wicket gates (the last unit to get rehabilitated) will be inspected upon removal from Unit 8. This set of gates will become the plant's replacement spare set (the plant's original spare set

was rehabilitated and used in the first rehabilitated unit at the start of this project). It is anticipated that Unit 8's wicket gates will not be in a condition that will allow a rehabilitation. Therefore, an additional set of new wicket gates is being recommended as the plant's replacement spare set, if existing Unit 8 gates are not suitable for rehabilitation.

Table 3 below is a list of known and anticipated expenses, primarily composed of items from the Contract Exhibit Z Risk Scope items:

<div align="center">Table 3</div>

Additional Costs	($000s)
███████	
Wicket gate related costs	$2,330
Submitted and Pending Change Orders	$430
Anticipated Change Orders (includes Risk Scope Items)	$1,590
Contingency for Unforeseen Events/Items not previously experienced	$0
██████████	$4,350
Project – Balance of Plant	
Project Management Extension (3 months)	$250
Potential High/Low Water Delays	$250
River Related Costs	$250
Contingency for Unforeseen Events/Items (approximately 0.3%) that are Owner Expenses	$400
Subtotal	**$1,150**
Total	**$5,500**

Project Engineering's project management costs for the Ohio Falls Rehabilitation project are forecasted to increase due to the anticipation of the project extending several months into the fall of 2017. In addition, river related costs have been higher than expected due to the record rainfall events over the last two years, and the budget for dewatering and re-watering requires adjustment. Project Engineering's recommendation increases the previously approved project authorization by $250k for the project extension (three months) for Project Engineering overheads, $250k for potential high/low water delays, and $250k for river related work to complete Unit 4, begin and complete Unit 8 and demobilization of the dewatering equipment, gates, and onsite storage.

- 3 -

It is also recommended to add 0.3% contingency to the remaining project budget to allow for completion of the project for smaller unforeseen events. With this contingency, the total project sanction request increases to $136,000k, compared to the 2016 BP total of $139,000k. Also, the 2016BP project estimate included a line item of $700k for Historic Properties Management Program. To date, preservation scope has not been identified, and as such, Project Engineering has removed this amount from the project scope and turned that potential future scope back to the Ohio Falls Station to manage, should it become necessary.

Financial Summary

Financial Summary ($000s): Capital Breakdown:	Approved	Revised	Explanation
Balance of Plant:	$38,100	$47,350	Project delays and river related costs
▉▉▉▉▉▉	$83,900	$88,250	Wicket gate costs and change orders
Contingency:	$8,500	$400	Original contingency absorbed, revised for future unforeseen events
Net Capital Expenditure:	$130,500	$136,000	

Financial Detail by Year - Capital ($000s)	Pre 2016	2016	2017	Post 2017	Total
1. Capital Investment Proposed	106,957	12,273	9,083		128,313
2. Cost of Removal Proposed	5,568	2,119			7,687
3. Total Capital and Removal Proposed (1+2)	112,525	14,392	9,083	-	136,000
4. Capital Investment 2016 BP	108,285	12,273	10,722		131,279
5. Cost of Removal 2016 BP	5,568	2,119			7,687
6. Total Capital and Removal 2016 BP (4+5)	113,853	14,392	10,722	-	138,966

Investment Proposal for Investment Committee Meeting on: September 28, 2016

Project Name: Network Management System Upgrade

Total Expenditures: $1,200k   (Including $158k of contingency)

Project Number(s): IT0077L, IT0077K, IT0077CG

Business Unit/Line of Business: Electric Distribution Operation / Information Technology

Prepared/Presented By: Steve Woodworth / Jason Jones

Executive Summary

EDO (Electric Distribution Operations) and IT (Information Technology) request funding to upgrade the existing ▌▌▌ NMS (Network Management System). The upgrade is driven by the requirement to keep the software version current to ensure continued vendor support. The ▌▌▌ NMS is a critical corporate system, essential for managing the electric restoration process. The NMS also provides data, such as ERTs (Estimated Restoration Times), to customer-facing systems like the IVRU (Interactive Voice Response Unit), Outage Maps, and smartphone applications.

The upgrade is included in 2017 in the approved 2016 Business Plan (BP) for $1,000K. However, the ▌▌▌ NMS is recommended to be the solution for DMS (Distribution Management System) to support DA (Distribution Automation). Since the outage functionality to be upgraded and the distribution management functionality to be implemented are in the same system, the two projects should be aligned.

EDO recommends the Investment Committee approve the NMS Upgrade Project for the capital cost of $1,200K ($250K in 2016, $700K in 2017, $250K in 2018) including a 10% contingency on vendor services for $38K and a 20% contingency on internal labor for $120K. The funding request has been approved by the Technology Portfolio Management Committee (TPMC) as well as the Corporate RAC in the July 2016 meeting. There is no on-going O&M.

Background

The NMS was last upgraded in 2013 and is currently on v1.11.0.4. ▌▌▌▌▌▌ ▌▌▌ for v1.11 ended in July 2016, but the Extended Support Program is available through July 2019. Starting the upgrade now will ensure completion prior to the end of ▌▌▌ Extended Support Program. In addition to support implications, the timing of the project has been adjusted to support the DA (Distribution Automation) Program. For the DA Program to achieve its expected electric reliability benefits, the DMS (Distribution Management System) modules of the NMS are required. The DMS modules will be installed with this upgrade.

- **Alternatives Considered**
    1. Recommendation: NPVRR: $1,340K
    2. Alternative #1: Do nothing   NPVRR: N/A

Alternative #1: Do Nothing:

The Do Nothing alternative would be to stay on the current ▮▮▮▮ NMS version and allow support to expire or switch vendors.

Staying on the current version is not a reasonable option because it would put a critical system at risk. Failure of the ▮▮▮▮ NMS would have a significant negative impact on the restoration process and the customer experience. In addition, it would limit LKE's ability to leverage the advanced distribution management functionality reducing the reliability benefits expected from DA.

Switching vendors is not a viable option for a number of reasons. First, it would be cost prohibitive. Replacing the ▮▮▮▮ NMS would cost approximately $10M - $12M. Secondly, ▮▮▮▮ is an industry leader in this space. No additional functionality would be gained. Finally, the decision has recently been made to expand the use of the NMS to include implementation of the DMS modules to support DA. This decision was made through the competitive bid process. Replacing the ▮▮▮▮ NMS would require reassessing the DMS decision and delay the electric reliability benefits of the DA Program.

Project Description

- **Project Scope and Timeline**
    - **Project Scope**
        - Upgrade the ▮▮▮▮ NMS to the latest version
        - Replace the existing, custom Smallworld GIS extractor with the standard ▮▮▮▮ extractor.
        - Automate the Smallworld GIS extractor process.
        - Implement integration to distribution SCADA.
        - Enable DMS modules.
        - Train users.

    - **Project Schedule/ Milestones**
        - Project Start: October 2016
        - Development Complete: December 2017
        - Testing Complete: June 2018
        - Go-Live: July 2018

- **Project Cost**
    - $1,200K
        - $250K in 2016

- $700K in 2017
- $250K in 2018
  - Includes a 10% contingency on vendor services and a 20% contingency on internal labor.
  - Includes $382K for outside services to be managed on time & materials basis.

Economic Analysis and Risks

- **Bid Summary**
  This is a sole source item. As the product vendor, ▮▮▮▮ is the only viable option to perform the upgrade.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2016	2017	2018	Post 2018	Total

Financial Summary ($000s):

Discount Rate:	6.49%
Capital Breakdown:	
Labor:	$660
Contract Labor:	$382
Materials:	$0
Local Engineering:	$0
Burdens:	$0
Contingency:	$158
Reimbursements:	($0)
Net Capital Expenditure:	$1,200

Financial Analysis - Project Summary ($000)	2016	2017	2018	2019	2020	Life of Project
Project Net Income	-	31.00	129.00	44.00	32.00	262.00
Project ROE	0.00%	4.90%	14.90%	17.00%	9.90%	11.80%

- **Assumptions**
  Not applicable.

- **Environmental**
  Not applicable.

- **Risks**
  o Failing to continue vendor support for the ▮▮▮▮ NMS will put the restoration process at risk.
  o The timing of the project is to maximize synergies between this project and the DA project. Completing the project outside of the proposed timeframe will negatively impact the expected reliability benefits of the DA project.

Conclusions and Recommendation   Arbough

EDO recommends Investment Committee authorization of $1,200K ($250K in 2016, $700K in 2017, $250K in 2018), including a 10% contingency on vendor services and a 20% contingency on internal labor, for the NMS Upgrade Project.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $1 million:</u>

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: July 31, 2018

Project Name: Pad Mount Meter Replacement

Total Approved Expenditures: $1,800k (Approved on 12/08/2017)

Total Revised Expenditures: $2,666k

Project Number(s): 406000003

Business Unit/Line of Business: Gas Distribution Operations

Prepared/Presented By: Lesley Hill/Tom Rieth

Background

Louisville Gas and Electric started a program in 2017 to replace all pad mount and AL-1400 gas meters currently in service over seven and a half years. At the beginning of 2018, approximately 650 pad meters and 50 AL-1400 meters remained in service, most of which serve commercial and industrial customers.

Unlike the common hanging diaphragm meters, pad meters are not simply replaced after a certain period, but are recertified (tested) and left in place. As a result, some pad meters have been in service since the 1950s. Pad meters are randomly selected and recertified as part of a Kentucky Public Service Commission requirement. If a meter is unsuccessful in the recertification process, the assembly must be removed and sent off to a meter remanufacturer. As the meters age, more are failing the recertification process, resulting in more being remanufactured. Due to the age of the meters, the availability of the parts needed to remanufacture the meters is decreasing. This in turn increases the price to remanufacture the meter and the time involved in the remanufacturing process. This combination of an increasing number of meters failing the recertification process, along with increasing costs to keep the meters in service, has led Gas Engineering to request this project.

The meters included in this project will be replaced with a rotary meter set or large commercial diaphragm meter (typically an AL-1000), and appropriate meter loop and regulator. Target meter sets on this project are usually replaced entirely with new meter sets, but occasionally involve modifications to the existing piping.

This project will replace approximately 100 pad mount meters in 2018. Annual projects are also currently planned for 2019-2024, replacing approximately 100 pad mount meters per year. Approval will be requested annually for each new project.

Pad meters are located throughout LG&E's service area. Approximately 85% of the 700 Although meters are within Jefferson County, and 15% spread throughout the rest of the service area. The majority of total meters will be replaced with AL-1000 diaphragm meters (59%), with the remainder being replaced with 3M (38%) or larger (3%) rotary meters. We expect the annual percentages to mirror the total project makeup.

This project also covers replacing existing medium pressure steel customer services as they are encountered with plastic services, and replacement of high pressure farm taps or meter loops. Service replacement is in conjunction with the service replacement project (#CRSS414) approved to begin in 2018, and is consistent with service replacement parameters used by that project. This will help aid in the customer experience by only having to interrupt their gas service once, versus multiple times for different projects. Approximately 75% of the meter replacements will require service work.

Reason for Revision

The 2018 Pad Meter Replacement project was approved in December 2017 for $1,800k. See attached original proposal. The revised estimated cost for 2018 is $2,666k. The 2018 Business Plan (BP) included $1,996k for this project, and was revised to $1,800k in the January 2018 RAC. The amount is now being adjusted due to higher cost of replacing steel services included in the project. The initial estimate of $1,800k was based on costs incurred in 2017. In 2017, only 10% of the meters replaced required service replacement, which made the overall project cost lower. In 2018, 75% of the meters replaced require service work, which matches the original project estimate. The remainder of the 2018 forecast is being adjusted to reflect the actual costs incurred by replacing 75% of the customer services. The Corporate RAC has approved the incremental 2018 funding.

Financial Summary ($000s):	Approved	Revised	Explanation
Discount Rate:	6.32%	6.59%

Attachment 1

Investment Proposal for Investment Committee Meeting on: <u>N/A</u>

Project Name: <u>Pad Mount Meter Replacement</u>

Total Expenditures: <u>$1,800k</u>   (Including $164k of contingency)

Project Number(s): <u>406000003</u>

Business Unit/Line of Business: <u>Gas Distribution Operations</u>

Prepared/Presented By: <u>Lesley Hill</u>

Executive Summary

Louisville Gas and Electric started a program in 2017 to replace all pad mount and AL-1400 gas meters currently in service over seven and a half years. In 2018, approximately 700 pad meters will remain in service, most of which serve commercial and industrial customers. The meters included in this project will be replaced with a rotary meter set or large commercial diaphragm meter (typically an AL-1000), and appropriate meter loop and regulator. Target meter sets on this project are usually replaced entirely with new meter sets, but occasionally involve modifications to the existing piping.

This project will replace approximately 100 pad mount meters in 2018. Annual projects are also currently planned for 2019-2024, replacing approximately 100 pad mount meters per year. Approval will be requested annually for each new project.

Pad meters are located throughout LG&E's service area. Approximately 85% of the 700 total meters are within Jefferson County, and 15% spread throughout the rest of the service area.

The majority of total meters will be replaced with AL-1000 diaphragm meters (59%), with the remainder being replaced with 3M (38%) or larger (3%) rotary meters. We expect the annual percentages to mirror the total project makeup.

This project will also cover replacing existing medium pressure steel customer services as they are encountered with plastic services, and replacement of high pressure farm taps or meter loops. Service replacement is in conjunction with the service replacement project (#CRSS414) approved to begin in 2018, and is consistent with service replacement parameters used by that project. This will help aid in the customer experience by only having to interrupt their gas service once, versus multiple times for different projects. Approximately 75% of the meter replacements will require service work.

The estimated cost for 2018 is $1,800k. The proposed 2018 Business Plan (BP) includes Arbough $1,996k for this project. The forecast will be adjusted for the revised lower cost in the January Corporate RAC process.

Background

This is a continuation of the term program for retirement of existing pad meters (#3, #4, and #10) from service. These meters will be replaced by either rotary style meters or large diaphragm meters. There will be approximately 700 pad meters in service after 2017, most of which supply larger commercial customers.

Unlike the common hanging diaphragm meters, pad meters are not simply replaced after a certain period, but are recertified (tested) and left in place. As a result, some pad meters have been in service since– 1955 (#3), –1937 (#4), and –1960 (#10). Pad meters are randomly selected and recertified as part of a Kentucky Public Service Commission requirement. The #3 gas meters have a 10 year recertification period, while #4 and #10 gas meters have a 5 year recertification period. All meters of a certain style must be tested within that period. If a meter is unsuccessful in the recertification process, the assembly must be removed and sent off to a meter remanufacturer. As the meters age, more are failing the recertification process, resulting in more being remanufactured.

Over the years, a large number of these older pad meters may end up becoming inactive, or incorrectly sized for the current loading. These periods of inactivity or underutilization can result in increased stiffness in the diaphragms and linkages, and allow moisture and other contaminants to collect inside the meter, both of which can adversely affect the recertification testing and cause more meters to fail. This can also affect the accuracy of the meters, leading to lost and unaccounted for gas, rebilling, and in turn, negatively affect the customer experience.

Due to the age of the meters, the availability of the parts needed for remanufacture is decreasing, because the meters are becoming obsolete. This in turn increases the price to remanufacture the meter and the time involved in the remanufacturing process.

This combination of an increasing number of meters failing the recertification process, along with increasing costs to keep the meters in service, has led Gas Engineering to request this project.

LG&E has had two programs that helped reduce the number of pad meters in service over the last several years - Gas Main Replacement and Riser Replacement Programs. Both of these programs are on schedule to end in 2017. If the current pace of meter removal continues, (which is unlikely considering the two existing programs will soon end) it will be another 10 years before these meters are eliminated.

Pad meters are also removed by the Gas Meter Shop (GMS), at a rate of approximately 25 meters per year. GMS replaces pad mount meters when they are identified through the recertification process as causing potential safety hazards. Going forward, GMS will provide a list of pad mount meters they plan to test each year so those meters can be replaced on this project. That will eliminate any duplication of efforts.

- **Alternatives Considered**
    1. Recommendation: NPVRR: $2,400k
    2. Do Nothing: NPVRR: N/A
       This is not a viable option for reasons mentioned in the project background section. These meters will become more and more expensive to maintain, requiring more cost for parts, along with more manpower to test and repair. Leaving these meters in place would also affect negatively the customer experience. Failing meters increase the possibility of having to rebill customers for incorrect gas usage.

Project Description

- **Project Scope and Timeline**
  This project will replace 100 pad mount gas meters in 2018 with equivalent rotary or diaphragm meters. These replacement meters are the current standard meters used by the Company.

  Engineering has analyzed gas usage data from current pad meter customers in order to estimate the replacement meter types and sizes for this project, and the associated meter costs.

  Replacement will take place year round.

- **Project Cost**
  The 2018 estimated project cost is $1,800k, which includes a 10% contingency. The contingency amount was based on previous project experience, and will be used to cover variation in contract labor and miscellaneous costs, including but not limited to restoration costs, traffic control, and expenses due to meter locations such as taps under pavement or inside of buildings.

Economic Analysis and Risks

- **Bid Summary**
  The construction portion of the project was bid to eight vendors, both local and non-local. Of those eight, six companies chose to bid the project. The bids covered the entire program through 2024. It was chosen to bid the entire duration of the project in order to procure the best pricing. The terms and conditions of the labor contract allow the company to terminate the contract with thirty days' notice, if that becomes necessary during the life of the project. If that becomes necessary, the labor will be bid again.

  The project was awarded to ███████████████████ in 2017, who was the lowest bidder and is also very experienced performing this type of work for LG&E. Please see bid summary below. Materials have been purchased under existing blanket contracts and under new contracts.

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total
1. Capital Investment Proposed	1,750	-	-	-	1,750
2. Cost of Removal Proposed	50	-	-	-	50
3. Total Capital and Removal Proposed (1+2)	1,800	-	-	-	1,800
4. Capital Investment 2018 BP	1,996	-	-	-	1,996
5. Cost of Removal 2018 BP	-	-	-	-	-
6. Total Capital and Removal 2018 BP (4+5)	1,996	-	-	-	1,996
7. Capital Investment variance to BP (4-1)	246	-	-	-	246
8. Cost of Removal variance to BP (5-2)	(50)	-	-	-	(50)
9. Total Capital and Removal variance to BP (6-3)	196	-	-	-	196

Financial Detail by Year - O&M ($000s)	2018	2019	2020	Post 2020	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2018 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

This project is included in the proposed 2018 BP. The 2018 forecast will be adjusted through the Corporate RAC process to reflect the current estimate of $1,800k, which is lower than the proposed 2018 BP amount.

Financial Summary ($000s):

Discount Rate:	6.32%
Capital Breakdown:	
Labor:	$ 130
Contract Labor:	$ 779
Materials:	$ 510
Local Engineering:	$ 57
Burdens:	$ 160
Contingency:	$ 164
Reimbursements:	($ 0)
Net Capital Expenditure:	$1,800

- **Assumptions**
  - Capital expenditures were estimated in part using historical data. Non-construction contractor costs (materials, restoration, traffic control, locates, etc.) were assumed to be consistent and proportional with current programs.

- **Environmental**
  This project does not include any major environmental requirements.

- **Risks**

  Risks of not completing this project include increased company labor and materials costs associated with the maintenance of existing pad meters, and decreased customer satisfaction due to billing inaccuracies.

Conclusions and Recommendation

It is recommended that Management approve the Pad Mount Meter Replacement project for $1,800k to replace existing pad mounted meters.

Investment Proposal for Investment Committee Meeting on: June 28, 2017

Project Name: Paynes Mill Substation Project

Total Expenditures: $7,234k (includes $344k contingency)

Project Number: Distribution-152860, Substation-138168, Transmission-134256

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Tim Smith/Kevin Patterson

Executive Summary
Electric Distribution Operations (EDO) - Electric Engineering and Planning seeks funding authority for the construction of a new 37.3MVA distribution substation to be located at the intersection of US 60 and Paynes Mill Road in Versailles, Ky. The additional capacity at Paynes Mill Substation is required to meet the electrical service needs of approximately 7,651 existing customers in the Versailles/Woodford County service area, as well as new developments proposed along US 60 in this high potential growth area in Woodford County. Electric service for this area is currently provided by extended distribution circuits from Alexander and Versailles Bypass 1 Substations. The current System Planning winter load forecast data base predicts that Alexander 12KV (22.4MVA) will reach 111% of its top nameplate capacity during the winter of 2019/2020 (assumes average winter temperature conditions) and Versailles Bypass 1 will reach 90% of its top nameplate. However several large customer proposals in various stages of project completion are expected to exacerbate the demand at Versailles Bypass 1 to a much higher than currently forecasted level. The expected winter demand at Versailles Bypass 1 due to new customer growth is anticipated to be 27.4MVA (122%) during the winter of 2019/2020 exceeding Distribution Planning's allowable winter loading limit of 120% of the transformer's nameplate rating. This project will address overloading issues at Versailles Bypass 1, improve transmission and distribution reliability in the area, and provide additional capacity to support new development. The additional transformer capacity from the proposed substation will also remove Alexander 12kV, Versailles Bypass 1 and Versailles Bypass 2 transformers from the Company's "Distribution Substation Transformer Contingency Program (N1DT)" list (transformers that cannot be fully backed up for a failure of a substation transformer during high load periods). Project completion is expected in December 2019.

Funding is requested in the amount of $7,234k to construct the new Paynes Mill 37.3MVA 69/12kV Substation. The 2017 Business Plan (BP) included $7,234k in 2017 and 2018 for this project. The project has now shifted to a 2018/2019 project with $1,210k spending in 2017 for major equipment.

Background   **Arbough**

Paynes Mill Substation will be located on the southeast corner of a 410 acre property in Versailles called Edgewood Farm. This property is located near the intersection of US 60 and Paynes Mill Road on the east side of Versailles, Ky. This general area was determined by Distribution System Planning models to be an optimal substation location to support developing load growth along US 60. In 2012, KU purchased 2.6 acres of land and associated utility easements for a new substation in the predetermined area. Load forecasts determined that future transformer capacity would be needed to relieve loading at surrounding substations that currently serve this area. Edgewood Farm, which is the property's official name and where the new substation will be located, is currently planned for development. There has been significant new growth in the area, including the largest Kroger store in the state, as well as multiple new retail and dining establishments. A large bakery and a hotel are currently under construction in the immediate vicinity. Officials for the City of Versailles have identified this location as ideal for development, and growth is expected to continue in this vicinity due to the many positive amenities such as available land for development, close proximity to major highways (US 60, and the Bluegrass Parkway), existing railway access (along the northern boundary), and easy access to Keeneland Race Track, Lexington Bluegrass Airport (both 6.6 miles to the east via US 60) and the city of Lexington.

The Versailles area 12kV distribution system is comprised of five existing substations: Alexander 12kV, Versailles Bypass (1 and 2), Versailles West and Shannon Run. Electric Distribution Operations has been managing new customer growth in the area by shifting loads to Versailles Bypass Substation as a short-term plan. This process reduces system reliability and has resulted in over 35MVA of load downstream of one 69kV switching point. Having exhausted all transfer options and circuit reconfigurations, Versailles Bypass 1 is anticipated to exceed it top winter rating during the winter of 2019/2020. The strategic location of the proposed substation will allow for approximately 15MVA of load to be shifted from Alexander 12kV and Versailles Bypass 1 Substations, relieving the projected overloads. The new developments planned along US 60 will be served from distribution circuits fed from the proposed Paynes Mill Substation. In addition to relieving expected overloads, providing capacity for new growth and improving area reliability, the additional capacity provided by this new substation will also remove Alexander 12kV, Versailles Bypass 1 and Versailles Bypass 2 transformers from the Company's N1DT Contingency Program List.

This project includes the construction of a new distribution substation with a 69/13.09kV 37.3MVA transformer in Versailles, Kentucky. Transmission improvements include a new transmission tap, line upgrades and line breakers which enhance the reliability of the 69kV line which feeds multiple substations. Because of the visibility of the station and its proximity to planned developments, the exterior of the station will include a split face block wall enclosure on three sides and high security fencing on the company accessible side. Distribution circuit improvements include three new underground distribution circuits to be extended from the substation to overhead feeder circuits along US 60. Once complete, load shifts will allow the new station to serve 2,134 of the 7,651 customers currently served by Alexander 12kV and Versailles Bypass 1 Substations.

A Network Integration Transmission Service (NITS) request was submitted to TranServ International to establish a new 69kV delivery point on October 25, 2016. No additional transmission improvements are expected beyond the cost to serve the new substation.

Alternatives Considered

1. Recommended Option: NPVRR: $8,240k
   The recommended option is to construct a new substation and 69kV transmission delivery point.

   Install a new 37.3MVA substation transformer with switchgear type breakers on substation property owned by KU near the intersection of US 60 and Paynes Mill Road. Install a 69kV transmission tap, three transmission line breakers, transformer breaker and three circuit breakers. Install three underground parallel 1000 kCM Aluminum distribution circuits from the substation to the new riser poles on US 60 to offload Alexander 12kV and Versailles Bypass 1 transformers. The estimated total cost of this option is $7,234k.

2. Do Nothing Option: NPVRR: N/A
   KU has an obligation to serve all customers and associated load. The "do nothing" option is not considered an acceptable option because it exceeds Distribution Planning's operating limits for distribution substation power transformers, and this practice reduces the life of the substation transformer and elevates the risk of failure of a high value, critical asset.

3. Alternative 1: Upgrade Versailles Bypass 1 Substation to 37.3MVA   NPVRR: $13,985k
   The alternative option considered was to replace the existing Versailles Bypass 1 Substation 22.4 MVA transformer with a 37.3 MVA transformer. This would require purchasing additional land to expand the substation and reconfiguring the single 69kV transmission tap feeding both transformers in the substation into separate taps for Versailles Bypass 1 and 2 transformers. Distribution work would require extending approximately 13,000' of new 795kCM Aluminum conductor feeder with a significant transmission under build to reach the areas where growth is expected. Based on expected developments in the area, a new substation (Paynes Mill) would still be required in 7-12 years. This alternative results in a less flexible and a less reliable system while providing less capacity for future growth. This option will remove only the Versailles Bypass 2 transformer from the Company's N1DT Contingency Program List. Planning studies indicate an outage of the Versailles Bypass 2 transformer at peak would cause as much as 3,888kW of load to go unserved and the loss of the Alexander 12kV transformer would cause as much as 6,732kW of load to go unserved. Using the corporate "Cost of Unserved Energy" ($17.2/kWh) with estimated load at risk going unserved at peak for 24 hours, the Cost of Unserved Energy would total $4,384k. While the loss of a substation transformer is a relatively low probability event in any given year, the estimated annualized Cost of Unserved Energy based on an annual 5% probability of an outage on either transformer is $219k.

   The estimated capital cost for this option is $8,442k (2018 - $4,670k, 2019 – $3,772k).

Project Description

Project Scope
- Transmission project #134256: estimated cost $1,104k ($397k-2018, $707k-2019)
  - Install transmission poles for a tap for a new 69kV delivery point on the Tyrone 65 to Pisgah 210 69kV line on US 60 to the Paynes Mill Substation. Install a 400' double circuit 69kV tap into the proposed Paynes Mill Substation from US 60.

- Substation project #138168: estimated cost $5,630k ($1,210k-2017, $920k-2018 $3,500k-through-2019)
  - Perform a geotechnical survey, site prep and service road construction needed for the development of this "greenfield" site that previously has been used for agriculture. Install a 14 foot high split face decorative block wall enclosure on three sides with a wrought iron fence on the accessible side. Install one 69/13.09 kV, 37.3MVA substation transformer, transmission line breakers, transformer breakers and associated switchgear type breakers, steel structure, control house, SCADA communications and associated equipment.
- Distribution project #152860: estimated cost $500k (in 2019)
  - Install a 6" underground duct bank (approximately 1,600') and manhole system for three new distribution circuits. Install six three-phase cable sets (2 per circuit) of 1000kCM Aluminum exit circuits and three electronic reclosers to complete circuit ties.

- **Project Timeline**
  - July 2017: Open project
  - July-December 2017: Order and accrue 2017 portion of the cost of the substation transformer and switchgear.
  - 1st Qtr. 2018: Complete transmission, substation and distribution engineering design. Take delivery of substation transformer and switchgear.
  - 2nd Qtr. 2018: Complete material and equipment orders for transmission, substation and distribution, complete geotechnical survey of property.
  - May-December 2018: Install service road, site prep, wall construction, fencing footers and concrete piers.
  - November 2018-January 2019 final engineering, protection scheme settings, relay settings, and circuit coordination.
  - January 2019: Begin transmission and distribution circuit construction.
  - April 2019: Take delivery of long lead items, including transmission poles, substation control house, steel package and distribution cable.
  - April-October 2019: Install substation transformer, switchgear and SCADA communications.
  - November-December 2019: Site cleanup, landscaping, system check out and commissioning.

- **Project Cost**
  The total estimated cost of the project is $7,234k. The substation and transmission line cost estimates are consistent with the "Conceptual level 1" engineering design designation. The distribution cost estimate is consistent with the "preliminary" engineering design designation and is based on field experience from similar projects. There is an estimated 5% of contingency ($344k) incorporated into the project cost estimates.

Economic Analysis and Risks
- **Bid Summary**
  - Substation Engineering and Design will use established Engineering Procurement and Construction Management (EPCM) contracts to augment engineering and construction management resources as required.
  - The substation transformer, steel package and transmission poles will be bid using established Supply Chain procedures.

- Substation Construction and Maintenance (SC&M), Distribution Operations, and Arbough Transmission Lines will use existing material and labor contracts and follow established Supply Chain procedures.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	1,210	1,317	4,674	-	7,201
2. Cost of Removal Proposed	-		33	-	33
3. Total Capital and Removal Proposed (1+2)	1,210	1,317	4,707	-	7,234
4. Capital Investment 2017 BP	2,743	4,474	-	-	7,217
5. Cost of Removal 2017 BP	-	17	-	-	17
6. Total Capital and Removal 2017 BP (4+5)	2,743	4,491	-	-	7,234
7. Capital Investment variance to BP (4-1)	1,533	3,157	(4,674)	-	16
8. Cost of Removal variance to BP (5-2)	-	17	(33)	-	(16)
9. Total Capital and Removal variance to BP (6-3)	1,533	3,174	(4,707)	-	-

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed					-
2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The timing changes between years have been adjusted through the Corporate RAC process for 2017 and will be adjusted in the 2018 BP process.

Financial Summary ($000s):

Discount Rate: 6.5%
Capital Breakdown:
   Labor: $ 502
   Contract Labor: $2,789
   Materials: $2,334
   Local Engineering: $ 658
   Burdens: $ 521
   Transportation: $ 86
   Contingency: $ 344
   Reimbursements: ($ 0)
   Net Capital Expenditure: $7,234

- **Assumptions**
  - Substation load demands will be in line with the company's distribution System Planning load forecast.
  - Project unknowns will not exceed the estimated contingency amounts.
  - The estimated cost of the distribution facilities are consistent with similar past projects.
  - No significant unknown costs for transmission improvements will be associated with the addition of a new service point.
  - The project will be completed by December 2019.

- **Environmental**
  There are no known environmental issues at this time.

- **Risks**
  Failure to complete this substation project before the winter of 2019/2020 will result in declining reliability for the Versailles area and substation transformer loading above normal operating limits escalating the potential for failure of the Versailles Bypass 1 or Alexander 12kV Substation transformers. Load restriction could result in an inability to serve new development in the Versailles area.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the Paynes Mill Substation Project to build a new 37.3MVA substation for $7,234k to serve existing customers and new development in Versailles, Kentucky.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake   Paul W. Thompson
Chief Financial Officer   President and Chief Operating Officer

Investment Proposal for Investment Committee Meeting on: December 19, 2018

Project Name: PC Tech Refresh

Total Expenditures: $2,485k

Project Number(s): IT0477B

Business Unit/Line of Business: IT

Prepared/Presented By: Jeff Smith / Priya Mukundan

Executive Summary

LGE KU Energy (LKE) implemented a program in 2002 to replace desktops and laptops on a three-year cycle. The program was reevaluated in 2005 and it was determined then that the refresh cycle could be extended to four years for desktop computers. In 2017, the decision was made to begin refreshing laptop computers on the same four year cycle due to advancements in technology, improved reliability and better warranties. The replacement cycle is consistent with industry norms as confirmed by Gartner, an American research and advisory firm that provides technology related insights to businesses.

The refresh process has continued to evolve over the years through various means. The 2019 Technology Refresh budget was reduced from its original budgeted amount by approximately $500k, with the savings attributed to thin client placement, reduction of the number of devices an individual may have, and placing the appropriate device into production. LKE continues to deploy thin client technology, which extends the rotation cycle to an estimated 6 years. During the Tech Refresh process, devices are assessed for possible conversion with more than 500 thin clients currently deployed. Because we have hit some limits on the number of desktops that we can convert to thin clients, we have adopted a new strategy with the use of Chromebooks which run the Chrome OS. These can be viewed as mobile thin clients and will allow us to further target reductions in laptops (which is the largest segment of machines). This strategy is a reduction in both capital purchase as well as ongoing O&M.

In addition to the desktop and laptop refreshment, LKE also refreshes ruggedized Toughbooks on a 4 year rotation. These are devices placed into service in 2015 and earlier for Electric and Gas Operations business. In 2019, some of these devices will be refreshed as part of the normal process while others will begin transitioning to iPad or other lower cost devices. This project is included in the 2019BP for $2,485k.

Background

This project is the continuation of current IT policy to provide upgrades to the workstation infrastructure and will include implementation of the new Windows 10 operating system and deployment throughout the organization. The project will provide the rotation of approximately 1410 new desktops, laptops and Toughbooks into the environment in 2019. The project maximizes operating efficiency for our knowledge workers and keeps IT support costs from increasing due to unplanned hardware maintenance.

- **Alternatives Considered**

    Recommendation for 2019 Refresh Project   NPVRR: $2,663K
    - Positive impact on business operations for 2019
    - Windows 10 will be deployed to all devices
    - Keep pace with advancing technology
    - Minimize risk to O&M budgets for repairs
    - Ability to rollout new applications required by the lines of business

    Alternative 1 "Do Nothing"
    - Negative impact on business operations for 2019   NPVRR: N/A
    - Not keeping pace with advancing technology
    - Risk to O&M budgets for repairs
    - Inability to rollout Windows 10 and other new applications required by the lines of business
    - This is not considered a viable long-term option because it poses productivity and down-time risks to operational areas dependent on the technology being updated.

    Alternative 2 "Defer Project"   NPVRR: N/A
    - Same as Alternative 1 "Do Nothing" and not considered a viable alternative
    - Schedule impact for rollout of new applications to lines of business

    Alternative 3 "Replace only failed equipment"   NPVRR: N/A
    - Same as Alternative 1 "Do Nothing" and not considered a viable alternative
    - Adverse effects to rolling out new applications required by the lines of business
    - Productivity impact and "down-time" for clients when equipment fails

    Alternative 4 "Extend rotation period to 5 years"   NPVRR: N/A
    - Same as Alternative 1 "Do Nothing" and not considered a viable alternative
    - Productivity impact and "down-time" for clients when equipment fails
    - Extended rotation cycle is not consistent with Gartner recommendation

Project Description

- **Project Scope and Timeline**

This project will evaluate and replace four year old desktops and laptops in 2019 before the computers experience hardware issues that cause out of warranty repair and unnecessary client down time. The project will be completed by 12/31/2019. All LKE desktops, laptops, and Toughbooks that were purchased in 2015 (and earlier) will be evaluated for replacement. Where possible, thin clients or Chromebooks will be used for replacements. The replacement schedule will be determined by site and will be reported monthly through departmental status reports. The project is budgeted and there are no incremental O&M expenditures or savings related to the project. There are avoided costs associated with this project including improved reliability, reduced downtime for clients, and out of warranty repair costs, etc.

Economic Analysis and Risks

- **Bid Summary**

The hardware for this project will be purchased under the PC Hardware and Peripherals Contract to ▮▮▮▮. In 2016, PPL and LKE issued a joint bid seeking a larger volume discount and synchronized the PA and KY contracts. ▮▮▮▮ was awarded the supplier contract for both PPL and LKE through a competitive bid process that included Minority-Owned and Woman-Owned businesses. ▮▮ was awarded the hardware contract for both PPL and LKE, and both companies will purchase the ▮▮ hardware through the ▮▮▮ supplier contract.

Net Capital Expenditure:	$2,485

- **Assumptions**
  - Workstations will be available and delivered in 14 business days or less after order.
  - Cost per workstation will not shift dramatically during the year.
  - Contract labor will be available and no reduction of internal labor will occur.

- **Environmental**
  No environmental impact.

- **Risks**
  If the project is not approved, the main risk would include aging hardware that could fail that would create disruptions to individuals and processes. It would also hinder our ability to complete our Windows 10 migration by the hard deadline of end of year 2019 due to not having enough refresh machines to complete the process. Hardware replacement after failure would be expected to be more costly than replacing prior to failure, along with the negative productivity impact to employees that experience unplanned hardware failure.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the 2019 PC Tech Refresh project for
$2,485k to ensure that our workstation environment meets the needs of the operational areas who
are dependent upon the tools and technology to do their job.

<u>Approval Confirmation for Capital Projects Greater Than $2 million</u>:

Investment Proposal for Investment Committee Meeting on: November 28, 2018

Project Name: LGE PILC UG Network Cable Replacement Program-2019

Total Expenditures: $11.949M   (includes no contingency)

Project Number(s): 151486

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Jason Tipton / Shawn Stickler

Executive Summary

Electric Distribution Operations (EDO) proposes to invest $11.949M in 2019 towards the continuation of the PILC Cable Replacement Program. The program was initiated in 2013, and involves replacement of bare (unjacketed), paper insulated, lead covered (PILC) low voltage (LV) secondary and medium voltage (MV) primary cables operating in the downtown Louisville network distribution system. The program places replacement priority on secondary cable sections, and provides for necessary reconstruction or replacement of any discovered defective duct lines and manhole structures. The Program is included in the proposed 2019 Business Plan (BP) funded at $11.949M. The $11.949M includes $1.1M to meet enhanced street resurfacing requirements imposed in 2017 by Louisville Metro Public Works.

This program originally was anticipated to span 11 years and conclude in 2023. The total 11-year program cost, originally projected at $62M (2013 dollars), is expected to reach an estimated $74.739M by program completion. Additionally, EDO is accelerating the PILC program from 11 years to 9 years (2013-2021). The remaining program requires a 3-year (2019-2021) capital investment of approximately $33.867M. This will yield replacement of approximately 31 miles of cable in the remaining three years of the program. Actual amounts in any year will vary based on the mix of cable replacement, duct replacement, and manhole work. The higher than expected rate of defective duct line replacement has been partially offset by improved cable replacement efficiencies during the cable installation and removal processes.

PILC Network Cable Replacement Program	2019	2020	2021
PILC Cable Replacement ($000s)	10,849	10,550	9,163
PILC Cable Replacement - Curb to Curb Paving ($000s)	1,100	1,100	1,100
Cable Replacement Targets (Miles)	10.5	10.5	10

Projected program costs are reevaluated annually as additional data becomes available to better quantify the amount of PILC cable in the network and the condition of ducts and manholes.

Background

LG&E operates five separate secondary network systems with 27 circuits within the core downtown Louisville business and medical districts, roughly bounded by the Ohio River (north), Floyd Street (east), York Street (south), and 8th Street (west). Three of the five network systems, served by the Waterside, Magazine, and Madison Substations, contain bare PILC cables. All primary and secondary conductors in main thoroughfares are completely underground and installed in manhole and duct systems.

Network distribution systems were developed in the early 1910's in order to provide the highest degree of service reliability to downtown business districts and to facilitate service to densely populated areas desiring a totally underground distribution system. The original LG&E network was built using PILC cables, constructed of oil impregnated paper tape insulations and jacketed with a bare lead sheath, the most reliable cable construction available at the time. At the beginning of this program, an estimated 70 miles of bare primary and secondary PILC cables, ranging in age from 48 to 100 years old, were in service in the downtown Louisville network distribution system.

Early PILC primary cables and all PILC secondary cables utilized bare lead sheaths that have experienced varying degrees of surface corrosion over their service lives. Corrosion and/or mechanical damage allow the insulating oil to leak from the insulation and allow water to enter the cable, ultimately leading to a cable failure. Insulating oils in the older bare PILC cables are also reportedly much drier than when newly manufactured, indicating the degree of insulation aging and degradation. While service from the downtown network is designed for high reliability, and the number of cable failures is relatively small, primary PILC cable failure rates had shown an increasing trend over the past fifteen years and were failing at twice the average rate per mile as the rest of the LG&E and KU underground systems. Primary cable failures over the three consecutive five-year periods preceding program initiation increased from an average of 3.2 (1999-2003), to 5.6 (2004-2008), to 8.2 (2009-2013). Known secondary failures averaged approximately two each year and had significantly greater consequences than primary failures due to high fault currents, and because secondary cables are not protected against faults and must burn in the clear before a fault is extinguished. The increase in secondary cable burnouts, the documented primary cable failure incidence rate, and the risk posed to adjacent cables in the duct and manhole system highlights the need to continue replacement program funding to address secondary and primary PILC cables.

Under this program, PILC cables are replaced with the latest generation of solid dielectric cables using either rubber or crosslinked polyethylene insulation. The new cables are not subject to corrosion under wet conditions and will be more resistant to water ingress with aging. Current generation cables have a life expectancy of more than 50 years.

Since program initiation, asset field inventories of cable and duct line capacity assessments in the network continue to reveal that significant quantities of aged duct lines are collapsed and deteriorated, requiring the need for additional duct lines and manhole capacities. Thus far, during the program, additional PILC secondary cable failures have been found located out of sight within the duct line that had not yet propagated to the point of a violent burnout or loss of

customer service. Nearly all manholes encountered required replacement of cable support hardware and repositioning of fallen cables.

- **Alternatives Considered**

    1. Recommendation: NPVRR: ($000s) $15,153
        EDO recommends investing $11.949M during 2019 towards continuance of the PILC Cable Replacement Program to ensure the ongoing operating reliability of the Downtown Louisville Network distribution system.
    2. Do Nothing: NPVRR: N/A
        While the total loss of one of the three grid networks in downtown Louisville is a very low probability event, it could occur if more than two circuits on the same network system containing PILC cable sustained failures to primary system components at the same time.   Failure to proceed with the bare PILC cable replacement program introduces growing risk for cable failures caused by increasingly aged PILC cables, which could result in a significant partial or total outage to one of Louisville's three downtown grid networks which contain PILC cable. The network could be partially or completely restored only after one or two of the failures were located and repaired, depending on loading. In addition, a lengthy network outage would severely impact downtown central business district customers comprised of metro and federal government agencies (police, security, traffic, etc.), judicial and legal systems, hospitals and medical offices, banking and investment institutions as well as other commercial businesses, including entertainment and tourism.
    3. Next Best Alternative(s):   NPVRR: N/A
        There are no alternatives to a traditional replacement program for extending the useful life of aged and deteriorating PILC cable systems and no reliable and/or practical method for testing the physical or electrical condition of bare PILC cable systems.

Project Description

- **Project Scope and Timeline**

    The 2019 PILC replacement project continues the planned removal and replacement of aged and deteriorating bare PILC secondary and primary cables in the downtown Louisville network distribution system including the projected replacement of more than 16,000 feet of damaged duct line. The project includes the replacement of cable and cable accessories (splices and terminations), the conversion of PILC terminated network transformers, and the necessary maintenance, additions and/or reconstruction of defective duct line and manhole structures. Funding also includes an expected increase in the cost of street restoration associated with duct replacement resulting from more stringent roadway repair requirements implemented by Louisville Metro. Requested 2019 funding allows for the replacement of a projected 10.5 miles of secondary and primary cable.

Electric Distribution attempts to prioritize and schedule PILC replacement based on **Arbough** pedestrian density, historical performance, and asset condition, subject to City of Louisville Public Works planning and permitting. Replacement priorities will focus on secondary PILC cable with bare lead jackets (installed between 1929 and the mid-1960's), followed by primary network cable with bare sheaths (installed between the mid-1910's and mid-1960's).

- **Project Cost**
  The 2019 proposed estimate for this work is $11.949M for duct line and manhole structures assessment, necessary structure additions and rebuilds, cable removal, installation and termination. No contingency is included in the projected cost.

- **Project Progress and Program Projection**
  The PILC Replacement program began in 2013 and is summarized in the following table:

Period (Project #)	Costs Applied (Budget)	Cable Circuit Miles Replaced	Duct line Ft Installed
2013 (#139271)	$1,990,597	1.65	820
2014 (#141195)	$5,833,931	6.57	4,110
2015 (#146442)	$6,050,569	7.07	7,353
2016 (#148497)	$6,274,861	7.24	5,236
2017 (#148739)	$9,290,788	8.27	11,530
2018 (#148899) *Estimated*	$11,333,000	10.5	16,000
2019 (#151486) *Proposed*	$11,949,000	10.5	18,000
Total Program 2013 thru 2019	$52,722,746	51.8	63,049

2019 Expectations:
   o Complete the last remaining portions of secondary grid replacement in the Madison network and shift replacement work to the Waterside grid. The Madison secondary is located in a highly congested area of the hospitals. LG&E is coordinating with the hospitals around this area.
   o Secondary work on Magazine grid complete except for lower priority PILC service and street light taps to be backlogged until the end of the secondary portion of the program.
   o Duct line replacement activity expected to increase above 2018 levels in response to finding significant duct line and manhole deterioration levels in the Network grid, predominantly in the Madison and Waterside networks.

Economic Analysis and Risks

- **Bid Summary**
  No special service contracts are required. The higher cost cable and connector materials are competitively bid and direct shipped to minimize inventory handling burdens.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2019	2020	2021	Post 2021	Total

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$ 558
Contract Labor:	$ 5,898
Materials:	$ 3,576
Local Engineering:	$ 841
Burdens:	$ 852
Transportation:	$ 152
Miscellaneous:	$ 72
Contingency:	$ 0
Reimbursements:	($ 0)
Net Capital Expenditure:	$11,949

- **Assumptions**
  - Cost estimates are based on current knowledge of network assets. Asset quantities affected, costs, and project term will be adjusted as the project progresses.
  - Actual cable replacement quantities in 2019 are subject to net available project funding for cable replacements following necessary duct line and manhole structures work. Additionally, cable replacement quantities could also be affected if funding anticipated for enhanced street resurfacing requirements imposed by the Louisville Metro Council is insufficient.
  - Some work will be performed at night when necessary to minimize traffic congestion on downtown streets during daily business hours.

- **Environmental**

  No additional environmental issues are anticipated beyond the normal lead and cable oil handling and disposal requirements.

- **Risks**

  Failure to proceed with the bare PILC cable replacement program will incrementally increase risks to network system reliability. Delays could compress a planned multi-year replacement program into a shorter term, requiring greater annual manpower and funding levels to address system reliability.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the continuance of the PILC Replacement Project for $11.949M for 2019 in order to ensure the ongoing operating reliability of the Downtown Louisville Network distribution system by the replacement of aged, defective, and deteriorating PILC cable and structural assets.

<u>Approval Confirmation for Capital Projects Greater Than $2 million</u>:

Investment Proposal for Investment Committee Meeting on: <u>December 19, 2018</u>

Project Name: <u>Distribution Wood Pole Inspection and Maintenance Program - 2019</u>

Total Expenditures: <u>$12,278k</u>   (Including $246k of contingency)

Project Number(s): <u>LGE: 19PITP340, KU: 19PITP216, 19PITP156, 19PITP246, 19PITP315, 19PITP766, 19PITP416, 19PITP366, 19PITP236 and 19PITP426</u>

Business Unit/Line of Business: <u>Electric Distribution Operations / Distribution</u>

Prepared/Presented By: <u>John Ashton / Denise Simon</u>

Executive Summary

The Investment Committee approved the Electric Distribution Operations' Distribution Wood Pole Inspection and Maintenance Program on February 24, 2010, with the provision that future year investments in the program be presented and approved annually. The purpose of this Investment Proposal is to obtain 2019 program funding authority from the Investment Committee. The 2019 program scope is focused on providing a detailed pole inspection; preservative re-treatment and load analysis of approximately 65,000 poles and reinforcement or replacement of structures found to be defective. The program projections for 2019 include replacement of approximately 2,300 defective poles and reinforcement of 245 poles.

The other option considered is to only inspect on the 2-year KPSC required inspection cycle. This type of inspection is not rigorous enough to adequately identify at-risk poles, does not inspect for ground line rot and does not include pole loading calculations. Foregoing a pole inspection and treatment program dependent only on the regulatory cycle inspections will result in decreased life of the assets, increase pole failures and associated outages.

The 2019 Business Plan (BP) includes $12,278k for this program in 2019.

Background

The Distribution Wood Pole Inspection and Maintenance Program was implemented in 2010. By year end 2018, approximately 497,000 poles will have been inspected, 154,000 poles will have been treated, 19,000 poles will have been replaced and 1,400 poles will have been reinforced by splinting. Cumulative spend from 2010-2017 is $78.3 million with the 2018 forecasted spend at $11.9 million.

EDO has more than 516,000 distribution wood poles in the asset base with an estimated average age of 30 years. An additional 156,000 foreign-owned poles have LG&E and KU attachments.

Wood poles are initially treated with a preservative during processing to extend the life of the pole. The effectiveness of the initial preservative treatment declines with age. Wood poles become more susceptible to deterioration from fungal decay and insect damage. In most cases, the decay is difficult to detect because it occurs out of sight just below the ground-line where conditions of moisture, temperature and air are most favorable for growth of fungi. Ground-line is also the point of maximum loading stress for a pole.

In addition to the wood pole inspection program, distribution poles receive an inspection every two years in accordance with KPSC requirements. During these inspections, only a small percentage of poles are inspected near ground-line or tested to detect internal decay. No poles are excavated to inspect below ground-line which is critical for detecting decay. Continuing the wood pole inspection program as proposed will enhance the ability to detect decay and extend the life of the treated and reinforced poles.

A survey of utilities confirms that the industry typical program generally involves inspecting and applying a supplemental treatment to the ground-line area on every pole. The supplemental treatment arrests any decay present and can significantly increase the useful life of the pole at a very small cost relative to the cost to replace a pole. One industry study indicates the predicted pole life with no remedial treatment is 32.5 years compared to a predicted pole life of greater than 50 years for poles with remedial treatment.

By associating historical pole failure outage data with previously completed PITP circuits, there is an annual SAIDI and SAIFI benefit of 0.53 minutes and 0.002 interruptions per customer, respectively, through the Pole Inspection and Treatment Program.

EDO's program is "condition based," such that the level of inspection and re-treatment is dependent on each pole's actual condition. The use of a "condition based" approach provides a cost effective strategy to inspect and re-treat poles. Inspection will include above and below grade evaluations. Re-treating and load analysis will only be performed on the poles that indicate a need. The program entails a progressive level of inspection for each pole and re-treatment only when necessary. In conjunction with the pole inspection, pole loading will be assessed. Any pole found to be loaded beyond acceptable limits will be reinforced or replaced. Joint-use poles not owned by LGE and KU will only receive a loading analysis.

The estimated 2019-2023 capital costs included in the 2019BP are shown below. This proposal only requests funding for 2019.

	2019	2020	2021	2022	2023
Amount in 000s	$12,278	$12,646	$13,025	$13,416	$13,818

- **Alternatives Considered**

  1. Recommendation: NPVRR: ($000s) $16,136

  2. Alternative #1:   NPVRR: ($000s) $38,307
     Electing not to continue the PITP program would result in an increase in pole failures and outages. The NPVRR shown is the combination of the investment to replace poles as they fail rather than proactively (capital costs of $10,355k), and the resulting cost of unserved energy from these failures (costs of $27,001k). Projections indicate approximately 2,300 poles will be replaced as part of the PITP program during 2019. Without remedial actions, these 2,300 poles are projected to fail within 2 years. The cost of unserved energy was calculated using the projected number of pole failures over the next two years along with the 5-year average outage duration of preventable, pole-related failures. During a pole-failure outage, the time required to restore the outage is nearly 2.5 times longer than that of an outage taken for planned pole replacement work.

Project Description

- **Project Scope and Timeline**
  - The 2019 pole inspection and treatment program will begin in January of 2019. Inspection crews will plan to complete work in 9 months. Pole replacement crews will begin work in January and work through December of 2019. This program covers distribution poles only. Transmission poles are covered under a separate inspection program.

- **Project Cost**
  - The total estimated capital project cost for 2019 is $12,278k and $65,183k over the BP period of 2019-2023.

  - A capital contingency of 2% for the program is included to cover any variables that may deviate from the business plan projections (i.e. higher pole reject rates and miscellaneous costs such as ground-wire repairs).

Economic Analysis and Risks

- **Bid Summary**
  - The inspection and treatment work is completed by ███████████████████ ████████████████████████ The contract was approved at the November 2014 Investment Committee and will expire December 31, 2019.

  - Pole replacements will be performed by contract labor under currently approved contracts and unit prices. The wood poles used will be purchased under an existing contract for wood poles.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2019	2020	2021	Post 2021	Total
1. Capital Investment Proposed	10,949	-	-	-	10,949
2. Cost of Removal Proposed	1,329	-	-	-	1,329
3. Total Capital and Removal Proposed (1+2)	12,278	-	-	-	12,278
4. Capital Investment 2019 BP	10,949	-	-	-	10,949
5. Cost of Removal 2019 BP	1,329	-	-	-	1,329
6. Total Capital and Removal 2019 BP (4+5)	12,278	-	-	-	12,278
7. Capital Investment variance to BP (4-1)	-	-	-	-	-
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	-	-	-	-	-

Financial Detail by Year - O&M ($000s)	2019	2020	2021	Post 2021	Total
1. Project O&M Proposed	506	-	-	-	506
2. Project O&M 2019 BP	506	-	-	-	506
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The 2019 Business Plan includes this funding in projects 123136 and 123137 in the Reliability department. The projects listed on page 1 are the specific projects (in the applicable operations centers' departments) for which approval is requested. Funds will be moved from the budgeted projects to the specific operations center projects through the Corporate RAC process.

Financial Summary ($000s):

Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$ 0
Contract Labor:	$ 9,323
Materials:	$ 1,278
Local Engineering:	$ 1,098
Burdens:	$ 333
Contingency:	$ 246
Reimbursements:	($ 0)
Net Capital Expenditure:	$12,278

- **Assumptions**
  o Estimates are based on field experience from EDO inspections during the first nine years of the pole inspection and treatment program.

  o A minimal number of poles associated with structure loading will be replaced and the associated cost can be managed within existing funding.

- **Environmental**
  - There are no environmental issues. Chemicals used for the re-treatment of wood poles are EPA approved and will be applied by qualified contractors licensed for their application.

- **Risks**
  - Actual rejection rates could be greater than those experienced in previous years of the program resulting in the need for additional funding or an extended cycle to complete the program.

  - Average cost to replace a pole could increase significantly if the majority of rejects are located in metro areas.

Conclusions and Recommendation   Arbough

EDO recommends the Investment Committee approve continuation of the Distribution Wood Pole Inspection and Maintenance Program, and authorize 2019 investments of $12,278k for the project. The program continues to enhance the life of EDO wood pole assets and contribute to improved reliability performance for customers.

<u>Approval Confirmation for Capital Projects Greater Than $2 million</u>:

Investment Proposal for Investment Committee Meeting on: March 29, 2017

Project Name: Richmond North Substation

Total Expenditures: $5,920k (includes $538k contingency)

Project Number(s):   Substation- 148710, Distribution- 152792, Transmission- 137752

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Jim Burns/Kevin Patterson

Executive Summary
Electric Distribution Operations (EDO) - Electrical Engineering and Planning (EEP) seeks funding authority to construct a new Richmond North 12kV Substation on property acquired in late 2016. The new substation, planned along US 25 approximately one mile north of the Interstate 75 crossing at Exit 90, is required to meet existing and future service needs of customers on the north side of Richmond, KY in Madison County. Red House Substation, located approximately seven miles north of Richmond, serves 1,002 customers and is forecasted to exceed Distribution System Planning's allowable winter loading limit of 120% of the transformer's 14MVA nameplate rating during the 2018/2019 winter. This project addresses the forecasted overload at Red House Substation and also provides relief for Richmond Substation's circuit 2325 and Richmond Substation 069-5 transformer. Circuit 2325 is one of two tie circuits between Richmond and Red House Substations and serves 2,242 customers. Circuit 2325 was loaded to 90% of its conductor capacity during the winter of 2014/2015 and transformer capacity, small wire, and distance limit the ability to transfer load between Red House and Richmond Substations. Load relief for the Richmond Substation 069-5 transformer will defer a transformer upgrade project planned as a 2022/2023 project. This Investment Proposal provides for the construction of a new substation between Red House and Richmond Substations and associated circuit improvements to address transformer and circuit overloads while adding capacity and contingency to serve future load growth in the area. This project also removes two Richmond Substation transformers from the Company's "Distribution Substation Transformer Contingency Program (N1DT)" list (transformers that cannot be fully backed up for a failure of the substation transformer during high load periods during the year).

Approval is requested in the amount of $5,920k ($2,739k-2017, $3,181k-2018) to complete the construction of the new Richmond North Substation to meet existing and future service requirements and remove two distribution transformers from the N1DT Contingency Program List. Project completion is expected in December 2018. A total of $5,743k has been budgeted for this project including $4,816k ($2,200k-2017, $2,616-2018) in the 2017 EDO Business Plan (BP) and $927k ($234k-2017, $693k-2018) in the 2017 Transmission BP. The Corporate RAC has approved funding for 2017 expenditures for completion of a portion of the distribution circuit work. The remaining funding differences will be addressed in the 2018 BP.

Background

Red House 12kV (687-1) Substation consists of a 14MVA, 69-12kV transformer and three distribution circuits. It is located approximately seven miles north of Richmond, KY in northern Madison County and serves 1,002 customers, including commercial customers surrounding Exit 95 (Boonesboro Road) and Exit 97 (Clays Ferry) on Interstate 75. During the winter of 2014/2015, the Red House Substation transformer experienced actual loading of 128% of its 14MVA nameplate rating. The substation is forecasted to reach 121% under normal winter conditions during the winter of 2018/2019, exceeding Distribution System Planning's allowable winter loading limit of 120%. Richmond Substation consists of two 22.4MVA 69-12kV transformers and 5 distribution circuits.

Richmond Substation is located on the northwestern edge of the city of Richmond in Madison County and serves 3,914 customers. The Richmond 069-5 transformer reached 119% of its 22.4MVA nameplate rating during winter 2014/2015 but is not forecasted to exceed 120% of nameplate until winter 2023/2024. Circuit 2325, a circuit fed by Richmond's 069-5 transformer serves 2,242 customers and 14,000' of this circuit reached 90% of its 397kCM ACSR winter rating of 866 amps during the winter of 2014/2015. Richmond 069-5 and the Red House transformer are tied by two separate circuit routes. Due to conductor capacity and voltage concerns resulting from long circuit distances, these two tie circuits can provide only limited load transfers and contingency, and only during light loading conditions. Red House and both Richmond transformers cannot be backed up during heavier loading periods in the event of a transformer failure which places them on the N1DT Contingency Program list.

Several alternatives were evaluated to relieve existing and pending loading issues in the Richmond area, including multiple projects to independently target transformer and circuit improvements. Capacity addition at Red House was determined to not be optimal due to the small station footprint where additional space necessary for expansion is owned by an uninterested seller. Substation and circuit improvements at Richmond would have allowed load to be transferred from Red House to Richmond. This option would have addressed future overloads at Richmond Substation and on Circuit 2325 while providing transformer contingency at Richmond, but due to limits on the amount of load that could transferred it would only provide near term relief for loading issues at Red House. The least cost solution was determined to be the construction of a new substation positioned between the two substations to address loading issues at both Red House and Richmond Substations while removing two transformers at Richmond Substation from the N1DT Contingency Program list. The desired location for a new substation was determined to be in the area of US 25 north of the Interstate 75 crossing at Exit 90. This would place the substation between Richmond and Red House Substations and in close proximity to Richmond circuit 2325 and an existing KU 138kV transmission line. In late 2016/early 2017, KU purchased a suitable site along US 25 for the new circuit on Project #148251 for $230k. Once constructed, the new substation will eliminate all pending overloads and provide capacity for future growth along interstate 75 (Exits 90, 95 and 97) and US 25. This project also enhances contingency and reliability in the area and provides year round contingency for two Richmond Substation transformers.

The recommendation of this investment proposal is to construct a short transmission extension off the KU Fawkes to Clark County 138kV transmission line to serve a new delivery point, construct a new 138-12kV, 37MVA substation and upgrade 15,700' of 2/0 ACSR to 795kCM ACSR. This will

eliminate all overload conditions, relieve loading on the Richmond 069-5 transformer and provide full contingency for both Richmond Substation transformers.

A Transmission Service System Impact Study for a new service point on the Fawkes to Clark County 138kV line has been completed by TranServ. A Facilities Study has also been completed with no additional transmission improvements identified beyond the cost to serve the new station.

- **Alternatives Considered**

1. Recommended Option: NPVRR: $6,861k

   The recommended option is to construct a short transmission line extension to serve a new 138-12kV, 37MVA substation north of Richmond, including substation structures, one 2000 amp main breaker, two 1200 amp line breakers, one 138kV breaker and two 138kV MODs. Replace 15,700' of 2/0 ACSR three phase conductor with 795kCM Aluminum to provide tie circuits from the recommended Richmond North Substation to the Red House and Richmond 069-5 Substations. This provides capacity to relieve all area pending and near term loading issues, provides capacity for new growth, provides full year contingency capacity for the Richmond 069-5 and 069-6 transformers and improves contingency for Red House Substation. Both Richmond transformers are currently on the Company's N1DT Contingency Program List where a portion of customers would remain out of service for up to 24 hours in the event of a transformer failure or outage. The estimated total capital cost of this option is $5,920k.

2. Do Nothing Option: NPVRR: N/A

   KU has an obligation to serve all customers and associated load. The "do nothing" option is not considered an acceptable option because it exceeds Distribution System Planning's operating limits for distribution substation power transformers, and this practice reduces the life of the substation transformer and elevates the risk of failure of a high value, critical asset.

3. Alternative 1:   NPVRR: $17,032k

   Upgrade Red House Substation from 14MVA to 22.4MVA and reconductor 14,000' of Richmond circuit 2325 from the substation northward from 397kCM ACSR to 795kCM Aluminum in 2017/2018. This project addresses the pending overload of the Red House transformer and the pending overload on Richmond circuit 2325. However, this alternative is not recommended because it results in a less reliable and flexible system, provides less new capacity to the system and provides no contingency for the loss of either of the two transformers at Richmond substation. Failure of either of the heavily loaded Richmond substation transformers would result in an extended outage of up to 24 hours for a large number of customers until a new transformer or mobile transformer could be installed. While the loss of a substation transformer is a relatively low probability event in any given year, planning studies indicate an outage of the Richmond 069-5 transformer at peak would cause as much as 14,493kW of load to go unserved and the loss of the Richmond 069-6 transformer would cause as much as 12,415kw of load to go unserved. Using the corporate "Cost of Unserved Energy" ($17.2/kWh) with estimated load at risk going unserved at peak for 24 hours, the Cost of Unserved Energy would total $11,107k. The estimated annualized Cost of Unserved Energy based on an annual 5% probability of an outage on either transformer is $555k. The estimated capital cost of this option is $5,155k.

Project Description

- **Project Scope and Timeline**
  - Substation Project #148710: Install a 37MVA, 138-12kV transformer on property acquired in 2016 under a separate project. This estimate includes funds for labor, equipment, material, and wildlife protection for a 37MVA transformer, substation steel structure, one 15kV, 2000A main breaker, two 15kV, 1200A line breakers, one 138kV transformer breaker and two 138kV MOD's. The total estimated substation cost is $4,130k.
    - Apr-Dec 2017: Complete engineering and design. Order all material and equipment. Receive material and equipment. Begin site preparation and foundations.
    - Jan-Dec 2018: Complete foundations and install transformer, steel, breakers and all associated materials and equipment. Install control house, SCADA communications and perform final check out and commissioning.
    - Dec, 2018: Energize new substation.
  - Distribution Project #152792:   Reconductor 15,700' of 2/0 ACSR conductor with 795 Aluminum. The total estimated distribution cost is $942k.
    - Feb-Dec, 2017: Design and complete 5,200' distribution circuit construction.
    - Jan-Dec, 2018: Design and complete 10,500' distribution circuit construction.
  - Transmission Project #137752:   Install new 138kV line structures and line extension to serve the new substation. The total estimated transmission cost is $848k.
    - Jan-Dec, 2017: Complete design and order poles, conductor and materials.
    - Jan-Dec, 2018: Complete construction of 138kV tap to new substation.

- **Project Cost**
  The total estimated cost of the Richmond North 12kV Substation project is $5,920k. The transmission, substation and distribution cost estimates are consistent with the "Conceptual Level 1" engineering design designation. There is an estimated 10% of contingency ($538k) incorporated into the project cost estimates to address any unexpected costs.

 Economic Analysis and Risks

- **Bid Summary**
  - Substation Engineering and Design will use established Engineering Procurement and Construction Management (EPCM) contracts to augment engineering and construction management resources as required.
  - Transmission and Distribution Lines will use existing material and labor contracts and follow established Supply Chain procedures. KU Company crews will be utilized based on availability at the time of work.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total
1. Capital Investment Proposed	2,739	3,165	-	-	5,904
2. Cost of Removal Proposed	-	16	-	-	16
3. Total Capital and Removal Proposed (1+2)	2,739	3,181	-	-	5,920
4. Capital Investment 2017 BP	2,434	3,309	-	-	5,743
5. Cost of Removal 2017 BP	-	-	-	-	-
6. Total Capital and Removal 2017 BP (4+5)	2,434	3,309	-	-	5,743
7. Capital Investment variance to BP (4-1)	(305)	144	-	-	(161)
8. Cost of Removal variance to BP (5-2)	-	(16)	-	-	(16)
9. Total Capital and Removal variance to BP (6-3)	(305)	128	-	-	(177)

Financial Detail by Year - O&M ($000s)	2017	2018	2019	Post 2019	Total
1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2017 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The Corporate RAC approved the incremental funding in 2017. The 2018 BP will reflect the net reduction in 2018.

Financial Summary ($000s):

Discount Rate: 6.5%
Capital Breakdown:
  Labor: $ 182
  Contract Labor: $2,015
  Materials: $2,408
  Local Engineering: $ 498
  Burdens: $ 250
  Contingency: $ 538
  Transportation: $ 29
  Reimbursements: ($ 0)
  Net Capital Expenditure: $5,920

- **Assumptions**
  - Substation load growth will be consistent with the company's distribution System Planning load forecast.
  - The project unknowns will not exceed the estimated contingency amounts.
  - The project will be completed in time to serve a winter 2018/2019 peak demand.

o No significant unknown costs for transmission improvements beyond the line extension to the new substation will be associated with the addition of a new service point.

- **Environmental**
  There are no known environmental issues at this time.

- **Risks**
  Failure to complete this project before winter 2018/19 could result in the overload and failure of the Red House Substation transformer and an extended outage for up to 1,002 customers and/or the overload and failure of Richmond circuit 2325 and an extended outage for up to 2,242 customers.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Richmond North Substation Project for $5,920k to eliminate a forecasted overload of the Red House Substation transformer and a future overload of the Richmond 069-5 Substation transformer and circuit. The project also provides for adequate capacity for future load additions in the Richmond and Red House areas, improves reliability and removes the Richmond 069-5 and 069-6 transformers from the N1DT Contingency Program list.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for October Investment Committee E-mail Vote

Project Name: ███████ DB Server Refresh

Total Expenditures: $2,144K ($0 contingency)

Project Number(s): IT0366B

Business Unit/Line of Business: IT Infrastructure

Prepared/Presented By: Tom Sager

Executive Summary

This project will refresh the ███████ Database (DB) servers in conjunction with the ███ Business Warehouse (BW) on ██████ upgrade. The server refresh is necessary to provide security of customer data due to the desupport of the existing BW platform. Efficiencies are gained by combining the refresh of existing ██████ DB servers with the acquisition of new ██████ DB servers for the ███ BW upgrade.

This IP is seeking approval of $2,144k of Capital (includes $0k contingency because of fixed pricing from vendor) for this upgrade effort. The project was approved by the Corp RAC in the 8+4FC. It was not included in the 2018 BP due to the assumption the AMS project would be approved, which would have covered the ██████ DB server refresh.

Background

████ BW is older technology running on out-of-date hardware (BW Accelerators) that is no longer manufactured. Obtaining spare parts will become increasingly difficult. ██████ direction with BW is ██████ (rather than current █████ DBs and ████ BW Accelerators). LKE has already migrated other ████ components to ██████ DB with server hardware purchased in 2015. This hardware is due for retirement by 2020. However, if not retired until then, the BW project will require more servers than would otherwise be needed if LKE refreshes the existing ████ ██████ DB infrastructure now. The combination of refresh and new capacity for BW is a more efficient use of resources than separate acquisitions in different years.

- **Alternatives Considered**
    1. Recommendation (12 servers: 8-6TB+4-3TB)   NPVRR: ($000s) 2,366
    2. BW now and refresh in 2020   NPVRR: ($000s) 2,651
    3. Do nothing - is not considered a viable alternative because the BW system would be unsupported by ████, risking security of customer data.

Other alternatives considered involve more servers than the recommendation made above, thus all higher cost. Analysis of workloads, resources and environments indicate the recommendation above is optimal.

- 12 Servers (12-6TB)
- 14 Servers (8-6TB+6-3TB)
- 16 servers (8-6TB+8-3TB)

Project Description

- **Project Scope and Timeline**
  This project will implement new ▮▮▮▮▮▮▮▮DB servers to house LKE's entire ▮▮▮▮▮ environment. It includes the following primary phases:
  - Finalize contract/P.O. and schedule installation services
  - Technical design
  - Install and configure

  This project will be initiated in October 2018 and will be completed by the end of 2018.

- **Project Cost**
  The total capital cost of this project is $2,144K and incremental O&M of $51K.

Economic Analysis and Risks

- **Bid Summary**
  An RFQ was placed with three manufacturers (▮▮▮▮▮▮▮▮▮▮▮▮) in October 2018. The ▮▮▮▮▮▮ quote was lowest cost. Therefore we plan to award the bid to ▮▮▮▮▮▮

Revised Capital Investment Proposal   **Arbough**

Revised Investment Proposal for Investment Committee Meeting on: November 28, 2018

Project Name: Solar Share Program

Total Approved Expenditures: $643k (Approved on 04/30/2018)
Total Additional Expenditures Requested: $2,232k
Total Combined Expenditure: $2,875k (Compared to $2,341k approved in December 2016)

Project Number(s): 158286, 158287, 158336, 158337

Business Unit/Line of Business: Customer Services

Prepared/Presented By: Lisa Keels/David Huff

Reason for Revision

This project requests project sanction approval to build the first 500 kW (DC) facility and common facilities of the 4MW (DC) Photo-Voltaic (PV) solar array (Solar Share Program Phase I Contract). The full scope of the Solar Share Program was presented to the Investment Committee in December 2016 (Exhibit B attached).

The value of the initial request is included in the original Investment Proposal. See Exhibit B for the fully approved original Capital Investment Proposal.

As of July 1, 2018, 100% of the available shares have been subscribed as required to construct the first 500kW (DC) solar array (Phase I). The recently approved tariff changes eliminated the need to invoice customers for the enrollment fee. Additionally, the closing on the land purchase concluded on June 26, 2018 (as approved by the Investment Committee in April 2018). See Exhibit B for that Investment Proposal.

A competitive bid was conducted for the construction of the first array and the site common facilities. ▮▮▮▮▮▮▮▮▮▮▮ is the best evaluated bidder based on price, schedule, safety and experience. The estimated contract award value of $1,350k plus a 10% management contingency is included in the project sanction request.

Approval to offer Community Solar to our customers was granted by the Kentucky Public Service Commission in November 2016. Building the first array will confirm our commitment to the incorporation of renewable options as offerings to our customers.

Subsequent solar share arrays on this property will be initiated upon gaining additional customer subscriptions. The location of the first array on the Solar Share site will be optimized to increase

the visibility of the first array from Highway 64 to support the continued effort of attracting customers and increasing awareness required to support growth in this community solar project.

