¹Includes waste coal.
²These values represent the energy obtained from uranium when it is used in light water reactors. The total energy content of uranium is much larger, but alternative processes are required to take advantage of it.
³Includes grid-connected electricity from wood and wood waste; biomass, such as corn, used for liquid fuels production; and non-electric energy demand from wood. Refer to Table A17 for details.
⁴Includes grid-connected electricity from landfill gas; biogenic municipal waste; wind; photovoltaic and solar thermal sources; and non-electric energy from renewable sources, such as active and passive solar systems. Excludes electricity imports using renewable sources and nonmarketed renewable energy. See Table A17 for selected nonmarketed residential and commercial renewable energy data.
⁵Includes non-biogenic municipal waste, liquid hydrogen, methanol, and some domestic inputs to refineries.
⁶Includes imports of finished petroleum products, unfinished oils, alcohols, ethers, blending components, and renewable fuels such as ethanol.
⁷Includes coal, coal coke (net), and electricity (net). Excludes imports of fuel used in nuclear power plants.
⁸Includes crude oil, petroleum products, ethanol, and biodiesel.
⁹Balancing item. Includes unaccounted for supply, losses, gains, and net storage withdrawals.
¹⁰Estimated consumption. Includes petroleum-derived fuels and non-petroleum derived fuels, such as ethanol and biodiesel, and coal-based synthetic liquids. Petroleum coke, which is a solid, is included. Also included are hydrocarbon gas liquids and crude oil consumed as a fuel. Refer to Table A17 for detailed renewable liquid fuels consumption.
¹¹Excludes coal converted to coal-based synthetic liquids and natural gas.
¹²Includes grid-connected electricity from wood and wood waste, non-electric energy from wood, and biofuels heat and coproducts used in the production of liquid fuels, but excludes the energy content of the liquid fuels.
¹³Includes non-biogenic municipal waste, liquid hydrogen, and net electricity imports.
¹⁴Includes reported prices for both open market and captive mines. Prices weighted by production, which differs from average minemouth prices published in EIA data reports where it is weighted by reported sales.
¹⁵Prices weighted by consumption; weighted average excludes export free-alongside-ship (f.a.s.) prices.
 Btu = British thermal unit.
 Note: Totals may not equal sum of components due to independent rounding. Data for 2018 are model results and may differ from official EIA data reports.
Sources: 2018: EIA, *Short-Term Energy Outlook*, October 2018 and EIA, AEO2019 National Energy Modeling System run ref2019.d111618a. **Projections:** EIA, AEO2019 National Energy Modeling System runs lowmacro.d111618a, ref2019.d111618a, and highmacro.d111618a.

Carbon dioxide emissions (million metric tons).	5,250	4,876	4,977	5,030	4,593	4,856	5,105	4,606	5,019	5,399

¹Includes residential use of kerosene.
²Includes wood used for residential heating. See Table A4 and/or Table A17 for estimates of nonmarketed renewable energy consumption for geothermal heat pumps, solar thermal water heating, and electricity generation from wind and solar photovoltaic sources.
³Includes ethanol and ethers blended into gasoline.
⁴Excludes ethanol. Includes commercial sector consumption of wood and wood waste, landfill gas, municipal waste, and other biomass for combined heat and power. See Table A5 and/or Table A17 for estimates of nonmarketed renewable energy consumption for solar thermal water heating and electricity generation from wind and solar photovoltaic sources.
⁵Includes energy for combined heat and power plants that have a non-regulatory status, and small on-site generating systems.
⁶Includes ethane, natural gasoline, and refinery olefins.
⁷Includes petroleum coke, asphalt, road oil, lubricants, still gas, and miscellaneous petroleum products.
⁸Represents natural gas used in well, field, and lease operations, and in natural gas processing plant machinery.
⁹Fuel used in facilities that liquefy natural gas for export.
¹⁰Includes consumption of energy produced from hydroelectric, wood and wood waste, municipal waste, and other biomass sources. Excludes ethanol in motor gasoline.
¹¹E85 refers to a blend of 85 percent ethanol (renewable) and 15 percent motor gasoline (nonrenewable). To address cold starting issues, the percentage of ethanol varies seasonally. The annual average ethanol content of 74 percent is used for these projections.
¹²Includes only kerosene type.
¹³Diesel fuel for on- and off- road use.
¹⁴Includes aviation gasoline and lubricants.
¹⁵Represents consumption unattributed to the sectors above.
¹⁶Does not include residential use of kerosene.
¹⁷Includes aviation gasoline, petroleum coke, asphalt, road oil, lubricants, still gas, and miscellaneous petroleum products.
¹⁸Includes electricity generated for sale to the grid and for own use from renewable sources, and non-electric energy from renewable sources. Excludes ethanol and nonmarketed renewable energy consumption for geothermal heat pumps, buildings photovoltaic systems, and solar thermal water heaters.
¹⁹Includes consumption of energy by electricity-only and combined heat and power plants that have a regulatory status.
²⁰These values represent the energy obtained from uranium when it is used in light water reactors. The total energy content of uranium is much larger, but alternative processes are required to take advantage of it.
²¹Includes conventional hydroelectric, geothermal, wood and wood waste, biogenic municipal waste, other biomass, wind, photovoltaic, and solar thermal sources. Excludes net electricity imports.
²²Includes conventional hydroelectric, geothermal, wood and wood waste, biogenic municipal waste, other biomass, wind, photovoltaic, and solar thermal sources. Excludes ethanol, net electricity imports, and nonmarketed renewable energy consumption for geothermal heat pumps, buildings photovoltaic systems, and solar thermal water heaters.
 Btu = British thermal unit.
 Note: Includes estimated consumption for petroleum and other liquids. Totals may not equal sum of components due to independent rounding. Data for 2018 are model results and may differ from official EIA data reports.
 Sources: 2018: EIA, *Short-Term Energy Outlook*, October 2018 and EIA, AEO2019 National Energy Modeling System run ref2019.d111618a. Projections: EIA, AEO2019 National Energy Modeling System runs lowmacro.d111618a, ref2019.d111618a, and highmacro.d111618a.

ARTICLE

OCTOBER 2019

Projections overview and highlights, 2018–28

Employment growth is projected to slow during the 2018 to 2028 decade because of slowing population growth and changing demographics. As the population ages, the labor force participation rate is projected to decline. The demand for healthcare from the aging baby-boomer generation will drive employment growth in healthcare and related industries and occupations.

The U.S. Bureau of Labor Statistics (BLS) projects that overall employment growth will be 5.2 percent from 2018 to 2028, slower than during the prior projections decade (2016 to 2026). Growth of the labor force is projected to continue to slow because of changing demographics and a slowdown in population growth. In addition, since the base year of the projections (2018) follows a long economic expansion, projected economic growth is muted because BLS assumes a full employment economy in the target year (2028). From 2018 to 2028, many new jobs and rapid employment growth are projected in healthcare and related industries and occupations, because of increasing demand from the aging population and those with chronic conditions.

This article presents an overview of the 2018–28 projections. Highlights include the following:

- The labor force is projected to increase by 8.9 million people, to 171.0 million in 2028, for a compound annual rate of 0.5 percent. The labor force participation rate is projected to decline from 62.9 percent in 2018 to 61.2 percent in 2028.
- Gross domestic production (GDP) is projected to grow 1.8 percent annually over the projections period, the same rate as during the prior decade (2008–18), but lower than earlier decades.
- Real output is projected to increase by \$6.8 trillion, to over \$40.0 trillion in 2028. This amount is larger than the increase of \$4.3 trillion from 2008 to 2018.
- Healthcare occupations and those related to healthcare are projected to account for 18 of the 30 fastest growing occupations. Other occupations projected to grow rapidly include computer and math occupations and those involved in alternative energy production.

Over the next 10 years, the population and the labor force will grow slower than they have historically. The labor force participation rate will continue to decline, although more slowly than in the prior decade. In some subgroups, labor force participation is projected to increase. The labor force participation rate for people ages 65 and older is projected to grow. Women in the prime-age working group, ages 25 to 54, are projected to increase their participation rate slightly. All of these projections are based on the current structural trends within the economy.

The total real output of the service-providing sectors is projected to grow slightly faster than that of the overall economy from 2018 to 2028. Although employment in the goods-producing sectors is projected to grow by an annual rate of 0.1 percent from 2018 to 2028, real output in those sectors is projected to grow 1.6 percent annually over the decade.

By 2028, the service-providing sectors are projected to account for more than 85 percent of all wage and salary jobs in the economy and for most of the job growth. The healthcare and social assistance

sector will account for more than 40 percent of the jobs added over the projections period.

Employment is projected to grow 5.2 percent overall from 2018 to 2028, slower than the 7.4-percent growth rate projected for the 2016–26 decade. Employment growth from 2018 to 2028 is projected to be largest in occupational groups that provide healthcare and related services and in the food preparation and serving occupations and computer and mathematical occupations groups. Three occupational groups are projected to lose jobs—production occupations, office and administrative support occupations, and sales and related occupations.

Preparing the projections—methodology overview

BLS prepares projections in four areas: population and labor force, aggregate demand, industry output and employment, and occupational employment. Each step in the projections process affects those that follow. The expectations for the population affect those for the labor force, which in turn affect the projections of productivity and GDP growth. These projections further affect output and employment at the industry level, which then limit occupational employment projections.

BLS makes labor force projections by applying U.S. Census Bureau population projections to BLS projections of the labor force participation rate. In the BLS labor force model, population growth and changes in participation rates are the main factors in labor force growth. However, most of the changes in labor force growth are because of changes in the population. The current BLS labor force projection to 2028 is based on the 2017 national population projections made by the U.S. Census Bureau and includes assumptions about future fertility and mortality rates of the U.S. population. Also included are assumptions about immigration, an important but uncertain factor affecting the size of the future labor force (immigration data are from the Census Bureau).

Because labor force growth is one of the major determinants of long-term economic growth, labor force projections describe the future path of the economy and its capacity to create goods and services. The long-term gradual slowdown in the labor force growth continues to be key in determining the growth of the economy and of employment.

BLS develops macroeconomic projections with a model licensed from Macroeconomic Advisers (MA) by IHS Markit.¹ Energy prices come from the Energy Information Agency (EIA), and BLS determines other critical variables and supplies them to the MA model exogenously.² The MA model then projects economic aggregates, including total employment, output, productivity, prices, interest rates, and many other variables for the U.S. economy. These variables, most importantly nonfarm payroll employment, labor productivity, and GDP, serve as constraints for the industry output and employment projections. These critical variables set the parameters for the nation’s economic growth and set the trend that GDP will follow and the number of jobs needed to support that trend.

BLS produces model-based projections for hundreds of detailed industries that are then summed to subsectors and sectors. Macroeconomic factors, such as the labor force, GDP and its components, and labor productivity, affect the growth in total employment. These factors, as well as the projections models for the individual industries, determine the final projections of industry employment and output.

BLS produces occupational employment projections by analyzing current and projected future staffing patterns (the distribution of occupations within an industry) in an industry–occupation matrix. Changes in the staffing pattern for each industry are projected and applied to the final industry projections, yielding detailed occupational projections by industry. This projected employment matrix includes estimates for 809 occupations across 295 industries.³

The current projections, for 2018 to 2028, are the last set released biennially. Future projections will be released annually beginning with the publication of the 2019-to-2029 projections in 2020.

Population and labor force

The labor force is the driving factor behind the U.S. economy, growing since the United States began tracking it. The growth slowed over the past 10 years, however. This slowdown is attributable to a population growth slowdown and demographic changes. These structural changes are expected to continue, resulting in relatively muted labor force growth over the 2018–28 BLS projections period, compared with prior history. The labor force is projected to increase by 8.9 million people, 0.5 percent

annually, to 171.0 million in 2028.

The labor force growth rate of 0.5 percent annually over the oncoming decade is low historically. This growth reflects structural and demographic shifts. Overall population growth has slowed, and the share of the portion of the population most likely to work, those ages 25 to 54, has declined. Growth in the labor force has been driven entirely by those ages 55 and older over the past 10 years. The rest of the labor force actually declined over that time span. (See figure 1a–c.)

In addition, women are no longer contributing to as much growth in the labor force as they have in the past. Over the second half of the 20th century, women were entering the labor force at greater rates than men, contributing to historic increases in overall labor force growth. Had women not been entering the workforce, the overall growth rate would not have been notable. (See figure 2.) Women's labor force growth began to slow down in the end of the century. The women's labor force growth has been a little higher than the men's in the last two decades. Women no longer entering the workforce at a higher rate and slower population growth are the main drivers of lackluster labor force growth.

Population growth and demographic shifts

BLS relies on overall population projections from the U.S. Census Bureau, including birth rates and net migration. These population projections are converted to civilian noninstitutional population projections.⁴ This conversion ensures consistency with the labor force concept and definition. The

civilian noninstitutional population will hereafter be referred to as “the population.”

Population growth has slowed recently. The slow growth is driven primarily by lower birth rates and flat net migration.⁵ People joining the labor force through 2028 are at least 6 years old in the base year of 2018. Their impacts on the population and the labor force are already determined. Net migration, on the other hand, is a more uncertain projection component. Net migration has been declining since the late 1990s.⁶ It is expected to remain flat, at approximately 1 million incoming migrants a year over the projection period.⁷ Together, birth rates and the net migration result in a projected population growth of 0.8 percent annually over the upcoming decade—to 279.5 million. This percentage is slightly slower than the 2008–18 decade rate, when the population grew 1.0 percent.

Population growth is not uniform among age groups. For the youngest age group, ages 16 to 24, annual growth is projected to be flat. The prime-working-age population, those ages 25 to 54, is projected to grow 0.5 percent a year. In contrast, the population older than age 55 is projected to grow at a relatively high 1.5-percent annual growth as the baby boomers age into this group. (See figure 1.) Most of the population growth and labor force growth over the past 20 years have come from the 55-years-and-older group, and this group is projected to continue growing the fastest among the age groups over the next 10 years. An outcome of these growth patterns is a declining overall labor force participation rate.

Aging of the population and its effect on the participation rate

The labor force participation rate is driven by many underlying structural effects. The overall participation rate peaked at 67.1 percent in 2000, as the surge from women entering the workforce ebbed (the women’s participation rate peaked at 60.0 percent in 1999). While one effect waned, another—the aging of the population—has accelerated. As a larger proportion of the population is exiting the primary working age range (ages 25–54), the effect is to drive down the participation rate, because people ages 55 and older are less likely to work. From its peak of 67.1 percent in 2000, the total participation rate declined to 62.9 percent in 2018. This decline is expected to continue—though at a slower rate—and should reach 61.2 percent in 2028.

The participation rate of older people

Older people, particularly those 65 to 74 and those 75 and older, are increasingly participating in the labor force more than they have historically. (See figure 3.) This increase in participation is made possible, in part, by U.S. job growth being in service sector jobs rather than in more physically taxing “blue collar” jobs, such as manufacturing and construction.⁸ Lack of sufficient retirement savings and employer-provided health insurance may be further reasons for some older workers to stay in the labor force. Another reason may be an employer’s increased willingness to hire and retain older workers who may have institutional knowledge that is not easily replaceable.⁹

[View Chart Data](#)

The participation rate of younger people

The younger group, those 16 to 24, saw large declines in participation rates over the last 10 years. This younger group can be split out further into those 16 to 19 and those 20 to 24. While both groups have seen substantially lower participation rates, for those ages 20 to 24, this decline in participation has been driven by men. (See figure 4.) The women’s participation rate for 20-to-24-year-olds fell minimally, on net, over the past decade. Both the women’s and men’s participation rates for the 16-to-19-year-old groups declined during the last 10 years. These differences suggest that structural effects for the 16-to-19-year-olds are different than those for people ages 20 to 24.

Figure 4. Labor force participation rates, historic and projected, by gender and age, 1990 to projected 2028

[View Chart Data](#)

Part of this decrease, especially for those ages 16 to 19, is likely due to reduced opportunities to work combined with increased time spent in school. Many jobs that were traditionally considered “after-school” or “summer” jobs available to teens are increasingly being held by older workers.¹⁰ The percentage of the population completing college continues to increase as well.¹¹ Many of those

attending college forgo entering the labor force during this time to concentrate on studies. This decision also contributes to the lower participation rates for young people. Another factor likely contributing to lower participation rates, particularly for young men, is increased leisure time (often more time being spent playing video games and using the computer recreationally).¹² The extent to which each of these factors may be affecting the youth participation rate is unclear, and there is no indication the factors will change. Therefore, the overall declining trend is projected to continue. Participation rates for those ages 16 to 24 are projected to continue declining over the next decade, similar to their behavior over the past 10 years.

Aggregate demand

The labor force projections are crucial for the next step—projecting the nation’s overall economic growth, commonly referred to as “GDP.” In addition to the labor force, other critical macroeconomic variables set the parameters for economic growth. These variables and GDP will be discussed further in this article.

To remove cyclicalities from the projections, BLS uses a full employment assumption in the target year (2028). This assumption essentially states that the economy is toward the top of an expansion or business cycle peak. More technically, the full employment assumption asserts that the economy is operating at a high rate of resource utilization while output growth is sustainable.¹³

While the full employment assumption eliminates cyclicalities in projected levels, some cyclicalities can remain in the growth rates. If the base year of the projections is during a recession, one would expect growth rates to be somewhat higher in the projected year, because there is more room to grow. If the base year occurs after a long economic expansion (the current economic environment), growth rates can be expected to be somewhat lower over the projection period. This result is one of the main drivers behind the seemingly low economic growth projected over the next 10 years, relative to history (for both GDP and other macroeconomic variables explained further). In addition, the changing demographics and lower participation rate are important contributors to lower growth rates. GDP is projected to grow 1.8 percent annually over the next decade. (See figure 5.)

[View Chart Data](#)

Nonaccelerating inflation rate of unemployment

While the labor force is critical to economic growth, not everyone in the labor force is working. There are always individuals in the labor force not working (frictional unemployment) as they transition from one job to another. Also, other people may be unemployed for economic reasons for longer periods (structural unemployment). However, when the economy is at full employment, this type of unemployment is minimal to nonexistent. Unemployment associated with an economy at full

employment is referred to as the “nonaccelerating inflation rate of unemployment” or NAIRU. If even fewer people are unemployed than the NAIRU suggests, the inflation rate tends to accelerate, hence the name. The unemployment rate has recently gone below NAIRU: in 2018, the unemployment rate was 3.9 percent. Current estimates of NAIRU are at 4.6 percent, which is what BLS projects the unemployment rate to rise to in 2028.¹⁴

Productivity and its components

Productivity, calculated as GDP divided by the total hours worked in the economy, affects total output. The higher the productivity, the more goods and services are produced by each worker. Productivity can increase in numerous ways. Increased investment in capital is the most notable source of productivity gains. Technological advances, education or quality of the workforce, improvements in management practices, and economies of scale can also increase productivity. Capital stocks can be quantified—increases in capital relative to labor throughout the economy are referred to as “capital deepening.” The other sources are much harder to measure and are generally lumped together in a term referred to as “total factor productivity” or TFP.

Over the past 10 years, capital deepening resulted in a substantial proportion of productivity increases—0.8 percentage point of the total 1.3-percent growth rate. This percentage stems from the anemic TFP growth (0.4 percentage point) rather than inordinate growth in capital deepening. Over the next 10 years, BLS projects TFP growth to pick up some, though not to levels experienced prior to the most recent decade. Capital deepening growth is expected to rise slightly. Overall, productivity is expected to grow 1.6 percent annually. (See figure 6.)

[View Chart Data](#)

GDP components: private investment, consumption, government spending, and exports

The deferred or slowing of investment during the recent recession followed by a rebound immediately after can be seen in figure 7. From 2007 through 2009, gross private investment declined, pulling down GDP. In those years, high government spending and net exports growth offset some of this decline. Personal consumption expenditures (PCE) also fell, but not nearly to the extent that private investment did. Immediately after the 2007–09 recession, investment bounced back and accounted for most of GDP growth in 2010. This result is unusual since PCE growth is generally larger than investment. The usual dynamic occurred in most years following the recent recession. Private investment and PCE growth were both positive; PCE accounted for most of the GDP growth while government and net export growth made a minimal impact. This is the relationship BLS projects going forward, with investment growth being responsible for 0.5 percentage point of overall annual GDP growth and PCE responsible for 1.4 percentage points.

Figure 7. Contributions to growth in real domestic product, 1998–2018 and projected 2028

Fiscal and monetary policy

As the economic expansion has continued, the Federal Reserve (referred to as “the Fed” or “Fed” hereafter) started raising the federal funds rate, although these increases have recently been halted, and the rate was lowered in late July 2019. As these projections were being developed, the yield on the 10-year Treasury Constant Maturity Index was declining.¹⁵ The 10-year Treasury yield fell from over 3.0 percent in November 2018 to slightly above 1.6 percent in August 2019. There has been a yield inversion because short-term Treasury notes have been less responsive to Fed actions.¹⁶

While longer term U.S. rates have declined, they are still high relative to other countries. (The United Kingdom 10-year government bonds yielded 0.8 percent while Germany and Japan 10-year yields were negative at the time of publication of this article.) These low yields indicate low growth expectations among these countries and entice foreigners to purchase more U.S. Treasury securities, which further reduces U.S. yields. These reasons may be more responsible for low interest rates and the inverted yield curve than Fed actions.¹⁷

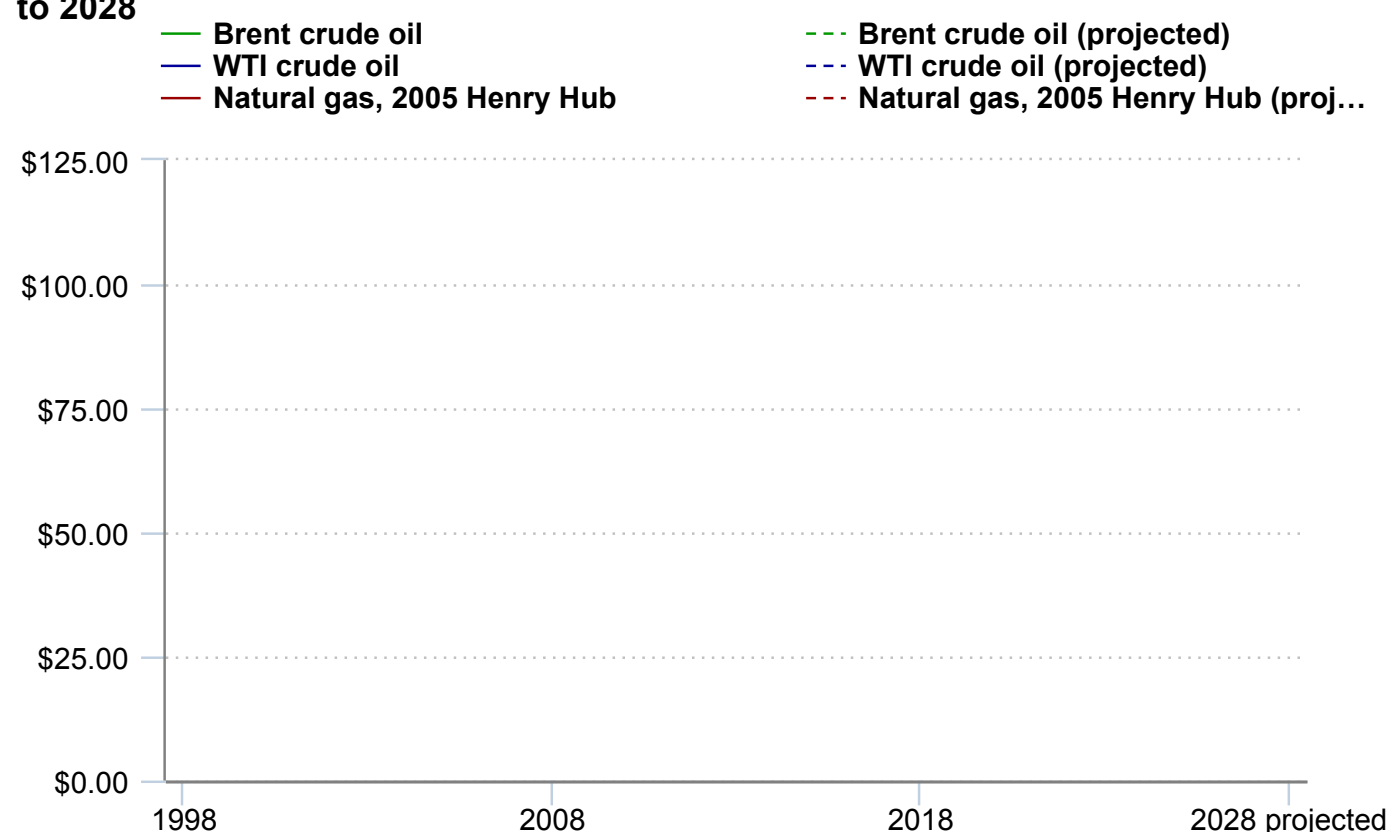

BLS projects the yield curve to normalize and rates to generally rise higher. In 2028, the 90-day Treasury bill rate is projected to be 2.8 percent and the 10-year Treasury note to yield 3.5 percent. The federal funds rate is projected to be 2.6 percent.

Assumptions about fiscal policy, including tax policies and government spending, substantially affect expectations for government revenue, national debt, and economic growth. BLS generally assumes no major changes to current tax laws over the projections decade. Effective marginal tax rates are also held constant at their current levels.

Energy prices

Energy prices, notably oil, are an additional factor affecting GDP. Generally, increases in energy prices are associated with less economic growth, particularly in the PCE component of GDP.¹⁸ A surge in oil prices occurred in 2011 when oil topped \$100 per barrel (Brent crude). It stayed above \$100 through 2014 before dramatically falling to under \$50 per barrel in 2016. It has since risen modestly to \$71 per barrel in 2018. Brent oil is projected to rise modestly, to \$89 per barrel in 2028. (See figure 8.) As mentioned earlier, energy projections come from the EIA long-term energy projections¹⁹ and are overwritten into the MA/U.S. model.²⁰

[View Chart Data](#)

Output and employment projections

BLS projects that output will increase more during the 2018–28 decade than it did during the previous decade, while employment growth will be slower. Industry output and employment projections were prepared with the use of the North American Industry Classification System (NAICS). Major sectors—hereafter referred to as “sectors”—are aggregations of NAICS industries. Occupational employment projections use the 2010 Standard Occupational Classification System (SOC).

Industry output

BLS projects that real output will increase from just over \$33.2 trillion in 2018 to over \$40.0 trillion in 2028.²¹ The more than \$6.8 trillion increase is larger than the 2008–18 increase of \$4.3 trillion. Most of the increase in real output is projected to come from nonagricultural sectors, specifically service-providing sectors.

Sector output

Real output in the service-providing sectors is projected to grow at an annual rate of 2.0 percent from 2018 to 2028, which is faster than the 1.7-percent growth rate experienced from 2008 to 2018.²² Over the 2018–28 decade, this 2.0-percent projected growth in output is about the same as the 1.9-percent projected growth for the entire economy. All service-providing sectors are projected to experience real output growth over the projections decade, except the federal government sector—it is projected to decline slightly, at 0.1 percent annually. The healthcare and social assistance sector is expected to have the fastest growth among service-providing sectors, increasing at a 2.9-percent annual rate.

Real output in the nonagricultural goods-producing sectors is projected to grow 1.6 percent a year from 2018 to 2028, which is lower than the expected growth rate for the overall economy. However, the expected growth is much faster than the 0.5-percent increase experienced by nonagricultural goods-producing sectors from 2008 to 2018. The mining sector is expected to have the fastest growth in real output, increasing annually at 3.4 percent.

The agricultural sectors (which include forestry, fishing, and hunting, and crop and animal production) are projected to grow 1.9 percent annually during the 2018–28 decade. This increase is faster than the 1.3-percent annual increase in the agricultural sectors from 2008 to 2018.

Fastest growing output

The information sector is projected to have 4 of the 20 fastest growing real output industries, which includes the fastest growing real output industry in the economy—the software publishers industry.

The increased needs for Internet of Things devices, network security, cloud computing, and Web publishing are driving the rise in the projected real output of the sector.

The healthcare and social assistance sector includes 8 of the 20 industries with the fastest growing real output. The offices of other health practitioners industry, the offices of physicians industry, and the individual and family services industry are 3 of the 8 fastest growing industries. The aging of the population and an expected rise in chronic conditions, such as diabetes, will increase demand of all types of healthcare services and social services geared toward older people.

Most rapidly declining output

The manufacturing sector has 2 of the 9 industries expected to have a decline in real output. The tobacco manufacturing industry is projected to have the largest decline in output of all industries, falling 3.6 percent annually over the projections decade. The continued decline in the rate of people who use tobacco products is one of the reasons for the industry’s drop in output. The hardware manufacturing industry is the third fastest declining industry.

The federal government sector has 6 of the 9 industries that are expected to decline in real output, largely because of pressure to reduce government spending to lower the budget deficit. The Postal Service industry is projected to have the second largest decline in output of all industries, falling 1.7 percent annually over the projections decade. The increased use of the internet for communication—such as social media and email, along with online bill payment and digital subscriptions—are factors affecting this decline.

Industry and occupational employment projections

BLS projects that total employment in 2028 will reach over 169.4 million, an increase from 2018 of about 8.4 million.²³ This increase represents a 0.5-percent annual rate of growth, which is slower than the 0.8-percent annual rate of growth experienced from 2008 to 2018. Most of the increase in employment, about 94 percent, is for nonagricultural wage and salary workers. Their employment is projected to rise from just over 149.8 million in 2018 to about 157.7 million in 2028, an increase of almost 7.9 million jobs.²⁴ (See figure 9.) This increase is less than the 11.8 million jobs that were added from 2008 to 2018.

Figure 9. Total nonagricultural wage and salary employment, 1998–2018 and projected 2028

[View Chart Data](#)

The labor force and changing demographics in the population affect employment growth, just as they affect GDP and other macroeconomic measures. Since the base year (2018) occurs after a long economic expansion, growth rates can be expected to be somewhat lower than in the previous projections cycles. In addition, an aging population leads to a declining participation rate, limiting the number of workers available for employment.

Industry sector employment

The service-providing sectors are projected to add more than 7.6 million jobs, to reach about 136.8 million jobs by 2028. This increase represents just over 91 percent of all jobs added from 2018 to 2028. Employment in the service-providing sectors is projected to grow 0.6 percent annually from 2018 to 2028, which is slightly faster than the 0.5-percent growth rate in jobs for the entire economy. (See table 1.) However, this growth rate is slower than the 1.0-percent annual growth that the sectors experienced from 2008 to 2018.

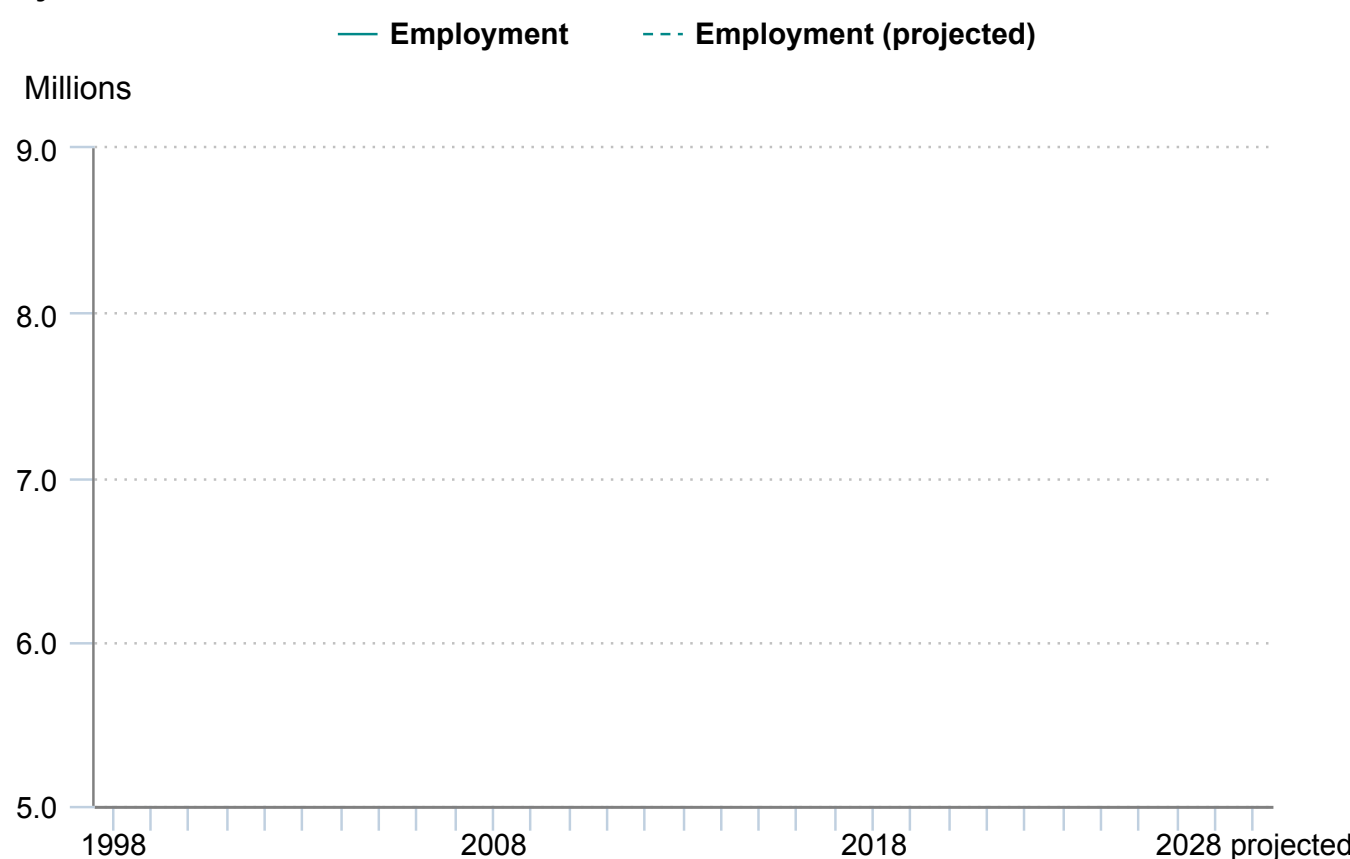

As with the last four sets of projections, the healthcare and social assistance sector is projected to have the most employment growth. The sector is projected to increase by almost 3.4 million jobs and to reach over 23.3 million jobs in 2028. Employment in the healthcare and social assistance sector is projected to grow at a 1.6-percent annual rate, which is more than 3 times as fast as the overall annual growth of jobs in the entire economy. Still, this growth rate is below the 2.1-percent annual growth rate that occurred during the 2008–18 decade for the healthcare and social assistance sector.