Economic Analysis and Risks

Financial Summary ($000s):	Requested
Discount Rate:	6.59%
Capital Breakdown:	
Labor:	$115
Contract Labor and Materials:	$1,914
Contingency:	$203
Reimbursements:	($0)
Net Capital Expenditure:	$2,232
NPVRR:	$2,549

Subcontractor/Department	Cost Components	Amount ($000s)
Solar General Contractor	Panels, Inverters, Racking, Ongoing Maintenance (Includes Subsurface Rock Contingency)	$ 835
	EPC Bid Common items	$ 515
	EPC Contract Value	$ 1,350
Security	Card Readers and Annual Service Plan, 2 additional cameras on PDC (one on each door)	$ 78
Distribution Operations	Upgrade circuit from site to US-60, Air Break Switch, Regulators, 1.5 MW XFMR	$ 365
Telecom/IT	Fiber Infrastructure from Site to US-60	$ 121
Engineering/Construction Management	PE Project Management	$ 115
	Total without Contingency	$ 2,029
Contingency	Contingency	$ 203
	Total array 1 and common requested amount	$ 2,232
Real Estate & Right of Way	Land - 35 Acres Total	$ 643
	Total including Land	$ 2,875

In December 2016, the Investment Committee approved the costs associated with construction of the first array totaling $2,341k (including the purchase of the land) contingent upon full subscription. This revised proposal includes only the construction of the first 500kW solar array, extended access road, enhanced data collection, full fencing of the property, and the first phase of common structures (i.e. security).

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Arbrough
1. Capital Investment Proposed	100	2,132	-	-	2,232
2. Cost of Removal Proposed	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	100	2,132	-	-	2,232
4. Capital Investment 2019 BP	1,172	919	914	4,039	7,044
5. Cost of Removal 2019 BP	-	-	-	-	-
6. Total Capital and Removal 2019 BP (4+5)	1,172	919	914	4,039	7,044
7. Capital Investment variance to BP (4-1)	1,072	(1,213)	914	4,039	4,812
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	1,072	(1,213)	914	4,039	4,812

Financial Detail by Year - O&M ($000s)	2018	2019	2020	Post 2020	Total
1. Project O&M Proposed	-	105	20	56	181
2. Project O&M 2019 BP	-	105	121	465	691
3. Total Project O&M Variance to BP (2-1)	-	-	101	409	510

2019 BP amounts above for both Capital and O&M reflect not only the construction of the first phase of common structures and first solar array, but also construction and maintenance costs of the remaining seven solar arrays and the second phase of common structures.

Conclusions and Recommendation
It is recommended that the Investment Committee approve this Revised Investment Proposal for the Solar Share facility build for $2,232k to ensure customer engagement and timely execution of the array construction.

Approval Confirmation for Capital Projects Greater Than $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake Date	Paul W. Thompson Date
Chief Financial Officer	Chairman, CEO and President

Appendix:

Exhibit A

Capital Investment ($000s)		LG&E	KU	Total
Year 1	Land	$ 283	$ 360	$ 643
Year 2	Common & Array 1	982	1,250	2,232
Year 3	Array 2	455	580	1,035
Year 4	Array 3	455	580	1,035
Year 5	Array 4	455	580	1,035
Year 6	Array 5	457	581	1,038
Year 7	Array 6	457	581	1,038
Year 8	Array 7	457	581	1,038
Year 9	Array 8	457	581	1,038
	Total Capital:	**$ 4,458**	**$ 5,674**	**$ 10,132**

*Assumed 44% LG&E / 56% KU for all assets.
*"Land" and "Common" costs are distributed over the entire 8 arrays.
E.g. The costs incurred during construction of Array 1 are larger than the costs attributed to Array 1, because a portion of those incurred costs are assigned to subsequent arrays.
* Project costs have increased since the original version due to the inclusion of stores burden on all materials.
* Costs for Arrays 2-8 are based on the originally submitted estimate as each will need to be bid separately as they are fully subscribed.

Exhibit B

Investment Proposal for Investment Committee Meeting on: November 29, 2016

Project Name: Solar Share Program

Total Capital Expenditures Requested: $2,341k

Total Capital Expenditures Projected: $9,802k (total project including $625k contingency)

Project Number(s): To be determined once arrays are fully subscribed

Business Unit/Line of Business: Customer Services

Prepared/Presented By: Jay Robertson/Jeff Myers/David Huff

Executive Summary

The Companies received an order from the KPSC approving the application to develop a "community" solar facility along I-64 in Simpsonville, KY (PSC Case No. 2016-00274). The subscription-based Solar Share Program will include constructing a regional facility up to 4MW (DC) for the utilities' residential and business customers interested in receiving solar energy credits generated from the facility. Solar Share facilities will be built in 500 kilowatt sections based on customer demand. Construction will begin once a 500 kilowatt section is 100% subscribed. Likewise, construction on subsequent sections will require all previous facilities plus the next facility to be at 100% subscription before each section is built.

This program is for customers who want access to solar, but prefer to avoid the space, up-front cost and maintenance requirements associated with a private system. Customers will be able to subscribe to 250-watt (DC) increments in the solar facility. The cost of participating in the program includes a non-refundable subscription fee of $40, as well as a non-levelized monthly capacity fee of $6.29 per 250-watt increment. Customers will receive a credit on their monthly bill for the solar energy generated based on the variable cost of production and their subscription level.

This program was largely borne of customer demand. Market research shows that customers in Kentucky and across the country are demanding access to solar energy. Business Development professionals have stated the importance of access to renewable energy in attracting great companies to the state. This project has the potential to expand access to renewable energy in our service territories while keeping generation assets within the company.

The total capital cost of this project is $9.8M, spent in phases triggered by customer demand. The first phase is cost-heavy due to the shared infrastructure that will need to be constructed during the project onset. $3.0M per year in capital is included in the 2017 Business Plan (BP) through 2021.

Background

The Company has performed internal market research and consulted external reports that indicate there is significant public interest in having the Companies offer a renewable energy program like the proposed Solar Share Program. This includes interest concerning state-wide economic development efforts, meeting the needs of businesses that have set corporate renewable energy-supply targets, and perhaps most importantly, regional public authorities, commercial, and residential customers continue to express great interest in alternative energy supply options. The expected benefits of completing this project are increased customer satisfaction across customer classes and an improved landscape for state-wide economic development.

This project is not required to ensure compliance with industry/environmental regulation, address potential safety issue or address an immediate operational issue. However, this project could be an asset for future federal restrictions on fossil fuel generation.

- **Alternatives Considered**
    1. Recommendation: NPVRR: $894k
    2. Alternative #1: Do nothing   NPVRR: N/A
       Do Nothing has not been considered at this time as the Company has received KPSC approval to proceed with this project, which is driven by customer demand.

Project Description

- **Project Scope and Timeline**

    This project plans to purchase a 35 acre property in Simpsonville, KY for the construction of up to 4MW (DC) of PV solar. The solar array will be built in 500kW (DC) sections based on customer demand. The proposed solar facility No. 1 will include Canadian Solar PV panels, Solectria PVI60TL inverters, and an RBI ground mount fixed-tilt racking system. Other components to the solar array include switchgear, production monitoring equipment, and a contracted maintenance plan. External to the solar generating and associated equipment, the project budget also includes allotments for distribution upgrades to the site, security measures (fencing, cameras, access card readers, trespassing detection system), landscaping, transformers, network infrastructure, and environmental permits.

    The project will be built in up to eight 500kW sections. Assuming customer subscriptions start by the end of 2016, the first section can be initiated at the beginning of 2017 and completed in Spring 2017. Subsequent sections will be initiated upon customer subscriptions. The construction timeline for sections 1 and 5 (when common facilities such as fencing and transformers will be installed) is expected to be four months each. The other 6 sections are expected to take one month each. If customer subscriptions allow for multiple sections to be built at once, the combined timeline could be compressed.

The company has experience completing a 14MW (DC)/10MW (AC) array at E.W. Brown in 2016. Key project team members who worked on the Brown Solar Facility have been consulted and their experience has been vital to the successful design of this project.

The technology installed has been proven. This project plans to incorporate silicon chrystalline-based photovoltaic panels and string inverters.

The system electrical engineering design has been completed by ████████████████ In addition, LG&E-KU engineers have completed the design of distribution upgrades and studied how this installation will affect the circuit and substation to which it is interconnected.

- **Project Cost**
  The total project capital cost is expected to be $9.8M. Cost incurred during construction of Facility No. 1 is expected to be $2M. Cost incurred during construction of Facility No. 2 is expected to be $1.1M. Cost incurred during construction of subsequent 500kW sections, other than Facility No. 5, is expected to be $834k. Cost incurred during construction of Facility No. 5 is expected to be $2.1M. Refer to the appendix for the breakdown of costs on a cash-flow basis and how they are attributed to each facility and common facilities (which are spread evenly over all sections.) The program is specifically designed so that customers participating in the program will bear the cost of the program. This project is designed to be self-funding.

  A contingency of $625k was calculated as a function of the distribution, substation, and transmission upgrades, and an amount for miscellaneous charges as determined through evaluation of similar company projects. Other than distribution, substation, and transmission upgrades, the majority of the project was bid as contracted amounts.

  The main element of this construction project will be contracted through ████████████ ████ ███ won a competitive bid process via a lump sum proposal of generic PV solar projects. The proposed cost for this specific solar facility is in line with the generic bid submitted by ███ during the RFP process. The auxiliary costs of this project are compiled from a variety of departments and a number of existing contracts.

Economic Analysis and Risks

- **Bid Summary**

MBE/WBE		
Experience		
Responsiveness		
Unit Cost ($/watt)		

The Companies accepted proposals from six companies in early 2016 – ████████████ ████████ in addition to the three finalists listed above. The proposals were written

around four generic solar projects as the contract will be used to construct our Business Solar arrays in addition to the Solar Share facilities. ▮▮▮▮▮▮▮▮▮ was chosen based on their experience in projects ranging from 250kW to 500kW, their ability to be responsive to our needs, and their lowest average cost per watt. An award recommendation (attached) was approved in May 2016 for ▮▮▮▮▮▮▮▮▮ for ▮▮▮▮ for the initial phases of this solar project. As the project progresses, if additional contract value is needed, Energy Efficieny and Supply Chain will come back to the Investment Committee for additional approval on the contract.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2016	2017	2018	Post 2018	Total
1. Capital Investment Proposed	580	3,534	3,915	1,773	9,802
2. Cost of Removal Proposed	-	-	-	-	-
3. Total Capital and Removal Proposed (1+2)	580	3,534	3,915	1,773	9,802
4. Capital Investment 2017 BP	-	3,000	3,000	9,000	15,000
5. Cost of Removal 2017 BP	-	-	-	-	-
6. Total Capital and Removal 2017 BP (4+5)	-	3,000	3,000	9,000	15,000
7. Capital Investment variance to BP (4-1)	(580)	(534)	(915)	7,227	5,198
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	(580)	(534)	(915)	7,227	5,198

Financial Detail by Year - O&M ($000s)	2016	2017	2018	Post 2018	Total
1. Project O&M Proposed	80	309	363	653	1,405
2. Project O&M 2017 BP	-	200	45	135	380
3. Total Project O&M variance to BP (2-1)	(80)	(109)	(318)	(518)	(1,025)

Cost incurred to date of $37k, which is a component of the $580k cost listed above. These costs have been categorized as O&M and will be transferred to capital projects once they are approved.

Financial Summary ($000s):

Discount Rate:	6.49%
Capital Breakdown:	
Internal Labor:	$85
Contracted Labor and Materials:	$7,899
Materials:	$457
Land:	$545
Permits:	$57
Local Engineering:	$69
Burdens:	$65
Contingency:	$625
Reimbursements:	($0)
Net Capital Expenditure:	$9,802

Reimbursements do not include the expected customer revenue of $21,323k associated with this project.

- **Assumptions**

  The economic useful life of the program is 25 years.

  Customers subscribing to less than 50kW capacity will have a 12 month commitment to participate in the program. They may increase the number of shares subscribed at any time thus restarting the 12 month commitment; however, they can only make a decrease or end participation every 12 months. Customers subscribing to 50kW or more are required to sign a five year contract. No single customer may subscribe more than 50% of a Solar Share Facility (250kW), and single customers are limited to no more than 500kW total subscription across all Solar Share Facilities.

- **Environmental**

  The project team has coordinated with Environmental Affairs and applied for or received permits for the following:
  - Wetlands Delineation Determination,
  - Endangered Species Study,
  - Cumulative Environmental Assessment,
  - Historic Structures and Archaeological Study, and
  - A railroad crossing permit.

  No issues have been identified from the permitting process to date.

  There is a small wetland on the site, which the proposed construction avoids. No other environmental issues have been identified.

  There is no evidence that the site has been used for anything other than agricultural activities. There are no existing structures on the site.

  There are no air emission or forced outage issues with this project.

- **Risks**

  The major risk related to this project is low customer participation. This risk is mitigated by only building each section of the array once customer subscriptions are confirmed. However, customers subscribing to the program, then leaving after their minimum 12 month commitment could become a burden to the program financials, and ultimately, ratepayers.

  The risk of not completing the project is for customers to go elsewhere for their renewable energy needs. If the Companies do not provide it, customers may build their own arrays or leave the service territory to obtain renewable energy, in which case the Companies lose revenue.

  The Commonwealth's economic development efforts and visibility to site-selection professionals will be improved by having a renewable energy offering like the Solar Share Program available as soon as possible.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the spending request for the initial phases of the Solar Share project for $2,341k based on full subscription for Facility Array 1. Subsequent phases of the project will be presented for approval upon each achieving full subscription as well. The total full project estimate of $9,802k will be updated through the course of the construction program. This project is expected to increase the availability of renewable energy to customers in our service territory and improve customer satisfaction.

<u>Approval Confirmation for Capital Project Greater Than or Equal to $1 million:</u>

The Capital project spending in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Year 3	Array 5	390	496	886
Year 3	Array 6	390	497	887
Year 4	Array 7	390	496	886
Year 4	Array 8	390	497	887
	Total Capital:	**$ 4,313**	**$ 5,489**	**$ 9,802**

*Assumed 44% LG&E / 56% KU for all assets as we do not yet know the ownership percentages of the arrays. Those will be determined once each individual array is fully subscribed.

*"Land" and "Common" costs are distributed over the entire 8 arrays. Eg. the costs incurred during construction of Array 1 are larger than the costs attributed to Array 1, because a portion of those incurred costs are assigned to subsequent arrays.

Revised Capital Investment Proposal   **Arbough**

Investment Proposal for Investment Committee Meeting on: April 25, 2018

Project Name: Solar Share Program

Total Approved Expenditures: $2,341k (Approved on 12/06/2016)

Total Revised Expenditures: $660k

Project Number(s): TBD

Business Unit/Line of Business: Customer Services

Prepared/Presented By: Lisa Keels/David Huff

Reason for Revision

This project requests approval to purchase a 35 acre property in Simpsonville, KY for the construction of up to 4MW (DC) of PV solar. The solar array will be built in 500kW (DC) sections based on customer demand. The full scope of the Solar Share Program was approved by the Investment Committee in December 2016 (see attached for details).

The value of the revised request is included in the original Investment Proposal. See Exhibit B for the fully approved original Capital Investment Proposal.

As of April 1, 2018, nearly 45% of the first solar array has been subscribed. It is anticipated the participation level will maintain and reach the 2,000 subscriptions required to construct the first 500kW (DC) solar array in late 2018 or 2019.

Completing the purchase of the land will reduce the lead time needed to begin construction once the full subscription level is attained, addressing the concerns from early adopters. Subsequent solar share facilities on this property will be initiated upon gaining additional customer subscriptions. Additionally, all options to exercise an intent to purchase the land have been exhausted. As noted in solar share filing 2016-00274, the property currently identified was chosen due to its visibility, price, access and proximity to transmission facilities.

In the event subscription levels are not achieved, the land will be sold at market value.

Financial Summary

Financial Summary ($000s):	Approved	Revised	Explanation
Discount Rate:	6.49%	6.58%	Current rate
Capital Breakdown:			
Labor:	$85	$0	
Contract Labor and materials:	$7,899	$0	
Materials:	$457	$0	
Land	$545	$610	Includes additional purchase options and easements
Permits	$57	$50	
Local Engineering:	$69	$0	
Contingency:	$625	$0	
Reimbursements:	($0)	($0)	
Net Capital Expenditure:	$9,802	$660	
NPVRR:	$894	$986	

The approved amount above includes costs for the full solar project. In December 2016, the Investment Committee approved the costs associated with construction of the first array totaling $2,341k, which includes the purchase of the land, contingent upon full subscription. The approved project capital amount does not include the expected customer revenue of $21,323k as a reimbursement associated with the full solar project. However, the CEM NPVRR calculation does include the customer revenue. This revised proposal includes only the purchase of the land and the NPVRR calculation for this revision does not include customer revenue.

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total
1. Capital Investment Proposed	660	-	-	-	660

4. Capital Investment 2018 BP	1,839	919	914	3,125	6,797
5. Cost of Removal 2018 BP	-	-	-	-	-
6. Total Capital and Removal 2018 BP (4+5)	1,839	919	914	3,125	6,797
7. Capital Investment variance to BP (4-1)	1,179	919	914	3,125	6,137
8. Cost of Removal variance to BP (5-2)	-	-	-	-	-
9. Total Capital and Removal variance to BP (6-3)	1,179	919	914	3,125	6,137

Financial Detail by Year - O&M ($000s)	2018	2019	2020	Post 2020	Total
1. Project O&M Proposed	6	12	12	23	53
2. Project O&M 2018 BP	117	133	149	352	750
3. Total Project O&M Variance to BP (2-1)	111	121	137	328	697

Cost incurred to date of $99k ($60k in 2016 and $39k in 2017), which is a component of the $660k cost listed above, has been charged to O&M and will be reclassified to the capital project once it is approved. 2018 BP amounts above for both Capital and O&M reflect not only the purchase of

the land, but also construction and maintenance costs of solar arrays and common structures (although fencing and security).

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the Solar Share land purchase for $660k to ensure customer engagement and timely execution of the array construction.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

Investment Proposal for Investment Committee Meeting on: November 29, 2016

Project Name: Solar Share Program

Total Capital Expenditures Requested: $2,341k

Total Capital Expenditures Projected: $9,802k (total project including $625k contingency)

Project Number(s): To be determined once arrays are fully subscribed

Business Unit/Line of Business: Customer Services

Prepared/Presented By: Jay Robertson/Jeff Myers/David Huff

Executive Summary

The Companies received an order from the KPSC approving the application to develop a "community" solar facility along I-64 in Simpsonville, KY (PSC Case No. 2016-00274). The subscription-based Solar Share Program will include constructing a regional facility up to 4MW (DC) for the utilities' residential and business customers interested in receiving solar energy credits generated from the facility. Solar Share facilities will be built in 500 kilowatt sections based on customer demand. Construction will begin once a 500 kilowatt section is 100% subscribed. Likewise, construction on subsequent sections will require all previous facilities plus the next facility to be at 100% subscription before each section is built.

This program is for customers who want access to solar, but prefer to avoid the space, up-front cost and maintenance requirements associated with a private system. Customers will be able to subscribe to 250-watt (DC) increments in the solar facility. The cost of participating in the program includes a non-refundable subscription fee of $40, as well as a non-levelized monthly capacity fee of $6.29 per 250-watt increment. Customers will receive a credit on their monthly bill for the solar energy generated based on the variable cost of production and their subscription level.

This program was largely borne of customer demand. Market research shows that customers in Kentucky and across the country are demanding access to solar energy. Business Development professionals have stated the importance of access to renewable energy in attracting great companies to the state. This project has the potential to expand access to renewable energy in our service territories while keeping generation assets within the company.

The total capital cost of this project is $9.8M, spent in phases triggered by customer demand. The first phase is cost-heavy due to the shared infrastructure that will need to be constructed during the project onset. $3.0M per year in capital is included in the 2017 Business Plan (BP) through 2021.

- 1 -

Background

The Company has performed internal market research and consulted external reports that indicate there is significant public interest in having the Companies offer a renewable energy program like the proposed Solar Share Program. This includes interest concerning state-wide economic development efforts, meeting the needs of businesses that have set corporate renewable energy-supply targets, and perhaps most importantly, regional public authorities, commercial, and residential customers continue to express great interest in alternative energy supply options. The expected benefits of completing this project are increased customer satisfaction across customer classes and an improved landscape for state-wide economic development.

This project is not required to ensure compliance with industry/environmental regulation, address potential safety issue or address an immediate operational issue. However, this project could be an asset for future federal restrictions on fossil fuel generation.

- **Alternatives Considered**
  1. Recommendation: NPVRR: $894k
  2. Alternative #1: Do nothing   NPVRR: N/A
     Do Nothing has not been considered at this time as the Company has received KPSC approval to proceed with this project, which is driven by customer demand.

Project Description

- **Project Scope and Timeline**

  This project plans to purchase a 35 acre property in Simpsonville, KY for the construction of up to 4MW (DC) of PV solar. The solar array will be built in 500kW (DC) sections based on customer demand. The proposed solar facility No. 1 will include Canadian Solar PV panels, Solectria PVI60TL inverters, and an RBI ground mount fixed-tilt racking system. Other components to the solar array include switchgear, production monitoring equipment, and a contracted maintenance plan. External to the solar generating and associated equipment, the project budget also includes allotments for distribution upgrades to the site, security measures (fencing, cameras, access card readers, trespassing detection system), landscaping, transformers, network infrastructure, and environmental permits.

  The project will be built in up to eight 500kW sections. Assuming customer subscriptions start by the end of 2016, the first section can be initiated at the beginning of 2017 and completed in Spring 2017. Subsequent sections will be initiated upon customer subscriptions. The construction timeline for sections 1 and 5 (when common facilities such as fencing and transformers will be installed) is expected to be four months each. The other 6 sections are expected to take one month each. If customer subscriptions allow for multiple sections to be built at once, the combined timeline could be compressed.

The company has experience completing a 14MW (DC)/10MW (AC) array at E.W. Brown in 2016. Key project team members who worked on the Brown Solar Facility have been consulted and their experience has been vital to the successful design of this project.

The technology installed has been proven. This project plans to incorporate silicon chrystalline-based photovoltaic panels and string inverters.

The system electrical engineering design has been completed by ███████████████ In addition, LG&E-KU engineers have completed the design of distribution upgrades and studied how this installation will affect the circuit and substation to which it is interconnected.

- **Project Cost**
  The total project capital cost is expected to be $9.8M. Cost incurred during construction of Facility No. 1 is expected to be $2M. Cost incurred during construction of Facility No. 2 is expected to be $1.1M. Cost incurred during construction of subsequent 500kW sections, other than Facility No. 5, is expected to be $834k. Cost incurred during construction of Facility No. 5 is expected to be $2.1M. Refer to the appendix for the breakdown of costs on a cash-flow basis and how they are attributed to each facility and common facilities (which are spread evenly over all sections.) The program is specifically designed so that customers participating in the program will bear the cost of the program. This project is designed to be self-funding.

  A contingency of $625k was calculated as a function of the distribution, substation, and transmission upgrades, and an amount for miscellaneous charges as determined through evaluation of similar company projects. Other than distribution, substation, and transmission upgrades, the majority of the project was bid as contracted amounts.

  The main element of this construction project will be contracted through ████████████████ ████████ won a competitive bid process via a lump sum proposal of generic PV solar projects. The proposed cost for this specific solar facility is in line with the generic bid submitted by ████ during the RFP process. The auxiliary costs of this project are compiled from a variety of departments and a number of existing contracts.

Economic Analysis and Risks

- **Bid Summary**

MBE/WBE			
Experience			
Responsiveness			
Unit Cost ($/watt)			

The Companies accepted proposals from six companies in early 2016 – ████████████████ ████████████ in addition to the three finalists listed above. The proposals were written

around four generic solar projects as the contract will be used to construct our Business ██████
arrays in addition to the Solar Share facilities. ████████████████ was chosen based on
their experience in projects ranging from 250kW to 500kW, their ability to be responsive to
our needs, and their lowest average cost per watt. An award recommendation (attached) was
approved in May 2016 for ████████████████ for ███████ for the initial phases of this
solar project. As the project progresses, if additional contract value is needed, Energy
Efficieny and Supply Chain will come back to the Investment Committee for additional
approval on the contract.

9. Total Capital and Removal variance to BP (6-3)	(580)	(534)	(915)	7,227	5,198

Financial Detail by Year - O&M ($000s)	2016	2017	2018	Post 2018	Total
1. Project O&M Proposed	80	309	363	653	1,405
2. Project O&M 2017 BP	-	200	45	135	380
3. Total Project O&M variance to BP (2-1)	(80)	(109)	(318)	(518)	(1,025)

Cost incurred to date of $37k, which is a component of the $580k cost listed above. These costs
have been categorized as O&M and will be transferred to capital projects once they are approved.

Financial Summary ($000s):
Discount Rate: 6.49%
Capital Breakdown:
   Internal Labor: $85
   Contracted Labor and Materials: $7,899
   Materials: $457
   Land: $545
   Permits: $57
   Local Engineering: $69
   Burdens: $65
   Contingency: $625
   Reimbursements: ($0)
   Net Capital Expenditure: $9,802

Reimbursements do not include the expected customer revenue of $21,323k associated with this
project.

- **Assumptions**

  The economic useful life of the program is 25 years.

  Customers subscribing to less than 50kW capacity will have a 12 month commitment to participate in the program. They may increase the number of shares subscribed at any time thus restarting the 12 month commitment; however, they can only make a decrease or end participation every 12 months. Customers subscribing to 50kW or more are required to sign a five year contract. No single customer may subscribe more than 50% of a Solar Share Facility (250kW), and single customers are limited to no more than 500kW total subscription across all Solar Share Facilities.

- **Environmental**

  The project team has coordinated with Environmental Affairs and applied for or received permits for the following:
    o Wetlands Delineation Determination,
    o Endangered Species Study,
    o Cumulative Environmental Assessment,
    o Historic Structures and Archaeological Study, and
    o A railroad crossing permit.
  No issues have been identified from the permitting process to date.

  There is a small wetland on the site, which the proposed construction avoids. No other environmental issues have been identified.

  There is no evidence that the site has been used for anything other than agricultural activities. There are no existing structures on the site.

  There are no air emission or forced outage issues with this project.

- **Risks**

  The major risk related to this project is low customer participation. This risk is mitigated by only building each section of the array once customer subscriptions are confirmed. However, customers subscribing to the program, then leaving after their minimum 12 month commitment could become a burden to the program financials, and ultimately, ratepayers.

  The risk of not completing the project is for customers to go elsewhere for their renewable energy needs. If the Companies do not provide it, customers may build their own arrays or leave the service territory to obtain renewable energy, in which case the Companies lose revenue.

  The Commonwealth's economic development efforts and visibility to site-selection professionals will be improved by having a renewable energy offering like the Solar Share Program available as soon as possible.

Conclusions and Recommendation Arbough

It is recommended that the Investment Committee approve the spending request for the initial phases of the Solar Share project for $2,341k based on full subscription for Facility Array 1. Subsequent phases of the project will be presented for approval upon each achieving full subscription as well. The total full project estimate of $9,802k will be updated through the course of the construction program. This project is expected to increase the availability of renewable energy to customers in our service territory and improve customer satisfaction.

Approval Confirmation for Capital Project Greater Than or Equal to $1 million:

The Capital project spending in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Kent W. Blake
Chief Financial Officer

Year 4	Array 7	390		496		886
Year 4	Array 8	390		497		887
	Total Capital:	**$ 4,313**	**$**	**5,489**	**$**	**9,802**

*Assumed 44% LG&E / 56% KU for all assets as we do not yet know the ownership percentages of the arrays. Those will be determined once each individual array is fully subscribed.

*"Land" and "Common" costs are distributed over the entire 8 arrays. Eg. the costs incurred during construction of Array 1 are larger than the costs attributed to Array 1, because a portion of those incurred costs are assigned to subsequent arrays.

Investment Proposal for Investment Committee Meeting on: November 29, 2016

Project Name: Solar Share Program

Total Capital Expenditures Requested: $2,341k

Total Capital Expenditures Projected: $9,802k (total project including $625k contingency)

Project Number(s): To be determined once arrays are fully subscribed

Business Unit/Line of Business: Customer Services

Prepared/Presented By: Jay Robertson/Jeff Myers/David Huff

Executive Summary

The Companies received an order from the KPSC approving the application to develop a "community" solar facility along I-64 in Simpsonville, KY (PSC Case No. 2016-00274). The subscription-based Solar Share Program will include constructing a regional facility up to 4MW (DC) for the utilities' residential and business customers interested in receiving solar energy credits generated from the facility. Solar Share facilities will be built in 500 kilowatt sections based on customer demand. Construction will begin once a 500 kilowatt section is 100% subscribed. Likewise, construction on subsequent sections will require all previous facilities plus the next facility to be at 100% subscription before each section is built.

This program is for customers who want access to solar, but prefer to avoid the space, up-front cost and maintenance requirements associated with a private system. Customers will be able to subscribe to 250-watt (DC) increments in the solar facility. The cost of participating in the program includes a non-refundable subscription fee of $40, as well as a non-levelized monthly capacity fee of $6.29 per 250-watt increment. Customers will receive a credit on their monthly bill for the solar energy generated based on the variable cost of production and their subscription level.

This program was largely borne of customer demand. Market research shows that customers in Kentucky and across the country are demanding access to solar energy. Business Development professionals have stated the importance of access to renewable energy in attracting great companies to the state. This project has the potential to expand access to renewable energy in our service territories while keeping generation assets within the company.

The total capital cost of this project is $9.8M, spent in phases triggered by customer demand. The first phase is cost-heavy due to the shared infrastructure that will need to be constructed during the project onset. $3.0M per year in capital is included in the 2017 Business Plan (BP) through 2021.

Background

The Company has performed internal market research and consulted external reports that indicate there is significant public interest in having the Companies offer a renewable energy program like the proposed Solar Share Program. This includes interest concerning state-wide economic development efforts, meeting the needs of businesses that have set corporate renewable energy-supply targets, and perhaps most importantly, regional public authorities, commercial, and residential customers continue to express great interest in alternative energy supply options. The expected benefits of completing this project are increased customer satisfaction across customer classes and an improved landscape for state-wide economic development.

This project is not required to ensure compliance with industry/environmental regulation, address potential safety issue or address an immediate operational issue. However, this project could be an asset for future federal restrictions on fossil fuel generation.

- **Alternatives Considered**
  1. Recommendation: NPVRR: $894k
  2. Alternative #1: Do nothing   NPVRR: N/A
     Do Nothing has not been considered at this time as the Company has received KPSC approval to proceed with this project, which is driven by customer demand.

Project Description

- **Project Scope and Timeline**

  This project plans to purchase a 35 acre property in Simpsonville, KY for the construction of up to 4MW (DC) of PV solar. The solar array will be built in 500kW (DC) sections based on customer demand. The proposed solar facility No. 1 will include Canadian Solar PV panels, Solectria PVI60TL inverters, and an RBI ground mount fixed-tilt racking system. Other components to the solar array include switchgear, production monitoring equipment, and a contracted maintenance plan. External to the solar generating and associated equipment, the project budget also includes allotments for distribution upgrades to the site, security measures (fencing, cameras, access card readers, trespassing detection system), landscaping, transformers, network infrastructure, and environmental permits.

  The project will be built in up to eight 500kW sections. Assuming customer subscriptions start by the end of 2016, the first section can be initiated at the beginning of 2017 and completed in Spring 2017. Subsequent sections will be initiated upon customer subscriptions. The construction timeline for sections 1 and 5 (when common facilities such as fencing and transformers will be installed) is expected to be four months each. The other 6 sections are expected to take one month each. If customer subscriptions allow for multiple sections to be built at once, the combined timeline could be compressed.

The company has experience completing a 14MW (DC)/10MW (AC) array at E.W. Brown in 2016. Key project team members who worked on the Brown Solar Facility have been consulted and their experience has been vital to the successful design of this project.

The technology installed has been proven. This project plans to incorporate silicon chrystalline-based photovoltaic panels and string inverters.

The system electrical engineering design has been completed by ███████████████. In addition, LG&E-KU engineers have completed the design of distribution upgrades and studied how this installation will affect the circuit and substation to which it is interconnected.

- **Project Cost**
  The total project capital cost is expected to be $9.8M. Cost incurred during construction of Facility No. 1 is expected to be $2M. Cost incurred during construction of Facility No. 2 is expected to be $1.1M. Cost incurred during construction of subsequent 500kW sections, other than Facility No. 5, is expected to be $834k. Cost incurred during construction of Facility No. 5 is expected to be $2.1M. Refer to the appendix for the breakdown of costs on a cash-flow basis and how they are attributed to each facility and common facilities (which are spread evenly over all sections.) The program is specifically designed so that customers participating in the program will bear the cost of the program. This project is designed to be self-funding.

  A contingency of $625k was calculated as a function of the distribution, substation, and transmission upgrades, and an amount for miscellaneous charges as determined through evaluation of similar company projects. Other than distribution, substation, and transmission upgrades, the majority of the project was bid as contracted amounts.

  The main element of this construction project will be contracted through ████████ ██████████████ won a competitive bid process via a lump sum proposal of generic PV solar projects. The proposed cost for this specific solar facility is in line with the generic bid submitted by ███ during the RFP process. The auxiliary costs of this project are compiled from a variety of departments and a number of existing contracts.

Economic Analysis and Risks

- **Bid Summary**

MBE/WBE	
Experience	
Responsiveness	
Unit Cost ($/watt)	

The Companies accepted proposals from six companies in early 2016 – ████████████ ████████████ in addition to the three finalists listed above. The proposals were written

around four generic solar projects as the contract will be used to construct our Business Ashborough arrays in addition to the Solar Share facilities. ████████████████ was chosen based on their experience in projects ranging from 250kW to 500kW, their ability to be responsive to our needs, and their lowest average cost per watt. An award recommendation (attached) was approved in May 2016 for ██████████████████ for ████████ for the initial phases of this solar project. As the project progresses, if additional contract value is needed, Energy Efficieny and Supply Chain will come back to the Investment Committee for additional approval on the contract.

Investment Proposal for Investment Committee Meeting on: March 29, 2017

Project Name: TC2 Generator Excitation Replacement

Total Expenditures: $2,160k gross, ($1,620k net) (Including $196k gross, $147k net of contingency)

Project Number(s): 153053LGE/153053KU

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Emmett Moore/Tyson Janisch

Executive Summary

The Trimble County Unit 2 (TC2) generator excitation system is a Hitachi Type VCS6000. This Hitachi exciter, one of three in-service in the United States, was commissioned into service in 2011 as part of the TC2 Hitachi turbine-generator. The plant faces many challenges in maintaining the Hitachi exciter including limited support and extended lead-time for replacement parts. Since many questions require involvement from Hitachi Japan, responses are delayed causing extended down time when a problem or question arises.

The scope of this project is complete replacement of the TC2 generator excitation system to increase reliability by ensuring support and parts are readily available. All hardware components of the current exciter will be replaced, with the exception of the existing bus and cabling. Along with the hardware, a new software platform will provide seamless integration with the TC2 control system.

The total project cost is $2,160k gross ($1,620k net). The 2017BP included $1,171k (net) with $585k budgeted in 2017 and $586k budgeted in 2018. The overage in 2017 will be funded from reallocation of funds from other projects and has been approved in the RAC 1+11 forecast.

Background Arbough

The project mitigates the risk associated with limited resources and parts availability when TC2 experiences forced outage time due to exciter issues. Hitachi's Original Equipment Manufacturer (OEM) representative in the United States is ████, and it has only one qualified person to work on or troubleshoot issues specific to the current TC2 Hitachi exciter. Based on the plant's experience, the lead-time for many integral components is six to twelve months.

When Trimble County attempted to source individual components during the research of this project, it was discovered that certain suppliers, although located in the United States, would not allow direct orders or discuss other alternatives that might reduce the component lead-time. Because of this obstruction, there is not a viable way to source these parts from the original supplier or an alternate supplier directly. Additionally, the lack of cooperation from these component manufacturers makes reverse engineering these parts particularly difficult.

The exciter software provided by Hitachi is written in Japanese. This requires the Japanese version to be compiled, translated to English, and then downloaded to the exciter. Due to an error in this process, a software update caused a delayed startup of TC2 in 2012. The result of this software error caused the exciter to operate backwards. The proposed exciter replacement (from Hitachi to ████████████ will simplify the process of software updates and logic changes and result in fewer repair decisions that require significant time to resolve.

- **Alternatives Considered**
  1. Recommendation: ████ Full Replacement   NPVRR: ($000s) $1,890

  2. Alternative #1: ████ Front-End Upgrade   NPVRR: ($000s) $2,280
     The front-end upgrade replaces the controls portion of the current exciter and leaves a majority of the existing hardware components in use. This alternative addresses the software issues associated with translating Japanese code to English prior to updating the exciter system. In addition, this alternative addresses the delayed response to support calls that currently are routed through Japan. While this is a lower capital cost alternative, the substantial lead-time of parts excluded in the upgrade would still leave the plant in a vulnerable position of significant risk.

  3. Alternative #2: Do Nothing   NPVRR: ($000s) $2,929
     Do not replace any portion of the existing TC2 exciter. Based on a lead-time of 26 to 52 weeks on replacement parts, along with the availability of qualified repair technicians, major downtime is expected in the event of a component failure. Note that this does not factor other equipment repair costs or downtime that could occur in the event of an excitation failure.

Project Description   Arbough

- **Project Scope and Timeline**

The scope of the project is a complete replacement of the TC2 exciter. The project will span 2017 and 2018. The engineering, design, and factory acceptance testing will take place during 2017. The plant will receive the hardware in 2017, and the installation will take place during the TC2 Spring 2018 outage. Comprehensive testing will take place at the vendor factory. The demolition of the Hitachi excitation cabinets and hardware begins at the onset of the outage. The existing cabling and bus will be de-terminated and reused wherever feasible. When demolition is complete, installation of new hardware will commence. LG&E will conduct offline testing, online commissioning and performance testing with contractor assistance.

The project timeline with major milestones is as follows:

March 2017 –   Project Approval
April 2017 –   Award Contract/Kickoff Meeting
June 2017 –   Engineering complete and approved
October 2017 –   Factory Acceptance Testing
December 2017 – Receive new hardware onsite and approve commissioning procedures
March 2018 –   Demolition/construction of new hardware
April 2018 –   Offline testing
April/May 2018 – Commissioning and performance online testing

- **Project Cost**

The total cost of the project is expected to be $2,160k ($1,620k net), including sales tax, freight and burdens. There is $196k ($147k net) (10%) allotted for contingency included in the total. Further, the total includes $75k estimated for the owner's engineer, and another $75k estimated for company labor.

Economic Analysis and Risks

- **Bid Summary**

Monetization	
Base Bid	
AC Breaker	
Extended I/O	
Spare Parts	
Total Cost ($000s)	
Standardization Adder	
Total Cost of Ownership	

▮▮▮▮▮▮▮ were invited to bid on the project. ▮▮▮ provided two options in the bid, full replacement of the exciter or a front-end upgrade of the exciter controls. ▮ provided a bid

for full replacement of the exciter. Please note that ▉ was invited to bid on the exciter because **Although**
of its TC2 Turbine Control System (TCS) upgrade bid. At the time, the plant sought increased integration between the exciter software and the TCS. The plant has since recommended the TCS upgrade be awarded to ▉▉▉▉▉▉▉, which mitigates this concern due to the expansive ▉▉▉▉ experience that plant personnel possess.

Although the ▉▉ bid is less expensive based on first cost, the plant recommendation is for a ▉▉▉▉ full replacement of the TC2 exciter. The ▉▉▉▉ recommendation builds consistency within the fleet with multiple exciter units already in-service including TC1. The familiarity of both plant personnel and Generation Engineering is deemed highly advantageous to the recommendation as maintenance and operation are directly coupled to unit performance. The ▉▉▉▉ software readily interfaces with the existing generator protection system and plant DCS control and monitoring system. Further, the ▉▉▉▉ system will cleanly integrate with the main turbine controls being upgraded during the 2018 spring outage. The lack of these benefits within the ▉▉ offering is monetized in the bid summary table on the Standardization Adder line. When considering this adder, the total cost of ownership comparison favors the selection of ▉▉▉.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total

Financial Summary ($000s):

Discount Rate: 6.5%

Capital Breakdown:

Labor:	$75
Contract Labor:	$310
Materials:	$1,401
Local Engineering:	$84
Burdens:	$94
Contingency:	$196
Reimbursements:	($540)
Net Capital Expenditure:	$1,620

- **Assumptions**

  - Inflation is not considered since all pricing is based on 2018 prices.

  - Alternative #1 ▇▇▇ Front-End Upgrade – Availability disimprovement of 3.5 weeks each year with a probability percentage of 0.6% starting in 2017 and increasing by 0.2% every year until 2056.

  - Do Nothing – Availability disimprovement of 8 weeks each year with a probability percentage of 0.6% starting in 2017 and increasing by 0.2% each year until 2056.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes, like-kind
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	No

#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	**Arbough** No

- **Risks**

  - The TC2 exciter is an integral component of the generator system. There is always a risk that a mistake during installation results in component damage. That risk is mitigated by hiring a seasoned owner's engineer, thorough factory acceptance testing and extensive testing during commissioning of the new installation.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the TC2 Generator Excitation Replacement project for $1,620k (net) / $2,160k (gross) to improve reliability through improved support and critical part availability.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: <u>December 19, 2016</u>

Project Name: <u>TC 2 Turbine Controls Upgrade</u>

Total Expenditures: <u>$1,416k gross, ($1,063k net)   (Including contingency of 10% or $97k net)</u>

Project Number(s): <u>140048LGE</u>

Business Unit/Line of Business: <u>Power Generation</u>

Prepared/Presented By: <u>Tommy Della Rocco</u>

Executive Summary

Trimble County Unit 2 (TC 2) steam turbine, generator, and balance of plant related to the steam turbine generator is controlled by a ▮▮▮▮▮▮▮ control system. The ▮▮▮▮▮ reaches end-of-life in 2019 and, therefore, parts and support are not guaranteed. The ▮▮▮▮▮ control system engineering and operating interface also uses a ▮▮▮▮▮▮▮▮▮▮▮ that will no longer be supported by ▮▮▮▮▮ after January 2020, which violates a NERC Alert from February 2016.

The scope of this project is to upgrade the TC 2 Turbine Control System (TCS) to ensure parts and support are available and the system is in compliance. The entire hardware platform will be upgraded to modern components, and while maintaining all existing features, the software will be rewritten and enhanced by the vendor providing the hardware.

TC 2 TCS is unique in the fact that the hardware and software are from two different companies. The hardware is all ▮▮▮▮▮▮▮▮▮ and the software is designed by ▮▮▮▮ The issue is further complicated by the fact that neither company is keen on providing support for the system as a whole. This project will consolidate the supplier for both hardware and software and ensure support for the entire TCS.

The total cost of this project is $1,416k gross ($1,063k net). The 2017BP included $980k (net) with $390k in 2017 and $590k in 2018. The overage in 2017 will be funded from reallocation of funds from other Capital projects within the plant budget as part of the 2017BP.

Background   **Arbough**

The project addresses an industry regulation where ██████ will no longer be supported by ██████ in January 2020. NERC Alert dated February 9, 2016 implies that all control systems' operating systems should be supported by the OEM to ensure security updates are available to prevent unauthorized use.

LG&E recently performed a Human Machine Interface (HMI) upgrade on TC 2 when ██████ ceased support of ████████; however, TC 2 has been in service for less than seven years and, as such, it has not required an entire TCS upgrade. There have been card failures on the ████ ██████ but replacement parts have always been in stock and available for re-order. However, in 2019, technical support and replacement parts will no longer be available; therefore, we are recommending this upgrade occur in 2018. This project will address this issue and guarantee parts are in stock and available for re-order.

██ manufactured the TC2 TCS hardware, whereas the logic was written by ██████; consequently, neither ██ nor ██████ will accept full ownership of the TC2 TCS. Even though ████ is the TC2 TCS OEM, they do not currently provide timely and satisfactory support, and ██ and other outside vendors are hesitant to offer TC2 technical support as it is not their logic or operating philosophy. The proposed controls upgrade will address this issue. The winning bidder will agree to provide ongoing operational support for at least 10 years.

- **Alternatives Considered**

  1. Recommendation: Complete TCS Upgrade   NPVRR: ($000s) $1,228
  2. Alternative #1: Stock obsolete parts/Upgrade HMI NPVRR: ($000s) $11,599
  3. Alternative #2: Do nothing   NPVRR: ($000s) $11,566

Alternative #1 is to upgrade the HMI to ████████ and stock soon to be obsolete parts. Upgrading the HMIs to ████████ prior to 2020 will cost approximately $115k which would ensure compliance with the current NERC Alert. Obsolete parts can be purchased in surplus for around $50k and would provide a short term fix to any part failures. It is inevitable that more parts will become obsolete and interfacing systems will have compatibility issues with legacy components thus leading to a failure that will force an entire TCS upgrade or replacement which could lead to extensive outages.

It is recommended that the entire TCS be upgraded in 2018. This recommendation will result in more funding upfront, but it will save significant downtime and resulting cost in the future.

Project Description

- **Project Scope and Timeline**

  The project will span 2017 and 2018. The engineering, design, and factory acceptance testing will take place during 2017, and the installation will take place during the TC2 spring 2018 outage. The engineering phase is quite extensive. The required logic that controls the turbine,

generator, and balance of plant will all be copied with specific enhancements requested by Trimble County as well as from the vendor. Comprehensive testing will take place at the vendor factory. When the outage begins, then the demolition of any applicable hardware will start and installation of new hardware will follow. LGE will conduct a series of offline testing and online commissioning and performance testing.

The TC 2 Turbine Driven Boiler Feed Pumps were recently converted from OEM ▬▬ controls to ▬▬▬▬▬▬ controls during the TC2 Spring 2015 outage. If ▬▬▬▬ is the successful bidder, TC2's new main turbine controls will be identical to the TC2 TDBFP ▬▬▬▬▬ controls.

Both the ▬▬▬▬ and ▬▬▬▬▬▬ are used throughout the fleet for TCS and are proven reliable.

A TCS technical specification was created and used for the bidders.

The project timeline with major milestones are as follows:

February 2017 – Award Contract
March 2017 – Kickoff meeting
October 2017 – Engineering complete and approved
November 2017 – Factory Acceptance Testing
February 2018 – Receive new hardware onsite and approve commissioning procedures
March 2018 – Demolition/construction of new hardware
April 2018 – Offline testing
April/May 2018 – Commissioning and performance online testing

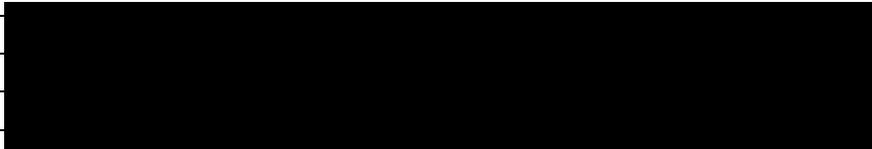
- **Project Cost**

The total cost of the project is expected to be $1,287k ($965k net), including sales tax and burdens. There is $129k (or 10%) allotted for contingency to bring the total to $1,416k ($1,063k net). Firm bids have been received for the TCS and construction management; however, the demolition, construction, and owner's engineer have not been bid out. We have estimated the construction and demolition costs based on a very similar project performed in 2015 and extrapolated out the costs based on the number of I/O points for the TCS. Time and Material pricing has been received for the owner's engineer and the amount of time has been predicted based on the scope and previous projects.

The upgraded TCS will interface with over 700 field instruments and is expected that there may be some changes required that are not foreseen.

Economic Analysis and Risks

- **Bid Summary (See Appendix A for details)**

MBE/WBE		
Total Cost ($000s)		


███████ and ██ were invited to bid on the project. The bids were received on October 23, 2016. ██ has proposed upgrading the ████████ to ████████. ████████ has proposed replacing the ████████ with ████████████ which controls the remaining systems on TC 2 and the entire control system on TC 1. ████ controls upgrade is less extensive and, therefore, should present less risk and cost; whereas ████████ proposal would require significantly lower O&M costs going forward, since all steam turbines would be controlled by one Distributed Control System (DCS). The bid summary indicates a relatively flat cost between the ██ and ██████ options, but for the following reasons ███████ is recommended:

- Future upgrade costs for ███████ is $25k and GE is approximately $500k ████ base price plus HMI upgrades)
- ████████ field services and support contract currently exists at no extra cost for new TCS. An equivalent contract would have to be created between ██ and LGE for extra costs.
- Plant personnel are familiar with ███████████ controls and as a result issues are resolved quickly and efficiently. Significant training would be required to bring plant personnel to the same experience level and efficiency.

The CEM recommended values are based on an award to ████████

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2016	2017	2018	Post 2018	Total

Financial Summary ($000s):

Discount Rate: 6.5%

Capital Breakdown:
Labor:	$ 50
Contract Labor:	$ 761
Materials:	$ 335
Local Engineering:	$ 25
Burdens and Tax:	$ 117
Contingency:	$ 129
Reimbursements	($ 354)
Net Capital Expenditure:	$1,063

- **Assumptions**

  - Inflation is not considered since all pricing is based on 2018 prices.
  - The product lifecycle of the █████ control system are typically 10 – 12 years.
  - Spare obsolete parts will ensure the unit runs without issue for five years.
  - █ will install new versions of software when they upgrade the HMIs to ████. That new software may not communicate with the obsolete cards and would cause a one week outage to correct.
  - The ███ system as a whole will be obsolete by 2028. When an issue arises, a complete replacement will be required. The unit will be down for 18 weeks while a new system is being engineered, built, and installed.

- The unit will require a one week outage to procure and install an obsolete part if a part were to fail and spares were not purchased.
- Spare obsolete parts will be difficult to procure after five years of being obsolete. A four week outage will occur if an obsolete part were to fail.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes, Like kind
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	No 2014
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

Environmental Affairs is currently reviewing this project.

- **Risks**

  - The TCS controls the turbine, generator, and balance of plant related to the steam turbine generator and as such is a large program. There is always risk that logic will be missed resulting in component damage. That risk is mitigated by hiring a seasoned owners engineer, an extensive factory acceptance test, and thorough commissioning testing.

  - There is some risk that the project costs could be greater than expected, and that risk has been mitigated by developing a detailed technical specification that has been used in the bid process, and including a reasonable amount of contingency based on experience from similar projects.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the TC 2 Turbine Controls Upgrade project for $1,063k net ($1,416k gross) to upgrade the turbine control system on Trimble County unit 2 and ensure long term unit reliability.

Investment Proposal for Investment Committee Meeting on: May 30, 2017

Project Name: TC2 Boiler Water Wall Replacement   **Arbough**

Total Approved Expenditures: $7,003k gross, ($5,251k net) (including contingency of $150k gross ($113k net)) (Approved on 09/01/2016 - See Appendix A)

Total Revised Expenditures: $8,350k gross, ($6,263k net) (including contingency of $150k gross ($113k net))

Project Number(s): 152049LGE

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Francisco Maldonado

Reason for Revision

A revised proposal is required due to defects identified in the cladding on the water wall panels purchased for TC2 under the original approved project. The project was scheduled to be completed during the TC2 spring 2017 planned outage to help combat corrosion issues, which have been prevalent on the TC2 boiler water walls since it was originally commissioned. In preparation for the project's planned timeline and risk mitigation plan, Trimble County placed an order with ███████████████████████████████ for the supply of fifty-two (52) laser cladded replacement furnace sidewall panels on 7/29/16. Project progress meetings and site visits were conducted on a regular basis for several months leading up to the outage and no major issues with the project were identified until late December 2016. Cracks were identified on some of the tube panels during a site visit at the facility where the tube cladding work was being completed. The Trimble County project management team requested a work stop until a full root cause analysis (RCA) was completed to determine the extent of the damage. Upon completion of the RCA, ████ deemed the panels unfit for the intended service and since new panels could not be delivered in time to meet the outage schedule, the project was postponed until 2018. Given that the project was postponed and the boiler tubing is still susceptible to corrosion, a "do nothing" option in 2017 was not feasible. Extensive inspections to identify problem areas were conducted. The inspections concluded that, at a minimum, 150 Dutchmen would need to be installed and approximately 3,600 square feet (sf) of metal spray would need to be applied or refurbished to minimize the possibility of a tube leak associated with corrosion. This work is a temporary solution to protect the boiler tubing from corrosion-related failures until the 2018 planned TC2 outage, when the project will be completed and the new clad water wall tubing will be installed.

An overview of the additional costs incurred and the reason for the revision to this project are highlighted in the attached table, "TC2 Boiler Water Wall Replacement Project Budget Overview." The corporate RAC approved the additional funding needed in 2017 as part of the 3+9 forecast. There will be $2,090k gross ($1,568k net) in 2018 that will be reallocated from other projects in the plant to help fund the additional costs of this project. The balance for 2018 will be managed by the corporate RAC as part of the 2018BP cycle.

Financial Summary   **Arbough**

Investment Proposal for Investment Committee Meeting on: August 31, 2016

Project Name: TC2 Boiler Water Wall Replacement

Total Expenditures: $7,003k gross, ($5,251k net) (including contingency of $150k gross and $113k net)

Project Number(s): 152049LGE

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Francisco Maldonado

Executive Summary

This proposal encompasses the requirements for the water wall replacement project for the Trimble County Unit 2 (TC2) boiler. TC2 is equipped with low NOx burners and, as such, it is susceptible to higher corrosion rates near the over fire air elevations at its side walls. ████, the Original Equipment Manufacturer (OEM), anticipated some elevated levels of corrosion and, as such, took proactive measures to protect against it by installing Amstar 888 (metal spray). Inspections during the TC2 2016 spring outage found evidence of the Amstar coating failing. As a result, the parent tube metal became severely corroded and on five different instances, led to boiler tube leaks and forced the unit to come off line. In an effort to reduce the risk of another unit outage, ninety-nine (99) tube sections (Dutchmen) were cut out and new tubes were installed where corrosion was the most prevalent. Amstar was applied to the remaining areas. This project will replace the diminished tubes with new weld overlaid tubes. The weld overlay material will be high chrome content Inconel, which helps improve corrosion resistance and has better bonding properties than the metal spray. The project will cover 2,500 square feet on each wall (left and right). Metal spray will also have to be added at the boundary lines where the weld overlay and existing Amstar meet. This is due to the fact that at least four to six inches of metal spray will have to be removed to properly prepare the weld area for the new panels.

The total project cost is estimated to cost $7,003k gross ($5,251k net). Based on the timing of this scope of work identified during the TC2 2016 outage inspections, this project was not included in the 2016BP. There is a total of $6,801k gross ($5,101k net) in 2017 included in the proposed 2017BP, and $200k gross ($150k net) in 2016 spending, which has been approved by the RAC in the 2016 6+6 FC.

Background   **Arbough**

The TC2 boiler is a once-through unit that is comprised of small diameter tubes arranged at a 25º spiral at its water walls. The water wall tube material is SA213 T12 with chromium specifications between 0.8% and 1.25%. In 2014, TC2 was equipped with new low NOx burners to meet the contract requirements set forth in the construction phase of the unit. The Low-NOx combustion system aids in meeting the NOx requirements for the unit. The burner design and intended operation is one which creates a reducing atmosphere within the furnace. In particular, it creates a reducing atmosphere at the boiler side walls between elevations 570' and 620'. These reducing conditions prevent the formation of a protective iron oxide scale on the water wall tubes.

The lack of a protective oxide scale layer exposes the tubes to the corrosive conditions in the atmosphere and eventually leads to wall loss on the tubes. The high water pressure in the tubes and the tube wall loss eventually lead to water wall tube leaks. In 2016, before the spring outage, the unit experienced five separate tube leaks due to corrosion. We anticipate that this trend will continue to rise if proper action is not taken to help protect the tubes from corrosion.

Inspections during the spring 2016 outage showed tubes which had experienced 50% wall loss. Therefore, ninety-nine Dutchmen were installed to replace thinned tubes. This project will replace the remaining diminished tubes with new weld overlaid tubes. The weld overlay material will be high chrome content Inconel. The high chrome (22%) helps combat corrosion issues and it has better bonding properties than metal spray. The weld overlay will be nominally 60 thousands of an inch.

- **Alternatives Considered**

    1. Recommendation (2500 sf on side walls, 5,000 sf total): NPVRR: ($000s) <u>$6,405</u>

    2. Replace only 2500 sf: NPVRR: ($000s) <u>$8,571</u>

        This option is not recommended as it leaves a large amount of corroded water wall tubing in the furnace which has the potential to fail and cause a unit outage. Furthermore is has a less favorable NPVRR than the recommendation.

    3. Do Nothing: NPVRR: ($000s) <u>$6,901</u>

        This option is not recommended because it leaves the water tubing exposed to further corrosion and it is likely that a tube leak related outage will occur.

Project Description

- **Project Scope and Timeline**

This project is scheduled to be completed during the TC2 outage starting in late February 2017. The material shall be on site no later than February 1, 2017. The weld overlay proposed for the panels is a high chrome content Inconel, which has been proven in the industry to protect against corrosion. Furthermore, the Inconel has a better bonding properties than does a metal spray. It is a welding process as opposed to a mechanical bond process and therefore does not spall. Many utilities including those in our own fleet have used the weld overlaid panels and have done so with success. Based on the issues experienced on TC2, we believe that this is a more reliable option than metal coatings. The timeline below highlights the anticipated project milestones from inception to completion.

Project timeline:

- Material Purchase: August 2016
- Award Install Labor: August 2016
- Award Scaffolding Labor: September 2016
- Start of Panel Fabrication: September 2016
- Award Metal Spray Install: October 2016
- Material Delivery: January 2017
- Start Outage: February 2017
- Complete Project March 2017

- **Project Cost**

The project costs are based on competitive bids received for the material and labor. Both the scaffolding and metal spray prices are based on historical pricing of similar projects. Both the scaffolding and metal spray install will each be competitively bid. The contingency includes potential risks associated with the pressure part install, scaffolding and metal spray installation. Given the size and history of the unit, we believe that there is a potential for unknown issues to arise, particularly with the welding of the blocks to the straps and potential rework at the headers stub pieces.

Economic Analysis and Risks

- **Bid Summary**

Material Bid Summary

The material purchase was sent out for bid. Five contractors were solicited for bids including ███ declined to participate in the request for quotation. ███████████ were competitively priced but could not meet our delivery requirements or panel

specification. For the purpose of this proposal we used the ▮▮▮▮▮▮▮▮▮▮▮ bid. Although the OEM, ▮▮ offers crucial knowledge and added value in the fabrication process of the panels. They are able meet the original specifications for the water walls and understand the nuances and specific characteristics of the furnace (spiral wound design). The ▮▮ position is further reinforced by their ability to supply the blocks and stub tubes already welded to the panels which will make the installation process more manageable. There are 2,400 blocks that would have to be welded in the field. The other bidders declined to bid on the blocks and the installation of the blocks. The previous ▮▮ performance on TC2 with the burner install and the balance header work has proven that they are able to provide quality components with precise fit-up. Partnering with ▮▮▮▮▮▮▮▮▮▮▮ will help minimize unforeseen issues and help complete this project within the small outage window proposed.

Material Bid Table

MBE/WBE	
Tubing

Lead Time	
Total Cost ($000s)	

Labor Bid Summary

The install labor for the pressure parts was submitted on July 17th to five bidders. Contractors which were solicited include ▮▮ The early evaluations indicate that ▮▮▮ proposal offers the best value proposition. The evaluation team will be conducting bid reviews with a short listed group made up of ▮▮▮▮▮▮▮▮ This analysis utilizes ▮▮ proposal due to their effective response to major risk factors identified and their exemplary work experience within their recommended craft labor. ▮▮ proposed personnel for the job have had many successful jobs on TC2 including burner replacements, roof tube replacements and transition replacements. Their bid meets the specifications set forth in the SOW and we believe they are the most competent and capable team to complete this work in a safe and timely manner. Additionally, their rigging plan provides the safest option for staging the new panels and removing the existing ones. Their proposal is to mobilize the panels outside of the furnace as opposed to inside the furnace where scaffolding is installed.

▮▮▮▮▮▮▮▮▮▮▮ were invited back for a bid review and further clarification on their respective scopes. ▮▮▮ provided a comprehensive and attractive proposal. They demonstrated that they understood the criticality of the project schedule and complexity of the installation and rigging process. ▮▮ also provided an exceptional proposal. Their rigging plan and installation process was far more superior to what the other contractors provided. ▮▮▮ provided a proposal which included an inherently risky rigging plan. Their plan included the removal and reinstallation of furnace scaffolding every time a panel has to be removed or reinstalled. The furnace scaffolding is an engineered scaffold and designed to meet the access

needs of the project. If major modifications are required then re-engineering will be required as well. This is not a viable option as this would increase cost to LG&E and pose a significant safety risk. For the reasons stated above, ▇▇▇ was eliminated for further consideration and ▇▇▇ proposal is being used for this project request.

The scaffolding and metal spray labor will be bid out. We have used budgetary numbers based on previous projects of the same magnitude.

Financial Summary ($000s):

Discount Rate: 6.5%

Capital Breakdown:

  Contract Labor (Pressure Parts): $3,108
  Contract Labor (Metal Spray): $ 500
  Contract Labor (Scaffolding): $ 500
  Materials: $2,700
  Local Engineering: $ 15
  Burdens: $ 30
  Contingency: $ 150
  Reimbursements: ($1,752)
  Net Capital Expenditure: $5,251

- **Assumptions**

  It was assumed that if a tube leak occurred, it would cost approximately $100k to repair and it would take at minimum 4 days to repair. This case was assumed for both alternate options.

  It is assumed that this project will take care of most of the high risk areas, and it is anticipated that more will be identified during the 2017 inspection.

- **Environmental**

	New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.	
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	NO
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes/Yes
#3	Does the project increase through-put with any of the material handling systems?	NO
#4	Will the project affect the dispatch order or utilization of the unit?	NO
#5	Does the project increase the emissions unit's maximum hourly heat input?	NO
#6	Does the project increase the emissions unit's electrical output (gross MW)?	NO
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes 2016 (repaired)
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	Yes

The above was verified by Environmental Affairs

- **Risks**

Prior to the TC2 2016 spring outage, five separate tube leaks were identified due to the corrosion issue noted in this proposal. Two of the leaks lead to unit forced outages. The other three were found when the unit was in the process of being brought down or started back up. If the water walls are left as is, there is a certain possibility that the unit will suffer many more forced outages.

If tubing is not ordered in time, we run the risk of not meeting the proposed outage window. Additionally, we run the risk of having to pay expedited premiums if we place an order too late.

Conclusions and Recommendation   **Arbough**

It is recommended that Investment Committee approve the TC2 Water Wall Replacement project for $5,251k (net) / $7,003k (gross) to ensure long term unit reliability.

Combined Investment Proposal for Investment Committee Meeting on: December 19, 2016

Project Name: TC2 HP-IP TURBINE BLADES

Total Investment Expenditures: $1,650k (gross), $1,237k (net) (including 5% contingency)

Total Sole Source Contract Expenditures: $1,489k (including 5% contingency)

Project Number(s): 152099LGE

Business Unit/Line of Business: Power Generation - Trimble County Generating Station

Prepared/Presented By: Tyler Turner

Executive Summary

This project involves the sole source procurement of the first and second stage turbine blades for Trimble County Unit 2 (TC2) high pressure (HP) turbine section and intermediate pressure (IP) turbine section. Discussions with the ▮▮▮▮ and ▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮ turbine experts regarding TC2 HP turbine section revealed that there is a likelihood the 1st and 2nd stage blades will show considerable solid-particle-erosion (SPE). ▮▮▮▮ is aware of this issue as it was encountered during the turbine overhauls of TC2 "sister" units that were performed by ▮▮▮▮ ▮▮▮▮ indicated that TC2 would likely experience the same issue.

Moreover, there were a few occurrences in which the TC2 HP turbine section 1st and 2nd stage blades were exposed to elevated main steam temperature. The concern is there is a small risk that the blades and/or rotor wheels[1] experienced thermal stress cracking during these temperature excursions. New blades will be required if either the blades or the rotor wheels indicate stress cracking as the blades cannot be repaired nor reused due to their metallurgical properties.

▮▮▮▮ also issued a report for TC2's IP turbine section 1st and 2nd stage rotating blades detailing concerns with cover lifting. ▮▮▮▮ engineering links this condition to the steam characteristics in this area and possibly inadequate tenon design. ▮▮▮▮ indicates that TC2's IP turbine will very likely experience this issue and advised that the station procure the 1st and 2nd stage blades now in preparation of replacing them.

Based on the available information regarding the issues, LGE's Generator-Turbine group advised the station to procure the 1st and 2nd stage blades now in preparation of replacing them as early as the 2018 major outage. Procuring the 1st and 2nd stage blades for both the HP and IP turbines offers a significant increase to the unit's operational availability; thereby, considerably reducing the Company's overall financial risks. Alternatively, electing not to proceed with blade procurement would delay repairs by up to 60 weeks in the event either of the above issues are discovered during inspections; the manufacturing lead time is 60 weeks for either set of blades.

The project's capital investment totals $1,237k (net) and includes a small five percent contingency as this is a firm bid for materials. The 2017BP includes $901k (net) and the remaining $336k (net) is to be covered by allocation from other projects in the plant's capital budget and approved through the Resource Allocation Committee (RAC).

---

[1] Refer to Appendix A for detailed schematic of the turbine rotor assembly.

Background

In addition to TC2's HP turbine section SPE concerns, there are concerns regarding main steam (MS) overheating events also affecting the 1st and 2nd stage blades. These events mostly stemmed from the tuning surrounding TC2's MS temperature control scheme. TC2's MS temperature is effectively controlled by regulating feed water flow into the economizer and the initial tuning allowed for less than satisfactory MS temperature control under certain unit conditions. Note that measures were taken to address this issue.

The concern with overheating is that there is a risk of stress cracking in the turbine rotor wheels and the turbine blades. ████ and structural analysis firm ███████████ both suggest that there is a minimal risk of over stress to the 1st and 2nd stage rotor wheels and turbine blades. However, removal of the turbine blades will be required if integrity testing in 2018 reveals stress cracking in the wheels or blades. Turbine blade replacement is required in the event we determine stress cracking has occurred as this mechanical degradation mechanism cannot be repaired. Blade replacement will also be required even if stress cracking is isolated to the rotor wheels; the turbine blades cannot be reinstalled due to their material composition.

████ report for TC2's IP turbine section 1st and 2nd stage rotating blades detailed concerns with cover lifting or blade covers separating from the blades. ████ engineering links this condition to the steam characteristics in this area and possibly inadequate tenon design; tenons are an integral part of the blade and are intended to firmly secure the covers to the blades. The intentions are to inspect the covers for lifting and perform ultrasonic testing (UT) during the 2018 spring outage. Blade replacement is required in the event lifting or tenon integrity issues are discovered.

Furthermore, there are concerns that the IP turbine section 1st and 2nd section stage blades will exhibit signs of SPE. Note that SPE is to be expected in the IP section just as it is expected in a subcritical unit due to the operational characteristics of the boiler reheat section. Therefore, the intention is to procure coated turbine blades for both the HP and IP so minimize the effects of SPE and the need to prematurely replace the 1st and 2nd stage turbine blades in the future.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $ 2,242

  2. Do Nothing: NPVRR: ($000s) $ 124,584
     Do not perform an inspection during the 2018 spring outage to determine the extent of the described issues. In the event one of the described issues results in failure, then more than 60 weeks of downtime is to be expected due to the extended manufacturing lead time; the current lead time for either set of turbine blades is 60 weeks. Note this does not consider the added repair cost and downtime due to damage that is certain to occur from the failure.

  3. Alternative 2 Procure Following Inspection: NPVRR: ($000s) $ 5,263
     Perform an inspection during the 2018 spring outage to determine the extent of the described issues. Electing to procure blades following the inspection of the HP & IP turbines would result in more than 60 weeks of outage time due to the extended manufacturing lead time.

Project Description
- **Project Scope and Timeline**
  Project Scope:
  - Procure the 1st and 2nd stage HP rotating blades

o Procure the 1st and 2nd stage turbine end and generator end n rotating blades

Timeline

o December 2016 – Provide Vendor PO to begin manufacturing the six (6) sets of turbine blades.
o March 2018 – Six (6) sets of turbine blades delivered to TC Generating Station.

- **Project Cost**
  - o HP 1st Stage Blades, Coated   - $252k (gross), $189k (net)
  - o HP 2nd Stage Blades, Coated   - $194k (gross), $146k (net)
  - o IP 9th Stage Blades TE, Coated   - $336k (gross), $252k (net)
  - o IP 9th Stage Blades GE, Coated   - $336k (gross), $252k (net)
  - o IP 10th Stage Blades TE, Coated   - $266k (gross), $199k (net)
  - o IP 10th Stage Blades GE, Coated   - $266k (gross), $199k (net)

    - **Total Project Cost**   -   **$1,650k (gross), $1,237k (net)**

Economic Analysis and Risks

- **Bid Summary**

  TC2's higher than normal (i.e. sub-critical unit) operating pressures and temperatures coupled with ███████ designed blades results in a lack of information within the industry (e.g. ███████████) regarding blade metallurgy and geometry. Therefore, a bid summary is not available as ███████████ is currently the only source for these turbine blades.

Materials:	$ 1,418
State Tax	$ 85
Local Engineering:	$ 30
Burdens:	$ 38
Contingency (5%):	$ 79
Reimbursements:	$ (412)
Net Capital Expenditure:	$ 1,237

- **Assumptions**

  o Recommendation – Availability Dis-improvement of zero weeks and maintain continued operation as prescribed by Generation Planning. Probability % - HP & IP blade SPE degradation and IP blade cover failures were modeled as a Weibull (exponential) failure rate function. Data regarding turbine blade failure rates is nonexistent but there is strong evidence from similarly designed units that TC2 will likely experience the same described issues. Therefore, one may reason that the blades are at the onset of their *Wearout Life* in which failure rate increases (exponentially) with time and model it as such.

  o Do Nothing – In the "do nothing" approach, it is assumed that the the baldes are not produred, and the unit runs until failure. There is an availability dis-improvement of 52 weeks each year with an increasing probability until it reaches 100% in 2027. At that point, the blades are purchased and the unit is unavailable for a total of 64 weeks (60 week lead time for the turbine blades and 4 weeks for turbine assembly) – 52 weeks in 2026 and 12 weeks in 2027. Probability % – Same as described in *Recommendation* assumptions. A 2% inflation rate is assumed for the blades.

  o Alternative #2 Procure Following Inspection – Availability dis-improvement of 52 weeks in 2016 thru 2018 and 24 weeks in 2019. The 24 weeks in 2019 is the remaining time of the 64 weeks (60 week lead time for the turbine blades and 4 weeks for turbine assembly) necessary to procure and assemble the turbine following the discovery of issues during the 2018 spring outage inspection. Probability % – Same as described in *Recommendation* assumptions. A 2% inflation rate is assumed for the blades.

- **Environmental**

  There are no environmental implications.

- **Risks**
  o Recommendation → minimal if either of the issues described in this proposal are discovered.
  o Do Nothing → catastrophic failure of a turbine blade resulting in additional turbine damage and the complete loss of TC2 generation for an extended period of time potentially well beyond 64 weeks; thereby significantly increasing the Company's overall financial risk.
  o Alternative #2→ Procuring Following Inspection → complete loss of TC2 generation capacity for up to 64 weeks if either of the two issues described in this proposal are discovered.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the TC2 HP-IP Turbine Blades project though $1,650k gross ($1,237k net) to increase the operational availability of the unit and significantly reduce the Company's overall financial risks.

In addition, it is recommended that the SSA with ███████████ for $1,489k be approved for the turbine blades due to lack of available information regarding the blade metallurgy and geometry; the station will reverse engineer the turbine blades to allow for competitive bidding for future needs.

Please see the attached Award Recommendation Approvals page for additional proponent and Supply Chain or Commercial Operations approvals.

Investment Proposal for Investment Committee Meeting on: August 30, 2017

ProjectProject Name: TC2 PJFF Bag and Cage Replacement

Total Expenditures: $2,793k gross($2,095k net),(including 10% contingency of $225k gross ($167k net))

Project Number(s): 135245LGE/135245KU

Business Unit/Line of Business: Power Generation

Prepared/Presented By: Haley Turner

Executive Summary

The Trimble County 2 (TC2) Pulse Jet Fabric Filter (PJFF) was placed into service in January 2011, when the unit was commissioned. The PJFF has 12 compartments with approximately 1,100 bag and cage pairs per compartment. This is a total of approximately 13,200 bag and cage pairs.   The bags and cages are 26' in length and 5" in diameter. They are fiberglass bags with a Teflon membrane. The bags were replaced in 2014, but the cages were not replaced at that time unless damaged.

The scope of this project includes the purchase and installation of the filter bags and cages in the TC2 PJFF. The removal and disposal of the old bags and cages is included as well. The project also includes a fluorescent leak test to verify proper installation and pre-coating with perlite. The perlite adds a thin protective powder layer to the new bags to protect them during initial start up conditions. The particulate matter (PM) limit on TC2 is 0.015 lb/MBTU, which is half of the Mercury and Air Toxics Standards (MATS) limit for all the other units. This limit was one of the stringent state requirements to construct TC2 and preceded the MATS requirements. This limit is extremely low, and does not allow for a significant number of broken bags. If the bags are not changed out in the 2018 outage, maintaining PM compliance will become more difficult. The unit would need to be load limited and additional outages will be required. The option to change the bags in one compartment at a time would decrease the life of the new bags due to the majority of the air flow going through these new, more permeable bags.