The retail trade sector is projected to have the greatest employment decline of the service-providing sectors, down 153,700 jobs over the 2018–28 decade. This decrease contrasts with the increase of 544,000 jobs over the previous decade. A shift in retail to e-commerce, which is driving up employment in the transportation and warehousing sector, contributes to the employment drop in retail trade.²⁵

Employment in the goods-producing sectors excluding agriculture is projected to increase by 211,400 over the 2018–28 decade. This growth compares favorably with the loss of 616,600 jobs over the previous decade. Employment in the construction sector is expected to increase substantially, adding 807,500 jobs. This increase will bring the construction sector above its 2006 level, which was the height of construction employment, just prior to the 2007–09 recession. (See figure 10.)

Manufacturing, the largest sector in this group, is projected to have the largest decrease in jobs over the 2018–28 projections decade, declining by 640,700 jobs. Although large, the loss is less than that experienced from 2008 to 2018, which was a decrease of 716,800 jobs. (See figure 11.)

[View Chart Data](#)

Total employment in the agriculture, forestry, fishing, and hunting sector is expected to increase by 10,600 jobs from 2018 to 2028. This increase is much smaller than the 238,600 increase experienced from 2008 to 2018. The expected lower growth is largely a result of slow employment growth in the crop production industry mainly due to increased productivity. The crop production industry is projected to add 28,900 jobs over the 2018–28 projections decade, whereas 268,900 jobs were added to crop production over the 2008–18 decade.

Occupational projections of major groups

BLS uses the 2010 SOC system to categorize occupations in 22 major groups. Occupations are classified in the SOC on the basis of the type of work performed, their tasks, and their duties; for example, statisticians, mathematicians, computer programmers, and web developers are all in the computer and mathematical occupational group. Table 2 shows the projected employment change, in terms of both numeric and percent change, for all 22 major groups.

Healthcare support is the fastest-growing occupational group, at 18.2 percent. (See figure 12.) Increased demand for healthcare and related employment is also reflected in the high projected growth rates for healthcare practitioners and technical occupations, personal care and service occupations, and community and social service occupations. Personal care and service occupations include personal care aides, the detailed occupation projected to add the most new jobs from 2018 to 2028.

Figure 12. Projected percent change, by select occupational groups, 2018–28

Hover over chart to view data.
 Source: U.S. Bureau of Labor Statistics.

[View Chart Data](#)

Other occupational groups in which employment is projected to grow markedly faster than the average for all occupations (5.2 percent) include computer and mathematical occupations, food preparation and serving related occupations, and construction and extraction occupations. Computer occupations are expected to see job growth as various technologies expand and are adopted by more and more users. Rising incomes and a higher share of expenditures on food away from home are expected to drive growth for food preparation workers.²⁶ The recovery of the construction industry to near prerecession levels and the expected increase in energy prices will drive employment growth for associated occupations in construction and extraction.

Three major occupational groups are expected to lose employment: production occupations, with a projected decline of 4.5 percent over the decade; office and administrative support occupations, with a projected decline of 2.6 percent; and sales and related occupations, with a projected decline of 0.5 percent. These employment declines will be largely because of productivity growth in the manufacturing sector, automation of clerical and administrative work, and increasing competition from e-commerce, respectively.

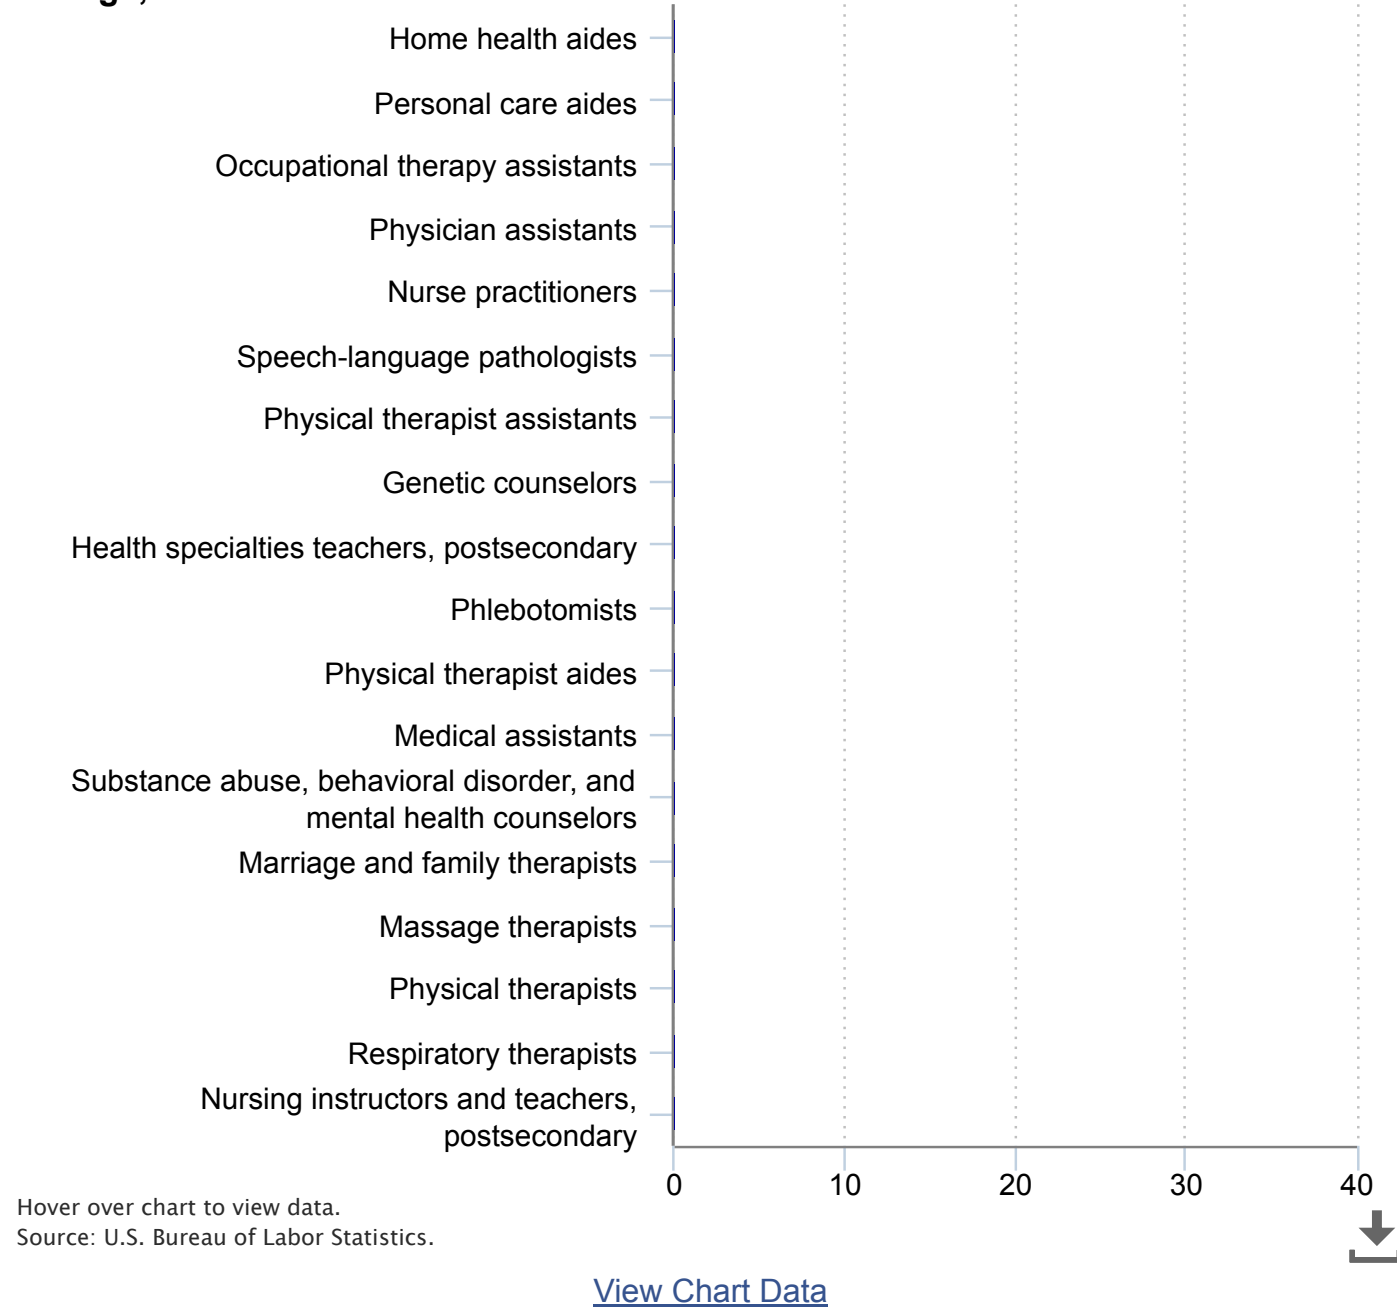

Fastest growing employment

Employment in the healthcare and social assistance sector is projected to grow the fastest among all sectors. It also has 7 of the 20 fastest growing industries. Factors that contribute to the large increase in the number of these jobs (and fast growth) are the needs of an aging baby-boom population, longer life expectancies, and growing rates of chronic conditions.²⁷ Employment in the home healthcare services industry is projected to grow the fastest over the 2018–28 projections decade, increasing annually at 4.0 percent. This rapid growth is due to patient preferences for in-home care and shifts in federal funding toward in-home or community-based care.²⁸

The projected fast growth in healthcare and social assistance sector employment is expected to increase employment substantially in many healthcare occupations from 2018 to 2028. (See figure 13.) Healthcare occupations and those associated with healthcare (including mental health) account for 18 of the 30 fastest growing occupations from 2018 to 2028. Increased demand for healthcare services by aging baby boomers and people with chronic conditions will drive the projected employment growth. Several of the fastest growing healthcare occupations—including physician assistants, nurse practitioners, medical assistants, and respiratory therapists—are projected to be in greater demand as team-based healthcare models are increasingly used to deliver healthcare services.²⁹ Employment in two counseling occupations also is projected to grow rapidly. Substance abuse, behavioral disorder, and mental health counselors and marriage and family therapists are projected to have fast employment growth because of increased demand for treatment of mental and behavioral issues,

including opioid addiction. Two education occupations associated with healthcare—postsecondary health specialties teachers and postsecondary nursing instructors and teachers—are also among the fastest growing occupations.

Figure 13. Healthcare and related occupations, projected employment change, 2018–28

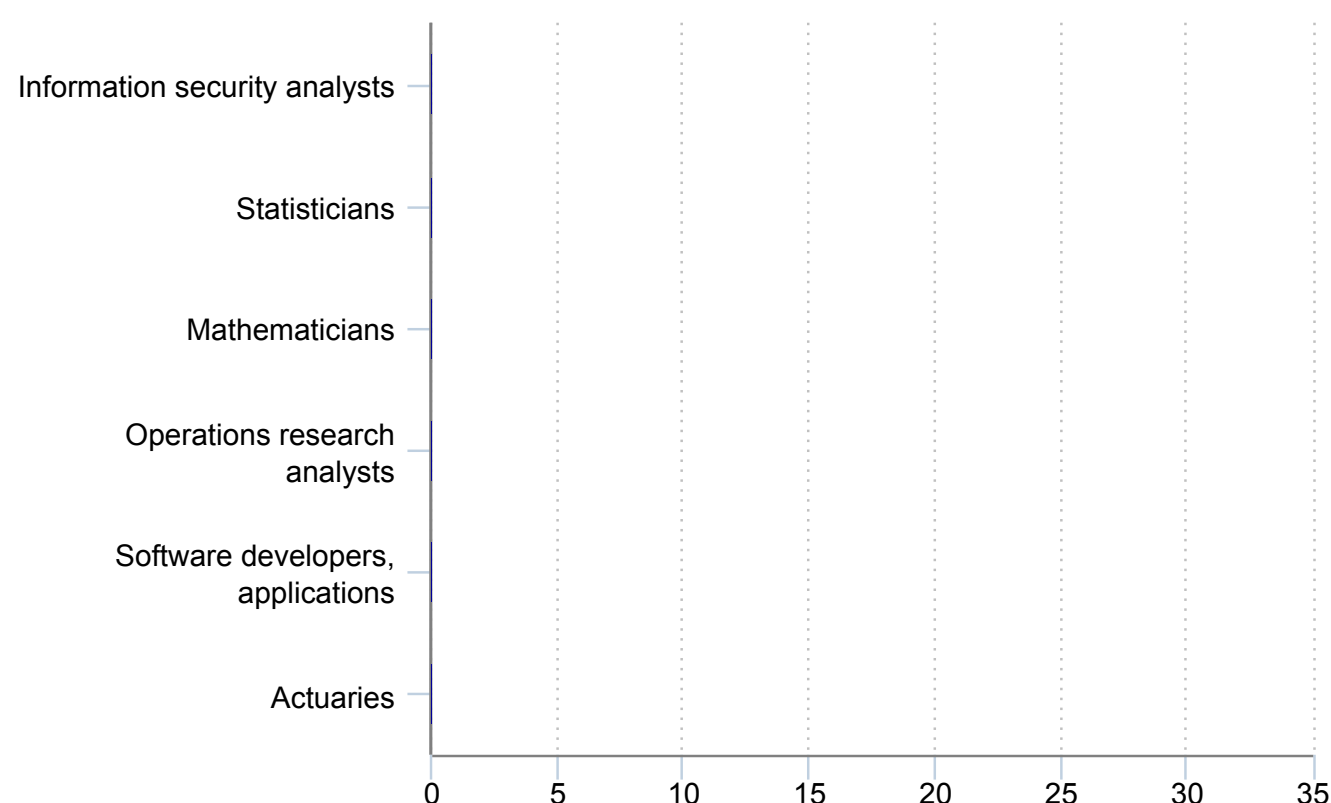

The information sector includes 3 of the 20 fastest growing industries over the projections decade. Within this sector, the other information services industry, which includes internet publishing and broadcasting and web search portals, is the fourth fastest growing industry, growing annually at 2.5 percent over the 2018–28 period. An increase in internet entertainment sites and video broadcast sites, including audio and video-streaming services, contribute to the fast employment growth.

Growth in information and related computer industries is expected to drive employment growth for several occupations in the computer and mathematical group. The computer and mathematical group contains 6 of the 30 fastest growing occupations. As more devices are connected to the internet, the need to combat cybersecurity threats will increase. The risk of cyberattacks is expected to create demand for information security analysts, who will be needed to prevent the theft of critical information and service attacks on computer networks. Employment of these analysts is projected to increase 31.6 percent from 2018 to 2028. The expected increased use of mobile devices and software to operate or manage everything from home appliances to medical devices will create demand for application software developers. Employment of this occupation is projected to grow 25.6 percent over the decade.

Employment is projected to grow for statisticians, mathematicians, operations research analysts, and actuaries as a result of the increasing widespread use of statistical analysis to make informed business, healthcare, and policy decisions. (See figure 14.) In addition, the growing amount of data available online (“big data”) will open new areas for analysis for these occupations.

Figure 14. Computer and mathematical occupations, projected employment change, 2018–28

Hover over chart to view data.
 Source: U.S. Bureau of Labor Statistics.

[View Chart Data](#)

The two projected fastest growing occupations—solar photovoltaic (PV) installers and wind turbine service technicians—are involved in alternative energy production. Employment for solar photovoltaic (PV) installers is expected to grow extremely fast (63.3 percent) from 2018 to 2028 as the expansion and adoption of solar panels and their installation create new jobs. However, because this is a relatively small occupation, with a 2018 employment level of 9,700, this growth will account for only about 6,100 new jobs over the next 10 years. In addition, developments in wind energy generation have made this energy option increasingly competitive with traditional forms of power generation, such as coal and natural gas, and are expected to drive employment growth for wind turbine service technicians. Employment of these workers is projected to grow 56.9 percent over the next 10 years. As with solar PV installers, this occupation is small, and its rapid growth will account for only about 3,800 new jobs.

Most rapidly declining employment

The manufacturing sector is projected to lose the most jobs and have the most rapid employment decline of any sector over the projections decade. The large manufacturing sector contains 10 of the 20 industries projected to have the most rapid employment declines. Some factors contributing to the loss of jobs in the manufacturing sector are international competition and the adoption of new productivity-enhancing technologies, such as robotics.³⁰ The tobacco manufacturing industry is projected to have the most rapid declines in industry employment, falling 4.6 percent annually.

The decline in employment in the manufacturing sector is expected to decrease employment over the projections decade in a number of occupations concentrated in manufacturing. Production occupations are projected to experience the strongest employment decline of any occupational group, because of a combination of automation and offshoring. Of the 30 occupations with the fastest employment declines, 13 are in the production occupational group and include various machine and tool setters, assemblers, and operators. Although their employment is projected to decline rapidly, they are relatively small occupations and are projected to lose only about 56,200 jobs in total.

Although the information sector has 3 of the 20 fastest growing industries over the projections decade, it also contains 4 of the 20 most rapidly declining industries. Contributing to these industry declines are technological changes that lead to fewer job opportunities. The newspaper, periodical, book, and directory publishers industry is projected to be among the most rapidly declining industries, with employment falling 2.7 percent annually. A shift toward digital from print publication contributes to the decline in this industry, as well as to the increase in the other information services industry.³¹

Technological changes are expected to continue to negatively affect the employment of several office

and administrative support occupations. For example, software tools can facilitate the scheduling of meetings and appointments (replacing secretaries and administrative assistants), and digital data collection and handwriting recognition software can perform work previously done by data entry keyers. Of the 30 occupations with the fastest declining employment, 10 are from office and administrative support occupations; collectively, these 10 occupations are projected to lose about 356,200 jobs from 2018 to 2028.

Sales and related occupations are also expected to decline in employment over the next decade, largely because of competition from e-commerce activity. Cashiers, retail salespersons, and first-line supervisors of retail sales workers are each projected to decline from 2018 to 2028, for a combined total loss of 270,800 jobs, as online shopping displaces brick-and-mortar retail employment.³²

Conclusions

An aging population and slower population growth will result in slower growth in the labor force from 2018 to 2028 than in prior decades. Older people participate in the labor force less than younger people, so that means fewer people are available to be employed. As a result, the projected growth for wage and salary jobs, at 5.2 percent, is lower than it was during the prior projections decade. In addition, since the base year of the projections (2018) is after a long economic expansion, economic growth rates are expected to be lower than in previous projection cycles.

Over 90 percent of employment growth from 2018 to 2028 is projected to be in the service-providing sectors. Occupations that provide healthcare or services related to healthcare are projected to make up most of the fastest growing occupations. An aging population is projected to demand more healthcare and related services. In addition, the number of people with chronic conditions is projected to continue to grow, adding to the demand for health-related occupations. Other occupations projected to grow rapidly include those involved with computers and math and with alternative energy.

Notes

¹ BLS develops macroeconomic projections with the Macroeconomic Advisers (MA) model, a structural econometric model of the U.S. economy. The model, licensed from MA by IHS Markit, comprises more than 1,000 variables, behavioral equations, and identities. Central characteristics of MA are a life-cycle model of consumption, a neoclassical view of investment, and a vector autoregression for the monetary policy sector of the economy. The full-employment foundation of the model is the most critical characteristic for the BLS outlook. Within MA, a submodel calculates an estimate of potential output from the nonfarm business sector; the calculation is based on full-employment estimates of the sector's hours worked and output per hour. Error correction models are embedded into MA so that the model's solution is aligned with the full-employment submodel. MA does not forecast sharp cyclical movements in the economy over the 10-year projection horizon. "Add-factors" are either left unchanged after the first couple of years of the solution or returned to historical norms. Add-factors represent changes made to the base result of a forecast or projection equation; see "Glossary of statistical terms" (Paris: Organisation for Economic Co-operation and Development, March 28, 2014), <https://stats.oecd.org/glossary/detail.asp?ID=44>. The structure of the model, exogenous assumptions, and MA's view of the Federal Reserve's long-term policy objective largely determine the characteristics of the model's long-term outlook for the economy. For more information, see <http://www.macroadvisers.com/>.

² EIA estimates include prices for West Texas Intermediate crude oil, Brent crude oil, and natural gas and assume current energy regulations will remain unchanged. For more information, see *Annual energy outlook 2015* (U.S. Energy Information Administration, April 2015), <https://www.eia.gov/outlooks/archive/aeo15/>.

³ Visit our "Projections Methodology" page for a detailed description of the projections process at <https://www.bls.gov/emp/documentation/projections-methods.htm>.

⁴ The resident population projections of the U.S. Census Bureau have to be converted to a civilian noninstitutional population concept to be used in the BLS labor force projections. The U.S. Census Bureau uses a cohort-component method and assumptions regarding demographic components of change to project the resident population, which includes members of the Armed Forces residing in the United States and individuals residing in institutional group quarters. Methods and data are available at <https://www.census.gov/programs-surveys/popproj.html>. The conversion from the resident population concept of the Census Bureau to the civilian

noninstitutional population concept of the BLS Current Population Survey (CPS) occurs in three steps. First, the population of children under 16 years is taken from the total resident population. Then, the population of the Armed Forces, broken down into different age, gender, race, and ethnic categories, is subtracted. Finally, the institutional population is subtracted from the civilian population for all the different categories. Thus, the civilian noninstitutional population comprises all nonmilitary people (those not on active duty in the U.S. Armed Forces) 16 years and older who are not inmates of penal or mental institutions or are not residents of sanitariums or homes for the aged.

CBO

An Update to the Budget and Economic Outlook: 2019 to 2029

Percentage of Gross Domestic Product

Percent

Trillions of Dollars

AUGUST 2019

At a Glance

The Congressional Budget Office regularly publishes reports that present projections of what federal deficits, debt, revenues, and spending—and the economic path underlying them—would be for the current year and for the next 10 years if existing laws governing taxes and spending generally remained unchanged. This report is the latest in that series.

- **Deficits.** In CBO’s projections, the federal budget deficit is \$960 billion in 2019 and averages \$1.2 trillion between 2020 and 2029. Over the coming decade, deficits (after adjustments to exclude the effects of shifts in the timing of certain payments) fluctuate between 4.4 percent and 4.8 percent of gross domestic product (GDP), well above the average over the past 50 years. Although both revenues and outlays grow faster than GDP over the next 10 years in CBO’s baseline projections, the gap between the two persists.
- **Debt.** As a result of those deficits, federal debt held by the public is projected to grow steadily, from 79 percent of GDP in 2019 to 95 percent in 2029—its highest level since just after World War II (see Chapter 1).
- **The Economy.** Real (inflation-adjusted) GDP is projected to grow by 2.3 percent in 2019, supporting strong labor market conditions that feature low unemployment and rising wages. This year, real output is projected to exceed CBO’s estimate of its potential (maximum sustainable) level. After 2019, consumer spending and purchases of goods and services by federal, state, and local governments are projected to grow at a slower pace, and annual output growth is projected to slow—averaging 1.8 percent over the 2020–2023 period—as real output returns to its historical relationship with potential output. From 2024 to 2029, both output and potential output are projected to grow at an average pace of 1.8 percent per year, which is less than the long-term historical average. That slowdown occurs primarily because the labor force is expected to grow more slowly than it has in the past (see Chapter 2).
- **Changes in CBO’s Projections Since May 2019.** CBO’s estimate of the deficit for 2019 is now \$63 billion more—and its projection of the cumulative deficit over the 2020–2029 period, \$809 billion more—than it was in May 2019. The agency’s baseline projections of primary deficits (that is, deficits excluding net outlays for interest) for that period increased by a total of \$1.9 trillion. Recently enacted legislation accounts for most of that change. In particular, incorporating the higher discretionary funding limits for 2020 and 2021 that were established in the Bipartisan Budget Act of 2019 increased CBO’s projections of primary deficits for the 2020–2029 period by \$1.5 trillion. (Those projections reflect the assumption—required by law—that future discretionary funding will grow at the rate of inflation after those limits expire.)

Partly offsetting the increase in projected primary deficits is a net reduction of \$1.1 trillion in the agency’s projections of interest costs over that same period. The largest factor contributing to that change is that CBO revised its forecast of interest rates downward, which lowered its projections of net interest outlays by \$1.4 trillion (including interest savings from the resulting reductions in deficits and debt). Taken together, other changes to the budget projections increased projected debt-service costs by nearly \$0.3 trillion; \$0.2 trillion of that amount is associated with the increase in projected spending stemming from the Bipartisan Budget Act (see Appendix A).

Notes

Unless this report indicates otherwise, all years referred to in describing the budget outlook are federal fiscal years, which run from October 1 to September 30 and are designated by the calendar year in which they end. Years referred to in describing the economic outlook are calendar years.

Numbers in the text, tables, and figures may not add up to totals because of rounding. Also, some values are expressed as fractions to indicate numbers rounded to amounts greater than a tenth of a percentage point.

Some figures in this report have vertical bars that indicate the duration of recessions. (A recession extends from the peak of a business cycle to its trough.)

The Congressional Budget Office completed its current economic forecast on July 25, 2019. Unless this report indicates otherwise, the projections of economic variables are based on information that was available at that time. Thus, the projections do not reflect the comprehensive revisions to the national income and product accounts that the Bureau of Economic Analysis released on July 26. However, the actual and historical data shown in figures describing the economic forecast are based on those revisions, as are the discussions of recent economic events in the text.

CBO periodically reports to the Congress about the accuracy of its baseline projections of economic outcomes (www.cbo.gov/publication/53090) and about the accuracy of its projections of spending, revenues, and the deficit (www.cbo.gov/publication/54872). And CBO will soon publish a short report about how budget projections would differ if they were based on certain revenue and spending policies that differed from those underlying the agency's baseline projections.

Supplemental data for this analysis are available on CBO's website (www.cbo.gov/publication/55551), as are a glossary of common budgetary and economic terms (www.cbo.gov/publication/42904), a description of how CBO prepares its baseline budget projections (www.cbo.gov/publication/53532), a description of how CBO prepares its economic forecast (www.cbo.gov/publication/53537), and previous editions of this report (<https://go.usa.gov/xQrzS>).

Visual Summary

In this report, the Congressional Budget Office provides projections of the federal budget and the U.S. economy under current law for this year and the decade that follows. Deficits in the current projections are larger than those in the projections that CBO published in May, primarily because recently enacted legislation raised the caps on discretionary funding for fiscal years 2020 and 2021. The budgetary effects of new legislation were partially offset by revisions that the agency has made to its economic forecast since it was last updated in January 2019. In particular, markedly lower projected interest rates reduced the agency's projections of borrowing costs. CBO also raised its projections of economic growth in the near term.

Deficits

CBO estimates a 2019 deficit of \$960 billion, or 4.5 percent of gross domestic product (GDP). The projected shortfall (adjusted to exclude the effects of shifts in the timing of certain payments) rises to 4.8 percent of GDP in 2029.

Over the 2020–2029 period, deficits are projected to average 4.7 percent of GDP, totaling \$12.2 trillion. Such deficits would be significantly larger than the 2.9 percent of GDP that deficits averaged over the past 50 years.

See Figure 1-1

Deficits (Continued)

Trillions of Dollars

Since May 2019, CBO has increased its projection of the 10-year deficit by a total of \$0.8 trillion. The largest factor in that revision was the Bipartisan Budget Act of 2019, which increased projected deficits for the 2020–2029 period by \$1.7 trillion (including debt-service costs). A reduction in projected net interest outlays, which stemmed from lower projected interest rates than those in CBO’s January 2019 forecast, offset much of that increase.

See Figure A-1

Debt

Federal debt held by the public is projected to rise steadily over the coming decade, from 79 percent of GDP in 2019 to 95 percent of GDP in 2029. It would continue to grow after 2029.

Percentage of Gross Domestic Product

Relative to the size of the economy, federal debt in 2019 is projected to be nearly twice its average over the past 50 years. At the end of 2029, debt is projected to reach a higher level than it has at any point since just after World War II.

See Figure 1-4

Revenues In CBO’s baseline projections, revenues total \$3.5 trillion in 2019, or 16.3 percent of GDP, and rise to 18.2 percent of GDP in 2029. Over the past 50 years, revenues averaged 17.4 percent of GDP.

Percentage of Gross Domestic Product	Revenues		Change (Percentage points)	
	2019	2029		
Individual Income Taxes	8.0	9.6	1.6	Total revenues as a share of GDP are projected to rise over the next decade, primarily because of increases in individual income taxes. The largest of those increases stem from the expiration of certain provisions of the 2017 tax act at the end of 2025 and from real bracket creep.
Payroll Taxes	5.9	5.9	*	
Corporate Income Taxes	1.1	1.3	0.3	
Other Sources of Revenue	1.3	1.3	*	

See Figure 1-7; * = between zero and 0.05 percent of GDP

Outlays In 2019, CBO estimates, outlays will total \$4.4 trillion, or 20.8 percent of GDP. In the agency’s baseline projections, they rise to 23.0 percent of GDP in 2029 (after an adjustment to exclude the effects of certain timing shifts). Over the past 50 years, outlays averaged 20.3 percent of GDP.

Percentage of Gross Domestic Product	Outlays		Change (Percentage points)	
	2019	2029		
Social Security	4.9	5.9	1.0	The aging of the population and the rising costs of health care drive an increase in mandatory outlays (particularly for Social Security and Medicare).
Major Health Care Programs	5.3	6.6	1.3	
Other Mandatory Spending	2.6	2.3	-0.4	Outlays for discretionary programs fall in relation to GDP because rates of inflation, which are used to project future funding, are lower than the rate of economic growth.
Discretionary Spending	6.3	5.6	-0.7	
Net Interest	1.8	2.6	0.9	Net interest costs rise because of accumulating debt and rising interest rates.

See Figure 1-5

The Economy

The economy was strong in 2018 and the first half of 2019: Real (inflation-adjusted) GDP grew at an average annual rate of 2.5 percent, unemployment remained low, and wages rose. In CBO’s forecast, the economy expands more slowly over the next decade than it did in 2018, growing at an annual rate of 1.8 percent, on average. That rate of output growth is below the long-run historical average, primarily because the labor force is expected to grow more slowly than it has in the past.

Real GDP growth is projected to slow from 2.3 percent in 2019 to an average of 1.8 percent over the 2020–2023 period, reflecting slower growth in consumer spending and government purchases as well as the effect of trade policies on business investment.

See Figure 2-1

In CBO’s projections, the unemployment rate remains close to its current level of 3.7 percent through the end of 2020 and then rises to 4.6 percent by the end of 2023 as output growth slows.

See Figure 2-3

CBO expects the Federal Reserve to keep the target range for the federal funds rate at its current level through most of 2020 and then increase it at the end of that year. That increase, along with other factors, would put upward pressure on short-term and long-term interest rates.

See Figure 2-1

CHAPTER

1

The Budget Outlook

Overview

The Congressional Budget Office now estimates that, if no further legislation is enacted this year that affects revenues or outlays, the total federal budget deficit for fiscal year 2019 will be \$960 billion, or 4.5 percent of gross domestic product (GDP). According to CBO's projections, the deficit would generally increase in nominal terms through 2029 and would remain a considerably larger share of GDP than its average over the past 50 years (see Figure 1-1). Such increases in deficits would lead to growth in debt held by the public: Under current law, the federal government is projected to borrow an additional \$13.6 trillion from the end of 2018 through 2029, boosting debt held by the public to \$29.3 trillion, or 95 percent of GDP, in that year—up from 79 percent now. Relative to the projections CBO published earlier this year, the agency's estimate of the deficit for 2019 is now \$63 billion more—and its projection of the cumulative deficit over the 2020–2029 period, \$809 billion more—than it was in May 2019 (see Appendix A).¹

CBO's projections are created in accordance with provisions set forth in the Balanced Budget and Emergency Deficit Control Act of 1985 (Public Law 99-177, referred to here as the Deficit Control Act), and the Congressional Budget and Impoundment Control Act of 1974 (P.L. 93-344). Those laws require CBO to construct its baseline under the assumption that current laws will generally remain unchanged. Thus, CBO's baseline is not intended to provide a forecast of future budgetary outcomes; rather, it is meant to provide a benchmark that policymakers can use to assess the potential effects of future policy decisions. Future legislative action could lead to markedly different outcomes—but even if federal laws remained unaltered for the next decade, actual budgetary outcomes would probably differ from CBO's baseline, not only because of unanticipated economic conditions, but also as a result of the many other factors that affect federal revenues and outlays.

1. See Congressional Budget Office, *Updated Budget Projections: 2019 to 2029* (May 2019), www.cbo.gov/publication/55151.

The Budget Outlook for 2019

In CBO's baseline projections, the 2019 budget deficit is \$960 billion, which is \$181 billion more than the shortfall recorded last year (see Table 1-1). That increase would be smaller if not for a shift in the timing of certain payments. The 2018 deficit was reduced by \$44 billion because certain payments that would ordinarily have been made on October 1, 2017 (the first day of fiscal year 2018), were instead made in fiscal year 2017 because October 1 fell on a weekend. If not for that shift, last year's shortfall would have been \$823 billion, and the estimated increase in the deficit in 2019 would be \$137 billion, or 17 percent (see Table 1-2). (The discussion of CBO's projections in this chapter reflects adjustments to remove the effects of those timing shifts.)