A total of $2,095k net was included in 2018 in the 2017BP. A total of $500k gross ($375k net) in 2017 was funded as part of the RAC approved 3 and 9 forecast.

Background

The TC2 coal-fired unit at the Trimble County Generating Station began commercial operation on January 22, 2011. The unit has a PJFF which contains approximately 13,200 filter bags and cages across twelve compartments. The bags are 5" diameter and 26' long. During original construction, ▇▇▇▇ installed 16 oz/yd Acid Resistant Fiberglass bags with a polytetrafluoroethylene (PTFE, commonly known as Teflon) membrane. Five compartments of bags were replaced in September, 2011 due to ash bridging issues which overheated the bags. The new bags installed were 22 oz/yd Acid Resistant Fiberglass bags, which ▇▇▇▇ recommended for long-term strength. Another 1,000 bags were replaced due to failure between fall 2012 and fall 2013. All bags were replaced in the spring of 2014. The cages were not replaced unless they were damaged or broken.

The pressure drop across the fabric filter on TC2 was extremely high due to high gas flows and high air to cloth ratio. The high differential pressure (dP) this caused required more frequent pulse cleaning of the bags.   This increased pulsing caused the bags to fail prematurely. The bags were in operation for only 2.5 years before they had to be replaced the first time. The gas flows were decreased significantly with the installation of the new burners on TC2. The air to cloth ratio is still higher than the industry standard. This higher ratio causes the PJFF to operate at a high dP resulting in more pulsing than ideal. Due to this dP, the bags have begun to show failures.

Sample bags have been sent out for testing during each outage, and the permeability and strength monitored over time. The Company has also conducted leak tests with fluorescent powder. Due to these tests, results showing degradation and the increasing amount of broken bags found during outages, it is necessary to replace the bags during the next outage in order to ensure the continued reliability of the unit. The bags will be in service for 4 years next spring.

The cages were not replaced during the last bag replacement and they have reached the end of their lifespan. They are now becoming more brittle and bent. Broken cages will damage the new bags if not replaced during the 2018 outage.

Installation of new bags and cages will allow the unit to continue operating as necessary for PM removal rates.

- **Alternatives Considered**
  1. Recommendation: Install new bags and cages   NPVRR: $2,396k
  2. Alternative #1: Delay Project One Year   NPVRR: $2,572k
  3. Alternative #2: Do Nothing   NPVRR: $8,432k

  Recommendation – Install New Bags and Cages
     The purchase and installation of new bags and cages in the 2018 outage is the recommended project. This plan is least cost over the life of the project and avoids the probability of unit outages and decreases in PM removal efficiency.

Alternative 1 – Delay project one year

Delay of the bag and cage change-out one year to the next planned unit outage presents two large risks: decreased PM removal efficiency and risk of unit outages due to environmental compliance. As bags start to fail, the failure will accelerate exponentially leading to PM compliance issues. This alternative is not recommended due to the above risks and unfavorable NPVRR.

Alternative 2 – Do Nothing

This alternative is not recommended as this would be extremely detrimental to unit operation and condition with high probability of unit forced outages.

Project Description

- **Project Scope**

The scope of this project includes the purchase and installation of new bags and cages which will replace the current bags and cages in the TC2 PJFF. This will occur during the planned spring outage in 2018 for TC2. The supply of new bags and cages is being competitively bid and an order will be placed in the 3rd quarter of 2017. The removal of the old bags and cages as well as the installation of the new bags and cages is also included in the scope being competitively bid, as well as the disposal of all the old bags and cages.

We are using the spare bags and cages in storage that were purchased during the 2014 outage for this project. We currently have approximately 2,100 cages and 1,150 bags in storage. We will be replacing a number of these with new spare bags and cages. We will also be replacing the access door gaskets as part of this project. Leak-testing with fluorescent powder to ensure proper installation and pre-coating with perlite to protect new bags is also included in the project.

- **Project Scope and Timeline**

The following details the expected project timeline:
- July 2017   Bids received for bags and cages and installation
- September 2017   Issue PO for new bags and cages and installation
- February 2018   Delivery begins for bags and cages
- March 2018   Outage starts, work begins
- April 2018   Installation complete
- April 2018   Leak test and pre-coating complete

- **Project Cost**

The total cost of the project is $2,793k gross ($2,095k net), which includes $225k gross of contingency. The project also includes $319k gross burden. Values of plant labor, disposal and other material portions of the project are estimates from past projects. The bags and cages are estimated to be a maximum of $1,313k based on recently received bids. The contractor costs for removal and installation are estimated to be a maximum of $429k based on recently received bids.

Discount Rate: 6.3%

Capital Breakdown:

Labor:	$151
Contract Labor:	$428
Materials:	$1,451
Disposal:	$200
Local Engineering:	$20
Burdens:	$319
Contingency:	$225
Reimbursements:	($698)
Net Capital Expenditure:	$2,095

- **Assumptions**

For the proposed project to install new bags and cages, assumptions include capital spend occurring only in 2017 and 2018. Cost estimates are based on preliminary bids and historical costs for similar projects completed.

For the 'Do Nothing' alternative, assumptions included a 25% probability of one week of unplanned unavailability starting in 2018 and increasing by 25% each year. The probability would be 100% by 2021. Each year the probabilities increase due to more damage caused by pulsing and ash abrasion resulting in damage to the bags and cages.

For the Delay One Year alternative, the first assumption was that capital expenditures would occur in 2018 and 2019 (the next available outage year) and that costs would increase by three percent each year based on current 2017 pricing estimates. The next assumption was that there would be seven days of unplanned availability in 2018 at 25% probability.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	No
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	Yes 2014
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

Environmental is currently reviewing, but no issues are expected.

- **Risks**

The risks of not completing the project include:
- Failure to meet particulate emissions limit: TC2 is subject to a particulate emission limit of 0.015 lb/MBTU per day. If the filter bags are not replaced the particulate emissions will continue to increase and pose a risk to the unit's reliability.
- Outages: If the bags are not replaced the particulate emissions will continue to increase and the unit will have to take outages to replace sections of broken bags.
- Changing bags online: The bags could be changed one compartment at a time while the unit remains online, however, the life expectancy of the new bags would be greatly affected due to air flow taking the path of least resistance through the new, clean bags. Also, changing the bags online constitutes a higher risk in safety.

- **Conclusions and Recommendation** Arbough

It is recommended that the Investment Committee approve the TC2 PJFF Bag and Cage Replacement project for $2,793k gross, ($2,095k net) to continue to meet particulate matter emission limits and avoid unit outages.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

Investment Proposal for Investment Committee Meeting on: <u>April 26, 2017</u>

Project Name: <u>TC2 SCR CATALYST L3</u>

Total Expenditures: <u>$2,873k gross, ($2,155k net) (including contingency of $250k gross and $187k net)</u>

Project Number(s): <u>134113LGE/134113KU</u>

Business Unit/Line of Business: <u>Power Production / Trimble County 2</u>

Prepared/Presented By: <u>Haley Turner</u>

Executive Summary

The Trimble County 2 (TC2) Selective Catalytic Reduction (SCR) was placed in service when the unit was commissioned. The SCR is designed to hold three layers of catalyst and currently has all three layers utilized. Initial combustion issues created more NOx output from the boiler than designed requiring the third layer of catalyst to not only be installed earlier than planned, but a taller layer was installed to increase NOx removal capability. During the Spring 2014 outage, the top layer (Layer 1) of catalyst was replaced with a like-kind ▮▮▮▮▮ catalyst of the same original designed height. The original Layer 1 was regenerated and replaced the original Layer 2 in 2016. However, as catalyst sampling and testing continued, it was determined that the regeneration was not performing as predicted. In an effort to improve the catalyst management plan and better control catalyst life and performance, the decision was made to change the Trimble County catalyst management plan to utilize new catalyst modules.

The scope of this project includes removing the existing catalyst modules in Layer 3 and replacing them with brand new, plate type catalyst modules, a total of 182 new modules. The removed catalyst will be disposed of due to the past poor regeneration results of TC2 catalyst. If the catalyst is not installed, the SCR performance will degrade below the target removal rate for NOx emissions. Also, as the SCR catalyst deactivates further, the ammonia slip through the SCR will increase which accelerates air heater fouling and increases the risk of an unplanned outage to wash the air heater.

A total of $3,283k gross ($2,462k net) is included in the 2017BP for this project, with $502k gross ($377k net) in 2017 and approved by the RAC in the 2-10 forecast. The total requested project funding is $2,873k gross ($2,155k net) with 10% contingency. It is recommended that the project be approved in order to meet the target NOx emissions, reduce ammonia slip, avoid unplanned outages, and improve safety and timing for future catalyst replacement projects.

Background   **Arbough**

The TC2 SCR was placed in service when the unit was commissioned and is designed to hold three catalyst layers. The two layers were filled with catalyst initially, and the third, taller layer was added in 2012 due to boiler outlet NOx exceeding system design due to poor burner performance. In the Spring of 2014, the top layer (layer 1) of catalyst was replaced with brand new catalyst in order to meet SCR performance requirements and outage scheduling. The middle layer (layer 2) of catalyst was replaced in 2016 by the regenerated original layer 1. Based on the most recent catalyst test results, the bottom layer (layer 3) of catalyst must be replaced in 2018 in order for the TC2 SCR to meet NOx removal requirements and avoid unplanned outages due to ammonia slip plugging the air heater.

The current catalyst management plan, based on continued catalyst sampling and testing, shows a need for Layer 3 to be replaced in 2018 during the planned outage for TC2. Due to the results of the continued catalyst sampling and testing program, regeneration is not a viable option to ensure the catalyst management plan can be maintained. Sample testing results have shown that the regenerated catalyst modules are not performing to the guaranteed levels. This poor performance reduces the useful life of the catalyst for NOx removal and ammonia slip resistance. For these reasons, regeneration has been removed as a viable option for the TC2 catalyst management plan and therefore only new catalyst modules will be considered in the future for catalyst replacement projects. The third layer added in 2012 was taller than the other two original layers. Due to the improved burner performance, the third layer can be replaced with a thinner layer (same size of the other two layers).

Installation of a new layer of catalyst in Layer 3 will allow the unit to continue operating as necessary for NOx removal rates and reducing ammonia slip to the air heater which poses risk of air heater fouling if not controlled and minimized.

- **Alternatives Considered**
  1. Recommendation: Install new layer   NPVRR: $2,475k
  2. Alternative #1: Delay Project One Year   NPVRR: $3,505k
  3. Alternative #2: Do Nothing   NPVRR: $10,657k

  Recommendation – Install New Layer
  > The purchase and installation of a new layer in the 2018 outage is the recommended project. This plan is least cost over the life of the project and avoids the probability of air heater wash outages, unit derates, and decreases in NOx removal efficiency.

  Alternative 1 – Delay project one year
  > Delay of the catalyst layer change-out one year to the next planned unit outage presents two large risks: decreased NOx removal efficiency and risk of air heater wash outages due to ammonia slip. As catalyst activity deteriorates past the recommended replacement year the NOx removal efficiency declines. Additionally, the increasing ammonia slip would foul the air heaters faster than typical and poses risk of forced air heater wash outages. This alternative is not recommended due to the above risks and unfavorable NPVRR.

<u>Alternative 2 – Do Nothing</u>   **Arbough**

This alternative is not recommended as this would be extremely detrimental to unit operation and condition with high probability of unit derates/forced outages.

Project Description

- **Project Scope and Timeline**

The scope of this project includes the purchase of a new layer of catalyst modules which will replace the layer currently installed on Layer 3 of the TC2 SCR. This will occur during the planned outage in 2018 for TC2. The supply of new catalyst modules is being competitively bid fleet-wide and an order will be placed in the second quarter of 2017. The catalyst material will be delivered at least one month prior to the start of the outage. A total of 182 modules (91 per reactor) will be removed from Layer 3 and replaced with new modules.

The labor for removal and installation was bid as part of a fleet-wide initiative and was awarded earlier this year. New swing bolt-style doors will be purchased as part of this project and industrial cleaning of the SCR will also be completed. Disposal of this layer of catalyst and the layer removed in 2016 (in storage) will be included in this project. Additional seals and miscellaneous material will be purchased in the winter of 2017 for the catalyst replacement project.

The following details the expected project timeline:
- March 2017   Bids received for catalyst material
- April 2017   Issue PO for new catalyst material, progress payment
- 4th Quarter 2017   Issue PO for Industrial cleaning of the SCR
- 3rd Quarter 2017   Issue PO for new access doors
- March 2018   Outage start, catalyst replacement/door install completed
- April 2018   Used SCR catalyst shipped for disposal
- June 2018   Tune SCR to optimize ammonia distribution

- **Project Cost**

The total cost of the project is $2,873k gross ($2,155k net), which includes $250k gross of contingency for materials. The project also includes $125k gross in burdens (5%). Values of the labor and other material portions of the project are estimates from recent projects. The catalyst module material is estimated at $1,600k based on recently received catalyst bids.

Economic Analysis and Risks

- **Bid Summary**

The catalyst removal/installation labor was awarded as part of a fleet-wide bid which included change-outs scheduled during 2017 and 2018 at Mill Creek, Brown, Trimble County, and Ghent. There were no W/V/MBE bidders identified, and the bid was awarded to ███ in February 2017.

Contingency:	$ 250
Reimbursements:	($ 718)
Net Capital Expenditure:	$ 2,155

- **Assumptions**

For the proposed project to install a new catalyst layer, assumptions include capital spend occurring only in 2017 and 2018. Cost estimates are based on catalyst bids and historical costs for similar projects completed.

For the Delay alternative, the first assumption was that capital expenditures would occur in 2018 and 2019 (the next available outage year) and that costs would increase by three percent each year based on current 2017 pricing estimates. The next assumption was that there would be six days of unplanned availability in both 2018 and 2019 with 50% and 90% probability, respectively. These probabilities are based on issues that will arise as ammonia slip and NOx emissions increase due to reduced catalyst activity. Six outage days are equivalent to two unplanned air heater washes. Air heater washes are estimated to cost $36,000 each, which would be an incremental cost of $72,000 per year in 2018 and 2019.

For the Do Nothing alternative, assumptions included 50% probability of six days of unplanned unavailability starting in 2018 and increasing to 90% in 2019 and 100% in 2021. Each year the probabilities increase due to ammonia slip and NOx emission issues from the aging catalyst. Six outage days are equivalent to two unplanned air heater washes. Air heater washes are estimated to cost $36,000 each, which would be an incremental cost of $72,000 per year. The cost of exceeding NOx emission targets was not included at this time due to the unknown nature of the NOx allowance market and our plan to self-comply to mitigate the risk.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	Yes a. Yes
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit?	Yes L3 added -2012

		a. Provide frequency or when equipment or component in question was last repaired or replaced.	L1 replaced – 2014 Arbough L2 replaced – 2016
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.		No

This project follows the TC2 Catalyst Management Plan

- **Risks**

    The risks of *not completing* this project include:
    Exceeding NOx emissions target: NOx removal performance will decrease as the catalyst layer deactivates with age. Without the replacement of a new catalyst layer in the TC2 SCR the NOx emissions will increase and will risk exceeding the Unit's NOx limit. Operating at the necessary NOx removal rate will become more critical due to compliance regulations associated with the finalization of CSAPR-II.

    Forced Unit Outages: Without replacement of a new catalyst layer in the TC2 SCR, the amount of un-reacted ammonia leaving the system will increase. This ammonia will then be available to form ammonia bisulfate which deposits in the air heater. The deposits will build-up over time and will require a unit outage for air heater cleaning which will increase O&M costs and negatively impact unit availability

A general risk for this project was found as a result of the recent outage and inspection on the TC2 SCR. During the process of removing routine catalyst samples, it was found that the second layer of catalyst is more brittle than expected. This is physically the oldest layer of catalyst in the TC2 SCR due to the fact is it an original layer that was regenerated. Multiple samples were taken from this layer and sent off for testing and evaluation. The catalyst planned for the third layer install could be used to replace the second layer if it is found to be in most need of a replacement after evaluation.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the TC2 SCR Catalyst L3 project for $2,155k (net) / $2,873k (gross) to ensure NOx removal continues to meet target removal rates and environmental regulations and to avoid forced outages and/or derates due to ammonia slip or NOx emission issues.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

Trimble County Gas Turbine Hot Gas Path Inspection & Controls Platform Upgrade Although **Projects Contract Proposal**

Investment Proposal for Investment Committee Meeting on: November 24, 2015

Project Name: Trimble County Combustion Turbine Hot Gas Path Inspection & Controls Platform Upgrade Projects and Contract

Total Capital Expenditures: $31,389k (Including $3,138k of contingency)

Total O&M Expenditures: $2,430k (no contingency included)

Total Project Proposed: $33,819k

Total Contract Expenditures: ▇▇▇▇ (Including $2,754k of contingency)
Project Number(s): 132000, 132001, 132002, 132003, 132004, 132005 (HGPIs) 152001LGE, 152002LGE, 152003LGE, 152004LGE, 152005LGE, 152006LGE (Exciter) 140660LGE, 140658LGE, 140659LGE (LCI Upgrade), 152011LGE, 152012LGE, 152013LGE, 152014LGE, 152015LGE, 152016LGE (Mark VI Controls)

Business Unit/Line of Business: Generation - Trimble County Station

Prepared/Presented By: Charles Ransdell/ Laura Mohn/ Tomas Menezes/ Jeff Joyce

Executive Summary

This project and contract proposal is seeking authorization for the second round of hot gas path inspections (HGPIs) for all six (6) Trimble County ▇▇▇▇ simple cycle natural gas turbines (CTs). Units TC5 through TC10 are expected to reach nine-hundred factored starts since the first cycle of HGPIs within the 2016-2024 timeframe. HGPIs are required on these units in order to avoid risk of component failure associated with thermal fatigue. Component thermal fatigue is caused by rapid heating and cooling of parts in the combustion path as units are cycled with load.

Funding for controls upgrade projects included in the proposed 2016 BP for all six (6) CTs is also requested within this proposal. The existing ▇▇ platforms for the turbine controls (▇▇▇▇ ▇▇, generator excitation system, and the load commutator inverters (LCI) will become obsolete and unsupported within the next five years and need to be upgraded. These additional projects have been leveraged along with the HGPIs in the bidding and negotiating process and have resulted in favorable discounts to list pricing and positive budget variances.

This proposal recommends and requests approval for both the contract amount of ▇▇▇▇, the capital project amount of $31,389k and O&M expenditures of $2,430k to perform the HGPIs as well as the turbine controls, excitation, and LCI system upgrades discussed herein. The total request for capital investment and cost of removal is included in the proposed 2016 BP.

Background   Arbough

Trimble County Generating Station has six (6) ███████████████ frame ███ single fuel gas turbines. The units are designated TC5 through TC10. TC5 and TC6 were commissioned in 2002, and TC7 through TC10 were commissioned in 2004.

███ provides a detailed recommended maintenance schedule ███████ for major gas turbine components and issues Technical Information Letters (TIL), which is ███ method of communicating known wear and design issues. The Trimble units are operated as peaking units and are subject to the maintenance schedule based on factored starts. HGPIs are required at 900 factored start intervals to maintain reliable operation of the machines. All six of the gas turbines are currently forecasted to reach 900 factored starts since the first round of HGPIs within the 2016 to 2024 timeframe. This will be the second round of combustion component inspection and maintenance for these turbines. Peaking units experience their damage primarily from thermal fatigue cycles. The damage caused by thermal fatigue is very predictable. Exceeding 900 factored starts significantly increases the risk of catastrophic failure and will result in a higher percentage of unrepairable parts. In this case, replacement costs would exceed refurbishment costs. LG&E would increase their risk of equipment failure if the OEM's recommended maintenance schedule is not followed.

The Trimble CTs have three different control platforms that will become unsupported in the next five years. Each of the six (6) units' ███████ turbine control systems requires an upgrade to ██████ to address obsolescence/non-support in the equipment components. This is the first of three planned upgrades that will allow the systems to be supported through 2020. The last two upgrades are not available at this time. Also, each of the units' generator excitation systems ████████████ requires an upgrade to ██████. This will align the exciter with the turbine ███████ which will maintain support into 2020. Finally, pairs of the Trimble gas turbines (TC5/6, TC7/8 and TC9/10) share a load commutator inverter (LCI) that performs speed control or low current soft starting of the units. An upgrade is required on the three LCIs in order to maintain support and avoid obsolescence through 2020.

- **Alternatives Considered (1 –Recommendation, 2 –Do nothing, 3 –Next Best Alt)** Arbough

    1. Recommendation: NPVRR: ($000s) $31,649

       Perform the HGPIs and control platform upgrades utilizing ▮▮▮▮▮▮▮ as the contractor along with recommended options outlined later.

    2. Do Nothing: NPVRR: ($000s) $138,101

       The "Do Nothing" alternative is to not perform the HGPIs or controls upgrades. In this case, the gas turbines will become inoperable, making this not a viable option.

    3. Next Best Alternative(s):   NPVRR: ($000s) $32,205

       The next best alternative is to perform the HGPIs and complete the controls projects as stand-alone projects. The 2016BP includes individual projects associated with each of these items, but pricing is better by combining them with the HGPIs.

Project Description

- **Project Scope and Timeline**

The scope for the HGPIs includes disassembly, inspection, replacement of parts, and reassembly. LKE's existing set of spare parts will be installed on the first machine, and the parts removed from the first unit will be refurbished for use on the second unit. This pattern will continue until all six machines have been completed. Upon conclusion of the HGPI projects, there will be a complete set of refurbished capital spare parts. Also included are all recommended repairs to address applicable Technical Information Letters (TILs), which is ▮▮ method of communicating known wear and design issues. A detailed list of the applicable TILs addressed as part of the HGPI is located in Appendix 1.

As part of the offering, the OEM and recommended vendor, ▮▮ presented other scopes for consideration, that they can uniquely provide. The scopes described below are recommended to be included as part of the HGPIs for all units.

Table 1. Additional Scope Items included in Proposal

Scope item	Description
Plant Ally	Access to 24 hour x 365 days technical service focusing on issues that affect major turbine components. This will provide OEM level support and feedback related to real time operations. This is vital in monitoring the condition and operation of TC5 with known compressor rotor cracking; TC9, which has a known shorted turn; and all units to predict issues before they become apparent.
Autotune	Monitors unit performance and allows real-time feedback on specific adjustments to control operations based on actual hardware performance and environmental conditions, which will improve operations, availability, and improve or help maintain emissions.
R-0 blade upgrade (compressor)	Improves strength and damage tolerance of blading, which results in reduced inspection requirements while improving availability and reliability.
Generator rotor removal	Included in the project scope due to ▇ experience with shorted turns in the field windings of generators like the Trimble units. We are currently aware of a shorted turn on TC9. The generator rotor removal will allow the field to be rewound or replaced.

The projects in this investment proposal include upgrades to all six units' turbine controls, excitation systems, and LCIs. These scopes are outlined in Table 2.

Table 2. Control Platform Upgrade Scopes

Control Platform Upgrades	Description
▇ Control Upgrades	First of 3-phase approach to upgrade turbine controls, which will maintain support through 2020.
Excitation Upgrades ▇	Exciter upgrade, which will align controls with ▇. This will be required to maintain support into 2020.
LCI (Load Commutator Inverter) Upgrades	This will allow the generator to operate as a synchronous motor to accelerate the gas turbine set according to a specific speed profile, thus providing optimum starting conditions. This software/hardware upgrade is required to maintain support into 2020.

The current schedule for this work by year and unit is as follows:

Table 3. Schedule for HGPI and Controls Platform Upgrades

Year	2016	2017	2018	2019	2020	2021	2022	2023	2024
HGPI	TC6	TC5 TC7	TC9				*TC8		*TC10
Turbine Controls Upgrade	TC6	TC5 TC7	TC9	TC8 TC10					
Excitation Upgrade	TC5 TC6	TC7 TC8	TC9 TC10						
LCI Upgrade	TC5/6	TC7/8	TC9/10						

* The fast start units (TC8 & TC10) are currently scheduled for HGPI in 2022 and 2024, respectively. This is due to a lower level of accumulated factored starts due to related reserve requirements.

- **Competitive Bid Process / Project Cost**

The initial scope of the bid process sought to test the competitive ▮▮▮ frame market as well as combine the combustion turbine maintenance needs at E.W. Brown and Trimble County Generating Stations. After market research and pre-bid screening meetings with potential bidders, four firms where selected to be included in the competition. ▮▮▮ is the OEM for all EW Brown units and provides service to ▮▮▮ machines through a wholly owned subsidiary, ▮▮. ▮ is the OEM for the Trimble County CTs and chose only to bid on services for those machines. ▮▮▮ is a firm long used by LKE for successful steam turbine/generator overhaul labor services. ▮▮▮ teamed with ▮▮▮ ▮▮▮ to bid the Trimble County scopes only. ▮▮▮ was added based on a request from E.W. Brown and their experience with their refurbishment efforts. ▮▮▮ participated with ▮▮▮ as their installation contractor. ▮▮▮ was the only bidder to provide a proposal for all units (▮▮ units and ▮▮ at E.W. Brown and ▮▮ at Trimble). Due to its high pricing for both stations, a decision was made to separate the scopes by station and proceed with negotiations and project authorizations separately. The results of the initial proposals for Trimble County's HGPIs on six ▮▮ are as follows in Table 4.

Table 4. Initial Proposals for HGPIs (2014)

▮			
▮			
▮			
▮			

Table 8 summarizes pricing from ▮ for upgrades to control system hardware and software that are required to maintain support for the listed systems through 2020. These upgrades are in the 2016BP as separate projects and are included in this authorization request. Costs include a 3% escalation rate.

Table 8. ▮ **Controls Platform Upgrade Offerings**

Option		Cost ($000) – Includes Escalation	
▮			
▮			
▮			

▮ is recommended for award of the HGPIs, excitation, LCI, and ▮ (shown in Tables 6, 7 and 8) for the following reasons:

- A fifteen percent discount for items outside the HGPI scopes (Tables 7 and 8) were achieved by including them along with the HGPI scope.
- ▮ has agreed to a reduced markup of 20% (lowered from the Master Agreement markup of 25%) for any additional labor, materials and consumables related to company approved changes to the current scope of work.
- Improved warranty terms have also been achieved, with ▮ agreeing to a warranty of 18 months from initial operation or 36 months from delivery, whichever occurs first.
- Pricing will be escalated beyond 2016 based on standard industry indices as agreed upon with a floor of 0.5% and a cap of 2.5%. If inflation greater than 5% is experienced, LG&E and ▮ will split these increases equally.
- Liquidated damages are in place at a daily rate of $15k/day and capped at 10% of the value for each individual HGPI and ancillary scopes.
- ▮ is able to provide additional scope items ▮ and control platform upgrades that are uniquely applicable to ▮ gas turbines.

Economic Analysis and Risks

Table 10. Project and Contract Amounts Requested in This Paper   Arbough

Six (6) Units	2015 Base Bid ($000)	Contract Amount [with 3% escalation] ($000)	Capital ($000)	O&M ($000)
HGPI Base Scope			*24,820	
Other Scope Items:				
				2,430
			1,020	
			685	
			1,165	
Local Engineering			541	
Burdens			20	
Contingency			3,138	
Total Request			**31,389**	**2,430**

*Capital HGPI budget included other scope items:
Capital and O&M request is consistent with 2016 BP.
The detailed split between Capital and O&M by year and Unit is provided within Appendix 3.

A detailed comparison of the individual project expenditures compared to the contract amount is located in Appendix 2. A detailed cost roll-up of all projects can also be found in Appendix 3.

Table 11. Financial Analysis

Financial Analysis - Project Summary ($000)	2016	2017	2018	2019	2020	Life of Project
Project Net Income	(120)	(37)	(198)	713	915	31,389
Project ROE	-9.4%	-0.7%	-2.4%	7.7%	10.4%	9.8%

Assumptions

- The interval between HGPI is six (6) years, which is consistent with the actual average time needed to accumulate 900 factored between the first and second HGPI. The units will reach their second round of 900 factored starts as follows: TC5 – Spring 2017, TC6 – Fall 2016, TC7 – Fall 2017, TC9 – Fall 2018
- Based on current operating conditions, TC8 and TC10 (fast-start units) will accumulate 900 factored starts in 2022 and 2024, respectively.
- The recommendation assumes the HGPIs and controls projects are completed, and there would be no generation system reserve margin shortfall.

- For the "Do Nothing" alternative, there will be no investment, and the units will not be available to run once they accumulate 900 factored starts. Without these units, there will be a reserve margin shortfall. LG&E is currently purchasing capacity from ███████ ████████████████████████████ Based on this cost, the value of capacity for a Trimble County CT (159 MW) is $771,150/month. The units are assumed to be unavailable until the next overhaul (major inspection) scheduled in the 2016BP.
- For the "Next Best" alternative, the additional projects already in the 2016BP (turbine controls, excitation, and LCI upgrades) would be completed under stand-alone projects and not bundled with the HGPI contract. This would increase the cost of those projects by 15%.
- Three percent per year escalation is included within the contract summary for all years beyond 2016 based on the time period covered within the project.

- **Environmental**

Table 12. New Source Review Evaluation

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.	
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	NO
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	NO
#3	Does the project increase through-put with any of the material handling systems?	NO
#4	Will the project affect the dispatch order or utilization of the unit?	NO
#5	Does the project increase the emissions unit's maximum hourly heat input?	NO
#6	Does the project increase the emissions unit's electrical output (gross MW)?	NO
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	YES Frequency = 6 years, last performed 2010-2013.
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	NO

- **Risks and Issues**

Based on the current operating conditions, TC8 and TC10 (fast-start units) are forecasted to accumulate 900 factored starts in 2022 and 2024, respectively. However, the starts on these units are subject to many factors, which could move their HGPI dates earlier, but likely later and potentially past 2025. These units' factored starts will continue to be monitored, and the plans for investments will be shifted as part of the business planning cycle. If the HGPIs for these units push out past the ▮ contract agreement, then there is potential to re-negotiate to include major inspections for the other units. Major inspections occur after 2400 factored starts, and four of the other units are forecasted to reach that milestone before 2024.

The ▮▮▮▮▮▮▮▮▮▮▮ in this offering is the first of three planned upgrades to the equipment to address obsolescence/non-support in the equipment components. ▮ has advised that the last two phases of the migration/upgrade are not yet available. This issue applies to all of the Trimble gas turbines and the Trimble 2 steam turbine.

Appendix 4 outlines other risks and issues related to the Trimble CTs, but not part of this proposal

- **Conclusions and Recommendation**

It is recommended that the Investment Committee approve the Hot Gas Path Inspections, Exciter (EX2100e), Load Commutator Inverter (LCI) and ███████████████████████ ██ projects for $31,389k. LG&E is also seeking contract approval for all aforementioned projects in the amount of ████████.

Appendix 1: List of TILs to be addressed as part of HGPI   Arbough

TIL #	Title	Description
1132-2R1	Variable Inlet Guide Vanes - Spring and Thrust Washers	Inspection only at IGV washers
1280-2R1	Inspection of F-Class Turbine Wheel Retaining Ring Tabs	Inspection of turbine wheel at retaining tab that holds bucket lock wire
1397-1R2	DLN 2.0 and DLN 2.6 Combustion Forward Casing Inspections	Inspect steam injection annulus on combustion casing
1509-R3	F-Class Front End (R0/R1) Compressor Inspections	Inspect compressor blades
1540-2	F-Class Turbine Rotor Inspection and Maintenance Recommendations	Inspection of the cooling air slot on turbine wheel that feeds cooling air to bucket
1584-R1	████ Turbine Shell Inlet Bleed Heat (IBH) Extraction Pipe Weld Crack	Inspection of pipe that takes off air from compressor discharge casing to inlet bleed heat
1585	Proper Use and Care of Flexible Metal Hoses	Inspect the flexible hoses on the machine, mainly the fuel gas flex hoses
1606	████ End Cover Purge Air Diffusion Pipe Weld Inspection	Inspection of purge air connection on fuel nozzle for cracks
1638-R1	F-Class R0/R1 Platform Ultrasonic Testing	Inspection of compressor blades at root of blade
1724-R1	Inspection and Cleaning of Quaternary Fuel Annulus	This annulus is prone to contamination from failing brazing used to make the fuel nozzle
1742	F-Class Turbine Wheel 1 Balance Weight Groove Inspection	Correct staking procedure for balance weights on turbine wheels
1858	████ 2nd Stage Bucket Inspection Recommendations	The second stage bucket is prone to bucket shroud lifting
1907	Rotor Forward Shaft Dovetail Crack	The stub shaft that holds the R0 blades are developing cracks

Appendix 2: Project and Contract Approval Comparison ($000's)   Arbough

Trimble 2016 BP	2016	2017	2018	2019	2020	2021	2022	2023	2024	Total
Unit	6	5&7	9				8		10	

Notes:

- Difference between project and contract amounts is for other work related to the HGPI or controls upgrade projects, and not part of ▮▮▮ scope.

- Project amounts include 10% contingency for unknowns related to part conditions and unforeseen expenditures.

- ▮▮▮▮ (9%) of contract contingency is reserved for potential change orders and is not included in the above contract amount.

Appendix 3: See Attached Excel Spreadsheet

Appendix 4: Other Risks and Issues Related to the Trimble CTs, but not part of the Arbough proposal

Cracking on the 12th through 17th stages of compressor rotor

TIL 1972 covers potential crack development on the 12th through 17th stage compressor rotor wheels due to the thermal stresses experienced by these wheels during normal operation of the turbine. These cracks are more susceptible on wheels with flat slot bottoms and we have two units identified to be on that list. The units are TC5 and TC6, commissioned in 2002 and most likely manufactured in the end of 2000 and beginning of 2001 time frame. If cracks are found to the extent that makes the unit inoperable, we are exposed to a $13 million variance (price for a refurbished rotor) per unit, or an extended outage until the existing turbine rotor is removed, de-stacked, repaired, and re-installed in the unit. We do not have an estimate for the rotor removal and repair because we will be at the mercy of compressor wheel availability and market forces driving metal prices at that point.

Presently, we know cracking exists on the TC5 compressor from a borescope inspection completed in September 2015.   We have notified ▮ of this condition and supplied data. Presently, we believe the recommendation for this unit will be to monitor the unit.   Repairs may / will be required in the future.

Shorted turns on generator rotors

Through monitoring of vibration data and some testing, it has been determined that TC9 has shorted turns in the field winding. Trimble 9 is experiencing high vibrations during a critical speed during its startup process. After reviewing our unit specific data with ▮ they agree we have a shorted turns. ▮ has told us issue is caused by a combination of:

- Time spent on turning gear
- Cycling of machine
- Thermal forces associated with cycling of machine
- Breaker misoperations / malfunctions that stress the machine

▮ has a fleet of over 800 machines that are like the Trimble CT generators with over 60 rewinds in their field.   They indicated an 8% probability of shorted turns occurring in any fleet of similar machines. Ultimately, this field may need to be rewound with an estimated cost of $820,000 per machine, plus labor and services estimated at $300,000 per unit.   Other options include purchase of a spare field and ▮ field exchange program. We plan additional testing on Trimble 9, a more detailed review of vibration trends on the entire fleet, and the addition of flux probes on each unit.

Given cycling of the machines and turning gear time are the primary causes of shorted turns, the potential exist for shorted field turns for the remainder of the Trimble Co CT fleet.

Investment Proposal for Investment Committee Meeting on: <u>November 28, 2018</u>

Project Name: <u>TC DCS Upgrades</u>

Total Expenditures<u>: $3,748k gross ($2,880k net) (Including $341k gross ($262k net of contingency)</u>

Project Number(s): <u>137587 – TC1 DCS Upgrade, 137585LGE – TC2 DCS Upgrade, 140014LGE – TC CT DCS Upgrade</u>

Business Unit/Line of Business: <u>Power Generation</u>

Prepared/Presented By: <u>Rick Boone / Tommy Della Rocco</u>

Executive Summary

This project will help ensure Cyber Security Compliance of our Distributive Control Systems (DCS) at Trimble County in accordance with NERC CIP-007-3 (*NERC Critical Infrastructure Protection*).

The ▮▮▮▮▮▮▮▮▮DCS System Operator Station HMIs (Human Machine Interface) run on the ▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮▮ will be discontinuing support of ▮▮▮▮▮▮ on January 14, 2020. This means that ▮▮▮▮▮▮will no longer be providing Security Patches for ▮▮▮▮▮▮ The ▮▮▮▮▮▮ Control System network relies on ▮▮▮▮switches and routers for all network communication. The ▮▮▮▮ products currently in service at Trimble are becoming obsolete. ▮▮▮▮ will be discontinuing support on these products October 31, 2019. These two issues require that every Workstation (HMI) and all ▮▮▮ Switches/Routers be replaced and loaded with latest software configurations to keep Trimble County compliant with NERC CIP-007-3.

Since our initial install of the ▮▮▮▮▮▮▮▮ DCS in 2007, we have added several controllers and other hardware devices to our DCS network to accommodate new projects. These projects include the TC1 Pulse Jet Fabric Filter (PJFF), Coal Combustion Residual Transport (CCRT), Process Water System (PWS) and TC2 Turbine Controls, etc. These additions have added to the network loading and communication traffic on our DCS System. To help ease the network loading, we will be upgrading the Processor Modules in all of the ▮▮▮▮▮▮Controllers. This will also allow us to bring our DCS up to the latest ▮▮▮▮▮▮▮▮ Software version.

One other hardware item that is becoming obsolete in our ▮▮▮▮▮▮▮▮ Controllers are the DC Power Supplies. We will be replacing critical DC Power Supplies during this Evergreen Project and use our existing ▮▮▮▮▮▮ Service Agreement to replace the remaining DC Power Supplies when necessary.

This proposal covers the entire DCS Control System at Trimble County. The total cost of the combined projects is $3,748k gross, and a total of $4,385k gross was included in the 2018BP across the three projects as follows:

- Project Number 137587: covers the Trimble County Unit 1 DCS Control System Network.
- Project Number 137585LGE: covers the Trimble County Unit 2, Common and the Trainer DCS Control System Network.
- Project Number 140014LGE: covers the Trimble County Combustion Turbine DCS Control System Network.

These projects are fully funded in the proposed 2019 Business Plan.

Background

The current DCS Control Systems are fully functional and operate on the ███████████████. These systems are fully supported by ████████. However, the requirements of NERC-CIP 007, ████████ discontinuing support of the network Routers and Switches, and ████████ discontinuing support for ████████ require us to upgrade the Control System as described in this proposal. The current replacement for the ████████████ platform is ████████.

The HMI hardware currently in place at Trimble County will be over 7 years old when this project begins and they are not sized to run the new software (████████). Therefore, this hardware must be replaced with ██████ validated equipment designed to operate with ████████ software.

████████ is currently planning to provide support for ████████ through October 2025. We anticipate similar projects in 2025 based upon ████████ end of support schedule.

The benefits we will obtain upon completion of this project are:
- Maintain NERC-CIP-007-3 compliance through 2025.
- Control System Network performance improvements will be gained by upgrading the ████████ Controller processor modules.
- Upgrading our control system software from ████████████████████ to the latest ████████████████████, will give us more flexibility with alarm management on our control system. ████████████████████ also offers additional troubleshooting tools to diagnose problems as they occur on our system. This will decrease downtime if problems on our control system network occur.

- **Alternatives Considered**

  1. Recommendation: (Upgrade Existing System)   NPVRR: ($000s)__$3,109____
  2. Alternative #1: (Do Nothing)   NPVRR: ($000s)__$5,963____
  3. Alternative #2: (Control System Change out) NPVRR: ($000s)__$11,394 +_

The Recommendation is to make the necessary upgrades to our existing ████████ Control System. It is the most cost effective and offers the least amount of risk to the Trimble County Control System.

Alternative #1: (Do Nothing) exposes us to potential fines due to non-compliance with NERC CIP-007-3. The ██████████████████████, used on the HMIs (Human-Machine Interface Stations) on our Control System would no longer receive updated Security Patches from ████████ This would make our Control Systems vulnerable to software viruses and malware that could potentially force extended Unit Outages.

Alternative #2: (Complete Control System Change Out) a complete change out of all system control and configurations would be risky and likely result in the same proprietary structure at a higher cost than upgrading our existing ████████controls. It would also require extended outages to install and thoroughly checkout a new control system, not to mention the months of Engineering and planning involved to undertake this task. The NPVRR amount for Alternative #2 was based off our initial Control System change out of the TC Unit 1 (2009) and Common (2007) Control Systems with a 3% inflation rate over 10 years ($11,394k). This estimate does not include upgrading the DCS on Trimble County Unit 2 which would be an additional significant impact.

Project Description

- **Project Scope and Timeline**

This project will replace all necessary hardware and software required to meet the requirements of NERC CIP-007-3.

Since we have a Multi-network design in our DCS Systems at Trimble, the hardware and software installation for this project will be completed in five stages throughout 2019. Those stages are listed in chronological order below:

1. Trimble Unit 2 DCS Network and Core Network (3/11/2019 – 4/14/2019)
2. Trimble Combustion Turbine DCS Network (6/10/2019 – 6/14/2019)
3. Trimble Trainer System DCS Network (6/10/2019 – 6/14/2019)
4. Trimble Common DCS Network (10/14/2019 – 11/8/2019)
5. Trimble Unit 1 DCS Network (10/14/2019 – 11/8/2019)

Trimble County Major Milestones for Stage 1 (Trimble Unit 2 DCS Network and Core Network, 3/11/2019 – 4/14/2019):

November, 2018	Proposal to Investment Committee
January, 2019	Material order placement
February, 2019	Factory Acceptance Test for TC Unit 2 and Core Networks
March, 2019	Hardware and Software installation *(TC2 Spring Outage)*

Trimble County Major Milestones for Stages 2 & 3 (Trimble Combustion Turbine DCS
Network and the Trimble Trainer System DCS Network, 6/10/2019 – 6/14/2019):

November, 2018	Proposal to Investment Committee
March, 2019	Material order placement
May, 2019	Factory Acceptance Test for TC Combustion Turbine and Trainer System Networks
June, 2019	Hardware and Software installation

Trimble County Major Milestones for Stages 4 & 5 (Trimble Common DCS Network and the
Trimble Unit 1 DCS Network, 10/14/2019 – 11/8/2019):

November, 2018	Proposal to Investment Committee
May, 2019	Material order placement
September, 2019	Factory Acceptance Test for TC Common and TC Unit 1 Networks
October, 2019	Hardware and Software installation *(TC1 Fall Outage)*

The date ranges listed above for Stage 1 and Stage 4 correlate to the outage schedules for
Trimble Units 1 and 2. Each of these Stages will take 2 weeks to complete. Stage 2 will only
require 2-3 days to complete.

- **Project Cost**

The total cost of the projects in 2019 will be $3,748k gross. This includes all labor, materials and
engineering required to complete the full scope of the work. A 10% contingency has been
included for unexpected issues that may arise during the upgrade process.

Economic Analysis and Risks

- **Bid Summary**

A formal bid process was not conducted for control system components, upgrades and services.
The control systems at Trimble County are proprietary to ▇▇▇▇▇▇ which makes competitively
bidding control hardware, software and services extremely difficult, unless a complete change
out of all system control and configurations are made. A complete change out of all system
control and configurations would be risky and likely result in the same proprietary structure at a
higher cost than upgrading our existing Emerson controls.

LG&E and KU entered a contract with ▇▇▇▇▇▇ in 2015 to provide control system components,
upgrades, and services for Cane Run, Ghent and Trimble County generating stations through
2020. These projects are included in the aforementioned contract.

There are two "Budget Comparison and Financial Summary" charts included in this
document. The first chart is for the Steam Side DCS Networks which are co-owned with
IMEA and IMPA. The second chart is for the Combustion Turbine DCS Network which is
not co-owned.

Net Capital Expenditure:	$ 275

- **Assumptions**

The CEM assumed a 5% risk of a cyber-attack or security breach that could lead to a one week unit outage, if we choose to "DO NOTHING' the first year. If we are unable to install the latest ▉▉▉▉ Security Patches, the risk and outage times increase as more time passes. This assumption does not consider other potential equipment damage or risk to personnel safety that could be caused by losing control of the DCS System. Also, certain components in our control system will become obsolete (processor modules, power supplies, etc.). This could increase outage rates and down time while we try to acquire adequate replacements for failed components.

By choosing the recommendation to secure control system components, upgrades and technical services to support the ████████ proprietary control system, we will be able to maintain NERC-CIP-007-3 compliance through 2025, as well as, improve control system performance, maintain a robust resilience from cyber-attacks and ease network loading as described in the Executive Summary.

- **Environmental**

New Source Review Evaluation questions 1-8 must all be completed on all investment proposals.		
#1	Does the project include any new equipment or component with air emissions or result in air emissions not previously emitted?	No
#2	Does the project involve equipment that is part of a regulated air emission unit? a. Is change a like-kind or functionally equivalent replacement?	No
#3	Does the project increase through-put with any of the material handling systems?	No
#4	Will the project affect the dispatch order or utilization of the unit?	No
#5	Does the project increase the emissions unit's maximum hourly heat input?	No
#6	Does the project increase the emissions unit's electrical output (gross MW)?	No
#7	Has the equipment or component in question been repaired or replaced in the past at this unit? a. Provide frequency or when equipment or component in question was last repaired or replaced.	No
#8	Have there been forced outages or unit derates in the past 5 years due to this component of the equipment? a. Provide GADS data of derates and forced outage for each of the last 5 years applicable to the project.	No

There are no environmental implications associated with this project.

- **Risks**

The risk of not completing this project is the Control System at Trimble County would become vulnerable to cyber-attacks that could result in loss of generation and equipment damage. Also, Trimble County would no longer be compliant with NERC CIP-007-3.

Conclusions and Recommendation

It is recommended that the Investment Committee approve the Trimble County DCS Upgrade projects for $3,748k gross ($2,880k net) to comply with NERC CIP007-3 and decrease the risk of cyber-attack.

<u>Approval Confirmation for Capital Projects Greater Than $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal for Investment Committee Meeting on: December 20, 2017

Project Name: Viley Road Distribution Substation Expansion

Total Approved Expenditures: $7,291k (Approved on 1/3/2017)

Total Revised Expenditures: $8,049k, with an additional $758k requested

Project Number(s): Distribution Substations 148720, Distribution Lines 152820, Transmission Lines 137751

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: Tony Durbin

Reason for Revision
The original investment proposal (attached) was approved by the Investment Committee on January 3, 2017 for $7,291k. An additional $758k is necessary to complete the substation portion of the project. After the project was opened and contracts initiated, it was determined that additional funding was needed in the following areas to complete the substation:

Category	Original Estimate Direct Cost ($000s)	Current Actuals Plus Additional Estimated Cost ($000s)	Requested Additional Funding ($000s)
Site Construction	$ 1,000	$1,385	$ 385
Capital Equipment	$ 1,640	$1,930	$ 290
Design Engineering	$ 370	$ 453	$ 83
		Total (Burdened)	$ 758

Site Construction. The "Below Grade" site construction bid package was issued to four experienced substation contractors with whom the substation group has previously done business. Three contractors submitted a bid. The original estimate for site work (both below grade and above grade) was $1,000k, but the actual bid for below grade work alone was $989k. Estimates for yet-to-be-completed above grade work bring the total site construction estimate to $1,385k.

Capital Equipment. Some of the capital equipment on this project was underestimated Although original project estimate. These increases are partially offset by lower than estimated costs on breakers and transformers.

	Original Estimate	*Actual Cost*	*Difference*
Steel Package	$300k	$514k	$214k
Control House	$300k	$555k	$255k

Design Engineering. An engineering contract partner was chosen to complete the substation design. Initial estimates included in the original Investment Proposal were lower than the actual costs to complete the design.

Financial Summary ($000s):	**Approved**	**Revised**	**Explanation**
Discount Rate:	6.5%	6.32%	
Capital Breakdown:			
Labor:	$ 208	$ 308	
Contract Labor:	$2,693	$3,208	See explanations above
Materials:	$2,591	$2,879	See explanations above

Burdens:	$ 533	$ 548	
Contingency:	$ 663	$ 453	
Reimbursements:	($ 0)	($ 0)	
Net Capital Expenditure:	$7,291	$8,049	
NPVRR:	$8,423	$9,456	

Financial Detail by Year - Capital ($000s)	2017	2018	Post 2018	Total
1. Capital Investment Proposed	3,848	3,867	-	7,715
2. Cost of Removal Proposed	35	299	-	334
3. Total Capital and Removal Proposed (1+2)	3,883	4,166	-	8,049
4. Capital Investment 2018 BP	2,772	4,109	-	6,881
5. Cost of Removal 2018 BP	35	165	-	200
6. Total Capital and Removal 2018 BP (4+5)	2,807	4,274	-	7,081
7. Capital Investment variance to BP (4-1)	(1,076)	242	-	(834)
8. Cost of Removal variance to BP (5-2)	-	(134)	-	(134)
9. Total Capital and Removal variance to BP (6-3)	(1,076)	108	-	(968)

Financial Detail by Year - O&M ($000s)	2017	2018	Post 2018	Total
1. Project O&M Proposed	-	-	-	-
2. Project O&M 2018 BP	-	-	-	-
3. Total Project O&M Variance to BP (2-1)	-	-	-	-

The 2018 BP includes $4,274k in 2018 for this project. The incremental $1,076k for 2017 was approved through the Corporate RAC process in October and includes some minor burden changes offsetting the total amount of $1,100k. The lower cost in 2018 is due to a $342k shift from 2017 (for the total incremental requested on the approved amount of $758k), partially offset by a shift in the circuit work spending from 2017 to 2018.

With this requested increase, this recommended scope of work remains the least cost alternative to address the issues presented as part of this project. The original estimates for the site construction and capital equipment in the alternative in the original proposal were under estimated as well as in this option.

Conclusions and Recommendation
It is recommended that the Investment Committee approve the revised Viley Road Distribution Substation Expansion project for $8,049k, an increase of $758k, to provide adequate distribution substation capacity for existing and future loads in Lexington, KY, and remove the Viley Road and Trafton Substations from EDO's N1DT list.

Attachment A

Investment Proposal for Investment Committee Meeting on: December 19, 2016

Project Name: Viley Road Distribution Substation Expansion

Total Expenditures: $7,291k (includes $663k of contingency)

Project Number(s): Distribution Substations 148720, Distribution Lines 152820, Transmission Lines 137751

Business Unit/Line of Business: Electric Distribution Operations

Prepared/Presented By: James Cline/Beth McFarland

Executive Summary

Electric Distribution Operations (EDO) Electric Engineering and Planning (EEP) seeks funding authority for distribution substation, distribution circuit, and transmission line improvements in and near the Viley Road substation. The Viley Road substation is located on Alexandria Drive on the northwest side of Lexington, KY and serves approximately 3,874 industrial, commercial, and residential customers. The existing 39.2 MVA distribution transformer is forecasted to reach 123% of its top nameplate capacity during the winter of 2016-2017 (assumes average temperature conditions), and 130% during the winter of 2018-2019. The purpose of this Investment Proposal is to request substation capacity improvements in the form of a second 37.3 MVA transformer in the Viley Road substation (plus associated transmission and distribution circuit improvements) in order to reduce the load on the existing Viley Road substation transformer. In addition, the proposed improvements remove the Viley Road and Trafton Ave 12 kV transformers from the Company's "Distribution Substation Transformer Contingency Program" (N1DT) list, while reducing the load on the most heavily loaded distribution circuit. This project is scheduled to begin in January 2017 with completion in December 2018.

This project is included in EDO's 2017 Business Plan (BP) for $6,196k. The budget shortfall in 2018 will be addressed through reallocation from approved funding sources which will be presented for approval through the Corporate RAC process.

Background

The Viley Road substation contains a single 39.2 MVA, 138-12 kV transformer. The measured peak transformer load was 50.35 MVA (128% of its top nameplate) during the winter of 2014-2015 and the transformer load is currently forecasted (under average temperature conditions) to reach 123% (winter 2016-2017) and 130% (winter 2018-2019). Distribution Planning guidelines allow up to 120% of the top nameplate rating during forecasted normal winter conditions. The installation of a new 37.3 MVA substation transformer and associated improvements in the Viley Road substation are proposed to provide load relief for the Viley Road substation transformer.

In addition, the Viley Road substation is on EDO's N1DT list. This list identifies substation transformers, which in the event of a transformer failure during high load periods, cannot be completely restored by switching to surrounding substations and circuits. Complete restoration to all customers would require either replacement of the failed transformer or installation of a portable transformer, which in the case of the Viley Road substation, could take up to 36 hours. While not the primary justification for this project, removing the substation transformer from the N1DT list is a recommended secondary goal for this project because: 1) the largest mobile transformer is a 30 MVA transformer which is not large enough to meet capacity needs at this substation, and 2) it is difficult to schedule planned outages to perform maintenance even during off-peak periods. In addition, the completion of this project as proposed would also remove the Trafton Ave 12 kV transformer from the N1DT list.

- **Alternatives Considered**

1. Recommended Option: NPVRR ($000): $8,423
   EEP's recommended option is to install a new standard 37.3 MVA transformer, steel, and breakers in the Viley Road substation (plus associated transmission and distribution line improvements). This option is expected to eliminate the forecasted Viley Road transformer overload, remove the Viley Road and Trafton Ave 12 kV transformers from EDO's N1DT list, and reduce the load on the most heavily loaded Viley Road circuit. The estimated cost of this option is $7,291k.

2. Do Nothing Option: NPVRR ($000): N/A
   KU has an obligation to serve all customers and associated load. The "do nothing" option is not considered an acceptable option because it exceeds Distribution Planning's operating limits for distribution substation power transformers, and this practice reduces the life of the substation transformer and elevates the risk of failure of a high value, critical asset.

3. Alternative 1:   NPVRR: ($000s) $9,362
   This option considers the installation of a new 37.3 MVA transformer, steel, and breakers on a new green field site (plus associated transmission and distribution line improvements). This option meets capacity needs and accomplishes the same level of N1DT service as the recommended option, but is expected to cost more than the recommended option because of property, site preparation and transmission line extension costs. The estimated cost of this alternative is $8,011k.

Project Description
- **Project Scope**
  - Substation project #148720: estimated cost $4,900k ($2,200k-2017; $2,700k-2018).
    - Install a new 37.3 MVA, 138-12 kV transformer, breakers, steel, control house, and associated equipment in the Viley Road substation; install the mobile transformer to serve the substation load during construction.
  - Distribution project #152820: estimated cost $1,644k ($600k-2017; $1,044k-2018).
    - Install approximately 13,700' of 795 AAC conductor for two new distribution exit circuits and relocate other substation exit circuits to the new substation transformer;

perform other temporary work as necessary to accommodate the use of the mobile Although transformer during construction.

- Transmission project #137751: estimated cost $747k ($233k-2017; $514k-2018).
  - Install poles and conductor as needed to route the 138 kV transmission line into the Viley Road substation; perform other temporary work as necessary to accommodate the use of the mobile transformer during construction.
  - A Network Integration Transmission Service (NITS) request was submitted to TranServ International on September 30, 2016 for a new delivery point. Load will be transferred from the existing Viley Road transmission delivery point to the new delivery point, but is not expected to alter the existing transmission improvement plans in the area.

- **Project Timeline**
  - January, 2017: Open projects.
  - February-March, 2017: Perform substation and transmission engineering design related tasks; order major equipment.
  - April-June, 2017: Perform distribution engineering design related tasks for planned 2017 work; order materials.
  - July-December, 2017: Complete distribution conductor improvements for planned 2017 work; receive major substation and transmission equipment.
  - January-April, 2018: Perform substation site preparation and foundation work; perform distribution engineering design related tasks for planned 2018 work; order materials.
  - May-August, 2018: Progress on transmission foundations and pole installation; progress on distribution conductor improvements for planned 2018 work.
  - September-November, 2018: Install mobile transformer, substation structures and equipment; progress on distribution conductor improvements.
  - December, 2018: Complete remainder of substation, transmission, and distribution improvements; commission substation.

- **Project Cost**
  The total estimated cost of the project is $7,291k. The substation and transmission line cost estimates are consistent with the "Conceptual Level 1" engineering design designation. The distribution cost estimate is consistent with the 'Preliminary" engineering design designation and is based on field experience from similar projects. There is an estimated 10% of contingency ($663k) incorporated into the project cost estimates.

Economic Analysis and Risks

- **Bid Summary**
  - The substation transformer and steel package as well as transmission poles will be bid using established Supply Chain procedures.
  - For other requirements, Substation Construction and Maintenance (SC&M), Distribution Operations, and Transmission Lines will use existing material and labor contracts and follow established Supply Chain procedures.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total

1. Project O&M Proposed					-
2. Project O&M 2017 BP					-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

This project was identified and funded in EDO's 2017 Business Plan at the following levels: Substation project #148720 ($2,210k-2017; $2,000k-2018); Distribution project #152820 ($600k-2017; $600k-2018); Transmission project #137751 ($371k-2017; $415k-2018). The $1,243k budget shortfall in 2018 will be addressed in the 2018 Business Plan.

Financial Summary ($000s):

Discount Rate:	6.5%
Capital Breakdown:	
Labor:	$ 208
Contract Labor:	$ 2,693
Materials:	$ 2,591
Local Engineering:	$ 603
Burdens:	$ 305
Contingency:	$ 663
Transportation:	$ 228
Reimbursements:	($ 0)
Net Capital Expenditure:	$ 7,291

- **Assumptions**
  - The project unknowns will not exceed the estimated contingency amounts.
  - The estimated cost of the distribution improvements are consistent with similar past projects.

- **Environmental**
  There are no known environmental issues at this time.

- **Risks**
  - The cost of the distribution portion of the project could escalate because a detailed engineering design was not conducted due to resource limitations and time constraints prior to the preparation of the cost estimates. Costs are based on similar completed work for other projects of similar scope and size.
  - Failure to complete this project in a reasonable time frame could negatively impact the company's ability to serve the growing loads in the area. Insufficient infrastructure could result in outages and/or failure of the existing substation transformer.

Conclusions and Recommendation

EDO EEP recommends that the Investment Committee approve the Viley Road Distribution Substation Expansion project for $7,291k to provide adequate distribution substation capacity for existing and future loads in Lexington, KY, and remove the Viley Road and Trafton Substations from EDO's N1DT list.

Investment Proposal for Investment Committee Meeting on: November 29, 2016

Project Name: Transmission Relocation for Expansion of Waste Management's Outer Loop
Recycling and Disposal Facility (R.D.F.)

Total Project Expenditures: $13.4Mk gross, $0.5M net   (Includes $1.2M contingency)
Total Estimated Contract Value (Electric Transmission Relocation): $9.0M gross, $0 net
Total Estimated Contract Value (Gas Transmission Relocation): $4.4M gross, $0.5M net

Project Number(s): 146709 (Electric Transmission) and 148081 (Gas Transmission)

Business Unit/Line of Business: Electric Transmission/Gas Distribution

Prepared By: Dave Harmeling and John Doll

Presented By: Keith Steinmetz/Tom Reith

Executive Summary

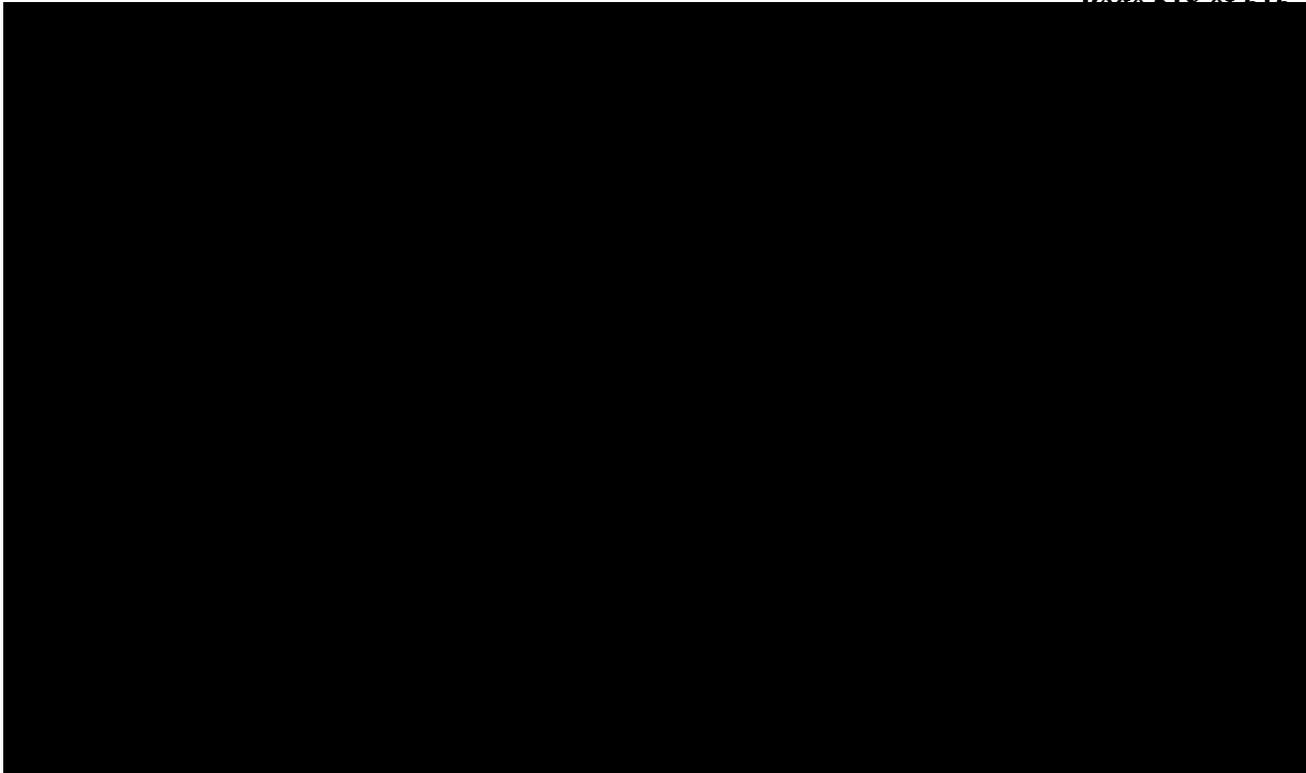
Approval is requested from the Investment Committee to proceed with a $13.4M relocation
project to be funded by Waste Management, Inc., along with approval of the associated Electric
Transmission Line Relocation Contract and the Gas Transmision Line Relocation Contract
which specify the scope of work, funding and timing for the project. During December 2013,
Waste Management contributed $250k to Louisville Gas and Electric (LG&E) for LG&E to
prepare estimates for the relocation of approximately 6,000 feet of an electric transmission line
and a natural gas pipeline. Following completion of the study and based on the estimates
provided, Waste Management expressed an interest in committing to the relocation of both lines
with construction to occur in 2017 and 2018. Upon approval of the projects, Waste Management
signed applications for relocation of the electric and gas transmission lines on an "actual cost"
basis. The application terms include Waste Management making periodic contributions
throughout the project and receiving either an invoice or a partial refund at the conclusion of the
project depending on whether the actual cost exceeds or falls short of the estimate.

The gross cost of this project is estimated to be ████████ Waste Management will pay ████
████ of the costs through periodic contributions. Waste Management will not pay ████
for the difference in the diameter of the gas pipe being relocated and that of the pipe that LG&E
may elect to use instead. The contributions will be taxable when received. Although Waste
Management will also not reimburse LG&E for the amount of the taxes paid, LG&E will recover
the entire amount of the tax payments through future tax savings through depreciation during the
following 20 years. The net present value of the difference in timing between payment and
recovery of the taxes is ($2.1M).

The project is included in the 2016 BP for net $0 ($10.9M gross) and the proposed 2017 BP through net $0 ($9.1M gross). As the scope, timing and certainty of work has evolved, the estimates have been further refined. The unreimbursed portion of the project will be addressed by the Corporate RAC and in the 2018 BP. All gross and net amounts included in the electric and gas contract agreements are based on the estimates for the project.

Background

LG&E was approached by Waste Management during mid-2013 to provide an estimate to relocate approximately 6,000 feet of both the electric and gas transmission lines that currently bisect their recycling and disposal facility commonly referred to as the Outer Loop landfill. This would provide Waste Management several additional years during which the facility could remain in active operation and accept waste deliveries. The timing of Waste Management's request is due partly to their current engagement in a project to expand the footprint of their fillable area. The contract specifies that LG&E will complete the project on or before March 1, 2019. During December 2013, Waste Management contributed $250k to fund the study necessary to produce the estimates for the relocation of the 138KV Appliance Park – Ashbottom electric transmission line and the 20" Preston-Penile natural gas transmission pipeline. Concurrent to Waste Management's design efforts on their disposal facility expansion and in cooperation with their contracted consulting engineer, relocation plans were developed and estimates were prepared for these company facilities. Gas management is considering increasing the size of this pipeline from 20" to 24" and assuming that 24" pipe is installed, Waste Management would be paying what it would cost to relocate a 20" pipeline.
Through August 2016, LG&E has spent approximately $74k of the $250k contribution for the study. Both the study costs and contribution will ultimately be transferred to this project, and any of the unspent contribution will be applied to the cost of the construction.

Following is an aerial view of the relocation where the red line represents the existing route and the green line the proposed.


- **Alternatives Considered (1 –Recommendation, 2 –Do nothing, 3 –Next Best Alt)**
  1. Recommendation: NPVRR: ($000s) $0.6M net
     Taxes on contributions received   NPV: ($000s) ($ 2.1M)
     The recommended project is to relocate, at the request of Waste Management, the gas and electric transmission lines that bisect their Outer Loop Landfill in order to accommodate their expansion of that facility. As part of the gas location, LG&E will install a larger diameter (24") gas pipeline than the existing size gas pipeline (20"). Waste Management will pay for the cost of the relocation but will not pay for the difference in cost related to the difference in the size of the pipe. As such, 96% of the costs of this project through periodic contributions. The contributions will be taxable when received. Although Waste Management will not reimburse LG&E for the amount of the taxes paid, LG&E will recover the entire amount of the tax payments through future tax savings during the following 20 years. The Net Present Value of the tax payments, as calculated by the Corporation Tax Department outside of the CEM, is ($2.1M). Separate CEMs were completed for the electric and gas projects. The NPVRR above is the sum of both.

  2. Relocate with 20" gas pipeline   NPVRR: ($000s) $0.0M net
     Taxes on contributions received   NPV: ($000s) ($2.1M)
     To relocate, at the request of Waste Management, the gas and electric transmission lines that bisect their Outer Loop Landfill in order to accommodate their expansion of that facility using the existing 20" diameter gas pipeline. Under this alternative, Waste Management would pay 100% of the costs of the relocation through periodic contributions. However, increasing the gas pipeline diameter from 20-inches to 24-

inches supports future system planning and provides flexibility for system alignment. Although. Thus, installing a new 20" segment of pipeline is not recommended.

3. Do Nothing: NPVRR: ($000s) N/A
   Because the company transmission lines exist in private easements the company has the right to refuse to relocate. However, there is no net cost to accommodate the request and the company would risk community relation issues if such a refusal were to be portrayed as contributing to increased waste removal costs if Waste Management were forced to prematurely close their facility.

4. Relocate along a different route: NPVRR: ($000s) $0.9M net
   An alternate route along route KY 1065 (the Outer Loop) was considered but rejected due to increased length (approximately 150% longer) and due to a greater portion of the land required for it being designated wetlands. The increased length would result in more energy transmission losses for both the electric and gas transmission lines and greater maintenance costs. The larger resulting footprint in the wetlands would result in increased environmental risks with no benefit to the company.

Project Description

- **Electric Transmission Project Scope and Timeline**
  The electric transmission materials will be ordered upon project approval and after execution of the relocation agreement. Waste Management has proposed the construction of an access road around the perimeter of the fill boundary that will be within the transmission and gas easement. The final grade of the access road must be achieved before construction of the transmission line can begin as it will be a significant increase in grade. Waste Management is responsible for the construction of the access road. Once this is achieved, seven spans of the line will be constructed first (the relocated portion) and the tie in with the main circuit will need to occur during a period of low demand. The first milestone is the design of the deep drilled shaft foundations for each proposed structure location which will begin upon project approval. Once the design of the foundations is complete, construction will be scheduled. Once the tie in is complete, the existing lattice tower line will be removed.

Waste Management Access Road (begin construction)	January 2017 – March 2017
Design Foundations	May 2017 – June 2017
Order Material	January 2017
Receive Material	March 2017 – April 2017
Begin Construction (contingent on WM access road)	October 2017
Remove Lattice Towers	October – November 2018
Complete Construction	November 2018

- **Gas Project Scope and Timeline**
  The gas transmission pipeline materials will be ordered upon project approval and after execution of the relocation agreement in time for construction after the 2017-2018 heating

season. Construction is timed to allow Waste Management time to re-grade the area where though company facilities will be located. The completion is timed to provide an adequate allowance for the tie-in of the new pipeline to be made during a period of low demand.

Design and layout to be completed	October 2016
Construction contract to be awarded	May 2017*
Major materials (pipe and fittings) to be ordered	October 2017
Major materials to be received	March 2018
Construction to begin	March 2018
Construction to be completed	September 2018
Tie-in to be completed	October 2018

     * Contract award date is not set yet. A contract could be awarded as early as January 2017 if Waste Management decides to commit to gas construction work in 2018.

- **Project Cost** (Gross Costs)

	Electric	Gas	Total
Gross Cost	$9.0M	$4.4M	$13.4M
Contingency	10%	10%	

Economic Analysis and Risks

- **Bid Summary**

Electric Transmission:
Based on preliminary engineering, Transmission Lines has estimated the material package for construction of this project to be $1,593k. This project will utilize standard and custom steel structures that will be ███████████████████████████████ The line construction will be based on continuing contracts with our line contractors. Davis H. Elliot, Pike Electric, B&B Electric and William E. Groves are the four contractors which have been awarded the T&D Overhead Construction Maintenance contracts.

Gas Transmission:
Material costs are based on a quote from ████████████████ Construction of the gas pipeline will be completed by traditional trenching methods. Gas pipeline construction bids were received from several gas pipeline contractors including contractors which have completed several pipeline projects for LG&E.

- **Assumptions**

It is expected that a Certificate of Public Convenience and Necessity (CPCN) will be needed from the Kentucky Public Service Commission (KPSC) for the electric relocation. Approval of the CPCN is not expected to result in delays as the relocation is limited to property owned by Waste Management.

A significant amount of trash was encountered in the geotechnical analysis for the structure foundations. Poor geotechnical conditions were therefore assumed in the estimation process. This led to a highly conservative assumption for the size and installation techniques of the drilled shaft foundations. It was also anticipated that lead paint would be encountered in the lattice towers which considerably increased the estimated cost of removal.

Retirement of the old gas pipeline assumes that if PCBs (Polychlorinated Biphenyls) are detected the level will be below the thresholds that require draining and disposal of liquids or

grouting of the line. At this time Waste Management has not decided whether it will have entire length of the old pipe removed, thus its removal cost has not been included.

It is expected that the fill in which the pipeline will lay will be compacted clay and the native material will be clay with the possibility of encountering soft shale or small pockets of mixed clay and trash. It is assumed that hazardous materials will not be encountered.

It is expected the natural gas pipeline can be installed without having to use Horizontal Directional Drilling (HDD) construction methods.

Waste Management obtains all required permits.

- **Environmental**
  A lead paint inspection will precede the removal of the existing lattice towers. If lead paint is detected, special precautions will be taken when removing.

  Part of the agreement between the company and Waste Management is for Waste Management to obtain all necessary permits including environmental. It is planned for the old pipeline to be retired in place in accordance with regulations applicable to asbestos and potential PCB disposal. Environmental Affairs has been providing guidance on permit and disposal issues.

  There are no known environmental issues regarding air, water, lead, asbestos, etc., associated with the electric transmission relocation.