Relative to the size of the economy, this year's deficit, at 4.5 percent of GDP, is also expected to exceed last year's shortfall of 4.1 percent. Estimated debt held by the public has also increased, to 78.9 percent of GDP from 77.8 percent in 2018. Outlays are estimated to rise as a percentage of GDP, from 20.5 percent in 2018 to 20.8 percent this year. In contrast, revenues are expected to fall slightly below their 2018 level relative to GDP, from 16.5 percent in that year to 16.3 percent in 2019.

Outlays

In CBO's projections, total federal outlays increase by \$258 billion (or 6 percent) in 2019, to a total of \$4.4 trillion. More than half of that growth is attributable to mandatory outlays, which are projected to rise by \$144 billion, or 6 percent. Discretionary outlays are projected to increase from last year's amount—\$1.3 trillion—by \$67 billion, or 5 percent. The government's net interest costs are also anticipated to grow in 2019, increasing by \$47 billion (or 14 percent), to \$372 billion.

Federal outlays in 2019 are projected to be 0.5 percentage points of GDP above their 50-year average of 20.3 percent. That increase over historical amounts is

Figure 1-1.

Total Deficits and Surpluses

Percentage of Gross Domestic Product

Source: Congressional Budget Office.

When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. All projections presented here have been adjusted to exclude the effects of those timing shifts. Historical amounts have been adjusted as far back as the available data will allow.

largely attributable to significant growth in mandatory spending (net of the offsetting receipts that are credited against such outlays), which is expected to equal 12.8 percent of GDP in 2019, compared with its 9.9 percent average over the 1969–2018 period. As a share of GDP, the other major components of federal spending are estimated to fall below their 50-year averages: Discretionary outlays are projected to equal 6.3 percent of GDP this year, compared with their average of 8.4 percent over the past 50 years, and net outlays for interest are expected to equal 1.8 percent of GDP, compared with their 50-year average of 2.0 percent.

Mandatory Spending. Mandatory, or direct, spending includes outlays for some federal benefit programs and for certain other payments to people, businesses, non-profit institutions, and state and local governments. Such outlays are generally governed by statutory criteria and are not normally constrained by the annual appropriation process.² Certain types of payments that federal

agencies receive from the public and from other government agencies are classified as offsetting receipts and are accounted for in the budget as reductions in mandatory spending.

The Deficit Control Act requires CBO to construct baseline projections for most mandatory spending under the assumption that current laws continue unchanged.³

for Coast Guard retirees and annuitants, are considered mandatory but require benefits to be paid from amounts provided in appropriation acts. Section 257 of the Deficit Control Act requires CBO to project outlays for those programs as if they were fully funded, regardless of the amounts actually appropriated.

- Section 257 of the Deficit Control Act also requires CBO to assume that certain mandatory programs will continue beyond their scheduled expiration and that entitlement programs, including Social Security and Medicare, will be fully funded and thus will be able to make all scheduled payments even if the trust funds associated with those programs do not contain the funding to make full payments. Other rules that govern the construction of CBO's baseline have been developed by the agency in consultation with the House and Senate Committees on the Budget. For further details, see Congressional Budget Office, *How CBO Prepares Baseline Budget Projections* (February 2018), www.cbo.gov/publication/53532.

GDP = gross domestic product.

a. When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. Those shifts primarily affect mandatory outlays; discretionary outlays are also affected, but to a much lesser degree. Net interest outlays are not affected. (For the 2018–2029 period, revenues are not affected by timing shifts.)

Therefore, CBO's baseline projections for mandatory spending reflect the estimated effects of economic influences, growth in the number of beneficiaries for certain mandatory programs, and other factors related to the costs of those programs, even for those that are set to expire under current law. The projections also incorporate a set of across-the-board reductions in budgetary resources (known as sequestration) that are required under current law for some mandatory programs.

In 2019, CBO estimates, total mandatory outlays (net of offsetting receipts) will amount to \$2.7 trillion, up from \$2.6 trillion in 2018. Most of that \$144 billion increase is attributable to greater outlays for Social Security, Medicare, and higher education, moderated by an increase in offsetting receipts from Fannie Mae and

Freddie Mac (among other, smaller and largely offsetting, changes):

- Social Security outlays will rise by \$56 billion (or 6 percent) relative to those outlays in 2018, CBO estimates, reaching \$1.0 trillion this year, or 4.9 percent of GDP. That increase stems from growth both in the number of beneficiaries and in the average benefit payment.
- Outlays for Medicare (net of offsetting receipts) will rise from \$605 billion in 2018 to \$636 billion in 2019, remaining at 3.0 percent of GDP. That increase results from growth both in the number of beneficiaries and in the amount and cost of services.

- Federal outlays for higher education will increase by \$41 billion this year, primarily because the Department of Education made an upward revision to the estimated net subsidy costs of loans and loan guarantees issued in prior years.
- In the other direction, payments from Fannie Mae and Freddie Mac are estimated to increase by \$15 billion in 2019. (Such receipts are recorded in the federal budget as offsetting receipts, which are reductions in outlays.)

Discretionary Spending. Discretionary spending encompasses an array of federal activities that are funded or controlled through annual appropriations. Such spending includes most outlays for national defense, elementary and secondary education, housing assistance, international affairs, and the administration of justice, as well as outlays for highways and other programs. In any year, some discretionary outlays arise from budget authority provided in the same year, and some arise from appropriations made in previous years.⁴

CBO's baseline incorporates all appropriations for 2019, which amount to \$1.4 trillion, including both regular and supplemental appropriations.⁵ CBO anticipates that, if no further appropriations are provided this year, discretionary outlays will total \$1.3 trillion in 2019—\$67 billion (or 5 percent) more than last year's amount.

Discretionary funding for defense for 2019 totals \$719 billion, including \$69 billion for overseas contingency operations (OCO) and \$3 billion for activities designated as emergency requirements. Defense outlays, which amounted to \$627 billion in 2018, will increase by \$44 billion (or 7 percent), to \$670 billion, according to CBO's estimates. Outlays are projected to increase by \$16 billion (or 6 percent) for operation and maintenance, \$10 billion (or 9 percent) for procurement, \$5 billion (or 4 percent) for military personnel, and \$11 billion (or 15 percent) for research and development.

For 2019, nondefense discretionary funding totals \$658 billion. That amount includes \$44 billion that is not limited by the caps on discretionary funding: \$22 billion for activities designated as emergency requirements, \$12 billion for disaster relief, \$8 billion for OCO, \$2 billion for program integrity initiatives, and \$1 billion for programs authorized by the 21st Century Cures Act (P.L. 114-255).⁶ CBO expects that nondefense discretionary outlays will increase by \$23 billion (or 4 percent) in 2019, to \$662 billion. Higher spending on veterans' benefits and services accounts for \$6 billion of that increase in outlays. In addition, discretionary outlays for various health programs will increase by \$5 billion, and outlays for federal law enforcement activities by \$3 billion, CBO estimates.⁷ The remaining growth in nondefense discretionary outlays is the result of a number of smaller increases in spending for various programs.

Net Interest. In 2019, net outlays for interest will rise to \$372 billion (or 1.8 percent of GDP), from \$325 billion last year, CBO estimates, primarily because interest rates on short-term debt have been higher in 2019 than in 2018 and because the amount of federal debt is larger than it was a year ago.

Revenues

On the basis of receipts through June 2019, CBO expects federal revenues to total \$3.5 trillion this fiscal year, \$121 billion (or 3.6 percent) more than in 2018. Because CBO anticipates that nominal GDP will grow at a faster rate (4.6 percent), revenues are projected to decrease relative to GDP.

Individual Income Taxes. CBO estimates that collections of individual income taxes will increase by \$15 billion (or 1 percent) in 2019. That increase reflects income growth that is offset in part by the effects of changes in tax law and in part by reallocations the Treasury makes between income and payroll taxes.

Although wages and salaries are projected to grow by about 4 percent in 2019, individual income taxes

4. Budget authority is the funding provided by law to incur financial obligations that will result in immediate or future outlays of federal government funds. Outlays are the amount of money spent each year.

5. That amount does not include changes in mandatory programs included in supplemental appropriation acts.

6. Budgetary resources for 2019 include \$60 billion in limitations on obligation authority for certain transportation programs.

7. Spending for most federal health care programs, such as Medicare and Medicaid, is mandatory. Spending for some health programs is discretionary; the largest recipients of discretionary funding include the Centers for Disease Control and Prevention, the National Cancer Institute, the National Institute of Allergy and Infectious Diseases, and the Indian Health Service.

withheld from paychecks will decrease by \$18 billion (or 1 percent), in CBO's estimation. That decline reflects two factors: First, the Internal Revenue Service issued new withholding tables in January 2018 to reflect changes made by the 2017 tax act (P.L. 115-97). Those new withholding rates were in effect during all of this fiscal year but for only seven-and-a-half months of 2018. Second, withheld taxes classified as individual income taxes were boosted in 2018 and reduced in 2019 by reallocations made between income and payroll taxes. Specifically, the Treasury recategorized about \$21 billion in collections from payroll to individual income taxes during 2018 and about \$7 billion from individual income to payroll taxes so far in 2019. The Treasury does not observe a difference between amounts withheld for payroll and income taxes as they are collected, instead initially allocating withheld taxes to one source or the other on the basis of estimates. As detailed tax-return information becomes available, amounts are reallocated between payroll and income taxes. Even though those revisions amend allocations made in prior years, the reallocations are made in the current fiscal year.

Nonwithheld payments of individual income taxes are expected to rise by \$9 billion (or 1 percent) in 2019. Those payments include both estimated and final payments for the 2018 tax year, as well as estimated payments for the 2019 tax year. Refunds, largely for the 2018 tax year, are expected to be \$23 billion (or 9 percent) lower than last year, further boosting net receipts. The extent to which those changes reflect the effects of the 2017 tax act or other factors will become clearer as detailed tax-return data become available over the next several years. (For a discussion of what CBO has learned from recent data about the effects of the 2017 tax act, see Box 1-1.)

Payroll Taxes. CBO expects that receipts from payroll taxes—which primarily fund Social Security and Medicare's Hospital Insurance program—will increase by \$76 billion (or 6 percent) this year. The expected increase in payroll taxes exceeds growth in wages and salaries, largely because of amounts reallocated between income and payroll taxes in 2018 and 2019.

Corporate Income Taxes. Income tax payments by corporations, net of refunds, are expected to grow by \$24 billion (or 12 percent) in 2019. Collections in fiscal year 2019 include businesses' final tax payments for the 2018 tax year and their initial payments for 2019.

During the first eight months of 2019, those payments declined by about 9 percent compared with amounts during the same period a year ago. At least some of that initial decline stems from provisions of the 2017 tax act, which lowered the corporate income tax rate to 21 percent from a top rate of 35 percent and expanded the tax rules allowing businesses to immediately deduct the value of qualifying business investments.

The decrease in 2019 may also partly reflect a continuation of unexplained weakness in income tax payments by corporations in recent years—a trend that only reversed in June, the first month in which receipts consisted predominantly of estimated payments for tax year 2019. Receipts in June 2019 rose by 35 percent compared with receipts in June 2018, and stronger payments are expected to persist through the remainder of the fiscal year. The specific reasons for the pattern of corporate receipts will become clearer as detailed information from corporate income tax returns becomes available over the next two years.

Other Revenues. CBO expects that other revenues will increase, on net, by \$7 billion (or 2 percent) in 2019. Most of that increase stems from customs duties, which are anticipated to climb by \$29 billion (or 70 percent) owing to new tariffs imposed by the Administration and in effect as of July 25, 2019. Partially offsetting those increases are smaller remittances from the Federal Reserve to the Treasury. Those remittances are expected to decline by \$16 billion this year, because higher short-term interest rates in the early part of the fiscal year led the central bank to pay depository institutions more interest on their reserves. Estate and gift taxes are also expected to decrease this year—by \$7 billion—largely as a result of a provision in the 2017 tax act that temporarily doubles the amount of the exemption. All other receipts are expected to increase by a combined \$1 billion, on net.

CBO's Baseline Budget Projections for 2020 Through 2029

Although both revenues and outlays are projected to grow faster than GDP over the next 10 years, CBO's baseline projections show a persistent gap between the two. Federal revenues rise, in CBO's projections, from 16.4 percent of GDP in 2020 to 18.2 percent of GDP in 2029. (The projected growth in revenues after 2025 is largely attributable to the scheduled expiration of nearly all of the individual income tax provisions of the

Figure 1-2.

Total Revenues and Outlays

Percentage of Gross Domestic Product

When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. All projections presented here have been adjusted to exclude the effects of those timing shifts. Historical amounts have been adjusted as far back as the available data will allow.

2017 tax act.) Federal outlays, adjusted to exclude shifts in the timing of certain payments, are projected to climb from 21.0 percent of GDP in 2020 to 23.0 percent in 2029 (see Figure 1-2).

Deficits are projected to average 4.7 percent of GDP over the 2020–2029 period. Over the past 50 years, deficits have averaged 2.9 percent of GDP; and in years when the unemployment rate has been below 6 percent, deficits averaged just 1.5 percent of GDP.

Primary deficits—that is, deficits excluding net outlays for interest—are projected to decrease over time, averaging 2.7 percent of GDP from 2020 through 2024 and 2.2 percent from 2025 through 2029. At the same time, because of projected increases in interest rates and federal borrowing, net interest outlays grow steadily, from 1.8 percent of GDP in 2020 to 2.6 percent in 2029 (see Figure 1-3 on page 14).

Those deficits are projected to boost federal debt held by the public, which consists mostly of the securities that the Treasury issues to raise cash to fund federal activities and pay off the government’s maturing liabilities. The

net amount that the Treasury borrows by issuing those securities (calculated as the amounts that are sold minus the amounts that have matured) is influenced primarily by the annual budget deficit.

Consequently, under current law, debt held by the public would increase in upcoming years. In CBO’s baseline, after accounting for all of the government’s borrowing needs, debt held by the public rises from \$17.8 trillion at the end of 2020 to \$29.3 trillion at the end of 2029 (see Table 1-3 on page 15). As a percentage of GDP, that debt would increase from 79 percent in 2019 to 95 percent by the end of the projection period (see Figure 1-4 on page 16). At that point, such debt would be the largest since 1946 and more than twice the 50-year average.

Outlays

Over the coming decade, CBO projects, federal outlays would grow at an average annual rate of 5 percent, reaching \$7.1 trillion in 2029 (adjusted to exclude the effects of timing shifts). Outlays for Social Security, Medicare, and net interest account for about two-thirds of that \$2.7 trillion increase.

Box 1-1.

Recent Data About the Effects of the 2017 Tax Act on Revenues

In December 2017, major tax legislation, originally titled the Tax Cuts and Jobs Act and referred to here as the 2017 tax act, was enacted. The Congressional Budget Office, as part of its regular process of updating its baseline budget projections, has been monitoring the Treasury’s implementation of that act and assessing its effects on revenues.

Currently, only limited information is available about tax returns filed this year for income earned in 2018—the first returns that reflect most of the changes made by the tax act. That information does not give a clear indication about whether the act’s effects differed from those estimated by CBO and the staff of the Joint Committee on Taxation (JCT) when the Congress was considering the act in December 2017.¹ Even when more information becomes available, assessing the act’s effect on receipts may not be possible, because it will be difficult to disentangle changes in revenues caused by the tax act from changes driven by other factors.

Receipts in 2018 and 2019

Data about revenues in fiscal year 2018 and the first 10 months of fiscal year 2019 are available, so those amounts can be compared with CBO’s projections. CBO and JCT estimated in December 2017 that in fiscal years 2018 and 2019, the tax act would reduce revenues by \$144 billion and \$271 billion, respectively. In April 2018, CBO incorporated those projected reductions into its baseline budget projections, estimating that revenues would total \$3,338 billion in fiscal year 2018 and \$3,490 billion in fiscal year 2019.² The April 2018 projections of revenues also incorporated changes to the economic outlook that had taken place between June 2017 and early 2018, some of which reflected the effects of the tax act and some of which were driven by unrelated factors.

Actual revenues in 2018 totaled \$3,330 billion, or \$8 billion less than CBO projected in April 2018. Receipts from individual income taxes were 3 percent higher than CBO had projected,

and receipts from corporate income taxes were 16 percent lower. As for fiscal year 2019, collections so far this year—and especially collections of corporate income taxes—have been lower than CBO expected in April 2018, so the agency now projects that 2019 revenues will total \$3,451 billion, about 1 percent less than the estimate made in April 2018.

One likely reason for the lower-than-expected receipts is that some parts of the economy have been weaker than CBO projected in April 2018—but in CBO’s assessment, that difference has not stemmed from errors in projecting the effects of the 2017 tax act on the economy. Some parts of the economy that CBO expected to be boosted by the tax act, such as investment in 2018, have proved consistent with CBO’s April 2018 projections. CBO estimated that the tax act would increase the growth of real (inflation-adjusted) business fixed investment in 2018 by 2.1 percentage points. Incorporating that effect, CBO projected that investment would grow by 5.9 percent in 2018, and current data show that it did grow by 5.9 percent. And although investment in 2019 has been weaker so far than CBO had projected, a number of developments other than the tax act appear to have contributed to that weakness, including increases in tariffs, greater uncertainty about trade policy, and slower economic growth in the rest of the world.

Recent Data About Individual and Corporate Income Taxes

A full accounting of net individual income taxes that can be attributed to income earned in calendar year 2018 (including withholding in 2018 and payments and refunds in 2019) is consistent with the projections that CBO made in April 2018. Preliminary data related to one of the most significant changes resulting from the 2017 tax act are also consistent with CBO’s expectations. CBO projected that itemized deductions would be reduced after the tax law was enacted, and the Internal Revenue Service’s tabulations of tax returns filed through May 2019 have borne out that projection.³ However, those preliminary tabulations do not help CBO assess the total effect of the tax act because they do not include the full population of tax filers; in particular, filers with high income and complicated tax returns are less likely to be included.

Tax receipts from withholding for individual income and payroll taxes in the first half of calendar year 2019 have been lower

1. See Congressional Budget Office, cost estimate for the conference agreement on H.R. 1 (December 15, 2017), www.cbo.gov/publication/53415.
 2. For those projections, see Congressional Budget Office, *The Budget and Economic Outlook: 2018 to 2028* (April 2018), www.cbo.gov/publication/53651. For an explanation of the changes made by the 2017 tax act and their effects, see Appendix B of that report. The most significant changes of the 2017 tax act took effect after December 31, 2017, and therefore did not begin to influence receipts until partway through fiscal year 2018. The current fiscal year—fiscal year 2019—is thus the first to be covered largely by the new rules.

3. See Internal Revenue Service, “Filing Season Statistics” (June 28, 2019), www.irs.gov/statistics/filing-season-statistics.

Box 1-1.

Continued

Recent Data About the Effects of the 2017 Tax Act on Revenues

than CBO projected in April 2018, but they are consistent with the slower growth in income that CBO currently projects. Taxpayers' estimated payments of individual income taxes have similarly been smaller than CBO expected in April 2018, but the degree to which that difference reflects the slower growth in income is not yet known. Another possible explanation is that taxpayers may have chosen to reduce their estimated payment amounts on the basis of information that they learned from filing their 2018 tax returns. For example, taxpayers whose tax liability was lower than expected may have applied part of their refund to future taxes and reduced their estimated payments in 2019.

The lower-than-expected corporate income tax receipts in fiscal year 2018 probably reflect the continuation of a poorly understood weakness in corporate receipts that predates the 2017 tax act. (Recent revisions to data about corporate income may explain some portion of the weakness; for more information, see Box 2-1 on page 30.) Recent data suggest a strengthening of receipts, however. Net corporate tax receipts were 35 percent larger in June 2019 than they were in June 2018. Those June 2019 receipts generally reflect 2019 income, and CBO's current projections of revenues in 2019 reflect that strengthening of receipts. But it is difficult to interpret recent data on corporate receipts, in part because corporations may calculate and pay taxes for a 12-month period other than the calendar year. As a result, provisions of the 2017 tax act became effective for different corporations at different times, so there is variation in when their payments began to fully reflect the changes made by the 2017 tax act.

Other Sources of Data

One provision of the 2017 tax act that affected some tax returns for 2017 was a onetime tax on previously untaxed foreign profits. Some corporations had to submit information to the Treasury about their total liability for that tax, along with the first installment of the tax, with their 2017 return. However, the information collected by the Treasury may not be complete—which would make it difficult to interpret the information in the 2017 returns.⁴ Furthermore, other corporations did not have to

submit information about their liability and their first installment until they filed their 2018 returns, so until information about those returns becomes available, it will not be possible to estimate the total amount of liability for the onetime tax.

Corporations' financial reports also provide some information about how the 2017 tax act affected them. The reports suggest that many corporations experienced a reduction in their effective tax rate—as calculated for financial reporting purposes—after the tax act was enacted.⁵ Such reductions would be consistent with the effects of the act that CBO projected in April 2018, but because they are based on financial accounting rules rather than tax rules, they cannot be used to calculate the precise change in a company's federal tax payments. Companies also provide some information in their financial reports about how specific provisions affected their taxes, but for many reasons, that information cannot be used to estimate the effect of a provision on federal tax revenues.⁶

Considerations for the Future

CBO will be able to better assess the effects of the 2017 tax act as the Treasury continues to issue guidance and regulations and as more information about 2018 returns becomes available. The earliest that detailed information about those returns will be available to CBO is late 2020.

However, even as more data become available, challenges will remain. For example, how taxpayers responded to the new law in filing their 2018 tax returns may not accurately indicate how they will respond in 2019 and beyond. Also, part of the way in which the 2017 tax act affects the federal budget is through its effects on the economy. But the performance of the economy reflects not just the economic effects of the tax act but also the effects of other changes. As time passes, additional policy changes and unexpected economic developments that are unrelated to the tax act will occur, making it increasingly difficult to estimate the effects of the tax act on the economy.

4. See Treasury Inspector General for Tax Administration, *Implementation of the Tax Cuts and Jobs Act Deemed Repatriation Tax Presented Significant Challenges*, 2019-34-033 (May 2019), <https://go.usa.gov/xytRA> (PDF, 1.6 MB).

5. See, for example, Theo Francis and Richard Rubin, "After U.S. Tax Overhaul, Corporate Rates Fall but Unevenly," *Wall Street Journal* (July 21, 2019), <https://tinyurl.com/yycvtwj>.

6. One important reason is that it accounts for only the effects directly attributed to that provision, not the resulting change in a company's total tax payments (for example, if actions taken by the company to reduce its liability under that provision wind up increasing its liability under other provisions).

Figure 1-3.

Total Deficit, Primary Deficit, and Net Interest

Percentage of Gross Domestic Product

In CBO's projections, primary deficits shrink as a percentage of gross domestic product, but total deficits grow because of rising interest costs.

Source: Congressional Budget Office.

When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. All projections presented here have been adjusted to exclude the effects of those timing shifts. Historical amounts have been adjusted as far back as the available data will allow.

Primary deficits or surpluses exclude outlays for net interest.

Relative to the size of the economy, federal outlays over the 2020–2029 period are projected to average 22.1 percent of GDP, higher than their 50-year average of 20.3 percent. That increase over the historical average is largely attributable to growth in mandatory spending; that spending (net of offsetting receipts) is expected to equal 12.9 percent of GDP in 2020 and grow to 14.7 percent of GDP by 2029 (compared with an average of 9.9 percent over the 1969–2018 period). In contrast, from 2020 to 2029, discretionary outlays are projected to decline from 6.4 percent of GDP to 5.6 percent, compared with an average of 8.4 percent over the previous 50 years. In CBO's projections, net outlays for interest in 2020 are equal to 1.8 percent of GDP, below their 50-year average of 2.0 percent, but they grow over the next decade, reaching 2.6 percent of GDP in 2029 (see Figure 1-5 on page 17).

Mandatory Spending. From 2020 to 2029, outlays for mandatory programs (net of offsetting receipts) are projected to rise by an average of about 5 percent per year, reaching \$4.5 trillion by the end of the period (see Table 1-4 on page 18).

Much of the projected growth in mandatory spending over the coming decade is attributable to two factors. First, the share of the U.S. population that is age 65 or older, which has more than doubled over the past 50 years, is expected to expand by about one-third by 2029.

Second, although growth in the costs of health care (per person, adjusted to account for the aging of the population) has slowed in recent years, that growth is faster than projected growth in the economy over the long term. The reasons for that slowdown are not clear. In CBO's projections, per-enrollee spending in federal health care programs grows more rapidly over the coming decade, although it does not return to the higher rates of growth that were experienced previously.

The effects of those two long-term trends on federal spending are already apparent over the 10-year baseline period—especially for Social Security and Medicare—and will persist beyond that period (see Figure 1-6 on page 20).

GDP = gross domestic product.

- Factors not included in budget totals that also affect the government's need to borrow from the public. Those factors include cash flows associated with federal credit programs such as student loans (because only the subsidy costs of those programs are reflected in the budget deficit), as well as changes in the government's cash balances.
- Debt held by the public minus the value of outstanding student loans and other credit transactions, cash balances, and various financial instruments.
- Federal debt held by the public plus Treasury securities held by federal trust funds and other government accounts.
- The amount of federal debt that is subject to the overall limit set in law. Debt subject to limit differs from gross federal debt mainly in that it excludes debt issued by the Federal Financing Bank and includes certain other adjustments that are excluded from gross debt. The debt limit was most recently set at \$22.0 trillion but has been suspended through July 31, 2021. On August 1, 2021, the debt limit will be raised to its previous level plus the amount of federal borrowing that occurred while the limit was suspended. For more on the debt limit, see Congressional Budget Office, *Federal Debt and the Statutory Limit, February 2019* (February 2019), www.cbo.gov/publication/54987.

Social Security and the Major Health Care Programs.

Outlays for Social Security and the major health care programs (Medicare, Medicaid, subsidies offered through the health insurance marketplaces established under the Affordable Care Act and related spending, and the Children's Health Insurance Program) account for more than 90 percent of the projected growth in nominal mandatory spending through 2029. Under current law,

spending for those programs, net of offsetting receipts, would grow at an average annual rate of 6 percent over the coming decade, CBO estimates, increasing from 10.3 percent of GDP in 2020 to 12.5 percent in 2029.⁸

8. Offsetting receipts primarily include payments of premiums, recoveries of overpayments made to providers, and amounts paid by states from savings on Medicaid's prescription drug costs.

Figure 1-4.

Federal Debt Held by the Public

Percentage of Gross Domestic Product

Source: Congressional Budget Office.

Specifically, in CBO's current baseline:

- Outlays for Social Security total 5.0 percent of GDP in 2020 and then rise steadily thereafter, reaching 5.9 percent of GDP in 2029.
- Outlays for Medicare remain close to 3.0 percent of GDP through 2020 and then grow in each year through 2029, when they total 4.0 percent.
- Federal outlays for Medicaid are relatively stable as a percentage of GDP over the coming decade, averaging about 2 percent each year.
- Outlays for subsidies for health insurance purchased through the marketplaces and related spending are projected to average 0.2 percent of GDP per year through 2029.

Other Mandatory Programs. Aside from spending on Social Security and the major health care programs, all other mandatory spending is projected to decline as a share of GDP, falling from 2.6 percent in 2020 to 2.3 percent in 2029. That category includes spending on income support programs (such as unemployment compensation and the Supplemental Nutrition Assistance Program), military and civilian retirement programs,

most veterans' benefits, and major agriculture programs. The projected decline in spending occurs in part because benefit amounts for many of those programs are adjusted for inflation each year, and inflation in CBO's economic forecast is estimated to be below the rate of growth in nominal GDP. (For more details about CBO's economic forecast, see Chapter 2.)

Discretionary Spending. Projections of discretionary spending for the 2020–2029 period are based on funding provided in 2019 (adjusted for inflation), taking into account limits on such funding required by law. The recently enacted Bipartisan Budget Act of 2019 (P.L. 116-37) raised the limits (or caps) on discretionary appropriations by a total of \$171 billion for 2020 and by \$153 billion for 2021.⁹ CBO's baseline projections for

9. Most discretionary funding is limited by caps on annual discretionary appropriations that were originally specified in the Budget Control Act of 2011 (P.L. 112-25) and modified by subsequent legislation. Under current law, separate caps exist for defense and nondefense funding through 2021. If the total amount of discretionary funding provided in appropriation acts for a given year exceeds the cap for either category, the President must sequester—or cancel—a sufficient amount of budgetary resources (following procedures specified in the Budget Control Act) to eliminate the breach. See Congressional Budget Office, *CBO Estimate for the Bipartisan Budget Act of 2019* (July 2019), www.cbo.gov/publication/55478.

Figure 1-5.

Changes in Projected Outlays From 2019 to 2029

Percentage of Gross Domestic Product

	Outlays		Change (Percentage points)	Major Reasons for Change
	2019	2029		
Social Security	4.9	5.9	1.0	Aging of the population
Major Health Care Programs ^a	5.3	6.6	1.3	Aging of the population; rising costs of health care
Other Mandatory Spending	2.6	2.3	-0.4	Inflation rate is less than nominal GDP growth
Discretionary Spending	6.3	5.6	-0.7	Caps on funding; inflation rate is less than nominal GDP growth
Net Interest	1.8	2.6	0.9	Accumulating debt; rising interest rates

Source: Congressional Budget Office.

When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. Outlays have been adjusted to exclude the effects of those shifts.

GDP = gross domestic product.

a. Consists of outlays for Medicare (net of premiums and other offsetting receipts), Medicaid, and the Children’s Health Insurance Program, as well as outlays to subsidize health insurance purchased through the marketplaces established under the Affordable Care Act and related spending.

those two years incorporate the new limits, and funding for those two years is projected to be at or slightly below those new caps (see Table 1-5 on page 21). For 2022 and later years, those projections reflect the assumption that funding constrained by the caps keeps pace with inflation. Some elements of discretionary funding are not constrained by the caps—in particular, appropriations designated for OCO, activities designated as emergency requirements, and some or all funding for disaster relief and some efforts to reduce overpayments in benefit programs.¹⁰ In addition, in accordance with the 21st Century Cures Act, a portion of funding for certain authorized activities—up to amounts specified in law—is exempt from the caps. For those elements, funding

is generally assumed to grow with inflation from the amounts provided in 2019.¹¹

The Bipartisan Budget Act of 2019 raised the caps on discretionary appropriations subject to the limits to \$1,288 billion in 2020. Discretionary funding is projected to grow at the rate of inflation, unless constrained by the caps; and between 2019 and 2020, projected inflation for defense funding is less than the rate of growth of the cap on such funding. Thus, in CBO’s baseline, discretionary budget authority constrained by the caps is just below that amount, at \$1,286 billion in 2020. By 2021, in CBO’s baseline, discretionary budget authority constrained by the caps equals the combined defense and nondefense limits of \$1,298 billion. The caps expire in 2021, so all budget authority after that

10. The caps are adjusted to accommodate funding for those activities. Beginning in 2020, funding for wildfire suppression and activities related to the 2020 census also will lead to an increase in the nondefense cap, subject to specified limits.

11. Spending for certain transportation programs is controlled by obligation limitations, which also are not constrained by the caps on discretionary spending.

Outlays Adjusted to Remove the Effects of Timing Shifts, Net of Offsetting Receipts

Medicare ^a	605	636	673	721	776	833	895	959	1,026	1,106	1,171	1,243	3,899	9,403
Major health care programs	1,061	1,114	1,163	1,226	1,310	1,399	1,493	1,591	1,695	1,811	1,914	2,028	6,591	15,630

- a. When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. Outlays presented in this table for programs affected by such timing shifts have been adjusted to exclude the effects of those shifts.
- b. Excludes the effects of Medicare premiums and other offsetting receipts. (Net Medicare spending, which includes those offsetting receipts, is shown in the memorandum section of the table.)
- c. Consists of outlays to subsidize health insurance purchased through the marketplaces established under the Affordable Care Act and provided through the Basic Health Program, as well as spending to stabilize premiums for health insurance purchased by individuals and small employers.
- d. Includes outlays for the American Opportunity Tax Credit and other credits.
- e. Includes Temporary Assistance for Needy Families, Child Support Enforcement, Child Care Entitlements to States, and other programs that benefit children.
- f. Includes benefits for retirement programs in the civil service, foreign service, and Coast Guard; benefits for smaller retirement programs; and annuitants' health care benefits.
- g. Includes veterans' compensation, pensions, and life insurance programs. (Outlays for veterans' health care are classified as discretionary.)
- h. Cash payments from Fannie Mae and Freddie Mac to the Treasury are recorded as offsetting receipts in 2018 and 2019. Beginning in 2020, CBO's estimates reflect the net lifetime costs—that is, the subsidy costs adjusted for market risk—of the guarantees that those entities will issue and of the loans that they will hold. CBO counts those costs as federal outlays in the year of issuance.
- i. Includes premium payments, recoveries of overpayments made to providers, and amounts paid by states from savings on Medicaid's prescription drug costs.

Figure 1-6.

CBO's Baseline Projections of Outlays and Revenues, Compared With Actual Values 25 and 50 Years Ago

Percentage of Gross Domestic Product

Source: Congressional Budget Office.

In 2028, October 1 (the first day of fiscal year 2029) falls on a weekend, so certain payments that are due on that date will instead be made in September, thus boosting outlays in fiscal year 2028 and reducing them in 2029. Such shifts affect projections of outlays for the major health care programs, other mandatory outlays, defense discretionary outlays, total outlays, and the deficit. A similar shift boosted outlays in those categories in 1994. The data presented here have been adjusted to exclude the effects of those timing shifts.

a. Consists of outlays for Medicare (net of premiums and other offsetting receipts), Medicaid, and the Children's Health Insurance Program, as well as outlays to subsidize health insurance purchased through the marketplaces established under the Affordable Care Act and related spending.

year is assumed to grow with inflation for the duration of the baseline projection period.