- **Risks**
  Potential risks for completing the project include unknown weather conditions, difficulty in coordinating work with Waste Management's site contractor, encountering unexpectedly large volumes of buried trash, etc. Completing the project subjects the company to only the direct financial risks of the difference in cost related to the increased size of pipeline; otherwise, there is no direct financial risk beyond the remote possibility that the actual cost will exceed the applicant's contribution and the applicant will not be able to pay the difference. (Senior notes issues by Waste Management in 2015 were assigned an A- rating by S&P.) Potential customer relation issues if actual costs are significantly higher than estimates.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the Transmission Relocation for Expansion of Waste Management's Outer Loop R.D.F. project for $13.4M gross capital ($0.5M net) to accommodate Waste Management's request to relocate the electric and gas transmission lines that bisect its Outer Loop recycling and disposal facility, along with approval of the associated Electric Transmission Line Relocation Contract and the Gas Transmision Line Relocation Contract which specify the scope of work and funding for the project.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $1 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LG&E and KU Investment Committee. Pursuant to the LG&E and KU Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal Project 153351 Adams-Millersburg Pole Replacement　　　　**Arbough**

Investment Proposal for Investment Committee Meeting on: November 29, 2016

Project Name: Adams-Millersburg Pole Replacement

Total Expenditures: $4,528k
Total Contingency: $412k (10%)

Project Number(s): 153351

Business Unit/Line of Business: Transmission Lines

Prepared/Presented By: Joe Mina/Adam Smith

Executive Summary

The proposed project is to replace seventy-five (75) existing wood structures with seventy-five (75) steel structures, and one (1) existing steel switching station with one (1) steel single pole structure on the Adams-Millersburg 69kV line based on the results of a routine line inspection. The recommendation is to replace the structures energized due to the difficulty in obtaining an extended outage. If the opportunity to complete the project de-energized would occur, we would pursue this option and it would reduce the cost by $965k   As such, this proposal is to proactively replace them over the course of the next year, prior to failure, to ensure the integrity and reliability of this line and to prevent outages resulting from such failures.

The alternative of replacing poles upon failure will result in much higher long term replacement costs due to mobilization of crews back to the site each time one fails and the probable overtime work involved in replacing each during an emergency situation. This alternative would also have a negative impact on network reliability.

This project is not included in the 2016 Business Plan, however is included in the proposed 2017 Business Plan under the K9-2017 Priority Pole Replacement Blanket. All spending will occur in 2017.

Background   Arbough

Above ground pole inspections are performed by the company at defined intervals in order to discover problems that may impact the integrity and reliability of the Transmission System. During a routine climbing inspection of the Adams-Millersburg 69kV line, seventy-six (76) structures were identified as priority poles and found to be in need of replacement. All seventy-six (76) structures need to be replaced in order to ensure the integrity and reliability of this line. There are 510 total structures along this 35.37 mile line.

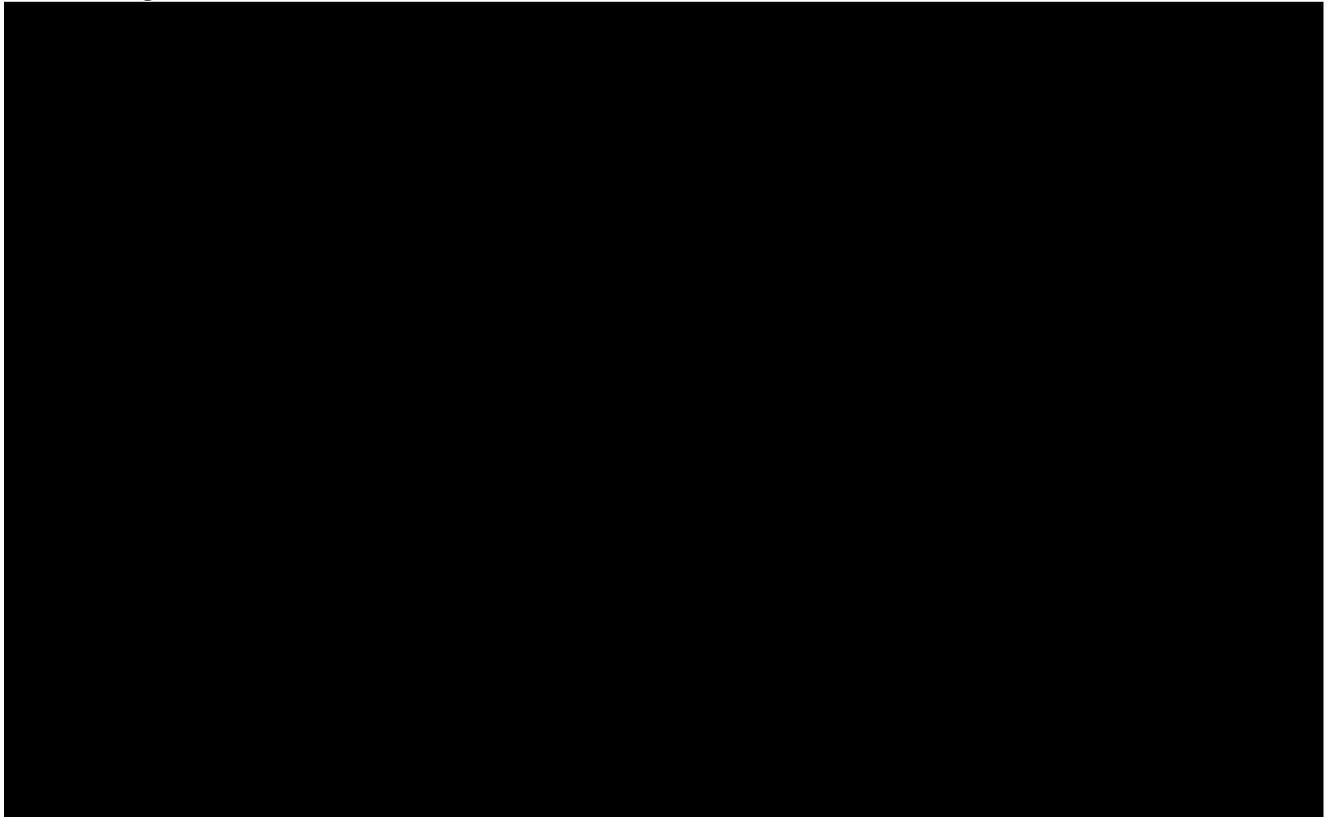
- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $5,680k
        The recommendation is to replace the structures energized due to the difficulty in obtaining an extended outage. If the opportunity to complete the project de-energized would occur, we would pursue this option and it would reduce the cost by $965k and the NVPRR by $1,210k.
    2. Alternative #1 (Do Nothing):   NPVRR: ($000s) $8,855k
        The alternative of do nothing would result in replacing the poles upon failure, which would result in a much higher long term replacement cost due to contract crew mobilization and overtime costs. This cost was derived by an estimated percentage of failure over the next four years. The failure rate and costs may vary depending on environmental factors. This option would also have a negative impact on reliability.
    3. Alternative #2 (Next Best Alternative):   NPVRR: ($000s) $7,357k
        The next best alternative would be to replace the seventy-five (75) of the proposed seventy-six (76) structures with wood. The manufacturer's recommended life span of a wood pole is 30-35 years, whereas steel poles have a recommended life span of 90 years. This option assumes replacement of wood structures in 30 years and an escalation factor of 4% which is in line with market cost increases over the last 15 years.

Project Description

- **Project Scope and Timeline**
  The scope of work will consist of installing twenty-three (23) standard steel H-frame structures, forty-nine (49) standard single pole structures, one (1) custom steel single pole switch structure, one (1) steel lattice tower, one (1) steel 3-pole running corner, one (1) steel single pole running corner, and associated hardware and material, and the removal of seventy-five (75) wood structures, one (1) steel switching station, and associated hardware and material. The line construction will be based on continuing contracts from our line contractors. B&B, Elliot, Groves and Pike are the four contractors awarded the T&D Overhead Construction and Maintenance contract from the October 2011 Investment Committee meeting. The contract extension was re-approved by the IC in July of 2014. Construction is scheduled to begin in January of 2017 and be completed in April of 2017.

The construction milestones for this project are provided below: **Arbough**

Construction Milestones	
November 2016	Engineering and Design
December 2016	Steel Poles Ordered
January 2017	Steel Poles Received
January 2017	Line Construction Begins
April 2017	Line Construction Completed

A facility map of the Adams-Millersburg 69kV line is shown below:
Line length: 35.37 miles


- **Project Cost**
  The total project cost is $4,528k and was not included in the 2016 Business Plan, however is included in the proposed 2017 Business Plan under the K9-2017 Priority Pole Replacement blanket. All spending will occur in 2017. Historical and existing contract and purchasing agreements were used to estimate the cost of material and contract labor. This project contains a 10% contingency which is reasonable based on the level of detailed engineering, confidence in cost of materials and contractors, and potential unknown risks such as weather delays, rock, structure access, and potential outage restrictions.

Economic Analysis and Risks

- **Bid Summary**

Based on preliminary engineering, Transmission Lines has estimated the material package for construction of this project to be $1,119k. This project will utilize standard and custom steel structures. The steel structures will be purchased through ███████████ ████████ Hardware will be purchased through ██████████████. The line construction will be based on continuing contracts with our line contractors. Davis H. Elliot, Pike Electric, B&B Electric and William E. Groves are the four main contractors which have been awarded the T&D Overhead Construction and Maintenance contracts.

Transmission Lines Material Cost Breakdown	
Material	**Cost**
Steel Poles	$1,043k
Hardware	$76k
Total	$1,119k

- **Budget Comparison and Financial Summary**

2. Project O&M 2016 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

The 2017 spending is included in the proposed 2017 Business Plan under the K9-2017 Priority Pole Replacement Blanket.

Financial Summary ($000s):

Discount Rate: 6.49%

Capital Breakdown:

Labor:	$176k
Contract Labor:	$2,322k
Materials:	$1,119k
Local Engineering:	$275k
Burdens:	$224k
Contingency:	$412k
Reimbursements:	($0)
Net Capital Expenditure:	$4,528k

Financial Analysis - Project Summary ($000)	2017	2018	2019	2020	2021	Life of Project
Project Net Income	$ 96	$ 182	$ 176	$ 169	$ 163	$ 4,038
Project ROE	5.1%	7.5%	10.0%	10.0%	10.0%	9.8%

- **Assumptions**

  Recommendation – The cost of this alternative assumes that the line outage will not be available and the structure replacements will need to be completed with the 69kV line energized.

  Do nothing alternative – The cost of this alternative would be approximately 60% higher due to overtime labor charges and the cost to mobilize and demobilize the construction crews. These poles would fail and require replacement within the next four years.

  Next best alternative - The cost of this alternative assumes the cost of the wood poles is 28% of the cost of the steel poles, and that the wood poles would be replaced again in 30 years.

- **Environmental**
  There are no known environmental issues regarding air, water, lead, asbestos, etc., associated with this project.

- **Risks**
  Without the proposed replacement of the priority poles on the Adams-Millersburg 69kV line, the company risks unplanned outages and increased cost of repairs in emergency situations. Inclement weather which affects site access and working conditions could increase the project cost and cause schedule delays.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Adams-Millersburg Pole Replacement project for $4,528k to maintain system integrity, reliability, and to prevent failures and unplanned outages.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $1 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

_____   _____
Kent W. Blake   Victor A. Staffieri
Chief Financial Officer   Chairman, CEO and President

Investment Proposal for Investment Committee Meeting on: November 28, 2018

Project Name: Earlington North-Green River Pole Replacement

Total Expenditures: $8,766k
Total Contingency: $797k (10%)

Project Number(s): 156689

Business Unit/Line of Business: Transmission Lines

Prepared/Presented By: Addam Gooch/Adam Smith

Executive Summary
The proposed project is to replace ninety-six (96) wood structures on the Earlington North-Green River Plant 161kV line with new steel structures. The scope of work includes the replacement of eighty-nine (89) structures identified through inspection in 2017. The replacement of seven (7) additional adjacent structures is required to accommodate the height of the new structures. Due to the difficulty in obtaining an extended outage, approximately 50% of the ninety-six (96) structures will be completed energized when they are replaced. If the opportunity to complete the entire project de-energized would occur, this option would be pursued and would reduce the cost by $612k.

The alternative of replacing poles upon failure will result in much higher long term replacement costs due to mobilization of crews back to the site each time one fails and the probable overtime work involved in replacing each during an emergency situation. This alternative would also have a negative impact on network reliability. As such, this proposal is to proactively replace them over the course of the next year, prior to failure, to ensure the integrity and reliability of this line and to prevent outages resulting from such failures.

This project was included in the 2019 Business Plan (BP) for $4,713k with estimated spend of $447k in 2018, $3,364k in 2019, and $902k in 2020. The current total project cost is $8,766k, with estimated spend of $178k in 2018, and $8,588k in 2019. Subsequent to the 2019 BP planning, a decision was made to complete 50% of the ninety-six (96) structures energized. In addition, seven (7) adjacent structures will need to be replaced in order to accommodate the height of the new structures. This project also includes funding for storm water pollution prevention, wetlands permitting, and entrance matting for structure access. The 2018 spend was approved by the RAC in the 11+1 forecast. Incremental funding in the amount of $5,224k will be sourced by a reallocation of other Transmission projects scheduled for 2019.

Background

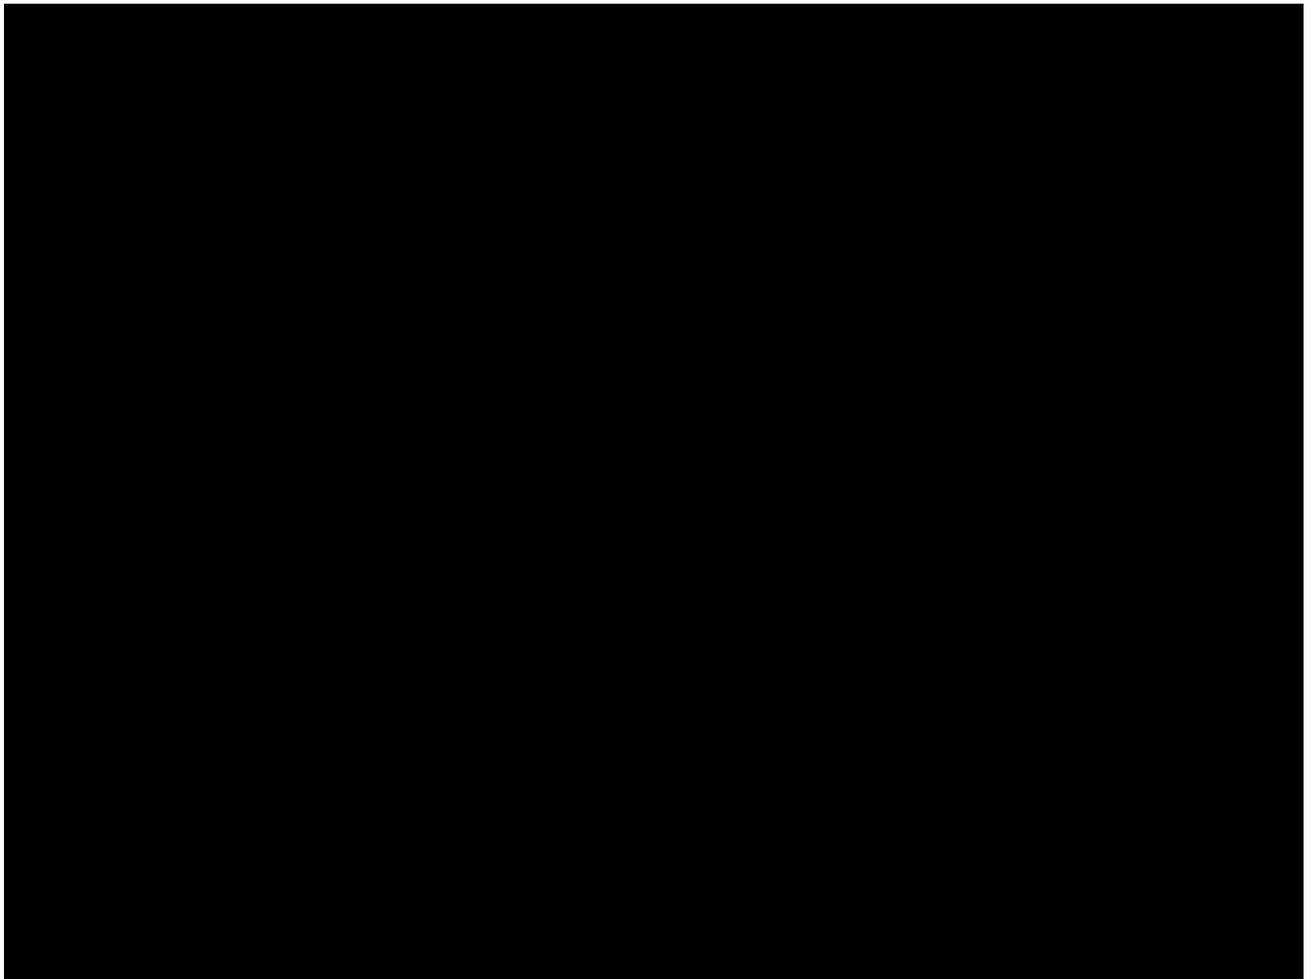
Above ground pole inspections are performed by the company at defined intervals in order to discover problems that may impact the integrity and reliability of the Transmission System. A routine climbing inspection of the Earlington North-Green River Plant 161kV line was completed in 2017, and eighty-nine (89) structures were identified as priority poles and determined to be in need of replacement in order to ensure the integrity and reliability of this line. The replacement of seven (7) additional adjacent structures is required to accommodate the height of the new structures. Due to the location of the structures, AECOM will be used to determine the extent of the geographic location of the wetlands area, and provide support in developing the storm water pollution prevention plan (SWPPP). Assistance will also be provided to obtain the required wetlands permitting. Access matting will also be needed to gain entrance to the structures.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $10,262
     Due to the difficulty in obtaining an extended outage, 50% of the ninety-six (96) wood structures will be completed energized when they are replaced with steel structures. If the opportunity to complete the entire project de-energized would occur, this option would be pursued and would reduce the cost by $612k and the NPVRR by $715k.
  2. Alternative #1:   NPVRR: ($000s) $15,749
     The alternative of do nothing would result in replacing the poles upon failure, which would result in a much higher long term replacement cost due to contract crew mobilization and overtime costs. This cost was derived by an estimated percentage of failure over the next four years. The failure rate and costs may vary depending on environmental factors. This option would also have a negative impact on network reliability.
  3. Alternative #2:   NPVRR: ($000s) $11,414
     The next best alternative would be to replace the poles with wood structures. The recommended life span of a wood pole is 30-35 years, whereas steel poles have a recommended lifespan of 90 years. This option assumes replacement of wood structures in 30 years and an escalation rate of four percent (4%) which is in line with market cost increases over the last 15 years.

Project Description

- **Project Scope and Timeline**
  The scope of work will consist of installing eighty-eight (88) steel H-frame structures, three (3) steel three pole running corners, five (5) steel dead end structures, and associated hardware and material, and the removal of ninety-six (96) wood structures, and associated hardware and material. Construction is scheduled to begin in January of 2019 and be completed in May of 2019.

Construction Milestones	Arbough
September 2018	Engineering and Design
September 2018	Space reserved for steel pole production with manufacturer
November 2018	Steel Poles Ordered to Inventory
January 2019	Steel Poles Received to Inventory
January 2019	Line Construction Begins
May 2019	Line Construction Completed

A facility map of the Earlington North-Green River Plant 161kV line is shown below:


- **Project Cost**

  The current total project cost is $8,766k. This project contains a 10% contingency which is reasonable based on the level of detailed engineering, confidence in cost of materials and contractors, and potential unknown risks such as weather delays, rock, structure access, and potential outage restrictions.

Economic Analysis and Risks

- **Bid Summary**
  Based on preliminary engineering, Transmission Lines has estimated the material packages for construction of this project to be $2,405k. This project will utilize standard and custom steel structures. The steel structures will be purchased through ████████████████ ████████████████████ The line construction will be based on continuing contracts with the Company's line contractors. Davis H. Elliot, Pike Electric, B&B Electric and William E. Groves are the four main contractors which have been awarded the Transmission Overhead Construction and Maintenance contracts.

Transmission Lines Material Cost Breakdown	
Material	**Cost**
Steel Poles	$2,262k
Hardware	$143k
Total	$2,405k

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2018	2019	2020	Post 2020	Total
1. Capital Investment Proposed	178	6,935	-	-	7,113
2. Cost of Removal Proposed		1,653	-	-	1,653
3. Total Capital and Removal Proposed (1+2)	178	8,588	-	-	8,766
4. Capital Investment 2019 BP	447	3,364	902		4,713
5. Cost of Removal 2019 BP	-	-	-	-	-
6. Total Capital and Removal 2019 BP (4+5)	447	3,364	902	-	4,713
7. Capital Investment variance to BP (4-1)	269	(3,571)	902	-	(2,400)
8. Cost of Removal variance to BP (5-2)	-	(1,653)	-	-	(1,653)
9. Total Capital and Removal variance to BP (6-3)	269	(5,224)	902	-	(4,053)

1. Project O&M Proposed	-	-	-	-	-
2. Project O&M 2019 BP	-	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-	-

Financial Summary ($000s):

Discount Rate: 6.59%

Capital Breakdown:

  Labor: $249

  Contract Labor: $4,039

  Materials: $2,412

  Local Engineering: $614

  Burdens: $655

  Contingency: $797

  Reimbursements: ($0)

  Net Capital Expenditure: $8,766

- **Assumptions**

  Recommendation – The cost of this alternative assumes that the line outage will not be available for the duration of the project, and approximately 50% of the ninety-six (96) structures will need to be completed with the 161kV line energized.

  Alternative #1 – The cost of this alternative would be approximately 60% higher due to overtime labor charges and the cost to mobilize and demobilize construction crews. These poles would fail and require replacement within the next four years.

  Alternative #2 – The cost of this alternative assumes the cost of the wood poles is 31% the cost of the steel poles, and that the wood poles would be replaced again in 30 years. The estimated life of the steel poles is 90 years.

- **Environmental**

  There are no known environmental issues regarding air, water, lead asbestos, etc., associated with this project.

- **Risks**

  Without the proposed replacement of the priority poles on the Earlington North-Green River Plant 161kV line, the company risks unplanned outages and increased cost of repairs in emergency situations. Inclement weather which affects site access and working conditions could increase the project cost and cause schedule delays. Schedule delays may also occur if the required wetlands permitting is not received within the required timeframe.

Conclusions and Recommendation Arbough

It is recommended that the Investment Committee approve the Earlington North-Green River pole replacement project for $8,766k to maintain system integrity, reliability, and to prevent failures and unplanned outages.

<u>Approval Confirmation for Capital Projects Greater Than $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal Project 156691 Grahamville-Paducah Primary Pole Replacement Although

---

Investment Proposal for Investment Committee Meeting on: October 31, 2018

Project Name: Grahamville-Paducah Primary Pole Replacement

Total Expenditures: $2,399k
Total Contingency: $218k (10%)

Project Number(s): 156691

Business Unit/Line of Business: Transmission

Prepared/Presented By: Addam Gooch/Adam Smith

Executive Summary

The proposed project is to replace thirty-five (35) wood structures on the Grahamville-Paducah Primary 161kV line with new steel structures. The scope of work includes the replacement of thirty-five (35) structures identified through inspection in 2017. Due to the difficulty in obtaining an extended outage, approximately 50% of the thirty-five (35) structures will be completed energized when they are replaced. If the opportunity to complete the entire project de-energized would occur, this option would be pursued and would reduce the cost by $199k.

The alternative of replacing poles upon failure will result in much higher long term replacement costs due to mobilization of crews back to the site each time one fails and the probable overtime work involved in replacing each during an emergency situation. This alternative would also have a negative impact on network reliability. As such, this proposal is to proactively replace them over the course of the next year, prior to failure, to ensure the integrity and reliability of this line and to prevent outages resulting from such failures.

This project was included in the 2019 Business Plan (BP) for $2,280k with estimated spend of $318k in 2018 and $1,962k in 2019. The current total project cost is $2,399k, with all spending to occur in 2019. Subsequent to the 2019 BP planning, a decision was made to complete construction of the project in 2019 due to potential material delays. In addition, funding in the amount of $119k was identified for incremental site clearing. The incremental funding of $437k was funded by a reduction in the K9-2019 pole replacement blanket.

Background   **Arbough**

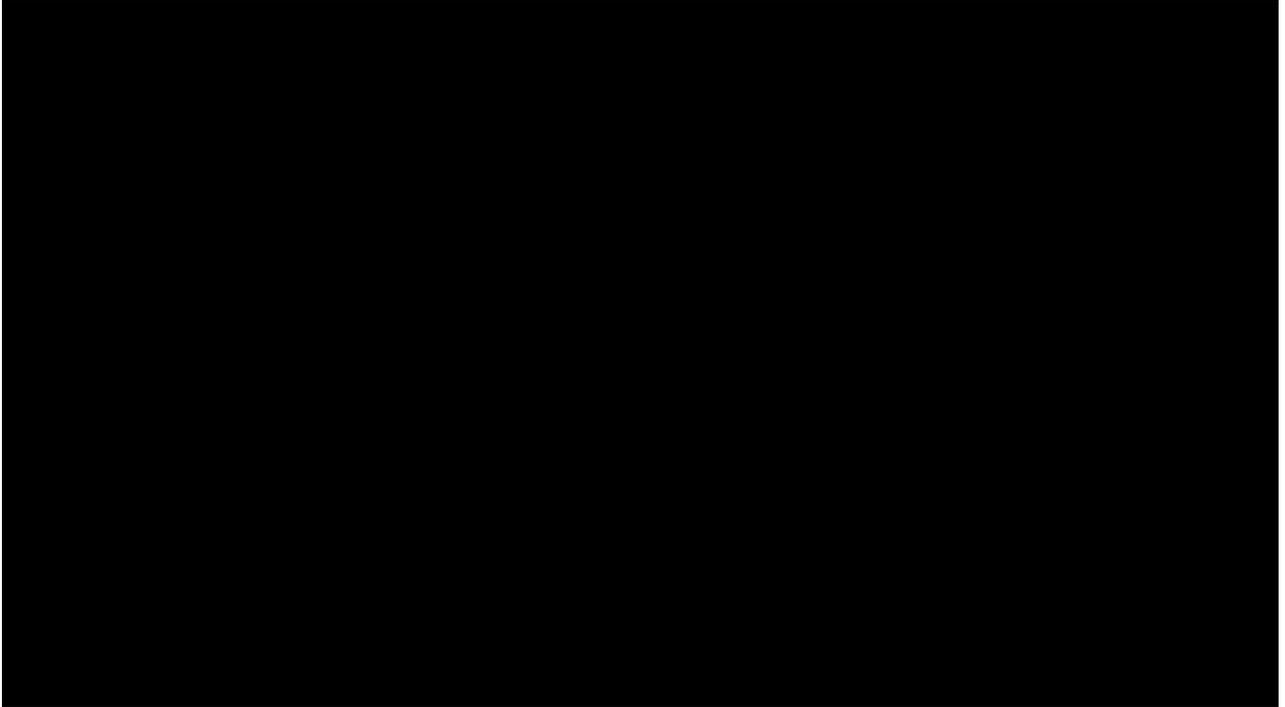
Above ground pole inspections are performed by the company at defined intervals in order to discover problems that may impact the integrity and reliability of the Transmission System. A routine climbing inspection of the Grahamville-Paducah Primary 161kV line was completed in 2017, and thirty-five (35) structures were identified as priority poles and determined to be in need of replacement in order to ensure the integrity and reliability of this line.

- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $2,989
       Due to the difficulty in obtaining an extended outage, 50% of the thirty-five (35) wood structures will be completed energized when they are replaced with steel structures. If the opportunity to complete the entire project de-energized would occur, this option would be pursued and would reduce the cost by $199k and the NPVRR by $263k.
    2. Alternative #1: Do Nothing   NPVRR: ($000s) $4,298
       The alternative of do nothing would result in replacing the poles upon failure, which would result in a much higher long term replacement cost due to contract crew mobilization and overtime costs. This cost was derived by an estimated percentage of failure over the next four years. The failure rate and costs may vary depending on environmental factors. This option would also have a negative impact on network reliability.
    3. Alternative #2:   NPVRR: ($000s) $3,087
       The next best alternative would be to replace the poles with wood structures. The recommended life span of a wood pole is 30-35 years, whereas steel poles have a recommended lifespan of 90 years. This option assumes replacement of wood structures in 30 years and an escalation rate of four percent (4%) which is in line with market cost increases over the last 15 years.

Project Description

- **Project Scope and Timeline**
  The scope of work will consist of installing twenty-nine (29) standard steel H-frame structures, six (6) steel three pole running corner, and associated hardware and material, and the removal of thirty-five (35) wood structures, and associated hardware and material. Construction is scheduled to begin in January of 2019 and be completed in May of 2019.

Construction Milestones	
August 2018	Engineering and Design
August 2018	Space reserved for steel pole production with manufacturer
November 2018	Steel Poles Ordered
January 2019	Steel Poles Received
January 2019	Line Construction Begins
May 2019	Line Construction Completed

A facility map of the Grahamville-Paducah Primary 161kV line is shown below:


- **Project Cost**

The current total project cost is $2,399k. This project contains a 10% contingency which is reasonable based on the level of detailed engineering, confidence in cost of materials and contractors, and potential unknown risks such as weather delays, rock, structure access, and potential outage restrictions.

Economic Analysis and Risks

- **Bid Summary**

Based on preliminary engineering, Transmission Lines has estimated the material packages for construction of this project to be $861k. This project will utilize standard steel structures. The steel structures will be purchased through ███████████████████ ███████████. The line construction will be based on continuing contracts with the Company's line contractors. Davis H. Elliot, Pike Electric, B&B Electric and William E. Groves are the four main contractors which have been awarded the Transmission Overhead Construction and Maintenance contracts.

Investment Proposal Project LI-000030 Lancaster-Danville East Pole ReplacementArbough

---

Investment Proposal for Investment Committee Meeting on: September 26, 2018

Project Name: Lancaster-Danville East Pole Replacement

Total Expenditures: $3,107k
Total Contingency: $282k (10%)

Project Number(s): LI-000030

Business Unit/Line of Business: Transmission Lines

Prepared/Presented By: Addam Gooch/Adam Smith

Executive Summary
The proposed project is to replace eighty-six (86) wood structures, on the Lancaster-Danville East 69kV line with new steel structures during a scheduled outage. The scope of work includes the replacement of sixty-four (64) structures identified through inspection in 2017. The replacement of twenty-two (22) additional adjacent structures is required to accommodate the increased height of the new structures. This project will begin in January of 2019 and is being submitted for approval in 2018 to ensure the project will be open and ready for charges beginning January 1, 2019.

The alternative of replacing poles upon failure will result in much higher long term replacement costs due to mobilization of crews back to the site each time one fails and the probable overtime work involved in replacing each during an emergency situation. This alternative would also have a negative impact on network reliability. As such, this proposal is to proactively replace them over the course of the next year, prior to failure, to ensure the integrity and reliability of this line and to prevent outages resulting from such failures.

This project was included in the 2018 Business Plan (BP) for $3,200k for work to be completed in 2019. The current total project cost is $3,107k and is consistent with the proposed 2019 BP.

Background   **Arbough**

Above ground pole inspections are performed by the company at defined intervals in order to discover problems that may impact the integrity and reliability of the Transmission System. A routine climbing inspection of the Lancaster-Danville East 69kV line was completed in 2017, sixty-four (64) structures were determined to be in need of replacement in order to ensure the integrity and reliability of this line. In addition, twenty-two (22) additional adjacent structures will also need to be replaced in order to accommodate the height of the new structures.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $3,871
     The recommendation is to replace all eighty-six (86) wood structures with new steel structures during a scheduled outage.
  2. Alternative #1:   NPVRR: ($000s) $5,568
     The alternative of do nothing would result in replacing poles upon failure, which would result in a much higher long term replacement cost due to contract crew mobilization and overtime costs. This cost was derived by an estimated percentage of failure over the next four years. The failure rate and costs may vary depending on environmental factors. This option would also have a negative impact on reliability.
  3. Alternative #2:   NPVRR: ($000s) $4,042
     The next best alternative would be to replace eighty-six (86) existing wood structures with new wood structures. The recommended life span of a wood pole is 30-35 years, whereas steel poles have a recommended life span of 90 years. This option assumes replacement of wood structures in 30 years and an escalation factor of 4% which is in line with market cost increases over the last 15 years.

Project Description

- **Project Scope and Timeline**
  The scope of work will consist of installing sixty-five (65) standard steel Z-frame structures, three (3) steel single-pole running corners, two (2) steel single pole dead end structures, sixteen (16) standard steel H-frame structures, and associated hardware and material, and the removal of eighty-six (86) wood structures, and associated hardware and material. The line construction will be based on continuing contracts from the Company's line contractors. B&B Electric, Davis H. Elliot, William E. Groves and Pike Electric are the four contractors awarded the Transmission Overhead Construction and Maintenance contract from the October 2011 Investment Committee meeting. A two-year optional contract extension was approved by the IC in April of 2017. Construction is scheduled to begin in January of 2019 and be completed in June of 2019.

Construction Milestones	
June 2018	Engineering and Design
July 2018	Space Reserved with Steel Pole Manufacturer
October 2018	Steel Poles Ordered to Inventory

January 2019	Steel Poles Removed from Inventory**Arbough**
January 2019	Line Construction Begins
June 2019	Line Construction Completed

A facility map of the Lancaster-Danville East 69kV line is shown below:

- **Project Cost**
  This project was included in the 2018 Business Plan (BP) for $3,200k for work to be completed in 2019. The current total project cost is $3,107k and is consistent with the proposed 2019 BP. This project contains a 10% contingency which is reasonable based on the level of detailed engineering, confidence in cost of materials and contractors, and potential unknown risks such as weather delays, rock, structure access, and potential outage restrictions.

Economic Analysis and Risks

- **Bid Summary**
  Based on preliminary engineering, Transmission Lines has estimated the material packages for construction of this project to be $1,062k. This project will utilize standard steel structures. The steel structures will be purchased through ███████████████ ████████████████████ The line construction will be based on continuing contracts with the Company's line contractors. Davis H. Elliot, Pike Electric, B&B Electric and William E. Groves are the four main contractors which have been awarded the Transmission Overhead Construction and Maintenance contracts.

Transmission Lines Material Cost Breakdown	
Material	**Cost**
Steel Poles	$1,010k
Hardware	$52k
Total	$1,062k

Capital Investment Proposal

Investment Proposal for Investment Committee Meeting on: April 25, 2018

Project Name: Mobile Control House

Total Expenditures: $2,727k   (Including $249k of contingency)

Project Number(s): 151465

Business Unit/Line of Business: Transmission

Prepared/Presented By: Aaron Burns, Sargent & Lundy/Brent Birchell

---

Executive Summary

Transmission has initiated a strategic objective to improve the overall resiliency of the LG&E/KU (LKE) grid. The two primary components of this plan consist of: 1) Physical Security improvements to mitigate threats to the Transmission Substation facilities and 2) Procurement of spare equipment required to recover from a High Impact Low Frequency (HILF) event.   Although our comprehensive resiliency program is not required for compliance, there has been an increased focus on the resiliency of the grid.

Existing LG&E/KU transmission protection and control (P&C) equipment is typically contained in a single control house located at each site. A catastrophic event at a control house would cause a complete loss of transmission P&C equipment resulting in a prolonged transmission outage of multiple lines and transformer capacity. Complete restoration of a control house could take 18-24 months and the station would be inoperable during this time.

By procuring a Mobile Control House, LKE would gain the option of deploying a prefabricated control house capable of restoring a sufficient level of P&C functionality at any existing station. The Mobile Control House can be deployed at any time without the need of permits, special tools, or special equipment. Obtaining a Mobile Control House will reduce the restoration time for the loss of a control house from 18–24 months down to 4-8 weeks.

The total cost of this project will be $2,727k with $1k in 2017, $538k in 2018 and $2,188k in 2019. This project was included in the 2018 BP for $3,959k with $75k in 2017, $419k in 2018 and $3,465k in 2019. The project is being accelerated to address the immediate need to strengthen LKE's resiliency posture instead of waiting on construction and delivery of the mobile control house in 2019. The higher estimated spending during 2018 will be addressed by the RAC in the 3+9 forecast.

Background   Arbough

The impact of a complete control house failure at a transmission station would have a severe impact on the LKE transmission system. The sudden and complete loss of transmission P&C at any station could take as long as 18-24 months to completely restore. The use of a Mobile Control House could reduce station restoration time down to 1-2 months and would provide adequate P&C functionality while a permanent control house is reconstructed and commissioned.

P&C needs at critical LG&E/KU stations such as ████████████████████ ████ were considered during preliminary engineering of the Mobile Control House. P&C needs at these stations were accounted for in the preliminary engineering design to ensure that a single Mobile Control House would be capable of supporting the needs at any existing LG&E/KU station. The preliminary Mobile Control House design includes 23 standard LG&E/KU relay panels with microprocessor based protection schemes for Transformers, Transmission Lines, Bus Differentials, and UPLC transceivers. Additionally the Mobile Control House will contain a metering panel, SCADA, telecomm racks, and AC & DC panelboards. The preliminary control house layout is shown below.

Existing mobile control house solutions owned by other utilities (████ & ████████████████) were examined and considered during preliminary engineering for the project. The dimensions of the preliminary layout are based on standard ISO shipping container sizes, similar to what Southern Company utilizes for its mobile control house. This design offers the greatest amount of mobility for the unit as it can be deployed quickly without requiring any special transportation permits. Once deployed to a site, the mobile control house will be connected to existing

equipment with control cables that enter the termination cabinets through floor openings. Although mobile control house is intended to be utilized for emergency service restoration and will not be considered as a permanent solution for any control house replacement.

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $2,824
     It is recommended that a Mobile Control House be procured to increase reliability of the LG&E/KU transmission system by minimizing restoration time in the event of a catastrophic control house failure.

  2. Purchase two traditional small control houses: NPVRR: ($000s) $3,036
     This option is not advisable as the width of a traditional control house is 14 ft and would require special permitting to transport. This option lacks the mobility needed and requires additional time for the concrete pads to be installed and trenches to be dug. Additional deployment time is estimated at 1-2 months.

  3. Do Nothing: NPVRR: ($000s) N/A
     This option is not advisable as it would leave the LG&E/KU transmission system in an undesirable state in the event of a catastrophic control house failure. As noted above, restoration time would be 18-24 months and is therefore unadvisable. This alternative is not in alignment with the resiliency program strategic objectives.

Project Description

- **Project Scope and Timeline**

Description	Date
Preliminary Engineering	2/1/18
Submit RFP for Control House	5/1/18
Detailed Engineering Start	5/11/18
Engineering Complete	9/20/18
Receive Mobile Control House	1/7/19
Begin Testing and Check-Out	1/14/19
Complete Testing and Check-Out	4/15/19
Project Complete	4/30/19

- **Project Cost**

  The total cost of this project will be $2,727k with $1k in 2017, $538k in 2018 and $2,188k in 2019. This project was included in the 2018 BP for $3,959k with $75k in 2017, $419k in 2018 and $3,465k in 2019. The estimated total project figure includes a 10% contingency. This contingency is reasonable based on the level of detailed engineering and is expected to cover uncertainty with the material and contract labor costs based upon variances that have been observed on past projects.

Economic Analysis and Risks

- **Bid Summary**
  Bids for the Mobile Control House will be sent out soon after project approval.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	2020	Post 2020	Total

- **Assumptions**
Equipment lead time is similar to that of a standard control building. The Mobile Control House will be stored at an existing LKE facility.

- **Environmental**
This project does not require permitting and there are no known issues regarding air, water, waste, lead, or asbestos.

- **Risks**
The Mobile Control House is intended to be deployed during emergency situations, and therefore incurs minimal or no risk at this time.

Conclusions and Recommendation   **Arbough**

It is recommended that the Investment Committee approve the Mobile Control House project for $2,727k to improve the overall resiliency of the LKE grid.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Capital Investment Proposal   **Arbough**

Investment Proposal for Investment Committee Meeting on: April 26, 2017

Project Name: Spare 345/161 X 138kV, 450 MVA Transformer Purchase

Total Expenditures: $3,323k (Including $302k of Contingency)

Project Number(s): 151750

Business Unit/Line of Business: Transmission Substation Construction & Maintenance

Prepared/Presented By: Chris Talley – Director Transmission Engineering and Construction

---

Executive Summary
In November 2016, the North American Electric Reliability Corporation's (NERC) Reliability
Issues Steering Committee (RISC) issued recommendations to the NERC Board of Trustees
outlining strategic priorities of risks to the reliable operation of the bulk power system. Extreme
natural events (hurricanes, tornadoes, extreme temperatures, geomagnetic disturbances,
earthquakes, etc.) and physical security vulnerabilities are two of the nine risk profiles identified.
Extreme natural events, physical attacks and fire are examples of threats that, while having a low
probability of occurrence, can have a crippling effect on reliability of the electric grid if they
occur at certain locations. An evaluation of the loss of certain critical LG&E and KU (LKE)
substations was undertaken to determine the vulnerability of the system to extreme events. That
analysis shows that loss of certain key facilities could result in the inability to serve all firm load
for extended periods of time.   As indicated in the RISC report, "resilience and recovery actions
can mitigate exposure from multiple risks." One of the primary recommendations from the RISC
analysis is to focus on spare equipment strategies both to identify critical equipment and to
consider transportation logistics and requirements for replacing critical assets. NERC has
identified the limited availability of large power transformers as a "potential issue for critical
infrastructure resilience in the United States". While it is not possible to mitigate every threat,
utilities should be prepared to recover from the loss of key critical facilities. Maintaining an
adequate inventory of long lead, critical spares is a cost effective measure to help mitigate the
threat of low probability high impact event. This proposal recommends the purchase of a new
spare 345/161 X 138kV, 450 MVA Transformer to ensure adequate reserves of critical
transformers which can have a lead time of more than nine months.

The total cost of this project will be $3,323k, with $2,237k spending in 2017 and $1,086k
spending in 2018. $3,200k of funding was included in the 2017 BP for this project, with $75k
budgeted in 2017 and $3,125k budgeted in 2018. The unbudgeted amount in 2017 was approved
by the RAC in the 3+9 forecast.

Background
Specific to the LKE system, planning studies have indicated that it will take (2) 345/138kV
450MVA transformers to recover from a disaster scenario where multiple transformers at a

critical substation in the Louisville area are destroyed or severely damaged. ▮▮▮▮▮▮▮▮gh
▮▮

▮▮▮▮▮▮▮▮ An additional spare transformer is recommended so that LKE has adequate spares
to recover from a catastrophic event at this location.

There are (19) 345/138kV transformers and (3) 345/161kV transformers in service. Since April
of 2011, there have been (3) 345/138kV transformer failures. The Appendix shows a graph of
the ages of the 345kV transformers in the LKE System. This additional spare can be considered
not only a spare to recover from a disaster scenario, but it would also be considered an additional
spare in the event of loss of two 345kV transformers within a year.   This spare transformer will
be specified and located to ensure ability to get it to critical locations will be possible in a
reasonable time frame.

This proposal does not recommend further purchases to mitigate the threat of a coordinated
physical attack on multiple locations, or a widespread catastrophic event damaging transformers
at multiple locations. To address that threat, LKE is a member of the EEI Spare Transformer
Equipment Program (STEP) which facilitates the sharing of spare transformers in the event of a
terrorist attack and resulting declaration of emergency by the President of the United States. LKE
is also leading the development of a new mutual assistance group for transmission equipment
called RESTORE.   The vision of RESTORE is to proactively create a pool of spare transformers
that will be sold between members in the event of a catastrophic event in which one member is at
risk of not being able to serve significant load for an extended period and has exhausted all of its
available spares.

- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $3,884k
       It is recommended that a spare 345/161X138, 450 MVA transformer be purchased to
       reduce the potential risk to the Transmission system.

    2. Alternative #1:   NPVRR: ($000s) $7,769k
       An alternative to LKE's resilient spare is to purchase a highly optimized transformer
       specifically designed for HILF events. These types of transformers reduce the
       installation time by weeks but have a much shorter life due to design. These
       transformers are new in design true to the nature of the response and reliability has
       not yet been proven.

    3. Do Nothing: NPVRR: ($000s) N/A
       This is not recommended as this is a strategic initiative to mitigate a low probability,
       very high consequence risk and to ensure adequate spares for the 345-138 and 161kV
       systems to mitigate the risk of transformer failure from routine causes.

Project Description

- **Project Scope and Timeline**

Description	Date
Project Approved	April, 2017
Materials Ordered	May, 2017
Engineering Complete	July, 2017
Construction Complete (Foundation, Oil Containment)	Sept, 2017
Materials Received	Jan, 2018
Project Complete	April, 2018

- **Project Cost**
The total cost of this project will be $3,323k, with $2,237k spending in 2017 and $1,086k spending in 2018. $3,200k of funding was included in the 2017 BP for this project, with $75k budgeted in 2017 and $3,125k budgeted in 2018. The unbudgeted amount in 2017 was approved by the RAC in the 3+9 forecast. The estimated total project figure includes a 10% contingency. This contingency is expected to cover uncertainty with the cost of the transformer as the market has been volatile over the past few years.

Economic Analysis and Risks

- **Bid Summary**
This transformer will be bid out and awarded immediately after Investment Committee approval. The bid evaluation process will closely follow previous transformer purchases.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2017	2018	2019	Post 2019	Total

Financial Summary ($000s):   **Arbough**

Discount Rate: 6.5%

Capital Breakdown:

   Labor: $47k

   Contract Labor: $150k

   Materials: $2,432k

   Other: $0k

   Local Engineering: $304k

   Burdens: $88k

   Contingency: $302k

   Net Capital Expenditure: $3,323k

- **Assumptions**

  The cost of the transformer is based on estimates from vendors and based on costs of previously purchased 345kV, 450MVA transformers.

- **Environmental**

  This project does not require permitting and there are no known issues regarding air, water, waste, lead, or asbestos.

- **Risks**

  Alternate transformer designs will be considered to address transportation concerns. An attempt will be made to limit the overall shipping dimensions and weight, which may introduce additional costs.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Spare 345/161X138kV, 450 MVA Transformer Purchase project for $3,323k.

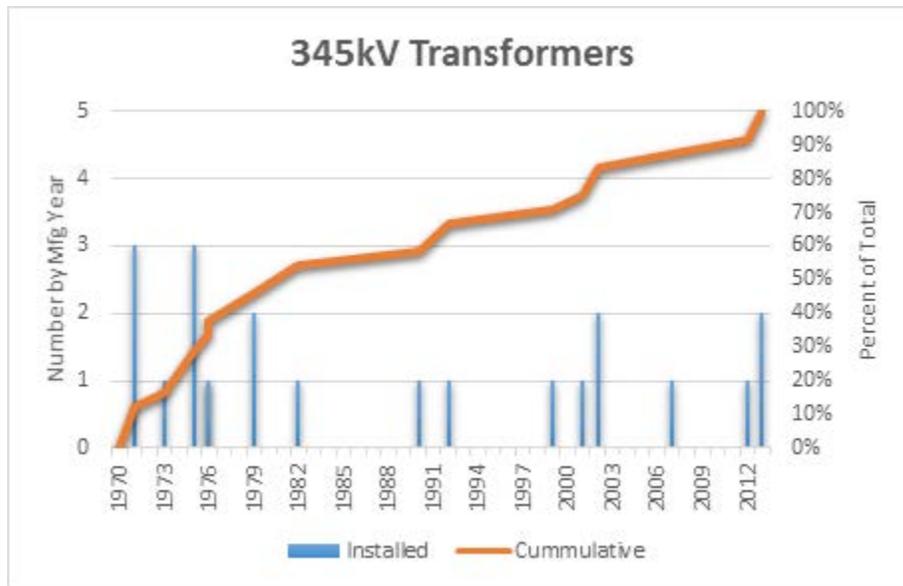
Age of installed 345kV Transformers on the LKE system:


Capital Investment Proposal   **Arbough**

Investment Proposal for Investment Committee Meeting on: December 19, 2016

Project Name: Upgrade Rodburn & Farmers 138/69kV Transformers; Spare 138/69kV Transformer Purchase

Total Expenditures: $2,852k (Including $285k of contingency)

Project Number(s): 144488 (Rodburn), 153518 (Farmers), 153590 (Spare Transformer)

Business Unit/Line of Business: Transmission

Prepared/Presented By: Chris Balmer – Director, Transmission Strategy & Planning

---

Executive Summary

The Rodburn and Farmers 138/69kV transformer replacements are a Transmission Expansion Plan (TEP) project which is required to prevent the overload of both the existing Rodburn and Farmers transformers during winter peak conditions. The Rodburn 138/69kV transformer overloads during the loss of the Rodburn to Farmers to Spencer Road 138kV line. The Farmers transformer overloads during the loss of the Rodburn 138/69kV transformer. The existing Farmers transformer has a winter emergency rating of 58 MVA and the existing Rodburn transformer has a winter emergency rating of 82 MVA. At the completion of the project, the winter emergency ratings will be 82 MVA at Farmers and 122 MVA at Rodburn. The replaced transformers are not expected to overload for extreme cold weather conditions within the ten year load forecast.

This project will install a spare transformer currently located at the Loudon Avenue substation to Rodburn and relocate the existing Rodburn transformer to Farmers where it will replace the transformer currently in-service there. The (3) single phase transformers removed from Farmers will be scrapped. The project also includes replacement of two 69kV breakers at Rodburn that have a breaker duty overload as a result of the new transformer installation. A spare transformer will be purchased to replace the spare and will be stored at Louden Avenue.

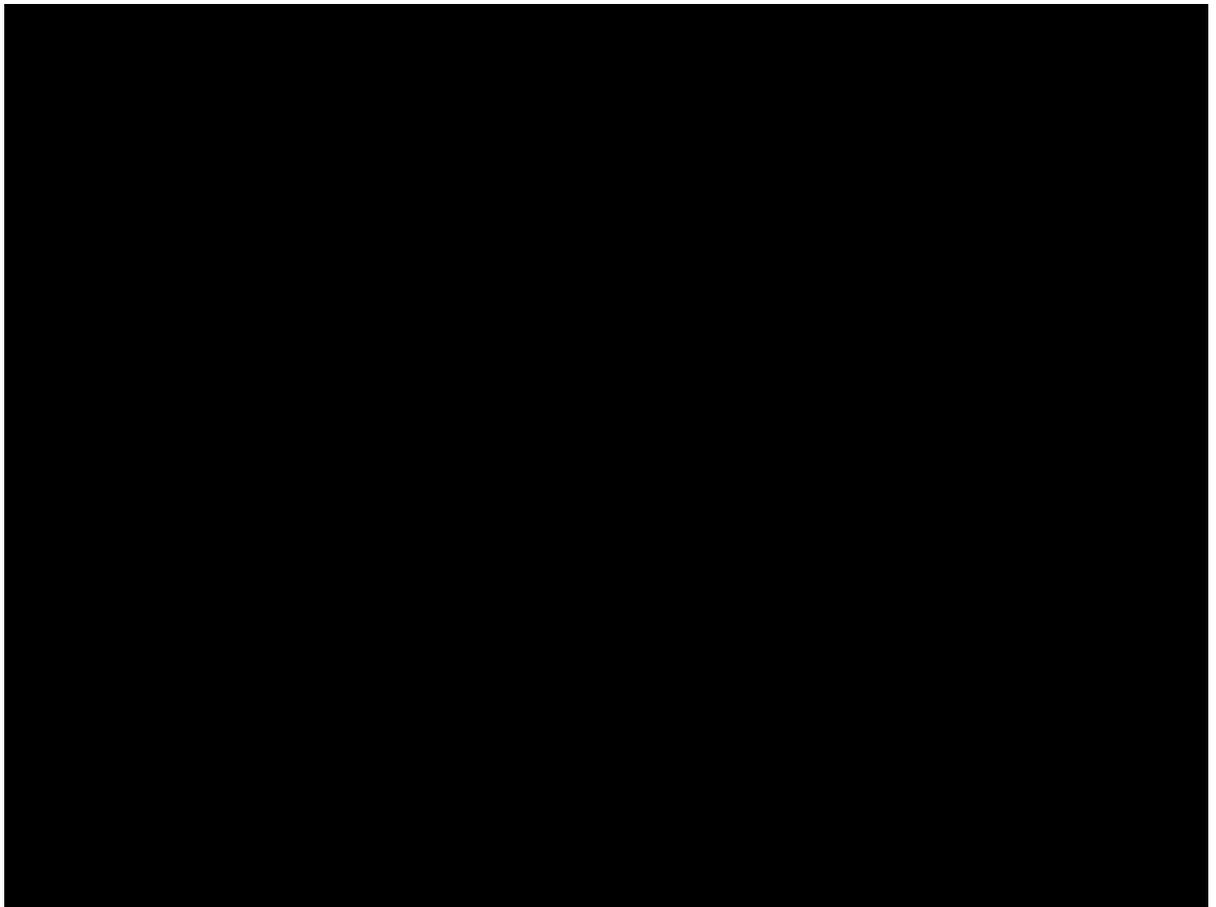
The total cost of this project is $2,852k. This project was not included in the 2016 BP. $4,937k of funding was included in the 2017 BP under projects 144488 and 151809, $2,179k in 2017 and $2,758k in 2018. The funding originally budgeted for this project was based on adding a second 138/69 transformer at Rodburn along with the associated protection and controls work (alternative #1) but after further analysis, the recommended option was determined to be the least cost solution to serve customers.

Background   **Arbough**

The overload of the Rodburn and Farmers transformers was identified in the Transmission
Expansion Planning (TEP) process and approved by the Company and TranServ, the Company's
Independent Transmission Organization (ITO).

During peak winter conditions, an outage of the Rodburn transformer results in an overload of
the Farmers transformer and an outage of the Rodburn to Farmers to Spencer Road 138kV line
results in an overload of the Rodburn transformer. A rating increase of both transformers is
required to prevent them from overloading and interrupting service to customers. The map
below shows the location of these substations and the surrounding area.

The Rodburn 138/69kV transformer has an existing winter emergency rating of 82 MVA when
adjusted for winter ambient temperatures. The Farmers 138/69kV transformer has an existing
winter emergency rating of 58 MVA when adjusted for winter ambient temperatures. During the
2018/19 winter analysis, the Rodburn loading is 84.0 MVA (105.7%), and the Farmers loading is
58.9 MVA (105.4%). After moving and replacing the transformers, the new winter emergency
rating at Rodburn will be 122 MVA and at Farmers will be 82 MVA. The Rodburn transformer
loads to 106.7 MVA and the Farmers loads to 60.6 MVA in the 2026/27 Winter Peak during
extreme cold weather conditions. Therefore the replacement transformers are expected to meet
the high load forecast for the ten year planning horizon and beyond. The project was confirmed
using the October 2015 load forecast.

The figure below shows the Rowan County area and the location of the Rodburn and Farmers
substations.


- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $3,276k
        Replace the existing Rodburn transformer with an existing spare transformer and
        relocate it to Farmers. Purchase a new spare transformer. The single phase
        transformers at Farmers will be scrapped.

    2. Alternative #1:   NPVRR: ($000s) $5,472k
        Add a second transformer at Rodburn. Adding a second transformer at Rodburn also
        requires adding breakers, switches, bus, and equipment in the control house. This
        alternative has a higher cost than the recommendation.

    3. Alternative #2:   NPVRR: ($000s) $5,609k
        Add a reactor at Rodburn to relieve loading on both the existing Rodburn and
        Farmers transformers and delay the recommended option until 2028.   This
        alternative has a higher cost than the recommendation.

    4. Do Nothing: NPVRR: ($000s) $0k
        This alternative puts customer load at risk and violates NERC TPL-001-4 reliability
        standard and the Companies' Transmission Planning Guidelines.

Project Description

- **Project Scope and Timeline**

Description	Date
Project Originally Approved	December, 2016

Capital Investment Proposal   **Arbough**

Investment Proposal for Investment Committee Meeting on: August 31, 2016

Project Name: West Lexington Reactor Additions

Total Expenditures: $1,283k (Including $117k of contingency)

Project Number(s): 149705

Business Unit/Line of Business: Transmission

Prepared/Presented By: Chris Balmer – Director Transmission Strategy & Planning

Executive Summary

The West Lexington Reactor Additions project is a Transmission Expansion Plan (TEP) project which is required to prevent the overload of (2) 138kV lines at the West Lexington substation. TEP analyses show that during summer peak conditions, the West Lexington to Viley Road line overloads during an outage of West Lexington to Haefling line and the West Lexington to Haefling line overloads during the outage of West Lexington to Viley Road line.   Therefore, this project is proposed in order to comply with the LG&E and KU (the Companies') Transmission Planning Guideline requirements and the North American Electric Reliability Corporation (NERC) TPL-001-4 Reliability Standard.

The scope of this project is to purchase and install reactors to each of these lines in the West Lexington substation, which adds impedance to each line. The increased impedance reduces flows on these constrained lines by diverting flow to other lines that have available capacity. Adding reactors is expected to be a long term solution and delays the need to reconductor these two 138kV lines from 2017 to beyond the ten year planning horizon.

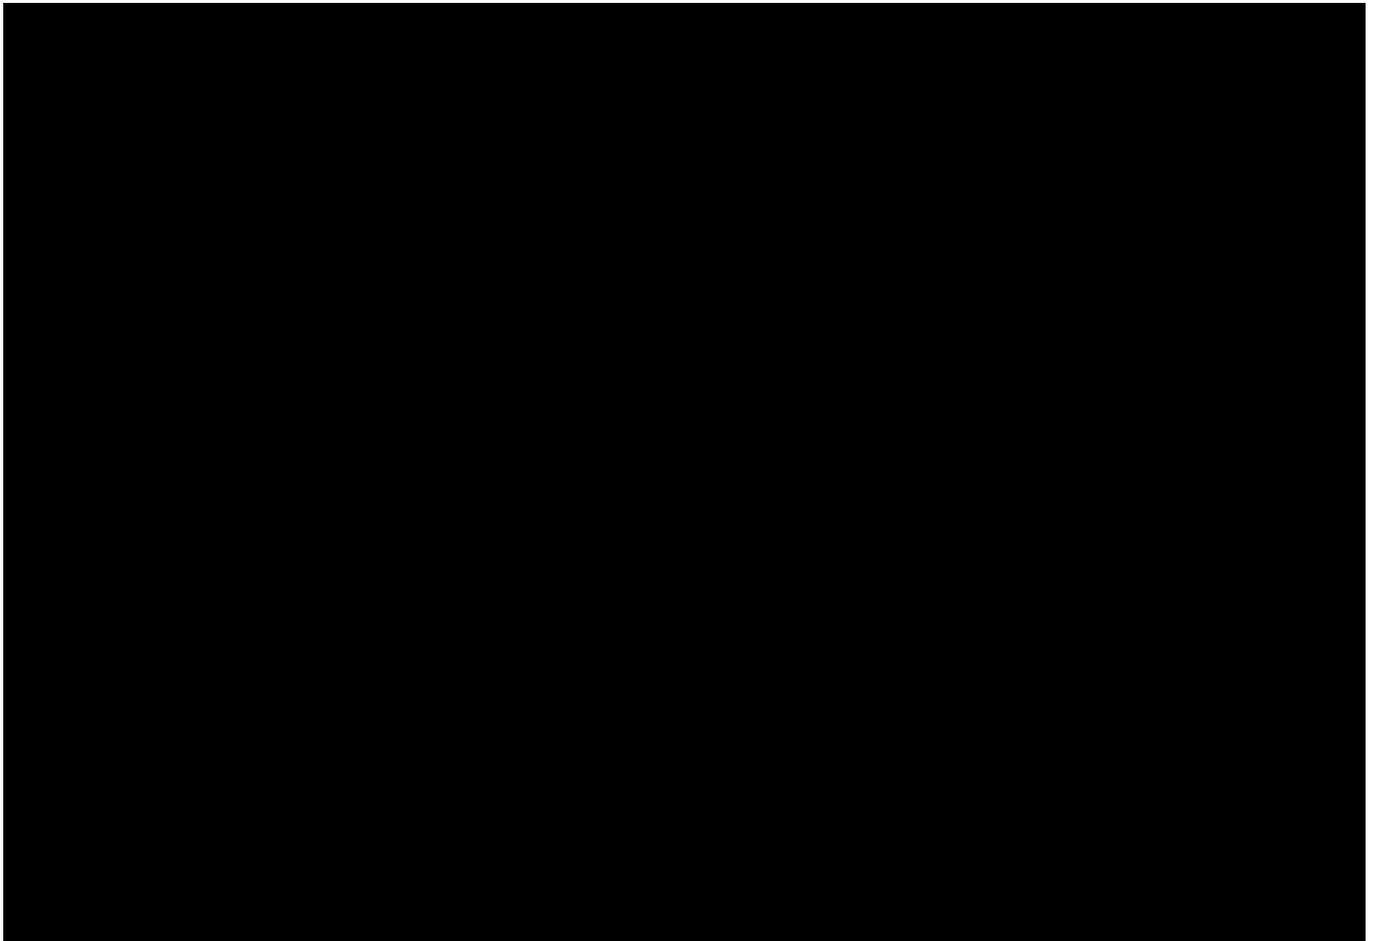
The total cost of this project is $1,283k and was approved by the RAC in the 2016 7+5 forecast. $3,000k of funding was included in the 2016 Business Plan (BP) under project 149705 and 149706 (149706 is no longer needed and has been cancelled). As detailed scoping and development progressed, the estimated cost decreased. The estimated cost includes a 10% contingency.

Background

The overload of the West Lexington to Viley Road line during an outage of the West Lexington to Haefling line and the overload of the West Lexington to Haefling line during an outage of the West Lexington to Viley Road line was initially identified in the 2013 Transmission Expansion Plan, confirmed in subsequent Transmission Expansion Plans, and confirmed by TranServ, the Company's Independent Transmission Organization. This overload was further analyzed and confirmed utilizing the recent 2017 Business Plan Electric Sales Forecast.

The existing summer emergency rating of each line is 265 MVA based on the limiting element of the overhead 795 MCM 26X7 aluminum conductor steel-reinforced (ACSR) conductor. During a summer peak scenario and with the contingency described, the loading of the West Lexington to Haefling line is 99.2% and the loading of the West Lexington to Viley Road line is 100.4%. After the reactors are installed, the expected flow on West Lexington to Viley Road is reduced to approximately 93% of capacity and 92% of capacity on West Lexington to Haefling during a high load, summer peak scenario in our 2026 transmission planning model.

While the reactors are expected to be a long term solution, if there were changes to load or topology of the transmission system that would require the reconductoring of both lines in the future, installation of the reactors is still the least cost solution if reconductoring is required beyond 2021.

The figure below shows the Lexington area and the transmission lines. The two lines follow the


- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $1,546k
       Purchase and install reactors at the West Lexington substation on the West Lexington to Viley Road and West Lexington to Haefling lines in order to comply with the Companies' Transmission Planning Guideline requirements and the North American Electric Reliability Corporation (NERC) TPL-001-4 Reliability Standard.

2. Alternative #1:   NPVRR: ($000s) $12,362k
   Reconductor both the West Lexington to Viley Road ($4,300k) and West Lexington
   to Haefling ($6,100k) 138kV lines.

3. Do Nothing: NPVRR: ($000s) N/A
   This alternative violates the Companies' Transmission Planning Guidelines and the
   North American Electric Reliability Corporation (NERC) TPL-001-4 Reliability
   Standard.

Project Description

- **Project Scope and Timeline**

Milestone Schedule	Date
Project Approved	August, 2016
Materials Ordered	December, 2016
Materials Received	May, 2017
Below Grade Work Begins	March, 2017
Below Grade Work Completed	May, 2017
Above Grade Work Begins	May, 2017
Above Grade Work Completed	May, 2017
Project Complete	May, 2017

- **Project Cost**
  The total cost of this project will be $1,283k and was approved by the 2016 7+5 RAC.
  $3,000k of funding was included in the 2016 BP under project 149705 and 149706. The
  variance between the estimated costs versus the budgeted amount in the 2016 BP can be
  attributed to further developing the scope and determining that a bypass switch is not
  required on either reactor. The estimated total project figure includes a 10% contingency.
  This contingency is reasonable based on the level of detailed engineering and is expected to
  cover uncertainty with the contract labor costs based upon variances that have been observed
  on past similar projects.

Economic Analysis and Risks

- **Bid Summary**
  Previously established blanket contract agreements will be utilized for related materials. Bids
  for any other necessary materials, as well as the below and above grade construction, will be
  sent out soon after project approval.

- **Budget Comparison and Financial Summary**

Financial Summary ($000s):

Discount Rate: 6.5%

Capital Breakdown:
- Labor: $109k
- Contract Labor: $510k
- Materials: $375k
- Other: $0k
- Local Engineering: $74k
- Burdens: $98k
- Contingency: $117k
- Reimbursements: ($0k)
- Net Capital Expenditure: $1,283k

Financial Analysis - Project Summary ($000)	2016	2017	2018	2019	2020	Life of Project
Project Net Income	$ -	$ 40	$ 65	$ 62	$ 59	$ 1,435
Project ROE	0.0%	4.6%	7.9%	10.0%	10.0%	9.7%

- **Assumptions**
  - The cost for installation of the reactors does not include a transfer bus and that the existing transfer bus can be removed.
  - Outages are obtainable with no extra costs for overtime or temporary configurations. The schedule for the reactor installation assumes the transfer bus will be removed first to allow below grade work to be completed. Line outages are required to install the above grade equipment.
  - No obstructions or rock below grade will cause a cost increase.

- ▪ The protection and control costs for relay settings are included, but it is assumed Although existing carrier and protection equipment can be used.
- ▪ Assumes installation of reactors is a long term solution and reactor removal costs are not required.

- **Environmental**
  This project does not require permitting and there are no known issues regarding air, water, waste, lead, or asbestos.

- **Risks**
  There is a risk that we will not be able to get the required outage(s).

Conclusion and Recommendation Arbough

It is recommended that the Investment Committee approve the West Lexington Reactor Additions project for $1,283k to reliably serve customers and to comply with the Companies' Transmission Planning Guideline requirements and the North American Electric Reliability Corporation (NERC) TPL-001-4 Reliability Standard.

Approval Confirmation for Capital Projects Greater Than or Equal to $1 million:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

Investment Proposal Project LI-158437 TEP-CR-Eastwood-Simpsonville   **Arbough**

Investment Proposal

Project Name: TEP-CR-Eastwood-Simpsonville

Total Expenditures: $2,466k
Total Contingency: $233k (10%)

Project Number(s): Transmission Lines – LI-158437
                    Distribution Operations - 158353

Business Unit/Line of Business: Transmission

Prepared/Presented By: Delyn Kilpack

Executive Summary

The Eastwood – Simpsonville 69 kV line overloads during planning studies and was identified through the 2018 Transmission Expansion Plan (TEP). This project will provide a facility rating increase for 1.86 miles of the Eastwood – Simpsonville 69 kV line and eliminate the overloads currently identified. The 2018 TEP identified a need date of 11/30/2019.

Transmission Lines plans to replace a 1.86 mile section of 336.4 ACSR 26/7 between the Eastwood and Simpsonville substations on the Eastwood-Shelbyville 69kV line with 556.5 ACSR 26/7, and the existing static wire will be replaced with new optical ground wire (OPGW). In addition to the conductor and static being replaced, thirty-seven (37) existing wood structures will be replaced with new steel structures. Electric Distribution Operations (EDO) will provide the layout work and transferring of distribution underbuild where needed.

The total project cost is $2,466k ($2,118k Transmission Lines, $348k Distribution Operations). This project was included in the 2019 Business Plan under project LI-000086 for $1,395k, with estimated spend of $50k in 2018 and 1,345k in 2019. As scope, timing, and certainty of work has evolved, the estimates have been further refined. The current total project cost is $2,466k, with estimated spend of $30k in 2018, and $2,436k in 2019. Incremental Transmission Lines funding of $743k in 2019 was funded by a reduction in project K9-2019. Funding for the Distribution Operations work in 2019 will be identified through the EDO RAC process in 2019.

Background   **Arbough**

The overload of the Eastwood-Shelbyville 69 kV line was identified in the TEP and approved by TranServ, the Company's Independent Transmission Organization (ITO).

The Eastwood – Simpsonville 69 kV line currently consists of 1.86 miles of 336.4 MCM 26X7 ACSR (aluminum conductor steel reinforced). To eliminate the overload, this line section will be replaced with 556.5 MCM 26X7 ACSR conductor.

During the 90/10 winter peak conditions, an outage of the Blue Lick 345/161 kV transformer or an outage of the Middletown – Mid-Valley Simpsonville 69 kV line results in an overload of 105% in the 2019 winter. This overload exists throughout the planning horizon.

- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $2,885
       The recommendation is to replace 1.86 miles containing 336.4 ACSR 26/7 conductor with new 556.5 ACSR 26/7 conductor, existing static with OPGW, and thirty-seven (37) wood structures will be replaced with new steel structures.
    2. Alternative #1: Do Nothing   NPVRR: ($000s) N/A
       This alternative puts customer load at risk and violates the Company's Planning Guidelines.
    3. Alternative #2:   NPVRR: ($000s) $20,323
       This alternative is to build a new 69 kV line from the LG&E Middletown 69 kV substation to the KU Finchville 69 kV substation, approximately 12.3 miles. This project would require purchase of new or expansion of existing 69 kV ROW, all new 69 kV structures, and 795 ACSR MCM conductor or an equivalent. Expansion of both the Middletown & Finchville 69 kV substations to accommodate the additional 69 kV line exits, breakers, and all other associated terminal equipment would also be necessary.

Project Description   **Arbough**

TEP-CR-Eastwood-Simpsonville Facility Map

- **Project Scope and Timeline**
  The scope of work will involve the upgrade of 1.86 miles of existing conductor with ACSR, existing static wire with new OPGW, and the replacement of thirty-seven (37) existing wood structures with new steel structures on a section of the Eastwood-Shelbyville 69 kV line. Construction is scheduled to begin in January of 2019 and be completed in August of 2019.

Economic Analysis and Risks

- **Bid Summary**

Transmission Lines
Based on detailed engineering, Transmission Lines has estimated the material package for this project to be $565k. The project will utilize standard steel structures, and material. The conductor will be competitively bid through normal Supply Chain processes. The line construction will be based on continuing contracts with our line contractors. B&B Electric, Davis H. Elliot, William E. Groves and Pike Electric are the four current contractors which have been awarded Transmission Overhead Construction Maintenance contracts.

Distribution Operations:
Distribution Operations line relocation will be performed by company labor (no bids required).

- **Assumptions**

  Recommendation - This assumes that the 1.86 miles of existing conductor will be replaced with new ACSR, the existing static wire will be replaced with new OPGW, and thirty-seven (37) existing wood structures will be replaced with new steel structures. An outage must be obtained to complete the project and is scheduled for 2019.

  Alternative #1 – Do Nothing - This alternative puts the customer load at risk and violates the Company's Transmission Planning Guidelines.

  Alternative #2 – Build a new 69 kV line from the LG&E Middletown 69 kV substation to the KU Finchville 69 kV substation, approximately 12.3 miles. This project would require purchase of new or expansion of existing 69 kV ROW, all new 69 kV structures, and 795 ACSR MCM conductor or an equivalent. Expansion of both the Middletown & Finchville 69 kV substations to accommodate the additional 69 kV line exits, breakers, and all other associated terminal equipment would also be necessary.

- **Environmental**

  There are no known environmental issues regarding air, water, lead, asbestos, etc., associated with this project.

- **Risks**

  Without the recommended re-conductor of the Eastwood – Simpsonville 69 kV line, there is risk of losing load in the Simpsonville area.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the TEP-CR-Eastwood-Simpsonville project for $2,466k to maintain system integrity, reliability, and to prevent failures and unplanned outages.

Approval Confirmation for Capital Projects Greater Than or Equal to $2 million:

Investment Proposal Project 140440 TEP-CR-North Tap-South Park   **Arbough**

Investment Proposal for Investment Committee Meeting on: August 29, 2018

Project Name: TEP-CR-North Tap-South Park

Total Expenditures: $3,324k
Total Contingency: $326k (11%)

Project Number(s): Transmission Lines - 140440
                       Distribution Operations – 158292

Business Unit/Line of Business: Transmission Lines

Prepared/Presented By: Delyn Kilpack

Executive Summary

The North Tap-South Park 69k line overloads during planning studies and was identified through the Transmission Expansion Plan (TEP) back in 2014. This project will provide a facility rating increase for 1.99 miles of the North Tap-South Park 69kV line and eliminate the overloads currently identified. The 2017 and 2018 TEPs showed a need date of summer 2019, however recently completed analysis in the 2019 TEP indicates an upgrade of this line is needed now.

Recent Transmission Expansion Plans have also identified this line as overloaded after a contingency (outage) situation during summer peak conditions, using both the average summer and extreme summer conditions. This line segment has an existing rating of 100 MVA, an upgrade of the existing conductor from North Tap to South Park is required to eliminate the overload condition on the line. After the project is complete, the new line rating for summer emergency conditions will be 127 MVA.