In addition to budget authority constrained by the caps, CBO projects funding of \$121 billion in 2020 and in 2021 for overseas contingency operations and other activities not constrained by the caps. Included in those totals are amounts for emergency requirements—\$25 billion in 2020 and \$26 billion in 2021.¹² Those

amounts are based on the \$25 billion appropriated for emergencies in 2019, which is assumed to grow with inflation for the rest of the projection period. (For comparison, emergency funding averaged \$25 billion per year from 2012 to 2018.)

Between 2020 and 2029, total discretionary budget authority is projected to rise by about 2 percent a year, on average. Measured in dollar terms, total discretionary outlays would climb from \$1.4 trillion in 2020 to \$1.7 trillion in 2029, for an average yearly increase of

Source: Congressional Budget Office.

CBO's current baseline projections incorporate the assumption that the caps on discretionary budget authority and the automatic enforcement procedures specified in the Budget Control Act of 2011 (as amended) remain in effect through 2021.

Nondefense discretionary outlays are usually greater than budget authority because of spending from the Highway Trust Fund and the Airport and Airway Trust Fund that is subject to obligation limitations set in appropriation acts. The budget authority for such programs is provided in authorizing legislation and is considered mandatory.

n.a. = not applicable.

- The amount of budget authority for 2018 and for 2019 in CBO's baseline does not match the sum of the caps on funding plus adjustments to the caps, mostly because changes to mandatory programs included in appropriation acts for those years (including those assumed to be enacted for 2019) are credited against the caps. In the baseline, those changes (which reduce mandatory budget authority in both years) appear in their normal mandatory accounts.
- The amount of budget authority for 2020 in CBO's baseline is less than the sum of the caps on funding plus adjustments to the caps because discretionary funding is projected to grow at the rate of inflation unless constrained by the caps; projected inflation for defense funding between 2019 and 2020 is less than the rate of growth of the cap on such funding.
- When October 1 (the first day of the fiscal year) falls on a weekend, certain payments—mainly for military pay—that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year.
- Some or all of the discretionary funding related to five types of activities is not constrained by the caps; for most of those activities, the caps are adjusted to accommodate such funding, up to certain limits. Specifically, appropriations designated for overseas contingency operations and activities designated as emergency requirements are assumed to grow with inflation after 2019, and the caps are adjusted accordingly. For two other activities—disaster relief and certain efforts to reduce overpayments in benefit programs—the extent to which the caps can be adjusted is subject to annual constraints, as specified in law. (Beginning in 2020, funding for wildfire suppression and the 2020 census also will lead to an increase in the nondefense caps, subject to specified limits.) Finally, CBO follows a similar approach in projecting a portion of funding to carry out the 21st Century Cures Act (Public Law 114-255), which requires that discretionary funding for certain authorized activities—up to amounts specified in law—be excluded from calculations of the caps.

about 2½ percent. Measured as a share of GDP, though, discretionary outlays would drop from 6.4 percent in 2020 to 5.6 percent in 2029. That 2029 percentage would be the smallest in any year since 1962 (the earliest year for which such data have been reported); by comparison, discretionary outlays averaged 8.4 percent of GDP over the past 50 years, although they were as low as 6.0 percent of GDP in 1999.

Defense. Budget authority for defense programs—including funding for OCO—is projected to equal \$737 billion in 2020, which is \$19 billion (or 3 percent) greater than it was in 2019.¹³ After 2020, funding is estimated to grow by 2 percent a year, on average, reaching \$905 billion in 2029. Outlays for defense programs are projected to be \$670 billion in 2019 and \$700 billion in 2020. They then grow at a rate similar to that of budget authority, rising to \$874 billion in 2029. Despite that growth, discretionary defense outlays as a percentage of GDP are projected to fall from 3.2 percent in 2019 to 2.8 percent in 2029.

Nondefense. Budget authority for nondefense programs is also projected to rise in 2020. In CBO’s projections, nondefense discretionary budget authority is \$669 billion in that year, an increase of \$11 billion (or 2 percent) over 2019 amounts. After 2020, funding is projected to grow by 2 percent a year, on average, reaching \$818 billion in 2029. Discretionary outlays for nondefense programs are estimated to total \$662 billion in 2019 and projected to be \$700 billion in 2020; they would then follow the same trajectory as budget authority, increasing to \$868 billion in 2029. Relative to the size of the economy, outlays for nondefense discretionary programs are projected to fall from 3.1 percent of GDP in 2019 to 2.8 percent of GDP in 2029.

Net Interest. In the budget, net interest outlays primarily encompass the government’s interest payments on federal debt, offset by interest income that the government receives. Net outlays for interest are dominated by the interest paid to holders of the debt that the Treasury Department issues to the public. The Treasury also pays interest on debt issued to trust funds and other government accounts, but such payments are intragovernmental transactions that have no effect on the budget deficit.

13. If budget authority for defense programs was equal to the cap in 2020 and not slightly below it, funding in that year would be \$21 billion (or 2.9 percent) greater than it was in 2019.

In CBO’s projections, net outlays for interest increase from \$372 billion in 2019 to more than double that amount—\$807 billion—by 2029. As a result, under current law, outlays for net interest are projected to grow from 1.8 percent of GDP in 2019 to an average of 2.5 percent from 2025 to 2029 (see Table 1-6). That amount is 0.5 percentage points higher than their 50-year average as a share of economic output. The primary factors that affect the federal government’s net interest costs are the amount of debt held by the public and interest rates on Treasury securities.

The increase in federal borrowing projected in the baseline is the most significant factor affecting the projected growth in net interest costs. Those costs are also boosted by higher interest rates on federal borrowing as Treasury securities that were issued when interest rates were relatively low mature and are rolled over and as interest rates on Treasury securities rise over the next decade. In 2018, the average interest rate on debt held by the public was 2.3 percent; that rate is estimated to reach 3.0 percent in 2029. As a result, debt held by the public is projected to rise by 86 percent (in nominal terms) over the next 11 years, increasing from \$15.8 trillion, or 78 percent of GDP, at the end of 2018 to \$29.3 trillion, or 95 percent of GDP, in 2029.

Revenues

Under current law, revenues are projected to grow by \$2.2 trillion over the projection period—an average annual increase of 5 percent, nearly the same rate of increase that CBO projects for outlays through 2029 (after adjusting for the timing of certain payments). As a share of GDP, total revenues are projected to rise from 16.3 percent this year to 18.2 percent in 2029. That growth mainly reflects an increase in revenues relative to GDP from individual income taxes and, to a lesser extent, from corporate income taxes. Other sources of revenues are projected to grow at the same pace as GDP (see Figure 1-7). The largest movements over the next decade are the following:

- Individual income tax receipts are projected to increase relative to GDP in each year from 2019 to 2029 because of the expiration of provisions of the 2017 tax act that have temporarily lowered receipts relative to taxable personal income, because of real bracket creep, and from other factors (explained in more detail, below).

Source: Congressional Budget Office.

This table satisfies a requirement specified in section 3111 of S. Con. Res. 11, the Concurrent Resolution on the Budget for Fiscal Year 2016.

- a. Consists of outlays for Medicare (net of premiums and other offsetting receipts), Medicaid, and the Children's Health Insurance Program, as well as outlays to subsidize health insurance purchased through the marketplaces established under the Affordable Care Act and related spending.
- b. Includes payroll taxes other than those paid by the federal government on behalf of its employees; those payments are intragovernmental transactions. Also includes income taxes paid on Social Security benefits, which are credited to the trust funds.
- c. Does not include outlays related to administration of the program, which are discretionary. For Social Security, outlays do not include intragovernmental offsetting receipts stemming from the employer's share of payroll taxes paid to the Social Security trust funds by federal agencies on behalf of their employees.
- d. The net increase in the deficit shown in this table differs from the change in the trust fund balance for the associated program. It does not include intragovernmental transactions, interest earned on balances, or outlays related to administration of the program.

Figure 1-7.

Changes in Projected Revenues From 2019 to 2029

Percentage of Gross Domestic Product

	Revenues		Change (Percentage points)	Major Reasons for Change
	2019	2029		
Individual Income Taxes	8.0	9.6	1.6	Expiration of temporary tax provisions after 2025; real bracket creep ^a
Payroll Taxes	5.9	5.9	*	Not applicable
Corporate Income Taxes	1.1	1.3	0.3	Scheduled changes in tax rules enacted in the 2017 tax act; dissipation of temporary weakness in recent tax collections
Other Sources of Revenue	1.3	1.3	*	Not applicable

Source: Congressional Budget Office.

* = between zero and 0.05 percent of gross domestic product.

a. Real bracket creep occurs when more income is pushed into higher tax brackets because people's income is rising faster than inflation.

- Corporate income tax receipts are projected to increase relative to GDP in each year from 2019 to 2025 and then gradually decline. Those receipts are boosted over the next decade by scheduled changes in tax rules enacted by the 2017 tax act, as well as the expectation that recent unexplained weakness in collections will slowly dissipate. After 2025, corporate income taxes are projected to shrink as a share of the economy, mostly because of the end of the scheduled payments for a onetime tax on previously untaxed foreign profits.
- Estate and gift tax receipts are projected to increase slightly relative to GDP through 2026 and then increase greatly, as the provision in the 2017 tax act that doubled the exemption amount expires.

Individual Income Taxes. If current laws remain generally unchanged, receipts from individual income taxes would rise by 1.6 percentage points as a share of economic output over the next decade—from 8.0 percent in 2019 to 9.6 percent by 2029—CBO estimates.

Expiration of Temporary Tax Provisions After 2025. The most significant factor pushing up taxes relative to income is the scheduled expiration, after tax year 2025,

of nearly all the individual income tax law changes made by the 2017 tax act. The provisions that are scheduled to expire include lower statutory tax rates, the higher standard deduction, the repeal of personal exemptions, and the expansion of the child tax credit. Those expirations would cause tax liabilities to rise in calendar year 2026, boosting individual income tax receipts relative to GDP by 0.8 percentage points.

Real Bracket Creep and Related Factors. The second most significant factor pushing up taxes relative to income arises from the way certain parameters of the tax system are scheduled to change over time in relation to growth in income, which reflects the effects of both real (inflation-adjusted) economic activity and inflation. The most important component of that effect, real bracket creep, occurs because the income tax brackets are indexed only to inflation. If income grows faster than inflation, as generally occurs when the economy is expanding, more income is pushed into higher tax brackets. Still other parameters of the tax system, including the amount of the child tax credit, are fixed in nominal dollars and are not adjusted for inflation. In CBO's baseline, those factors cause projected revenues measured as a percentage

of GDP to rise by 0.5 percentage points from 2019 to 2029.¹⁴

Other Factors. Over the next decade, other factors would raise projected receipts as a share of GDP by 0.3 percentage points, on net, in CBO’s estimation. Several factors would boost individual income tax receipts relative to GDP. According to CBO’s projections, taxable personal income, which includes wages and salaries, and taxable distributions from tax-deferred retirement accounts would both grow faster than GDP through 2029. CBO also expects wages and salaries to increase faster for people with higher earnings than for others during the next decade—as has been the case for the past several decades—pushing a larger share of income into higher tax brackets. Finally, in addition to the individual income tax provisions that are scheduled to expire after 2025, rules allowing accelerated depreciation deductions for certain business investments are scheduled to phase out between 2022 and 2027. Partially offsetting those tax increases is a projected decline in realizations of capital gains relative to the size of the economy. Those realizations are projected to gradually return to levels consistent with their historical average share of GDP (after accounting for differences in applicable tax rates) by 2029.

Corporate Income Taxes. Under current law, corporate income tax receipts would rise from 1.1 percent of GDP in 2019 to 1.5 percent of GDP in 2025 and then decline to 1.3 percent of GDP by 2029.

Provisions of the 2017 Tax Act. A number of provisions of the 2017 tax act will affect corporate taxes over the next decade, raising receipts as a share of GDP by 0.2 percentage points between 2019 and 2029, on net. Most significantly, provisions allowing firms to immediately deduct from their taxable income 100 percent of their investments in equipment are scheduled to phase out between 2023 and 2026. Several other provisions of the tax act will alter how businesses calculate their tax liability over the next decade and, as a result, will boost receipts. Among those provisions is a change in how taxable income is calculated, which results from new limits on the deductibility of interest expenses that take effect in 2022. Also in 2022, firms will be required to capitalize and amortize certain expenditures for research and experimentation as they are incurred over a five-year period,

rather than immediately deducting them. Rules related to the taxation of profits abroad will also change in 2026, increasing revenues in subsequent years. Provisions with such rules include the tax on Global Intangible Low-Taxed Income, the deduction for Foreign-Derived Intangible Income, and the Base Erosion and Anti-Abuse Tax.¹⁵

Receipts will be further affected over the next decade by the end of the scheduled payments for a onetime tax on previously untaxed foreign profits. Taxes on those earnings, which are based on the value of those profits as of late 2017 (and which are unrelated to future business activity), can be paid in installments over the next eight years. Because the required installments are not equal in size, the effect of those receipts in CBO’s baseline varies over the 2019–2026 period. As a result, those payments are projected to boost receipts to varying degrees from 2019 through 2026 but not in subsequent years, thereby contributing to the reduction in receipts in relation to GDP through 2029.

Temporary Weakness in Recent Tax Collections. Corporate tax collections in 2018 and early 2019 were weaker than can be explained by the available data on business activity. (After this analysis was completed, the Bureau of Economic Analysis released its annual revisions of historical economic data. Those revisions included significant reductions in estimated corporate profits for 2017 and 2018, which probably explain part of the weakness in observed collections. For a discussion of those revisions, see Box 2-1 on page 30.) The full set of factors responsible for that weakness, and the extent to which they relate to the 2017 tax act or other factors, will not become apparent until detailed information from tax returns becomes available over the next few years. Depending on the source, the effects of those factors on receipts might be expected to persist permanently, end abruptly, or even reverse. In CBO’s projections, unexplained weakness is anticipated to continue temporarily and gradually dissipate over the next few years, boosting corporate income tax receipts by 0.1 percent of GDP from 2020 to 2029.

Estate and Gift Taxes. As a result of a provision in the 2017 tax act that temporarily doubles the amount of the estate and gift tax exemption through tax year 2025,

14. See Congressional Budget Office, “How Income Growth Affects Tax Revenues in CBO’s Long-Term Budget Projections” (presentation, June 2019), www.cbo.gov/publication/55368.

15. For additional explanation of the tax provisions included in the 2017 tax act, see Congressional Budget Office, *The Budget and Economic Outlook: 2018 to 2028* (April 2018), pp. 108–110, www.cbo.gov/publication/53651.

revenues from that source are projected to drop in 2019 to less than 0.1 percent of GDP. In 2027 and later years, projected revenues from estate and gift taxes rise to just above 0.1 percent.

Receipts From Other Sources. Receipts from all other sources are expected to remain at about the same share of GDP over the next decade.

- Between 2019 and 2029, receipts from payroll taxes, which fund social insurance programs, are projected to rise only slightly as a share of the economy. Those receipts are expected to remain close to 5.9 percent of GDP throughout the next decade because workers' earnings, which constitute most of the payroll tax base, remain relatively stable as a share of GDP.
- Customs duties, which are assessed on certain imports, are projected to remain between 0.3 percent and 0.4 percent of GDP throughout the next decade. Those duties include tariffs implemented by the Administration during 2018 and 2019.¹⁶ For example, in May 2019, tariffs were raised from 10 percent to 25 percent on \$164 billion of imports from China. CBO's baseline incorporates the assumption that tariffs, along with any subsequent exemptions provided by the Administration, continue throughout the projection period at the rates in effect as of July 25, 2019.¹⁷
- The federal government also collects revenues in the form of excise taxes, remittances from the Federal

Reserve, and miscellaneous fees and fines. CBO projects that, under current law, revenues from each of those sources would grow at the same pace as GDP through 2029.

Tax Expenditures. The tax rules that form the basis for CBO's projections include an array of exclusions, deductions, preferential rates, and credits. Those provisions reduce revenues for any given level of tax rates in both the individual and corporate income tax systems. Many of those provisions are called tax expenditures because, like government spending programs, they provide financial assistance for particular activities as well as to certain entities or groups of people.

Tax expenditures have a major effect on the federal budget. In fiscal year 2019, the value of the more than 200 tax expenditures in the individual and corporate income tax systems will total about \$1.6 trillion—or 7.8 percent of GDP—if their effects on payroll as well as income taxes are included.¹⁸ That amount, which was calculated by CBO on the basis of estimates prepared by the staff of the Joint Committee on Taxation, equals almost half of all federal revenues projected to be collected in 2019 and exceeds all projected discretionary outlays combined.¹⁹

Uncertainty in Budget Projections

CBO's baseline budget projections are intended to show what would happen to federal spending, revenues, and deficits and debt if current laws governing spending and taxes generally remained the same. Changes to laws—particularly those affecting fiscal policies—that cause them to differ from the laws underlying CBO's baseline projections could lead to budgetary outcomes that diverge considerably from those in the baseline.

Even if federal laws remained the same for the next decade, actual budgetary outcomes would differ from

16. The Administration's recent actions on tariffs were taken under authority granted in section 232 of the Trade Expansion Act of 1962 and sections 201 and 301 of the Trade Act of 1974.

17. Specifically, the baseline projections incorporate the assumption that, in cases in which the Administration exercises its broad authority to impose tariffs without legislative action, the tariffs in effect when the analysis was completed would continue permanently without planned or unplanned changes. The tariffs imposed during the past two years include those on imports of solar panels and certain appliances, which took effect on February 7, 2018; on steel and aluminum imports from most countries, which took effect on March 23, 2018; and on a range of products imported from China, the first of which took effect on July 6, 2018. On August 1, 2019, the President announced that tariffs would be imposed on an additional \$300 billion of Chinese imports beginning on September 1, 2019; on August 13, the U.S. Trade Representative announced that those tariffs would be delayed on certain products. Those scheduled changes to tariffs are not included in CBO's current baseline projections.

18. Most estimates of tax expenditures include only their effects on individual and corporate income taxes. However, tax expenditures can also reduce the amount of income subject to payroll taxes. Tax expenditures that reduce the tax base for payroll taxes will eventually decrease spending for Social Security by reducing the earnings base on which Social Security benefits are calculated.

19. For more information on how that total was determined, as well as estimates of the size of the 10 largest tax expenditures in 2019, see Congressional Budget Office, *The Budget and Economic Outlook: 2019 to 2029* (January 2019), pp. 99–102, www.cbo.gov/publication/54918.

Figure 1-8.

The Uncertainty of CBO’s Baseline Projections of the Budget Deficit

Percentage of Gross Domestic Product

Source: Congressional Budget Office.

When October 1 (the first day of the fiscal year) falls on a weekend, certain payments that would have ordinarily been made on that day are instead made at the end of September and thus are shifted into the previous fiscal year. All projections presented here have been adjusted to exclude the effects of those timing shifts. Historical amounts have been adjusted as far back as the available data will allow.

CBO’s baseline projections because of unanticipated changes in economic conditions and in other factors that affect federal spending and revenues. CBO’s projections of outlays and revenues and, therefore, of deficits and debt depend in part on the agency’s economic projections for the coming decade, which include forecasts for such variables as interest rates, inflation, and growth in productivity. Discrepancies between those forecasts and actual economic outcomes can cause significant differences between baseline budget projections and budgetary outcomes. Such differences might also be caused by unanticipated developments, such as new trends in spending on health care or a crisis in the financial sector. CBO aims for its projections to be in the middle of the distribution of possible outcomes, given the baseline assumptions about federal tax and spending policies, and recognizes that actual outcomes will typically differ to some degree from any such projections.

Historical experience gives some indication of the magnitude of the uncertainty of budget projections. On the basis of an analysis of its past projections, CBO estimates that there is approximately a two-thirds chance that in 2020 the deficit under current law would be between

3.5 percent and 5.6 percent of GDP. The range in 2024 would be larger: CBO estimates that, under current law, there is approximately a two-thirds chance that the deficit would be between 2.9 percent and 6.7 percent of GDP in that year (see Figure 1-8).

Errors in the projections of debt tend to compound over time, so the uncertainty surrounding those projections is greater. For example, in CBO’s baseline, federal debt held by the public is projected to equal 88 percent of GDP in 2024. After analyzing its past projections, CBO estimates that there is approximately a two-thirds chance that, under current law, federal debt would be between 79 percent and 97 percent of GDP in that year.

The Long-Term Outlook for the Budget

Beyond the coming decade, the fiscal outlook is more challenging. Although long-term budget projections are highly uncertain, the aging of the population and growth in per capita spending on health care would almost certainly boost federal outlays significantly relative to GDP after 2029 if current laws generally remained in effect. Outlays would be further boosted by sizably higher interest costs, driven by projected increases in federal

borrowing. Although federal revenues would continue to rise relative to GDP under current law, they would not keep pace with outlays. As a result, CBO estimates, public debt would reach a higher percentage of GDP by 2049 (taking into account the effects of the rising debt on the economy) than has been previously recorded in the United States.²⁰ Moreover, debt is on track to grow even larger after 2049. If federal debt as a percentage of GDP continues to rise at the pace that CBO projects it would under current law, the economy would be affected in two significant ways:

- That debt path would dampen economic output over time, and
- Rising interest costs associated with that debt would increase interest payments to foreign debt holders and thus reduce the income of U.S. households by increasing amounts.

20. For more information, see Congressional Budget Office, *The 2019 Long-Term Budget Outlook* (June 2019), www.cbo.gov/publication/55331. CBO will next update its long-term projections in 2020.

That debt path would also pose significant risks to the fiscal and economic outlook, although those risks are not currently apparent in financial markets. In particular, the significant increase in federal borrowing would elevate the risk of a fiscal crisis and would limit lawmakers' ability to adopt deficit-financed fiscal policies to respond to unforeseen events or for other purposes. Negative economic and financial effects that were less abrupt but still significant—such as higher inflation expectations or an increased burden of financing public and private activity in international markets—would also have a greater chance of occurring. Those effects would worsen the consequences associated with high and rising federal debt.

To put debt on a sustainable path, lawmakers will have to make significant changes to tax and spending policies—increasing revenues more than they would under current law, reducing spending below projected amounts, or adopting some combination of those approaches.

CHAPTER
2

The Economic Outlook

Overview

If current laws governing federal taxes and spending generally remained in place, the economy would expand by 2.3 percent this year and then grow at an average annual rate of 1.8 percent over the next decade, the Congressional Budget Office projects. The current pace of job gains remains solid, the unemployment rate is near its lowest point in five decades, and wage growth has been strong. In CBO's projections, from 2019 to 2023, economic growth gradually slows as the growth of consumer spending subsides; as growth in purchases by federal, state, and local governments ebbs; and as trade policies weigh on economic activity, particularly business investment. From 2024 to 2029, economic growth is largely determined by underlying trends in the growth of the labor force and productivity.

The agency's economic forecast, which underlies its baseline budget projections, includes projections of real (inflation-adjusted) gross domestic product (GDP; also referred to as output or actual output), inflation, interest rates, and other key variables for 2019 through 2029. Considerable uncertainty stemming from recent and prospective policy changes and non-policy-related factors surrounds those projections. (CBO's economic projections were completed in late July and do not reflect subsequently released economic data; see Box 2-1.)

Fiscal and Trade Policies

Federal fiscal and trade policies under current law affect CBO's economic outlook in a variety of ways. CBO's economic projections incorporate the assumptions that new limits on discretionary funding contained in the Bipartisan Budget Act of 2019 (Public Law 116-37) will boost federal discretionary outlays and that many temporary provisions of the 2017 tax act (P.L. 115-97, originally called the Tax Cuts and Jobs Act) will phase out or expire. The increase in federal spending is projected to boost economic growth by providing fiscal stimulus over the next few years. In later years, the agency projects that high and rising levels of federal borrowing would reduce private investment activity. In addition, the expiration of

the temporary provisions of the 2017 tax act—including the expiration of most of the provisions affecting individual income taxes at the end of 2025 and the phaseout of bonus depreciation by the end of 2026—is projected to temporarily slow economic growth.

CBO's economic projections also incorporate the assumption that U.S. tariffs imposed by the Administration and in effect as of July 25, 2019 (the day the agency completed its economic projections), and tariff increases on U.S. exports implemented by other countries will remain in place through 2029. Those tariffs affect CBO's projections of trade flows, prices, and U.S. output over the next decade. On balance, tariffs are projected to lower economic output, primarily by making consumer goods and investment goods (such as structures and equipment) more expensive. Uncertainty about future trade policies also reduces business investment. Those economic effects wane after 2020 as businesses make adjustments to their supply chains to mitigate the costs associated with the tariffs.

Projections for 2019 to 2023

In CBO's projections for the next five years, real GDP initially exceeds its maximum sustainable level and then falls below that level because of slower but still positive economic growth. That sustained economic growth continues to support the demand for labor, driving up employment and wages. After falling in 2019, interest rates are expected to increase in 2020 as wage growth, inflation, and foreign economic growth pick up.

Output. Compared with the 2.5 percent pace of growth in 2018, output growth under current law is expected to slow. Real GDP is projected to grow by 2.3 percent in 2019 and then by 1.8 percent per year, on average, over the 2020–2023 period (see Figure 2-1 on page 32).

The slowdown in growth this year largely results from slower growth of business fixed investment as the positive effects of the 2017 tax act on investment growth wane, lower oil prices than in 2018 reduce drilling activity,

Box 2-1.

Revisions to the National Income and Product Accounts

In late July, the Bureau of Economic Analysis (BEA) released its annual revision of the national income and product accounts (NIPAs), as well as new data about economic growth during the first half of 2019. The revision incorporated new data from various sources, as well as some changes in statistical methodology.

BEA revised its estimates of the annual growth of real gross domestic product (GDP) from 2014 to 2018, although the average annual growth rate over that entire period was unchanged. In addition, BEA increased its estimates of personal income in recent years and decreased its estimates of corporate income. The Congressional Budget Office completed its forecast before BEA released that new information, but an initial review does not suggest a substantial change to CBO's projections of economic growth.

Revisions to Historical Data

The largest change to GDP growth for an individual year (measured on a fourth-quarter-to-fourth-quarter basis) was a downward revision to the rate of growth in 2018 to 2.5 percent from the previously published 3.0 percent. Because BEA increased its estimates of GDP growth in 2014, 2016, and 2017, there was no net reduction in the average annual growth rate for the 2014–2018 period.

BEA's estimates of total national income were little changed, but significant revisions occurred for domestic corporate profits and for wages and salaries, which together make up the bulk of taxable income. In particular, domestic corporate profits were revised downward by \$99 billion for 2017 and by \$205 billion for 2018; wages and salaries were revised upward

by \$67 billion for 2018. In addition, BEA increased its estimate of disposable personal income for 2018 by \$220 billion, in part because of the revision to wages and salaries and also because of an upward revision of \$86 billion to personal interest receipts. As a result of the higher estimates of disposable personal income, the personal saving rate was also revised upward.

Key price indexes in the NIPAs—including for GDP, personal consumption expenditures (PCE), and core PCE (which excludes changes in food and energy prices)—were largely unchanged.

Growth in 2019

BEA also revised its estimate of GDP for the first quarter of 2019 and released its initial estimate of growth for the second quarter. The new data indicate that real GDP grew at an annual rate of 2.6 percent in the first half of 2019—higher than the 2.4 percent CBO incorporated into its economic forecast. That difference reflects more consumer spending and fixed investment, partly offset by lower net exports. An initial review of that new data indicates that CBO's projection of economic growth of 2.3 percent between the fourth quarter of 2018 and the fourth quarter of 2019, although made before the publication of the new data, remains a reasonable prospect.

Consistent with the revisions to income for 2017 and 2018, the new data show an upward revision of \$199 billion to wages and salaries in the first quarter of 2019 and a downward revision of \$252 billion to domestic corporate profits in that quarter. For 2019 as a whole, wages and salaries are now likely to be stronger and corporate profits weaker than in CBO's projection.

slower growth in demand reduces businesses' incentive to expand their capacity, tariffs make new structures and equipment more expensive, and uncertainty about trade policies leads some businesses to delay investments or forgo them entirely.

From 2020 to 2023, in CBO's projections, the growth of output slows further because of slower growth in consumer spending and in the purchases of goods and services by federal, state, and local governments. Increased tariffs on certain imported and exported goods, on balance, are expected to have a small negative effect on output over the next few years. Additionally, businesses'

uncertainty about trade policies is expected to continue to weigh on private investment and, thus, output.

Output Gap. CBO estimates that GDP has exceeded potential GDP since early 2018. (Potential GDP is an estimate of the maximum sustainable output of the economy.) As a result of robust economic growth throughout 2018 and early 2019, the output gap—the difference between actual and potential GDP, expressed as a percentage of potential GDP—peaked earlier this year. When GDP is above its potential (as it is now), it indicates that the demand for goods and services exceeds the economy's maximum sustainable level of production, which leads to heightened demand for labor as well as

upward pressure on inflation and interest rates. Real GDP is expected to grow more slowly than its potential over the next few years, falling below the level of real potential GDP by the end of 2022. That development would reduce the upward pressure on inflation and interest rates.

Labor Market. The labor market carried momentum from 2018 into the first half of 2019 and is expected to continue to grow at a healthy, albeit slower, pace over the next several years. In CBO’s projections, the unemployment rate averages 3.7 percent in 2019 and 2020 and then steadily rises to 4.6 percent by the end of 2023 as output growth slows. Employment rose above its potential, or maximum sustainable, level in 2018 and is expected to remain above its potential level over the entire 2019–2023 period. The labor force participation rate is projected to remain stable through 2020 before falling gradually toward its long-run trend. Wage growth has accelerated and become increasingly broad-based in recent years, with low-wage earners experiencing particularly robust gains in their hourly wages. In CBO’s projections, wage growth picks up further before slowing in 2021.

Inflation and Interest Rates. Inflation, as measured by the growth rate of the price index for personal consumption expenditures (PCE), remained below the Federal Reserve’s 2 percent long-run objective in early 2019. The Federal Reserve reduced its target range for the federal funds rate (the interest rate that financial institutions charge each other for overnight loans of their monetary reserves) in late July—at least in part because of low inflation and increased risks to U.S. economic growth stemming from international trade tensions and slower foreign economic growth.

After 2019, CBO expects a number of factors to temporarily push inflation above the Federal Reserve’s 2 percent long-run objective. CBO expects the Federal Reserve to maintain its current target range for the federal funds rate through most of 2020 and then increase that range at the end of next year, which would put upward pressure on other interest rates.

Projections for 2024 to 2029

CBO’s projections of GDP, unemployment, inflation, and interest rates for 2024 through 2029 are based mainly on the agency’s projections of underlying trends in the factors that determine those variables. Over most of that period, in CBO’s forecast, real GDP tends to

grow at the same rate as potential GDP, which is determined by factors such as the size of the labor force, the average number of labor hours per worker, capital investment, and productivity. In analyzing those factors, CBO takes into account the effects of federal tax and spending policies—as well as trade and other public policies—embodied in current law. In some cases, the agency expects that policies would change the output gap not only by affecting potential output but also by influencing the overall demand for goods and services.

In CBO’s projections, potential output grows more quickly over the next decade than it has since the 2007–2009 recession, mainly because potential labor force productivity grows more quickly than it has since then. Nevertheless, the growth of potential output is projected to be slower than its long-term historical average since 1950 because the working-age population (and hence the potential labor force) and productivity are expected to grow more slowly than they did, on average, in the past. From 2024 to 2029, growth of potential output is about 1.8 percent per year.

The agency expects inflation, as measured by the growth rate of the PCE price index, to average 2.0 percent from 2024 to 2029. Over that period, in CBO’s projections, interest rates gradually rise in response to increases in federal debt as a percentage of GDP, as well as continued improvements in the global economy.

Uncertainty

A range of developments, such as unexpected changes in international conditions, business confidence, or productivity growth, could make economic outcomes differ significantly from CBO’s projections. Prospective changes in U.S. trade policies and possible retaliatory actions by U.S. trading partners add to that uncertainty. If trade disputes were resolved such that trade barriers were lowered or removed, economic growth would be faster than CBO projects. Conversely, if trade barriers increased, economic growth would be slower than CBO projects.

The agency constructs its projections so that they represent the average of a distribution of possible outcomes under current law. For example, CBO projects that real GDP will grow at an average annual rate of 2.0 percent (on a calendar year basis) over the 2019–2023 period. However, CBO also estimates that—if the errors in the agency’s current economic forecast are similar to those in its previous forecasts—there is approximately a

Figure 2-1.

CBO's Economic Forecast in Brief

Percent

In CBO's forecast, the growth of output slows over the next few years as growth in consumer spending subsides; as growth in purchases by federal, state, and local governments ebbs; and as trade policies weigh on economic activity.

Percentage of Potential GDP

As the growth of output slows, the gap between GDP and its potential narrows, easing the upward pressure on wages and prices, and GDP ultimately falls below its potential in 2022.

Percent

Wage growth, which tends to lag movements in output growth, is expected to pick up further in the next few years before slowing.

Sources: Congressional Budget Office; Bureau of Economic Analysis; Bureau of Labor Statistics; Federal Reserve.

Real values are nominal values that have been adjusted to remove the effects of changes in prices. The growth of real GDP is measured from the fourth quarter of one calendar year to the fourth quarter of the next.

Potential GDP is CBO's estimate of the maximum sustainable output of the economy. The output gap is the difference between GDP and potential GDP, expressed as a percentage of potential GDP. A positive value indicates that GDP exceeds potential GDP; a negative value indicates that GDP falls short of potential GDP. Values for the output gap are for the fourth quarter of each year.

Wages are measured using the employment cost index for wages and salaries of workers in private industry. Growth in wages is measured from the fourth quarter of one calendar year to the fourth quarter of the next.

Continued

Figure 2-1.

Continued

CBO's Economic Forecast in Brief

Percent

After 2019, CBO expects a number of factors, including strong demand for labor, to temporarily push inflation above the Federal Reserve's 2 percent long-run objective.

CBO expects the Federal Reserve to keep the target range for the federal funds rate at its current level through most of 2020 and then increase it at the end of that year, putting upward pressure on short-term and long-term interest rates.

In the coming decade, real potential GDP—the sum of the growth of the potential labor force and the growth of potential labor force productivity—is projected to grow faster than it has since the 2007–2009 recession but slower than it has in previous periods.

Consumer price inflation is based on the price index for personal consumption expenditures and is measured from the fourth quarter of one calendar year to the fourth quarter of the next.

The federal funds rate is the interest rate that financial institutions charge each other for overnight loans of their monetary reserves. The data for interest rates are fourth-quarter values.

The potential labor force is an estimate of the size of the labor force that has been adjusted to exclude the effects of business-cycle fluctuations. Potential labor force productivity is the ratio of real potential GDP to the potential labor force. The bars show average annual growth rates over the specified periods, calculated using calendar year data.

Values for real GDP growth and inflation in consumer prices from 1999 to 2018 (the thin line in the top panel on each page) reflect revisions to the national income and product accounts that the Bureau of Economic Analysis released on July 26, 2019. Values from 2018 to 2029 (the thick lines) reflect the data available when the projections were made earlier in July.

GDP = gross domestic product.

two-thirds chance that the average annual growth rate will be between 0.7 percent and 3.3 percent.

Comparison With CBO's Previous Projections and Other Economic Projections

CBO's current economic forecast has some notable differences from the forecast the agency published in January. In particular, CBO has lowered its projections of interest rates in response to new data and recent guidance from the Federal Reserve regarding its outlook for monetary policy. Projected average annual economic growth over the 2020–2023 period was revised upward because of the Bipartisan Budget Act of 2019 (which led CBO to increase its projections of federal discretionary spending over the next decade) and recent economic developments.

CBO's economic projections in this forecast do not differ significantly from those of other forecasters. In particular, they are generally within the range of the forecasts for 2019 and 2020 by the private-sector economists who contributed to the August 2019 *Blue Chip Economic Indicators*, as well as the latest forecasts for 2019 through 2021 contained in the Federal Reserve's *Summary of Economic Projections*.

Fiscal and Trade Policies

CBO's economic projections reflect federal fiscal and trade policies under current law. Federal fiscal policies affect the economy not only through government purchases, which contribute directly to the overall demand for goods and services, but also through the federal tax code and federal transfer programs (such as Social Security and Medicare), which affect both overall demand and the supply of resources. Changes to trade policies—such as increases in tariffs on certain imported and exported goods—can also affect economic activity through changes to domestic prices and through uncertainty about future changes in trade policies, which, in turn, influence trade flows, business investment, and real output and income. (See Box 2-2 for a discussion of the effects of changes in trade policies.)

In addition, fiscal policy and tariffs both have important implications for federal deficits and debt. Changes in deficits and debt affect CBO's long-run projections of potential GDP by altering national saving (the total amount of saving by households, businesses, and governments) and, in turn, the funds that are available for

private investment in productive capital (such as office buildings, factories, and equipment).

Fiscal Policies

The fiscal stimulus created by the 2017 tax act and by the increase in federal discretionary spending now projected as a result of recent legislation is estimated to diminish over the next several years. CBO expects that the positive effects of the tax act on investment growth will moderate over time and that the projected increase in discretionary spending will boost economic growth over the next few years but that the resulting increase in federal deficits will lower growth in later years.

As noted in its April 2018 report, CBO expects the 2017 tax act to have a positive net effect on investment, employment, and output over the next decade.¹ The act lowered marginal income tax rates and increased incentives for business investment, which boosted growth in both consumption and business fixed investment in 2018 and 2019. Those positive effects are projected to diminish as households and firms adjust to the increase in their after-tax income and the incentive effects on investment growth wane. In later years, as temporary provisions of the tax act phase out or expire, growth of actual GDP is projected to temporarily fall below the growth of potential output.

The Bipartisan Budget Act of 2019 led CBO to increase its projections of federal discretionary spending over the next decade by \$1.5 trillion (see Appendix A). That law raised the caps on discretionary appropriations in fiscal years 2020 (which starts in the final quarter of calendar year 2019) and 2021 (which starts in the final quarter of calendar year 2020) by \$171 billion and \$153 billion, respectively. As a result, federal purchases of goods and services are projected to be higher than CBO previously estimated. In CBO's forecast, those additional purchases boost economic activity over the next few years. Under the assumptions that govern CBO's baseline projections, the increased spending persists over the entire projection period. Greater federal borrowing as a result of the larger deficits reduces the resources available for private investment in later years.

Trade Policies

Since January 2018, the United States has imposed tariffs on 11 percent of goods imported into the country, measured as a share of the value of all U.S. imports in 2017.² Some of those tariffs apply to imports from nearly all U.S. trading partners, including tariffs on washing machines, solar panels, and steel and aluminum products (see Table 2-1). A few countries are exempted from certain tariffs. For example, Canadian and Mexican imports were granted exemptions from the tariffs on steel and aluminum products. Other tariffs affect only imports from China, covering about half of U.S. imports from China and targeting mostly intermediate goods (items used for the production of other goods and services) and capital goods (such as computers and other equipment).

In response to the tariffs, U.S. trading partners have retaliated with their own tariffs. As of July 25, 2019, retaliatory tariffs had been imposed on 7 percent of all goods exported by the United States—primarily industrial supplies and materials as well as agricultural products (see Table 2-2 on page 38).

2. The values and shares of affected goods are measured relative to their values and shares in 2017—the year before those tariffs were imposed.

CBO’s analysis incorporates the assumption that the tariffs on U.S. imports and exports in effect as of July 25, 2019—the day the agency completed its economic projections—will remain in place through 2029.³

In CBO’s projections, those tariffs reduce U.S. economic activity in three ways. First, they make consumer goods and capital goods more expensive, thereby reducing the purchasing power of U.S. consumers and businesses. Second, they increase businesses’ uncertainty about future barriers to trade. Such uncertainty leads some U.S. businesses to delay or forgo new investments or make costly adjustments to their supply chains. Third, they prompt retaliatory tariffs by U.S. trading partners, which reduce U.S. exports by making them more expensive for foreign purchasers. All of those effects lower U.S. output. However, U.S. consumers and businesses are expected

3. The agency’s economic projections incorporate the assumption that, in cases in which the Administration exercises its broad authority to impose tariffs without legislative action, the tariffs in effect when the analysis was completed would continue permanently without planned or unplanned changes. On August 1, 2019, the President announced that tariffs would be imposed on an additional \$300 billion of Chinese imports beginning on September 1, 2019; on August 13, the U.S. Trade Representative announced that those tariffs would be delayed on certain products. Those scheduled changes to tariffs are not included in CBO’s current economic projections.

Box 2-2.

The Economic Effects of Changes in Trade Policies

In early 2018, the United States and its trading partners began imposing higher trade barriers—in particular, increases in tariff rates (see Table 2-1 and Table 2-2). In May 2019, the United States increased the tariff rate from 10 percent to 25 percent on a \$183 billion tranche of Chinese imports that were first targeted in September 2018. In that same month, the United States exempted Canadian and Mexican steel and aluminum products from tariffs affecting those imports. In response to those changes, China raised its tariff rates on roughly \$51 billion of imported U.S. products, whereas Canada and Mexico eliminated retaliatory tariffs they had imposed on U.S. products.¹

On balance, in the Congressional Budget Office’s projections, the trade barriers imposed since January 2018 reduce the level of real (inflation-adjusted) U.S. gross domestic product (GDP) by about 0.1 percent and the level of real household income by 0.2 percent by 2029. (CBO’s analysis reflects the assumption that the tariffs remain in place through 2029.) Those estimated economic effects are small because the value of imports subject to the tariffs is less than 2 percent of the value of all goods and services purchased by U.S. consumers and businesses. However, CBO’s estimates of the economic effects of the trade barriers are subject to considerable uncertainty.

Evidence of the Effects of Changes in Trade Policies Since January 2018

The tariffs implemented since January 2018 have altered the pattern of U.S. trade flows. For example, between the first quarter of 2017 and the first quarter of 2019, the value of all categories of imported Chinese goods targeted by the tariffs has declined by \$46 billion, or about 22 percent. At the same time, the value of U.S. imports of those goods from other trading partners has increased by \$116 billion, or 10 percent. The increased value of imports from other trading partners is

partly attributable to the replacement of imports that would have come from China. It also reflects an increase in the prices paid for those products.

Retaliatory tariffs imposed by U.S. trading partners have also affected U.S. export flows. For example, since the imposition of Chinese retaliatory tariffs, U.S. exports of targeted products to China have fallen by \$21 billion, or about 24 percent, and U.S. exports of those same products to other trading partners have risen by \$93 billion, or 9 percent. That increase in exports to unaffected countries partly reflects the diversion of exports that would have gone to China, in addition to other economic factors that have boosted U.S. exports.

Although the tariffs imposed since January 2018 have increased domestic prices paid for targeted goods, their effect on overall prices is less apparent. Since the tariffs have been implemented, the prices of some of the targeted products, such as washing machines and electrical equipment, have risen. However, for other targeted products and for products indirectly affected by the tariffs (such as those made with steel and aluminum), the effects on domestic prices are harder to observe.² That is because the targeted products represent a small share of all investment goods (such as computers and other equipment) and consumer goods. Moreover, in CBO’s assessment, tariffs on U.S. imports strengthen the U.S. dollar, which should dampen their effect on the prices of imports.

The tariffs have probably weakened business investment in the United States. Changes in trade policies have increased businesses’ uncertainty about future barriers to trade and thus their perceptions of risks associated with investment

1. The U.S. Department of Commerce also approved tariff exemption requests for a number of U.S. firms, mostly for imports of steel and aluminum products.

The Economic Effects of Changes in Trade Policies

in the United States and abroad.³ Uncertainty about future barriers to trade reduces the incentive for businesses to make long-term adjustments to their supply chains because changes in trade policies might affect the costs of their operations. The increased risk of such changes has probably led some businesses to delay investments or forgo them entirely. In addition, CBO estimates that the tariffs have suppressed investment growth by raising the prices of investment goods.

CBO's Estimates of the Tariffs' Effects on the U.S. Economy

CBO expects the changes in U.S. and foreign trade policies since January 2018 to reduce the level of real U.S. GDP by about 0.3 percent by 2020. Tariffs reduce domestic GDP chiefly by raising domestic prices, which reduces the purchasing power of U.S. consumers and increases the cost of business investment. In CBO's projections, the tariffs also reduce real income for the average U.S. household by 0.4 percent by 2020.

That projected reduction in U.S. output is partly explained by changes to U.S. trade flows. By 2020, in CBO's projections, the changes to tariffs since early 2018 lower real U.S. exports by 1.7 percent and lower real imports by 2.6 percent. The negative effect on output from reduced exports is partly offset by an expected boost in the production of domestic goods to replace a small portion of the forgone imports.

The remainder of the reduction in U.S. output can be explained by declines in real consumption and investment. CBO expects that higher prices for investment and consumer goods and greater business uncertainty will reduce real consumption by 0.3 percent and real private investment by 1.3 percent by 2020. Beyond 2020, CBO expects those effects to wane as businesses adjust their supply chains.

In CBO's projections, real investment continues to be dampened over the decade, which lowers potential (maximum sustainable) output. The reduction in investment is partly offset because the increase in revenues from the tariffs reduces

government deficits, boosting the resources available for private investment. It is also partly offset because CBO expects the production of some goods targeted by tariffs to be relocated from other countries to the United States. On balance, in CBO's projections, tariffs reduce the level of potential output by 0.1 percent in 2029.

Revisions to CBO's Estimates

CBO has increased its estimates of the effects of the changes in trade policies since January 2018 on the U.S. economy. CBO now expects those changes to reduce real U.S. GDP by 0.3 percent by 2020—0.1 percentage point more than the agency expected earlier this year. The revisions to the long-run effects are more modest.

The revision to the projection for 2020 is mostly attributable to a larger projected decrease in real investment. In particular, real investment is now expected to be 1.3 percent lower by 2020 in response to the tariffs, compared with 0.4 percent lower in CBO's January projections. That change in CBO's projection is the net effect of the higher tariff rates on certain Chinese imports as of May 2019, an increase in the expected size of the effects of businesses' uncertainty about future barriers to trade, and the increase in the value of imports that have been exempted from tariffs. The larger projected reduction in investment also reflects recent studies showing that a larger share of the cost of the tariffs than previously estimated is passed along to U.S. importers.

Uncertainty in CBO's Estimates

CBO's estimates of the economic effects of the tariffs implemented since January 2018 are uncertain for many reasons. The estimated short-run effects on trade flows are uncertain because it is difficult to predict how foreign exporters might adjust their prices in response to the tariffs and associated changes in the value of the dollar. Similarly, it is difficult to predict the extent to which domestic importers will pass along the increase in costs to their domestic customers. The magnitude of the long-run effects on investment is also uncertain because it is difficult to project how changes to tariffs and businesses' concerns about further changes to trade policies will affect long-run investment by companies that rely on global supply chains.

to replace certain imported goods with goods produced in the United States, which would offset some of that decline. In addition, tariff revenues, by reducing the deficit, increase the resources available for private investment in later years.

On balance, CBO expects trade barriers to reduce U.S. output. The effects of the tariffs on trade flows, prices, and output are projected to rise over the next year. By 2020, in CBO's projections, those tariffs reduce the level of real U.S. GDP by roughly 0.3 percent and reduce average real household income by \$580 (in 2019 dollars). Beyond 2020, CBO expects those effects to wane as businesses adjust their supply chains. By 2029, in CBO's projections, the tariffs lower the level of real U.S. GDP by 0.1 percent.

The Economic Outlook for 2019 to 2023

CBO expects real GDP to grow by 2.3 percent in 2019 and by an average of 1.8 percent per year between 2020 and 2023 (see Table 2-3). Economic growth in CBO's forecast over the next five years is largely driven by consumer spending and, to a lesser extent, by business and residential investment.

In CBO's projections, the gap between actual GDP and potential GDP and the gap between employment and

potential employment narrow over the next few years.⁴ (Both output and employment started to exceed their potential levels in early 2018, in CBO's assessment.) Economic growth slows after this year, but actual GDP remains above potential GDP until the end of 2022, and employment, which tends to lag behind movements in output, remains above its potential level over the entire 2019–2023 period. When GDP and employment are above their potential levels, over time there is upward pressure on inflation, interest rates, and wages.

CBO's projections of the economy over the next five years reflect anticipated fluctuations in the components of final demand (such as consumption and investment), projected changes in supply-side factors (such as growth in productivity and the labor supply), and the interactions between them.⁵ In CBO's forecast, short-run fluctuations in economic activity are determined

4. Potential employment is CBO's estimate of the maximum sustainable level of employment. It is the number of people who would be employed if the unemployment rate equaled its natural rate and if the labor force participation rate—that is, the percentage of people in the civilian noninstitutionalized population who are at least 16 years old and are either working or seeking work—equaled its potential rate.

5. See Robert W. Arnold, *How CBO Produces Its 10-Year Economic Forecast*, Working Paper 2018-02 (Congressional Budget Office, February 2018), www.cbo.gov/publication/53537.

primarily by demand-side developments but are also influenced by supply-side factors. For example, if an increase in demand pushed GDP beyond its maximum sustainable level, then one would expect upward pressure on inflation and interest rates, which would limit the increase in GDP growth. However, if the increase in demand was matched by an equivalent boost to potential output, then GDP would not exceed its maximum sustainable level and there would be no additional upward pressure on inflation or interest rates and, in turn, no additional restraint on economic activity.

Output

CBO expects the growth of real GDP to slow to 2.3 percent in 2019, down from 2.5 percent in 2018, as some of the factors that supported growth in output last year begin to taper off. On the one hand, strong growth in households' real disposable income (reflecting, among other things, rising labor income) is expected to support growth in consumer spending in 2019, and real purchases by federal, state, and local governments are projected to boost real GDP growth. On the other hand, CBO expects slower growth in business fixed investment, which contributed almost one-third of the GDP growth in 2018, as the effects of the 2017 tax act on investment moderate and the growth in demand for goods and services slows.

After 2019, economic growth is expected to slow further, averaging 1.8 percent per year from 2020 through 2023. In CBO's projections, both consumer spending and business fixed investment continue to grow but at rates that are lower, on average, than their respective growth rates since the end of the last recession. Real government purchases are also projected to grow more slowly after 2019.

Consumer Spending. CBO expects modest growth in consumer spending on goods and services to be the primary contributor to the growth of GDP over the remainder of 2019. In the agency's projections, real consumer spending on goods and services grows by 2.3 percent in 2019 (down from 2.6 percent in 2018), contributing 1.6 percentage points to the 2.3 percent growth rate of real GDP this year (see Table 2-4 on page 42). The projected growth in households' real disposable income for the year, at 2.0 percent, is weaker than the growth

reported in 2018, when reductions in personal taxes provided a boost.⁶

In CBO's projections, annual growth in consumer spending slows further to an average of 2.0 percent per year from 2020 through 2023. The effects of the 2017 tax act on that growth in consumption are projected to diminish because households will have already increased their spending in response to the step up in their after-tax income. Over that same period, CBO expects higher inflation (resulting in part from an elevated output gap and the increased tariffs on imported goods) to reduce the growth of real household income. That reduction in the growth of real household income, combined with an expected slowdown in the growth of equity and housing wealth, would restrain the growth of household spending. Increases in interest rates after this year are also expected to moderate the expansion of consumer credit.

Business Investment. In CBO's projections, real growth in business fixed investment slows this year, from 5.9 percent in 2018 to 2.2 percent in 2019. Several factors supported strong investment during 2018: increased incentives for investment under the 2017 tax act; accelerated growth of output, stemming in part from the tax act and from legislated increases in federal outlays; greater incentives for oil exploration and development created by higher oil prices; rising stock prices for much of the year, which reduced the cost of capital; and the easing of regulations coupled with a slowdown in new regulatory activity, which boosted businesses' confidence in making investments.

CBO expects many of those factors to diminish or reverse in 2019. Although provisions in the 2017 tax act have continued to increase incentives for investment, that effect is expected to be smaller in 2019 than it was in 2018; as a result, CBO projects growth in investment to drop by more than a percentage point in

6. The revisions to the national income and product accounts published in late July (see Box 2-1 on page 30) showed that growth in real disposable income, including wages and salaries, has been significantly stronger than previously estimated, particularly since 2017. That new evidence, which also includes higher estimates of the personal saving rate, indicates that household finances are healthier than previously thought. Therefore, the risk of weaker consumer spending in the near term is probably smaller than CBO expected when making its projections.

Table 2-3.

CBO's Economic Projections for Calendar Years 2019 to 2029

Continued

2019 compared with 2018. More moderate GDP growth and a decrease in oil prices, which rose in 2018, both slow the projected growth of business fixed investment in 2019. Higher costs of imported capital goods due to tariffs and businesses' uncertainty about trade policies are also projected to restrain investment this year.

From 2020 through 2023, in CBO's projections, slower GDP growth causes the growth of real business fixed investment to slow further to an average of 2.1 percent per year. In addition, the tax code's treatment of equipment and of research and development becomes less favorable in 2022 and 2023. However, CBO expects tariff rates and businesses' uncertainty about future trade policies to stop increasing by 2020, which would limit one factor restraining the growth of investment in 2019. To the extent that a halt to increases in tariffs reduced businesses' uncertainty about future trade policies,

investment growth would no longer be dampened by that factor in later years. In addition, CBO does not expect continued reductions in oil prices after 2021.

Residential Investment. In CBO's projections, real residential investment, which declined in 2018 and is expected to grow moderately in 2019, grows faster than overall GDP in 2020 and 2021. Specifically, real residential investment grows by 1.4 percent in 2019 (after declining by 4.4 percent in 2018) and by an average of 4.7 percent per year in 2020 and 2021 before slowing in 2022 and later years. In CBO's assessment, the decline in residential investment in 2018 resulted in part from provisions in the 2017 tax act that reduced incentives to own homes and from higher mortgage interest rates. The anticipated pickup in growth from 2019 through 2021, by contrast, mainly reflects continued strength

GDP = gross domestic product; PCE = personal consumption expenditures.

- a. Real values are nominal values that have been adjusted to remove the effects of changes in prices.
- b. Excludes prices for food and energy.
- c. The consumer price index for all urban consumers.
- d. The employment cost index for wages and salaries of workers in private industry.
- e. Value for the fourth quarter of 2023.
- f. Value for the fourth quarter of 2029.
- g. The average monthly change in the number of employees on nonfarm payrolls, calculated by dividing by 12 the change in payroll employment from the fourth quarter of one calendar year to the fourth quarter of the next.
- h. Adjusted to remove distortions in depreciation allowances caused by tax rules and to exclude the effects of changes in prices on the value of inventories.

in household formation, lower mortgage interest rates than in 2018, and further easing of mortgage lending standards.

Government Purchases. If current laws governing federal taxes and spending generally remained in place, real purchases of goods and services by federal, state, and local governments would increase by 2.8 percent in 2019—up from 1.5 percent in 2018—and then by 0.7 percent per year, on average, from 2020 through 2023, CBO estimates.

Those estimates reflect an increase in federal purchases in fiscal years 2020 (which starts in the final quarter of calendar year 2019) and 2021 (which starts in the final quarter of calendar year 2020). Specifically, in CBO's projections, real purchases by the federal government grow by 3.5 percent in 2019 and by 1.8 percent in 2020.

CBO's baseline projections for federal purchases beyond fiscal year 2021 incorporate the assumption that discretionary funding will grow at the rate of inflation.⁷

Real purchases by state and local governments are projected to increase by 2.4 percent this year, led by a surge in infrastructure investment. From 2020 through 2023, they are expected to grow by an average of 0.7 percent per year as state and local investment moderates.

Net Exports. Real net exports, which have declined since 2014, are projected to continue falling in 2019 as the growth of both real imports and real exports slows.

7. CBO's projections are made in accordance with provisions set forth in the Balanced Budget and Emergency Deficit Control Act of 1985 (P.L. 99-177) and the Congressional Budget and Impoundment Control Act of 1974 (P.L. 93-344). See Chapter 1 for a discussion of the agency's discretionary funding projections.

Real values are nominal values that have been adjusted to remove the effects of changes in prices.

Data are annual. Changes are measured from the fourth quarter of one calendar year to the fourth quarter of the next.

GDP = gross domestic product; * = between zero and 0.05 percentage points.

a. Personal consumption expenditures.

b. Business fixed investment and investment in inventories.

c. Purchases of equipment, nonresidential structures, and intellectual property products.

d. The construction of single-family and multifamily structures, manufactured homes, and dormitories; spending on home improvements; and brokers' commissions and other ownership-transfer costs.

e. Based on data from the national income and product accounts.

In CBO's projections, growth of real imports slows in 2019 for two reasons. The first reason is slower growth of domestic consumption and investment, which reduces the demand for imported consumption goods and investment goods. Because that decline in the growth of imports is a direct result of slower growth in domestic purchases, U.S. output growth is unaffected. (In other

circumstances, a slowdown in the growth of imports might contribute to stronger GDP growth.)

The second reason import growth is projected to slow in 2019 is tariffs imposed since January 2018 (see Box 2-2 on page 36). In CBO's assessment, those tariffs raised the prices that consumers and businesses pay for imported goods. CBO expects those higher prices to lead to some

reduction in domestic purchases but also to encourage U.S. consumers and businesses to replace the imports subject to the tariffs with domestically sourced goods, boosting domestic output, all else being equal. That substitution explains a small portion of the projected weakness in import growth.

After 2019, growth of real imports is expected to rebound, albeit only slightly, as businesses begin making adjustments to their global supply chains in response to tariffs, increasing imports from unaffected countries. For example, CBO expects some manufacturing to shift from China to other trading partners.

The growth of real exports in 2019 is also expected to be weak relative to historical rates, reflecting slow growth in the economies of major U.S. trading partners, which reduces the demand for U.S. exports, and the strength of the U.S. dollar, which makes U.S. exports less competitive in foreign markets.⁸ Moreover, tariffs imposed by some of the United States' trading partners in 2018 are expected to reduce the growth of real exports in the near term by making certain U.S. goods more costly for foreign purchasers. After 2019, the growth of real exports is expected to rebound slightly as the dollar falls, making U.S. exports more competitive.

CBO's projection of real export growth is based partly on the expected pace of economic activity among the United States' leading trading partners. CBO expects growth in those economies to be lower in 2019 than it was in 2017 and 2018. In 2020 and beyond, growth in the economies of the United States' leading trading partners is expected to rebound but remain slow relative to the (trade-weighted) average rates of growth in those economies over the past 20 years. That slow rate of growth abroad is expected to reduce demand for U.S. goods and services and to contribute to slow growth in real U.S. exports relative to average real U.S. export growth over the past 20 years.

Also contributing to CBO's projection of real export growth, the exchange value of the dollar rose substantially during 2018 and is expected to remain relatively high in 2019 and fall only gradually over the following years. The strength of the dollar in 2018 and 2019 can

be attributed to a relatively strong U.S. economy, to tighter monetary policy in the United States than in its major trading partners, and to an increase in the demand for dollars resulting from increases in tariff rates. As U.S. economic growth ebbs after 2019, demand for dollar-denominated assets and the value of the dollar are projected to fall slightly.

Potential Output and the Output Gap

In the agency's projections, potential output—a measure of the economy's fundamental capacity to supply goods and services—grows by an average of 2.1 percent per year from 2019 through 2023 (see Figure 2-2). That projected growth is still faster than the average rate of growth since the end of 2007, mostly because of a projected acceleration in the growth of total factor productivity in the nonfarm business sector.⁹ However, it is slower than the average rate of growth of potential output since 1950, largely because of the aging of the population.

CBO's estimates imply that the output gap reached a cyclical peak of 0.8 percent of potential GDP earlier this year. Starting in 2020, in CBO's projections, the output gap declines steadily, turning negative in 2022 and reaching its long-run average of -0.5 percent of potential GDP after 2023.

The Labor Market

Strong demand for goods and services over the past several years boosted the demand for labor and caused labor market conditions to strengthen steadily. As of mid-2019, many indicators point to a healthy labor market:

- Growth in employment has maintained a healthy pace. In CBO's estimation, employment reached its potential level by early 2018 and has since risen above it (see Figure 2-3).
- The labor force participation rate among prime-age workers (those between the ages of 25 and 54) has rebounded since 2015, adding about 1.5 million workers to the labor force and offsetting downward pressure on labor force participation from the retirement of baby boomers (those born between 1945 and 1960).

8. CBO's measure of the exchange value of the dollar is an export-weighted average of the exchange rates between the dollar and the currencies of leading U.S. trading partners.

9. The growth of total factor productivity is the growth of real output that is not explained by the growth of inputs of labor and capital services—the services provided by capital goods that constitute the actual input in the production process.

Figure 2-2.

The Growth of GDP and Potential GDP

Sources: Congressional Budget Office; Bureau of Economic Analysis.

Real values are nominal values that have been adjusted to remove the effects of changes in prices. Potential GDP is CBO's estimate of the maximum sustainable output of the economy. The growth of real GDP and of real potential GDP is measured from the fourth quarter of one calendar year to the fourth quarter of the next.

Values for real GDP growth from 1999 to 2018 (the thin line) reflect revisions to the national income and product accounts that the Bureau of Economic Analysis released on July 26, 2019. Values from 2018 to 2029 (the thick line) reflect the data available when the projections were made earlier in July.

GDP = gross domestic product.

- The number of initial claims for unemployment insurance benefits is at its lowest level since the 1970s. The U-6 unemployment rate—which includes not only unemployed workers but also marginally attached workers (those who are not looking for work now but have looked for it in the past 12 months) and workers employed part time for economic reasons—is the lowest it has been since late 2000.¹⁰
- Wage growth has picked up meaningfully over the past few years, and the gains have been increasingly broad-based, with low-wage earners seeing particularly robust growth in their hourly wages.

10. The U-6 measure, which is reported by the Bureau of Labor Statistics, is the number of unemployed workers, marginally attached workers, and workers employed part time for economic reasons as a percentage of the labor force plus all marginally attached workers. By contrast, the unemployment rate that is generally reported in the news—the U-3 unemployment rate—is the number of unemployed workers as a percentage of the labor force.

Some aspects of the labor market still show signs of slack, supporting an outlook of further job gains. For example, the share of the long-term unemployed (workers who have been out of work for 27 weeks or longer) among all unemployed workers remains elevated relative to its prerecession level.

In CBO's projections, the demand for goods and services continues to boost the demand for labor and employment continues to grow, although the pace of that growth slows down, particularly after 2020. As the labor market remains relatively tight (as indicated by employment being above its potential), employers are expected to bid up the price of labor to recruit and retain workers, putting further upward pressure on wages and salaries and other forms of labor compensation in the coming years.

From 2020 to 2023, in CBO's projections, employment remains above its potential level, unemployment remains below its natural rate, and labor force participation

Figure 2-3.

The Labor Market

Millions of People

The employment gap is expected to narrow after 2020 as the growth of output slows. By the end of 2024, employment is projected to fall below its maximum sustainable amount.

Percent

The unemployment rate is expected to rise steadily, reaching and surpassing its natural rate of 4.5 percent in 2023 before settling into its long-term trend in later years.

Percent

The labor force participation rate is expected to respond more slowly to the projected slowdown in output growth, remaining above its potential for the next five years.

Percent

Wage growth is expected to peak in 2020 before slowing thereafter.

Sources: Congressional Budget Office; Bureau of Labor Statistics.

The employment gap is the difference between the number of employed people and the number who would be employed in the absence of fluctuations in the overall demand for goods and services.

The unemployment rate is the number of jobless people who are available for and seeking work, expressed as a percentage of the labor force. The natural unemployment rate is CBO's estimate of the rate of unemployment arising from all sources except fluctuations in the overall demand for goods and services.

The labor force participation rate is the percentage of people in the civilian noninstitutionalized population who are at least 16 years old and either working or seeking work. The potential labor force participation rate is the rate that has been adjusted to exclude the effects of business-cycle fluctuations.

For the labor force participation and unemployment rates, data are fourth-quarter values.

Wages are measured using the employment cost index for wages and salaries of workers in private industry. Growth in wages is measured from the fourth quarter of one calendar year to the fourth quarter of the next.

remains above its potential rate. (The natural rate of unemployment is the rate arising from all sources other than fluctuations in the overall demand for goods and services, including normal job turnover and the structural mismatch between the skills that jobs require and those that job seekers possess.) Over that period, employment growth slows as labor compensation rises and the growth of output moderates.

Employment. Job growth in the first half of 2019 was slower than in 2018 but still relatively strong. Specifically, nonfarm payroll employment grew by an average of 165,000 jobs per month in the first half of 2019, an increase that was below the average of 223,000 jobs gained per month in 2018 but well above the growth of potential nonfarm payroll employment, in CBO’s estimation. In CBO’s projections, nonfarm payroll employment continues to grow by an average of 116,000 jobs per month in the second half of 2019 and by 100,000 jobs per month in 2020.¹¹ After 2020, job growth is expected to slow sharply, averaging just 31,000 jobs per month between 2021 and 2023, as labor compensation rises further and output growth slows.

CBO expects employment to remain above its long-run potential level over the entire 2019–2023 period. In CBO’s projections, the number of people employed exceeds its potential level by an average of 1.4 million in 2019 and 1.7 million in 2020. After 2020, the gap between employment and its long-run potential starts to narrow as higher wages and slower output growth dampen the demand for labor, causing employment to grow more slowly than its potential.

Unemployment. After a temporary uptick in the first quarter of 2019—owing largely to the five-week partial shutdown of the federal government that ended on January 25 and to slightly above-trend labor force participation—the unemployment rate resumed its downward trend in the second quarter of this year. As of July 2019, it stands at 3.7 percent, near its lowest point since the 1960s and about a percentage point below the agency’s estimate of the natural rate of unemployment.

One reason for the relatively low unemployment rate is a decline in the natural rate of unemployment. In

CBO’s estimation, the natural rate of unemployment has fallen from more than 6.0 percent in the early 1980s to 4.6 percent now. That decline has occurred because the workforce has shifted toward older workers, who tend to have lower unemployment rates, and away from less-educated workers, who tend to have higher unemployment rates. Because the natural rate of unemployment has fallen, the cyclical strength of the current labor market—and the amount of inflationary pressure it implies—is less pronounced than the historically low unemployment rate would otherwise suggest.

In CBO’s projections, the unemployment rate remains low—around 3.7 percent—for the rest of this year and next year. After 2020, as economic growth slows further, the unemployment rate is expected to rise steadily, reaching and surpassing its natural rate of 4.5 percent in 2023 before settling into its long-term trend (roughly a quarter of a percentage point higher than the natural rate) in later years.

Labor Force Participation. The labor force participation rate, which has hovered around 62.8 percent since 2014, remains close to that rate through the next year or so, in CBO’s projections. That continued stability reflects the balancing of two opposing forces: sustained economic growth, which encourages additional workers to enter and existing workers to stay in the labor force, and long-run shifts in demographics (particularly the aging of the population), which have led to a downward trend in the potential labor force participation rate. (In CBO’s estimation, the potential labor force participation rate fell from 64.0 percent in 2014 to 63.0 percent in 2018.) Because the actual rate of labor force participation has been stable while the potential rate has continued to fall, the gap between the two rates has narrowed steadily in recent years. In CBO’s projections, that gap closes this year and then turns positive in subsequent years because of continued strength in overall demand.