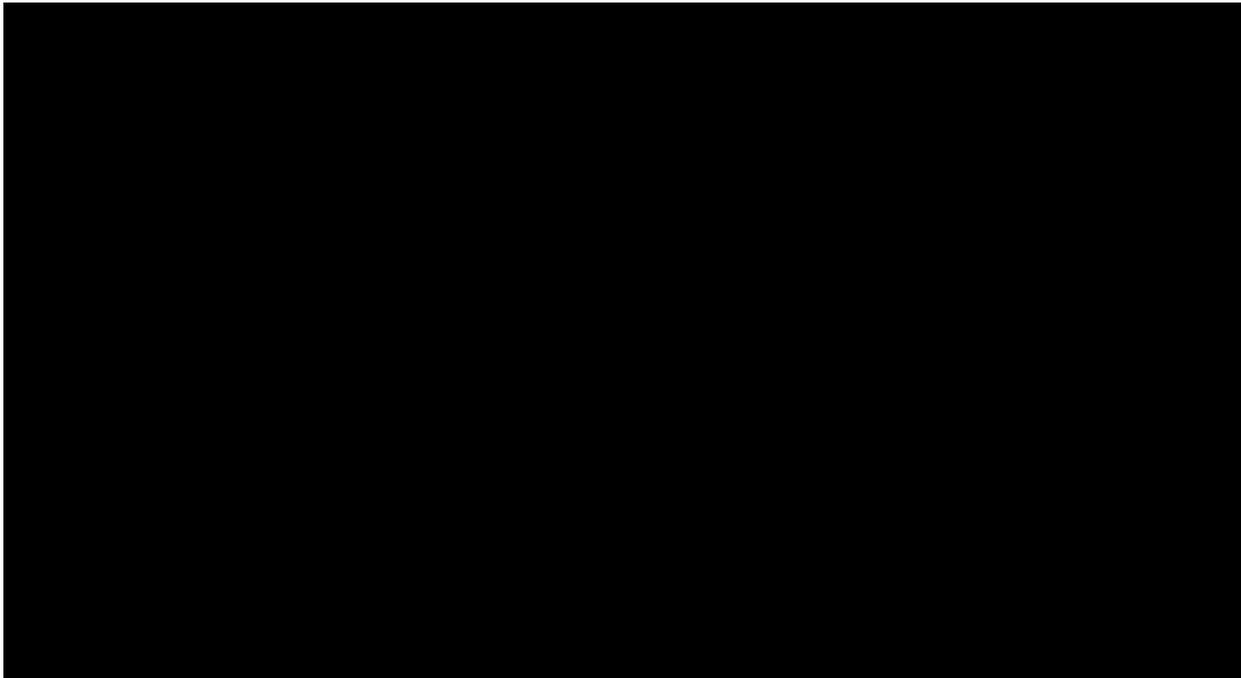
Transmission Lines plans to replace the 1.99 mile 69kV line between the North Tap and South Park substations with aluminum conductor steel-reinforced (ACSR) conductor. In addition to the conductor being replaced, thirty-nine existing wood structures will be replaced with new steel structures. Distribution Operations will provide the layout work and transferring of distribution underbuilt where needed.

The total project cost is $3,324k ($3,009k Transmission Lines, $315k Distribution Operations). This project was included in the 2018 Business Plan (BP) for $3,167k, with estimated spend of $158k in 2018 and $3,009k in 2019. As scope, timing, and certainty of work has evolved, the estimates have been further refined.

The current total project cost is $3,324k, with estimated spend of $172k in 2018, and $3,152k in 2019. The 2018 spend was approved by the RAC in the 7+5 forecast. The 2019 spend is consistent with the proposed 2019 BP.

Background
The overload of North Tap to South Park 69 kV line was identified in the TEP process and approved by the Company and TranServ, the Company's Independent Transmission Organization (ITO).

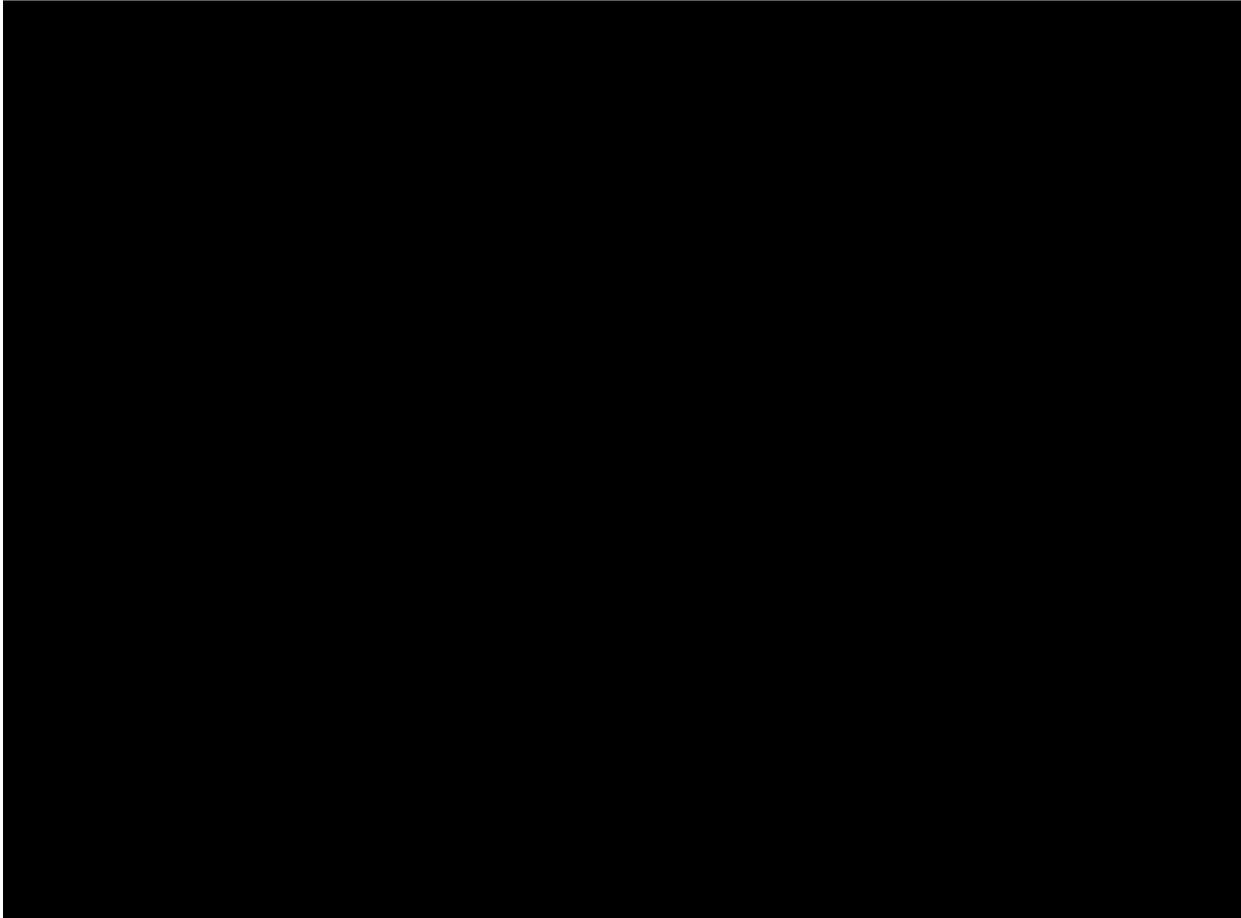
The North Tap to South Park 69kV line currently consists of 1.78 miles of 795 MCM 61-AAC (All Aluminum Conductor) and 0.21 miles of 840.2 MCM 24X13 ACAR (Aluminum Conductor Alloy Reinforced).   To eliminate the overload, 1.99 miles of line will be replaced with new ACSR.

During peak summer conditions, an outage of the Mud Lane 138/69kV transformer which includes outage of the Mud Lane 138kV bus, shows an overload at 101%. In the 2027 summer models, the overload is 108%.


The diagram above shows the location of the overloaded section of South Park to the North Tap section of 69 kV and also shows the location of the contingency.

- **Alternatives Considered**
    1. Recommendation: NPVRR: ($000s) $3,884
       The recommendation is to replace 1.99 miles containing 795 AAC conductor with new ACSR conductor, and thirty nine (39) wood structures will be replaced with new steel structures.
    2. Alternative #1 – Do Nothing   NPVRR: ($000s) N/A
       This alternative puts customer load at risk and violates the Company's Planning Guidelines.

3. Alternative #2 – Add Second Transformer   NPVRR: ($000s) $11,651 **Arbough**
   Add a second 2nd 138/69kV transformer at Mud Lane and rebuild the 138kV Mud
   Lane bus making it a breaker and a half scheme with eight 138kV breakers.

Project Description
TEP-CR-North Tap-South Park Facility Map


- **Project Scope and Timeline**

The scope of work will involve the upgrade of 1.99 miles of existing conductor with ACSR, and
the replacement of thirty-nine (39) existing wood structures with new steel structures on a
section of the South Park-Mud Lane 69kV line. The line construction will be based on
continuing contracts from the Company's line contractors. B&B Electric, Davis H. Elliot,
William E. Groves and Pike Electric are the four contractors awarded the Transmission
Overhead Construction and Maintenance contract from the October 2011 Investment Committee
meeting. A two-year optional contract extension was approved by the IC in April of 2017.
Construction is scheduled to begin in January of 2019 and be completed in May of 2019.

Capital Investment Proposal

Investment Proposal for Investment Committee Meeting on: April 25, 2018

Project Name: Trimble County Substation 345 kV Reactors

Total Expenditures: $2,858k (Including $260k of contingency)

Project Number(s): 156518

Business Unit/Line of Business: Transmission

Prepared/Presented By: Chris Balmer – Director, Transmission Strategy & Planning

Executive Summary
The Trimble County Substation 345 kV reactor project is a Transmission Expansion Plan (TEP) project to prevent the overload of the Trimble County – Clifty Creek 345 kV line. The LG&E/KU Planning Guidelines require a project to mitigate this overload and the installation of reactors is the least cost solution.

According to analysis performed as part of the 2018 TEP, the overload of the Trimble County – Clifty Creek line was identified during contingency of the 765 kV Jefferson – Rockport line, under summer peak conditions in 2021. In addition, the post contingent overload of the Trimble County – Clifty Creek 345 kV line has historically occurred during real-time operations and resulted in either generation redispatch and/or curtailment of firm and non-firm transmission service to mitigate the risk.

The Trimble County – Clifty Creek 345 kV line is approximately 12.5 miles long, crosses the Ohio River, and connects LG&E/KU's Trimble County generation plant with OVEC's Clifty Creek generation plant. It is a major transmission line interconnecting LG&E/KU and PJM with a summer emergency rating of 1,451 MVA. The Trimble County reactor project will raise impedence of this line, such that power flow will be diverted to other transmission lines with available capacity while maintaining the post contingent flow of the Trimble County – Clifty Creek 345 kV line below the summer line rating.

The total cost of this project is $2,858k with $491k in 2018 and $2,367k in 2019. This project was included in the 2018 BP under project SU-000098 with $2,322k in 2021. The project is being accelerated, by about one year, due to benefits of eliminating or minimizing operational issues that result in Transmission Loading Relief (TLRs) and generation redispatch and increasing the probability that the project will be completed by the need date.

Background

The overload of the Trimble County – Clifty Creek 345 kV line was identified in the 2018 Transmission Expansion Planning (TEP) process. The Company is awaiting final approval from TranServ, the Independent Transmission Organization (ITO), which is expected to occur in the next couple of months and is not expected to impact this recommendation.

Table 1 below shows the flows on the overloaded line for various scenarios summer peak conditions.

Table 1: Scenarios and Flows on Trimble County – Clifty Creek during Contingency

Scenario	Flow (MVA)	Percent of Overload	Flow with Reactor	Percent of Loading with Reactor
2021 Summer Peak				
2023 Summer Peak				
2028 Summer Peak				
2028 Summer Peak; Clifty Creek Retired Sensitivity				

██████   In addition, there have been operational issues in the past which have caused TLRs and generation redispatch. The proposed project is expected to eliminate or greatly reduce TLRs and generation redispatch for the overload of the Trimble County – Clifty Creek line in the future.

Since Clifty Creek generation output has a material impact on power flow in the area, a sensitivity scenario was conducted to evaluate whether installing reactors is expected to also eliminate an overload from the potential retirement of Clifty Creek units. As can be seen by the table above, and assuming all things are equal, the reactor project will be sufficient to eliminate an overload associated with lower output or complete retirement of the Clifty Creek generation site.

Further analysis indicates that approximately 5,000 MWs of non-firm transfers from MISO to PJM can be accommodated with the reactor project and not require reconductoring the Trimble County – Clifty Creek line. This analysis assumed Clifty Creek generation is still operational.

Figure 1 on the next page shows a geographic map of the Trimble – Clifty Creek 345 kV and the Rockport – Jefferson 765 kV line.

Figure 1: Geographic Map of Area

- **Alternatives Considered**
  1. Recommendation: NPVRR: ($000s) $3,154
     Add 345 kV reactors at the Trimble County substation on the Clifty Creek line.

  2. Alternative #1: NPVRR: ($000s) $19,111
     Reconductor the Trimble County – Clifty Creek 345 kV line. This alternative is higher cost and more difficult to complete due to the length of project time and outages required. A comparable project is to reconductor the line energized at a higher cost. The additional transmission capacity that would be gained by this alternative is not needed.

  3. Do Nothing: NPVRR: ($000s) N/A
     This alternative is not a viable option since it doesn't comply with the ITO approved LG&E/KU Planning Guidelines.

Project Description

- **Project Scope and Timeline**

Description	Date
Project Approved for Preliminary Engineering	10/11/2016
Project Approved for Full Funding	5/1/18
Materials Ordered	5/8/18
Engineering Complete	10/3/18
Materials Received	1/15/19
Construction Begins	3/1/19
Construction Completed	6/5/19
Project Complete	10/28/19

- **Project Cost**
  The total cost of this project is $2,858k with $491k in 2018 and $2,367k in 2019. This project was included in the 2018 BP under project SU-000098 with $2,322k in 2021. The estimated total project figure includes a 10% contingency based on the level of detailed engineering performed.

Economic Analysis and Risks

- **Bid Summary**
  Previously established blanket contract agreements will be utilized for related materials. Bids for any other necessary materials, as well as the below and above grade construction, will be sent out soon after project approval.

- **Budget Comparison and Financial Summary**

Financial Detail by Year - Capital ($000s)	2018	2019	Post 2019	Total
1. Capital Investment Proposed	491	2,367	-	2,858
2. Cost of Removal Proposed	-	-	-	-

9. Total Capital and Removal variance to BP (6-3)	(491)	(2,367)	2,322	(536)

Financial Detail by Year - O&M ($000s)	2018	2019	Post 2019	Total
1. Project O&M Proposed	-	-	-	-
2. Project O&M 2018 BP	-	-	-	-
3. Total Project O&M variance to BP (2-1)	-	-	-	-

The Post 2019 BP amount was included in the budgeted project SU-000098. The 2018 capital spending was approved in the 3+9 RAC forecast.

Financial Summary ($000s):

Discount Rate:	6.58%
Capital Breakdown:	
Labor:	$84k
Contract Labor:	$782k
Materials:	$1,140k
Other:	$0k
Local Engineering:	$423k
Burdens:	$169k
Contingency:	$260k
Reimbursements:	$0k
Net Capital Expenditure:	$2,858k

- **Assumptions**
  - TEP planning models developed by other industry participants and approved by the ITO are assumed to be an accurate reflection of future transmission system conditions. Specifically, the PJM/ MISO 345 kV projects of Coleman – Rockport – Duff are assumed to be operational and in service no sooner than 2021.
  - The ITO will approve this project as part of their overall review and approval of the 2018 TEP. Approval is expected within the next couple of months.
  - Outages required to perform the work will be granted at the time and duration necessary to maintain the estimated schedule.

- **Environmental**
  This project does not require permitting and there are no known issues regarding air, water, waste, lead, or asbestos.

- **Risks**
  - Outage of the Trimble County – Clifty Creek 345kV line presents challenges due to the criticality of the line. This risk is being mitigated by accelerating the project to account for the possibility that system conditions will not be conducisive to an outage in the spring of 2019. If this were to be the case, an outage window in the fall of 2019 will be pursued.

  - ITO will not approve the project as part of the 2018 TEP approval process. This is a low risk situation and can be mitigated. The Company has the right to construct facilities without ITO approval; however, this is not the preferred course. If the ITO does not approve the 2018 TEP prior to ordering material, Company will assess the project and coordinate with the ITO.

  - The project will not eliminate the overload as expected. If future conditions are different than planned, then future analysis will be performed via the annual TEP process or other study process and mitigations will be recommended based on that analysis.

Conclusions and Recommendation   Arbough

It is recommended that the Investment Committee approve the Trimble County Reactors project for $2,858k to relieve overloading of the Trimble County – Clifty Creek 345 kV line in order to reliably serve customers and meet the LG&E/KU Planning Guidelines in a least cost manner.

<u>Approval Confirmation for Capital Projects Greater Than or Equal to $2 million</u>:

The Capital project spending included in this Investment Proposal has been approved by the members of the LKE Investment Committee. Pursuant to the LKE Authority Limit Matrix, the signatures below are also required for approval of this Capital project spending request.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 34

Responding Witness: Daniel K. Arbough

Q-34.   Reference the Companies' response to AG DR 1-74.

    a. Does the Company's response to subpart (b) to AG DR 1-74 indicate that the Company does not have the forecasted expense for outages in 2023 and 2024, or merely that the Company chose not to provide the information?

    b. If the response to subpart (a), above, indicates that the Companies have the information available to provide the forecasted outage expense for years 2023 and 2024, provide same.

    c. Provide the total expected expense for 2018 for the attachment, using YTD actual data and forecasted data for 2018 not yet expended. Further, provide the actuals for 2018 upon the Companies' receipt of same.

A-34.

    a. The Company did not provide the forecasted outage expense for 2023 and 2024 since these years are outside of the eight-year cycle used to calculate the eight-year average outage expense. See the response to part b for forecasted 2023 outage expense. 2024 information has not been reviewed or approved by management.

    b. See attached for 2023 forecasted outage expense. 2024 information has not been reviewed or approved by management.

    c. See attached.

(1) The forecast includes YTD November Actuals and December Forecast

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 35

Responding Witness: Daniel K. Arbough / Christopher M. Garrett

Q-35.   Reference the Companies' response to AG DR 1-77.

    a. Provide the estimated amounts for the last two months of 2018 where the Company has provided YTD amounts for 2018.

    b. Provide actual amounts for 2018 where the Company provided YTD 2018 amounts, upon the Companies' receipt of same.

A-35.

    a. Forecast amounts for November and December 2018 are in the table below.

Forecast	November 2018	December 2018
Distribution	$ 724,429	$ 694,902
Transmission	$ 400,814	$ 388,143
Total	**$ 1,125,243**	**$ 1,083,045**

    b. Actuals through November 2018 are in the table below.

	YTD 11/30/18
Distribution	$ 7,414,408
Transmission	$ 3,078,748
Total	**$10,493,156**

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 36

Responding Witness: Daniel K. Arbough / John K. Wolfe

Q-36. Refer to the Companies' response to AG DR 1-77(b), Attachment, Distribution notes a and b, which states:

"a. Variances for both companies are due to changes from original budget estimates in order to address hazard trees as appropriate.

b. Variances for both companies are due to changes from original budget estimates in order to maintain the appropriate trimming cycles and to address hazard trees as appropriate."

a. Provide the original budget estimate.

b. Explain why the budget was changed from the original budget estimate.

c. Do actual expenses include storm costs? If so, provide the storm costs included in the actual for each year.

A-36.

a. Original budget estimate was provided in the Companies' response to AG 1-77 in Budget column.

b. Original budget estimate was not changed. Actuals were different than the budget, thus resulting in the variance.

c. No.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 37

Responding Witness: Daniel K. Arbough / Christopher M. Garrett

Q-37. Reference the Companies' response and attachments to KIUC DR 1-54 (LG&E) and KIUC DR 1-62 (KU). Explain the significant increases from the December 31, 2017, actual deferrals to the April 30, 2020, forecasted deferrals.

A-37. The increase from the actual deferral balance as of December 31, 2017 to the forecasted deferral balance as of April 30, 2020 for LG&E is due to the following changes in outages included as part of the eight-year planned outage cycle and inclusion of amortization of the regulatory asset through the period ending April 30, 2020:

Generating Unit	Amount
0231 - MILL CREEK 3 - GENERATION	$ 5,744,315
0221 - MILL CREEK 2 - GENERATION	$ 2,474,047
0172 - CANE RUN CC GT 2016	$ 1,486,787
0211 - MILL CREEK 1 - GENERATION	$ 1,352,592
0241 - MILL CREEK 4 - GENERATION	$ 1,138,616
All Other	$ 793,010
Regulatory Asset Amortization	$ (914,744)

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 38

Responding Witness: Daniel K. Arbough

Q-38.   Reference the Companies' response to KIUC 1-58.

a.   Explain and support the test year increases for: OTHER-LABOR-3RD PARTY, and OTHER EXPENDITURES.

A-38.
a.   The test year increases in Other-Labor-3rd Party are primarily due to O&M needed for automation of processes, creative work for customer education advertising and a reclassification of expenses from other non-labor to other outside services. The increase in Other Expenditures is primarily due to additional work related to cybersecurity.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 39

Responding Witness: Daniel K. Arbough / Christopher M. Garrett

Q-39. Reference the Companies' response to Staff DR 1-50.

    a. Provide the Company's calculation of test period storm damage expense, including the amounts averaged and the amounts removed assuming regulatory asset approval.

    b. Provide the annual storm damage expense, by company and separated between transmission and distribution, for each year since 2014, including actual or anticipated amounts for 2018.

A-39.
    a. See attached.

    b. See below. 2018 includes actuals through November 30 and forecast for December.

	2014	2015	2016	2017	2018
Distribution	$ 9,069,913	$ 4,844,213	$ 2,304,503	$ 2,267,174	$ 15,535,842
Transmission	$ 295,181	$ 143,350	$ 83,641	$ 99,240	$ 103,917
Total	**$9,365,094**	**$ 4,987,563**	**$ 2,388,144**	**$ 2,366,414**	**$ 15,639,759**

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 40

Responding Witness: Elizabeth J. McFarland

Q-40. Reference the Companies' response to AG DR 1-76.

    a. Explain, in detail, the Company's calculation of test year METER READING EXPENSE, as provided on Schedule C-2.1 in each matter.

    b. Explain, in detail, why the METER READING EXPENSE is expected to increase so dramatically for LG&E and KU electric operations as compared to LG&E gas operations.

A-40.

    a. Meter Reading contracts will expire on May 31, 2019. Staffing issues signaled changing market conditions and likely increases in costs for these services. Meter Reading Costs for the test year were calculated using anticipated costs per meter read per utility times the number of assigned reads per utility. Company Labor is calculated based on specific employees and their salaries. Other Expenses include miscellaneous items such as materials, office supplies, and fuel adjustments.

	LG&E	KU	KU Jurisdictional
Test Year	$6,156,772	$9,154,025	$8,696,598
Meter Reading Costs	$5,147,230	$8,064,069	$7,661,107
Company Labor	$798,178	$724,508	$688,304
Other Expenses	$211,364	$365,448	$347,187

    b. The contracted cost to read LG&E electric meters and gas meters are the same per meter. The anticipated percentage increase is the same for both. KU has many more meters to read than are read for LG&E's gas operations and the per-meter increase in metering reading cost is larger for KU than for LG&E, which are the main reasons KU's increase is larger. Meters in the KU territory are more widely dispersed and require significantly more time, fuel, and thus costs to read.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 41

Responding Witness: Gregory J. Meiman

Q-41. Reference the Companies' response to AG DR 1-112. Provide the reasoning for relying on such diversity of companies in the peer list of the WTW study (e.g., water utilities, solar companies, cooperatives, ISO New England) rather than those of similar size, operation, and region.

A-41. The referenced compensation surveys available to WTW cover all components of compensation (e.g., base salary and target short-term at-risk compensation) with survey participants primarily consisting of regulated utilities covering the United States, as this scope best aligns with the market for talent. A broader utility survey sample enables greater coverage of benchmark positions, which was critical given 230 positions were being benchmarked. Given limited data availability for utilities in the same geographic footprint or region of KU and LG&E, a more refined market scope was not used.

According to WTW, the surveys are considered some of the most reliable and comprehensive surveys for utility industry compensation data in the country and the survey participants consist primarily of regulated utilities. Neither the Companies nor WTW determine the participants in any given year.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 42

Responding Witness: Gregory J. Meiman

Q-42. Reference the Companies' response to AG DR 1-114. Provide the reasoning for recommending $16 per hour for call center starting pay when that amount is above both the mean and the median of the data provided in response to part a of the referenced data request.

A-42. Understanding some local call centers were paying more than $16, and the starting wage rate was within the Companies' competitive range, the Companies determined an adjustment was appropriate. Advertising a higher starting rate has increased the candidate pool with the goal of improving the retention and reducing the turnover costs. According to the Kentucky Center for Statistics, an agency within the Kentucky Education and Workforce Development Cabinet, in October 2018, Kentucky unemployment rate was 4.5 percent. This low unemployment rate makes it difficult to attract skilled candidates.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 43

Responding Witness: Gregory J. Meiman

Q-43. Reference the Companies' response to AG DR 1-114. The response to subpart (b) to AG DR 1-114 states that call center pay satisfaction survey scores were lower than those for the rest of the company.

    a. Did any other employment groups (similar to a grouping such as call center employees) have pay satisfaction survey scores as low as or lower than the call center employees? If the response is in the affirmative, discuss differences of management and results regarding those groups from the pay-raise approach taken with the call center employees.

    b. Were the call center pay satisfaction scores the only exit interview survey scores that were less than the rest of the company? If the response is in the negative, provide those other survey areas that were low, and discuss how the Companies determined the low satisfaction with pay was separate from and not a result of the other areas of dissatisfaction.

A-43.
    a. No other groups had pay satisfaction scores as low as or lower than the call center employees.

    b. From the time period 2015-2017, the call center had other exit interview scores that were less than the rest of the company in the below categories:

- Ability to balance family and work life
- Communication within your workgroup
- Cooperation with other departments
- Diversity of Workforce
- Hours required to work
- Overall work experience with LG&E and KU
- Manager/Supervisor approachable with work issues
- Manager/Supervisor demonstrated fair and equal treatment
- Manager/Supervisor support
- Opportunity for advancement

- Personal development opportunities
- Stress related to the job
- Teamwork and Support from co-workers
- Training opportunities
- Work Environment
- Would you recommend the company to a friend as a place to work

While the above were lower, only the categories of pay and stress related to the job were rated as dissatisfied. The score related to stress can be attributed to the nature of their job.

HR was consulted on starting wage rates (see response to AG DR1-115) and a recommendation was made to increase pay while staying within the established range for this position.

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 44

Responding Witness: Gregory J. Meiman

Q-44. Reference the Companies' response to AG DR 1-115. The response to the data request was that while the call center employee starting pay was within the competitive range, other factors prompted further assessment determining the pay level was not fair. Explain how the pay can fall within competitive range and not be fair. In other words, is not "competitive range" the criterion of fairness? If the response is in the negative, provide the following:

   a. Explain the Companies' definition of competitive range and how it differs from fairness.

   b. Will the Companies adjust their compensation philosophy to include other factors of fairness?

   c. Will the Companies adjust their studies to include only criteria-based peer companies to better align compensation fairness with employee expectations?

A-44.
   a. The Companies define their competitive range by targeting their base compensation salary range midpoints at the 50th percentile of market. Salary range minimums and maximums are based on 70% and 130% of the established 50th percentile midpoint.

   Regarding Mr. Meiman's reference to "fair", it is explained in his testimony, p. 7, line 17, as it was referencing "fair relative to the pay for other similarly-situated positions within the organization."

   b. No, the Companies will continue to use their current compensation philosophy.

   c. See b above.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 45

Responding Witness: Gregory J. Meiman

Q-45. Reference the Companies' response to AG DR 1-115. Provide the following:

  a. What is the current 50th percentile of national market for call center employees?

  b. What is the current 70% to 130% range based on that 50th percentile?

  c. What is the dollar impact to the revenue requirements of the projected increase to call center employee wages?

  d. Refer to the direct testimony of Gregory J. Meiman, page 6, wherein he explains the example of the Companies' determination that call center employee compensation was below market. Other than the call center employee example, were any other employee groups' compensation determined to be below market whose compensation was adjusted for the projected test period? If the answer is in the affirmative, provide a listing of the employee groups and the dollar impact per group to the revenue requirements of the projected or actual increase.

A-45.

  a. See attachment. Certain information requested is confidential and proprietary and is being provided under seal pursuant to a petition for confidential protection.

  b. See attachment. Certain information requested is confidential and proprietary and is being provided under seal pursuant to a petition for confidential protection.

  c. The dollar impact to the LG&E revenue requirement is $932,166.

  d. No.

CONFIDENTIAL INFORMATION REDACTED

A-45.

    a. According to the 2017 WTW MMPS compensation survey, the 50th percentile of national market data for entry level call center jobs was ███████ (However the Companies used a local geographical cut when determining the salary range midpoint for our entry level job).

    b. The calculated range based on the national 50th percentile is:

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 46

Responding Witness: Gregory J. Meiman

Q-46. Reference the Companies' response to AG DR 1-115. If relatively low exit interview pay satisfaction scores prompt the Companies to conduct further assessment for fairness, do relatively high exit interview pay satisfaction scores also prompt the Companies to conduct further assessment for fairness? If the response is in the affirmative, provide a recent example. If the response is in the negative, explain why no further assessment for fairness is conducted.

A-46. No. Exit interviews are conducted to identify issues and to better understand why an employee is leaving the organization. A satisfied score for pay does not indicate that pay is too high. The Companies rely on the established market range to determine whether or not compensation level is appropriate.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 47

Responding Witness: Gregory J. Meiman

Q-47. Reference the Companies' response to AG DR 1-117. Subpart (b) to AG DR 1-117
requested individual and team effectiveness criteria for senior managers in Electric
Distribution and Energy Supply and Analysis. The Companies' response stated that
goals vary by individual and department. Provide the following:

    a. The specific measures for a sample of three specific senior managers in each of
the departments specified.

    b. For each specific measure in subpart (a), above, specify to which of the five
broad measures and weightings (provided in the response to subpart (a) to AG
DR 1-117) it applies.

A-47.

    a. The requested specific measures can be found in AG 1-117a. Individual
objectives also can be found in the attachment.

    b. While individual goals are not required to link directly to the five measures, in
most cases they do support those objectives and the respective department
objectives. In the attachment, the links to the five measures have been noted
where applicable.

Electric Distribution-SM1

Objective 1: Management Objective - (All Measures)

Actively support company initiatives for safety, wellness, diversity, affirmative action, performance management, employee development and customer focus, while modeling company values and behaviors.

Objective 2: Safety Performance - (Corporate Safety)

Ensure, without compromise, that safety excellence is the core expectation of business operations, and that management and employees are responsible and accountable for a safe work environment.

Ensure hazard assessment and mitigation plans are completed for all responsibility areas, placing emphasis on performing risk analysis where personnel, work practices, technology, or business processes have changed.

Continue to mentor new employees on safety culture and best work practices; where feasible, assign employees with less than five years of experience a formal mentor that is different than their immediate supervisor.

Continue to place emphasis on critical danger zone (CDZ) tasks. A CDZ is present when there is a hazardous situation, condition or action that can potentially lead to an immediate and serious injury, a major loss of equipment, or significantly impact a process or the environment.

Continue to refine key business processes and leading safety indicators to influence desired safety cultures and behaviors. Continue to focus on initiatives to reduce unintended outages and vehicle incidents.

Objective 3: Operational Performance - (All Measures)

Direct resources under responsibility towards attainment of 2018 performance targets. Support business processes that provide for safe, effective, and timely restoration of services following routine and emergency outage events. Ensure EDO's reliability programs - distribution automation, capital investments, vegetation management, and enhanced hazard tree removal - align with strategies to provide step improvements in reliability performance. Support adequate controls and business processes in place to satisfy applicable regulations. Finally, continue to support effective execution and refinement of emergency preparedness and response plans.

Objective 4: Personal Development - (All Measures)

Develop key internal and external relationships which help to build on utility knowledge. Participate in industry forums to build professional networks, and to help identify industry, customer and

regulatory trends which should be considered when developing long term strategies for EDO. Build on relationships with regulators and other external stakeholders to achieve favorable outcomes related to new capital programs, business process changes, or organizational development.

Objective 5: Electric Distribution Business Strategy and Business Plans - **(All Measures)**

Actively lead development and execution of long term business strategies and plans which provide for the continued provision of safe, reliable, and resilient electric service consistent with evolving customer expectations and regulatory policies. Support flexible processes for effectively aligning and adjusting EDO's organizational, investment, and labor strategies with imminent and future activity in distributed generation, micro- grids, and renewable energy solutions. Assure labor succession plans adequately provide for the technical knowledge and skillsets needed to support design, construction, operation, and maintenance of a distribution grid with significantly advanced intelligence. Continue developing strategy/road map for increased data analytics associated with distribution automation and advanced metering infrastructure.

Electric Distribution-SM2

Objective 1: Management Objective - (All Measures)

Actively support company initiatives for safety, wellness, diversity, affirmative action, performance management, employee development and customer focus, while modeling company values and behaviors

Objective 2: Safety Performance - (Corporate Safety)

Ensure, without compromise, that safety excellence is the core expectation of business operations, and that management and employees are responsible and accountable for a safe work environment.

Ensure hazard assessment and mitigation plans are completed for all responsibility areas, placing emphasis on performing risk analysis where personnel, work practices, technology, or business processes have changed. Continue to refine key business processes and leading safety indicators to influence desired safety cultures and behaviors. Continue to focus on initiatives to reduce unintended outages and vehicle incidents.

Objective 3: Financial Performance - (Cost Control)

Support attainment of 2018 COO financial targets through effective management of resources and execution of the 2018 EDO Business Plan.

Work closely with Budgeting and Forecasting, and other LOB Officers to support attainment of COO budget commitments, effectively modifying business plans, resource levels, or work performed to meet budget constraints or new targets. Ensure adequate business processes and

organizational structure are in place to support efficient execution of capital programs. Ensure adequate controls are in place to accurately monitor and forecast budget trends and variances, and to assure timely and accurate accounting of investments and expenses.

Objective 4: Operational Performance - **(All Measures)**

Direct resources under responsibility towards attainment of 2018 performance targets. Ensure EDO's organizational structure and business processes provide for safe, effective, and timely restoration of services following routine and emergency outage events. Ensure EDO's reliability programs - distribution automation, capital investments, vegetation management, and enhanced hazard tree removal - align with strategies to provide step improvements in reliability performance. Ensure adequate controls and business processes are in place to satisfy applicable regulations. Finally, continue to direct effective execution and refinement of emergency preparedness and response plans.

Objective 5: Electric Distribution Business Strategy and Business Plans - (All Measures)

Actively lead development and execution of long term business strategies and plans which provide for the continued provision of safe, reliable, and resilient electric service, and effectively align the organization and electric distribution system with evolving customer expectations and regulatory policies. Develop flexible processes for effectively aligning and adjusting EDO's organizational, investment, and labor strategies with imminent and future activity in distributed generation, micro-grids, and renewable energy solutions. Assure labor succession plans adequately provide for the technical knowledge and skillsets needed to design, build, operate, and maintain a distribution grid with significantly advanced intelligence.

<u>**Electric Distribution-SM3**</u>

Objective 1: Management Objective - (All Measures)

Actively promote company initiatives for safety and wellness, customer experience, inclusion and employee engagement, affirmative action, employee performance and development, while modeling leadership commitments, values and behaviors.

Objective 2: Safety Performance - (Corporate Safety)

Ensure, without compromise, that safety excellence is the core expectation of business operations, and that management and employees are responsible and accountable for a safe work environment.

Ensure hazard assessment and mitigation plans are completed for all responsibility areas, placing emphasis on performing risk analysis where personnel, work practices, technology, or business processes have changed. Continue to refine key business processes and leading safety indicators to influence desired safety cultures and behaviors. Continue to focus on initiatives to reduce

unintended outages and vehicle incidents.

Objective 3: Financial Performance - (Cost Control)

Support attainment of 2018 COO financial targets through effective management of resources and execution of the 2018 EDO Business Plan.

Work closely with Budgeting and Forecasting, and other LOB Officers to support attainment of COO budget commitments, effectively modifying business plans, resource levels, or work performed to meet budget constraints or new targets. Ensure adequate business processes and organizational structure are in place to support efficient execution of capital programs. Ensure adequate controls are in place to accurately monitor and forecast budget trends and variances, and to assure timely and accurate accounting of investments and expenses.

Objective 4: Operational Performance - **(All Measures)**

Direct resources under responsibility towards attainment of 2018 performance targets. Ensure EDO's organizational structure and business processes provide for safe, effective, and timely restoration of services following routine and emergency outage events. Ensure EDO's reliability programs - distribution automation, capital investments, vegetation management, and enhanced hazard tree removal - align with strategies to provide step improvements in reliability performance. Ensure adequate controls and business processes are in place to satisfy applicable regulations. Finally, continue to direct effective execution and refinement of emergency preparedness and response plans.

Objective 5: Personal Development - (Customer Satisfaction)

Develop key internal and external relationships which help to build on utility knowledge. Participate in industry forums to build professional networks, and to help identify industry, customer and regulatory trends which should be considered when developing long term strategies for EDO. Build on relationships with regulators and other external stakeholders to achieve favorable outcomes related to new capital programs, business process changes, or organizational development.

Objective 6: Electric Distribution Business Strategy and Business Plans - **(All Measures)**

Actively lead development and execution of long term business strategies and plans which provide for the continued provision of safe, reliable, and resilient electric service, and effectively align the organization and electric distribution system with evolving customer expectations and regulatory policies. Develop flexible processes for effectively aligning and adjusting EDO's organizational, investment, and labor strategies with imminent and future activity in distributed generation, micro-grids, and renewable energy solutions. Assure labor succession plans adequately provide for the technical knowledge and skillsets needed to design, build, operate, and maintain a distribution grid with significantly advanced intelligence.

Energy Supply and Analysis-SM1

Objective 1: Management Objective - (All Measures)

Actively promote company initiatives for safety and wellness, customer experience, inclusion and employee engagement, affirmative action, employee performance and development, while modeling leadership commitments, values and behaviors.

Objective 2: Coal Inventory Optimization – (Cost Control)

Description: Establish appropriate inventory ranges and manage fuel stock within these limits to minimize operational risks on the lower end of the range and to avoid financial penalties on the higher end of the range.
Measurement: Monitor and report on a monthly basis against inventory limits established through the Coal Inventory Optimization Analysis. Provide explanations of variances. Identify, analyze and recommend options to be implemented to either continue to manage inventory levels within these ranges or when market conditions or fleet operations dictate, to manage inventory levels outside of these ranges.

Utilize the short term inventory forecasting process to routinely report current and projected inventory levels (and actions being taken) at Daily Operations meetings and Energy Supply and Analysis Metrics meetings.

Objective 3: Fuel Costs - (Cost Control)

Achieve fuel-related costs across the fleet.

Oversee fuel procurement activates to ensure compliance with the Fuel Procurement Strategy, the ALM, SOX Controls, and Fuel Procurement Policies and Procedures.

Objective 4: MTP Budgeting/Planning - (Cost Control)

Support the development of the Operations MTP and the assessment as to how future regulatory compliance obligations affect fuel utilization/by-product beneficial use and costs as well as supply side alternatives and costs, capital investments and on-going O&M.

Gain approval of coal forward price curves and inventory limits as a component of the MTP budgeting/planning process. Provide forward pricing for other commodities procured for power generating facilities.

Share with colleagues in Energy Supply and Analysis, Technology Research and Analysis, External Affairs, etc. information learned from meetings with various outside industry

groups that Fuels participated in during the year.

Objective 5: Special Projects - (Customer Reliability)

Continue Implementation of fleet wide CCR beneficial use strategy. Continue implementation of Refined Coal Project.

Participate in and advocate the company's and/or the Energy Supply and Analysis position.

Energy Supply and Analysis-SM2

Objective 1: Management Objective - (All Measures)

Actively promote company initiatives for safety and wellness, customer experience, inclusion and employee engagement, affirmative action, employee performance and development, while modeling leadership commitments, values and behaviors.

Objective 2: Power Supply Operations - (All Measures)

Provide leadership for managing the following activities:
- Dispatch operations
- Trading operations
- Marketing activities
- Maintaining reserve sharing arrangement
- others as identified

Achieve cost of serving native load ($/MWH) target

Objective 3: Natural Gas Procurement - (Cost Control)

- Increase depth of natural gas trading and scheduling experience within the group.
- Work with Energy Planning, Analysis, and Forecasting (EPAF) to periodically review the optimal portfolio of firm/non-firm transport to provide reliable gas supply at the least cost.
- Work with the risk manager within EPAF to determine the optimal natural gas contract terms for CR7 fuel portfolio.
- Continue the RFP and award recommendation process for procuring future supplies of gas, consistent with the fuel strategy.

Objective 4: Municipal and Co-owner Relationships - (Customer Satisfaction)

- Support commercial activities and business relationships with wholesale municipal customers
- Support relationship with Trimble County Co-owners

<u>Energy Supply and Analysis-SM3</u>

Objective 1: Management Objective - (All Measures)

Actively promote company initiatives for safety and wellness, customer experience, inclusion and employee engagement, affirmative action, employee performance and development, while modeling leadership commitments, values and behaviors.

Objective 2: Provide Departmental & Corporate Leadership on Key Issues - (All Measures)

Extend capabilities of department to support decisions across key areas and issues, improve tools, and understand major policy implications.

Objective 3: Oversee Dept Operations to Ensure Objectives are Met - (Cost Control)

Provide appropriate oversight and leadership to ensure budgets are met, analysis is timely, and filings are supported appropriately.

Objective 4: Make Individual Contributions on Special Projects as Directed - (All Measures)

Participate in special projects, including policy-related and broader energy use issues that arise during the year.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 48

Responding Witness: Gregory J. Meiman

Q-48. Reference the Companies' response to AG DR 1-120. The Mercer study introduction (of Attachment 4 to Tab 60 of the Companies' Applications) states that Mercer evaluated "benefits against organizations most similar to the client. Thus, utility companies are the most similar to LKE and are the primary market comparison." The lists of utilities in the study appendix includes such companies as California ISO, ERCOT, Northeast Texas Electric Cooperative, and PJM Interconnection, L.L.C. Provide the following:

   a. Explain how the companies specified in this data request can be characterized as among those "most similar to LKE."

   b. Provide the specific criteria by which peer companies were chosen for the Mercer study.

A-48.
   a. The companies specified in this data request were part of the comparison group for the health/group and time loss comparison, but not part of the comparison group for the retirement review. To select these companies, Mercer relied upon existing data in its US Benefits Database. The full database of approximately 1,000 companies was scoped to all companies in the utility industry and then further refined to exclude electric cooperatives. The Independent System Operators (California ISO, ERCOT, and PJM Interconnection, L.L.C., as listed above), which are governed by FERC (Federal Energy Regulatory Commission), operate a region's electricity grid, administer a region's wholesale electricity markets, and provide reliability planning for a region's bulk electricity system. Northeast Texas Electric Cooperative is an association that advocates for cooperatives in Texas. These companies were selected based on (1) their impact on companies in the utility industry and (2) the similarity in the backgrounds and experience of the employees hired.

   b. According to Mercer, they looked to three markets for benchmarking health/group, time loss, and retirement benefits: utilities, companies headquartered in KY, and the national market. The primary market was utilities, as those companies are most similar to LG&E/KU. For the

health/group and time loss comparison, the primary market companies are listed on slide 9 of 13 of the study provided by Mercer (which was attached as Attachment 4 to tab 60 to the Application). A description of how those companies were selected can be found in part a above.

For the retirement comparison, the primary market companies are listed on slide 10 of 13 of the study provided by Mercer. First, Mercer identified all organizations that are involved in the energy sector in any way, including publicly-traded, wholly-owned subsidiary, private, tax-exempt, and municipal organizations. Next, Mercer narrowed the organizations to those that provide either electricity or gas to residential customers through regulated rates. Big Rivers Electric Corporation, East Kentucky Power Co-op, and Tennessee Valley Authority were also retained, as these have a significant local presence in the utility space. Further, Mercer narrowed down the organizations by selecting those regulated utilities who had a customer base most similar to LG&E/KU. Mercer used number of customers as the primary scope comparison. Utilities with 1/3 to 3X the customer base of LG&E/KU were included. This scoping is consistent with Mercer's standard comparison group development practice.

Finally, Mercer identified which of the remaining regulated utilities had sufficient publicly disclosed data pertaining to current and past retirement benefits. Additionally, this group includes three utilities (Big Rivers Electric Corporation, East Kentucky Power Co-op, and Tennessee Valley Authority) that are not regulated utilities but have a significant local presence in the utility industry.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 49

Responding Witness: Daniel K. Arbough

Q-49. Reference the Companies' response to AG DR 1-82, AG DR 1-11, and the amounts provided in account 901 for the base and test period.

    a. Provide a breakdown of the base and test period amounts provided for this account, including the amounts dedicated to economic development, in whole or in part.

    b. Indicate which expenses provided in subpart (a), above, are dedicated, in whole or in part, to economic development.

    c. Are any amounts reflected in account 901 related to lobbying or government relations? If so, provide those amounts related to lobbying or government relations.

    d. Provide the total amounts, by Company, for the salaries and costs related to each lobbying, government relations and economic development.

A-49.

    a.

LG&E	Base Period	Test Period
Business Services	896,599	990,283
Retail Business Systems, Strategy & Learning	801,442	849,452
Residential Service Center	340,855	471,290
Business Offices	189,460	241,568
VP Customer Services	220,777	154,411
Director Revenue Integrity	101,695	103,742
Civic Affairs	72	
Corporate	(445)	
Total	**2,550,454**	**2,810,746**

b. Of the amounts above, the portion related to economic development is included within Business Services: $896,599 in the base period and $990,283 in the test period.

c. No.

d. Account 901 contains no lobbying and government relations costs. The salaries and other costs for economic development in account 901 are below:

Business Services	Base Period	Test Period
Labor	818,428	837,167
Nonlabor	78,171	153,116
Total	**896,599**	**990,283**

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 50

Responding Witness: Gregory J. Meiman

Q-50. Reference the Companies' response to AG DR 1-116. Explain why the Companies refuse to use regional comparisons for the Company's pay and compensation.

A-50. Organizations like to assess as robust and varied market compensation data as available when conducting benchmarking studies, but due to limited survey participation and data samples, regional comparisons, whether for general industry or utility/energy industry are not always available. Companies that participate in the compensation surveys change from year to year and it is each individual company's decision to determine whether to participate or not in a given year. Neither the Companies nor WTW determine the participants.

In the absence of robust regional compensation data comparisons, WTW provided geographic differential data, as was noted in their 2018 General Rate Case Target Total Cash Compensation Study.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 51

Responding Witness: Lonnie E. Bellar / Robert M. Conroy

Q-51. Reference the Companies' response to AG DR 1-73.

    a. Provide representative examples used during the most recent 12-months for each of the "Advertising Categor[ies]" in which the Companies are requested recovery for in the test period. Each item provided in response to this request should indicate the time period it was sent to customers.

A-51.
    a. See attached.

Turn your thermostat down two degrees.

Caulk gaps around windows and doors.

Install plastic film to insulate windows.

Change furnace filters regularly to improve HVAC efficiency.

Use LED lights and holiday timers so they're only on when you're home.

'Tis the season to save energy and money!

Cold temperatures can have a big impact on your energy bills. At LG&E, we're empowering you to save with lots of quick, easy tips that can help you reduce your energy usage and save money. Visit **lge-ku.com/tips** for more great ways to save – plus helpful how-to videos.

POWER SOURCE

OCTOBER 2018

TRANSMISSION WORK ENHANCING RELIABILITY FOR CUSTOMERS; ECONOMIC DEVELOPMENT FOR STATE

Interstate highways may be our fast-paced transportation routes on the ground, but take a look above, and you'll find multilane energy highways, in the form of overhead transmission lines, in the air.

Transmission lines are high-voltage power lines, energized up to as much as 765,000 volts, which connect the entire energy grid. The lines transport electric current from generating stations where energy is produced to substations where it's stepped down and transported through the distribution lines that serve commercial areas and neighborhoods.

When outages occur within a transmission system, they can have widespread, large-scale impacts – like the Northeast Blackout of 2003. Now recognized as one of the worst power outages in U.S. history, the incident started when a high-voltage power line in Ohio brushed against overgrown trees, causing it to shut down and create an overload and blackout that cascaded across eight U.S. states and Canada, impacting more than 50 million people.

Minimizing the potential for these types of large-scale outages is one of many reasons keeping transmission systems up-to-date is so critical.

We are working on ongoing transmission system improvements that include replacing aging equipment such as wooden poles, cross arms, lines and substation controls. We are also implementing cycle-based tree trimming and focused efforts to remove dead, dying and diseased trees around transmission infrastructure. The ongoing work will establish a schedule for keeping trees a safe distance from transmission lines. Failure to maintain the safe distance can be punishable by a significant fine from the North American Electric Reliability Corporation (NERC).

It's anticipated these enhancements, along with other infrastructure upgrades, will significantly reduce the duration of outages experienced by customers and ensure a safe, reliable system far into the future.

On the natural gas side, we are replacing aging steel service and transmission lines with new plastic pipe for increased reliability. Also, more than $11.5 million in upgrades are underway at our Muldraugh Compressor Station, including a major pipeline replacement.

SAFETY, SAFETY AND SAFETY: THE THREE REQUIREMENTS FOR YARD WORK THIS FALL

Autumn is the time of year to wrap up that last bit of yard work before settling in for the winter to come. There'll be leaves to rake, gutters to clean and maybe some fall planting in anticipation of next spring. And while the seasons are changing, one thing that never goes out of season is safety. Please heed these simple tips so you won't "fall" into any trouble:

- **Raking** – Dry leaves can spark a fire. Make sure they are cleared away from any outdoor lighting, power outlets and power cords.

- **Cleaning** – Getting gunk out of the gutters usually means using a ladder. Remember to carry your ladder parallel to the ground while checking for power lines and trees that may be touching power lines before raising the ladder to stand it up.

- **Planting** – Digging a hole for a new bush, shrub or tree requires a little planning. At least two days before your shovel hits the ground, contact **811**. Simply dial 8-1-1 or make your request online at **811now.com**. That alerts member utilities, including LG&E, to mark any underground wires, cables or pipelines so you can avoid digging in the wrong spot and prevent a serious accident or injury.

Whether you're working in the yard or just enjoying some nice weather by taking a walk through the neighborhood, your nose can keep you safe. A rotten-egg or sulfur odor could signal a natural gas leak. If you suspect a leak, get away from the affected area. Once safely away, call LG&E at **502-589-1444** (call **800-331-7370** outside Louisville) and also call **911** to report the situation.

RAYNEISHA RAVES ABOUT PAPERLESS BILLING

You've read it here before: a little less clutter can make life a little less hectic. That's why LG&E offers paperless billing. Just sign up through your online account (or easily create one) at **my.lge-ku.com**. Here's what one of our employees has to say about going paperless:

"I think paperless billing is awesome. I'm not a big fan of paper mail because it becomes too much to go to a mailbox every day, especially having to walk a distance with a very active 2-year-old. Paperless is a big convenience because I tend to misplace a lot of mail when I receive it. It's much easier to go back and search **ebill@lge-ku.com** in my email to look at it. It's a great thing when I need to look at my bill as a reference immediately and it's right there!"– **Rayneisha Anderson, customer care representative, Residential Service Center.**

Visit **lge-ku.com/paymybill** to learn more about paperless billing and other payment options.

Sign up for My Notifications and receive timely reminders about the due date of your bill by text, email and/or phone. Visit lge-ku.com/notifications for more information.

SOLAR SHARE PROGRAM NOW SHINES A LITTLE BRIGHTER FOR CUSTOMERS

On August 28 the Kentucky Public Service Commission approved LG&E's request to change the fee structure of the company's Solar Share program.

In an effort to make the program more convenient for those interested in supporting community solar, LG&E proposed including the enrollment fee in the monthly capacity charge, thus creating a slight increase in the monthly charge but no more up-front costs.

LG&E is hoping the change will encourage more customers to support community solar. Those who previously signed up for the program also will benefit from the removal of the up-front fee. The change means the monthly subscription cost for participating customers will increase slightly, from $6.24 per share to $6.27 per share.

"We're always exploring ways to make our offerings more appealing to customers, and gaining KPSC approval on our request to eliminate the up-front enrollment fee will help us build on the early success and customer interest we've seen with our Solar Share program," said David Huff, director of Customer Energy Efficiency and Emerging Technologies. "We're thankful for every customer and employee who has signed up for the program so far. We encourage everyone to take another look at the program and share this exciting opportunity with their friends and families."

In July, the company reached an important milestone with full subscription for the 2,000 shares in the facility's first section.

"We're still actively working to seek subscriptions for the remaining sections, and we appreciate employees' continuing to subscribe and spread the word about the program," added Huff.

Construction on the first fully subscribed section is anticipated to begin in early 2019. Visit lge-ku.com/solar-share to learn more about the program.

FIRE SAFETY: BE SURE TO CHECK SMOKE DETECTORS AND CHANGE BATTERIES REGULARLY

October is national Fire Prevention Month and is paired with a reminder to change your smoke detector batteries. That simple act can literally be a lifesaver, alerting you of a fire in time to escape safely and call emergency responders.

Smoke detector batteries should be checked each month (by pushing the test button on the detector) and replaced at least once a year. Smoke detectors should be replaced every 10 years.

In the event of a fire, the National Fire Prevention Association recommends having a preplanned meeting site a safe distance from your home so everyone knows where to gather when the smoke detector goes off. It's also important to make sure windows and doors leading outside open easily and are not blocked by any clutter.

Visit nfpa.org to learn more about fire safety.

OUR OFFICES WILL BE CLOSED FOR THANKSGIVING, BUT OUR SERVICE TO YOU NEVER SHUTS DOWN

Wasn't it summer just a little while ago? It's hard to believe, but the holidays are practically upon us. So, this is a reminder that LG&E's customer service center and call centers will be closed Thursday, November 22 and Friday, November 23 in observance of Thanksgiving.

Not to worry, as always, we're working nonstop to bring you safe, reliable, affordable energy. Our technicians will be on the job to ensure you have all the power you require to meet your holiday needs. And if some incident does cause a power outage, they will be on the scene faster than you can say "pass the dressing" to make the necessary repairs.

Also, remember that your LG&E payment is never due on a day our offices are closed, but you can make a payment. Take advantage of any of the available payment options, including:

- **Phone** – call **502-589-1444** (call **800-331-7370** outside Louisville) and press 1-2-3.
- **Online** – pay via your online account. (If you don't have one, easily create an account at **my.lge-ku.com**.)

Visit **lge-ku.com/paymybill** to learn more.

NATIONAL PIPELINE MAPPING SYSTEM

The National Pipeline Mapping System (NPMS) website – https://www.npms.phmsa.dot.gov/PublicViewer/ – enables users to view NPMS data one county at a time. NPMS data consists of gas transmission pipelines and hazardous liquid trunk lines. It does not contain gathering or distribution pipelines, such as lines which deliver gas to an individual customer's home. Therefore, not all pipelines in an area will be visible in the public map viewer.

NPMS data is for reference purposes only. It should never be used as a substitute for contacting Kentucky 811 prior to excavating.

LG&E'S INTEGRITY MANAGEMENT PROGRAM

Our lines are monitored and inspected so we can locate and fix potential problems before they occur. We also implement a pipeline integrity management program that includes identifying areas along our pipelines where the consequences of a failure would be significant, conducting inspections to verify the integrity of the pipeline, implementing pipeline safety communications plans, identifying pipeline risks and implementing measures to reduce pipeline risks. Additional natural gas and pipeline safety information, including emergency preparedness, land-use practices, carbon monoxide safety and the importance of digging safely can be found on our website: **lge-ku.com/customer-service/public-safety**

FOR ANY NATURAL GAS CONCERN OR EMERGENCY, CALL LG&E at 502-589-1444.

Individuals outside Louisville may call 800-331-7370. You can reach us 24 hours a day, 365 days a year.

LG&E
a PPL company

Before digging,

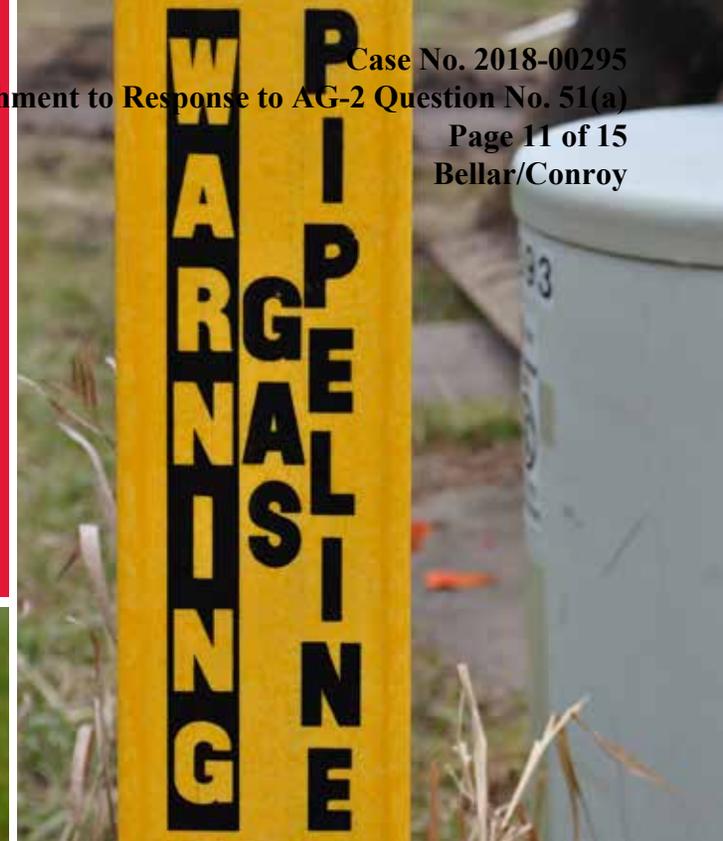
contact Kentucky 811 (by phone when you dial 8-1-1 or online using the One Click option at 811now.com) to have your underground lines marked free of charge.

NATURAL GAS & PIPELINE SAFETY FOR YOU.

You live or work near a natural gas pipeline. Please read this IMPORTANT INFORMATION.

LG&E
a PPL company

LOOK FOR MARKERS

Our underground pipelines are the safest, most efficient and reliable way to deliver natural gas to your home or business. Unfortunately, residential and commercial development in once-rural areas is encroaching on pipeline rights-of-way with increasing frequency. Encroachment can present safety concerns for local residents and for the physical integrity of the pipeline itself. To help prevent encroachment and excavation-related damage to pipelines, we install brightly colored signposts along the pipeline right-of-way to indicate the presence – but not necessarily the exact location – of underground pipelines. Pipeline markers come in a variety of shapes and sizes, but they all contain important information, including emergency contact information for LG&E or the company that operates the pipeline.


LG&E CARES

LG&E operates 4,600 miles of natural gas pipelines in 20 counties in Kentucky and Southern Indiana, transporting and delivering natural gas to 326,000 customers. We purchase natural gas from national pipeline operators and deliver it directly to our customers or store it for later use when our customers need it. We have resources available to respond promptly to a gas pipeline emergency, and we have ongoing relationships with emergency response agencies in our area who are:

- Trained to identify risks to help prevent gas emergencies.

- Prepared to respond to a gas emergency if one were to occur.

Hazards associated with pipeline failure include blowing gas with potential of a fire or explosion and, if gas is present in a confined space, possible asphyxiation. The current issue of *Power Source*, which came with this month's bill, includes tips for detecting leaks inside or outside your home.

Scratch and sniff this flame for natural gas odor.

WHAT IS A RIGHT-OF-WAY?

A pipeline right-of-way or easement is a corridor or strip of land that surrounds a pipeline. The right-of-way enables us to construct, operate, test, inspect, maintain and protect our pipelines. Access to the right-of-way often is inhibited by trees and other vegetation, fences, buildings and other structures. We encourage residents, excavators, land developers and governmental agencies to contact us during planning stages to help prevent obstructions which delay our response to emergencies and hinder our ability to operate effectively and efficiently.

DIG WITH CARE – IT'S THE LAW

Before digging, ensure the locations of underground utilities in the area are marked by contacting 811 (by phone when you dial 8-1-1 or online with the One Click option at **811now.com**). When you submit your request, Kentucky 811 will coordinate with us (and other member utilities) to mark – free of charge – our underground utilities. The law is designed to protect you and your property when you:

1. Contact 811 (by phone when you dial 8-1-1 or online with the One Click option at **811now.com**) at least two business days before you dig.

2. Wait until the lines have been marked.

3. Avoid digging near the marked areas. In fact, Kentucky law requires you to observe a safe tolerance zone by digging non-intrusively within 18" on either side of the utility.

LG&E
a PPL company

ELECTRIC **SAFETY**

ELECTRIC SAFETY

We work to provide safe, reliable service 24 hours a day, every day, but we can't guarantee uninterrupted service all the time. We all know a power outage can be a big inconvenience, but there are some key steps you can take to stay safe.

To report downed lines or an outage

LG&E customers: 502-589-1444
(toll free: 800-331-7370)

Safety first!

Stay away from all fallen wires and anything, such as a tree limb, that may be in contact with them. Camp stoves and charcoal grills should never be used indoors because they can produce deadly fumes. When using portable generators, always follow the manufacturer's instructions and operate in a well-ventilated area.

Turn off your major appliances

This includes electric stoves, ovens, washers and dryers. Unplug sensitive equipment such as televisions and computers. This reduces the electrical demand when power is restored and significantly reduces the chance of damage from electrical surges.

Visit **lge-ku.com/safety/electric** for more tips on indoor and outdoor electric safety.

Our energies go to serving you.

EXTREME HEAT =
HIGHER ENERGY USE.

We have tips and tools to help.

LG&E
a PPL company

HOT WEATHER TIPS

- Remember that *insulation* and *sealing air leaks* can improve your home's energy performance in the summer as well as the winter because they help you keep the cool air you have paid to cool inside your home.

- *Plant trees or shrubs* to shade air conditioning units, but do not block the air flow. Place a room air conditioner on the north side of the house. A unit that operates in the shade uses less energy than one operating in the sun.

- *Do not place lamps* or electronic equipment, such as a TV set, *near your home's thermostat*. The thermostat senses heat from these appliances, which can cause the air conditioner to run longer than necessary.

- *Use a fan* even when your air conditioner is running so you can spread the cooled air more effectively throughout your home without having to adjust the thermostat.

- *Adjust your home's thermostat* up two degrees in the summer.

- *Whole-house fans* can help cool your home by pulling cool air through the house and exhausting warm air out through the attic. Whole-house fans are effective primarily when they are operated at night because that is typically when the outside air is cooler than the inside.

- *Keep curtains, drapes and blinds closed* during the hottest part of the day to prevent the sun's rays from heating your home.

We've got more tips and tools online — including programs that can lend qualified customers a hand in weatherizing homes and assisting with bills. Visit **lge-ku.com/helpingyou** today.

Our energies go to serving you.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 52

Responding Witness: Daniel K. Arbough

Q-52.   Reference the Companies' response to AG DR 1-78.

    a. Provide the nature of the two litigation matters, and explain why they are beyond the Company's control.

    b. Explain why ratepayers should bear these costs.

    c. What is the status of these two litigation matters, and when are these two litigation matters expected to be resolved?

    d. How much is included in the forecast for these two litigation matters?

    e. How much of the outside services' costs associated with these matters could be recovered through insurance?

A-52.
    a. These litigation matters both involve challenges based on alleged environmental impacts from operations at two of our coal-fired generating stations. The Company is a defendant in these actions, and denies any liability for the matters complained of by the plaintiffs.

    b. The expenses associated with defending these suits are a normal cost of doing business.

    c. Both matters are in the pretrial stage. With no trial date set in either case, a date of resolution cannot be predicted at this time.

    d. $1,560,000 is included in the forecast for outside services related to these matters.

    e. We have placed our carriers on notice in both of these suits, but it is presently unknown how much, if any, coverage will be available in either case.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 53

Responding Witness: Daniel K. Arbough

Q-53.   Reference the Companies' response to AG DR 1-79.

a.   Explain the nature of the expected increased number of "separate matters" forecasted at over $100K in 2018 and 2019, and the single matter forecasted at over $500k in 2018.

b.   Further, explain if the Companies expect and have requested recovery for any expenses relating to the $500k 2018 matter during 2019 or the test period.

A-53.

a.   Refer to PSC 3-22.

b.   All of the categories shown in Attachment to Filing Requirement 807 KAR Section 16(7) I. page 215 of 235 are appropriately included in the revenue requirement calculation.   See attached.   The information requested is confidential and proprietary and is being provided under seal pursuant to a petition for confidential protection.

The entire attachment is Confidential and provided separately under seal.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 54

Responding Witness: Daniel K. Arbough / Christopher M. Garrett

Q-54. Reference the Companies' response to AG DR 1-71 . Ghent Station revenues were reflected in Accounts 454 Rent from electric property, 456 Other electric revenues, and an offset in 501 Fuel. Trimble County and Mill Creek stations were under contact at the time of the filing, and refined coal revenues are reflected in Account 456 Other electric revenues.

    a. Are rent revenues expected from Trimble County and Mill Creek stations? If the response is affirmative, how much? Provide a breakdown by company.

    b. Are offsets to 501 Fuel expected from Trimble County and Mill Creek stations? If the response is affirmative, how much? Provide a breakdown by company.

A-54.

    a. The Trimble County station refined coal contract was finalized in October 2018. Anticipated rent revenues for Trimble County station (75% share) are $2.8 million annually for the contract term which is approximately $1.5 million for LG&E and $1.3 million for KU (approximately $1.2 million for the Kentucky jurisdiction). Rent revenue is variable based on actual tons treated.

    The Mill Creek station refined coal contract is projected to be finalized soon with completion of construction and commencement of production expected in January 2019. Anticipated rent revenues for Mill Creek station are $4.6 million annually and are LG&E only revenues. Rent revenue is variable based on actual tons treated and these revenues will be passed on to customers.

    b. The Trimble County station (75% share) anticipated offset to account 501 is $0.7 million annually for the contract term split approximately $0.4 million for LG&E and $0.3 million for KU (approximately $0.28 million for the Kentucky jurisdiction). This offset is variable based on actual tons treated.

    The Mill Creek station anticipated offset to account 501 is $1.2 million annually for the contract term and is only offsetting LG&E expense. This offset is variable based on actual tons treated.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 55

Responding Witness: Daniel K. Arbough

Q-55. Reference Schedule B-8.

    a. Provide a summary list and amounts of the items in prepayments in the base
    year and forecasted period for each company.

    b. Provide the supporting detail for the summary totals for each company.

A-55.

    a. See attached.

    b. See attached.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 56

Responding Witness: Daniel K. Arbough / Christopher M. Garrett

Q-56.   Reference the Companies' response to AG DR 1-86.

   a.   Confirm that the Company has not reflected duplicative charges for the same
        service from more than one service company in the test year in this matter.

A-56.
   a.   The Company confirms that it does not budget duplicative charges.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 57

Responding Witness: Robert M. Conroy / David S. Sinclair

Q-57. Reference the Companies' response to AG DR 1-170.

a. Explain to what degree the Company will allow customers interested in Green Tariff Option #3 to choose or have input into what type of "renewable resource" it receives electricity from under Option #3.

b. Explain whether a customer can replace 10MW of current capacity with capacity from Green Tariff Option #3.

c. Explain, in detail, what the Companies envision the process will be with customers in its response that "The Companies will work with the potential Green Tariff Option #3 customer in any way."

d. Is the Company's response to subpart (h) to AG DR 1-170 indicating that all terms and conditions resulting from Green Tariff Option #3 are negotiable, including how the contract relates to ongoing tariff and rate mechanisms? For instance, is the response indicating that the interaction with certain special contracts may impact certain customers differently as it relates to local school taxes, off-system sales, fuel adjustment clause, applicable demand rates, applicable customer charges, contribution in aid of construction, surcharges, etc.?

A-57.

a. The customer can have input into the type of renewable resource so long as there is a market to procure the requested generation source bound by the terms of the Green Tariff and bilateral contract between the customer and Company. The Company has no interest in limiting the type of renewable resource choices of its customers under Option #3.

b. No. A customer cannot replace any capacity under Option #3.

c. The Green Tariff Option #3 requires a mutually agreed-to bilateral contract between the Company and customer as well as the Company and the renewable

energy provider. The terms of these contracts will be jointly determined in consultation with the potential customer.

d. No. The customer will continue to be billed under the appropriate Company tariff based on their usage and required facilities. The negotiable terms related to Option #3 only include the contractual terms for procuring the renewable resource and how the Company will recover its contract costs from the customer.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 58

Responding Witness: Robert M. Conroy / Elizabeth J. McFarland

Q-58. Reference the Companies' response to Staff DR 2-11.

    a. Confirm that AMI meters are available through the Company's AMS Customer Service Offering.

    b. Confirm that the cost of meters provided through the AMS Customer Service Offering are not recovered through base rates.

    c. Confirm that meters provided through the AMS Customer Service Offering provide the same benefits as those meters provided to customers who enroll in the Solar Share program.

    d. What would the reduction to the revenue requirement be if the Commission required the costs of the AMI meters be recovered via the Solar Share program and not through base rates?

A-58.

    a. Confirmed.

    b. Confirmed.

    c. Confirmed. See the response to PSC 3-5.

    d. There would be no reduction to the revenue requirement. See the response to PSC 3-6.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 59

Responding Witness: Lonnie E. Bellar

Q-59. Reference the Attorney General's request and Companies' response to AG DR 1-170. Further, reference Exhibit LEB-2 to the direct testimony of Lonnie E. Bellar, generally.

    a. Confirm that 16 U.S.C. § 824a-3 provides the option for an electric utility to request, and for the FERC to grant, termination of mandatory purchase and sale requirements regarding certain qualifying facilities under the Public Utility Regulatory Policies Act of 1978 ("PURPA"), if the FERC finds that the qualifying facility has nondiscriminatory access to independently administered, auction-based day ahead and real time wholesale markets for the sale of electric energy and wholesale markets for long-term sales of capacity and electric energy.

    b. Discuss whether the Companies' believe they adequately considered the impact of RTO membership on their current or future obligations under PURPA.

A-59.

    a. 16 U.S.C. § 824a-3 speaks for itself. See attached copy of the statute.

    b. See the response to PSC 3-30.

16 U.S.C.
United States Code, 2017 Edition
Title 16 - CONSERVATION
CHAPTER 12 - FEDERAL REGULATION AND DEVELOPMENT OF POWER
SUBCHAPTER II - REGULATION OF ELECTRIC UTILITY COMPANIES ENGAGED IN INTERSTATE
COMMERCE
Sec. 824a-3 - Cogeneration and small power production
From the U.S. Government Publishing Office, www.gpo.gov

§824a–3. Cogeneration and small power production

(a) Cogeneration and small power production rules

Not later than 1 year after November 9, 1978, the Commission shall prescribe, and from time to time thereafter revise, such rules as it determines necessary to encourage cogeneration and small power production, and to encourage geothermal small power production facilities of not more than 80 megawatts capacity, which rules require electric utilities to offer to—

(1) sell electric energy to qualifying cogeneration facilities and qualifying small power production facilities [1] and

(2) purchase electric energy from such facilities.

Such rules shall be prescribed, after consultation with representatives of Federal and State regulatory agencies having ratemaking authority for electric utilities, and after public notice and a reasonable opportunity for interested persons (including State and Federal agencies) to submit oral as well as written data, views, and arguments. Such rules shall include provisions respecting minimum reliability of qualifying cogeneration facilities and qualifying small power production facilities (including reliability of such facilities during emergencies) and rules respecting reliability of electric energy service to be available to such facilities from electric utilities during emergencies. Such rules may not authorize a qualifying cogeneration facility or qualifying small power production facility to make any sale for purposes other than resale.

(b) Rates for purchases by electric utilities

The rules prescribed under subsection (a) shall insure that, in requiring any electric utility to offer to purchase electric energy from any qualifying cogeneration facility or qualifying small power production facility, the rates for such purchase—

(1) shall be just and reasonable to the electric consumers of the electric utility and in the public interest, and

(2) shall not discriminate against qualifying cogenerators or qualifying small power producers.

No such rule prescribed under subsection (a) shall provide for a rate which exceeds the incremental cost to the electric utility of alternative electric energy.

(c) Rates for sales by utilities

The rules prescribed under subsection (a) shall insure that, in requiring any electric utility to offer to sell electric energy to any qualifying cogeneration facility or qualifying small power production facility, the rates for such sale—

(1) shall be just and reasonable and in the public interest, and

(2) shall not discriminate against the qualifying cogenerators or qualifying small power producers.

(d) "Incremental cost of alternative electric energy" defined

For purposes of this section, the term "incremental cost of alternative electric energy" means, with respect to electric energy purchased from a qualifying cogenerator or qualifying small power producer, the cost to the electric utility of the electric energy which, but for the purchase from such cogenerator or small power producer, such utility would generate or purchase from another source.

(e) Exemptions

(1) Not later than 1 year after November 9, 1978, and from time to time thereafter, the Commission shall, after consultation with representatives of State regulatory authorities, electric utilities, owners of cogeneration facilities and owners of small power production facilities, and after public notice and a reasonable opportunity for interested persons (including State and Federal agencies) to submit oral as well as written data, views, and arguments, prescribe rules under which geothermal small power production facilities of not more than 80 megawatts capacity, qualifying cogeneration facilities, and qualifying small power production facilities are exempted in whole or part from the Federal Power Act [16 U.S.C. 791a et seq.], from the Public Utility Holding Company Act,[2] from State laws and regulations respecting the rates, or respecting the financial or organizational regulation, of electric utilities, or from any combination of the foregoing, if the Commission determines such exemption is necessary to encourage cogeneration and small power production.

(2) No qualifying small power production facility (other than a qualifying small power production facility which is an eligible solar, wind, waste, or geothermal facility as defined in section 3(17)(E) of the Federal Power Act [16 U.S.C. 796(17)(E)]) which has a power production capacity which, together with any other facilities located at the same site (as determined by the Commission), exceeds 30 megawatts, or 80 megawatts for a qualifying small power production facility using geothermal energy as the primary energy source, may be exempted under rules under paragraph (1) from any provision of law or regulation referred to in paragraph (1), except that any qualifying small power production facility which produces electric energy solely by the use of biomass as a primary energy source, may be exempted by the Commission under such rules from the Public Utility Holding Company Act [2] and from State laws and regulations referred to in such paragraph (1).

(3) No qualifying small power production facility or qualifying cogeneration facility may be exempted under this subsection from—

(A) any State law or regulation in effect in a State pursuant to subsection (f),

(B) the provisions of section 210, 211, or 212 of the Federal Power Act [16 U.S.C. 824i, 824j, or 824k] or the necessary authorities for enforcement of any such provision under the Federal Power Act [16 U.S.C. 791a et seq.], or

(C) any license or permit requirement under part I of the Federal Power Act [16 U.S.C. 791a et seq.] any provision under such Act related to such a license or permit requirement, or the necessary authorities for enforcement of any such requirement.

(f) Implementation of rules for qualifying cogeneration and qualifying small power production facilities

(1) Beginning on or before the date one year after any rule is prescribed by the Commission under subsection (a) or revised under such subsection, each State regulatory authority shall, after notice and opportunity for public hearing, implement such rule (or revised rule) for each electric utility for which it has ratemaking authority.

(2) Beginning on or before the date one year after any rule is prescribed by the Commission under subsection (a) or revised under such subsection, each nonregulated electric utility shall, after notice and opportunity for public hearing, implement such rule (or revised rule).

(g) Judicial review and enforcement

(1) Judicial review may be obtained respecting any proceeding conducted by a State regulatory authority or nonregulated electric utility for purposes of implementing any requirement of a rule under subsection (a) in the same manner, and under the same requirements, as judicial review may be

obtained under section 2633 of this title in the case of a proceeding to which section 2633 of this title applies.

(2) Any person (including the Secretary) may bring an action against any electric utility, qualifying small power producer, or qualifying cogenerator to enforce any requirement established by a State regulatory authority or nonregulated electric utility pursuant to subsection (f). Any such action shall be brought only in the manner, and under the requirements, as provided under section 2633 of this title with respect to an action to which section 2633 of this title applies.

(h) Commission enforcement

(1) For purposes of enforcement of any rule prescribed by the Commission under subsection (a) with respect to any operations of an electric utility, a qualifying cogeneration facility or a qualifying small power production facility which are subject to the jurisdiction of the Commission under part II of the Federal Power Act [16 U.S.C. 824 et seq.], such rule shall be treated as a rule under the Federal Power Act [16 U.S.C. 791a et seq.]. Nothing in subsection (g) shall apply to so much of the operations of an electric utility, a qualifying cogeneration facility or a qualifying small power production facility as are subject to the jurisdiction of the Commission under part II of the Federal Power Act.

(2)(A) The Commission may enforce the requirements of subsection (f) against any State regulatory authority or nonregulated electric utility. For purposes of any such enforcement, the requirements of subsection (f)(1) shall be treated as a rule enforceable under the Federal Power Act [16 U.S.C. 791a et seq.]. For purposes of any such action, a State regulatory authority or nonregulated electric utility shall be treated as a person within the meaning of the Federal Power Act. No enforcement action may be brought by the Commission under this section other than—

(i) an action against the State regulatory authority or nonregulated electric utility for failure to comply with the requirements of subsection (f) [3] or

(ii) an action under paragraph (1).

(B) Any electric utility, qualifying cogenerator, or qualifying small power producer may petition the Commission to enforce the requirements of subsection (f) as provided in subparagraph (A) of this paragraph. If the Commission does not initiate an enforcement action under subparagraph (A) against a State regulatory authority or nonregulated electric utility within 60 days following the date on which a petition is filed under this subparagraph with respect to such authority, the petitioner may bring an action in the appropriate United States district court to require such State regulatory authority or nonregulated electric utility to comply with such requirements, and such court may issue such injunctive or other relief as may be appropriate. The Commission may intervene as a matter of right in any such action.

(i) Federal contracts

No contract between a Federal agency and any electric utility for the sale of electric energy by such Federal agency for resale which is entered into after November 9, 1978, may contain any provision which will have the effect of preventing the implementation of any rule under this section with respect to such utility. Any provision in any such contract which has such effect shall be null and void.

(j) New dams and diversions

Except for a hydroelectric project located at a Government dam (as defined in section 3(10) of the Federal Power Act [16 U.S.C. 796(10)]) at which non-Federal hydroelectric development is permissible, this section shall not apply to any hydroelectric project which impounds or diverts the water of a natural watercourse by means of a new dam or diversion unless the project meets each of the following requirements:

(1) No substantial adverse effects

At the time of issuance of the license or exemption for the project, the Commission finds that the project will not have substantial adverse effects on the environment, including recreation and water quality. Such finding shall be made by the Commission after taking into consideration terms and conditions imposed under either paragraph (3) of this subsection or section 10 of the Federal Power Act [16 U.S.C. 803] (whichever is appropriate as required by that Act [16 U.S.C. 791a et seq.] or the Electric Consumers Protection Act of 1986) and compliance with other environmental requirements applicable to the project.

(2) Protected rivers

At the time the application for a license or exemption for the project is accepted by the Commission (in accordance with the Commission's regulations and procedures in effect on January 1, 1986, including those relating to environmental consultation), such project is not located on either of the following:

(A) Any segment of a natural watercourse which is included in (or designated for potential inclusion in) a State or national wild and scenic river system.

(B) Any segment of a natural watercourse which the State has determined, in accordance with applicable State law, to possess unique natural, recreational, cultural, or scenic attributes which would be adversely affected by hydroelectric development.

(3) Fish and wildlife terms and conditions

The project meets the terms and conditions set by fish and wildlife agencies under the same procedures as provided for under section 30(c) of the Federal Power Act [16 U.S.C. 823a(c)].

(k) "New dam or diversion" defined

For purposes of this section, the term "new dam or diversion" means a dam or diversion which requires, for purposes of installing any hydroelectric power project, any construction, or enlargement of any impoundment or diversion structure (other than repairs or reconstruction or the addition of flashboards or similar adjustable devices) [4]

(l) Definitions

For purposes of this section, the terms "small power production facility", "qualifying small power production facility", "qualifying small power producer", "primary energy source", "cogeneration facility", "qualifying cogeneration facility", and "qualifying cogenerator" have the respective meanings provided for such terms under section 3(17) and (18) of the Federal Power Act [16 U.S.C. 796(17), (18)].

(m) Termination of mandatory purchase and sale requirements

(1) Obligation to purchase

After August 8, 2005, no electric utility shall be required to enter into a new contract or obligation to purchase electric energy from a qualifying cogeneration facility or a qualifying small power production facility under this section if the Commission finds that the qualifying cogeneration facility or qualifying small power production facility has nondiscriminatory access to—

(A)(i) independently administered, auction-based day ahead and real time wholesale markets for the sale of electric energy; and (ii) wholesale markets for long-term sales of capacity and electric energy; or

(B)(i) transmission and interconnection services that are provided by a Commission-approved regional transmission entity and administered pursuant to an open access transmission tariff that affords nondiscriminatory treatment to all customers; and (ii) competitive wholesale markets that provide a meaningful opportunity to sell capacity, including long-term and short-term sales, and electric energy, including long-term, short-term and real-time sales, to buyers other than the utility to which the qualifying facility is interconnected. In determining whether a meaningful

opportunity to sell exists, the Commission shall consider, among other factors, evidence of transactions within the relevant market; or

(C) wholesale markets for the sale of capacity and electric energy that are, at a minimum, of comparable competitive quality as markets described in subparagraphs (A) and (B).

(2) Revised purchase and sale obligation for new facilities

(A) After August 8, 2005, no electric utility shall be required pursuant to this section to enter into a new contract or obligation to purchase from or sell electric energy to a facility that is not an existing qualifying cogeneration facility unless the facility meets the criteria for qualifying cogeneration facilities established by the Commission pursuant to the rulemaking required by subsection (n).

(B) For the purposes of this paragraph, the term "existing qualifying cogeneration facility" means a facility that—

(i) was a qualifying cogeneration facility on August 8, 2005; or

(ii) had filed with the Commission a notice of self-certification, self recertification or an application for Commission certification under 18 CFR 292.207 prior to the date on which the Commission issues the final rule required by subsection (n).

(3) Commission review

Any electric utility may file an application with the Commission for relief from the mandatory purchase obligation pursuant to this subsection on a service territory-wide basis. Such application shall set forth the factual basis upon which relief is requested and describe why the conditions set forth in subparagraph (A), (B), or (C) of paragraph (1) of this subsection have been met. After notice, including sufficient notice to potentially affected qualifying cogeneration facilities and qualifying small power production facilities, and an opportunity for comment, the Commission shall make a final determination within 90 days of such application regarding whether the conditions set forth in subparagraph (A), (B), or (C) of paragraph (1) have been met.

(4) Reinstatement of obligation to purchase

At any time after the Commission makes a finding under paragraph (3) relieving an electric utility of its obligation to purchase electric energy, a qualifying cogeneration facility, a qualifying small power production facility, a State agency, or any other affected person may apply to the Commission for an order reinstating the electric utility's obligation to purchase electric energy under this section. Such application shall set forth the factual basis upon which the application is based and describe why the conditions set forth in subparagraph (A), (B), or (C) of paragraph (1) of this subsection are no longer met. After notice, including sufficient notice to potentially affected utilities, and opportunity for comment, the Commission shall issue an order within 90 days of such application reinstating the electric utility's obligation to purchase electric energy under this section if the Commission finds that the conditions set forth in subparagraphs (A), (B) or (C) of paragraph (1) which relieved the obligation to purchase, are no longer met.

(5) Obligation to sell

After August 8, 2005, no electric utility shall be required to enter into a new contract or obligation to sell electric energy to a qualifying cogeneration facility or a qualifying small power production facility under this section if the Commission finds that—

(A) competing retail electric suppliers are willing and able to sell and deliver electric energy to the qualifying cogeneration facility or qualifying small power production facility; and

(B) the electric utility is not required by State law to sell electric energy in its service territory.

(6) No effect on existing rights and remedies

Nothing in this subsection affects the rights or remedies of any party under any contract or obligation, in effect or pending approval before the appropriate State regulatory authority or non-

regulated electric utility on August 8, 2005, to purchase electric energy or capacity from or to sell electric energy or capacity to a qualifying cogeneration facility or qualifying small power production facility under this Act (including the right to recover costs of purchasing electric energy or capacity).

(7) Recovery of costs

(A) The Commission shall issue and enforce such regulations as are necessary to ensure that an electric utility that purchases electric energy or capacity from a qualifying cogeneration facility or qualifying small power production facility in accordance with any legally enforceable obligation entered into or imposed under this section recovers all prudently incurred costs associated with the purchase.

(B) A regulation under subparagraph (A) shall be enforceable in accordance with the provisions of law applicable to enforcement of regulations under the Federal Power Act (16 U.S.C. 791a et seq.).

(n) Rulemaking for new qualifying facilities

(1)(A) Not later than 180 days after August 8, 2005, the Commission shall issue a rule revising the criteria in 18 CFR 292.205 for new qualifying cogeneration facilities seeking to sell electric energy pursuant to this section to ensure—

(i) that the thermal energy output of a new qualifying cogeneration facility is used in a productive and beneficial manner;

(ii) the electrical, thermal, and chemical output of the cogeneration facility is used fundamentally for industrial, commercial, or institutional purposes and is not intended fundamentally for sale to an electric utility, taking into account technological, efficiency, economic, and variable thermal energy requirements, as well as State laws applicable to sales of electric energy from a qualifying facility to its host facility; and

(iii) continuing progress in the development of efficient electric energy generating technology.

(B) The rule issued pursuant to paragraph (1)(A) of this subsection shall be applicable only to facilities that seek to sell electric energy pursuant to this section. For all other purposes, except as specifically provided in subsection (m)(2)(A), qualifying facility status shall be determined in accordance with the rules and regulations of this Act.

(2) Notwithstanding rule revisions under paragraph (1), the Commission's criteria for qualifying cogeneration facilities in effect prior to the date on which the Commission issues the final rule required by paragraph (1) shall continue to apply to any cogeneration facility that—

(A) was a qualifying cogeneration facility on August 8, 2005, or

(B) had filed with the Commission a notice of self-certification, self-recertification or an application for Commission certification under 18 CFR 292.207 prior to the date on which the Commission issues the final rule required by paragraph (1).

REFERENCES IN TEXT

The Federal Power Act, referred to in subsecs. (e), (h), (j)(1), and (m)(7)(B), is act June 10, 1920, ch. 285, 41 Stat. 1063, as amended, which is classified generally to this chapter (§791a et seq.). Part I of the Federal Power Act is classified generally to subchapter I (§791a et seq.) of this chapter. Part II of the Federal Power Act is classified generally to this subchapter (§824 et seq.). For complete classification of this Act to the Code, see section 791a of this title and Tables.

The Public Utility Holding Company Act, referred to in subsec. (e), probably means the Public Utility Holding Company Act of 1935, title I of act Aug. 26, 1935, ch. 687, 49 Stat. 803, as amended, which was classified generally to chapter 2C (§79 et seq.) of Title 15, Commerce and Trade, prior to repeal by Pub. L.

109–58, title XII, §1263, Aug. 8, 2005, 119 Stat. 974. For complete classification of this Act to the Code, see Tables.

The Electric Consumers Protection Act of 1986, referred to in subsec. (j)(1), is Pub. L. 99–495, Oct. 16, 1986, 100 Stat. 1243. For complete classification of this Act to the Code, see Short Title of 1986 Amendment note set out under section 791a of this title and Tables.

This Act, referred to in subsecs. (m)(6) and (n)(1)(B), is Pub. L. 95–617, Nov. 9, 1978, 92 Stat. 3117, as amended, known as the Public Utility Regulatory Policies Act of 1978. For complete classification of this Act to the Code, see Short Title note set out under section 2601 of this title and Tables.

CODIFICATION

Section was enacted as part of the Public Utility Regulatory Policies Act of 1978, and not as part of the Federal Power Act which generally comprises this chapter.

August 8, 2005, referred to in subsec. (n)(1)(A), was in the original "the date of enactment of this section", which was translated as meaning the date of enactment of Pub. L. 109–58, which enacted subsecs. (m) and (n) of this section, to reflect the probable intent of Congress.

AMENDMENTS

2005—Subsecs. (m), (n). Pub. L. 109–58 added subsecs. (m) and (n).

1990—Subsec. (e)(2). Pub. L. 101–575 inserted "(other than a qualifying small power production facility which is an eligible solar, wind, waste, or geothermal facility as defined in section 3(17)(E) of the Federal Power Act)" after first reference to "facility".

1986—Subsecs. (j) to (l). Pub. L. 99–495 added subsecs. (j) and (k) and redesignated former subsec. (j) as (l).

1980—Subsec. (a). Pub. L. 96–294, §643(b)(1), inserted provisions relating to encouragement of geothermal small power production facilities.

Subsec. (e)(1). Pub. L. 96–294, §643(b)(2), inserted provisions relating to applicability to geothermal small power production facilities.

Subsec. (e)(2). Pub. L. 96–294, §643(b)(3), inserted provisions respecting a qualifying small power production facility using geothermal energy as the primary energy source.

EFFECTIVE DATE OF 1986 AMENDMENT

Pub. L. 99–495, §8(b), Oct. 16, 1986, 100 Stat. 1250, provided that:

"(1) Subsection (j) of section 210 of the Public Utility Regulatory Policies Act of 1978 (as amended by subsection (a) of this section) [16 U.S.C. 824a–3(j)] shall apply to any project for which benefits under section 210 of the Public Utility Regulatory Policies Act of 1978 are sought and for which a license or exemption is issued by the Federal Energy Regulatory Commission after the enactment of this Act [Oct. 16, 1986], except as otherwise provided in paragraph (2), (3) or (4) of this subsection.

"(2) Subsection (j) shall not apply to the project if the application for license or exemption for the project was filed, and accepted for filing by the Commission, before the enactment of this Act [Oct. 16, 1986].

"(3) Paragraphs (1) and (3) of such subsection (j) shall not apply if the application for the license or exemption for the project was filed before the enactment of this Act [Oct. 16, 1986] and accepted for filing by the Commission (in accordance with the Commission's regulations and procedures in effect on January 1, 1986, including those relating to the requirement for environmental consultation) within 3 years after such enactment.

"(4)(A) Paragraph (3) of subsection (j) shall not apply for projects where the license or exemption application was filed after enactment of this Act [Oct. 16, 1986] if, based on a petition filed by the applicant for such project within 18 months after such enactment, the Commission determines (after public notice and opportunity for public comment of at least 45 days) that the applicant has demonstrated that he had committed (prior to the enactment of this Act) substantial monetary resources directly related to the development of the project and to the diligent and timely completion of all requirements of the Commission for filing an acceptable application for license or exemption. Such petition shall be publicly available and shall be filed in such form as the Commission shall require by rule issued within 120 days after the enactment of this Act. The public notice required under this subparagraph shall include written notice by the petitioner to affected Federal and State agencies.

"(B) In the case of any petition referred to in subparagraph (A), if the applicant had a preliminary permit and had completed environmental consultations (required by Commission regulations and procedures in effect

U.S.C. Title 16 - CONSERVATION

on January 1, 1986) prior to enactment, there shall be a rebuttable presumption that such applicant had committed substantial monetary resources prior to enactment.

"(C) The applicant for a license or exemption for a project described in subparagraph (A) may petition the Commission for an initial determination under paragraph (1) of section 210(j) of the Public Utility Regulatory Policies Act of 1978 [16 U.S.C. 824a–3(j)(1)] prior to the time the license or exemption is issued. If the Commission initially finds that the project will have substantial adverse effects on the environment within the meaning of such paragraph (1), prior to making a final finding under that paragraph the Commission shall afford the applicant a reasonable opportunity to provide for mitigation of such adverse effects. The Commission shall make a final finding under such paragraph (1) at the time the license or exemption is issued. If the Federal Energy Regulatory Commission has notified the State of its initial finding and the State has not taken any action described in paragraph (2) of section 210(j) before such final finding, the failure to take such action shall be the basis for a rebuttable presumption that there is not a substantial adverse effect on the environment related to natural, recreational, cultural, or scenic attributes for purposes of such finding.

"(D) If a petition under subparagraph (A) is denied, all provisions of section 210(j) of the Public Utility Regulatory Policies Act of 1978 [16 U.S.C. 824a–3(j)] shall apply to the project regardless of when the license or exemption is issued."

Amendment by Pub. L. 99–495 effective with respect to each license, permit, or exemption issued under this chapter after Oct. 16, 1986, see section 18 of Pub. L. 99–495, set out as a note under section 797 of this title.

CALCULATION OF AVOIDED COST

Pub. L. 102–486, title XIII, §1335, Oct. 24, 1992, 106 Stat. 2984, provided that: "Nothing in section 210 of the Public Utility Regulatory Policies Act of 1978 (Public Law 95–617) [16 U.S.C. 824a–3] requires a State regulatory authority or nonregulated electric utility to treat a cost reasonably identified to be incurred or to have been incurred in the construction or operation of a facility or a project which has been selected by the Department of Energy and provided Federal funding pursuant to the Clean Coal Program authorized by Public Law 98–473 [see Tables for classification] as an incremental cost of alternative electric energy."

APPLICABILITY OF 1980 AMENDMENT TO FACILITIES USING SOLAR ENERGY AS PRIMARY ENERGY SOURCE

Pub. L. 100–202, §101(d) [title III, §310], Dec. 22, 1987, 101 Stat. 1329–104, 1329–126, provided that:

"(a) The amendments made by section 643(b) of the Energy Security Act (Public Law 96–294) [amending this section] and any regulations issued to implement such amendment shall apply to qualifying small power production facilities (as such term is defined in the Federal Power Act [16 U.S.C. 791a et seq.]) using solar energy as the primary energy source to the same extent such amendments and regulations apply to qualifying small power production facilities using geothermal energy as the primary energy source, except that nothing in this Act [see Tables for classification] shall preclude the Federal Energy Regulatory Commission from revising its regulations to limit the availability of exemptions authorized under this Act as it determines to be required in the public interest and consistent with its obligations and duties under section 210 of the Public Utility Regulatory Policies Act of 1978 [this section].

"(b) The provisions of subsection (a) shall apply to a facility using solar energy as the primary energy source only if either of the following is submitted to the Federal Energy Regulatory Commission during the two-year period beginning on the date of enactment of this Act [Dec. 22, 1987]:

"(1) An application for certification of the facility as a qualifying small power production facility.

"(2) Notice that the facility meets the requirements for qualification."

STUDY AND REPORT TO CONGRESSIONAL COMMITTEES ON APPLICATION OF PROVISIONS RELATING TO COGENERATION, SMALL POWER PRODUCTION, AND INTERCONNECTION AUTHORITY TO HYDROELECTRIC POWER FACILITIES

Pub. L. 99–495, §8(d), Oct. 16, 1986, 100 Stat. 1251, provided that:

"(1) The Commission shall conduct a study (in accordance with section 102(2)(C) of the National Environmental Policy Act of 1969 [42 U.S.C. 4332(2)(C)]) of whether the benefits of section 210 of the Public Utility Regulatory Policies Act of 1978 [16 U.S.C. 824a–3] and section 210 of the Federal Power Act [16 U.S.C. 824i] should be applied to hydroelectric power facilities utilizing new dams or diversions (within the meaning of section 210(k) of the Public Utility Regulatory Policies Act of 1978).

"(2) The study under this subsection shall take into consideration the need for such new dams or diversions for power purposes, the environmental impacts of such new dams and diversions (both with and without the

application of the amendments made by this Act to sections 4, 10, and 30 of the Federal Power Act [16 U.S.C. 797, 803, 823a] and section 210 of the Public Utility Regulatory Policies Act of 1978 [16 U.S.C. 824a–3]), the environmental effects of such facilities alone and in combination with other existing or proposed dams or diversions on the same waterway, the intent of Congress to encourage and give priority to the application of section 210 of Public Utility Regulatory Policies Act of 1978 to existing dams and diversions rather than such new dams or diversions, and the impact of such section 210 on the rates paid by electric power consumers.

"(3) The study under this subsection shall be initiated within 3 months after enactment of this Act [Oct. 16, 1986] and completed as promptly as practicable.

"(4) A report containing the results of the study conducted under this subsection shall be submitted to the Committee on Energy and Commerce of the United States House of Representatives and the Committee on Energy and Natural Resources of the United States Senate while both Houses are in session.

"(5) The report submitted under paragraph (4) shall include a determination (and the basis thereof) by the Commission, based on the study and a public hearing and subject to review under section 313(b) of the Federal Power Act [16 U.S.C. 825l(b)], whether any of the benefits referred to in paragraph (1) should be available for such facilities and whether applications for preliminary permits (or licenses where no preliminary permit has been issued) for such small power production facilities utilizing new dams or diversions should be accepted by the Commission after the moratorium period specified in subsection (e). The report shall include such other administrative and legislative recommendations as the Commission deems appropriate.

"(6) If the study under this subsection has not been completed within 18 months after its initiation, the Commission shall notify the Committees referred to in paragraph (4) of the reasons for the delay and specify a date when it will be completed and a report submitted."

MORATORIUM ON APPLICATION OF THIS SECTION TO NEW DAMS

Pub. L. 99–495, §8(e), Oct. 16, 1986, 100 Stat. 1251, provided that: "Notwithstanding the amendments made by subsection (a) of this section [amending section 824a–3 of this title], in the case of a project for which a license or exemption is issued after the enactment of this Act [Oct. 16, 1986], section 210 of the Public Utility Regulatory Policies Act of 1978 [16 U.S.C. 824a–3] shall not apply during the moratorium period if the project utilizes a new dam or diversion (as defined in section 210(k) of such Act) unless the project is either—

"(1) a project located at a Government dam (as defined in section 3(10) of the Federal Power Act [16 U.S.C. 796(10)]) at which non-Federal hydroelectric development is permissible, or

"(2) a project described in paragraphs (2), (3), or (4) of subsection (b) [set out as a note above].

For purposes of this subsection, the term 'moratorium period' means the period beginning on the date of the enactment of this Act and ending at the expiration of the first full session of Congress after the session during which the report under subsection (d) [set out as a note above] has been submitted to the Congress."

DEFINITIONS

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 60

Responding Witness: Lonnie E. Bellar / Robert M. Conroy

Q-60. Reference the Companies' responses to AG DR 1-36, 1-48, 1-51, 1-52, and the Companies' numerous other responses to data requests regarding Certificates of Public Convenience and Necessity ("CPCN").

    a. Explain what changes the Companies have made to its internal analysis regarding CPCN's since the Commission's June 22 Order in Case No. 2016-00371, finding that the Bullitt County Pipeline was not in the ordinary course of business and that "construction should be the subject of a CPCN finding."

    b. Confirm that the Bullitt County Pipeline is a 10-12 mile, 12-inch planned pipeline, with a preliminary cost estimate of $27.6M.

    c. Provide the Companies' threshold for materiality regarding a project's impact and capital outlay.

A-60.

    a. See the response to PSC 3-20.

    b. As described in the testimony of Mr. Bellar on page 60 beginning at line 9, the Bullitt County Pipeline "will be approximately 10-12 miles long" with a nominal 12-inch diameter, and with a current budgeted cost of $38.7 million.

    c. See the response to PSC 3-20.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 61

Responding Witness: Christopher M. Garrett

Q-61. Reference the responses to AG DR 1-92 and AG DR 1-93. Explain whether the Companies have any support that in reference to the portion of the invoices noting that 13% of regular membership dues, and 24% of dues relate to "influencing legislation," that EEI equates "influencing legislation" with the entirety of the definition of "covered activities," as defined in AG DR 1-90.

A-61. Beginning in 2007, EEI no longer prepared the breakout of activities by NARUC category as provided in the 2003 rate case. The "NARUC Reporting Requirement" document provided in response to PSC 3-44 and PSC 3-40 in Case Nos. 2003-00433 and 2003-00434 appears to have been developed by NARUC's "Committee on Utility Association Oversight," which was dissolved in 2001. EEI's calculation of the percentages that are considered "influencing legislation" now are based upon the Lobbying Disclosure Act (LDA) Lobbying Report and the IRS Form 990. In calculating the lobbying percentages EEI applies a broader definition than is contained in the LDA, but that is consistent with Section 6033(b)8 of the Internal Revenue Code, which covers contact with federal, state, and local officials, as well as grassroots lobbying.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 62

Responding Witness: Christopher M. Garrett

Q-62. Reference the responses to AG DR 1-90 through AG DR 1-108. Confirm that although EEI's invoices acknowledge EEI engages in activities associated with "influencing legislation," the EEI invoices attached to the response to AG DR 1-98 do not indicate the amounts dedicated to: (i) legislative advocacy; (ii) regulatory advocacy; and (iii) public relations.

    a. Provide the amounts of the Companies EEI dues dedicated or related to: (i) legislative advocacy; (ii) regulatory advocacy; and (iii) public relations.

A-62.
    a. See response to Question No. 61.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 63

Responding Witness: David S. Sinclair

Q-63. Reference the Commission's order dated May 16, 1984 in Case No. 8924,[7] at pp. 43, wherein the Commission placed the following conditions on LG&E's membership in EPRI:

"At this time, LG&E has not performed a definitive cost-benefit analysis regarding its potential membership in EPRI. Absent such an analysis, the Commission is limited as to the response it can give Mr. Royer concerning this matter. However, LG&E is hereby apprised that should it decide to become a member of EPRI it will bear the burden in future cases of justifying the cost of its membership. To do so, LG&E must present clear documentation of the benefits available through membership, its utilization of these benefits and its inability to obtain such benefits at a lower cost. The Commission is also concerned that a substantial portion of EPRI's research concerns nuclear power which is of no direct concern in Kentucky. In future cases, should it decide to join EPRI, LG&E must document whether it could receive all nonnuclear related benefits if it reduced its dues by the portion related to nuclear research. The Commission wishes to emphasize that these are the conditions LG&E must meet should it decide to become a member of EPRI.[8] These conditions in no way represent a prior endorsement of such membership."

a. Provide copies of any and all cost-benefit analyses the Companies have prepared pertaining to their membership in EPRI for the past five (5) years.

b. Provide a breakdown of the amount of LG&E-KU dues paid to EPRI which are related to nuclear energy generation.

c. Have LG&E-KU attempted to reduce the dues they seek to recover from ratepayers by the proportion of the dues they pay to EPRI which relate to nuclear energy generation? If so, provide that sum. If they have not attempted to reduce the dues they pay, explain in full why not.

[7] In Re: General Adjustment in Electric and Gas Rates of Louisville Gas & Electric Co.
[8] Emphasis in original.

A-63.

    a.   Although no formal cost-benefit analyses have been prepared pertaining to the Companies' membership in EPRI during the past five years, the Companies do conduct annual evaluations of each EPRI program based on its potential to bring value to customers to determine whether future participation is warranted. EPRI research brings value to ratepayers by promoting environmental protection and reduces costs by training staff to improve fuel efficiency, reduce operations and maintenance costs, and avoid future capital expenditures. Topics addressed by EPRI programs in which the Companies invest include Air Quality; Water Quality; Integrated Environmental Controls; Heat Rate Improvement; Cyber Security; and Boiler Life and Availability Improvement.

EPRI also provides collaborative leverage on the Companies' investment of approximately 20 to 1. By partnering with utilities across the country in EPRI research programs, the companies gain access to about $70 million in research value for their roughly $3.5 million investment. Many EPRI research projects are operationalized. The Companies were recently awarded an EPRI Tech Transfer Award for demonstrating at the Ghent Station the ability to run a generating unit at a lower load than the manufacturer's recommended operating point while continuing to utilize the selective catalytic reduction to reduce nitrous oxide emissions.

The Companies also note the Commission's long-standing interest in seeing research and development investments be maintained, including through larger organizations:

> The Applicants state that they will continue funding research and development ("R&D") programs as long as the programs produce benefits. The Commission concurs with this position because such programs produce a myriad of benefits, including advances in fuel and generation technology, environmental technology, and transmission grid technologies. However, many new technologies take several years to develop and successfully implement. Thus, the Commission is concerned that as electricity prices become more competitive, utilities will intensify cost cutting efforts and reduce spending on R&D. Reducing R&D spending would be short-sighted and not in the customers' long-term interest.
>
> The Commission strongly supports research and development and commends the Applicants for their commitments to such programs. Benefits can be realized whether research is sponsored solely by one utility or through a larger organization funded by multiple utilities or stakeholders. The benefits of

R&D may well help the Applicants in fulfilling their commitments to preserve LG&E's and KU's low rates and high quality service.

To assist the Commission in its efforts to monitor this commitment, the Applicants should provide written notice of any material changes in their level of participation or funding for R&D 30 days prior to the proposed change. This includes any change in R&D funding equal to or greater than 5 percent of the previous year's budget. The written notice should include an explanation and justification for the change in policy.[9]

The Commission's final order in the Companies' most recent change of control proceeding explicitly continues the requirement for the Companies to notify the Commission of any material (equal to greater than 5%) change in research and development funding from year to year for each of the Companies.[10]

b. The Companies do not fund EPRI research related to nuclear energy generation.

c. Not applicable.

---

[9] *In the Matter of: Joint Application of Powergen PLC, LG&E Energy Corp., Louisville Gas and Electric Company, and Kentucky Utilities Company for Approval of a Merger*, Case No. 2000-00095, Order at 34-35 (May 15, 2000).

[10] *In the Matter of: Joint Application of PPL Corporation, E.ON AG, E.ON U.S. Investments Corp., E.ON U.S. LLC, Louisville Gas and Electric Company, and Kentucky Utilities Company for Approval of an Acquisition of Ownership and Control of Utilities*, Case No. 2010-00204, Order at Appx. C page 8 (Sept. 30, 2010).

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 64

Responding Witness: Lonnie E. Bellar

Q-64. State whether EEI utilizes any of the dues the Companies pay to it for any purposes relating to nuclear power generation. If so, provide an estimate of the amount or percentage of those dues.

A-64. The Companies are not aware if EEI utilizes any of the dues paid by the Company for purposes relating to nuclear power generation. The annual dues calculation is based on a combination of specific customer, revenue and generation data for the Companies, none of which are related to nuclear power generation.

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 65

Responding Witness: Lonnie E. Bellar

Q-65. Provide the Companies' most recent cost-benefit analysis regarding its membership in EEI.

A-65. The Companies have not performed formal cost-benefit analyses specific to membership in EEI. The Company does periodically do a thorough internal review of our participation and engagement in EEI and the value derived from membership activities. The Company strongly believes there are significant benefits achieved in the collaboration with other utilities in the areas of best practices, industry information and networking. Furthermore, EEI membership provides the Company with the opportunity to learn and share relevant industry information with peer utilities. More specifically, EEI provides programs that directly support the Companies and the reliability and resilience of the electric power system including:

- Mutual Assistance: EEI companies have established and implemented an effective system whereby member companies may receive and provide assistance in the form of personnel and equipment to aid in restoring and/or maintaining electric utility service when such service has been disrupted.
- Spare Transformer Equipment Program (STEP): This is an electric industry program that strengthens the sector's ability to restore the nation's transmission system more quickly in the event of a terrorist attack. STEP represents a coordinated approach to increasing the electric power industry's inventory of spare transformers and streamlining the process of transferring those transformers to affected companies in the event of a transmission outage caused by a terrorist attack
- SpareConnect: This program provides an additional mechanism for utilities to network with other participants concerning the possible sharing of transmission and generation step-up (GSU) transformers and related equipment, including bushings, fans and auxiliary components. SpareConnect establishes a confidential, unified platform for the entire electric industry to communicate equipment needs in the event of an emergency or other non-routine failure.
- Additionally, EEI supports several initiatives to safeguard the energy grid from threats and is partnering with federal agencies to improve sector-wide resilience to cyber and physical threats.

Case No. 2018-00295

Question No. 66

Responding Witness: Christopher M. Garrett

Q-66. Reference the response to AG DR 1-98, attachment.

    a. Confirm that the attachment is missing page 1 of 2 of the invoice from EPRI dated Jan. 18, 2018. Provide the first page of that invoice.

    b. State whether the Southern Gas Association engages in "covered activities," as defined in AG DR 1-90.

    c. State whether the Kentucky Gas Association engages in "covered activities."

A-66.
    a.   Confirmed, see attached.

    b.   The Company is not aware of any engagement in "covered activities."

    c.   The Company is not aware of any engagement in "covered activities."

LOUISVILLE GAS AND ELECTRIC COMPANY

**Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018**

Case No. 2018-00295

Question No. 67

Responding Witness: John K. Wolfe

Q-67. Reference the response to AG DR 1-185. Identify the ways in which the Companies' distribution grid enhancements are making integration of distributed generation resources possible in a cost-effective manner.

　　a. Have the Companies identified any opportunities to standardize and streamline interconnection processes, and to adopt and implement interoperability standards, particularly at the distribution level?

　　b. Will any of the distribution grid improvements the Companies are currently implementing in any manner act to preclude the potential for future integration of distributed generation resources, or to make such integration more difficult? If so, provide a complete discussion.

A-67. The Companies' grid improvements aim to accommodate the integration of distributed generation in a cost effective manner by: leveraging upgrades in conductor ampacity providing higher hosting capacity opportunity; collecting real time operational data (e.g. voltage, current) through SCADA enabled field devices to further enable Distribution Management System (DMS) functions (e.g. power flow, voltage control), allowing real-time operational monitoring, control, and system planning modeling to assure system reliability; and implementation of microprocessor protection systems that provide for more flexible configurations to accommodate distributed resource installations. These investments will offset future investments that would be needed to accommodate higher levels of distributed generation resources.

　　a. The Companies continually evaluate industry best practices regarding the distributed generation application process. The Companies have found that one best practice is to implement a user friendly web-portal versus the traditional paper application process used today. This improvement is currently under evaluation. The Companies require all distributed generation interconnections to meet IEEE 1547 (Standard for Interconnecting Distributed Resources with Electric Power Systems), which contains requirements for interoperability.

　　b. No. Current improvements in the Companies' distribution systems will only help enable future distributed generation resource integration.

LOUISVILLE GAS AND ELECTRIC COMPANY

Response to Attorney General's Supplemental Data Requests for Information
Dated December 13, 2018

Case No. 2018-00295

Question No. 68

Responding Witness: John K. Wolfe

Q-68.   Reference the Companies' response to AG DR 1-188.

a.   Reference Bellar direct testimony exhibit LEB-5, p. 14, Table 2. State whether one or all of the terms: (i) "Distribution Automation;" (ii) "Distribution Automation Expansion;" and/or (iii) "DSCADA Expansion" include ADMS.

b.   Reference Bellar direct testimony exhibit LEB-6. State whether the term "Distribution Automation" as used in this exhibit includes ADMS.

c.   Provide a time line depicting estimated dates for the deployment of Distribution Automation technologies, including ADMS technologies.

d.   With regard to any existing distribution technology that will be replaced with Distribution Automation technologies (including ADMS), provide a calculation of current depreciation rates in Excel format with all formulas intact. Show all parameters used, and provide a source for those rates and underlying parameters. If the rates and parameters are not the same as approved in the most recent prior case, explain why not. Also, if there are any differences in the account numbers used, provide a reconciliation.

e.   State whether any of the Distribution Automation technology the Companies intend to deploy will be covered by any warranties. If so, provide the warranty period.

f.   Provide the estimated life spans of the Distribution Automation technologies the Companies intend to deploy, including ADMS.

g.   Discuss the extent (if any) to which the proposed Distribution Automation technologies and infrastructure will be capable of receiving remote downloads of firmware and/or software upgrades. Provide copies of all manufacturer's specifications in this regard.

(i) If applicable, how many such upgrades are the proposed new Distribution Automation technologies and associated infrastructure capable of receiving before the expected lifespans of the equipment will be shortened?

(ii) How many such upgrades does the company believe it will download on an annual basis?

h. State whether the hardware, firmware, software and any infrastructure associated with the Companies' proposed deployment of Distribution Automation technologies will be required to comply in any manner with the most recent release of the National Institute of Standards and Technology (NIST)'s, "NIST Framework and Roadmap for Smart Grid Interoperability Standards."

i. Will the Companies at any time prior to deploying any ADMS technology conduct any Testbed demonstrations in their service territories?

(i) Have the companies considered obtaining the Commission's permission for a pilot program of ADMS technology? If not, why not?

(ii) How can the Companies assert that their proposed distribution grid enhancements are being carried-out in a cost-effective manner if, as asserted in their response to AG DR 1-188, they have not conducted any ADMS Testbed demonstrations?

A-68.

a. "Distribution Automation" as referenced in Bellar direct testimony exhibit LEB-5, p. 14, Table 2 includes ADMS. "Distribution Automation Expansion" and "DSCADA Expansion" do not include ADMS.

b. "Distribution Automation" as used in Bellar direct testimony exhibit LEB-6 includes ADMS.

c. See attached.

d. ADMS and DSCADA do not replace existing distribution technologies. Any field equipment, such as non-electronically controlled reclosers, replaced as part of the overall DA implementation will be reconditioned if necessary and reinstalled in other locations as needed.

e. The ADMS has a warranty period of one year from the date of electronic download, which was December 14, 2018, in preparation for the 2019 go-live referenced in question A-68c above. The reclosers have a warranty period of 18 months from the date of shipment, or 12 months from date of

commissioning, whichever comes first. The recloser controls have a warranty period of ten years after shipment.

f.   Estimated life spans are ADMS – 5 years, DSCADA – 5 years, reclosers – 30 years.

g.   The recloser controls communicate using Internet Protocol (IP) and are capable of receiving remote firmware updates. See Appendix B of the attached manufacturer's specification (651R-2_IM_20180615.pdf) for details.

(i.) Not applicable.

(ii) At this time, the Company anticipates installing only critical security-related firmware updates on an as-needed basis.

h.   Compliance with NIST Framework and Roadmap for Smart Grid Interoperability Standard is not required.

i.   The companies do not plan to conduct ADMS Testbed demonstrations in their service territories prior to ADMS implementation.

(i.) As part of Case Numbers 2016-00370 and 2016-00371, the Companies obtained CPCN approval to complete their DA program, which includes implementation of ADMS technology. An ADMS pilot would amount to a subset of the program that has already been approved.

(ii.)Mr. Thompson's testimony Exhibit PWT-7 of Case Numbers 2016-00370 and 2016-00371 demonstrates the approved DA program is the lowest cost alternative for customers. Page 53 of Mr. Bellar's testimony in the current cases describes operating efficiencies enabled by DA consistent with widespread experience within the industry as referenced in AG 1-188.

Preface

Manual Overview

The SEL-651R-2 Recloser Control Instruction Manual describes common aspects of recloser control application and use. It includes the necessary information to install, set, test, and operate the relay and more detailed information about settings and commands.

An overview of each manual section and topics follows:

Preface. Describes the manual organization and conventions used to present information.

Section 1: Introduction and Specifications. Introduces SEL-651R-2 features, options, and accessories. This section also summarizes relay functions and applications; lists relay specifications, type tests, and ratings.

Section 2: Installation. Details enclosure dimensions, mounting, external cable connections, and grounding. Shows recloser control module front- and rear-panel features. Contains instructions for connecting extra I/O, communications, and 12 V auxiliary power. Explains how to access and set recloser control module main board jumpers. Describes the differences in control cable and internal cabinet wiring for the various supported reclosers.

Section 3: PC Software. Explains how to use ACSELERATOR QuickSet SEL-5030 Software.

Section 4: Protection Functions. Describes the function of various relay protection elements and how the relay processes these elements. Provides detailed specifics on protection scheme logic.

Section 5: Trip and Target Logic. Describes the factory-default tripping logic for single-phase (single-phase or three-phase tripping) and three-phase reclosers; includes switch-onto-fault logic and factory-default target logic.

Section 6: Close and Reclose Logic. Describes the factory-default close and reclose logic for single-phase and three-phase reclosers.

Section 7: SELOGIC Control Equation Programming. Describes SELOGIC control equations and how to apply these equations; discusses SELOGIC control equation features such as operands, timers, latches, counters, and analog comparisons. Explains debounce timers for recloser control inputs and extra optoisolated inputs. Details trip and close output logic and the extra programmable output contact logic.

Section 8: Metering and Monitoring. Provides information on viewing fundamental and rms metering quantities for voltages and currents, as well as power and energy metering data. Describes how to set the recloser/circuit breaker contact wear monitor and the battery monitor function.

xxiv | Preface
Manual Overview

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 26 of 1080
Wolfe

Section 9: Settings. Provides a list of all SEL-651R-2 settings and defaults. The organization of the settings is the same as for the settings organization in the relay and in QuickSet. Provides detailed information required to set the SEL-651R-2. It includes default settings and setting sheets.

Section 10: Communications. Explains the physical interfaces of the SEL-651R-2. Describes the various SEL software protocols and references appendices with detailed information on these protocols. Provides an alphabetical listing of all ASCII commands with examples for each ASCII command option.

Section 11: Front-Panel Operations. Describes the liquid crystal display (LCD) messages and menu screens. Shows how to use programmable front-panel targets, operator-control pushbuttons, and LEDs to provide local control.

Section 12: Analyzing Events. Explains how to obtain event summaries and history reports, obtain and interpret filtered and unfiltered event reports, obtain SER reports, and obtain SSI reports.

Section 13: Testing and Troubleshooting. Describes techniques for testing, troubleshooting, and maintaining the SEL-651R-2. Includes the list of status notification messages and a troubleshooting chart.

Appendix A: Firmware and Manual Versions. Lists the current firmware versions and details differences between the current and previous versions.

Appendix B: Firmware Upgrade Instructions. Describes the procedure to update the firmware stored in flash memory.

Appendix C: Compressed ASCII Commands. Contains a summary and description of the Compressed ASCII commands supported by the SEL-651R-2.

Appendix D: MIRRORED BITS Communications. Describes how SEL protective relays and other devices can directly exchange information quickly, securely, and with minimal cost.

Appendix E: DNP3 Communications. Describes the DNP3 communications protocol and how to apply this protocol to substation integration and automation.

Appendix F: Relay Word Bits. Contains a summary of Relay Word bits.

Appendix G: Analog Quantities. Contains a summary of analog quantities.

Appendix H: Fast SER Protocol. Describes special binary Fast Sequential Events Recorder (SER) messages.

Appendix I: Configuration, Fast Meter, and Fast Operate Commands. Contains a summary and description of the Binary Fast Meter and Fast Operate messages as well as the ASCII configuration messages supported by the SEL-651R-2.

Appendix J: Synchrophasors. Describes the C37.118 synchrophasor protocol and how to apply this protocol to monitor voltages and currents throughout the system.

Appendix K: Modbus RTU and TCP Communications. Describes the Modbus communications protocol and how to apply this protocol to substation integration and automation.

Appendix L: IEC 61850. Describes the IEC 61850 protocol and how to apply this protocol to substation integration and automation.

Safety Information

Appendix M: Cybersecurity Features. Describes the mechanisms within the SEL-651R-2 for managing electronic access.

SEL-651R-2 Recloser Control Command Summary. Briefly describes the communications port commands that are fully described in *Section 10: Communications*.

Safety Information

Dangers, Warnings, and Cautions

This manual uses three kinds of hazard statements, defined as follows:

⚠ **DANGER**
Indicates an imminently hazardous situation that, if not avoided, **will** result in death or serious injury.

⚠ **WARNING**
Indicates a potentially hazardous situation that, if not avoided, **could** result in death or serious injury.

⚠ **CAUTION**
Indicates a potentially hazardous situation that, if not avoided, **may** result in minor or moderate injury or equipment damage.

Safety Symbols

The following symbols are often marked on SEL products.

⚠	⚠ **CAUTION** Refer to accompanying documents.	⚠ **ATTENTION** Se reporter à la documentation.
⏚	Earth (ground)	Terre
⏚	Protective earth (ground)	Terre de protection
⎓	Direct current	Courant continu
∿	Alternating current	Courant alternatif
∿	Both direct and alternating current	Courant continu et alternatif
📖	Instruction manual	Manuel d'instructions

Other Safety Marks (Sheet 1 of 3)

⚠ **DANGER** Disconnect or de-energize all external connections before opening this device. Contact with hazardous voltages and currents inside this device can cause electrical shock resulting in injury or death.	⚠ **DANGER** Débrancher tous les raccordements externes avant d'ouvrir cet appareil. Tout contact avec des tensions ou courants internes à l'appareil peut causer un choc électrique pouvant entraîner des blessures ou la mort.
⚠ **DANGER** Do not access/move jumpers while the unit is powered up.	⚠ **DANGER** Ne pas accéder aux cavaliers ou les changer quand l'unité est sous tension.

Safety Information

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 28 of 1080
Wolfe

Other Safety Marks (Sheet 2 of 3)

⚠**DANGER**

If the recloser is energized while the control cable is disconnected from the recloser control, the CT secondaries in the control cable may generate dangerously high voltages. Do not come in contact with the pins or pin sockets in the control cable. Contact with high voltage can cause serious injury or death.

⚠**DANGER**

Si le réenclencheur est sous tension tandis que le câble de commande est débranché de la commande du réenclencheur, le secondaire des transformateurs de courant (TC) dans le câble de commande peut présenter des tensions dangereusement élevées. Ne pas toucher les broches du câble de commande. Tout contact avec une tension élevée peut entraîner des blessures graves ou la mort.

⚠**DANGER**

The removed cables for connections **J201**, **J202**, and **J205** are still energized. Contact with such terminals can cause electrical shock that can result in injury or death.

⚠**DANGER**

Les câbles retirés des raccordements **J201**, **J202** et **J205** sont encore sous tension. Le contact avec ces câbles peut causer des chocs électriques qui peuvent entraîner des blessures ou la mort.

⚠**WARNING**

Do not transport the SEL-651R-2 with the battery inside the enclosure.

⚠**AVERTISSEMENT**

Ne pas transporter le SEL-651R-2 avec la batterie à l'intérieur du coffret.

⚠**WARNING**

Have only qualified personnel service this equipment. If you are not qualified to service this equipment, you can injure yourself or others, or cause equipment damage.

⚠**AVERTISSEMENT**

Seules des personnes qualifiées peuvent travailler sur cet appareil. Si vous n'êtes pas qualifiés pour ce travail, vous pourriez vous blesser avec d'autres personnes ou endommager l'équipement.

⚠**WARNING**

Setting 79CLSD = OFF can create an indefinite "standing close" condition. This is usually not desirable in practice.

⚠**AVERTISSEMENT**

Le réglage 79CLSD=OFF peut créer une condition de commande de fermeture permanente. Cette pratique n'est normalement pas recommandée.

⚠**WARNING**

Take proper precautions to prevent personal injury or equipment damage when lifting and mounting the SEL-651R-2. Make sure doors are latched closed. Secure lifting attachments to the lifting holes. Lift slowly. Do not transport the SEL-651R-2 with the battery inside the enclosure.

⚠**AVERTISSEMENT**

Prendre les précautions appropriées pour éviter les blessures au personnel et les dommages à l'équipement quand on soulève et qu'on monte le SEL-651R-2. S'assurer que les portes sont verrouillées. Fixer les attaches sur les trous prévus pour l'élévation. Soulever lentement. Ne pas transporter le SEL-651R-2 avec la batterie dans le coffret.

⚠**WARNING**

This device is shipped with default passwords. Default passwords should be changed to private passwords at installation. Failure to change each default password to a private password may allow unauthorized access. SEL shall not be responsible for any damage resulting from unauthorized access.

⚠**AVERTISSEMENT**

Cet appareil est expédié avec des mots de passe par défaut. A l'installation, les mots de passe par défaut devront être changés pour des mots de passe confidentiels. Dans le cas contraire, un accès non-autorisé á l'équipement peut être possible. SEL décline toute responsabilité pour tout dommage résultant de cet accès non-autorisé.

⚠**CAUTION**

Disconnect the battery from the relay module (using the Quick Disconnect) before disconnecting the battery terminals and removing the battery. Connect the Quick Disconnect last when installing the battery.

⚠**ATTENTION**

Débrancher la batterie du module du relais (en utilisant le "Quick Disconnect") avant de débrancher les bornes de la batterie et ensuite retirer la batterie. Rebrancher le "Quick Disconnect" en dernier lorsqu' on replace la batterie.

⚠**CAUTION**

Do not connect the SEL-651R-2 to an energized recloser until all control settings have been properly programmed and verified. Failure to comply can result in control and recloser misoperation, equipment damage, and personal injury.

⚠**ATTENTION**

Ne pas raccorder le SEL-651R-2 à un réenclencheur sous-tension avant que tous les réglages de la commande n'aient été proprement programmés et vérifiés. Toute dérogation à cette directive peut entraîner une opération intempestive de la commande ou du réenclencheur, des dommages à l'équipement ou des blessures au personnel.

⚠**CAUTION**

Equipment components are sensitive to electrostatic discharge (ESD). Undetectable permanent damage can result if you do not use proper ESD procedures. Ground yourself, your work surface, and this equipment before removing any cover from this equipment. If your facility is not equipped to work with these components, contact SEL about returning this device and related SEL equipment for service.

⚠**ATTENTION**

Les composants de cet équipement sont sensibles aux décharges électrostatiques (DES). Des dommages permanents non-décelables peuvent résulter de l'absence de précautions contre les DES. Raccordez-vous correctement à la terre, ainsi que la surface de travail et l'appareil avant d'en retirer un panneau. Si vous n'êtes pas équipés pour travailler avec ce type de composants, contacter SEL afin de retourner l'appareil pour un service en usine.

General Information
Wolfe

Other Safety Marks (Sheet 3 of 3)

⚠ CAUTION	⚠ ATTENTION
Never apply voltage signals greater than 9 V peak-peak to the low-level test interface (J14) or equipment damage may result.	Au risque de causer des dommages à l'équipement, ne jamais appliquer un signal de tension supérieur à 9 V crête à crête à l'interface de test de bas niveau (J14).
⚠ CAUTION The battery temperature sensor board contains exposed components that are sensitive to Electrostatic Discharge (ESD). When working with this board, work surfaces and personnel must be properly grounded or equipment damage may result.	⚠ ATTENTION Le capteur de température de la batterie contient des composants à découvert qui sont sensibles aux décharges électrostatiques. Lorsqu'on travaille sur cette carte, les surfaces de travail et le personnel doivent être adéquatement mis à la terre sans quoi des dommages à l'équipement pourraient survenir.
⚠ CAUTION The recloser control must be mounted on the same pole as the recloser when low-energy analog (LEA) inputs are used. This practice reduces surges that may damage the recloser control. Shielded cables are recommended when using LEA inputs.	⚠ ATTENTION La commande du réenclencheur doit être montée sur le même poteau que le réenclencheur quand des entrées analogiques de bas niveau sont utilisées. Cette pratique réduit les bruits impulsifs qui pourraient endommager les circuits de commande du réenclencheur. Des câbles blindés sont recommandés avec ce type d'entrées.
⚠ CAUTION The relay contains devices sensitive to Electrostatic Discharge (ESD). When working on the relay with the front panel removed, work surfaces and personnel must be properly grounded or equipment damage may result.	⚠ ATTENTION Le relais contient des pièces sensibles aux décharges électrostatiques. Quand on travaille sur le relais avec les panneaux avant ou du dessus enlevés, toutes les surfaces et le personnel doivent être mis à la terre convenablement pour éviter les dommages à l'équipement.
⚠ CAUTION There is danger of explosion if the battery is incorrectly replaced. Replace only with Rayovac no. BR2335 or equivalent recommended by manufacturer. See Owner's Manual for safety instructions. The battery used in this device may present a fire or chemical burn hazard if mistreated. Do not recharge, disassemble, heat above 100°C or incinerate. Dispose of used batteries according to the manufacturer's instructions. Keep battery out of reach of children.	⚠ ATTENTION Une pile remplacée incorrectement pose des risques d'explosion. Remplacez seulement avec un Rayovac no BR2335 ou un produit équivalent recommandé par le fabricant. Voir le guide d'utilisateur pour les instructions de sécurité. La pile utilisée dans cet appareil peut présenter un risque d'incendie ou de brûlure chimique si vous en faites mauvais usage. Ne pas recharger, démonter, chauffer à plus de 100°C ou incinérer. Éliminez les vieilles piles suivant les instructions du fabricant. Gardez la pile hors de la portée des enfants.

General Information

Typographic Conventions

There are four ways to communicate with the SEL-651R-2:

➤ Using a command line interface on a PC terminal emulation window.

➤ Using a command line interface through the virtual terminal interface of a DNP3 communications link.

➤ Using the front-panel menus and pushbuttons.

➤ Using QuickSet.

The instructions in this manual indicate these options with specific font and formatting attributes. The following table lists these conventions:

Example	Description
STATUS	Commands typed at a command line interface on a PC.
n **SHO** *n*	Variables determined based on an application (in bold if part of a command).
<Enter>	Single keystroke on a PC keyboard.
<Ctrl+D>	Multiple/combination keystroke on a PC keyboard.
Start > Settings	PC software dialog boxes and menu selections. The > character indicates submenus.

Example	Description
CLOSE	Relay front-panel pushbuttons.
ENABLE	Relay front- or rear-panel labels.
MAIN > METER	Relay front-panel LCD menus and relay responses visible on the PC screen. The > character indicates submenus.
Are you sure?	Relay responses visible on the PC screen.

Examples

This instruction manual uses several example illustrations and instructions to explain how to effectively operate the SEL-651R-2. These examples are for demonstration purposes only; the firmware identification information or settings values included in these examples may not necessarily match those in the current version of your SEL-651R-2.

Trademarks

All brand or product names appearing in this document are the trademark or registered trademark of their respective holders. No SEL trademarks may be used without written permission.

SEL trademarks appearing in this manual are shown in the following table.

Section 1

Introduction and Specifications

The SEL-651R-2 Recloser Control builds upon the success of the SEL-651R-0/1 Recloser Control, with new features and wider applicability. Apply the SEL-651R-2 in urban and rural distribution systems for increased system reliability. Connect the SEL-651R-2 to existing traditional reclosers and newer single-phase trip/reclose-capable reclosers, as detailed in following information.

This section introduces the SEL-651R-2 Recloser Control and provides information on the following topics:

Features

The SEL-651R-2 contains many protection, automation, and control features. *Figure 1.1* presents a simplified functional overview of the relay.

1.2 Introduction and Specifications
Features

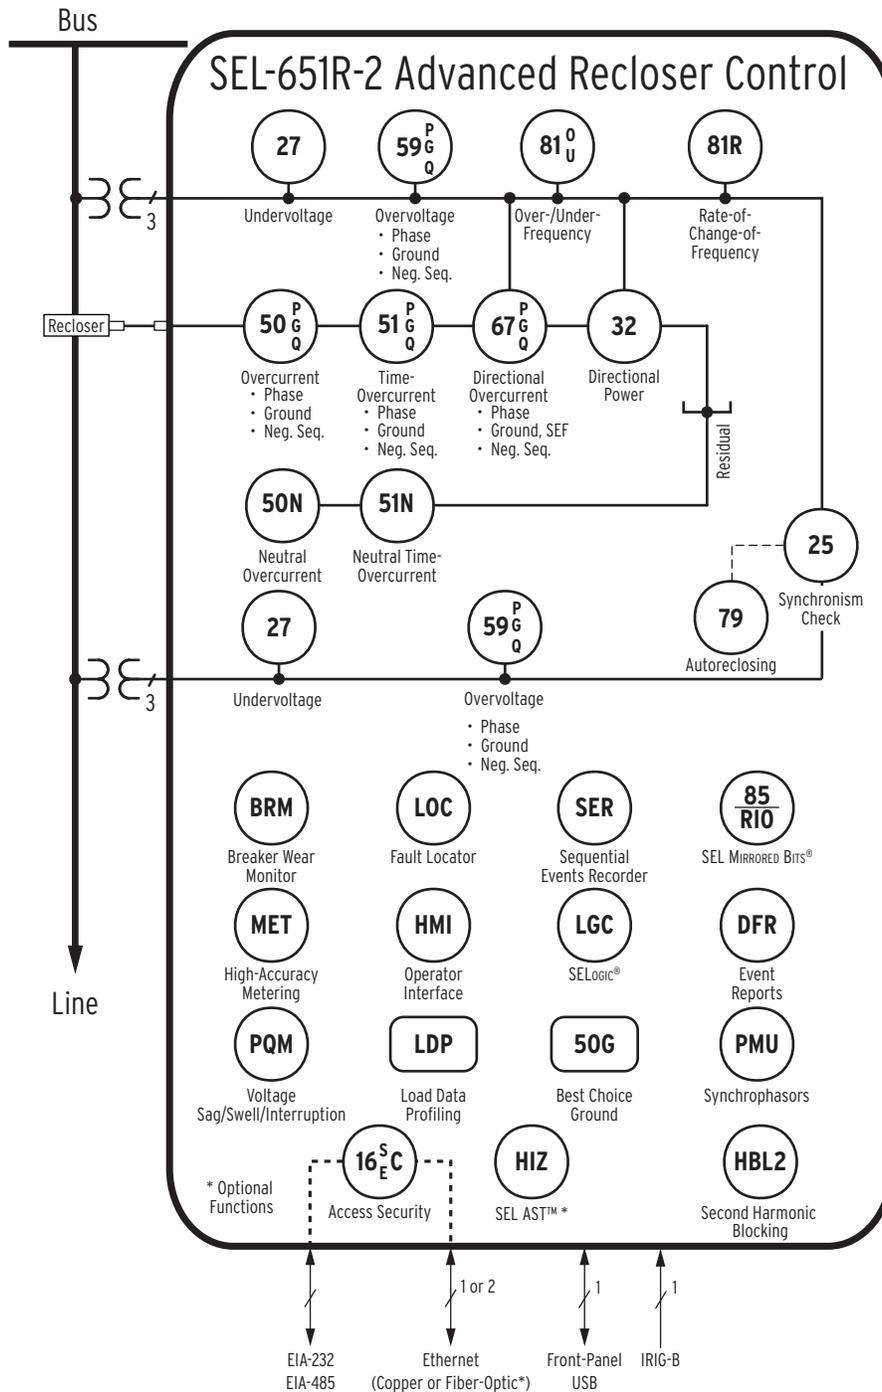
Attachment to Response to AG-2 Question No. 68(g)
Page 32 of 1080
Wolfe


Figure 1.1   Functional Overview

Automatic Network Reconfiguration

Augment system reliability by using Automatic Network Reconfiguration to automatically isolate faulted line sections and restore service to the unaffected areas of the system. The SEL-651R-2 includes six voltage inputs to monitor both source-side and load-side voltages, ensuring safe and secure Automatic Network Reconfiguration automation. Automatic Network Reconfiguration automation is especially applicable in urban areas.

Ethernet Communication	Communicate using single fiber-optic or dual-metallic or fiber-optic Ethernet ports via DNP3, Modbus, FTP, web server, and SNTP. Firmware upgrades can also be performed through use of the Ethernet ports. The IEC 61850 protocol is available with dual copper and dual or single fiber-optic Ethernet port options. Use the Ethernet ports for local and remote engineering access, SCADA, real-time protection and control, loop restoration, islanding detection, blocking, and fast bus-tripping schemes.
Firmware Upgrade Over Web Server	Reduce firmware upgrade time and costs by uploading firmware over an Ethernet connection by using the web server interface. This feature is enabled through an Ethernet port setting with the option to require front-panel confirmation upon completion of the file being uploaded. The firmware is digitally signed and compressed. Upon upload completion, the relay verifies the signature for security.
Single-Phase Tripping/Reclosing	Reduce system and customer impacts because of faults. With single-phase tripping, interrupt only faulted phases while maintaining service to unaffected customers. Select single-phase or three-phase lockout, depending on connected loads. Single-phase operation is especially applicable in rural areas (requires a single-phase capable recloser).
PC Software	In addition to communicating and setting the relay through use of an ASCII terminal, you can use the PC-based ACSELERATOR QuickSet SEL-5030 Software to more easily configure the SEL-651R-2 and analyze fault records with relay element response.
USB Port	Use the standard front-panel USB port to speed up local communication and file transfers such as reading/writing settings and firmware upgrades.
Substantial Auxiliary Power Supply	Adequately power demanding 12 Vdc accessories with a built-in 40 W (continuous) auxiliary power supply.
Large Cabinet (Ordering Option)	Front and rear doors provide fast and easy access for front-panel operation or rear-panel connections. Large internal volume and 19" rack system allow plenty of room for accessory installation. The removable connector panel at bottom of enclosure accommodates custom hole sizes/fittings.
Extensive Recloser Compatibility (Ordering Option)	The Control Cable Interface selections in *Models and Options on page 1.4* shows the compatible reclosers. Select the desired control cable interface for the SEL-651R-2 at ordering time. Learn the setting and operation of this one recloser control and retrofit numerous existing recloser installations and equip new recloser installations.
Low-Energy Analog (LEA) Voltage Inputs (Ordering Option)	Connect the low-level voltage outputs from less-costly power system voltage transducers to three-phase LEA voltage inputs on the SEL-651R-2.

Wolfe

Accessories (Ordering Option)

Order additional accessories for the SEL-651R-2, such as:

➤ 19" rack mount accessory shelf for radios, etc.

➤ Vandal sleeves to prevent cable connection tampering.

➤ Fuse blocks for voltage input and control power protection.

➤ AC transfer switch for alternate control power source switching—especially useful in Automatic Network Reconfiguration operation.

Models and Options

See the latest SEL-651R-2 Model Option Table at selinc.com.

SEL-651R Models

This instruction manual covers the SEL-651R-2 models introduced in 2012. *Table 1.1* describes distinguishing features of products covered and not covered by this manual. Use any row of the table to distinguish between recloser controls covered and not covered by this manual.

Table 1.1   SEL-651R Product Features

Distinguishing Feature	SEL-651R Recloser Controls Covered by This Instruction Manual	SEL-651R Recloser Controls Not Covered by This Instruction Manual
Model Number[a]	0651R-2	0651R-0/1
Ethernet Port(s) on Relay Module[b]	Yes	No
Serial Port +5 V Jumpers Accessible from JMP 2 3 Opening on Relay Module[b]	Yes	No
Firmware Revision Number	FID=SEL-651R-R4xx and higher	FID=SEL-651R-R3xx and lower

[a] The model numbers used in this table are derived from the SEL-651R Model Option Tables. These numbers should not be used to order an SEL-651R. To order an SEL-651R, refer to the actual Model Option Tables.
[b] See Figure 2.5 and Figure 2.9.

Recloser Compatibility

To determine the recloser interface of an SEL-651R-2, inspect the recloser control cable receptacle (see *Figure 2.34*). The part number (found on the serial number sticker inside the SEL-651R-2 enclosure) can also be checked and compared to the SEL-651R-2 Model Option Table.

Option Considerations

Consider the following options when ordering and configuring the SEL-651R-2 Recloser Control.

➤ Control Cable Interface

➢ Traditional Retrofit (14-pin)

➢ G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-pin, single-phase trip capable)

➢ ABB OVR-3/VR-3S (15 and 27 kV models) (24-pin, single-phase trip capable)

➢ G&W Control Power Viper-S or Control-Powered Eaton NOVA (19-pin)

➢ ABB Joslyn TriMod 600R (27-pin, single-phase trip capable)

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 35 of 1080
Wolfe
Introduction and Specifications 1.5
Models and Options

➢ Eaton NOVA-TS or NOVA-STS Triple-Single (26-pin, single-phase trip capable)

➢ Siemens SDR Triple-Single (40-pin, single-phase trip capable)

➢ Siemens SDR Three-Phase (40-pin)

➢ Multi-Recloser Interface (42-pin), see *Table 2.4* for compatible reclosers

➤ Enclosure Type

➢ Dual door (side mount)

➢ Single door (rear mount)

➤ Enclosure Material

➢ Painted steel

➢ Type 304 stainless steel

➤ Door Latching

➢ Three-point latch

➤ Secondary Input Voltage Ratings

➢ Two three-phase 300 Vac sets

➢ One three-phase 8 Vac LEA set
One three-phase 300 Vac set

➢ One three-phase 8 Vac LEA set
One three-phase "Lindsey SVMI LEA" set

➢ One three-phase "Eaton NOVA LEA" set
One three-phase 300 Vac set

➢ One three-phase "Eaton NOVA LEA" set
One three-phase "Lindsey SVMI LEA" set

➢ One three-phase 300 Vac set
One three-phase "Lindsey SVMI LEA" set

➢ Two three-phase 8 Vac LEA sets

➢ One three-phase 300 Vac set
One three-phase "Siemens LEA" set

➢ One three-phase "Lindsey SVMI LEA" set
One three-phase "Siemens LEA" set

➤ Extra Inputs/Outputs

➢ Seven 12 Vdc optoisolated inputs or two 125 Vdc and five 12 Vdc optoisolated inputs

➢ Eight output contacts

➤ Communications Ports/Interfaces

➢ Dual Copper Ethernet

➢ Dual or Single Fiber Ethernet

➢ IEC 61850 Protocol

➢ USB

➢ EIA-485

1.6 | Introduction and Specifications
Applications

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 36 of 1080
Wolfe

➤ Power Supply

➢ 120 Vac (includes GFCI [Ground-Fault Circuit Interrupter] outlet)

➢ 230 Vac

➢ 125 Vdc (battery charger not included)

➢ 48 Vdc (battery charger not included)

➤ Battery

➢ 12 V, 16 Ah

➢ 12 V, 40 Ah

➤ User Interface

➢ Configurable labels

➢ Tricolor LEDs

➤ Accessories

Contact the SEL factory or your local Technical Service Center for particular part number and ordering information (see *Technical Support on page 13.15*). You can also view the latest part number and ordering information on the SEL website at selinc.com.

Applications

As stated in preceding subsections, the SEL-651R-2 can be applied to:

➤ Traditional Retrofit (14-pin)

➤ G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-pin, single-phase trip capable)

➤ ABB OVR-3/VR-3S (15 and 27 kV models) (24-pin, single-phase trip capable)

➤ G&W Control Power Viper-S or Control-Powered Eaton NOVA (19-pin)

➤ ABB Joslyn TriMod 600R (27-pin, single-phase trip capable)

➤ Eaton NOVA-TS or NOVA-STS Triple-Single (26-pin, single-phase trip capable)

➤ Tavrida OSM Al_2 (32-pin, rectangular receptacle)

➤ Siemens SDR Triple-Single (40-pin, single-phase trip capable)

➤ Siemens SDR Three-Phase (40-pin)

➤ Multi-Recloser Interface (42-pin), see *Table 2.4* for compatible reclosers

Note that G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, ABB OVR/Gridshield (32-pin), ABB OVR-3/VR-3S (24-pin, 15 and 27 kV models), ABB Joslyn TriMod 600R, Eaton NOVA-TS or NOVA-STS Triple-Single, Siemens SDR Triple-Single, and the Multi-Recloser Interface reclosers include single-phase trip/reclose capability. They can also include three-phase trip/reclose and combinations in between (e.g., single-phase trip/reclose and three-phase lockout).

Figure 1.2 shows principal connections to the SEL-651R-2, with full voltage connections on each side. Complete voltage connections are used in such applications as Automatic Network Reconfiguration. *Figure 1.3* shows Automatic Network Reconfiguration augmented by MIRRORED BITS communications between SEL-651R-2 Recloser Controls. Automatic Network Reconfiguration operation automatically isolates faulted line sections and restores service to the rest of the system.

Introduction and Specifications 1.9
Specifications

Specifications

Compliance

Designed and manufactured under an ISO 9001 certified quality management system

General

AC Current Inputs

Channels IA, IB, IC

1 A Nominal:	3 A continuous (4 A continuous at 55°C), linear to 20 A symmetrical; 100 A for 1 s; 250 A for 1 cycle
Burden:	0.13 VA @ 1 A, 1.31 VA @ 3 A

Channel IN

0.2 A Nominal:	15 A continuous, linear to 5.5 A symmetrical; 500 A for 1 s; 1250 A for 1 cycle
Burden:	<0.5 VA @ 0.2 A

AC Voltage Inputs

300 V Maximum (PT):	300 V_{L-N} continuous (connect any voltage as high as 240 Vac, with allowance for surge): 600 Vac for 10 seconds
Burden:	<0.03 VA @ 67 V <0.06 VA @ 120 V <0.80 VA @ 300 V
8 V LEA Maximum:	8 V_{L-N} continuous (connect any voltage as high as 6.5 Vac, with allowance for surge): 300 Vac for 10 seconds
Burden:	Control Input Z = 1 MΩ
Common Mode Voltage	
Operation:	3 Vac
Without Damage:	50 Vac
Eaton NOVA LEA:	37 V_{L-N} continuous (connect any voltage as high as 29.6 Vac with allowance for surge): 250 Vac for 10 seconds
Burden:	Relay Input Z = 165 kΩ
Common Mode Voltage	
Operation:	3 Vac
Without Damage:	53 Vac
Lindsey SVMI LEA:	200 V_{L-N} continuous (connect any voltage as high as 160 Vac with allowance for surge): 250 Vac for 10 seconds
Burden:	Relay Input Z = 1 MΩ
Common Mode Voltage	
Operation:	3 Vac
Without Damage:	25 Vac
Siemens LEA:	8.49 V_{L-N} continuous (connect any voltage as high as 6.79 Vac with allowance for surge): 155 Vac for 10 seconds
Burden:	Relay Input Z = 24.22 kΩ
Common Mode Voltage	
Operation:	3 Vac
Without Damage:	50 Vac

Frequency and Rotation

Note: 60/50 Hz system frequency and ABC/ACB phase rotation are user-settable.