Starting in 2021, as the pace of economic growth drops below the growth of potential output, downward pressure from demographic shifts is expected to dominate, pushing down the labor force participation rate. In CBO’s projections, the labor force participation rate falls from 62.9 percent in 2020 to 62.3 percent by 2023, in line with its potential rate, which falls from 62.7 percent to 62.1 percent during that period. Driven by the decline of labor force participation, the share of employed workers in the civilian noninstitutionalized population

11. Part of the strength in nonfarm payroll growth in 2020 is associated with the temporary increase in federal employees needed to conduct the 2020 Census.

also falls, from 60.6 percent in 2019 and 60.5 percent in 2020 to 59.4 percent by the end of 2023.

Labor Compensation. Wage growth has accelerated in the past year or so. As the labor market remains relatively strong, employers are expected to bid up the price of labor to recruit and retain workers, putting further upward pressure on wages and salaries and other forms of labor compensation in the coming years.

In CBO’s projections, the annual increase in the employment cost index for wages and salaries of workers in private industry is 3.3 percent in 2019, 3.6 percent in 2020, and 3.5 percent from 2021 to 2023—slightly greater than its 3.1 percent pace in 2018 and considerably greater than the 2.0 percent average from 2009 to 2017. Other measures of labor compensation, such as the average hourly earnings of production and nonsupervisory workers in private industry, are also expected to grow more rapidly than in recent years. The faster pace of wage growth is expected to restrain the demand for labor, slowing the pace of wage growth in later years.

In addition to accelerated growth in overall measures of wages, data from surveys show that recent gains in hourly wages have become increasingly broad-based. For low-wage earners in particular, wage growth has been especially strong since late 2016. That development is consistent with historical experience, which indicates that further strengthening of an already strong labor market tends to confer extra benefits—in terms of higher wages and more opportunities for employment—to people in lower income groups.¹² (Another factor that may have contributed to wage growth among low-wage earners is recent increases in minimum wages at the state and local level.) Strong and more broad-based wage growth supports a healthy outlook for consumption and output growth.

Inflation and Interest Rates

The growth rate of the price index for personal consumption expenditures—the measure that the Federal Reserve uses to define its 2 percent long-run objective for inflation—slipped below that objective in late 2018 and

early 2019. The traditional measure of core PCE price inflation, which excludes food and energy prices because they tend to be volatile, also fell below 2 percent.

Many analysts have been surprised that core inflation has remained below the Federal Reserve’s long-run objective despite a strong labor market. The strength in the labor market has raised wage growth, but that higher wage growth has not led to higher inflation. However, evidence suggests that the recent decline in the traditional measure of core inflation is probably the result of temporary factors. Alternative measures of core inflation that are designed to eliminate the effects of short-lived factors (other than food and energy prices) remain close to 2 percent.¹³ CBO expects the effects of those factors to wear off over the remainder of the year.

In response, at least in part, to muted inflationary pressures and to increased risks to U.S. economic growth stemming from international trade tensions and slower foreign economic growth, the Federal Reserve reduced the target range for the federal funds rate in late July. CBO expects the Federal Reserve to raise the target range late next year as inflationary pressures and foreign growth pick up.

Over the next few years, a number of factors are expected to continue putting upward pressure on prices and wages. Those factors include the recent reduction in the federal funds rate, continued tight labor market conditions, and—particularly in 2019 and 2020—tariffs. On balance, in CBO’s estimation, tariffs increase the core PCE price index by 0.3 percent from the beginning of 2018 to the end of 2020. That effect on prices is expected to be somewhat drawn out as businesses respond to recently imposed tariffs only gradually, in part because of uncertainty about future changes in trade policies.

In CBO’s projections, growth in the core PCE price index rises from 1.9 percent in 2019 to 2.2 percent in 2020 (see Figure 2-4). The core consumer price index for urban households (CPI-U), which tends to grow faster than the PCE price index, rises by 2.3 percent in 2019 and 2.6 percent in 2020. The agency expects the

Figure 2-4.

Inflation and Interest Rates

In CBO's projections, a number of factors, including strong labor market conditions, cause growth in the core PCE price index to rise from 1.9 percent in 2019 to 2.2 percent in 2020.

CBO expects both short-term and long-term interest rates to remain near their current levels through most of 2020 and then to rise gradually as inflation stabilizes at 2 percent—the Federal Reserve's long-run objective.

Sources: Congressional Budget Office; Bureau of Economic Analysis; Federal Reserve.

The overall inflation rate is based on the price index for personal consumption expenditures; the core rate excludes prices for food and energy.

Values for inflation from 1999 to 2018 (the thin lines in the top panel) reflect revisions to the national income and product accounts that the Bureau of Economic Analysis released on July 26, 2019. Values from 2018 to 2029 (the thick lines) reflect the data available when the projections were made earlier in July.

Inflation is measured from the fourth quarter of one calendar year to the fourth quarter of the next.

For interest rates, data are fourth-quarter values.

Federal Reserve to increase its target range for the federal funds rate late in 2020 partly in response to a pickup in inflation during that year, thereby putting downward pressure on inflation in later years; for that reason, in CBO's projections, core PCE inflation stabilizes at about 2.0 percent after 2020. CBO expects the average federal

funds rate to rise from 2.2 percent in 2020 to 2.5 percent by the end of 2023.

The interest rate on 3-month Treasury bills is expected to fall slightly in the second half of 2019, partly in response to the reduction of the federal funds rate and partly in

response to a deceleration in economic growth. In CBO's projections, the interest rate on 3-month Treasury bills falls from 2.3 percent in the first half of 2019 to 2.1 percent by the end of the year. CBO expects short-term interest rates to remain at their current levels through most of 2020 and then to rise again as foreign economic growth improves and the Federal Reserve raises rates at the end of next year. The interest rate on 3-month Treasury bills is projected to rise to 2.4 percent by the end of 2023.

CBO expects long-term interest rates to remain near their current levels through early 2020 and then to rise for several reasons. First, long-term interest rates reflect investors' expectations about short-term interest rates. Second, CBO expects the term premium (the premium paid to bondholders for the extra risk associated with holding longer-term bonds) to increase over the next few years as a number of factors that have recently pushed it to historically low levels dissipate. Two such factors are investors' heightened concerns about relatively weak global economic growth and the increased demand for long-term bonds as a hedge against unexpectedly low inflation.

In CBO's projections, as foreign economic growth improves and the rate of inflation reaches the Federal Reserve's 2 percent long-run objective, investors' demand for long-term bonds weakens slightly, putting upward pressure on long-term interest rates. CBO also expects faster foreign growth to put upward pressure on the interest rates on foreign governments' debt. (Many of those interest rates were negative during the first half of 2019.) That would lessen the demand for, and therefore push up the interest rates on, U.S. Treasury securities. The interest rate on 10-year Treasury notes is projected to rise to 3.0 percent by the end of 2023.

The Economic Outlook for 2024 to 2029

CBO's projections of the economy for 2024 through 2029 are based mainly on its projections of underlying trends in key variables, such as the size of the labor force, the average number of labor hours per worker, capital investment, and productivity.¹⁴ In addition, CBO considers how the federal tax and spending policies—as well

as trade and other public policies—embodied in current law would affect those variables.

In some cases, policies might be projected not only to affect potential output but also to influence overall demand for goods and services, causing the gap between actual output and potential output to change. For example, the expiration of temporary provisions in current law—including the expiration of most of the provisions affecting individual income taxes at the end of 2025 and the phaseout of bonus depreciation by the end of 2026—is projected to slow real GDP growth and to lower real GDP in relation to its potential in those years.

Potential Output and Actual Output

In CBO's projections, potential output grows at an average rate of 1.8 percent per year over the 2024–2029 period, driven by average annual growth of about 0.4 percent in the potential labor force and about 1.4 percent in potential labor force productivity (see Table 2-5). That annual 1.8 percent growth of potential output is nearly one-quarter of a percentage point slower than the expected growth of more than 2.0 percent per year from 2019 to 2023. About two-fifths of that slowdown results from slower growth of the potential labor force; the remaining three-fifths results from slower growth in potential labor force productivity.

The slowdown in growth is expected to be slightly more pronounced in the nonfarm business sector, which produces roughly three-quarters of domestic output, than in other sectors of the economy. Annual growth of potential output in that sector is projected to slow by about a quarter of a percentage point, from more than 2.3 percent over the 2019–2023 period to about 2.1 percent over the 2024–2029 period. The contribution to potential output growth from potential hours worked falls from nearly 0.4 percentage points per year, on average, in the first half of the projection period to 0.2 percentage points in the second half. The contribution from capital services drops from an average of more than 0.9 percentage points per year to about 0.7 percentage points. (By itself, that reduction would lead to slower growth in labor force productivity.)

The slower growth of potential hours worked and capital services reflects underlying long-run trends—such as the aging of the population and other demographic shifts—as well as the expiration of temporary tax provisions under current law. (Changes in trade policies are

Source: Congressional Budget Office.

Real values are nominal values that have been adjusted to remove the effects of changes in prices. Potential GDP is CBO's estimate of the maximum sustainable output of the economy.

The table shows average annual growth rates over the specified periods, calculated using calendar year data.

GDP = gross domestic product.

- a. The ratio of potential GDP to the potential labor force.
- b. The services provided by capital goods (such as computers and other equipment) that constitute the actual input in the production process.
- c. The average real output per unit of combined labor and capital services, excluding the effects of business cycles.
- d. The ratio of potential output to potential hours worked in the nonfarm business sector.

expected to have a small negative effect on potential output in the long run, although considerable uncertainty surrounds that assessment. See Box 2-2 on page 36 for more details.)

Unlike the growth of potential hours worked and capital services, the annual growth of potential total factor productivity (the average real output per unit of combined labor and capital services, excluding the effects of business cycles) in the nonfarm business sector accelerates in CBO's forecast, from slightly more than 1.0 percent in the first half of the projection period to over 1.1 percent in the second half. That acceleration somewhat offsets

the slowdown in the growth of other inputs to production. The increase in potential total factor productivity growth also plays a key role in making potential output grow faster than its estimated average rate of nearly 1.6 percent per year since 2007, when the last recession began.

Typically, in CBO's forecasts, the growth of actual output and the growth of potential output converge in the second half of the 11-year projection period, and the level of actual output stays about 0.5 percent below that of potential output, which is consistent with the

long-term relationship between the two measures.¹⁵ However, that convergence is interrupted in the current forecast because the expiration of temporary provisions of the 2017 tax act not only diminishes the growth of potential output by reducing the supply of labor but also temporarily slows the growth of overall demand.

As a consequence, actual output temporarily falls relative to potential output. It then rises until the relationship between actual and potential output reaches its long-run average in the final years of the projection period. Correspondingly, the average growth of actual output during the 2024–2029 period is close to, but slightly slower than, that of potential output.

The Labor Market

CBO expects the natural rate of unemployment to decline slowly over the next decade, from 4.6 percent in 2019 to 4.4 percent by 2029. That slow decline reflects the continuing shift in the composition of the workforce toward older workers, who tend to have lower rates of unemployment (when they participate in the labor force), and away from less-educated workers, who tend to have higher ones.

In CBO’s projections, the unemployment rate reaches 4.7 percent in 2024, and the difference between the unemployment rate and the natural rate reaches its long-term average of about 0.25 percentage points in 2025.¹⁶ As the natural rate of unemployment declines slowly from 2024 to 2029, the unemployment rate also falls, except in 2025 and 2026, when it rises slightly. That temporary increase occurs because the slowdown in the growth of demand for goods and services caused by the expiration of certain provisions of the 2017 tax act also slows the growth in the demand for labor. The projected unemployment rate is 4.6 percent in 2029, slightly below its level of 4.7 percent in 2024.

CBO expects the labor force participation rate to follow its long-term trend and fall to about 61 percent by 2029,

roughly a percentage point below the agency’s projection for 2024. CBO attributes most of the decline from 2024 to 2029 to the aging of the population (because older people tend to participate less in the labor force than younger people do).¹⁷

The growth in employment and wages is projected to be moderate over the 2024–2029 period. In particular, nonfarm payroll employment increases by an average of 46,000 jobs per month during those years, in CBO’s projections. The employment-to-population ratio (the share of employed workers as a percentage of the civilian noninstitutionalized population) falls from 59.1 percent in 2024 to 58.0 percent in 2029, primarily reflecting the decline in potential labor force participation. Real compensation per hour in the nonfarm business sector, a measure of labor costs that is a useful gauge of longer-term trends, grows at an average annual rate of 1.9 percent from 2024 to 2029—the same rate as projected growth in labor productivity in that sector.

Inflation and Interest Rates

Between 2024 and 2029, in CBO’s forecast, the overall and core PCE price indexes increase by an average of 2.0 percent per year, which is in line with the Federal Reserve’s long-run objective for inflation. Inflation in the overall and core CPI-U measures averages 2.3 percent annually in those years. Those projections reflect the historical difference between the growth rates of the PCE price indexes and CPI-U measures.

CBO projects that the interest rates on 3-month Treasury bills and 10-year Treasury notes will average 2.5 percent and 3.1 percent, respectively, over the 2024–2029 period. Those projected rates are below the securities’ average rates from 1990 to 2007, a period that CBO uses for comparison because expectations about inflation during that time were fairly stable and there were no significant financial crises or severe economic downturns.

In CBO’s analysis, a number of factors act to push interest rates on Treasury securities below their averages from 1990 to 2007: lower average inflation, slower growth of the labor force (which reduces the return on capital), slightly slower growth of productivity (which

15. See Congressional Budget Office, *Why CBO Projects That Actual Output Will Be Below Potential Output on Average* (February 2015), www.cbo.gov/publication/49890. Actual output is below potential output, on average, in the latter part of the projection period so that inputs to the budget projections (such as income and interest rates) are consistent with historical averages.

16. That projected gap is consistent with the long-term relationship between actual GDP and potential GDP.

17. See Joshua Montes, *CBO’s Projections of Labor Force Participation Rates*, Working Paper 2018-04 (Congressional Budget Office, March 2018), www.cbo.gov/publication/53616.

also reduces the return on capital), a greater share of total income among high-income households (which tends to increase saving), and a higher risk premium on risky assets (which increases the relative demand for risk-free Treasury securities, boosting their prices and thereby lowering their interest rates). Other factors offset some of that downward pressure on interest rates: a larger amount of federal debt as a percentage of GDP; smaller net inflows of capital from other countries as a percentage of GDP (which reduce the supply of funds available for borrowing); and a higher share of income going to the owners of capital (which increases the return on capital assets with which Treasury securities compete, reducing the demand for those securities). On balance, interest rates on Treasury securities are projected to be lower, on average, over the 2024–2029 period than they were between 1990 and 2007.

Nevertheless, interest rates are projected to rise over the 2024–2029 period. In particular, rising federal debt in relation to GDP and an improving global economy are projected to exert upward pressure on short- and long-term interest rates. CBO expects the federal funds rate to rise from 2.5 percent in 2024 to 2.7 percent in 2029. Similarly, the rates for 3-month Treasury bills and 10-year Treasury notes are expected to rise from 2.4 percent and 3.1 percent to 2.5 percent and 3.2 percent, respectively, over that period. CBO expects the term premium on long-term bonds to increase slightly over that period as global economic growth continues to improve and the risk of unexpectedly low inflation continues to diminish.

Projections of Income for 2019 to 2029

Economic activity and federal tax revenues depend not only on the amount of total income in the economy but also on how that income is divided among labor income, domestic profits, proprietors' income, income from interest and dividends, and other categories. (Labor income includes wages and salaries as well as other forms of compensation, such as employer-paid benefits and a fraction of proprietors' income.) The shares for wages and salaries and for domestic profits are of particular importance for projecting federal revenues because those types of income are taxed at higher rates than others.

Labor income as a share of GDP fell from 58.6 percent in 2008 to 57.1 percent in 2010 but rebounded to 57.8 percent in 2017. CBO expects labor income as a share of GDP to continue its recovery over the entire projection period, consistent with the agency's forecasts

for employment and compensation, and to ultimately reach 58.5 percent by the end of 2029 (see Figure 2-5). In particular, wages and salaries are expected to grow more quickly than other kinds of income throughout the 11-year projection period; their share of total income rises from 43.2 percent of GDP in 2018 to 43.8 percent in 2029 in CBO's projections.

Longer-term factors have depressed labor income as a share of GDP, however, and CBO expects those factors to continue to have an influence. Since the early 2000s, labor income as a share of GDP has fallen below 60.4 percent—its average between 1947 and 2000. In CBO's assessment, factors contributing to that decline include technological change, which may have increased returns to capital more than it has increased returns to labor, and globalization, which has increased international competition in goods-producing industries, putting downward pressure on workers' compensation.¹⁸ Some income has also gone toward the returns on intangible capital, such as brand identity arising from advertising, which may have reduced the share of income that has gone toward labor.¹⁹ Increased market power might also have allowed some firms to raise their prices relative to their labor costs, possibly reflecting the rise in many industries of "superstar" firms with higher efficiency and hence lower costs than their competitors.²⁰ The relative importance and persistence of the factors that have depressed labor income as a share of GDP remain unclear, but some of them are expected to persist.

18. The role of technological change has been examined by some economists who investigated the role of information technology in lowering the cost of capital goods, which may have induced firms to shift away from the use of labor toward the use of capital. See, for example, Loukas Karabarounis and Brent Neiman, "The Global Decline of the Labor Share," *Quarterly Journal of Economics*, vol. 129, no.1 (October 2013), pp. 61–103, <https://bit.ly/2SHF5SH>. The role of globalization was examined by Michael Elsby, Bart Hobijn, and Aysegül Sahin, "The Decline of the U.S. Labor Share," *Brookings Papers on Economic Activity* (Fall 2013), <https://brook.gs/2VCVbyx>.

Figure 2-5.

Labor Income

Percentage of GDP

CBO expects labor income as a share of GDP to rise over the projection period, consistent with the agency's forecasts for employment and compensation. However, that share is not expected to reach previous historical averages.

Sources: Congressional Budget Office; Bureau of Economic Analysis.

Labor income is the sum of employees' compensation and CBO's estimate of proprietors' income that is attributable to labor.

Values for labor income from 1999 to 2018 (the thin line) reflect revisions to the national income and product accounts that the Bureau of Economic Analysis released on July 26, 2019. Values from 2018 to 2029 (the thick line) reflect the data available when the projections were made earlier in July.

Data are fourth-quarter values.

GDP = gross domestic product.

As a result, CBO does not expect that share to reach its previous historical average.

Domestic corporate profits as a share of GDP average 8.3 percent over the projection period, falling about 0.3 percentage points in the early years to reach 8.1 percent in 2026 and thereafter. That decline mostly reflects the projected rise in wages and salaries, but it also reflects an increase in corporate interest payments stemming from rising interest rates.

Some Uncertainties in the Economic Outlook

Significant uncertainty surrounds CBO's economic forecast, which the agency constructed to be the average of the distribution of possible outcomes if, through 2029, the federal policies embodied in current law were generally unchanged and the trade policies in effect when CBO completed its projections remained in place. If federal fiscal policies or trade policies changed, then

economic outcomes would probably differ from CBO's economic projections.

Even if no changes were made to federal fiscal policies or trade policies, economic outcomes would still probably differ from CBO's projections because of non-policy-related factors. Some uncertainty surrounds fundamental aspects of the economy (such as underlying trends in productivity and labor force growth), and some uncertainty surrounds households' and businesses' responses to policies under current law. Changes to trade policies since January 2018 and the prospect of further changes compound that uncertainty because it is particularly difficult to project how businesses will alter their investment activity or adjust their global supply chains in response.

Uncertainties for 2019 to 2023

Many developments—such as unexpected changes in the labor market, business confidence, the housing market, and international conditions—could cause economic

growth and other variables to differ considerably from CBO's projections. In the agency's view, CBO's economic forecast balances the risks of those potential developments, on average, over the 2019–2023 period, so that outcomes could differ from the forecast in either direction.

On the one hand, the agency's current forecast of employment and output for the near term may be too pessimistic. For example, data on employment through the first half of 2019 show that hiring remains strong; moreover, many newly hired workers were previously not classified as being in the labor force, so the labor force participation rate has increased without an increase in the unemployment rate. Moreover, although wage growth has accelerated, inflation remains relatively low. If the combination of strong hiring, robust wage growth, and subdued inflation continued longer than in CBO's projections, real income and household consumption would increase by more than CBO expects.

On the other hand, CBO's forecast for 2019 through 2023 may be too optimistic. A number of international factors pose significant risks to CBO's economic outlook over the next five years. For instance, a disorderly exit of the United Kingdom from the European Union or a government debt crisis in Europe could weaken the U.S. economic outlook by disrupting the international financial system, interfering with international trade, and weakening domestic business and consumer confidence. Slower growth in China—relating to the ongoing trade disputes with the United States and other issues within the country—could worsen China's credit markets, sparking even larger declines in the demand for U.S. exports.

Recent actions related to U.S. trade policy, particularly increases in tariffs, create further uncertainty about the current economic outlook. Because broad tariff increases in developed economies have been rare in recent history, existing empirical research sheds little light on how businesses and consumers in the United States and its trading-partner countries might respond.

Changes in trade policies have increased the risks associated with investments made by U.S. exporters and businesses that rely heavily on imported goods. To make investment decisions, businesses need to predict how trade policies might change in the future and how those changes will affect the cost of production and

demand for their products in the United States and abroad. Uncertainty stemming from the possibility of additional changes in trade policies makes it difficult for businesses to plan long-term investments and may cause them to postpone or reduce their investments. Because there is little recent evidence on how businesses react to uncertainty about future barriers to trade, CBO's projections of those reactions are inherently uncertain. (See Box 2-2 on page 36 for details on how changes in trade policies affect the economy.)

CBO's projections of the economic effects of those trade-policy changes may prove too pessimistic. If the tariffs facilitated new trade agreements that lowered trade barriers between the U.S. and its trading partners, domestic inflation would probably decline, trade flows and investment would rise, and GDP growth would be faster than projected. If those agreements also established stronger protections for intellectual property among U.S. trading partners, U.S. corporate profits and investment in research would probably increase. In addition, if the cost increases associated with the tariffs turned out to be smaller than expected or if trade tensions eased, then domestic inflation would be lower and the tariffs' negative effect on trade and GDP growth would be less than CBO currently projects.

Conversely, CBO's projections of the economic effects of changes in trade policies may be too optimistic. If businesses were less able to absorb the cost increases and therefore had to pass a greater share of them on to consumers, then domestic inflation would be higher and the negative effect on trade and GDP growth would be greater than CBO currently projects. If trade barriers rose further, domestic investment and output would probably be weaker than projected.

The outlook for monetary policy and interest rates is also uncertain, particularly in light of unexpectedly low inflation and interest rates. If the factors holding inflation below the Federal Reserve's 2 percent long-run objective were more persistent than expected, or if expectations about future inflation were to decline, then the Federal Reserve would probably respond by lowering its target range for the federal funds rate further and keeping it lower for longer than expected. Consequently, short- and long-term interest rates would probably be lower than in CBO's projections. Conversely, a sudden jump in inflation would probably prompt the Federal Reserve to increase the target range for the federal funds rate sooner

Figure 2-6.

The Spread Between Long-Term and Short-Term Interest Rates

Percentage Points

The spread between long-term and short-term interest rates on Treasury securities is near zero, probably in part because of market participants' concerns about weak future economic growth.

Sources: Congressional Budget Office; Federal Reserve.

The interest rate spread is defined as the 10-year Treasury note rate minus the 3-month Treasury bill rate.

Data are quarterly values.

than CBO currently expects, causing short- and long-term interest rates to be higher than projected.

Over the next few years, in CBO's projections, economic growth moderates but remains positive as actual GDP moves closer to its potential. But there have been some recent signs of elevated short-run risks to the economy. For example, the spread between long-term and short-term interest rates on Treasury securities is near zero, which probably reflects market participants' concerns about weakness in future economic growth, among other factors (see Figure 2-6). The current baseline projections account for such indicators, reflecting the agency's consideration of the risks and effects of possible recessions in both the near and the long term.

In particular, in CBO's assessment, there is a significant chance that output growth will be slower than projected in the near term, and that assessment includes the possibility of a recession over the next few years. However, there is also a significant chance that output growth will be faster than projected. The agency has constructed its baseline projection of economic growth in the near term to reflect the average of those possible outcomes.

Uncertainties for 2024 to 2029

Recent and prospective policy changes, as well as non-policy-related factors, add to the uncertainty in the economic outlook for the later years in CBO's projection period. The scheduled expiration of key provisions of the 2017 tax act is one source of such uncertainty. Individuals and businesses could respond more (or less) to those changes than CBO anticipates, resulting in slower (or faster) economic growth after 2024 than the agency forecasts.

If federal debt as a percentage of GDP continued to rise at the pace that CBO projects it would under current law, that debt path would ultimately pose significant risks to the fiscal and economic outlook, although those risks are not currently apparent in financial markets. In particular, that path would increase the risk of a fiscal crisis in which the interest rate on federal debt rose abruptly because investors lost confidence in the U.S. government's fiscal position. It would also increase the likelihood of less abrupt, but still significant, negative economic and financial effects, such as expectations of higher inflation and more difficulty financing public and private activity in international markets.

Other policy-related factors include recent shifts toward deregulation and a looser regulatory environment, which are expected to boost investment in the near term and thus potential output in the long term. For instance, a shift toward deregulation in the energy sector has resulted in the approval of pipeline applications that had been pending and increased access to oil and gas exploration in the Gulf of Mexico. Similarly, prohibitions against drilling for oil and gas in the Arctic National Wildlife Refuge have been eliminated. If the effects of deregulation are greater (or less) than CBO expects, then economic growth could be stronger (or weaker) than projected.

How businesses respond to changes in trade policies could also affect CBO's longer-term projections through effects on business investment and potential output. If businesses concluded that the recent escalation of trade tensions had subsided or if trade policies otherwise stopped weighing on investment activity, then business investment, and thus potential output, would be higher than CBO projects. If, however, businesses felt that trade tensions were escalating, then their uncertainty about future barriers to trade would probably increase, and investment, and thus potential output, would be lower than projected.

Economic growth in the later years of the projection period could also be faster or slower than CBO projects for reasons unrelated to policy. If, for example, the labor force grew more quickly than expected—say, because older workers chose to stay in the labor force longer or immigration was greater than anticipated—the economy could grow more quickly than projected.²¹ By contrast, if the growth of labor productivity did not exceed its average pace since the end of the 2007–2009 recession, as it does in CBO's projections, the growth of GDP might be weaker than the agency projects.

Further, substantial uncertainty exists about the growth of overall total factor productivity and related prospects for long-run growth. If growth of total factor productivity remained close to its estimated trend since the end

21. As birth rates in the native-born population have declined over time, immigration has become an increasingly important part of growth in the total U.S. population and labor force. In 2018, immigration accounted for over 40 percent of the growth in the U.S. population and labor force. Foreign-born people accounted for 17.4 percent of the U.S. civilian labor force in 2018, compared with 13.3 percent in 2000.

of the last recession, about 0.7 percent per year, annual growth of output would be about 0.3 percentage points slower than CBO projects. Conversely, if it returned to its more rapid longer-run average rate of growth, annual growth of output would be about one-quarter of a percentage point faster.

Estimates of the long-run neutral rate of interest—the rate at which inflation is stable and monetary policy is neither boosting nor constraining economic growth—underpin CBO's projection of interest rates in the latter years of the projection period. Those estimates are highly uncertain. A higher or lower rate would imply higher- or lower-than-projected short- and long-term interest rates. Forecasts of the term premium, which affects long-term interest rates, are also highly uncertain. For reasons detailed above, CBO expects the term premium to rise from its current historically low level but to remain lower than its level over the previous three decades. A higher or lower term premium would imply higher or lower long-term interest rates than CBO projects.

CBO expects little change in income inequality over the projection period. However, unexpectedly strong and persistent income gains at the bottom or the top of the income distribution could cause income inequality to increase or decline by more than CBO projects.

Income inequality's effect on economic growth, an issue on which economists' theories and empirical results have been mixed, is another source of uncertainty in CBO's longer-run projections.²² Some studies have concluded that income inequality leads to faster growth, others that it slows growth, and still others that it does not affect growth. Moreover, the effect could work in the opposite direction: Economic growth could directly increase or decrease income inequality. When a study concludes

Figure 2-7.

The Uncertainty of CBO's Projections of Real GDP

Trillions of 2012 Dollars

Sources: Congressional Budget Office; Bureau of Economic Analysis.

Real values are nominal values that have been adjusted to remove the effects of changes in prices. The shaded area around CBO's baseline projection of real GDP illustrates the uncertainty of that projection. The area is based on the errors in CBO's one-, two-, three-, four-, and five-year projections of the average annual growth rate of real GDP for calendar years 1976 through 2018.

Values for real GDP from 1999 to 2018 (the thin line) reflect revisions to the national income and product accounts that the Bureau of Economic Analysis released on July 26, 2019. Values from 2018 to 2029 (the thick line) reflect the data available when the projections were made earlier in July.

GDP = gross domestic product.

that a relationship exists between inequality and growth, that conclusion usually depends on factors specific to the time and place being studied. Economists continue to examine the issue, and CBO will update its analysis if research yields a more definitive conclusion.

Quantifying the Uncertainty in CBO's Projections

To quantify the uncertainty surrounding its projections for the next five years, CBO analyzed its past forecasts of real GDP growth.²³ On the basis of that analysis, CBO estimates that—if the errors in the agency's current economic forecast are similar to those in its previous forecasts—there is approximately a two-thirds chance that the average annual rate of real GDP growth (on a calendar year basis) will be between 0.7 percent and 3.3 percent over the next five years (see Figure 2-7).²⁴

23. See Congressional Budget Office, *CBO's Economic Forecasting Record: 2019 Update* (forthcoming).

24. The root mean square error of CBO's five-year projections of the average annual growth rate of real GDP since 1976 is

That range reflects some of the uncertainty inherent in CBO's estimates of the growth in real potential GDP, given that the errors in CBO's longer-horizon forecasts of real GDP growth are partly due to the agency's past underestimates (for example, during the late 1990s) or overestimates (for example, during the early 2010s) of potential GDP growth. To illustrate how changes in the factors underlying potential GDP might contribute to growth averaging 0.7 percent or 3.3 percent over the next five years, CBO examined scenarios in which the growth rates of total factor productivity and the size of the labor force varied.

For example, CBO estimates that if total factor productivity in the nonfarm business sector grew, on average, 1.1 percentage points slower than projected over the next five years (and thus remained roughly unchanged)

1.3 percentage points. For more on the inherent uncertainty underlying economic forecasts, see Congressional Budget Office, *CBO's Economic Forecasting Record: 2019 Update* (forthcoming).

and the labor force grew, on average, 0.8 percentage points slower than projected (and thus shrank), then real GDP growth would be 1.3 percentage points lower, on average, than the 2.0 percent growth (on a calendar year basis) in CBO's economic projections.²⁵ Conversely, if productivity in the nonfarm business sector grew, on average, 1.1 percentage points faster over the next five years and the labor force grew, on average, 0.8 percentage points faster, then real GDP growth would be 1.3 percentage points higher, on average, than CBO projects.

Comparison With CBO's January 2019 Projections

CBO's current economic projections have some notable differences from the set of projections the agency published in January (see Table 2-6).²⁶ In particular, CBO's current projections of interest rates over the 2019–2029 period are markedly lower. In the near term, those differences are driven by developments in financial markets and guidance from the Federal Reserve regarding its outlook for monetary policy. In the latter years of the projection period, the downward revisions are mainly due to CBO's reassessment of factors that influence the long-run neutral rate of interest and the premium on longer-term Treasury securities. The agency also raised its projection of economic growth in the near term as a result of the recent increases to the caps on federal discretionary funding. In addition, CBO's projections of inflation and wage growth have been lowered as a result of weakness indicated by recent data.

The agency now expects short- and long-term interest rates over the coming decade to be lower, on average, by 0.5 percentage points and 0.8 percentage points, respectively. The downward revision to short-term interest rates partly reflects the agency's expectation that the Federal

Reserve will maintain the current target range for the federal funds rate until late 2020 and then gradually increase it in later years. CBO decreased its projections of the federal funds rate in the near term in response to lower inflation in its forecast, lower foreign economic growth, and greater uncertainty about future trade barriers affecting the United States and its trading partners. That revision to the federal funds rate was also informed by statements from Federal Reserve officials, as well as changes in financial markets and outside forecasts.

CBO also lowered its forecast of the federal funds rate over the latter years of the projection period. That revision stemmed from CBO's reassessment of the long-run neutral rate of interest. Since January, CBO has lowered its estimate of that rate because of slower anticipated global growth, which CBO expects to reduce global demand for investment and put downward pressure on interest rates. Downward revisions to projections of the long-run neutral rate by the Federal Reserve and outside forecasters were additional factors in CBO's downward revision.

The downward revision to long-term interest rates in CBO's projections partly reflects the downward revision to short-term interest rates. In addition, CBO now expects the premium on risky assets, which has been elevated since the 2007–2009 recession, to decline more slowly than previously expected, remaining elevated throughout the coming decade. In general, a higher premium on risky assets implies lower rates of return on Treasury securities. The downward revision to long-term interest rates also reflects an updated assessment of the size of the Federal Reserve's holdings of Treasury and other securities. In March of this year, the Federal Reserve announced that it would continue to hold more of those securities than previously expected. That larger balance is expected to push the term premium below previous expectations. For that reason, CBO's downward revision to long-term interest rates is larger than its revision to short-term interest rates and extends throughout the projection period.

CBO also reduced its projection of average CPI and PCE inflation over the early years of the projection period because of data indicating lower-than-expected inflation. However, in CBO's assessment, the weakness in inflation was mainly caused by transitory factors. In CBO's forecast, that downward revision to consumer price inflation was partly offset by an upward revision to the estimated

25. Because the nonfarm business sector produces roughly three-quarters of domestic output, the 1.1 percentage points slower total factor productivity growth in that sector would, on its own, reduce the growth in potential labor force productivity by 0.8 percentage points each year. By contrast, the reduction in the growth of the labor force would, on its own, boost potential labor force productivity. On balance, growth in potential labor force productivity would be roughly 0.5 percentage points lower than in CBO's baseline projection. That reduction, along with the 0.8 percentage-point reduction in labor force growth, underlies the 1.3 percentage-point reduction in real GDP growth.

26. See Congressional Budget Office, *The Budget and Economic Outlook: 2019 to 2029* (January 2019), www.cbo.gov/publication/54918.

effect of tariffs on the prices of consumer goods. The estimate of those effects was increased because a higher tariff rate was imposed on certain Chinese imports in May 2019 and because recent research suggested that a larger share of the cost of the tariffs on U.S. imports are passed along to U.S. consumers and businesses. (See Box 2-2 on page 36 for more details.)

CBO's projection of real GDP growth in 2019 is unchanged but reflects offsetting effects. CBO now expects slower growth of real consumption than it did in January, in part because wages have been rising more slowly than expected given the strength of the labor market; less real business investment, primarily because of increased uncertainty about future trade policies and higher tariffs on imported capital goods; and weaker export growth as a result of slower projected economic growth in major U.S. trading partners. However, those downward revisions are offset by an upward revision to real government purchases, primarily because of an increase in projected federal discretionary spending, and a downward revision to real imports resulting from consumers' and businesses' expected substitution of domestically produced goods for imported consumption and investment goods.

CBO's projection of average annual real GDP growth over the 2020–2023 period has been revised upward for two main reasons. First, CBO projects more purchases by the federal government. Second, the agency anticipates greater growth of business fixed investment as a result of downward revisions to the cost of corporate debt and equity, which more than offsets the negative effects on investment from recent increases in tariffs. The stronger projected output growth led the agency to reduce its projections of the unemployment rate over the 2020–2023 period.

In the current forecast, the size of the potential labor force over the 2019–2029 period is slightly smaller—and its growth rate is slightly slower—than the agency projected in January. In the near term, the projected potential labor force is smaller mainly because the agency lowered the projected size of the population as a result of recent population data. After 2024, the projected potential labor force is smaller mainly because the agency reduced the potential labor force participation rate after reassessing trends in participation rates for each demographic group.

Despite CBO's projection of a smaller potential labor force, the agency now expects overall growth in potential output over the 2019–2029 period to increase slightly faster than in the January forecast. That more rapid growth is due to a number of minor technical adjustments in the projection. Those adjustments resulted in faster projected growth of capital services in nonfarm businesses and in owner-occupied housing, which more than offset slightly slower growth of potential total factor productivity in the nonfarm business sector.

CBO's projections of total national income have been reduced by an average of 0.2 percent per year over the 2019–2029 period, reflecting downward revisions to projections of various types of income, including total labor compensation and proprietors' income—downward revisions that were partly offset by upward revisions to the agency's projections of corporate profits and net income from foreign assets. Because of data showing that hourly compensation growth in the last quarter of 2018 and the first quarter of 2019 was lower than CBO expected, the agency lowered its projections of hourly compensation growth in 2019 without projecting a strong rebound in later years. That revision, along with other factors, led the agency to lower its projections of total labor compensation over the entire 2019–2029 period. Changes to other components of national income result from revised projections of other key economic variables. For example, CBO lowered its estimates of net interest paid by domestic businesses over most of the projection period as a result of downward revisions to interest rates. Higher estimates of corporate profits result from lower projections of interest costs and total labor compensation.

Comparison With Other Economic Projections

CBO's projections of the economy for the next two years are slightly more optimistic than the consensus view of the private-sector economists whose forecasts were published in the August 2019 *Blue Chip Economic Indicators* but are within the range of those forecasts (see Figure 2-8). In particular, CBO's projections of real GDP growth are above the middle two-thirds of the range of *Blue Chip* forecasts for 2019 and at the high end of that range for 2020. CBO's projections of the unemployment rate are in line with the consensus view of private-sector economists, but the agency's projections of GDP price inflation are lower than the consensus for 2019 and at the lower end of the middle two-thirds of

Table 2-6.

Current and Previous Economic Projections for 2019 to 2029

	2019	2020	2021	Annual Average		Total, 2019–2029

January 2019	2.2	2.1	2.0	2.0	1.8	1.9

Continued

the range for 2020. The agency’s projections of consumer price inflation and interest rates for both 2019 and 2020 are within the full range of the *Blue Chip* forecasts, although CBO’s forecasts for consumer price inflation and the interest rate for 3-month Treasury bills are both above the middle two-thirds of the *Blue Chip* forecasts’ range for 2020.

Compared with the middle two-thirds of the range of forecasts made by Federal Reserve officials and reported at the June 2019 meeting of the Federal Open Market Committee, CBO’s projections suggest a slightly stronger economic outlook for 2019, a similar outlook for 2020, and a slightly weaker outlook for 2021 and the longer

term (see Figure 2-9).²⁷ The full range of Federal Reserve forecasts is based on the highest and lowest forecasts made by the members of the Board of Governors of the Federal Reserve System and the presidents of the Federal Reserve Banks. CBO’s projections of real GDP growth and the federal funds rate are within the range of the forecasts by Federal Reserve officials for 2019, 2020, 2021, and the longer term. However, the agency’s projection of PCE price inflation is above the range for 2019, and the agency’s projection of the unemployment rate is above the range for the longer term. In addition,

GDP = gross domestic product; PCE = personal consumption expenditures.

- a. Real values are nominal values that have been adjusted to remove the effects of changes in prices.
- b. Excludes prices for food and energy.
- c. The consumer price index for all urban consumers.
- d. The employment cost index for wages and salaries of workers in private industry.
- e. Adjusted to remove distortions in depreciation allowances caused by tax rules and to exclude the effects of changes in prices on the value of inventories.

CBO’s projections of core PCE price inflation are above the range in both 2019 and 2020.

effect when CBO completed its projections will remain in place through 2029.

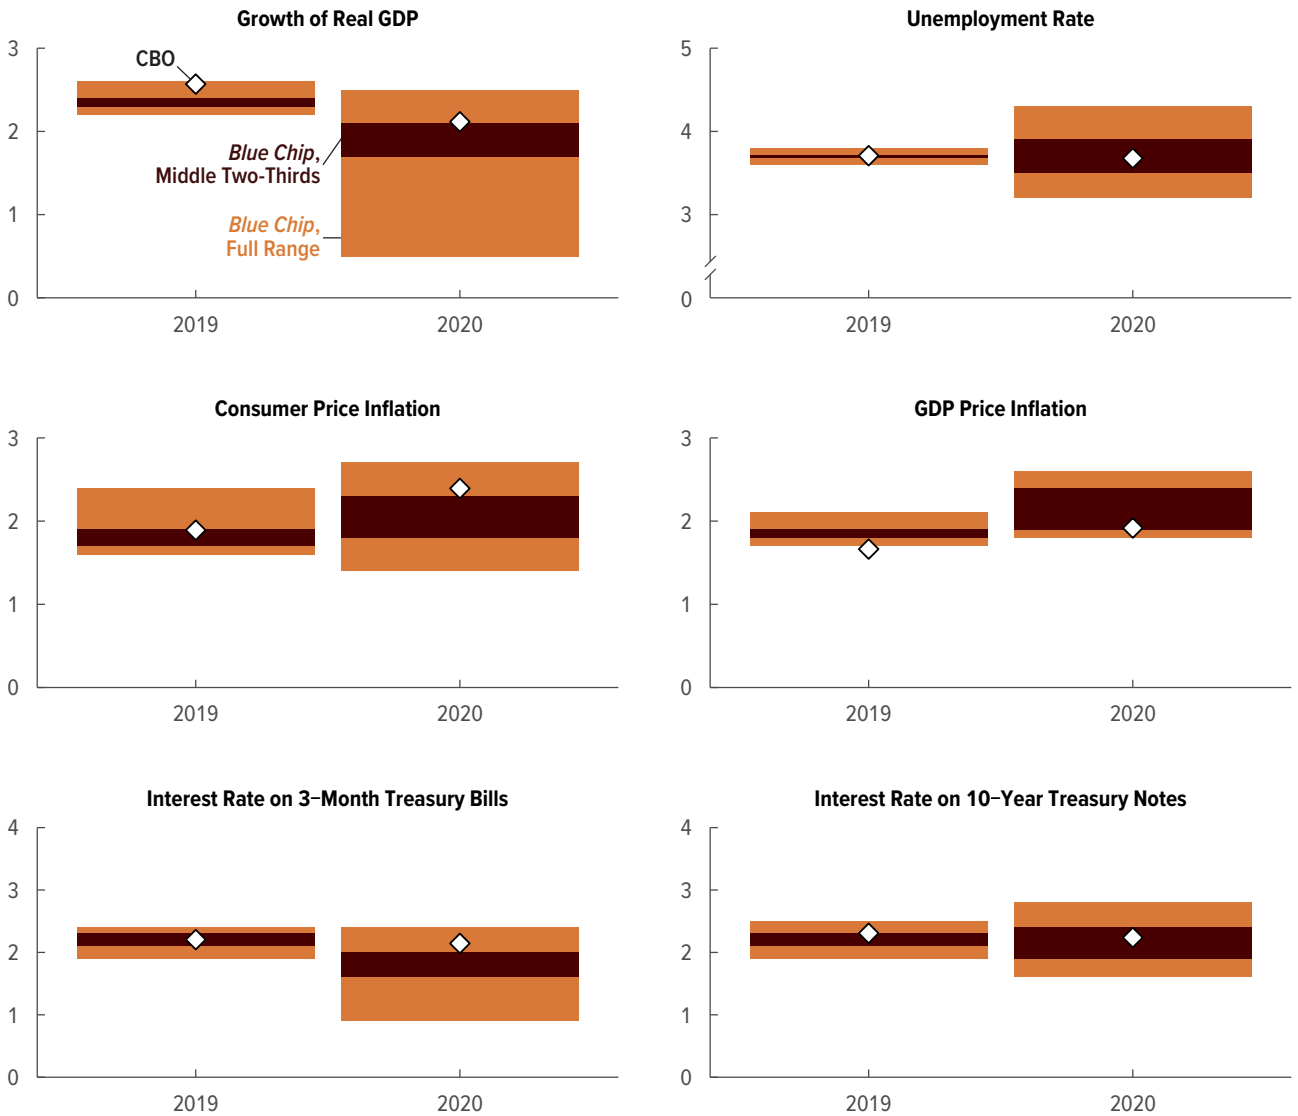

At least part of the discrepancy between CBO’s projections and those of other forecasters is probably attributable to differences in the economic data available when the forecasts were completed and to differences in the economic and statistical models used to prepare them. In addition, other forecasters may assume that certain changes in federal policies or trade policies will occur, whereas CBO’s projections are based on current law and incorporate the assumption that the trade policies in

A key difference between CBO’s economic projections and those made by Federal Reserve officials is that CBO reports the average of a distribution of possible outcomes under current law. Each individual Federal Reserve official, by contrast, reports the mode—the most likely outcome—of a distribution of possible outcomes under each official’s individual assessment of appropriate monetary policy.

Figure 2-8.

Comparison of CBO’s Economic Projections With Those From the *Blue Chip* Survey

CBO’s projections for the next two years are slightly more optimistic than the consensus view of the private-sector economists in the *Blue Chip* survey.
 Percent

Sources: Congressional Budget Office; Wolters Kluwer, *Blue Chip Economic Indicators* (August 9, 2019).

The full range of forecasts from the *Blue Chip* survey is based on the highest and lowest of the roughly 50 forecasts. The middle two-thirds of that range omits the top one-sixth and the bottom one-sixth of the forecasts.

Real values are nominal values that have been adjusted to remove the effects of changes in prices. Consumer price inflation is based on the consumer price index for all urban consumers. The growth of real GDP and inflation rates are measured from the average of one calendar year to the next.

The unemployment rate is the number of jobless people who are available for and seeking work, expressed as a percentage of the labor force. The unemployment rate and interest rates are calendar year averages.

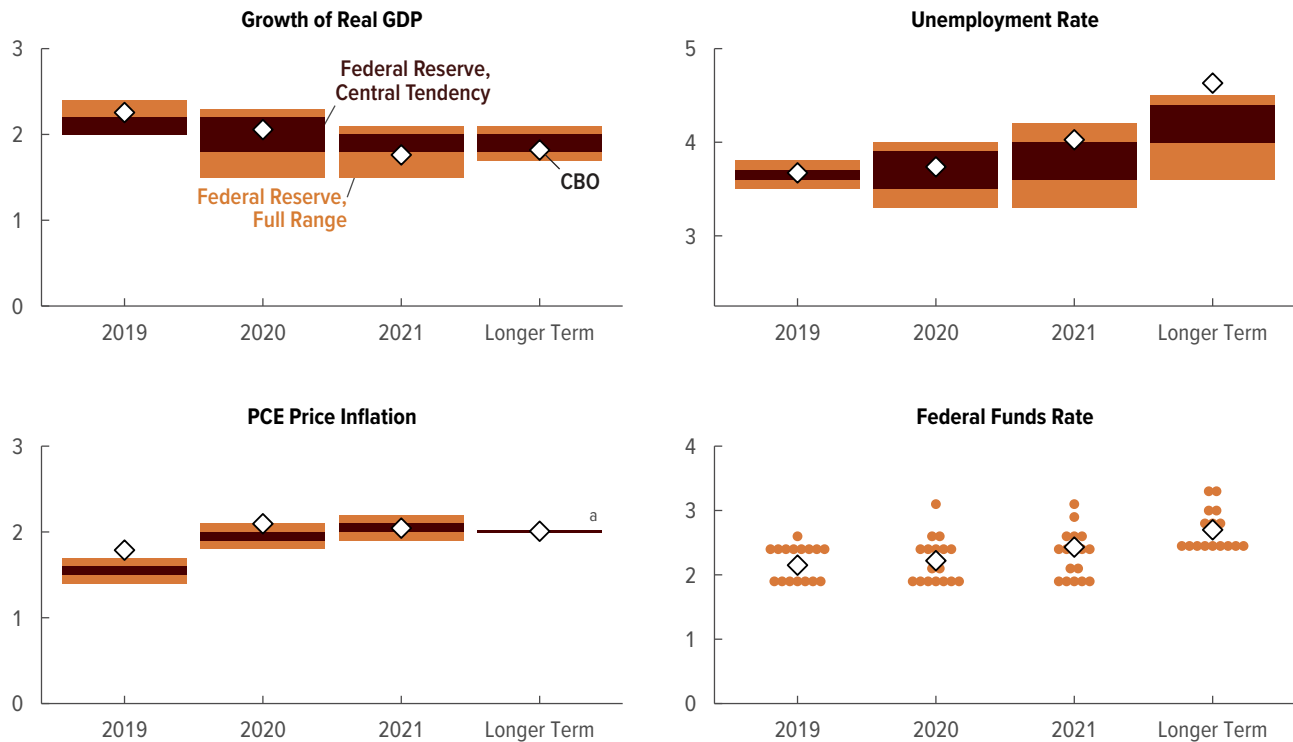

GDP = gross domestic product.

Figure 2-9.

Comparison of CBO's Economic Projections With Those by Federal Reserve Officials

Compared with the forecasts made by Federal Reserve officials, CBO's projections suggest a slightly stronger economic outlook for 2019, a similar outlook for 2020, and a slightly weaker outlook for 2021 and the longer term.

Percent

Sources: Congressional Budget Office; Board of Governors of the Federal Reserve System, "Economic Projections of Federal Reserve Board Members and Federal Reserve Bank Presidents Under Their Individual Assessments of Projected Appropriate Monetary Policy, June 2019" (June 19, 2019), <https://go.usa.gov/xVq34>.

The full range of forecasts from the Federal Reserve is based on the highest and lowest of the 15 projections by the Board of Governors and the presidents of the Federal Reserve banks. (One Federal Reserve official did not submit longer-run projections for the change in real GDP, the unemployment rate, or the federal funds rate.) The central tendency is, roughly speaking, the middle two-thirds of the full range, formed by removing the 3 highest and 3 lowest projections.

Each of the data points for the federal funds rate represents a forecast made by one of the members of the Federal Reserve Board or one of the presidents of the Federal Reserve banks in June 2019. The Federal Reserve officials' forecasts of the federal funds rate are for the rate at the end of the year, whereas CBO's forecasts are fourth-quarter values.

For CBO, longer-term projections are values for 2029. For the Federal Reserve, longer-term projections are described as the value at which each variable would settle under appropriate monetary policy and in the absence of further shocks to the economy.

Real values are nominal values that have been adjusted to remove the effects of changes in prices.

The unemployment rate is the number of jobless people who are available for and seeking work, expressed as a percentage of the labor force.

The growth of real GDP and inflation rates are measured from the fourth quarter of one calendar year to the fourth quarter of the next. The unemployment rate is a fourth-quarter value.

GDP = gross domestic product; PCE = personal consumption expenditures.

a. For PCE price inflation in the longer term, the range and central tendency equal 2 percent.

APPENDIX
A

Changes in CBO's Baseline Projections

Overview

The Congressional Budget Office estimates that if no new legislation affecting spending and revenues is enacted, the budget deficit for fiscal year 2019 will total \$960 billion. That amount is \$63 billion larger than the \$896 billion deficit the agency estimated in May 2019, when it last updated its baseline budget projections.¹ CBO also now projects that if current laws generally remained in place, the cumulative deficit for the 2020–2029 period would be about \$12.2 trillion—\$0.8 trillion more than the \$11.4 trillion in the agency's May 2019 baseline projections. All told, outlays over that period are about 0.6 percent larger in CBO's current projections than they were in May, and revenues are about 1.0 percent smaller.

That increase in the cumulative deficit is primarily the net result of three changes in CBO's baseline projections. First, to account for the Bipartisan Budget Act of 2019 (Public Law 116-37), CBO added a total of \$1.7 trillion to its projection of the 10-year deficit (see Figure A-1). That law increased discretionary funding limits for 2020 and 2021, and CBO's baseline projections reflect the assumption that the increased funding in 2021 will continue and grow at the rate of inflation in future years. Second, supplemental appropriations for disaster relief and border security for this year, which are also projected to grow with inflation in future years, added \$255 billion to the cumulative deficit for 2020 to 2029. Partially offsetting those increases was a third change: Downward revisions to CBO's forecast of interest rates reduced the agency's projections of interest costs for the period (including the debt-service savings from the resulting reductions in deficits and debt), and thus its projections of deficits, by a total of \$1.4 trillion.

When CBO updates its baseline budget projections, it groups the revisions it makes into three categories:

- Legislative changes, which result from laws enacted since the agency published its previous baseline projections and which generally reflect the budgetary effects reported in CBO's cost estimates when the legislation was enacted;
- Economic changes, which arise from changes the agency has made to its economic forecast (including those made to incorporate the macroeconomic effects of recently enacted legislation); and
- Technical changes, which are revisions to projections that are neither legislative nor economic.

Of the \$63 billion increase in the projected deficit for 2019, \$6 billion is attributable to legislative changes, \$29 billion to economic changes, and \$29 billion to technical changes. The legislative and economic revisions that CBO has made to its projections for the 2020–2029 period were largely offsetting: Legislative changes increased projected deficits by a total of \$1.9 trillion, while economic changes reduced deficits by \$1.4 trillion. On net, technical updates to the agency's projections of revenues and outlays increased* deficits over the period by a total of \$250 billion.

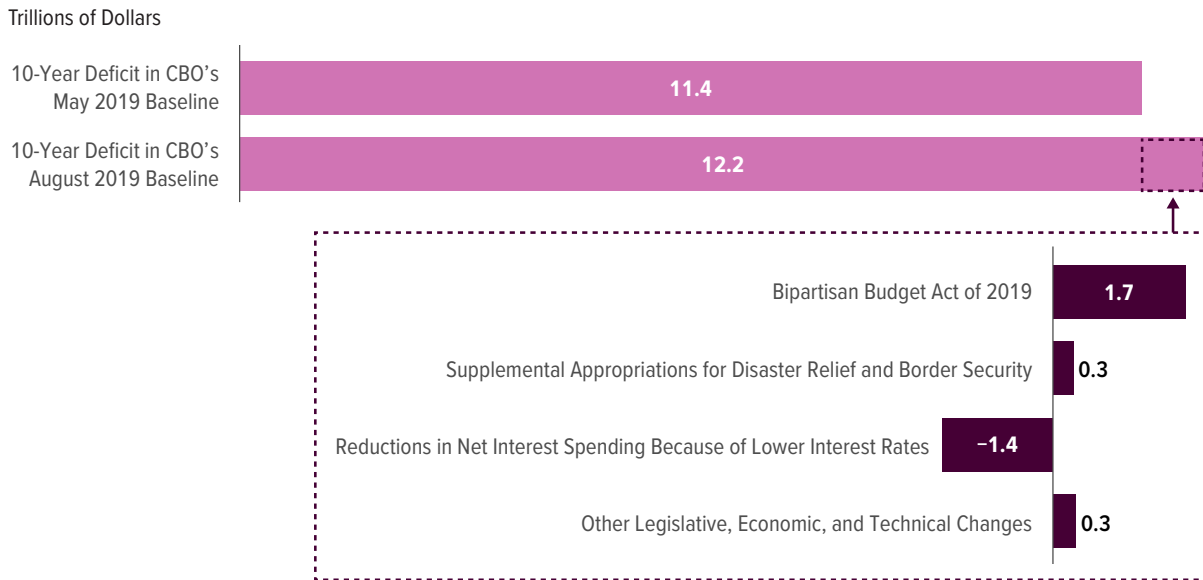

As a result of those changes, over the 2020–2029 period, *primary* deficits—that is, deficits excluding net outlays for interest—are now projected to be a total of \$1.9 trillion greater than they were in CBO's May 2019 baseline projections. That increase in projected primary deficits is offset by a reduction of \$1.1 trillion in the agency's projections of interest costs over that same period. Because projected interest rates are now lower than they were in May, debt held by the public in CBO's projections has not risen as much as it would have if the economic forecast had not changed. In May, the agency projected that debt held by the public would be \$28.5 trillion (or 92 percent of gross domestic product, or GDP) at the end of 2029; CBO now projects that the debt would reach \$29.3 trillion (or 95 percent of GDP) that year if current laws generally remained unchanged.

Figure A-1.

Changes in CBO’s Baseline Projection of the 10-Year Deficit Since May 2019

Source: Congressional Budget Office.

The amounts shown include the costs or savings in debt service resulting from the changes in deficits.

Legislative Changes

The largest changes CBO has made since May to its projections of deficits over the 2019–2029 period stem from recently enacted legislation. Almost all of those changes—\$6 billion this year and \$1.9 trillion over the 2020–2029 period—were to projected outlays (see Table A-1). The largest change was an increase in projections of discretionary outlays that stemmed from the higher limits on discretionary funding put in place by the Bipartisan Budget Act of 2019. Additional appropriations for disaster relief and border security also led CBO to increase its projections of outlays. Other legislation enacted since May has had a minor effect on CBO’s projections.

Bipartisan Budget Act of 2019

Of the 10-year increase in projected outlays attributable to new legislation, \$1.7 trillion stems from the enactment of the Bipartisan Budget Act of 2019 (see Table A-2 on page 70). That law raised the caps on defense and nondefense discretionary appropriations for fiscal year 2020 by \$171 billion and for fiscal year

2021 by \$153 billion.² CBO’s projections of discretionary outlays reflect the assumption that funding in 2020 and 2021 will be at or just below the new, higher caps set for those years and that it will grow with inflation thereafter.³ (In accordance with section 257 of the Deficit Control Act, CBO projects funding for individual accounts in future years by applying the specified inflation rate to the most recent appropriations for those accounts.) As a result, CBO now projects higher discretionary funding through 2029. Accordingly, CBO raised its projections of outlays for the entire 2020–2029 period by \$1.5 trillion—\$0.3 trillion resulting directly from the additional appropriations projected under the new caps for 2020 and 2021, and \$1.2 trillion stemming from the higher projections for 2022 to 2029, which are based on the new 2021 funding limits.

2. The caps on discretionary appropriations were originally set by the Budget Control Act of 2011 (P.L. 112-25), as amended.

3. CBO projects that discretionary budget authority will be just below the caps in 2020. That authority is not projected to reach the new limits because inflation for defense funding from 2019 to 2020 is projected to be less than the rate of growth of the cap on such funding. For a detailed explanation, see “CBO’s Baseline Budget Projections for 2020 Through 2029” on page 10.

CBO estimated that the Bipartisan Budget Act of 2019 would also reduce mandatory outlays for 2027 to 2029 by \$55 billion.⁴ Most of that reduction—\$39 billion—is attributable to the extension of a set of across-the-board reductions (known as sequestration) on spending for certain mandatory programs (primarily Medicare) that are required under current law. The law extended that mandatory sequestration, which was set to expire in 2027, through fiscal year 2029. The rest of the reduction in projected mandatory outlays stems from a \$16 billion increase in estimated collections of customs user fees for the 2027–2029 period. Collections of those fees—which apply to vessels, vehicles, and passengers and include a merchandise processing fee—are recorded as reductions in direct spending. The fees were set to expire in 2026, but the law extended them through September 30, 2029.

All told, before debt service is taken into account, the changes that CBO made to its projections to account for the enactment of the Bipartisan Budget Act of 2019 increased the cumulative deficit for the 2020–2029 period by \$1.5 trillion. The additional federal borrowing stemming from the larger annual deficits added \$200 billion to CBO's projection of total outlays for interest on federal debt over that period.

Supplemental Appropriations for Disaster Relief and Border Security

Two other laws enacted since May had a significant effect on CBO's projections of outlays. Those two laws provided funding for 2019 that was not constrained by the caps on discretionary funding because it was designated as an emergency requirement. Although those laws provided funding only for this year, in accordance with the statutory rules that govern CBO's projections of discretionary outlays, the agency projects that funding equal to the amount provided by those appropriations (adjusted for inflation) will continue to be provided each year from 2020 to 2029.

The first law, the Additional Supplemental Appropriations for Disaster Relief Act, 2019 (P.L. 116-20), provided \$19 billion in additional emergency funding in 2019 for several federal agencies to respond to natural disasters.⁵ As a result of that funding increase, CBO

raised its estimate of discretionary outlays for 2019 by \$5 billion and its projections for the 2020–2029 period by a total of \$171 billion. That law also will result in \$1 billion in additional spending on mandatory programs between 2019 and 2029, primarily on the Supplemental Nutrition Assistance Program (SNAP, which helps people in low-income households to purchase food).

The second law, the Emergency Supplemental Appropriations for Humanitarian Assistance and Security at the Southern Border Act, 2019 (P.L. 116-26), provided \$5 billion in emergency funding this year to expand federal agencies' capacity to respond to foreign nationals who attempt to enter the United States through the southern border and to provide them humanitarian assistance—including food, shelter, and medical services.⁶ To account for that increase in funding, CBO raised its estimate of discretionary outlays for 2019 by \$1 billion and its projections for the 2020–2029 period by a total of \$52 billion.

All told, as a result of those two laws, CBO increased its projection of outlays for the 2020–2029 period by a total of \$224 billion. The increase in federal borrowing stemming from those two laws would add a total of \$31 billion to outlays for interest on federal debt over the 10-year period, CBO estimates.

Economic Changes

The economic forecast that underlies CBO's baseline budget projections includes the agency's projections of GDP, income, the unemployment rate, interest rates, inflation, and other factors that affect federal spending and revenues. The current projections are based on the latest economic forecast, which was completed in July 2019; the agency's May 2019 budget projections were based on the economic forecast published in January 2019. The current economic forecast includes the agency's estimates of the effects of the Bipartisan Budget Act of 2019 on the economy.

4. Mandatory spending is governed by statutory criteria and is not normally controlled by the annual appropriation process.

* = between -\$500 million and \$500 million.

The changes that CBO has made to its economic forecast since January have increased its estimate of the deficit for 2019 by \$29 billion and decreased its projections of deficits for the 2020–2029 period by a total of \$1.4 trillion.

A decrease in projected net interest outlays, slightly offset by a decrease in projected revenues, accounts for most of the latter change.

Changes in Outlays

The revisions that CBO made to its economic forecast lowered its estimate of outlays for the current year by \$9 billion and decreased its projections of outlays for the 2020–2029 period by \$1.6 trillion (or 3 percent). Most of the reduction in outlays over that period stems from the downward revision in the agency's forecast of interest rates, which reduced its projections of net interest costs by \$1.2 trillion before the change in debt service associated with the smaller projected deficits is accounted for. When those debt-service savings are included, the revisions to the economic forecast lowered net interest costs by \$1.4 trillion.

Mandatory Outlays. Because of changes the agency made to its economic forecast, CBO increased its estimate of mandatory spending for 2019 by \$1 billion and decreased its projections for the 2020–2029 period by \$158 billion. The largest economic changes were in CBO's projections for Social Security.

Social Security. Projected outlays for Social Security over the 2020–2029 period declined by a total of \$93 billion

(or 1 percent), primarily because CBO reduced its estimates of the cost-of-living adjustments (COLAs) that will be made to beneficiaries' payments each January over that period. Social Security's COLAs are based on changes in the consumer price index for urban wage earners and clerical workers (CPI-W). Because of changes CBO made to its inflation forecast, it reduced its projections of the COLAs for 2020 and 2021 by 0.3 percentage points (or roughly 14 percent and 12 percent, respectively) and its projection for 2022 by 0.1 percentage point (or 4 percent). CBO also reduced its projection of wages, which led to lower projected Social Security benefits for new recipients.

Student Loans. CBO reduced its projection of the costs of student loans for the 2020–2029 period by a total of \$43 billion because it now forecasts lower interest rates on federal borrowing than it did in January. As prescribed by the Federal Credit Reform Act of 1990 (FCRA), CBO estimates the net cost of student loans to the federal government by discounting the value of expected future loan payments to express the value of those payments in today's dollars and then subtracting

that present-value amount from the loan disbursement.⁷ Those values are computed using interest rates on federal borrowing as the discount rates.⁸ When those interest rates go down, the value of future payments to the federal government increases, thus reducing the net cost of the loans. (That reduction was largely offset by a \$34 billion increase in costs for student loans that stems from technical changes; that increase is discussed below.)

Medicare. CBO increased its projections of Medicare spending for the 2020–2029 period by \$24 billion (or 0.3 percent) because of revisions it made to its economic forecast. Under current law, payment rates for much of Medicare’s fee-for-service sector (such as hospital care and services provided by home health agencies and skilled nursing facilities) are updated automatically. Those updates are based on changes in the prices of the labor, goods, and services that health care providers purchase and include an adjustment to account for economywide gains in productivity (the ability to produce the same output using fewer inputs, such as hours of labor) over a 10-year period. CBO now anticipates slightly larger updates between 2020 and 2029 than it did previously—a change that increases Medicare outlays in CBO’s baseline projections.

Medicaid. The agency lowered its projections of federal Medicaid spending for the 2020–2029 period by \$20 billion because it reduced its forecasts of unemployment and of inflation. The unemployment rate in CBO’s current forecast is lower than it was in the agency’s January forecast in every year of the 2020–2029 period, and especially in 2022 and 2023. In those years, the unemployment rate is now projected to be 4.1 percent and 4.4 percent instead of 4.5 percent and 4.8 percent, respectively. CBO also revised downward its projections of growth in the consumer price index for urban

households (CPI-U) and in the employment cost index (ECI) over the first few years of the projection period because new data indicate that inflation will be weaker than previously anticipated. Fewer people are expected to enroll in Medicaid when unemployment is lower, and average benefit costs are projected to be smaller as a result of lower inflation.

Unemployment Compensation. CBO lowered its projection of spending on unemployment benefits for the 2020–2029 period by \$17 billion primarily because it reduced its projections of the unemployment rate.

Other Mandatory Programs. The agency updated its projections of outlays for a number of other mandatory programs to reflect changes it made to its economic forecast that resulted in both upward and downward adjustments to such outlays. On net, those changes decreased projected outlays for the 2020–2029 period by a total of \$9 billion.

Discretionary Outlays. CBO’s baseline projections generally reflect the assumption that funding for discretionary programs keeps pace with inflation. Changes to the measures of inflation that CBO is required to use to develop its baseline projections of discretionary funding drove the economic changes in discretionary outlays. For discretionary funding related to federal personnel, the agency uses the employment cost index for wages and salaries to prepare its projections; for other types of discretionary funding, the agency uses the GDP price index. As a result of reductions in the agency’s forecasts of those measures, discretionary funding over the 2020–2029 period is now projected to be slightly lower than previously projected, and outlays for that period are \$5 billion less in the agency’s current baseline projections than they were in the May 2019 projections.

Net Interest. Economic changes have reduced CBO’s baseline projections of net interest costs for the 2020–2029 period by \$1.4 trillion. The main reason for that reduction is that CBO has lowered its forecasts of both short- and long-term interest rates on Treasury securities since January. CBO decreased projected interest rates for 2020 to 2024 in its economic forecast by an average of nearly 100 basis points (or nearly 30 percent) each year. The agency also lowered projected interest rates for the 2025–2029 period, though by smaller amounts; on average, rates projected for those years decreased by about 50 basis points (or roughly 15 percent). (For further

7. See Justin Humphrey, analyst, Congressional Budget Office, “How the Government Budgets for Student Loans” (presentation at the Postsecondary National Policy Institute, January 25, 2018), www.cbo.gov/publication/53511.