Frequency Tracking Range:	40–65 Hz
Maximum Rate of Change:	~20 Hz/s (The control will not measure faster-changing frequencies and will revert to nominal frequency if the condition is maintained for longer than 0.25 s)

Note: Voltage VnY or VnZ (where n = 1, 2, or 3) required for frequency tracking, depending upon Global setting FSELECT.

Power Supply

120 Vac Nominal

Rated Range:	85–132 Vac
Frequency Range:	40–65 Hz
Maximum Burden:	250 VA average, 500 VA peak
Inrush:	<100 A (I^2t < 24 A^2 – s)

230 Vac Nominal

Rated Range:	170–265 Vac
Frequency Range:	40–65 Hz
Maximum Burden:	250 VA average, 500 VA peak
Inrush:	<50 A (I^2t < 6 A^2 – s)

125 Vdc Nominal

Rated Range:	110.0–137.5 Vdc
Maximum Burden:	25 W continuous, 300 W for 1.5 s

48 Vdc Nominal

Rated Range:	43–60 Vdc
Maximum Burden:	25 W continuous, 300 W for 1.5 s

12 V Accessory Power Supply

For Models With AC Power Supply

12 Vdc ± 10%, 40 W continuous, 60 W for 6 s every 60 s

For Models With DC Power Supply

12 Vdc ± 10%, 3 W (0.25 A) continuous

Note: Some models momentarily dip to 9 Vdc during trip/close operations.

Output Contacts (Except Trip and Close)

Make:	30 A per IEEE C37.90-2005, Section 5.8
Carry:	6 A continuous carry at 70°C 4 A continuous carry at 85°C
1 s Rating:	50 A
MOV Protection:	270 Vac, 360 Vdc, 40 J
Pickup Time:	<5 ms
Update Rate:	1/8 cycle

Breaking Capacity (10,000 Operations):

24 V	0.75 A	L/R = 40 ms
48 V	0.50 A	L/R = 40 ms
125 V	0.30 A	L/R = 40 ms
250 V	0.20 A	L/R = 40 ms

1.10 | Introduction and Specifications
Specifications

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 40 of 1080
Wolfe

Cyclic Capacity (1 Cycle/Second):

24 V	0.75 A	L/R = 40 ms
48 V	0.50 A	L/R = 40 ms
125 V	0.30 A	L/R = 40 ms
250 V	0.20 A	L/R = 40 ms

Note: Per IEC 60255-0-20:1974, using the simplified assessment method.

AC Output Ratings

Maximum Operational Voltage (U_E) Rating:	240 Vac
Insulation Voltage (U_I) Rating (Excluding EN 61010-1):	300 Vac
Utilization Category:	AC-15 (control of electromagnetic loads >72 VA)
Contact Rating Designation:	B300 (B = 5 A, 300 = rated insulation voltage)
Voltage Protection Across Open Contacts:	270 Vac, 40 J
Rated Operational Current (I_E):	3 A @ 120 Vac 1.5 A @ 240 Vac
Conventional Enclosed Thermal Current (I_{THE}) Rating:	5 A
Rated Frequency:	50/60 ± 5 Hz
Electrical Durability Make VA Rating:	3600 VA, cos φ = 0.3
Electrical Durability Break VA Rating:	360 VA, cos φ = 0.3

Trip and Close Outputs

Traditional Interface Rating

Coil Voltage:	24 ± 2.4 Vdc
Coil Current:	15.5 A (Close), 12.2 A (Trip)

G&W Viper-ST\-LT, ABB Elastimold MVR, and ABB OVR/Gridshield (32-Pin and 42-Pin Versions) Rating

Coil Voltage:	155 + 5, – 3 Vdc
Coil Current:	12–17 A (Close), 4 A (Trip) (per phase)
Pulse Duration:	52–55 ms (Close), 27–30 ms (Trip)

ABB OVR-3/VR-3S (24-Pin, 15 and 27 kV Models) Rating

Coil Voltage:	48 + 5, – 3 Vdc
Pulse Duration:	85 ms (Close), 45 ms (Trip)

Control-Powered Eaton NOVA Rating

Coil Voltage:	48 + 5, – 3 Vdc

ABB Joslyn TriMod 600R Rating

Coil Voltage:	155 + 5, – 3 Vdc
Pulse Duration:	35 ms (Close), 14 ms (Trip)

Eaton NOVA-TS or NOVA-STS Triple-Single Rating

Coil Voltage:	48 + 5, – 3 Vdc

Tavrida OSM AI_2 Rating

Coil Voltage:	155 + 5, – 3 Vdc
Pulse Duration:	60 ms (Close), 15 ms (Trip)

Tavrida OSM AI_4 Rating

Coil Voltage:	155 + 5, – 3 Vdc
Pulse Duration:	60 ms (Close), 15 ms (Trip)

Siemens SDR Triple-Single Rating

Coil Voltage:	155 + 5, – 3 Vdc
Pulse Duration:	65 ms (Close), 40 ms (Trip)

Siemens SDR Three-Phase Rating

Coil Voltage:	155 + 5, – 3 Vdc
Pulse Duration:	65 ms (Close), 40 ms (Trip)

Eaton NOVA NX-T Rating

Coil Voltage:	155 + 5, – 3 Vdc
Pulse Duration:	45 ms (Close), 10 ms (Trip)

Note: Supports an entire trip-close-trip-close-trip-close-trip-close-trip-lockout sequence every minute.

Optoisolated Inputs (Optional)

When Used With DC Control Signals

125 Vdc:	On for 105–150 Vdc; off below 75 Vdc
12 Vdc:	On for 9.6–27 Vdc

When Used With AC Control Signals

125 Vdc:	On for 89.6–150.0 Vac; off below 53.0 Vac

Note: AC mode is selectable for inputs IN101 and IN102 when ordered with 125 Vdc options via Global settings IN101D and IN102D. AC input recognition delay from time of switching: 0.75 cycles maximum pickup, 1.25 cycles maximum dropout.

Note: All optoisolated inputs draw less than 10 mA of current at nominal voltage or ac rms equivalent.

Status Inputs

DC Dropout Range:	0–4 Vdc
DC Pickup Range:	8–28 Vdc
Current Draw:	1–10 mA

Communications Ports

EIA-232:	One front, two rear
EIA-485:	One rear with 2100 Vdc of isolation
Per Port Data Rate Selections:	300, 1200, 2400, 4800, 9600, 19200, 38400, 57600
USB:	One front port (Type-B connector, CDC class device)
Ethernet:	One 10/100BASE-T rear port (RJ45 connector) (discontinued option)
	Two 10/100BASE-T rear ports optional (RJ45 connector)
	One or two 100BASE-FX rear ports optional (LC connectors multimode)
	Internal Ethernet switch included with second Ethernet port

Time-Code Inputs

Recloser Control accepts demodulated IRIG-B time-code input at Port 2 or the BNC input.

Port 2, Pin 4 Input Current:	1.8 mA typical at 4.5 V (2.5 kΩ resistive)
BNC Input Current:	4 mA typical at 4.5 V (750 Ω resistive when input voltage is greater than 2 V)

Synchronization Accuracy

Internal Clock:	±1 μs
Synchrophasor Reports (e.g., **MET PM**, **EVE P**, **CEV P**):	±10 μs
All Other Reports:	±5 ms

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Introduction and Specifications 1.11
Specifications

Wolfe

Simple Network Time Protocol (SNTP) Accuracy

Internal Clock: ±5 ms

Unsynchronized Clock Drift

Control Powered: 2 minutes per year typical

Operating Temperature

Relay Module: –40° to +85°C (–40° to +185°F)

Batteries: –40° to +80°C (–40° to +176°F)

Entire SEL-651R-2: –40° to +55°C (–40° to +131°F)

Note: LCD contrast impaired for temperatures below –20°C (–4°F). The entire SEL-651R-2 unit is operationally tested to +70°C (+158°F). The 15°C (27°F) difference between the +55°C rating and +70°C is for direct sunlight temperature rise.

Weight

<114 kg (<250 lb)

Battery Specifications

Base Version Requirement

Normal Capacity: 16 amp-hours @ 25°C

Run Time (Control Electronics Operate Plus One Trip/Close Cycle): ≥9.6 hours @ +25°C
≥3.2 hours @ –40°C

Recharge Time (Deep Discharge to Fully Charged): ≤9.6 hours @ 25°C

Estimated Life: ≥4 years @ 25°C
≥1 year @ 80°C

Extended Capacity Option Requirement

Normal Capacity: 40 ampere-hours @ 25°C

Run Time (Control Electronics Operate Plus One Trip/Close Cycle): ≥24 hours @ +25°C
≥8 hours @ –40°C

Recharge Time (Deep Discharge to Fully Charged): ≤24 hours @ 25°C

Estimated Life: ≥4 years @ 25°C
≥1 year @ 80°C

Processing Specifications and Oscillography

AC Voltage and Current Inputs

128 samples per power system cycle, 3 dB low-pass filter cut-off frequency of 3 kHz.

Digital Filtering

Digital low-pass filter then decimate to 32 samples per cycle followed by one-cycle cosine filter.

Net filtering (analog plus digital) rejects dc and all harmonics greater than the fundamental.

Protection and Control Processing

Most Elements: Four times per power system cycle

Time-Overcurrent Elements: Two times per power system cycle

Oscillography

Length: 15, 30, or 60 cycles

Total Storage: 11 seconds of analog and binary

Sampling Rate: 128 samples per cycle unfiltered
32 and 16 samples per cycle unfiltered and filtered
4 samples per cycle filtered

Trigger: Programmable with Boolean expression

Format: ASCII and Compressed ASCII
Binary COMTRADE (128 samples per cycle unfiltered)

Time-Stamp Resolution: 1 µs when high-accuracy time source is connected (**EVE P** or **CEV P** commands)

Time-Stamp Accuracy: See *Time-Code Inputs* in these specifications

Sequential Events Recorder

Time-Stamp Resolution: 1 ms

Time-Stamp Accuracy (With Respect to Time Source): ±5 ms

Control Element Settings Ranges and Accuracies

Instantaneous/Definite-Time Overcurrent Elements (50)

Current Pickup Range (A Secondary)

Phase and Neg.-Seq.: 0.05–20.00 A, 0.01 A steps

Ground: 0.005–20.000 A, 0.001 A steps

Neutral: 0.005–2.500 A

Steady-State Pickup Accuracy

Phase and Neg.-Seq.: ±0.01 A plus ±3% of setting

Ground: ±0.001 A plus ±3% of setting (IN < 4.7 A)
±0.010 A plus ±3% of setting (IN ≥ 4.7 A)

Neutral: ±0.001 A plus ±3% of setting

Transient Overreach: ±5% of pickup

Pickup/Dropout Time: 1.25 cycles

Time Delay Range: 0.00–16,000.00 cycles, 0.25-cycle steps

Time Delay Accuracy: ±0.25 cycle plus ±0.1% of setting

Time-Overcurrent Elements (51)

Current Pickup Range (A Secondary)

Phase and Neg.-Seq.: 0.05–3.20 A, 0.01 A steps

Ground: 0.005–3.200 A, 0.001 A steps

Neutral: 0.005–0.640 A, 0.001 A steps

Steady-State Pickup Accuracy

Phase and Neg.-Seq.: ±0.01 A plus ±3% of setting

Ground: ±0.001 A plus ±3% of setting (IN < 4.7 A)
±0.010 A plus ±3% of setting (IN ≥ 4.7 A)

Neutral: ±0.001 A plus ±3% of setting

Time Dials

U.S.: 0.5–15.0, 0.01 steps

IEC: 0.05–1.00, 0.01 steps

Recloser Curves: 0.10–2.00, 0.01 steps

Curve Timing Accuracy: ±1.50 cycles plus ±4% of setting, between 2 and 30 multiples of pickup

Second-Harmonic Blocking Elements

Pickup Range: 5%–100% of fundamental, 1% steps

Steady-State Pickup Accuracy: 2.5 percentage points

Pickup/Dropout Time:	<1.25 cycles
Time Delay:	0.00–16,000.00 cycles, 0.25-cycle steps
Timer Accuracy:	±0.25 cycle and ±0.1% of setting

Undervoltage (27) and Overvoltage (59)

Pickup Ranges (V Secondary)

300 V Maximum Inputs

Phase:	1.00–300.00 V, 0.01 V steps
Phase-to-Phase:	1.76–520.00 V, 0.02 V steps
Sequence:	2.00–300.00 V, 0.02 V steps

8 V LEA Maximum Inputs

Phase:	0.03–8.00 V[a]
Phase-to-Phase:	0.05–13.87 V[a]
Sequence:	0.05–8.00 V[a]

Eaton NOVA LEA Inputs (37 Vac Maximum)

Phase:	0.12–37.09 V[a]
Phase-to-Phase:	0.21–64.24 V[a]
Sequence:	0.25–37.09 V[a]

Lindsey SVMI LEA Inputs (200 Vac Maximum)

Phase:	1.00–200.00 V
Phase-to-Phase:	1.76–346.00 V
Sequence:	2.00–200.00 V

Siemens LEA Inputs (8.49 Vac Maximum)

Phase:	0.03–8.49 V[a]
Phase-to-Phase:	0.05–14.72 V[a]
Sequence:	0.05–8.00 V[a]

Steady-State Pickup Accuracy

300 V Maximum

Phase:	±0.5 V plus ±1% of setting
Phase-to-Phase:	±1 V plus ±2% of setting
Sequence:	±1.5 Vac plus ±3% of setting @ 12.5–300.0 Vac

8 V LEA Maximum[a]

Phase:	±10 mV plus ±1% of setting
Phase-to-Phase:	±20 mV plus ±2% of setting
Sequence:	±30 mVac plus ±3% of setting @ 0.33–8.00 Vac

Eaton NOVA LEA[a]

Phase:	±60 mV plus ±1% of setting
Phase-to-Phase:	±120 mV plus ±2% of setting
Sequence:	±180 mVac plus ±3% of setting @ 1.55–37.09 Vac

Lindsey SVMI LEA[a]

Phase:	±0.5 V plus ±1% of setting
Phase-to-Phase:	±1 V plus ±2% of setting
Sequence:	±1.5 Vac plus ±3% of setting @ 12.5–200.0 Vac

Siemens LEA[a]

Phase:	±10 mV plus ±1% of setting
Phase-to-Phase:	±20 mV plus ±2% of setting
Sequence:	±30 mVac plus ±3% of setting @ 0.33–8.49 Vac

Transient Overreach:	±5%
Pickup/Dropout Time:	<1.25 cycles

Synchronism-Check Elements (25)

Slip Frequency Pickup Range:	0.005–0.500 Hz, 0.001 Hz steps
Slip Frequency Pickup Accuracy:	±0.003 Hz
Phase Angle Range:	0–80°, 0.01° steps
Phase Angle Accuracy:	±4°

Under- and Overfrequency Elements (81)

Frequency Range:	40.00–65.00 Hz, 0.01 Hz steps
Frequency Accuracy:	±0.01 Hz
Time Delay Range:	2.00–16,000.00 cycles, 0.25-cycle steps
Time Delay Accuracy:	±0.25 cycle plus ±0.1%

Undervoltage Frequency Element Block Range

300 V Inputs:	12.50–300.00 V[a]

Rate-of-Change-of-Frequency Element

Pickup Range:	0.10–15.00 Hz/s, 0.01 Hz/s steps
Dropout:	95% of pickup
Pickup Accuracy:	±100 mHz/s and ±3.33% of pickup
Pickup/Dropout Time:	See *Equation 4.5*.
Pickup Time Delay:	0.10–60.00 seconds, 0.01-second steps
Dropout Time Delay:	0.00–60.00 seconds, 0.01-second steps
Timer Accuracy:	±6 ms and ±0.1% of setting

Power Elements[b]

Minimum Current:	0.01 A
Minimum Voltage:	40 V
Steady-State Pickup Accuracy:	0.58 W plus ±5% of setting at unity power factor
Pickup/Dropout Time:	<3.75 cycles
Time Delay Accuracy:	±0.25 cycle plus ±0.1% of setting

Load Encroachment[b]

Minimum Current:	0.1 A
Minimum Voltage:	12.5 Vac
Forward Load Impedance:	0.5–640.0 ohms secondary
Forward Positive Load Angle:	−90° to +90°
Forward Negative Load Angle:	−90° to +90°
Negative Load Impedance:	0.50–640 ohms secondary
Negative Positive Load Angle:	+90° to +270°
Negative Negative Load Angle:	+90° to +270°

Pickup Accuracy

Impedance:	±3%
Angle:	±2°

Type Tests

Recloser Type Tests

IEEE C37.60-2003, Section 6.13 Control Electronic Elements Surge Withstand Capability (SWC) Tests

6.13.1 Oscillatory and fast transient surge tests (a control-only test, performed in accordance with IEEE C37.90.1-2002)

6.13.2 Simulated surge arrester operation test (performed with the control connected to the following reclosers)

G&W Viper-ST:	27 kV, 12.5 kA interrupting, 800 A continuous
	38 kV, 12.5 kA interrupting, 800 A continuous
ABB Elastimold MVR:	15/17 kV, 12.5 kA interrupting, 800 A continuous
	38 kV, 12.5 kA interrupting, 800 A continuous
Eaton NOVA:	27 kV, 12.5 kA interrupting, 630 A continuous
Eaton Recloser Type "WVE-27":	38 kV, 8 kA interrupting, 560 A continuous
ABB OVR-3:	27 kV, 12.5 kA interrupting, 630 A continuous
Eaton NOVA-TS:	15.5 kV, 8 kA interrupting, 400 A continuous
Eaton NOVA (Control Powered):	27 kV, 12.5 kA interrupting, 630 A continuous
Tavrida OSM Al_2:	27 kV, 12.5 kA interrupting, 600 A continuous
Tavrida OSM Al_4:	27 kV, 12.5 kA interrupting, 600 A continuous

IEC 62271-111:2012/IEEE C37.60-2012, Section 6.111 Control Electronic Elements Surge Withstand Capability (SWC) Tests

6.111.2 Oscillatory and fast transient surge tests

6.111.3 Simulated surge arrester operation test

Both performed with the control connected to the following reclosers:

G&W Electric Viper-ST, Solid Dielectric:

Voltage Rating:	38 kV
Current Break Rating:	12.5 kA
Continuous Current Rating:	800 A

Eaton Type NOVA 15, Aux. Power

Voltage Rating:	15.5 kV
Current Break Rating:	12.5 kA
Continuous Current Rating:	630 A

Tavrida OSM25_Al_2(630_150_2)

Voltage Rating:	27 kV
Current Break Rating:	12.5 kA
Continuous Current Rating:	630 A

ABB OVR/Gridshield TS Recloser (32-Pin)

Voltage Rating:	27 kV
Current Break Rating:	12.5 kA
Continuous Current Rating:	1000 A

Insulation Coordination

IEC 60255-27:2013; Section 10.6.4
EN 60255-27:2014; Section 10.6.4
IEEE C37.90-2005, Section 8
Severity Level—HiPot:
2.5 kVac on optoisolated inputs, contact outputs, CTs, and PTs
0.75 kVdc on IRIG-B, EIA-485, and Ethernet ports
3.6 kVdc on power supply
Type tested for one minute
Severity Level—Impulse:
5.0 kV on optoisolated inputs, contact outputs, CTs, PTs, and
power supply
0.8 kV on IRIG-B, EIA-485, and Ethernet ports

[a] See Section 9: Settings for details on how to set voltage elements when using LEA inputs.
[b] Voltage, Power, and Impedance values listed for 300 Vbase (PT) inputs.
[c] Accuracies specified with balanced phase voltages at 120 Vac.
[d] Voltage threshold for given accuracy is 0.67 Vac for 8 V LEA inputs, 1.70 Vac for Eaton NOVA LEA inputs, 14.00 Vac for Lindsey SVMI LEA inputs, and 0.60 Vac for Siemens SDR LEA inputs.
[e] For example, for a particular harmonic value applied at 10% of fundamental, the harmonic value meters in the range of 5% to 15%.
[f] SEL enclosure excluded from test.
[g] Serial cable (non-fiber) lengths assumed to be <3 m.
[h] The following pickup/dropout delays are used:
Under- and overvoltage elements: 0.0/0.0 cycles
(Eaton NOVA and Lindsey LEAs required 6.0/6.0 cycles)
Phase instantaneous overcurrent elements: 0.5/1.0 cycles
Neutral instantaneous overcurrent elements: 0.0/4.0 cycles
Digital inputs: 0.5/0.5 cycles
[i] SEL enclosure included in test.

This page intentionally left blank

Section 2

Installation

Overview

In addition to a general hardware overview and standard installation information, this section contains the following detail information for the various reclosers that are compatible with the SEL-651R-2 Recloser Control:

➤ Drill and cutout dimensions for connector panel at bottom of enclosure (see *Figure 2.10–Figure 2.26*)

➤ Voltage connections, including low-energy analog (LEA) voltage inputs available with some reclosers (see *Figure 2.41–Figure 2.46*)

➤ Control cable receptacle pinouts (see *Figure 2.34*)

➤ Current, trip/close and recloser status connections that pass through the control cable (see *Figure 2.49–Figure 2.80*)

Dual-Door Enclosure Hardware Overview

The control consists of four major pieces:

➤ Enclosure

➤ Power Module

➤ Relay Module

➤ Battery

These pieces are shown in *Figure 2.1* and are described briefly in the following text.

2.2 | Installation
Dual-Door Enclosure Hardware Overview

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 48 of 1080
Wolfe

Figure 2.1   SEL-651R-2 Front View With Enclosure Front Door Open (Dual-Door Enclosure)

Enclosure

NOTE: Serial number stickers are provided for the enclosure, power module, and relay module.

NOTE: A lock with a 9.53 mm (3/8-inch) diameter shackle will work with any padlockable handle. The cold rolled steel enclosure with a single-point latch will accept a shackle with a diameter as large as 12.7 mm (0.5 inches).

Select the painted cold-rolled steel enclosure (NEMA 3R rated) for normal applications or the painted type 304 stainless steel enclosure (NEMA 3RX rated) to reduce corrosion in harsh environments. Each enclosure provides a 19-inch rack and ample space for mounting of the relay module, power supply module, and accessories (e.g., radio). It includes a front door for fast and easy access to the front-panel HMI and a rear door for easy access to wiring and fuses. SEL fiber-optic transceivers can mount on serial ports, with enough room for training the fiber-optic cable.

The front-door document holder is 22.9 cm (9 in) wide, by 3.0 cm (1.2 in) deep. It can carry items weighing as much as 0.902 kg (2 lb).

Near the upper corner of the enclosure (side near the pole), a small louvered vent is installed for the venting of battery gases.

Painted cold-rolled steel enclosures without a three-point latch have a padlockable handle on the front door, and a quarter-turn padlockable latch on the rear door. Painted stainless steel enclosures and cabinets with the three-point latches have padlockable handles on the front and rear doors.

The internal 19-inch rack system is designed according to the IEC 297 19-inch rack standard and accepts #10-32 screws.

Case No. 2018-00295

Power Module

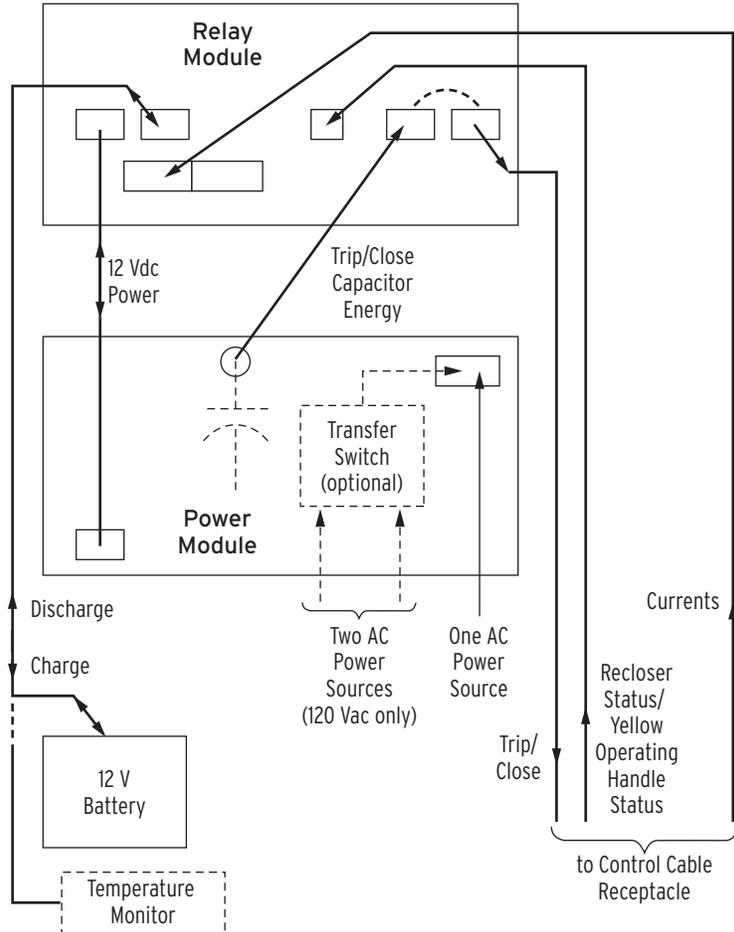
Figure 2.2 provides an overview of the major interconnections among the components within the SEL-651R-2 enclosure.


Figure 2.2   Major Interconnections Between SEL-651R-2 Components—Rear View (Dual-Door Enclosure)

The power module is ordered with one input power option:

➤ 120 Vac (includes a GFCI [Ground Fault Circuit Interrupter] convenience outlet on front)

➤ 230 Vac (two-wire)

➤ 125 Vdc

➤ or 48 Vdc

If two sources of 120 Vac power are brought to the power module, they must first be routed through a transfer switch on the power module. The output of the transfer switch is then connected to the power module inputs, as shown in *Figure 2.2*.

12 Vdc is output from the power module to power the relay module. The trip/close capacitor is charged inside the power module and this energy source is connected (via wire harness) to the trip and close output circuits in the relay module.

2.4 Installation
Dual-Door Enclosure Hardware Overview

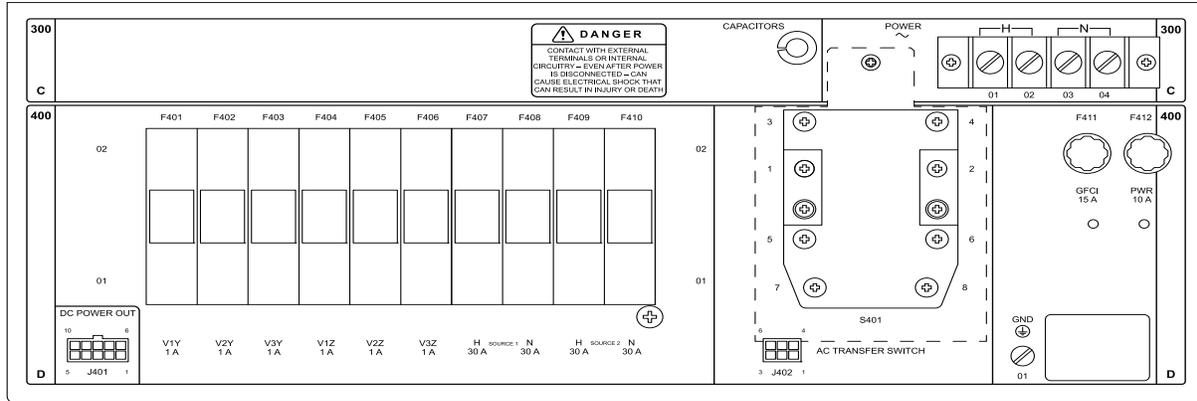
Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 50 of 1080
Wolfe


Figure 2.3 Rear View of SEL-651R-2 Power Module (Dual-Door Enclosure, Optional Features Shown)

Relay Module

Each SEL-651R-2 relay module provides protection, control, and monitoring features. The relay module is powered from 12 Vdc from the power module, as shown in *Figure 2.2*. This 12 Vdc also powers the battery charger in the relay module and is available as auxiliary power, such as for powering a radio. Secondary currents and voltages from the power system and recloser status are input to the relay module.

Trip and close signals are output from the relay module, with the trip/close capacitor (connected from the power module) providing the energy to actuate the trip or close operation.

Slide-in configurable front-panel labels can be customized for unique applications.

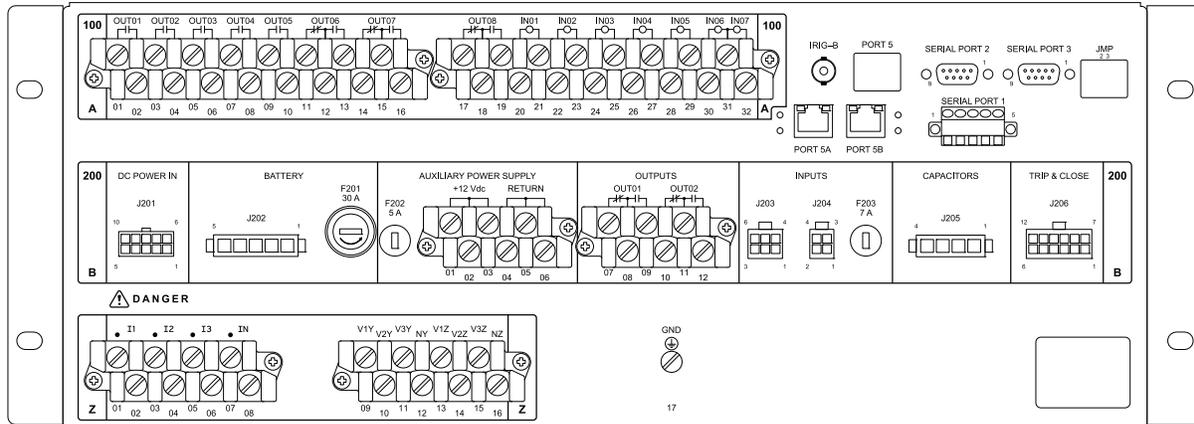
Wolfe


Figure 2.5   Rear View of SEL-651R-2 Relay Module (Dual-Door Enclosure, Optional Features Shown)

The internal wiring details of SEL-651R-2 relay module connectors J202, J203, J204, and J206 are shown in the following figures.

➤ J202 (BATTERY) is shown in *Figure 2.29*

➤ J203 (INPUTS) is shown in *Figure 2.50*, *Figure 2.54*, *Figure 2.57*, *Figure 2.60*, *Figure 2.64*, *Figure 2.66*, *Figure 2.67*, *Figure 2.69*, *Figure 2.72*, *Figure 2.73*, and *Figure 2.80*

➤ J204 (INPUTS) is shown in *Figure 2.60*, *Figure 2.67*, and *Figure 2.51*

➤ J206 (TRIP & CLOSE) is shown in *Figure 2.50*, *Figure 2.53*, *Figure 2.56*, *Figure 2.60*, *Figure 2.63*, *Figure 2.66*, *Figure 2.69*, *Figure 2.72*, *Figure 2.73*, and *Figure 2.79*

The internal wiring details for connectors J201 (DC POWER IN) and J205 (CAPACITORS) are not shown. J201 and J205 should only be connected to the factory-supplied harnesses emanating from the SEL-651R-2 power module. See *Figure 2.2* for an overview of such major interconnections.

Battery

Either a 16 or 40 Ah extended temperature 12 V battery is shipped with the recloser control. The battery sits upon a slightly raised platform. This platform provides space underneath for the battery temperature monitor, as shown in *Figure 2.2*.

See *Battery Installation and Connection on page 2.30* and *Battery and Fuse Replacement on page 2.57* for more information on battery service and characteristics.

Single-Door Enclosure Hardware Overview

The control consists of four major pieces:

➤ Enclosure

➤ Power Module

➤ Relay Module

➤ Battery

2.6 Installation
Single-Door Enclosure Hardware Overview

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 52 of 1080
Wolfe

These pieces are shown in *Figure 2.6* and are described briefly in the following text.

Figure 2.6   SEL-651R-2 Front View With Enclosure Door Open (Single-Door Enclosure)

Enclosure

NOTE: Serial number stickers are provided for the enclosure, power module, and relay module.

NOTE: A lock with a 9.53 mm (3/8-inch) diameter shackle will work with any padlockable handle. The cold rolled steel enclosure with a single-point latch will accept a shackle with a diameter as large as 12.7 mm (0.5 inches).

Select the painted cold-rolled steel enclosure (NEMA 3R rated) for normal applications or the painted type 304 stainless steel enclosure (NEMA 3RX rated) to reduce corrosion in harsh environments. Each single-door enclosure provides space for mounting of the relay module, power supply module, and accessories (e.g., radio). It includes a door for fast and easy access to the front-panel HMI and a swing-panel for easy access to wiring and fuses.

The front-door document holder is 22.9 cm (9 in) wide, by 3.0 cm (1.2 in) deep. It can carry items weighing as much as 0.902 kg (2 lb).

At the rear of the enclosure (near the mounting bracket), a small louvered vent is installed for the venting of battery gases.

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 52 of 1080
Wolfe
Installation 2.7
Single-Door Enclosure Hardware Overview

Power Module

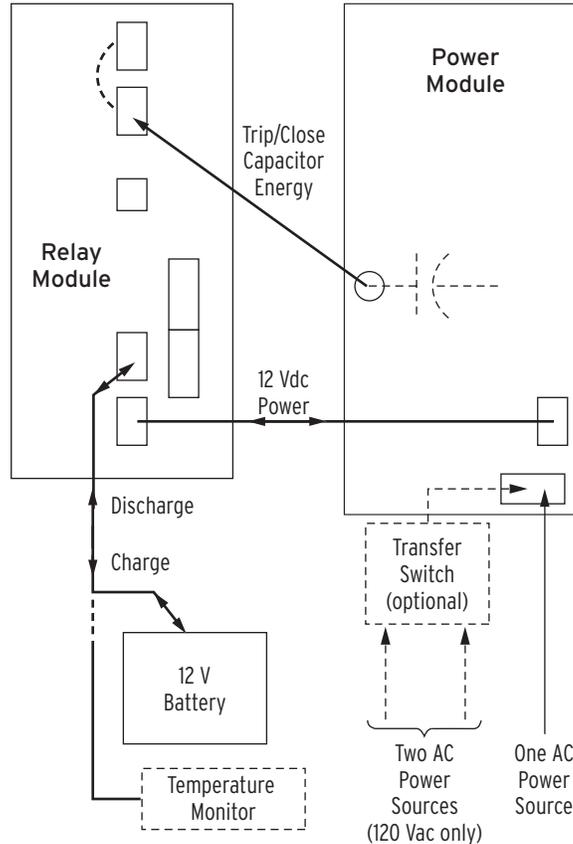
Figure 2.7 provides an overview of the major interconnections between the components within the SEL-651R-2 enclosure.


Figure 2.7 Major Interconnections Between SEL-651R-2 Components−Front View (Single-Door Enclosure)

The power module is ordered with one input power option:

➤ 120 Vac (includes a GFCI [Ground Fault Circuit Interrupter] convenience outlet in the cabinet)

➤ 230 Vac (two-wire)

➤ 125 Vdc

➤ or 48 Vdc

If two sources of 120 Vac power are brought to the power module, they must first be routed through a transfer switch. The output of the transfer switch is then connected to the power module inputs, as shown in *Figure 2.7*.

The power module outputs 12 Vdc to power the relay module. The trip/close capacitor is charged inside the power module and this energy source is connected (via wire harness) to the trip and close output circuits in the relay module.

2.8 Installation
Single-Door Enclosure Hardware Overview

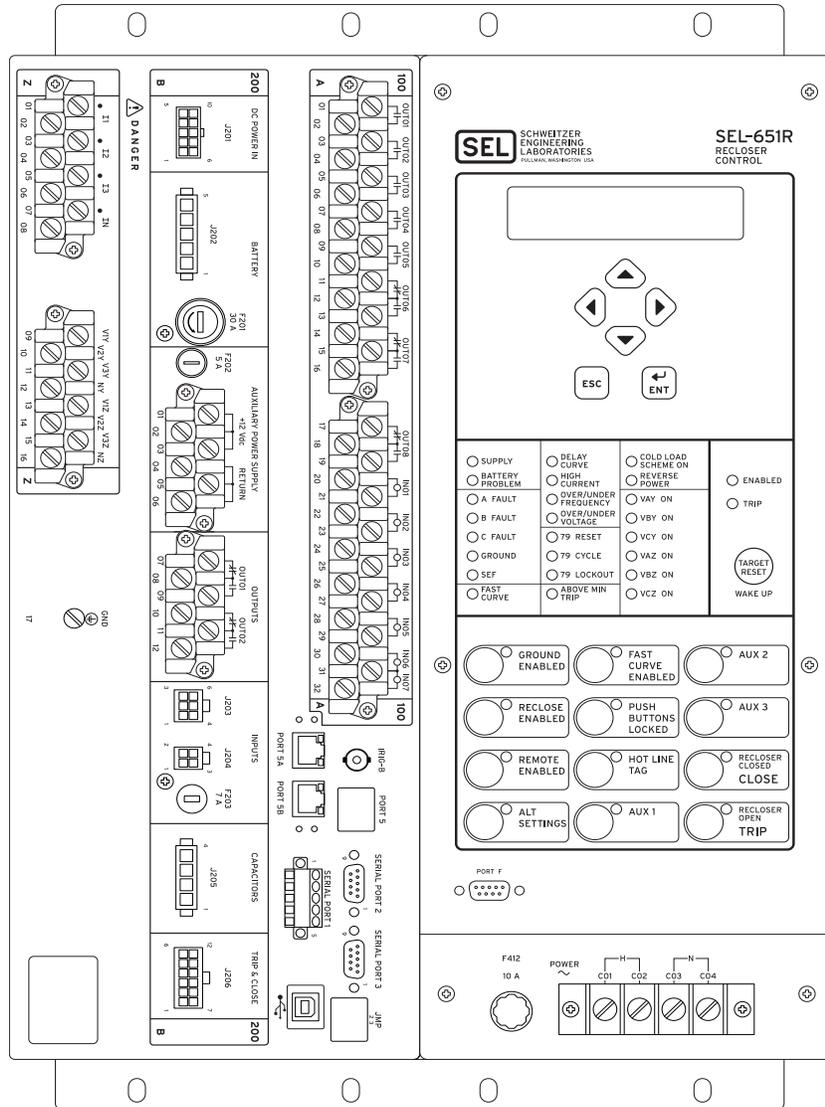
Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 54 of 1080
Wolfe


Figure 2.8   Front View of SEL-651R-2 Modules (Single-Door Enclosure, Optional Features Shown)

Relay Module

Each SEL-651R-2 relay module provides protection, control, and monitoring features. The relay module is powered from 12 Vdc from the power module, as shown in *Figure 2.7*. This 12 Vdc also powers the battery charger in the relay module and is available as auxiliary power, such as for powering a radio. Secondary currents and voltages from the power system and recloser status are input to the relay module.

Trip and close signals are output from the relay module, with the trip/close capacitor (connected from the power module) providing the energy to actuate the trip or close operation.

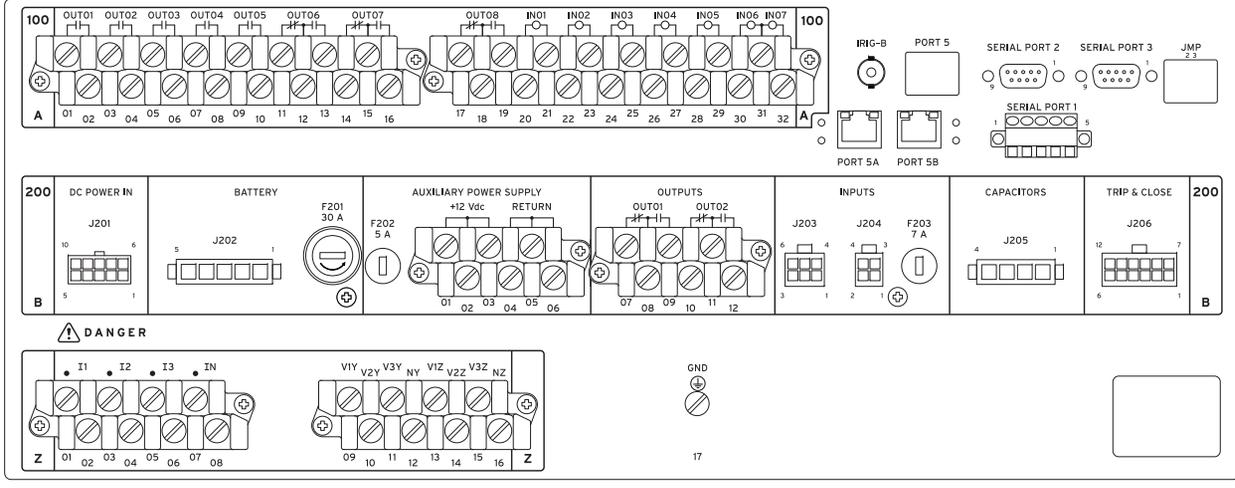
Slide-in configurable front-panel labels can be customized for unique applications.


Figure 2.9 View of SEL-651R-2 Relay Module (Single-Door Enclosure, Optional Features Shown)

The internal wiring details of SEL-651R-2 relay module connectors J202, J203, J204, and J206 are shown in the following figures.

▲ J202 (BATTERY) is shown in *Figure 2.29*.

▲ J203 (INPUTS) is shown in *Figure 2.50*, *Figure 2.54*, *Figure 2.57*, *Figure 2.60*, *Figure 2.64*, *Figure 2.66*, *Figure 2.67*, *Figure 2.69*, *Figure 2.72*, *Figure 2.73*, and *Figure 2.80*.

▲ J204 (INPUTS) is shown in *Figure 2.60*, *Figure 2.67*, and *Figure 2.51*.

▲ J206 (TRIP & CLOSE) is shown in *Figure 2.50*, *Figure 2.53*, *Figure 2.56*, *Figure 2.60*, *Figure 2.63*, *Figure 2.66*, *Figure 2.69*, *Figure 2.72*, *Figure 2.73*, and *Figure 2.79*.

2.10 | Installation
No Enclosure Options

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 56 of 1080
Wolfe

The internal wiring details for connectors J201 (DC POWER IN) and J205 (CAPACITORS) are not shown. J201 and J205 should only be connected to the factory-supplied harnesses emanating from the SEL-651R-2 power module (see *Figure 2.7* for an overview of such major interconnections).

Battery

Either a 16 or 40 Ah extended temperature 12 V battery is shipped with the recloser control. The battery sits upon a slightly raised platform. This platform provides space underneath for the battery temperature monitor, as shown in *Figure 2.7*.

See *Battery Installation and Connection on page 2.30* and *Battery and Fuse Replacement on page 2.57* for more information on battery service and characteristics.

No Enclosure Options

**CHOOSE HORIZONTAL
OR VERTICAL**
Choose between horizontal (Figure 2.3, Figure 2.4, and Figure 2.5) or vertical (Figure 2.8 and Figure 2.9) relay and power modules for the **no enclosure** option.

⚠**CAUTION**
The battery temperature sensor board contains exposed components that are sensitive to Electrostatic Discharge (ESD). When working with this board, work surfaces and personnel must be properly grounded or equipment damage may result.

SEL-651R-2 recloser controls can be ordered from SEL without enclosures. This option might be used where the control will be installed in a substation environment or where a custom enclosure will be used. An SEL-651R-2 ordered with no enclosure consists of four items:

➤ Relay Module

➤ Power Module

➤ Battery Temperature Sensor (with cables) (ac powered models only)

➤ Wiring Harnesses

All hardware is as described in the previous sections. See *Installation Steps and Drawings on page 2.10* and *Recloser Interface Connection Details (Control Cable Interface) on page 2.59* for details on wiring the recloser control.

Installation Steps and Drawings

Dual-Door Control Mounting

⚠**WARNING**
Have only qualified personnel service this equipment. If you are not qualified to service this equipment, you can injure yourself or others, or cause equipment damage.

The drill plan detailed in *Figure 2.10* (37 inches on center) is the same as the traditional drill plan for double-size Eaton enclosures. If a retrofit of such an enclosure is taking place, no extra drilling of the pole or mounting structure is needed.

Mounting Bolts/Washers: SEL does not provide the 5/8-inch mounting bolt/washer assemblies required for mounting the SEL-651R-2. The mounting hole on the enclosure is 2 inches in diameter, so any washer used with the mounting bolt must be less than 2 inches in diameter.

The SEL-651R-2 has one 1.5-inch diameter lifting hole on the mounting-bracket (angled out on top at 45 degrees) and one 1.5-inch diameter lifting hole on the smaller centered bracket at the top of the other side of the enclosure.

Step 1. Secure lifting attachments to the lifting holes.

Step 2. Lift slowly.

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 57 of 1080
Installation   2.11
Installation Steps and Drawings
Wolfe

⚠DANGER

If the recloser is energized while the control cable is disconnected from the recloser control, the CT secondaries in the control cable may generate dangerously high voltages. Do not come in contact with the pins or pin sockets in the control cable. Contact with high voltage can cause serious injury or death.

Step 3. Slip the top mounting hole/keyway over the top mounting bolt/washer assembly.

Step 4. Rest the unit on the bolt, settled in the keyway slot.

Step 5. Secure the bottom mounting bracket with another mounting bolt/washer assembly.

Step 6. Secure both top and bottom mounting bolt/washer assemblies.

The unit weighs (fully featured) 68 kg (≤150 lb), without the battery. Battery weights are given in *Table 2.2*.

Dual-Door Accessory Shelf

An optional accessory shelf can be installed in the 19-inch rack, below the power module. It has predrilled holes and installed PEM nuts for the installation of various radios, protocol converters, and other accessories (see the dimensions in *Figure 2.18*). The accessory shelf takes up 8.9 cm (3.5 in, vertical) and can carry as much as 6.8 kg (15 lb).

Single-Door Control Mounting

⚠WARNING

Have only qualified personnel service this equipment. If you are not qualified to service this equipment, you can injure yourself or others, or cause equipment damage.

⚠WARNING

Take proper precautions to prevent personal injury or equipment damage when lifting and mounting the SEL-651R-2. Make sure doors are latched closed. Secure lifting attachments to the lifting holes. Lift slowly. Do not transport the SEL-651R-2 with the battery inside the enclosure.

⚠DANGER

If the recloser is energized while the control cable is disconnected from the recloser control, the CT secondaries in the control cable may generate dangerously high voltages. Do not come in contact with the pins or pin sockets in the control cable. Contact with high voltage can cause serious injury or death.

The drill plan detailed in *Figure 2.19* (37 inches on center) is the same as the traditional drill plan for double-size Eaton enclosures. If a retrofit of such an enclosure is taking place, no extra drilling of the pole or mounting structure is needed.

Mounting Bolts/Washers: SEL does not provide the 5/8-inch mounting bolt/washer assemblies required for mounting the SEL-651R-2. The mounting hole on the enclosure is 2 inches in diameter, so any washer used with the mounting bolt must be less than 2 inches in diameter.

The SEL-651R-2 has one 1.5-inch diameter lifting hole on each side of the enclosure.

Step 1. Secure lifting attachments to the lifting holes.

Step 2. Lift slowly.

Step 3. Slip the top mounting hole/keyway over the top mounting bolt/washer assembly.

Step 4. Rest the unit on the bolt, settled in the keyway slot.

Step 5. Secure the bottom mounting bracket with another mounting bottom bolt/washer assembly.

Step 6. Secure both top and bottom mounting bolt/washer assemblies.

The unit weighs (fully featured) 68 kg (≤150 lb), without the battery. Battery weights are given in *Table 2.2*.

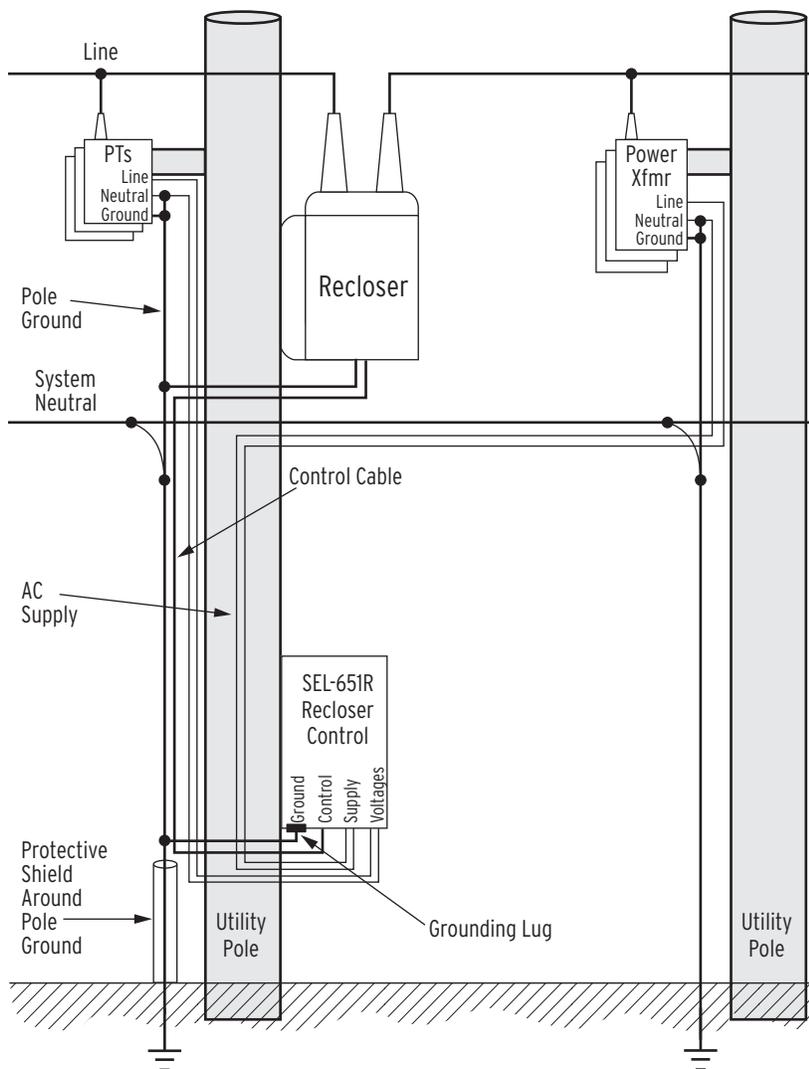
Installation 2.29
Installation Steps and Drawings

Control Grounding

Figure 2.28   SEL-651R-2 Recloser Control Customer Ground Connection to Required System Grounding


IMPORTANT: All devices interfacing to the SEL-651R-2 recloser control must be connected to the same pole ground. Figure 2.28 shows a suggested method of making these connections.

IMPORTANT: All connections to the SEL-651R-2 recloser control must be routed in close proximity to and parallel to their corresponding ground paths for adequate surge protection. The connections and their ground paths should be approximately equal in length. Use applicable IEEE and IEC grounding standards. Follow the proceeding recommendations to reduce high potentials from surges that can damage equipment.

Step 1.   Connect the pole ground to the grounding lug on the bottom of the recloser control enclosure as shown in *Figure 2.28*.

The grounding lug accommodates No. 10–No. 4 conductors (solid or stranded) (as many as two No. 4). A protective shield around the pole ground is suggested to help prevent physical damage to the ground wire, such as preventing an open circuit.

Step 2.   Ground all devices interfacing to the recloser control at the same pole ground.

Devices include: recloser, power transformer, potential transformers/voltage transducers, and SCADA. Even devices on adjacent poles with their own pole ground (e.g., power transformer) must still connect to the pole ground for the recloser control.

Step 3.   Route the control cable in close proximity to and parallel with the recloser ground.

Step 4.   Route ac supply voltage (power) and power system voltages in parallel with their transformer ground paths.

2.30 | Installation
Installation Steps and Drawings

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 76 of 1080
Wolfe

GROUNDING INSIDE ENCLOSURE

As referenced in the accompanying steps, all grounding inside the enclosure should be brought to the 5/16-inch diameter bolt that protrudes through the floor of the enclosure. On the outside of the enclosure, this bolt is integral to the grounding lug shown in Figure 2.28 and discussed in the first steps of this subsection (Control Grounding).

ENCLOSURE OPENINGS

No openings into the SEL-651R-2 enclosure should be left uncovered, with the exception of the vented hole plugs provided by SEL. Any conduit or other wire entry must be properly sealed.

Battery Installation and Connection

⚠ **CAUTION**

The Quick disconnect shown in Figure 2.29 should be the **first** connection pulled apart (disconnected) when removing the battery, and the **last** connection pushed together (connected) when installing the battery. Do not leave the battery wiring harness connected via the Quick Disconnect without the battery also connected to the battery wiring harness. This prevents the energized battery wiring harness positive (+; red) and negative (−; black) terminals from short-circuiting by coming in contact with the enclosure floor or each other.

Step 5. Bring all points inside the enclosure that require grounding (e.g., shielding on wires connected to inputs **IN101**–**IN107** or output contacts **OUT101**–**OUT108**; radio chassis) to the 5/16-inch diameter bolt that protrudes through the floor of the enclosure.

Make sure these grounding connections are secure.

Note that the relay module and power module are both grounded inside the enclosure at this protruding 5/16-inch diameter bolt.

Step 6. When installing the recloser control and recloser, include the following according to the manufacturers' recommendations:

➢ Protection of the recloser and the power transformer with lightning arresters.

➢ Grounding of the recloser head and tank.

➢ Grounding of the power transformer tank.

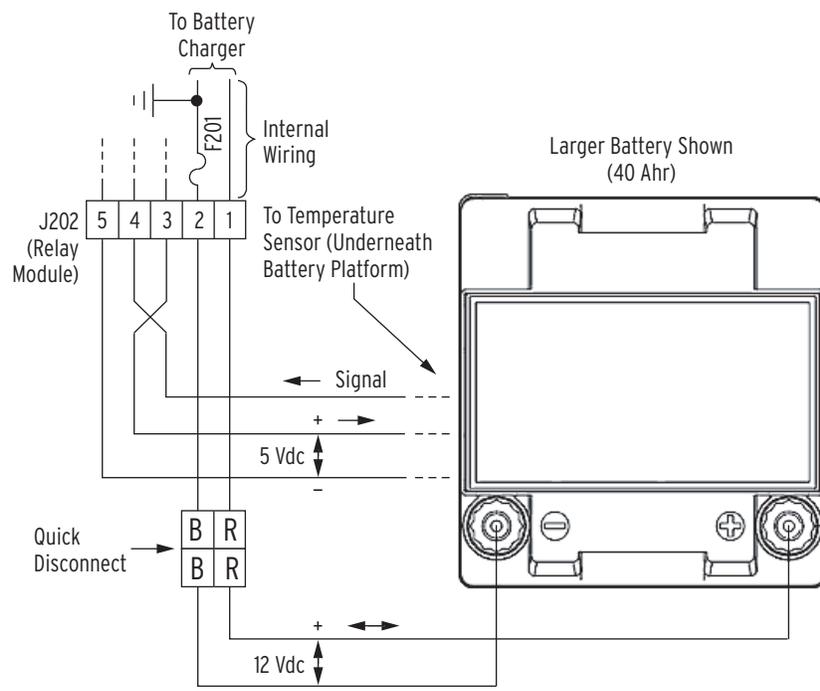
➢ Grounding of the control cabinet.


Figure 2.29   Battery Wiring Harness Connections (Shown Connected to Relay Module)

Step 1. Follow any manufacturer installation recommendations and warnings for the battery.

Step 2. Pull apart (disconnect) the Quick Disconnect shown in *Figure 2.29*, if not already separated (see ⚠).

Step 3. Connect the piece of the now separated battery harness with Connector J202 into corresponding receptacle **J202** on the relay module (if not already connected). The Quick Disconnect should still be pulled apart (disconnected).

Step 4. Outside the enclosure, connect the other piece of the battery harness piece to the 12 V battery, following the manufacturer's torque recommendations. The positive (**+**) battery terminal

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 77 of 1080
Installation 2.31
Installation Steps and Drawings
Wolfe

connects to the terminal of the red wire. The negative (–) battery terminal connects to the terminal of the black wire. The Quick Disconnect should still be pulled apart (disconnected).

Step 5. Inside the enclosure, unbuckle and move the two side-release buckle straps so that the raised battery platform is clear.

The straps should already be fitted underneath the slots provided on the raised platform, one strap oriented in one horizontal dimension and the other strap in the other horizontal dimension.

Step 6. Set the 12 V battery on the raised battery platform, with the terminals up and oriented toward the center of the enclosure.

Step 7. Fasten and secure the two side-release buckle straps over the battery, keeping the battery terminals clear.

Step 8. Push together (connect) the Quick Disconnect and ensure that it is fully engaged. Notice that making this last connection does not yet energize or turn on the control.

Proceed to *Wake Up* to turn on the control by using the **WAKE UP** pushbutton. The front panel will remain dark until you press the **WAKE UP** pushbutton.

See *Battery and Fuse Replacement on page 2.57* for more battery information.

See *Battery System Monitor on page 8.39* for help on testing the battery.

⚠**WARNING**

Do not transport the SEL-651R-2 with the battery inside the enclosure.

Wake Up

With the battery installed, press the front-panel **WAKE UP** pushbutton to energize the SEL-651R-2.

➤ If the unit turns on, the **ENABLED** LED illuminates and the **BATTERY PROBLEM** LED remains extinguished.

➤ If the unit does not turn on, check the following items:

➢ Battery condition.

➢ Battery fuse (panel-mount fuse F201 on the rear panel of the relay module, next to separable connector J202). See *Figure 2.29* and *Table 2.3*.

Note that application of Vac power (120 or 230 Vac, depending on unit) always energizes the SEL-651R-2.

Power Supply Connections

Order the power supply of the SEL-651R-2 at one of the following nominal voltage levels:

➤ 120 Vac (includes a Ground-Fault Circuit Interrupter [GFCI] convenience outlet on the front)

➤ 230 Vac

➤ 125 Vdc

➤ 48 Vdc

The serial number label lists the power supply rating. *Figure 2.30*, *Figure 2.31*, *Figure 2.32*, and *Figure 2.33* show the simplest 120 Vac, 230 Vac, 125 Vdc, and 48 Vdc power connections, respectively. These connections are made in the upper-right corner of the rear panel of the power module (dual-door enclosure, *Figure 2.3*) or below the front panel (single-door enclosure, *Figure 2.8*). Note that fuse protection is provided for all scenarios. The fuse blocks have integral fuse pullers, for ease of safely

2.32 | Installation
Installation Steps and Drawings

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 78 of 1080
Wolfe

NOTE: When 120 Vac (or 230 Vac, depending on ordered unit) power is correctly connected to the SEL-651R-2, the front-panel **SUPPLY** LED illuminates. If it is still extinguished, check fuse F412 (for the 120 Vac power supply) or both fuses F407 and F408 (for the 230 Vac power supply)—see Table 2.3. The **SUPPLY** LED illuminates if the relay module is powered-up/functional and the battery is not discharging. The **SUPPLY** LED may flicker at times when tripping or closing, because of the battery momentarily discharging.

The connected 120 Vac (or 230 Vac) power source is isolated from the power module chassis ground.

120 VAC (GFCI) CONVENIENCE OUTLET WIRING FOR SINGLE-DOOR ENCLOSURE UNITS
In single-door enclosure units (see Figure 2.6, lower right of open enclosure), the 120 Vac (GFCI) convenience outlet is wired externally to power module terminals C02 and C03. It does not use fuse F411 internal wiring as shown in Figure 2.30 (for dual-door enclosure units, see Figure 2.1). The external 120 Vac (GFCI) convenience outlet for single-door enclosure units is protected with a separate external fuse (unlabeled) of the same value as fuse F411 (see Table 2.3).

removing/installing fuses. Pull these fuses to de-energize/isolate the modules, although battery power can still keep the modules on. Fuse values are given in *Table 2.3*.

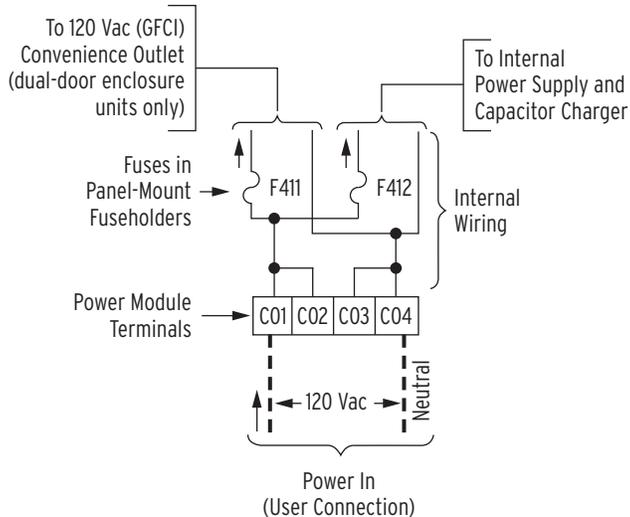
For additional 120 Vac power supply accessory options see *120 Vac Power Supply Connection Options and Accessories on page 2.37*.


Figure 2.30   120 Vac Power Connection

For the 120 Vac connection, the screws on terminals C01 and C04 are #10-32 (use max. width 11.4 mm [0.45 in] ring terminals; tightening torque of 1.0 to 2.0 Nm [9 to 18 in-lb]).

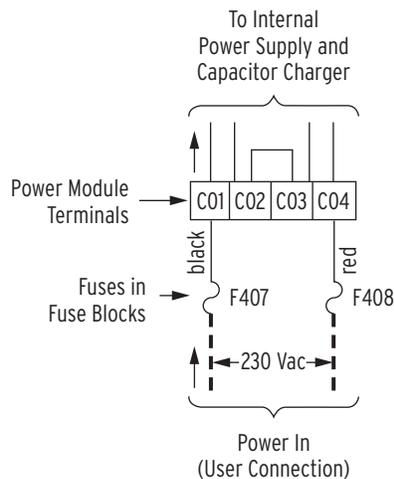
The 120 Vac power option has other possible connection options and accessories, detailed in *Figure 2.35–Figure 2.40*.


Figure 2.31   230 Vac Power Connection

For the two-wire 230 Vac connection, the screws on fuse blocks F407 and F408 are #10-32 (use max. width 11.4 mm [0.45 in] ring terminals; tightening torque of 1.0 to 2.0 Nm [9 to 18 in-lb]).

The 230 Vac power option has only the connection in *Figure 2.31*. No front-panel GFCI convenience outlet is provided with the 230 Vac power option.

Page 80 of 1080
Wolfe

Verify Settings/Set Date and Time

Note that this step presumes that the factory-set **ALTERNATE SETTINGS** operator control is operative.

Step 1. If the alternate settings are not going to be used, copy the main settings (Settings Group 1) to the alternate settings (Settings Group 2) with the **COPY** command (i.e., **COP 1 2**).

The settings in both settings groups will then be the same. If the **ALTERNATE SETTINGS** operator control pushbutton is accidentally pressed (switching the active settings group), the SEL-651R-2 still operates on the same settings.

Step 2. Set the date and time with the **DATE** and **TIME** commands (**DAT** and **TIM**, respectively).

⚠CAUTION

Do not connect the SEL-651R-2 to an energized recloser until all control settings have been properly programmed and verified. Failure to comply can result in control and recloser misoperation, equipment damage, and personal injury.

Disable Ground

Note that this step presumes that the factory-set **GROUND ENABLED** operator control is operative.

Disable ground overcurrent tripping with the **GROUND ENABLED** operator control on the SEL-651R-2 (corresponding LED extinguishes). Set other operator controls as desired for normal operation or whatever your standard commissioning procedure dictates.

Connect the Control Cable

Note that the control cable carries the currents among other signals, between the recloser and the SEL-651R-2. The phase current inscriptions for terminals Z01–Z06 in *Figure 2.5* and *Figure 2.9* (I1, I2, I3) have no permanent A-, B-, or C-phase designation. Phase designation is determined by Global setting IPCONN. See *Current Connection Setting (IPCONN) on page 9.28* for more information on this setting.

The SEL-651R-2 can be ordered with only one control cable receptacle (for connection to the desired recloser). This interface cannot be changed in the field.

The following help identify the control cable receptacle at the bottom of the SEL-651R-2 enclosure to which the control cable should be connected:

➤ The applicable figure of the connector panel at the bottom of the enclosure (see *Figure 2.11–Figure 2.26*)

➤ The pinout of the applicable control cable receptacle (see *Figure 2.34*)

⚠DANGER

If the recloser is energized while the control cable is disconnected from the recloser control, the CT secondaries in the control cable may generate dangerously high voltages. Do not come in contact with the pins or pin sockets in the control cable. Contact with high voltage can cause serious injury or death.

Presuming that the control cable is already connected to the recloser, connect the other end to the control cable receptacle at the bottom of the SEL-651R-2 enclosure. Pay attention to possible keying of the cable end and receptacle for proper connection.

Figure 2.34 shows the pinouts for the available control cable receptacles (view from inside enclosure). The common uses for the different pins are shown in the following figures:

➤ Traditional Retrofit control cable: *Figure 2.49* and *Figure 2.50*

➤ G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-pin) control cable: *Figure 2.43*, *Figure 2.52*, *Figure 2.53*, and *Figure 2.54*

➤ ABB OVR-3/VR-3S (24-pin,15 and 27 kV models) control cable: *Figure 2.55*, *Figure 2.56*, and *Figure 2.57*

➤ Control-Powered Eaton NOVA or G&W Control Power Viper-S control cable: *Figure 2.59* and *Figure 2.60*

Metering Check

Step 1.   Using the front-panel LCD and navigation buttons, go to the fundamental (instantaneous) metering screens.

Step 2.   Scroll through the fundamental metering values (primary), checking current IA, IB, and IC magnitude and angle for expected phase rotation.

The ground (IG) and neutral (IN) current displays should show relatively low current magnitudes, when compared to IA, IB, and IC, if system loading is well-balanced. The

Attachment to Response to AG-2 Question No. 68(g)
Page 83 of 1080
Wolfe

Installation   2.37
Hardware Details and Standard Accessories

negative-sequence (3I2) current display should show relatively low current magnitude, when compared to IA, IB, and IC, if system loading is well-balanced and phase rotation is correct.

Step 3. If system loading is well-balanced, but current display 3I2 shows an abnormally high current level (i.e., at a level near the phase current levels or above), suspect a wiring problem or setting problem (see settings listed below).

    a. Solve this problem before enabling ground overcurrent tripping.

    b. This may require taking the SEL-651R-2 out of service.

Step 4. Do similar checks for the voltage connections with the instantaneous metering screens, comparing phase voltages VAY, VBY, VCY (VY-side) and VAY, VBY, VCY (VZ-side) with corresponding negative-sequence voltage values (V2Y and V2Z). If system voltage (VY-side or VZ-side) is well-balanced, but the corresponding negative-sequence voltage (V2Y or V2Z) shows an abnormally high voltage level, such as a level near the phase voltage levels, suspect a wiring problem or setting problem (see settings listed below).

Check current and voltage-connection Global settings IPCONN, VYCONN, and VZCONN in case of problems (see *Table 9.8* and *Table 9.9*).

Step 5. Check the phase rotation setting, too (Global setting PHROT). *Figure 2.49*, *Figure 2.52*, *Figure 2.55*, *Figure 2.59*, *Figure 2.62*, *Figure 2.65*, *Figure 2.68*, *Figure 2.70*, *Figure 2.71*, *Figure 2.76*, and *Figure 2.77* show current connections. *Figure 2.41*, *Figure 2.42*, *Figure 2.43*, *Figure 2.44*, *Figure 2.45*. *Figure 2.52*, *Figure 2.55*, *Figure 2.65*, *Figure 2.68*, *Figure 2.70*, *Figure 2.71*, *Figure 2.76*, and *Figure 2.77* show voltage connections.

Enable Ground

Again, note that this step presumes that the factory-set **GROUND ENABLED** operator control is operative.

If desired for normal operation, enable ground overcurrent tripping with the **GROUND ENABLED** operator control on the SEL-651R-2 (corresponding LED illuminates), or whatever your standard commissioning procedure dictates.

This is the last of the basic installation steps. Information on extra connections and supporting material follow.

Hardware Details and Standard Accessories

120 Vac Power Supply Connection Options and Accessories

Figure 2.35–Figure 2.40 show additions to the simple 120 Vac power connection in *Figure 2.30*. The Universal Fuse Block, AC Transfer Switch, 3-Pin Power Receptacle, and Low-Voltage Close accessories, discussed herein, can be installed on a 120 Vac powered unit.

Universal Fuse Block

The Universal Fuse Block in *Figure 2.35* appears to provide redundant fusing (fuse F407 in line with fuses F411 and fuse F412). But, with the addition of the low-voltage (120 Vac) close option for Traditional Retrofit reclosers (see

2.38 | Installation
Hardware Details and Standard Accessories

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 84 of 1080
Wolfe

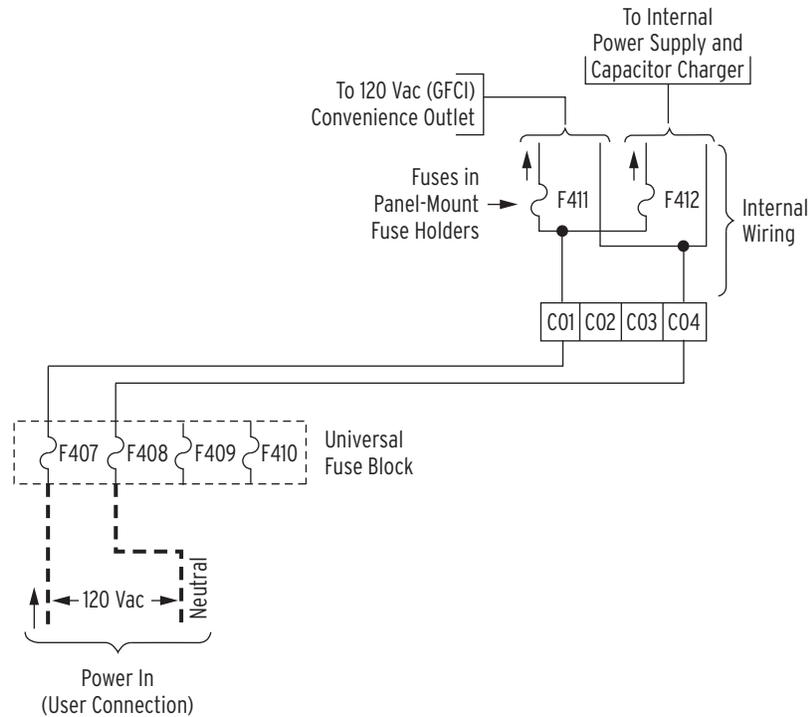
Figure 2.40), the Universal Fuse Block provides protection for this effective 120 Vac exposure going out to the recloser. The Universal Fuse Block is mounted near the center of the rear panel of the power module. The fuse blocks have integral fuse pullers, for ease of safely removing or installing fuses. Fuse values are given in *Table 2.3*.


Figure 2.35   Universal Fuse Block Power Connection

For the Universal Fuse Block connection, the screws on fuse blocks F407–F410 are #10-32. Use max. width 11.4 mm (0.45 in) ring terminals; tightening torque of 1.0 to 2.0 Nm (9 to 18 in-lb).

AC Transfer Switch

The AC Transfer Switch in *Figure 2.36* is used in automatic network reconfigurations, to switch the SEL-651R-2 to an alternate source of power if the primary source is unavailable. Two separate 120 Vac power sources are brought to the Transfer Switch. The Transfer Switch is a break-before-make switch, so the two 120 Vac power sources are never paralleled. The Transfer Switch is mounted on the right side of the rear panel of the power module.

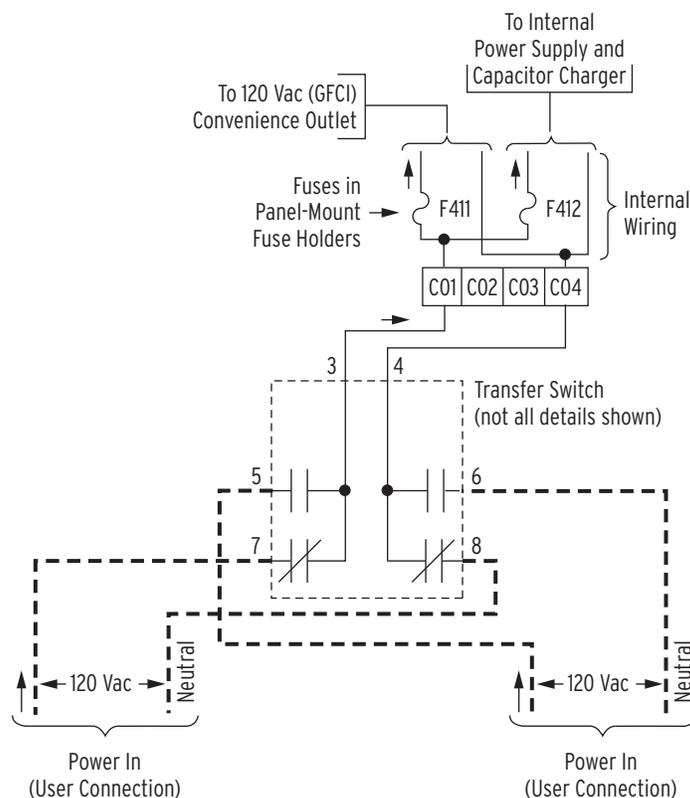
Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 85 of 1080
Installation 2.39
Hardware Details and Standard Accessories
Wolfe


Figure 2.36 AC Transfer Switch Power Connections

For the Transfer Switch connection, the screws on the Transfer Switch terminals (numbered 1–8) are #10-32 (use max. width 11.4 mm [0.45 in] ring terminals; tightening torque of 1.0 to 2.0 Nm [9 to 18 in-lb]).

Figure 2.37 shows the combination of the Universal Fuse Block and the Transfer Switch, with the Universal Fuse Block providing fuse protection for the Transfer Switch and every 120 Vac circuit beyond it.

120 Vac power sources for recloser controls are typically provided by dedicated distribution power transformers (e.g., 5 kVA), mounted on adjacent poles/structures (see *Figure 2.28*). *Figure 2.41* and *Figure 2.43* in the following subsection show other possible wiring to provide 120 Vac power.

2.40 | Installation
Hardware Details and Standard Accessories

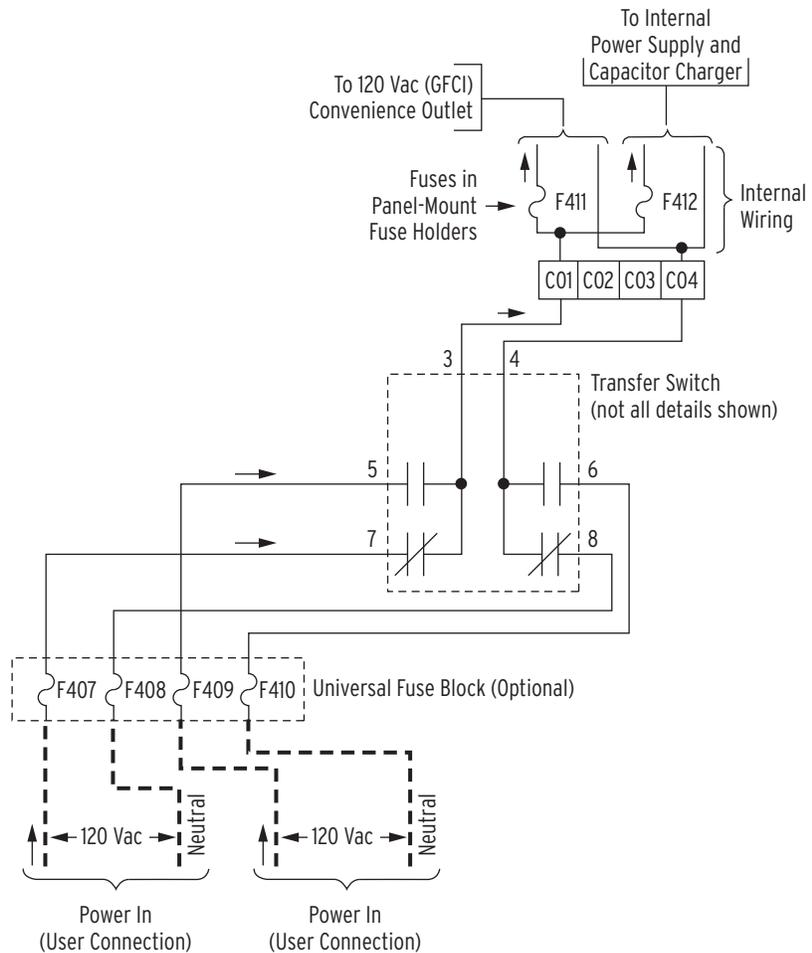
Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 86 of 1080
Wolfe


Figure 2.37   Universal Fuse Block/AC Transfer Switch Power Connections

Figure 2.38 provides the extra Transfer Switch connection and operational details, as compared to *Figure 2.36*. The Transfer Switch routes power either through Terminals 5/6 or Terminals 7/8. This routing is controlled by the dc coil shown in *Figure 2.38* (the dc coil is internal to the Transfer Switch and connected via Terminals 1 and 2).

➤ DC coil energized: Form A contacts corresponding to Terminals 5/6 **close** and Form B contacts corresponding to Terminals 7/8 **open** (power is routed through Terminals 5/6)

➤ DC coil de-energized: Form A contacts corresponding to Terminals 5/6 **open** and Form B contacts corresponding to Terminals 7/8 **close** (power is routed through Terminals 7/8)

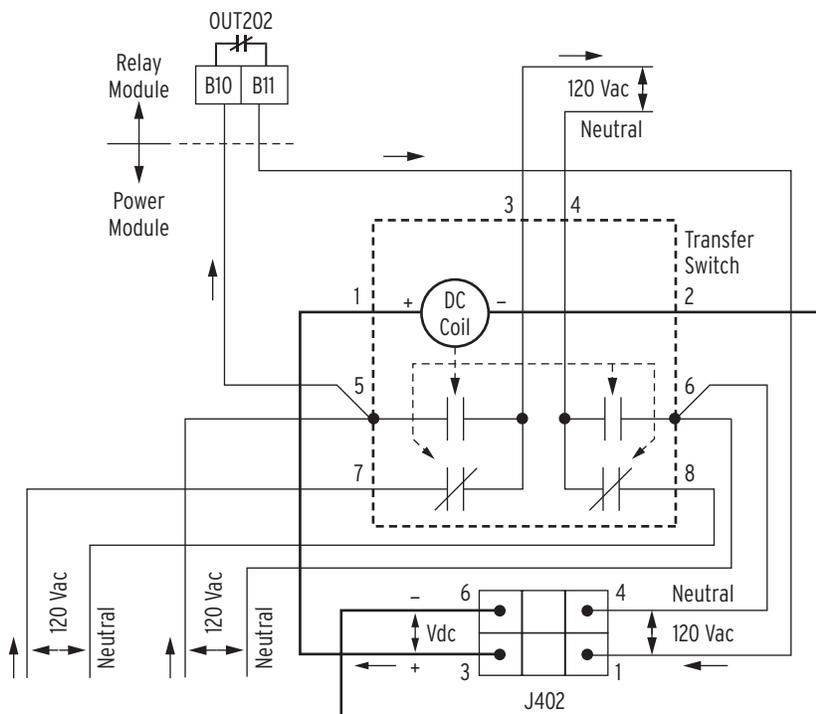
Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 87 of 1080
Installation 2.41
Hardware Details and Standard Accessories
Wolfe


Figure 2.38 AC Transfer Switch AC/DC Voltage Connections

The energization or de-energization of the dc coil is dependent on the presence or absence, respectively, of the preferred 120 Vac power source. The preferred source is the 120 Vac power connected to Terminals 5/6 of the Transfer Switch.

An ac to dc voltage conversion is needed to convert the preferred 120 Vac power source signal to a dc voltage to energize the dc coil. The electronics behind connector J402 do this conversion. In *Figure 2.38*, note the 120 Vac input into connector J402 comes from Terminals 5/6 (preferred source) on the Transfer Switch. The Vdc output from connector J402 is then connected across the dc coil, via Transfer Switch Terminals 1/2. The effective voltage operation range (120 Vac base) of the dc coil of the transfer switch is the following:

➤ Pick Up Voltage: 104 ± 4 Vac

➤ Drop Out Voltage: 96 ± 4 Vac

➤ Minimum Hysteresis: 4 Vac (helps eliminate Transfer Switch chattering)

Note that the preferred 120 Vac power source signal is supervised by Form B output contact OUT202. If no special SELOGIC setting is made for output contact OUT202, then output contact OUT202 remains closed and has no effect on the operation of the Transfer Switch. The Transfer Switch operates based on the presence or absence of the preferred 120 Vac power source connected to Terminals 5/6 of the Transfer Switch. If a special SELOGIC setting is made for output contact OUT202, then output contact OUT202 can open under control of the SELOGIC setting and cause the Transfer Switch to switch from the preferred 120 Vac power source (Terminals 5/6) to the alternate 120 Vac power source (Terminals 7/8), for reasons other than the loss of the preferred source. See *Output Contacts on page 7.34* for more information on output contact OUT202.

2.42 | Installation
Hardware Details and Standard Accessories

3-Pin Power Receptacle

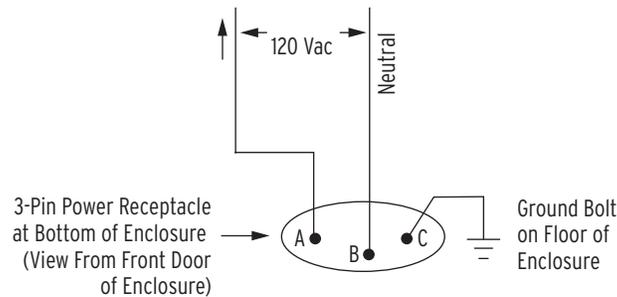
To ease connection and removal of 120 Vac power, install the 3-pin power receptacle accessory (see *Figure 2.39*). A 3-pin power receptacle can be applied in *Figure 2.30* or *Figure 2.35*; and two 3-pin power receptacles can be applied in *Figure 2.36* or *Figure 2.37*, where 120 Vac, Power In (User Connection) is listed.


Figure 2.39   3-Pin Power Receptacle

This 3-pin power receptacle accessory is installed at the bottom of the enclosure (male pins to the outside), ready for receiving an outside cable (female sockets on cable). Such an outside cable then connects to a 120 Vac power source. Note in *Figure 2.39* that Pin C on the receptacle is connected to the hex head bolt (#10-32, stainless steel) that protrudes through the floor of the enclosure.

The key for the receptacle (to help in guiding outside cable connection) is oriented toward the rear door of the enclosure.

Low-Voltage Close Power (Traditional Retrofit Recloser Only)

Many Traditional Retrofit reclosers need 120 Vac power to close the main recloser contacts. Close operations for traditional reclosers are started with the 24 Vdc close circuit (see *Figure 2.50*), but the power required to close the main contacts and compress the tripping springs in the recloser is usually either 120 Vac, as discussed here, or primary voltage. This depends on recloser construction.

For convenience, such 120 Vac power can be brought out to the bottom of the enclosure from terminals C01 (120 Vac) and C04 (neutral) on the relay module (see *Figure 2.40*). This low-voltage close power accessory has a 2-socket receptacle at the bottom of the enclosure (female sockets to the outside), ready for receiving an outside 2-pin (male) cable connection. This outside cable (SEL-C515) then takes the 120 Vac power out to the recloser.

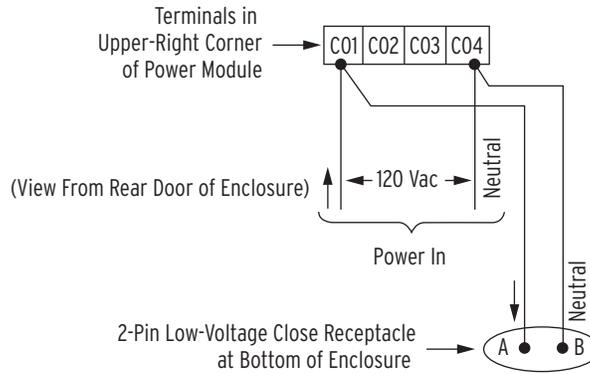
Attachment to Response to AG-2 Question No. 68(g)
Page 80 of 1080
Installation 2.43
Hardware Details and Standard Accessories
Wolfe


Figure 2.40 Low-Voltage Close Power Connections

The key for the receptacle (to help in guiding outside cable connection) is oriented toward the rear door of the enclosure.

Voltage Connections

In addition to traditional three-phase voltage connections, this subsection discusses:

➤ 8-pin receptacles for ease of connection and removal of power system secondary voltages

➤ Low-energy analog (LEA) voltage inputs connections

➤ Settings for designating phase connections

➤ Single-phase (line-neutral) and phase-to-phase voltage connections

Three-Phase Voltage Connections

Figure 2.41 shows two three-phase, Y-connected voltage circuits connected to the relay module voltage inputs (terminals Z09–Z16; voltage inputs rated as high as 300 Vac, line-neutral), via the Voltage Input Fuse Block. The Voltage Input Fuse Block can be installed as an accessory. The fuse blocks have integral fuse pullers, for ease of safely removing or installing fuses. Pull these fuses to simulate loss of voltage. Fuse values are given in *Table 2.3*.

If desired, the three-phase voltage circuits can be connected directly to the relay module voltage inputs (terminals Z09–Z16) in *Figure 2.41*, without going through the Voltage Input Fuse Block, although it is recommended that there be some kind of overcurrent protection on such voltage circuits. The three-phase voltage connections are used for Automatic Network Reconfiguration, under-/overvoltage elements, synchronism-check elements, power elements, metering, and so forth.

If the three-phase, Y-connected voltage circuits brought into the Voltage Input Fuse Block are capable of providing 120 Vac line-neutral power for the 120 Vac-powered unit, then additional wiring can be installed, as shown traversing to the right in *Figure 2.41*. This single-phase power is wired from the source side of the Voltage Input Fuse Block and available for connection to the power input circuitry portrayed in preceding *Figure 2.30*, *Figure 2.35*, *Figure 2.36*, and *Figure 2.37*. The power connections portrayed in *Figure 2.41* arbitrarily show line-neutral connections to the middle phases (i.e., V2Y-NY and V2Z-NZ).

2.44 Installation
Hardware Details and Standard Accessories

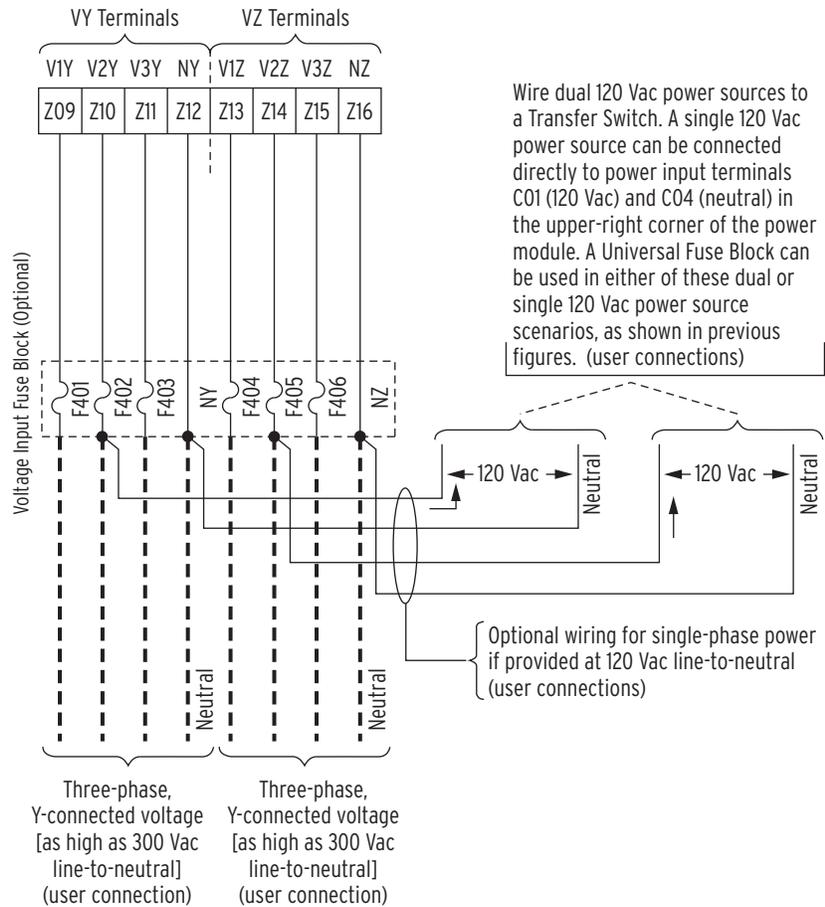
Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 90 of 1080
Wolfe


Figure 2.41   Three-Phase Voltage Connections for 300 Vac Voltage Inputs

For voltage input connections, the screws on terminals Z09–Z16 are #8-32. Use max. width 9.1 mm (0.36 in) ring terminals; tightening torque of 1.0 to 2.0 Nm (9 to 18 in-lb).

For Voltage Input Fuse Block connections (on older installations that use screws), the screws on fuse blocks F401–F406 are #10-32. Use max. width 11.4 mm (0.45 in) ring terminals; tightening torque of 1.0 to 2.0 Nm (9 to 18 in-lb).

For Voltage Input Fuse Blocks with wire insertion connections, strip the wire ends to 12 mm (0.47 in). Use 4 AWG to 16 AWG wire and a tightening torque of 2.5–3.0 Nm (23.0–27.0 in-lb). These newer fuse blocks also have wiring positions (unfused) NY and NZ for the respective voltage neutral connections (see *Figure 2.41*, *Figure 2.43*, and *Figure 2.45*).

8-Pin Receptacle for Voltage Connections

NOTE: In some cases when using low-energy analog (LEA) voltage input connections, not all connections are made.

For ease of connection and removal of power system secondary voltages, like those in *Figure 2.41*, install the 8-pin receptacle accessory for voltage inputs. *Figure 2.42* describes the 8-pin receptacle accessory. It is wired up directly to relay module voltage inputs Z09–Z16 or to the intermediate Voltage Input Fuse Block, if installed, as shown in *Figure 2.41*.

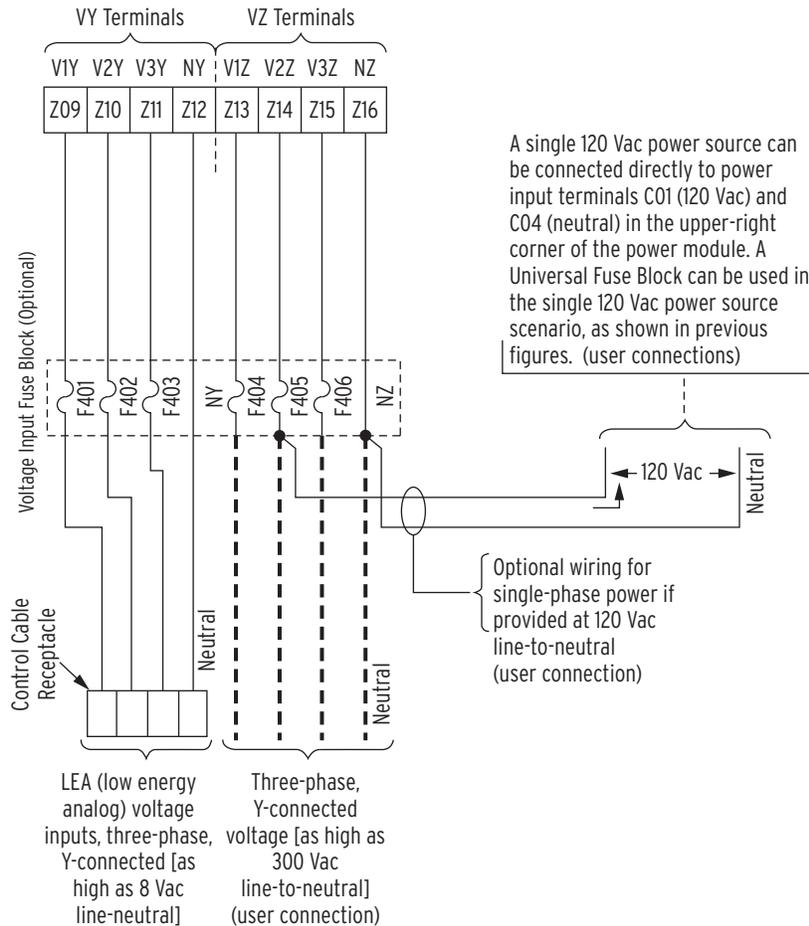
LEA (Low-Energy Analog) Voltage Inputs Connections
8 Vac LEA Inputs Voltage Connections

8 VAC LEA OPTIONS
There are more 8 VAC LEA input options than just those shown in Figure 2.43. See Figure 2.52 (GW Viper-ST, or G&W Viper-LT recloser), Figure 2.68 (Tavrida OSM AI_2 recloser), Figure 2.76, and Figure 2.77 (Multi-Recloser Interface). See the SEL-651R-2 Model Option Table.

FUSE BLOCK AND TERMINAL CONNECTION SPECIFICATIONS
See text following Figure 2.41.

SHIELDED CABLES
Shielded cables for LEA voltage inputs (not just 8 Vac LEA inputs) come preinstalled on some newer installations, with the shields effectively connected to ground at the bottom of the enclosure.

Figure 2.43   8 Vac LEA Voltage Connections for VY-Terminal Voltages


⚠️**CAUTION**
The recloser control must be mounted on the same pole as the recloser when LEA inputs are used. This practice reduces surges that may damage the recloser control. Shielded cables are recommended when using LEA inputs.

Figure 2.43 varies from *Figure 2.41* in that terminals Z09–Z12 (VY terminals) are rated as high as 8 Vac, line-to-neutral, instead of 300 Vac, line-to-neutral.

Figure 2.43 also varies from *Figure 2.45* and *Figure 2.46* in the voltage ratings of terminals Z13–Z16 (VZ terminals). The LEA ordering options for terminals Z09–Z12 accommodates the output of the three-phase capacitive screen voltage devices from one side of the G&W Viper-ST, G&W Viper-LT (see *Figure 2.52*), or Tavrida OSM AI_2 (see *Figure 2.68*), or Multi-Recloser Interface reclosers (see *Figure 2.76* and *Figure 2.77*).

Note the partial control cable shown at the bottom of *Figure 2.43*. These three-phase low-level voltage signals are brought from one side of the G&W Viper-ST or G&W Viper-LT recloser to the SEL-651R-2 in the standard control cable. The serial number label lists the phase voltage input ratings for the VY and VZ terminals.

These LEA voltage inputs can also be used with other low-level voltage signals, not exceeding 8 Vac. Such signals would be brought into the enclosure separately, such as through the 8-pin receptacle shown in *Figure 2.41*, not through any recloser control cable.

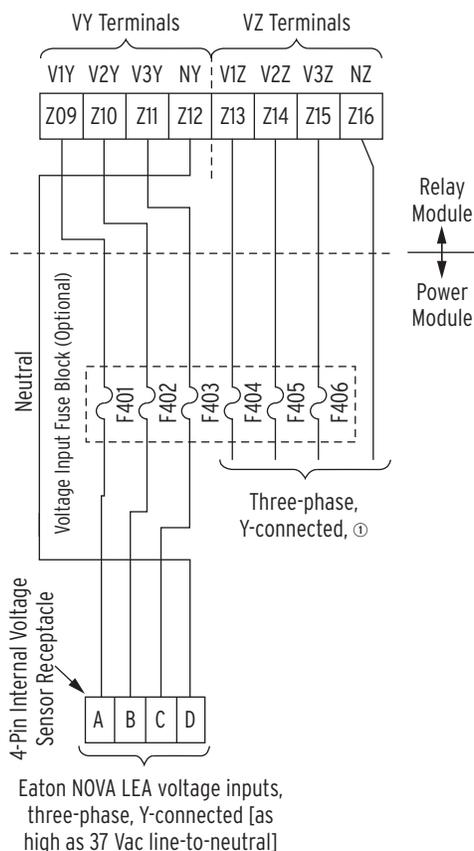
Eaton NOVA LEA Inputs Voltage Connections

EATON NOVA-TS OR NOVA-STS VOLTAGE CONNECTIONS

The Eaton NOVA-TS or NOVA-STS Triple-Single recloser can use the control cable to bring voltage sensor outputs to the SEL-651R-2 (see Figure 2.65).


① Refer to Figure 2.43, or Figure 2.45, for VZ-terminal voltage connections.

Figure 2.44   Eaton NOVA LEA Voltage Connections for VY-Terminal Voltages (Control-Powered Eaton NOVA Recloser Example)

The Eaton NOVA LEA inputs ordering option for terminals Z09–Z12 accommodates the internal voltage sensing outputs of Eaton NOVA reclosers.

The 4-pin Internal Voltage sensor receptacle is shown at the bottom of *Figure 2.44*. These three-phase low-level voltage signals are brought from the NOVA recloser (equipped with Internal Voltage sensors) to the SEL-651R-2 through a shielded 4-conductor cable provided by Eaton. The serial number label lists the phase voltage input ratings for the VY and VZ terminals.

Refer to VZ-terminal voltage connections in *Figure 2.43*, if VZ-terminal voltage inputs are rated as high as 300 Vac. Refer to VZ-terminal voltage connections in *Figure 2.45*, if VZ-terminal voltage inputs are Lindsey SVMI LEA inputs. Refer to VZ-terminal voltage connections in *Figure 2.46* if VZ-terminal voltage inputs are Siemens SDR LEA inputs.

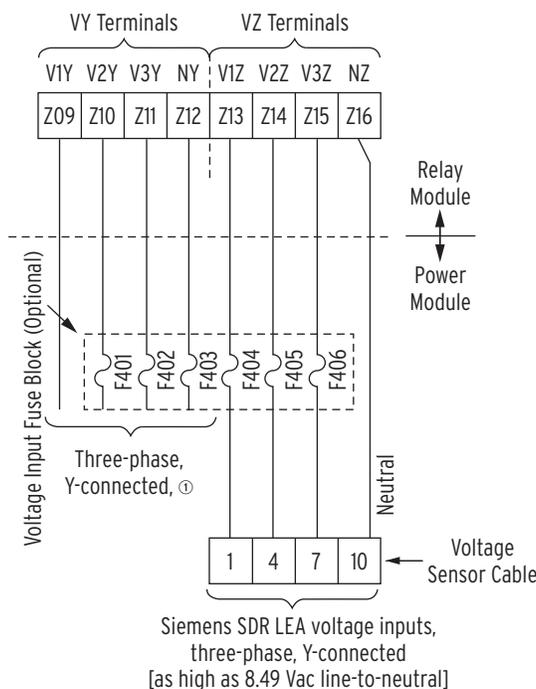
Installation 2.49
Hardware Details and Standard Accessories

Siemens SDR LEA Inputs Voltage Connections


① Refer to Figure 2.41, Figure 2.43, or Figure 2.44, for VY-terminal voltage
connections.

**Figure 2.46   Siemens SDR LEA Voltage Connections for VZ-Terminal
Voltages**

Siemens SDR LEA inputs ordering option for terminals Z13–Z16
accommodates ac output voltage of 8.49 Vac.

These three-phase low-level voltage signals are brought from Siemens SDR to
the SEL-651R-2 through a shielded voltage sensor cable. The serial number
label lists the phase voltage input ratings for the VY and VZ terminals.

Refer to VY-terminal voltage connections in *Figure 2.41*, if VY-terminal
voltage inputs are rated as high as 300 Vac. Refer to VY-terminal voltage
connections in *Figure 2.43*, if VY-terminal voltage inputs are 8 Vac LEA
inputs. Refer to VY-terminal voltage connections in *Figure 2.44*, if
VY-terminal voltage inputs are Eaton NOVA LEA inputs. Refer to
VZ-terminal connections in *Figure 2.45* if VZ-terminal voltage inputs are
Lindsey SVMI LEA inputs.

Phase Designations for Voltage Connections

The voltage inscriptions for terminals Z09–Z16 in *Figure 2.5*, *Figure 2.9*,
Figure 2.41–Figure 2.46:

➤ V1Y, V2Y, V3Y, NY (VY-terminal connections)

➤ V1Z, V2Z, V3Z, NZ (VZ-terminal connections)

have no permanent A-, B- or C-phase designation. Phase designation is
determined by Global settings:

➤ VYCONN for VY-terminal connections

➤ VZCONN for VZ-terminal connections

2.50 | Installation
Hardware Details and Standard Accessories

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 96 of 1080
Wolfe

See *Current and Voltage Connections (Global Settings) on page 9.28* for more information on these settings.

Single-Phase and Phase-to-Phase Voltage Connections

Any single-phase or phase-to-phase voltage connections are made between terminals V1Y-NY and V1Z-NZ for the VY and VZ sides, respectively. See *Current and Voltage Connections (Global Settings) on page 9.28* for information on how previously referenced Global settings VYCONN and VZCONN also handle single-phase or phase-to-phase voltage connections.

Additional Relay Connections

Connect extra I/O, IRIG-B time code, EIA-232 serial ports, and auxiliary 12 Vdc power as needed in the application.

Extra Inputs/Outputs

Optoisolated inputs IN101–IN107 and output contacts OUT101–OUT108 are an ordering option and available for connection at the top of the relay module rear panel, row 100. Output contacts OUT201 and OUT202 are standard and available for connection in the middle of the relay module rear panel, row 200. In *Figure 2.5* and *Figure 2.9* notice that the output contact types are:

➤ Form A (normally open): OUT101–OUT105

➤ Form C (normally closed/normally open): OUT106–OUT108, OUT201, OUT202

Notice that the Form C output contacts share a common terminal and that optoisolated inputs IN106 and IN107 also share a common terminal. Ratings for the optoisolated inputs and output contacts are found in *Specifications on page 1.9*. The serial number label lists the optoisolated input voltage rating (listed under label: **CONTACT INPUTS**).

For optoisolated inputs IN101–IN107 and output contacts OUT101–OUT108 connections, the screws on terminals A01–A32 are #8-32. Use max. width 9.1 mm (0.36 in) ring terminals; tightening torque of 1.0 to 2.0 Nm (9 to 18 in-lb).

The screw terminal connectors for optoisolated inputs IN101–IN107 and output contacts OUT101–OUT108 can be removed by unscrewing the screws at each end of the connector block.

Step 1. Remove the connector by pulling the connector block straight out.

Note that the receptacle on the relay circuit board is keyed; you can insert each screw terminal connector in only one location on the rear panel.

Step 2. To replace the screw terminal connector proceed with the following steps:

a. Confirm that you have the correct connector.

b. Push the connector firmly onto the circuit board receptacle.

c. Reattach the two screws at each end of the block.

This feature allows the terminal wiring to remain undisturbed.

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 97 of 1080
Installation 2.51
Hardware Details and Standard Accessories
Wolfe

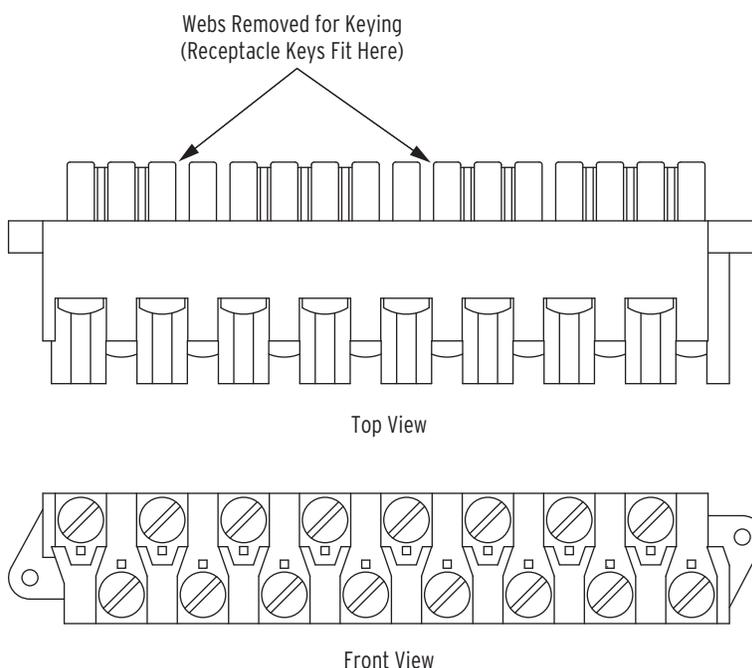
Additionally, you can rotate these screw terminal connectors so that the connector wire dress position is the reverse of the factory-installed position, for example, wires entering the relay panel from below instead of from above. To rotate these connectors, you must change the screw terminal connector keying. Inserts in the circuit board receptacles key the receptacles for only one screw terminal connector in one orientation. Each screw terminal connector has a missing web into which the key fits (see *Figure 2.47*). If you want to reverse the connector orientation, you must rearrange the receptacle keys to match the screw terminal connector block. Use long-nosed pliers to move the keys.


Figure 2.47   Screw Terminal Connector Keying

Standard Outputs

For output contacts OUT201–OUT202 connections, the screws on terminals B07–B12 are #6-32. Use max. width 7.9 mm (0.31 in) ring terminals; tightening torque of 0.9 to 1.3 Nm (8 to 12 in-lb).

Alarm Output

From the factory, OUT201 is configured as an alarm. OUT202 is wired into the Transfer Switch scheme, when installed at the factory (see *Figure 2.38*).

IRIG-B Time-Code Input

The SEL-651R-2 accepts a demodulated IRIG-B time signal to synchronize the recloser control internal clock with an external source. The demodulated IRIG-B time signal can come from an SEL Communications Processor, the SEL-2100 Logic Processor, or from a satellite-synchronized clock such as the SEL-2407, SEL-2404, or SEL-2401. The IRIG-B time signal can be input to the rear-panel BNC connector labeled IRIG or to Port 2.

A demodulated IRIG-B time code can be input into serial Port 2 by using an SEL-C273A cable to connect serial Port 2 of the SEL-651R-2 to an SEL Communications Processor.

2.52 | Installation
Hardware Details and Standard Accessories

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 98 of 1080
Wolfe

Connect the rear-panel BNC connector directly to a high-accuracy satellite synchronized clock such as the SEL-2407 or SEL-2401 to synchronize the relay internal clock within one microsecond, and enable high-accuracy synchrophasors. See *Appendix J: Synchrophasors* for more information on enabling and using synchrophasors in the SEL-651R-2.

If a time code is input to serial Port 2 and the BNC IRIG connector, the recloser control synchronizes to the time code received on the BNC connector.

Serial Ports

All EIA-232 ports accept 9-pin D-subminiature male connectors. Port 2 includes the IRIG-B time-code signal input.

The pin definitions for all the ports are given on the relay rear panel and detailed in *Table 10.3–Table 10.5*.

Refer to *Section 10: Communications* for detailed cable diagrams for selected cables (cable diagrams follow *Table 10.5*).

+12 Vdc Auxiliary Power Supply

A +12 Vdc auxiliary power supply rated for 40 W continuous and surges to 60 W is a standard feature in ac powered units. DC-powered units are rated at a lower level (see *Specifications on page 1.9* for ratings). Use this supply to power radios, small RTUs, or other accessories installed in the cabinet. Three +12 Vdc and three return terminal screws are provided for convenience. Fuse F202 protects this +12 Vdc supply (fuse F202 is in-line with the +12 Vdc rail; see *Table 2.3*).

For +12 Vdc and Return connections, the screws on terminals B01–B06 are #6-32. Use max. width 7.9 mm (0.31 in) ring terminals; tightening torque of 0.9 to 1.3 Nm (8 to 12 in-lb).

Relay Module Main Board Jumpers and Clock Battery

The main board (top circuit board) in the SEL-651R-2 relay module has features that very infrequently (if at all) need to be set or changed. These features are:

➤ Access and Breaker Control jumpers

➤ Serial port voltage jumpers

➤ Clock battery

Gain access to the Access and Breaker Control jumpers by removing the front panel. Access the serial port voltage jumpers by removing the plastic cover over the opening labeled **JMP 2 3** on the relay module (near **Serial Port 3**). Access the clock battery by removing the front panel and then sliding out the main board. The procedures for doing so follow later in this subsection.

Access and Breaker Control Jumpers

The Access and Breaker Control jumpers are jumpers JMP2-A and JMP2-B, respectively, found at the front of the main board (see *Figure 2.48*). In this figure, notice that these jumpers are lettered left to right (D C B A).

Figure 2.48 shows the location, function, and factory-default configuration for the Access and Breaker Control jumpers.

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 99 of 1080
Installation 2.53
Hardware Details and Standard Accessories
Wolfe

When the Access jumper is installed, passwords are disabled, and connection to any enabled communications port is allowed full access to inspect/change/reset all reports, settings, etc., to upgrade firmware and to control the circuit breaker (if the Breaker Control jumper is installed as described below) without password authentication.

The Access jumper also affects the relay behavior for settings EPORT and MAXACC at startup as follows:

➤ For the front-panel serial port (Port F) and the USB port, the Access jumper overrides the port enable setting EPORT = N, and enables the port(s) with EIA-232 Port F default settings for PROTO, SPEED, BITS, PARITY, STOP, and RTSCTS. If the Port F setting EPORT was already set to Y, the front port(s) remain enabled, and the EIA-232 Port F uses its previous settings.

➤ For the front-panel serial port (Port F) and the USB port, the Access jumper overrides the Port F MAXACC setting and allows access to security levels 1, B, 2, or C without a password.

➤ For Serial Ports 1, 2, or 3, and Ethernet Port 5 (except FTP and HTTP), if that port has setting EPORT = Y, the Access jumper overrides the MAXACC setting of that port and allows access to security levels 1, B, 2, or C without a password.

➤ For Serial Ports 1, 2, or 3, and Ethernet Port 5, if that port has setting EPORT = N, the Access jumper has no effect and the port remains disabled.

If passwords are forgotten, put jumper JMP2-A temporarily in place (ON) to gain access to the relay and retrieve the password settings, via the **PASSWORD** command.

Use the Breaker Control jumper to enable or disable breaker control **OPEN**, **CLOSE**, and **PULSE** commands through the SEL ASCII protocol and breaker operations through the SEL Fast Operate protocol (DNP3, Modbus, IEC 61850) and the front-panel menu-driven user interface. Note that the Breaker Control jumper does *not* supervise operation of Local Bits, Remote Bits, or the **Trip**/**Close** pushbuttons shown in *Figure 2.4* and *Figure 2.8*.

In *Figure 2.48*, note there are two additional jumper positions, JMP2-C and JMP2-D. These two jumpers are not used and the positions (ON or OFF) of these jumpers are of no consequence.

Serial Port Voltage Jumpers

The jumpers listed in *Table 2.1* connect or disconnect +5 Vdc to Pin 1 on the corresponding EIA-232 serial ports. The +5 Vdc is rated at 0.5 A maximum for each port. See *Table 10.3* for all EIA-232 serial port pin functions.

⚠ **CAUTION**
Do not access/move jumpers while the unit is powered up.

The jumpers are accessible from the opening labeled **JMP 2 3** on the relay module (near Serial **Port 3**; see *Figure 2.5* and *Figure 2.9*). The jumper under label **2** (JMP1-P2) corresponds to Serial Port 2 and the jumper under label **3** (JMP1-P3) corresponds to Serial Port 3.

The +5 Vdc is **not** connected to Pin 1 on the corresponding EIA-232 serial ports when the jumpers are OFF (removed/**not** in place over both pins). Put the jumpers ON (in place over both pins) so that the +5 Vdc is connected to Pin 1 on the corresponding EIA-232 serial ports, if needed. This Pin 1 power source is useful for powering some types of external modems.

Table 2.1   Serial Port Voltage Jumper Positions

+5 VDC to Pin 1	Serial Port 2	Serial Port 3
Disconnected	JMP1-P2 = OFF	JMP1-P3 = OFF
Connected	JMP1-P2 = ON	JMP1-P3 = ON

Condition of Acceptability for North American Product Safety Compliance

To meet product safety compliance for end-use applications in North America, use an external fused rated 3 A or less in-line with the +5 Vdc source on Pin 1. SEL fiber-optic transceivers include a fuse that meets this requirement.

Clock Battery

Refer to *Figure 2.48* for clock battery location (front of main board). A lithium battery powers the relay clock (date and time) if the external power source (ac power or 12 V battery) is lost or removed. The clock battery is a 3 V lithium coin cell. At room temperature (25ºC), the clock battery will nominally operate for 10 years at rated load.

If power is lost or disconnected, the clock battery powers the clock. When the relay is powered normally from an external source, the clock battery experiences a low self-discharge rate. Thus, clock battery life can extend well beyond the nominal 10 years because it rarely has to discharge after the relay is installed. The clock battery cannot be recharged.

If the relay does not maintain the date and time after power loss, replace the clock battery. Follow the main board removal instructions that follow.

Accessing the Relay Module Main Board in the Dual-Door Enclosure

Refer to *Figure 2.48*.

⚠**DANGER**

Disconnect or de-energize all external connections before opening this device. Contact with hazardous voltages and currents inside this device can cause electrical shock resulting in injury or death.

⚠**DANGER**

The removed cables for connections **J201, J202,** and **J205** are still energized. Contact with such terminals can cause electrical shock that can result in injury or death.

⚠**CAUTION**

Equipment components are sensitive to electrostatic discharge (ESD). Undetectable permanent damage can result if you do not use proper ESD procedures. Ground yourself, your work surface, and this equipment before removing any cover from this equipment. If your facility is not equipped to work with these components, contact SEL about returning this device and related SEL equipment for service.

Step 1.   Following your company's standard procedure, remove the SEL-651R-2 from service.

Step 2.   Make sure the unit remains grounded.

Step 3.   Remove any cables connected to serial ports on the front and rear panels.

Step 4.   Remove the IRIG-B cable, too.

Step 5.   De-energize the relay module by disconnecting the following cables from the rear panel in the following order (see *Figure 2.5* and *Figure 2.29*).

    a.   **CAPACITORS (J205)**

    b.   **BATTERY (J202)**

    c.   **DC POWER IN (J201)**

Step 6.   Loosen the four front-panel screws (they remain attached to the front panel).

Step 7.   Remove the relay module front panel (see *Figure 2.4*), disconnecting the large ribbon cable connected to it by operating the cable ejector latches on the front-panel circuit board.

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 104 of 1080
Wolfe

Installation 2.55
Hardware Details and Standard Accessories

Step 8. Place the front panel in an ESD (Electrostatic Discharge)-safe place to prevent ESD damage.

At this point, you can access the Access and Breaker Control jumpers (JMP2-A and JMP2-B, respectively) and the clock battery (see *Figure 2.48*), if need be.

Step 9. If changing the Access and Breaker Control jumpers, carefully remove and insert them in the desired configuration (ON or OFF).

Step 10. If changing the clock battery, carefully remove the old battery. If necessary, use a small tool to lever the battery up so that it can be extracted from the clip that holds it down.

Step 11. With the positive side (+) of the new battery face up, insert the battery at an angle to get it under the clip and then slide it into position.

Step 12. Later, set the relay date and time via the serial communications port or front panel.

Step 13. Reconnect the ribbon cable removed in *Step 7*.

Step 14. Replace the relay front-panel cover.

Step 15. Re-energize the relay module by reconnecting the following cables in the following order:

   a. **DC POWER IN (J201)**

   b. **BATTERY (J202)**

   c. **CAPACITORS (J205)**

Step 16. Replace any external cables previously connected to serial ports and IRIG-B port.

Step 17. Following your company's standard procedure, put the SEL-651R-2 back in service.

Accessing the Relay Module Main Board in the Single-Door Enclosure

Step 1. Following your company's standard procedure, remove the SEL-651R-2 from service.

Step 2. Make sure the unit remains grounded.

Step 3. Remove the swing panel that covers the relay module wiring.

Step 4. Remove the left mounting bracket and the smaller right mounting bracket (containing the 120 Vac convenience outlet), and set them in an "out-of-the-way" position on the floor of the enclosure.

Step 5. Remove any cables connected to the serial ports on the front and rear panels.

Step 6. Remove the IRIG-B cable.

Step 7. De-energize the relay module by disconnecting the following cables from the rear panel in the following order (see *Figure 2.9* and *Figure 2.29*).

   a. **CAPACITORS (J205)**

   b. **BATTERY (J202)**

   c. **DC POWER IN (J201)**

2.56 | Installation
Hardware Details and Standard Accessories

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 102 of 1080
Wolfe

Step 8.   Remove other individual connections to the power module (e.g., voltage and current connections), labeling them before removal so they can be reconnected correctly.

Step 9.   Remove the bottom and top row of nuts that fasten the respective bottom and top mounting plates (holding together the combined relay module/power module unit) to the enclosure. When these nuts are removed, the unit will still rest on the corresponding permanent mounting studs. Use caution to make sure the combined relay module/power module unit does not slide off the permanent mounting studs while the corresponding nuts are being removed.

Step 10.   With two people, lift the combined relay module/power module unit up and off the permanent mounting studs and out of the enclosure.

Step 11.   Take the combined relay module/power module unit to an ESD-safe area and follow standard ESD procedures in the following disassembly/reassembly procedure.

Step 12.   Remove the screws that hold the plate covering the back side of the relay module. Remove the plate and set aside.

At this point, you can access the Access and Breaker Control jumpers (JMP2-A and JMP2-B, respectively) and the clock battery (see *Figure 2.48*), if need be.

Step 13.   If changing the Access and Breaker Control jumpers, carefully remove and insert them in the desired configuration (ON or OFF).

Step 14.   If changing the clock battery, carefully remove the old battery. If necessary, use a small tool to lever the battery up so that it can be extracted from the clip that holds it down.

Step 15.   With the positive side (+) of the battery face up, insert the battery at an angle to get it under the clip and then slide it into position.

Step 16.   Later, set the relay time and date via the serial communications port or front panel.

Step 17.   Replace the plate that covers the back side of the relay module.

Step 18.   With two people, lift the combined relay module/power module down into the cabinet and onto the permanent mounting studs.

Step 19.   Replace the nuts that fasten the top and bottom mounting plates of the combined relay module/power module unit to the permanent mounting studs in the enclosure.

Step 20.   Reconnect all of the connections removed in *Step 5–Step 8*.

Step 21.   Replace the left and right mounting brackets removed in *Step 4*.

Step 22.   Replace the swing panel.

Step 23.   Following your company's standard procedure, put the SEL-651R-2 back in service.

Battery and Fuse Replacement

The SEL-651R-2 is shipped with either a 16 or 40 Ah extended temperature battery. Either of these battery types may be used as a replacement for the installed battery. The part numbers and characteristics are listed in *Table 2.2*. Full specifications are shown in *Battery Specifications on page 1.11*. Connections are shown in *Figure 2.29*. After replacing a failed battery, the **STA C** command should be issued to clear the failed battery condition (see *Section 10: Communications*). Perform a **BTT NOW** command to verify the condition of the replacement battery (see *Battery System Monitor on page 8.39* for help on testing the battery).

Recloser Interface Connection Details (Control Cable Interface)

Recloser Interface Connection Details (Control Cable Interface)

Traditional Retrofit Reclosers

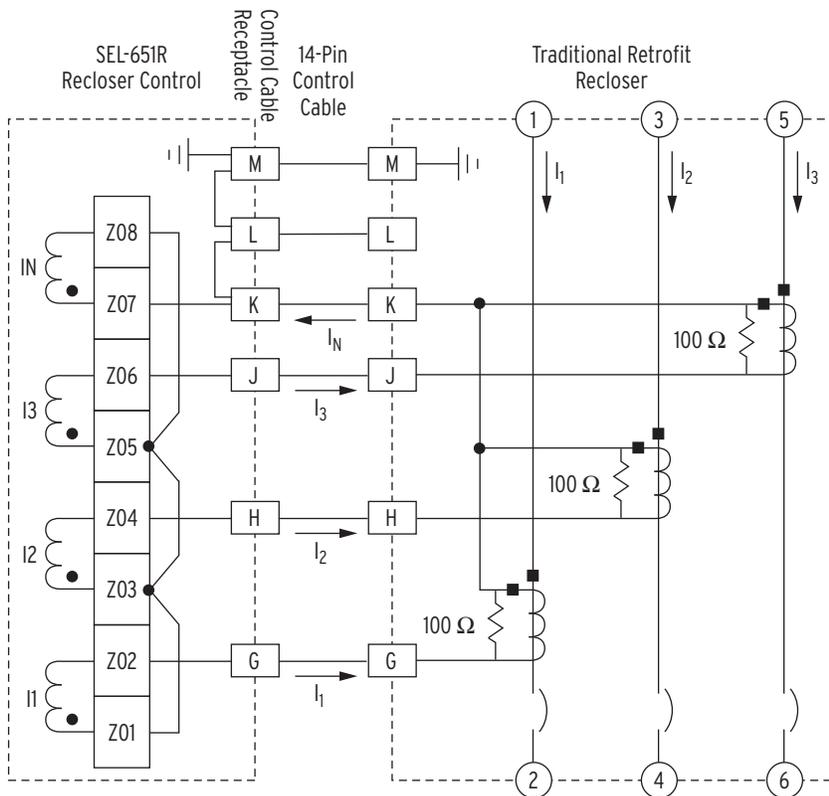
Figure 2.49 shows the SEL-651R-2 factory wiring for current connections for Traditional Retrofit reclosers. Notice that the current transformers in the recloser are wired such that the residual path (through Pin K) is on the polarity side of the current transformer secondaries. This is nonstandard as far as traditional circuit breakers are concerned, but is easily accommodated by the wiring on the Z01–Z08 terminals of the relay module of the SEL-651R-2.


Figure 2.49 Current Connections and Polarity From Traditional Retrofit Recloser Primary to SEL-651R-2 Recloser Control Current Inputs

Notice also that the phase current terminals are labeled I1, I2, I3 (not IA, IB, IC). A-B-C designations are given to the current channels with Global setting IPCONN. Current transformer polarity can effectively be changed with the global CTPOL setting, which is helpful for designating forward or reverse power flow, and so forth.

Figure 2.50 shows the SEL-651R-2 factory wiring for trip/close/recloser status for traditional reclosers; 24 Vdc power goes out Pin A to the recloser and then returns through the trip circuit and close circuit paths.

The trip circuit path (top to bottom) is described below:

Trip coil—SW1 (52a)—trip FET (controlled by Relay Word bit RCTR1X; see *Figure 7.25*)

Pins B, D are monitored by input IN203 and Pin C is monitored by input IN204. The 52a recloser status is derived from these inputs.

INTERNAL BATTERY-CHARGING TRANSFORMER
Some Eaton reclosers have an internal battery-charging transformer (current transformer). This charging transformer is not used by the SEL-651R-2: its 12 Vdc battery is charged from a user-supplied Vac power source. If one of these reclosers is connected to the SEL-651R-2, this charging transformer is electrically shorted at the control cable receptacle (Pins K and L are shorted together and grounded—see Figure 2.49).

Attachment to Response to AG-2 Question No. 68(g)
Page 106 of 1080
Wolfe

RELAY WORD BIT TCCAP
Relay Word bit TCCAP indicates that the 24 Vdc voltage in Figure 2.50 is present for recloser operations (TCCAP = logical 1). The 24 Vdc voltage comes into the relay module via connector J205 (CAPACITORS), from the trip/close capacitors in the power module (see Figure 2.2, Figure 2.5, Figure 2.7, and Figure 2.9). If there is a problem with this connection or otherwise in the power module, then Relay Word bit TCCAP = logical 0. Relay Word bit TCCAP is used in factory-default close logic settings (see Figure 6.4 and Figure 6.5) and reclose supervision settings (see Table 6.8). Relay Word bit TCCAP does not detect an operation of fuse F203 in Figure 2.50.

The close circuit path (top to bottom) is described below:

SW3 (52b)—SW2 (69)—close coil—close FET (controlled by Relay Word bit RCCL1X; see *Figure 7.25*)

Pin E is monitored by input IN202 and Pin F is monitored by input IN201. Contact SW2 (69) opens and stays open when the external yellow operating handle on the recloser is pulled to the lock-open position. With contact SW2 open, there is no way to close the recloser until the yellow operating lever is reset again. Contact SW2 is then closed.

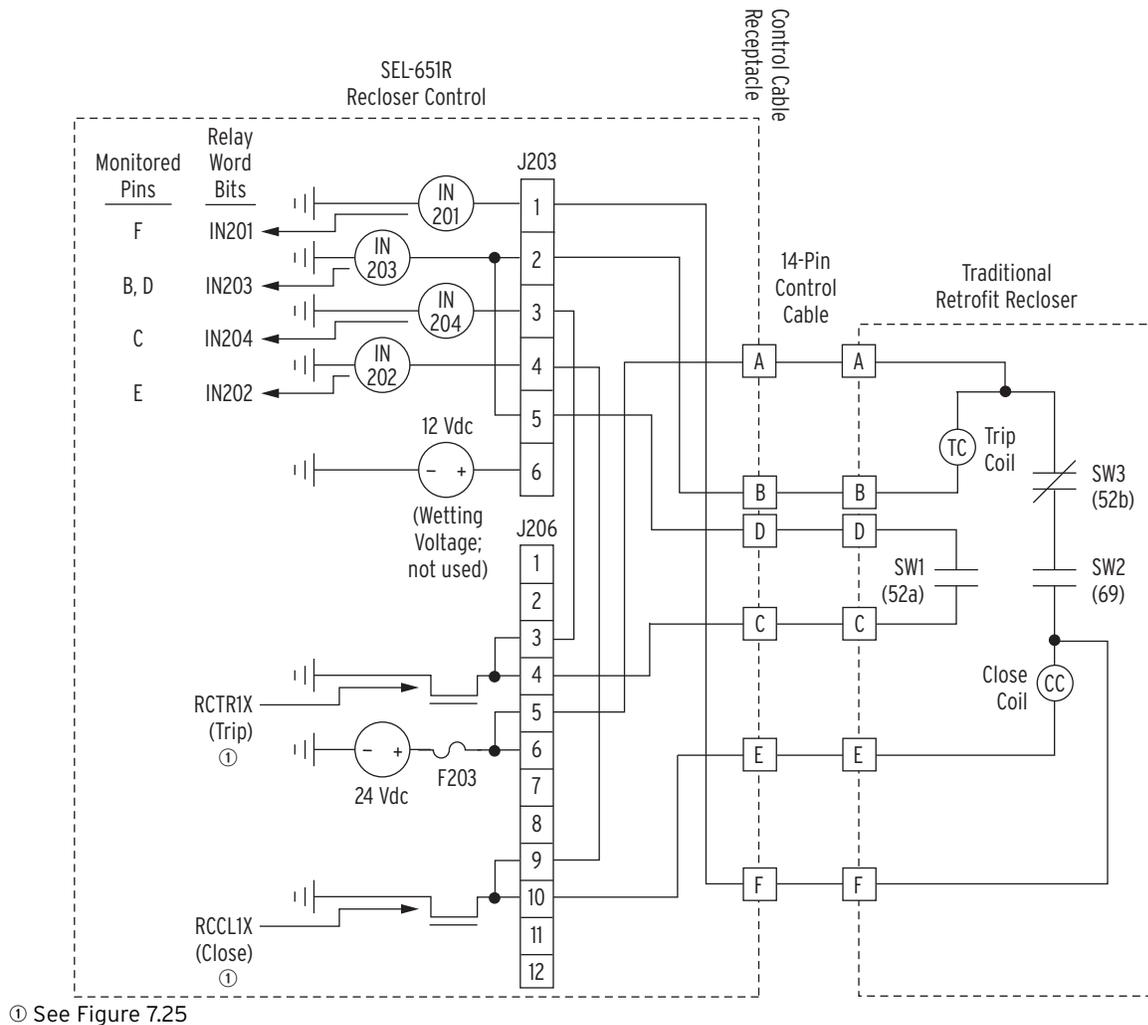
① See Figure 7.25


Figure 2.50   Trip/Close and Recloser Status Circuit Connections Between Traditional Retrofit Recloser and SEL-651R-2 Recloser Control

Motor-Operated Traditional Retrofit Reclosers

With factory settings, the SEL-651R-2 Recloser Control (ordered for a Traditional Retrofit recloser) also works with motor-operated reclosers, such as Eaton MVE, CVE, CXE, CZE, VSA, and VSO reclosers. Figure 2 in SEL Application Guide AG99-10, *Change Logic in SEL-351R Recloser Control for*

Case No. 2018-00295
Attachment to Response to AG-2 Question No. 68(g)
Page 1107 of 1080
Wolfe
Installation 2.61
Recloser Interface Connection Details (Control Cable Interface)

Motor-Operated Reclosers, shows the internal differences for such reclosers, especially 52a at the top of trip circuit and diode bypassing SW1(52a). The SEL-651R-2 factory settings important for working with these motor-operated reclosers are Group settings:

TDURD := **40 cycles** (longer trip duration)

ULTR3P := **1** (set directly to logical 1; not dependent on NOT 52A3P to unlatch trip)

The **RECLOSER OPEN** LED is set as follows:

PB12_LED := **NOT(52A3P)**

For a regular Traditional Retrofit recloser, as shown in *Figure 2.50*, as opposed to a motor-operated recloser (see *Figure 2* in the aforementioned SEL Application Guide AG99-10) this setting can be changed to:

PB12_LED := **NOT(52A3P) AND IN203**

Input IN203 monitors Pins B/D, as shown in *Figure 2.50*. With this setting change, the **RECLOSER OPEN** LED will extinguish when the control cable is removed from the SEL-651R-2 Recloser Control.

If the recloser is *not* a motor-operated recloser, setting TDURD can be changed, if desired. See *Minimum Trip Duration Timer on page 5.7* for more detail.

Inputs Connector J204/G&W 14-Pin Viper Recloser

INPUTS connector **J204** on the rear panel of the SEL-651R-2 relay module is for extra signaling back from the G&W Viper recloser, a Traditional Retrofit type recloser. *Figure 2.51* shows wetting voltage (24 Vdc) coming from connector **J204** Pin 1, routing through signaling contacts on the G&W Viper, and back to inputs IN205 and IN206 on connector **J204**.

The Form A contact connected to input IN205 indicates low SF6 gas pressure inside the G&W Viper recloser. The Form B contact connected to input IN206 indicates loss of 120 Vac low voltage close power at the G&W Viper recloser. Pin 3 on connector **J204** can be used as a ground return for a separate optoisolated input (e.g., IN101) wetted by the 24 Vdc on Pin 1.

NOTE: For the application in Figure 2.51, the wiring/cabling between the INPUTS connector **J204** on the SEL-651R-2 and the G&W Viper Recloser is not provided by SEL.

G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-Pin) Reclosers

SHIELDED CABLES
Shielded cables for LEA voltage inputs (see Figure 2.52) come preinstalled on newer G&W/ABB Elastimold recloser installations, with the shields effectively connected to ground at the bottom of the enclosure.

Figure 2.52 shows the SEL-651R-2 factory wiring for current connections for G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-pin) reclosers. The current transformers in the recloser are wired like a circuit breaker in that the residual path through control cable Pin D is on the nonpolarity side of the current transformer secondaries. This contrasts with the Traditional Retrofit recloser in *Figure 2.49*. Either wiring is easily accommodated by the wiring on the Z01–Z08 terminals of the SEL-651R-2 relay module.

Installation 2.63
Recloser Interface Connection Details (Control Cable Interface)

CAPACITIVE VOLTAGE SENSORS

To make use of the standard capacitive voltage sensors at the bottom of Figure 2.52, the SEL-651R-2 needs to be ordered with 8 Vac LEA voltage inputs for the three-phase VY voltage inputs. If both the standard and optional capacitive voltage sensors are to be used, then the SEL-651R-2 needs to be ordered with 8 Vac LEA voltage inputs for both the three-phase VY and VZ voltage inputs.

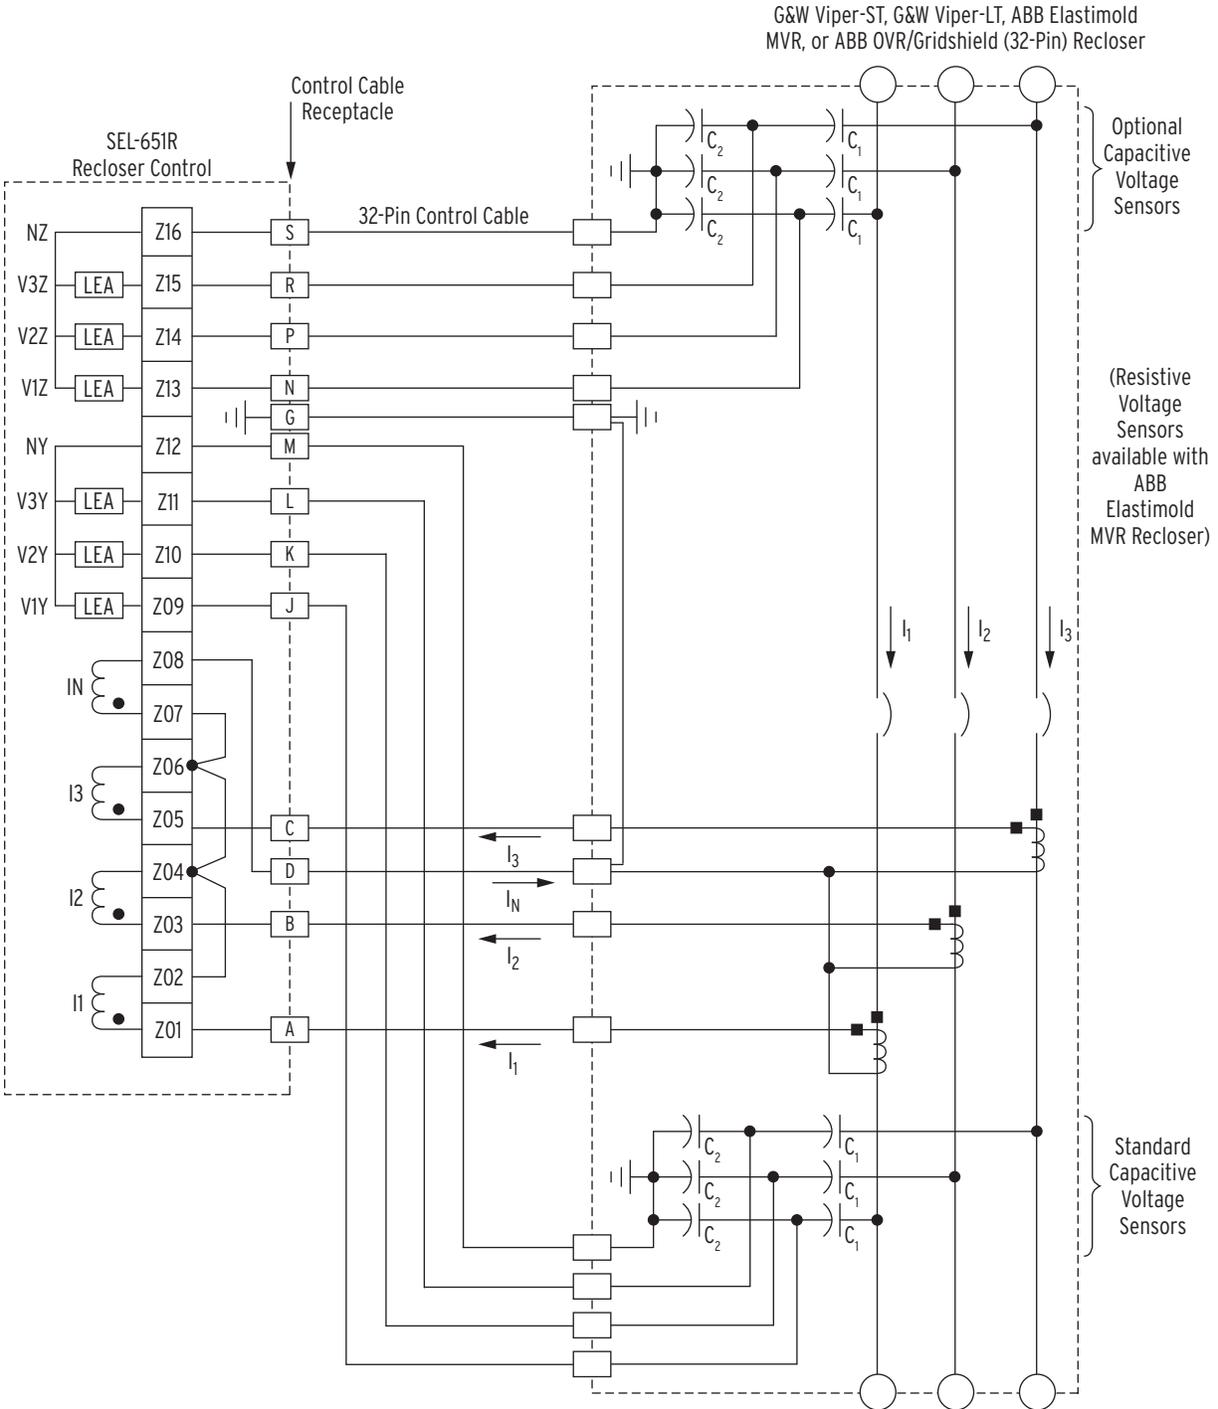
Other voltage input options are available, though not using the control cable shown in Figure 2.52 (see SEL-651R-2 Model Option Table).


Figure 2.52   Current Connections and Polarity From G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-Pin) Recloser Primary to SEL-651R-2 Recloser Control Current Inputs (Voltage Connections Also Shown)

2.64 | Installation

Page 110 of 1080
Wolfe

Notice also that the phase current terminals are labeled I1, I2, I3 (not IA, IB, IC). A-B-C designations are given to the current channels with Global setting IPCONN. Current transformer polarity can effectively be changed with the global CTPOL setting, which is helpful for designating forward or reverse power flow and similar things.

Figure 2.53 shows the SEL-651R-2 factory wiring for trip/close for G&W Viper-ST, G&W Viper-LT, ABB Elastimold MVR, or ABB OVR/Gridshield (32-pin) reclosers. Each pole of the recloser has its own trip/close coil, trip for current flow in one direction, close for current flow in the other direction. This facilitates single-phase tripping/reclosing, although the SEL-651R-2 factory settings have the recloser operating in a three-phase trip/close mode.

Note that the trip and close FETs in the SEL-651R-2 are stacked one atop another, between 155 Vdc power and ground, with a tap in the middle. For a given FET stack, both FETs can never be on at the same time or else there would be a direct short between the 155 Vdc power and ground. Interlocking logic prevents both FETs from being on at the same time.

Trace the trip path for Coil 1 in *Figure 2.53*:

Relay Word Bit RCTR1X (Trip 1; see *Figure 7.26*) turns on the bottom FET (ground) connected to terminal J206-3 and the top FET (155 Vdc) connected to terminal J206-9. This wiring goes through control cable Pins Y/10 and Z/22 to Coil 1. The 155 Vdc across Coil 1 (bottom to top) causes the current to flow in the indicated direction (Trip 1).

Trace the close path for Coil 1 in *Figure 2.53*:

Relay Word Bit RCCL1X (Close 1; see *Figure 7.26*) turns on the top FET (155 Vdc) connected to terminal J206-3 and the bottom FET (ground) connected to terminal J206-9. This wiring goes through control cable Pins Y/10 and Z/22 to Coil 1. The 155 Vdc across Coil 1 (top to bottom) causes the current to flow in the indicated direction (Close 1).

Tripping and closing for Coil 2 and Coil 3 operate similarly. The 69 contacts in the trip/close circuits open and stay open when the respective external yellow operating handles on individual poles of the recloser are pulled to the lock-open position (the ABB Elastimold MVR and ABB OVR/Gridshield [32-pin] reclosers have only one yellow operating handle that simultaneously operates the 69 contacts in each pole). With Contact 69 open for a particular pole, there is no way to close that particular recloser pole until the yellow operating handle is reset again. Contact 69 is then closed.

RELAY WORD BIT TCCAP
Relay Word bit TCCAP indicates that the 155 Vdc voltage in Figure 2.53 is present for recloser operations (TCCAP = logical 1). The 155 Vdc voltage comes into the relay module via connector J205 (CAPACITORS), from the trip/close capacitors in the power module (see Figure 2.2, Figure 2.5, Figure 2.7, and Figure 2.9). If there is a problem with this connection or otherwise in the power module, then Relay Word bit TCCAP = logical 0. Relay Word bit TCCAP is used in factory-default close logic settings (see Figure 6.4 and Figure 6.5) and reclose supervision settings (see Table 6.8).

ABB OVR-3/VR-3S (24-Pin, 15 and 27 kV Models) Reclosers

SHIELDED CABLES
Shielded cables for LEA voltage inputs (see Figure 2.52) come preinstalled on newer ABB recloser installations, with the shields effectively connected to ground at the bottom of the enclosure.

LEA CIRCUIT GROUNDING

Figure 2.55 shows the connection from terminal Z12 to ground at the bottom of the enclosure that comes for newer ABB recloser installations. This connection grounds the recloser LEA circuit.

Figure 2.55 shows the SEL-651R-2 factory wiring for current connections for ABB OVR-3/VR-3S (24-pin, 15 and 27 kV models) reclosers. The current transformers in the recloser are wired like a circuit breaker in that the residual path through control cable Pin 12 is on the nonpolarity side of the current transformer secondaries. This contrasts with the Traditional Retrofit recloser in *Figure 2.49*. Either wiring is easily accommodated by the wiring on the Z01–Z08 terminals of the SEL-651R-2 relay module.

The VY voltage connections shown in *Figure 2.55* connect to low-energy analog (LEA) sensors internal to the ABB recloser (consult with ABB as to the location of their internal LEA sensors if their recloser is equipped with such). This requires that the VY voltage inputs on the SEL-651R-2 be ordered with 8 Vac LEA voltage inputs.

If the VY voltage inputs in *Figure 2.55* are instead connected to traditional potential transformers (e.g., those with 120 Vac nominal output), then this requires that the VY voltage inputs on the SEL-651R-2 be ordered with 300 Vac voltage inputs and that such circuits are brought in via means other than the 24-pin control cable. VZ voltage inputs are also available, and any connections to them are via means other than the 24-pin control cable. See the SEL-651R-2 Model Option Table (MOT) at selinc.com/products/651r/ for secondary input voltage options.

Figure 2.55   Current Connections and Polarity From ABB OVR-3/VR-3S (24-Pin, 15 and 27 kV Models) Recloser Primary to SEL-651R-2 Recloser Control Current Inputs

Notice also that the phase current terminals are labeled I1, I2, I3 (not IA, IB, IC). A-B-C designations are given to the current channels with Global setting IPCONN. Current transformer polarity can effectively be changed with the global CTPOL setting, which is helpful for designating forward or reverse power flow and similar things.

Figure 2.56 shows the SEL-651R-2 factory wiring for trip/close for ABB OVR-3/VR-3S (24-pin, 15 and 27 kV models) reclosers. Each pole of the recloser has its own trip/close coil, trip for current flow in one direction, close for current flow in the other direction. This facilitates single-phase tripping/reclosing, although the SEL-651R-2 factory settings have the recloser operating in a three-phase trip/close mode.

Note that the trip and close FETs in the SEL-651R-2 are stacked one atop another, between 53 Vdc power and ground, with a tap in the middle. For a given FET stack, both FETs can never be on at the same time or else there would be a direct short between the 53 Vdc power and ground. Interlocking logic prevents both FETs from being on at the same time.

Trace the trip path for Coil 1 in *Figure 2.56*:

Relay Word Bit RCTR1X (Trip 1; see *Figure 7.26*) turns on the bottom FET (ground) connected to terminal J206-3 and the top FET (53 Vdc) connected to terminal J206-9. This wiring goes through control cable Pins 22 and 10 to Coil 1. The 53 Vdc across Coil 1 (bottom to top) causes the current to flow in the indicated direction (Trip 1).

Trace the close path for Coil 1 in *Figure 2.56*:

Relay Word Bit RCCL1X (Close 1; see *Figure 7.26*) turns on the top FET (53 Vdc) connected to terminal J206-3 and the bottom FET (ground) connected to terminal J206-9. This wiring goes through control cable Pins 22 and 10 to Coil 1. The 53 Vdc across Coil 1 (top to bottom) causes the current to flow in the indicated direction (Close 1).

Tripping and closing for Coil 2 and Coil 3 operate similarly.

RELAY WORD BIT TCCAP
Relay Word bit TCCAP indicates that the 53 Vdc voltage in Figure 2.56 is present for recloser operations (TCCAP = logical 1). The 53 Vdc voltage comes into the relay module via connector J205 (CAPACITORS), from the trip/close capacitors in the power module (see Figure 2.2, Figure 2.5, Figure 2.7, and Figure 2.9). If there is a problem with this connection or otherwise in the power module, then Relay Word bit TCCAP = logical 0. Relay Word bit TCCAP is used in factory-default close logic settings (see Figure 6.4 and Figure 6.5) and reclose supervision settings (see Table 6.8).

Control-Powered Eaton NOVA or G&W Control Power Viper-S Reclosers

Figure 2.59 shows the SEL-651R-2 factory wiring for current connections for Control-Powered Eaton NOVA or G&W Control Power Viper-S reclosers. Notice that the current transformers in the recloser are wired such that the residual path (through Pin K) is on the polarity side of the current transformer secondaries. This is nonstandard as far as traditional circuit breakers are concerned, but is easily accommodated by the wiring on the Z01–Z08 terminals of the relay module of the SEL-651R-2.

Notice also that the phase current terminals are labeled I1, I2, I3 (not IA, IB, IC). A-B-C designations are given to the current channels with Global setting IPCONN. Current transformer polarity can effectively be changed with the global CTPOL setting, which is helpful for designating forward or reverse power flow, and so forth.