8. An alternative method would be to use market-based discount rates; such an approach is referred to as a fair-value method. The discount rate is higher under the fair-value method, so the value of future payments is lower and the estimated costs of student loans higher than under the FCRA method. In CBO’s view, the fair-value approach provides a more comprehensive measure than FCRA estimates of the costs of student loans. See Congressional Budget Office, *Fair-Value Estimates of the Cost of Federal Credit Programs in 2020* (May 2019), www.cbo.gov/publication/55278.

explanation of those revisions, see “Comparison With CBO’s January 2019 Projections” on page 58.) As a result, CBO lowered the projected average interest rate on debt held by the public over the 2020–2029 period by roughly 70 basis points. Primarily because of the lower projected interest rates, CBO decreased its projection of net interest outlays (and thus of deficits) for the 2020–2029 period by \$1.2 trillion before accounting for the resulting change in the amount of federal debt. Those debt-service savings associated with the smaller projected deficits are estimated to amount to \$159 billion, bringing the total reduction in net interest outlays for the 2020–2029 period from economic changes to \$1.4 trillion.

Changes in Revenues

As a result of revisions the agency made to its economic forecast, CBO reduced its estimate of revenues for 2019 by \$38 billion (or 1 percent) and its projections for 2020 through 2029 by a total of \$186 billion (or less than 1 percent). The reduction in revenues for 2019 stems primarily from lower estimates of wages and salaries and of proprietors’ income, which brought down projections of individual income and payroll taxes. In addition, CBO reduced its estimate of corporate tax receipts for the year because it lowered its projection of domestic economic profits in 2019.

The \$186 billion reduction in projected revenues for 2020 through 2029 stems mostly from lower projections of the growth of GDP and of associated taxable incomes—primarily wages and salaries and proprietors’ income. In addition, CBO lowered its projections of interest rates and of imports and increased its projections of domestic and foreign profits; those updates to the agency’s economic forecast also affected the baseline revenue projections. Over the next decade, the total percentage reduction in CBO’s projections of revenues that is attributable to economic factors (0.4 percent) is about the same as the downward revision in the agency’s GDP forecast (0.4 percent).

Payroll Taxes. Incorporating the latest economic forecast in its budget projections, CBO lowered its projection of payroll tax revenues for the 2020–2029 period by \$123 billion (or less than 1 percent). Nearly all of that reduction stems from the agency’s lowering its projections of wages and salaries and of proprietors’ income for the next 10 years by \$1.7 trillion.

Individual Income Taxes. Economic changes raised CBO’s projection of total individual income tax revenues

over the next decade by \$55 billion (or less than 1 percent). The largest sources of the revisions to individual income taxes were the reductions in projections of wages and salaries and of proprietors’ income, but taken together, other smaller changes that the agency has made to its economic forecast since January more than offset those reductions over the next decade. CBO lowered its projection of interest paid on owner-occupied housing by about \$700 billion, which in turn reduced its projections of deductions for mortgage interest and raised income tax receipts. The agency increased its estimates of the expected returns on assets in retirement plans, boosting projections of taxable withdrawals over the next decade by almost \$400 billion. Moreover, CBO lowered its forecast of inflation; because the tax brackets and other parameters of the individual income tax system are indexed to inflation, lower inflation would push a larger portion of any given amount of taxable income into higher tax brackets and thus raise income tax receipts.

Corporate Income Taxes. CBO lowered its projection of corporate income tax revenues for 2020 to 2029 by \$28 billion (or 1 percent). Corporate profits, both domestic and foreign, for most of the next decade are larger in CBO’s current economic forecast than they were in the previous forecast. The increase in projections of domestic corporate profits boosted projected revenues, but those increases in revenues were more than offset by the combined effects of other changes in CBO’s current economic forecast, particularly higher foreign profits and lower interest rates. The increase in projected foreign profits would result in corporations’ claiming larger credits for their foreign earnings, and the lower interest rates would mean that a larger portion of corporations’ net interest expenses would fall below the new limitation on such expenses and thus be deductible from their current income tax liability.

Other Revenues. In response to announcements made by the Federal Open Market Committee (FOMC) since January 2019, CBO increased its projection of the amount of Treasury securities that the Federal Reserve will purchase early in the forecast period.⁹ Those additional purchases would, all else being equal, increase

9. The analysis does not incorporate changes that would result from the FOMC’s announcement on July 31, 2019, that provided additional detail regarding the composition of assets that the Federal Reserve would purchase. That announcement was made after the analysis for this publication was completed. CBO expects that incorporating that detail into its baseline would lower its projection of the Federal Reserve’s remittances for the 2020–2029 period.

interest earned by the central bank on its assets over the forecast period and the amount of interest that it pays to financial firms on the reserves they hold at the Federal Reserve. The lower interest rates in CBO's current economic forecast would partially offset those increases. On net, the additional expenses exceed the increase in interest income in CBO's projections. That change, along with other factors, lowered remittances from the Federal Reserve to the Treasury by \$69 billion (or 10 percent) over the 10-year period.

The agency also lowered its projections of imports over the 10-year period by a total of \$1 trillion (or 3 percent). That change in the economic forecast reduced CBO's projections of revenues from customs duties for 2020 through 2029 by \$38 billion (or 4 percent). (That reduction was largely offset by the technical changes to customs duties discussed below.)

Technical Changes

Technical changes—that is, changes that are neither legislative nor economic—increased CBO's estimate of the deficit in 2019 by \$29 billion and its projections of deficits over the 2020–2029 period by a total of \$250 billion. A downward revision in the agency's projections of revenues accounts for most of that change.

Changes in Revenues

For various technical reasons, CBO lowered its projections of revenues in 2019 by \$22 billion (or less than 1 percent). Tax collections from individual and corporate income taxes have been smaller in recent months than CBO estimated in January—and by more than the currently available economic data can explain. The main factors responsible for the shortfall will become clearer as additional data from tax returns and other sources become available. In addition, CBO has reduced the projection of other receipts in 2019 to reflect the fact that collections from the penalty on some employers that have at least 50 full-time equivalent employees and that do not offer health insurance coverage that meets certain standards have been less than anticipated.

All told, the technical changes that CBO has made have lowered its revenue projections for 2020 through 2029 by a total of \$263 billion. Again, reductions in projected income taxes and collections of penalties were two of the main factors contributing to that downward revision, but those changes were partially offset by increases in projected payroll taxes and customs duties.

Corporate Income Taxes. CBO has lowered its projections of corporate income tax receipts for the next decade by a total of \$186 billion because of modeling changes and new data from corporate tax returns on deductions and income for 2017. The most significant modeling changes are intended to better reflect the historical relationships between the corporate income and expenses accounted for in the national income and product accounts (NIPAs) and the income and expenses reported by businesses on their tax returns. Previously, most differences between the NIPA measure of profit and the tax measure were estimated by projecting those items to grow with broad measures of economic activity; now CBO models those differences in greater detail.

Collections of corporate income taxes in 2019 have been less than they were projected to be in January. The extent to which those smaller collections (as well as the recent weakness in individual income tax collections) are related to underlying economic activity, the effects of the 2017 tax act, or other factors is not yet known. (For a discussion of what CBO has learned from recent data about the effects of the 2017 tax act, see Box 1-1 on page 12.) Alternative causes of the weakness would have differing implications for future receipts. For example, if the weakness results from an underlying change in the relationship between aggregate economic income and reported taxable income, it may be expected to persist permanently.¹⁰ By contrast, if provisions of the 2017 tax act caused businesses to take more deductions in the current year than CBO anticipated rather than delay them for future use, the present weakness in collections would not be expected to persist; indeed, if businesses were accelerating deductions, it would suggest that receipts of corporate income taxes would be stronger in future years. Until the underlying causes are known, CBO anticipates that the unexplained weakness will persist and gradually dissipate over the next several years; the agency has reduced its projections of corporate income taxes during the first half of the decade accordingly.

Individual Income Taxes. The agency has lowered its projections of individual income tax receipts over the 2020–2029 period by \$172 billion. Part of that

10. After CBO completed this analysis, the Bureau of Economic Analysis released its annual revision of historical economic data. That revision included significant reductions in estimated corporate profits for 2017 and 2018, which probably explain part of the weakness in corporate income tax collections. For a discussion of the revisions, see Box 2-1 on page 30.

revision results from new data from the Social Security Administration that indicate that the share of taxes withheld from workers' paychecks in 2018 that went to payroll taxes (instead of income taxes) was larger than anticipated. As a result, CBO lowered its estimate of the amount of income taxes that were collected in 2018 and its projections of such collections in future years. Those changes were mostly offset by the upward revision to payroll taxes described below.

Further reducing CBO's projections of individual income tax receipts over the next several years are weaker-than-anticipated estimated payments for 2019 taxes. The recent payment data are difficult to interpret because taxpayers have discretion to adjust their estimated payments for various reasons. For example, some may have adjusted those payments to reflect recent changes in income, and some may have adjusted their withholding or estimated payment amounts after being surprised by the size of their final tax payment or refund when filing their 2018 return. Furthermore, taxpayers with higher income often take advantage of automatic six-month filing extensions and thus will not file their 2018 tax returns until October 2019.

The most significant factor leading CBO to lower its projections of individual income tax receipts in the latter half of the decade was that the agency reduced its projections of taxable withdrawals from retirement accounts, in response to recent data indicating that assets in retirement accounts are worth less than previously anticipated.

Payroll Taxes. The agency has increased its projections of payroll taxes throughout the next decade by a total of \$131 billion. That revision was made primarily because new data from the Social Security Administration indicate that the payroll tax base in 2018 was larger than CBO had projected.

Other Revenues. CBO lowered its projection of revenues from other sources for the 2020–2029 period by \$37 billion. The most significant change among those revenue sources was a reduction in the projected collections of penalties from some employers that have at least 50 full-time-equivalent employees and that do not offer health insurance coverage that meets certain standards. Although that penalty went into effect for coverage in 2015, the first penalties were not collected until 2019, and thus far, those collections have been lower than CBO anticipated. Consequently, CBO has reduced its

projections of the collections of those penalties for the 2020–2029 period by \$48 billion.

The agency has also increased its projections of customs duties for the next decade by a total of \$33 billion for technical reasons. That change reflects actions by the Administration that increased tariffs on a large share of imports from China from 10 percent to 25 percent in May 2019. In addition, the Administration has made certain types of products and products from certain countries exempt from tariffs; most notably, the Administration has exempted Canada and Mexico from tariffs on steel and aluminum that were imposed in 2018. CBO's projections of customs duties incorporate the assumption that the tariffs in place as of July 25, 2019, will continue permanently, without any changes.¹¹

Changes in Outlays

Because of technical updates—largely for mandatory spending programs—CBO increased its estimate of outlays in 2019 by \$7 billion and decreased its projections of outlays over the 2020–2029 period by a total of \$13 billion.

Mandatory Outlays. Technical changes made by CBO increased its estimate of mandatory outlays in the current year by \$10 billion and decreased its projections of such outlays for the 2020–2029 period by \$56 billion (or less than 1 percent).

Medicare. On the basis of actual outlays through June, CBO now estimates that net Medicare spending in fiscal year 2019 will exceed its previous projections by about \$5 billion (or 1 percent). Two factors account for that difference: higher-than-expected spending for Medicare Advantage stemming from annual payment adjustments to account for unanticipated spending increases in the current and previous calendar years, and less-than-projected receipts of premiums paid by Medicare beneficiaries. Additionally, CBO lowered its projection of outlays for Medicare Part D (prescription drug coverage) over the 2020–2029 period by \$85 billion because the Administration withdrew its proposed rule that would

11. On August 1, 2019, the President announced that tariffs would be imposed on an additional \$300 billion of Chinese imports beginning on September 1, 2019; on August 13, the U.S. Trade Representative announced that those tariffs would be delayed on certain products. Those scheduled changes to tariffs are not included in CBO's current baseline projections.

have eliminated the existing safe-harbor provision for pharmaceutical rebates.¹²

Student Loans. For technical reasons, CBO increased its projections of the costs of student loans over the 2020–2029 period by \$34 billion. That increase, which stems largely from changes to projections of the characteristics and income of borrowers in income-driven repayment plans, mostly offsets the \$43 billion decrease in projected student loan costs attributable to economic changes (discussed above).

Other Mandatory Programs. Technical changes increased CBO's estimate of outlays for other mandatory programs in 2019 by \$5 billion but decreased projections of such outlays for the 10-year period by \$5 billion. The largest of those changes was a \$15 billion increase in projected spending by the Commodity Credit Corporation in 2020 resulting from the Administration's announcement

that it would take actions to assist farmers in response to retaliatory tariffs imposed on their goods by U.S. trading partners and other trade disruptions.¹³ Technical changes reduced the agency's projections of spending for most other mandatory programs by small amounts, resulting in the net decrease in projections of other mandatory outlays for the 2020–2029 period.

Discretionary Outlays. Technical updates reduced CBO's estimate of discretionary outlays in 2019 by \$3 billion and its projections of such outlays over the 2020–2029 period by \$1 billion. Those changes stem from adjustments made to better reflect the recent rates at which funding for various discretionary programs has been spent.

Net Interest. Technical changes increased CBO's projections of net interest outlays for the 2020–2029 period by \$44 billion. That increase results from two partly offsetting effects. Technical changes to revenues and other outlays boosted projected deficits by \$203 billion, and the resulting higher debt-service costs added a total of \$47 billion to projected deficits over the 2020–2029 period. But interest costs for that period are now projected to be \$4 billion less than they were in CBO's May 2019 baseline projections because the agency has made slight changes to its projections of the mix of securities that the Treasury will use in its borrowing on the basis of actual debt issuance since that baseline was published.

12. The existing safe harbor is for rebates paid by pharmaceutical manufacturers to health plans and pharmacy benefit managers (PBMs) in Medicare Part D and Medicaid managed care. It protects those parties from liability or penalty in specific situations defined in regulations implementing the anti-kickback statute, which prohibits offering or accepting payments to induce use of services reimbursable under federal health care programs. Eliminating the safe harbor would have effectively made it illegal for drug manufacturers to pay rebates to health plans or PBMs in those programs in return for coverage or preferred treatment of their drug. After the Administration withdrew the rule, CBO also lowered its projections of Medicaid spending over the 2020–2029 period by \$4 billion. For more information, see Congressional Budget Office, "Incorporating the Effects of the Proposed Rule on Safe Harbors for Pharmaceutical Rebates in CBO's Budget Projections—Supplemental Material for *Updated Budget Projections: 2019 to 2029*" (May 2019), www.cbo.gov/publication/55151.

About This Document

This volume is one of a series of reports on the state of the budget and the economy that the Congressional Budget Office issues each year. It satisfies the requirement of section 202(e) of the Congressional Budget Act of 1974 for CBO to submit to the Committees on the Budget periodic reports about fiscal policy and to provide baseline projections of the federal budget. In keeping with CBO's mandate to provide objective, impartial analysis, this report makes no recommendations.

CBO's Panel of Economic Advisers commented on an early version of the economic forecast underlying this report. Members of the panel are Katharine Abraham, Alan Auerbach, David Autor, Olivier Blanchard, Markus Brunnermeier, Seth Carpenter, Steven Davis, Kathryn Dominguez, Robert Hall, Jan Hatzius, Donald Kohn, Nellie Liang, Gregory Mankiw, Emi Nakamura, Jonathan Parker, James Poterba, Valerie Ramey, Brian Sack, Robert Shimer, James Stock, Kevin Warsh, and Mark Zandi. Erik Brynjolfsson, Julia Coronado, John Friedman, Avi Goldfarb, Desmond Lachman, and Jeromin Zettelmeyer attended the panel's meeting as guests. Enhancements to the report this year were also made on the basis of comments about previous versions of it that were provided by Martin Neil Baily of the Brookings Institution and James Poterba of the Massachusetts Institute of Technology. Although CBO's outside advisers provided considerable assistance, they are not responsible for the contents of this report.

The following pages list the CBO staff members who contributed to this report by preparing the economic, revenue, and spending projections; writing the report; reviewing, editing, fact-checking, and publishing it; compiling the supplemental materials posted along with it on CBO's website (www.cbo.gov/publication/55551); and providing other support.

CBO continually seeks feedback to make its work as useful as possible. Please send any comments to communications@cbo.gov.

August 2019

Economic Projections

The economic projections were prepared by the Macroeconomic Analysis Division, with contributions from analysts in other divisions. That work was supervised by Jeffrey Werling, Robert Arnold, and John Kitchen.

Yiqun Gloria Chen	Labor markets
Erin Deal	Research assistance
Michael Falkenheim	Financial markets
Daniel Fried	Net exports, exchange rates, energy prices
Edward Gamber	Interest rates, monetary policy, current-quarter analysis
Ronald Gecan	Energy prices
Mark Lasky	Business investment, housing
Michael McGrane	Financial markets
Sarah Robinson	Research assistance, model and data management
Jeffrey Schafer	Inflation, house prices
John Seliski	Federal, state, and local government spending and revenues
Robert Shackleton	Potential output, productivity
Claire Sleigh (formerly of CBO)	Motor vehicle sector, model and data management
Adam Staveski (formerly of CBO)	Housing, research assistance
Christopher Williams	Consumer spending, incomes

Revenue Projections

The revenue projections were prepared by the Tax Analysis Division, supervised by John McClelland, Joseph Rosenberg, Joshua Shakin, and Edward Harris. In addition, the staff of the Joint Committee on Taxation provided valuable assistance.

Kathleen Burke	Individual income taxes, wage distribution
Paul Burnham	Retirement income
Dorian Carloni	Business taxation
Jacob Fabian (formerly of CBO)	Customs duties
Madeleine Fox	Customs duties
Nathaniel Frentz	Federal Reserve System earnings, miscellaneous fees and fines
Bilal Habib	Tax modeling
Bayard Meiser	Excise taxes
Shannon Mok	Estate and gift taxes
Kevin Perese	Tax modeling
Molly Saunders-Scott	International taxation, business taxation
Kurt Seibert	Payroll taxes, depreciation, tax modeling
Jennifer Shand	Corporate income taxes
Naveen Singhal	Capital gains realizations, tax modeling
Ellen Steele	Refundable tax credits
James Williamson	Business taxation

Spending Projections

The spending projections were prepared by the Budget Analysis Division, with contributions from analysts in other divisions. That work was supervised by Theresa Gullo, Leo Lex, Sam Papenfuss, Christina Hawley Anthony, Tom Bradley, Megan Carroll, Kim Cawley, Chad Chirico, Sheila Dacey, and David Newman of the Budget Analysis Division, as well as by David Weaver, Jessica Banthin, and Alexandra Minicozzi of the Health, Retirement, and Long-Term Analysis Division and Sebastien Gay of the Financial Analysis Division.

Defense, International Affairs, and Veterans' Affairs

Kent Christensen	Defense (projections, working capital funds, operation and maintenance, procurement, scorekeeping)
Sunita D'Monte	International affairs
Ann Futrell	Veterans' health care and employment training services, international food assistance
Raymond Hall	Defense (research and development, stockpile sales, atomic energy, Navy procurement, military construction, and family housing)
Paul Holland	Veterans' education benefits, reservists' education benefits
William Ma	Defense (operation and maintenance, procurement, compensation for radiation exposure and energy employees' occupational illness, other defense programs)
David Rafferty	Military retirement
Dawn Sauter Regan	Defense (military personnel)
Matthew Schmit	Military health care
Logan Smith	Veterans' compensation and pensions, other benefits for disabled veterans

Health

Alice Burns	Medicaid, health insurance coverage
Julia Christensen	Food and Drug Administration, prescription drugs
Jacob Fabian (formerly of CBO)	Workplace safety programs
Kate Fritzsche	Health insurance marketplaces, other programs
Philippa Haven	Medicare, Public Health Service
Lori Housman	Medicare, Federal Employees Health Benefits program
Jamease Kowalczyk	Medicare
Sarah Masi	Health
Kevin McNellis	Health insurance marketplaces, other programs
Ezra Porter	Health insurance coverage
Lisa Ramirez-Branum	Medicaid, health insurance coverage
Lara Robillard	Medicare
Sarah Sajewski	Medicare

Health (Continued)

Robert Stewart	Medicaid, Children’s Health Insurance Program, Indian Health Service
Emily Vreeland	Health insurance coverage
Ellen Werble	Prescription drugs, Public Health Service
Rebecca Yip	Medicare, Public Health Service

Income Security and Education

Susan Yeh Beyer	Child nutrition and other nutrition programs
Tia Caldwell	Child Care and Development Block Grant, refugee assistance
Meredith Decker	Unemployment insurance, training programs, Administration on Aging, Smithsonian Institution, arts and humanities
Elizabeth Cove Delisle	Housing assistance
Jennifer Gray	Supplemental Nutrition Assistance Program and other nutrition programs, Social Services Block Grant, support programs for children and families
Justin Humphrey	Student loans, higher education
Wendy Kiska	Pension Benefit Guaranty Corporation
Leah Koestner	Elementary and secondary education, Pell grants
Justin Latus	Supplemental Security Income
Susanne Mehlman	Temporary Assistance for Needy Families, Child Support Enforcement program, foster care, child care programs, Low Income Home Energy Assistance Program
Noah Meyerson	Old-Age and Survivors Insurance, Social Security trust funds, Pension Benefit Guaranty Corporation
Emily Stern	Disability Insurance

Natural and Physical Resources

Tiffany Arthur	Agriculture
Michael Falkenheim	Federal Deposit Insurance Corporation
Mark Grabowicz	Administration of justice, Postal Service, homeland security
Kathleen Gramp	Energy, Outer Continental Shelf receipts, spectrum auction receipts, Orderly Liquidation Fund
David Hughes	Recreational resources, Commerce, Small Business Administration, Universal Service Fund
Wendy Kiska	Federal Deposit Insurance Corporation
Erik O’Donoghue	Agriculture
Jeffrey Perry	Fannie Mae and Freddie Mac, Federal Housing Administration
Matthew Pickford	General government, legislative branch, air and water transportation

Natural and Physical Resources (Continued)

Stephen Rabent	Federal Deposit Insurance Corporation, credit unions, pollution control and abatement
Robert Reese	Other natural resources, highways, mass transit, Amtrak, Federal Housing Administration
Mitchell Remy	Fannie Mae and Freddie Mac, Federal Housing Administration
Janani Shankaran	Science and space exploration, conservation and land management
Jon Sperrl	Judicial branch, community and regional development, Federal Emergency Management Agency, Bureau of Indian Affairs
Aurora Swanson	Water resources, Fannie Mae and Freddie Mac

Other Areas and Functions

Shane Beaulieu	Computer support
Barry Blom	General budget projections
Joanna Capps	Appropriation bills (Labor, Health and Human Services, and Education; Legislative Branch)
Aaron Feinstein	Other interest, monthly Treasury data, historical data
Avi Lerner	Interest on the public debt, automatic budget enforcement and sequestration, Troubled Asset Relief Program
Amber Marcellino	Federal civilian retirement
George McArdle	Appropriation bills (Military Construction and Veterans Affairs; State and Foreign Operations)
Dan Ready	Various federal retirement programs, national income and product accounts, federal pay
Justin Riordan	Appropriation bills (Commerce, Justice, and Science; Financial Services and General Government)
Mark Sanford	Appropriation bills (Agriculture and Food and Drug Administration; Defense)
Esther Steinbock	Appropriation bills (Energy and Water Development; Transportation and Housing and Urban Development)
J'nell Blanco Suchy	Appropriation bills (Interior and Environment; Homeland Security), authorization bills
Patrice Watson	Computer applications and data systems

Writing

Barry Blom prepared the visual summary. Amber Marcellino wrote Chapter 1, with assistance from Aaron Feinstein, Nathaniel Frentz, Avi Lerner, and Molly Saunders-Scott. John Seliski wrote Chapter 2, with assistance from Daniel Fried and Christopher Williams. Aaron Feinstein wrote Appendix A, with assistance from Jennifer Shand. Sarah Robinson compiled Appendix B.

Reviewing, Editing, Fact-Checking, and Publishing

Wendy Edelberg, Mark Hadley, Jeffrey Kling, and Robert Sunshine reviewed the report. The editing and publishing were handled by CBO's editing and publishing group, supervised by Benjamin Plotinsky, and the agency's communications team, supervised by Deborah Kilroe.

Christine Bogusz, Christine Browne, Bo Peery, and Benjamin Plotinsky edited the report; Casey Labrack and Robert Rebach prepared it for publication; and Annette Kalicki, Adam Russell, and Simone Thomas published it on CBO's website.

Erin Deal, Ann Futrell, Stuart Hammond, Paul Holland, Justin Latus, Bayard Meiser, Aldo Proserpi, Sarah Robinson, and Logan Smith fact-checked the report. Dan Ready coordinated the preparation of figures of budget projections. Jeffrey Schafer coordinated the preparation of figures of economic projections. Bayard Meiser, Dan Ready, and Sarah Robinson compiled data and supplemental information. Bo Peery and Simone Thomas coordinated the presentation of those materials.

Economic Report of the President

Economic Report of the President

To the Congress of the United States:

In the past year, I have taken several major steps to implement an economic agenda that champions prosperity and success for the American people. This began with two crucial pro-growth policies: massive tax cuts and sweeping regulatory reform. These historic accomplishments, and many other achievements in our first year, have restored confidence within our families and businesses that the United States is, and always will be, the greatest place on Earth to pursue opportunity. I am proud to present the economic agenda my Administration has designed and begun implementing to enable every American to build a bright future—to achieve the American Dream.

The American people have long been awaiting an effective pro-growth agenda that inspires robust economic activity, spurs innovation, creates jobs, and improves families' financial security. The Federal Government's economic policy in recent decades, however, has been a story of one broken promise after another.

For too long, leaders have promised growth, but done little to change policies that drove business away and pushed our factories and jobs offshore. They promised prosperity, but layered on regulatory red tape that hurt workers and businesses in the struggle to keep up with the ever-increasing cost of complying with new rules. They promised to empower American citizens with opportunities and resources for their future. Instead, they enabled a bloated bureaucracy, special interest groups, and unaccountable international institutions. Consequently, my Administration inherited an economy with relatively slow growth. The median American's real household income from working had dropped lower than it was a decade ago. And the previous Administration's forecasts suggested that this would never get better.

My Administration's pro-growth policy agenda is reversing these trends and ending the disappointments of the past. No longer will we perpetuate the illusion that policies that encourage economic growth, job creation, and wage growth are out of our reach. No longer will we turn a blind eye to the regions of our country that have suffered from politicians' failed programs and misplaced priorities. No longer will we tolerate unfair and nonreciprocal trade practices that impoverish our workers. And no longer will we tolerate burdensome, backward, or perverse economic policies that guarantee bleak outcomes for our citizens.

Policies for a Pro-Growth Agenda

The primary components driving my Administration's pro-growth policy agenda—tax cuts, tax reform, and smart deregulation—have inspired enormous confidence in the economy and optimism that it will continue thriving.

We approached tax reform with the following principles: Our corporate tax system was uncompetitive with the rest of the world; the American middle class deserved a fairer, simpler tax code that lowered rates, exempted more income from taxation altogether, and limited costly deductions favoring special interests; and a smarter tax system would encourage business expansion, job creation, and wage growth.

On December 22, 2017, I signed into law the Tax Cuts and Jobs Act of 2017. My Administration worked closely with Congress to pass this historic bill, which brings much-needed tax relief to the middle class and to small businesses. For too long, our tax policy squeezed families and small businesses with unfairly high tax burdens. Our backward tax code drove companies, jobs, and profits abroad. Our corporate tax rate was 60 percent higher than that of our average economic competitor—it was the highest in the developed world. This came at a huge cost to our citizens: the median American's real household income collapsed at the beginning of this century, and it took 15 years to recover the losses.

The *Report* that follows shows that the corporate tax changes alone are expected to increase annual income for families by an average of \$4,000. Americans at all income levels will receive a tax cut. The standard deduction nearly doubles, and the child tax credit fully doubles. Bringing down the business tax rate from 35 to 21 percent, and allowing firms to fully expense their investments in equipment and intellectual property, is encouraging robust economic activity by making America a more competitive place to do business. Other changes to the tax code are encouraging companies to bring back to America the nearly \$3 trillion in wealth that they have parked overseas.

The enactment of the Tax Cuts and Jobs Act has inspired businesses to express their confidence in the economy even before the new law's complete implementation unleashes its full, tangible benefits, which include larger paychecks, greater profits, and lower tax burdens. My Administration has kept its commitment to making smarter, pro-growth economic policy, sending the crucial signal to businesses that America is once again the most promising place in the world to build, invest, create, expand, and hire. In response to our historic changes to the tax code, over 350 companies have, to date, announced billions in new investments in plant and equipment in the United States, along with improvements to workers' compensation or benefits, including raising the minimum wage for their employees, increasing 401(k) contributions, and giving bonuses. These improvements will affect more than 4.1 million employees.

As we knew when we set out to reform taxes and rein in the regulatory state, when America’s enterprises are optimistic about where the economy is heading, they will expand their operations; invest more in plant and equipment, which raises workers’ productivity; and, as a result, raise wages. We have recently seen capital spending again contribute to rising productivity, after holding productivity growth back under the previous Administration, and have also once again started to observe economic growth above the 3 percent level—which many claimed was impossible. The stock market reached record highs, creating trillions of dollars in wealth—reflecting consumers’ and investors’ confidence.

In addition to reforming tax policies that drove business away, my Administration began a Government-wide effort to eliminate costly, obsolete regulations soon after taking office. For too long, the regulatory state had grown at the expense of our economy and wages. It ballooned far beyond what is needed to protect citizens from harm. The effect of excessive regulation is well known: it functions as a tax, stunting economic growth and generally discouraging productive activity. This undermined the operation of our markets, increased costs for consumers, and empowered Washington bureaucrats over American consumers. To date, we have stopped the growth of the regulatory state in its tracks. In our first year, we adopted a miniscule fraction of the “economically significant” rules churned out by other Administrations. We exceeded our policy of striking two regulations for each one we create, eliminating 22 regulations for every 1 we have adopted. By creating fewer rules and reliably committing to eliminating the unnecessary old ones, we have signaled to firms that they can invest in growing their business. Business confidence has skyrocketed in response.

But the best is yet to come. As we continue to implement the new tax bill and cut regulatory red tape, the following priorities round out our pro-growth, America-first agenda.

Infrastructure and Energy

A modernized, safer transportation infrastructure is imperative for connecting our citizens to opportunities. Delayed projects, insufficient investment, traffic congestion, and wear and tear are slowing America down. My Administration is dedicated to generating \$1.5 trillion in new infrastructure investment and shortening the approval process so projects may be permitted in under two years.

Renewing our infrastructure must prioritize accountability and enable greater State and local control. We are committed to reversing the legacy of prolonged deadlines and the wasted resources that befell infrastructure projects in the past and that has deprived Americans of the infrastructure they deserve. President Obama’s stimulus package was intended to significantly increase investment in infrastructure, create jobs, and improve the economy;

however, only 3.5 percent of the over-\$800 billion plan went to constructing transportation infrastructure. Taxpayers felt severely misled. Bureaucracy created years-long delays to breaking ground on many projects. And millions of promised “shovel-ready” jobs never appeared.

The American people are tired of empty promises. They know this Nation is capable of doing so much better. They want accountability for promised projects and jobs. They want decisionmaking to be done at the State and local levels, where folks know what needs to be done and how to do it. My Administration will work with Congress to develop an infrastructure plan that enables sophisticated projects to be approved and finished promptly.

Advancing the capabilities of our infrastructure means more than just rebuilding roads and bridges. Americans rely on the Internet to work, learn, and connect with each other, and it must be modernized to suit their needs. In his 1994 *Economic Report of the President*, President Clinton promised to connect “every classroom, every library, and every hospital in America” to the Internet by 2000. Decades later, 39 percent of rural Americans still lack high-speed broadband. And a quarter of America’s K-12 students lack adequate Internet connectivity at school. It is intolerable to continue pretending that this is the best America can offer to our students. My Administration is working to expand accessibility and expedite the process of bringing the Internet to hard-to-reach areas.

As we plan for a reinvigorated infrastructure, we must also plan for the future of American energy by renewing our commitment to energy dominance. This encompasses energy independence, which ensures energy security for American families and businesses for decades to come, and global energy leadership, which consolidates our role as a major influence in the international energy sphere.

The United States is the world leader in combined total production of oil and natural gas. Technological ingenuity has unleashed the American energy supply, and domestic energy production is increasing for both petroleum and natural gas. Capitalizing on and expanding our energy supply solidifies our position as a global energy leader, reduces our reliance on imported energy, and provides opportunities for job creation and economic growth. Our untapped oil and natural gas fields are crucial resources for solidifying our energy security and independence. Increasing energy supply will also reduce electricity costs, lowering utility bills for American households—particularly low-income families, which are disproportionately affected by high utility bills. Lower electricity costs can also reinvigorate American manufacturing and job growth by decreasing manufacturing costs for American-made products.

To further unleash America’s energy potential, we must also reduce the excessive regulatory burden that inhibits production. Since I took office, my Administration has been working to remove these barriers, enabling the private sector to create more jobs; increase wages for its employees; produce

clean, affordable energy to power our economy; and increase American energy exports. Steady and secure supplies of coal, liquefied natural gas, refined products, and crude oil enable the United States to maintain our energy leverage in the international sphere. With our plentiful supply, the United States can reduce other nations' reliance on exporters that use energy as a geopolitical weapon. Diversifying our energy sources and furthering research on next-generation energy technologies will enable our Nation's firms to provide cleaner, more efficient, and more affordable energy for American citizens.

Trade and the International Sphere

International trade offers an opportunity to grow the economy, but it must be pursued with American interests in mind. We cannot continue to pursue a global order that disregards America's prosperity and the well-being of our citizens. My Administration believes in the benefits of free trade, and it is committed to robust trade relationships with other nations that value fairness and reciprocity. Some of our trading partners, however, do not share these values, and this places unsustainable stress on global trade. As such, the United States can no longer reward governments that distort the free market with illegal subsidies or handcuff American exporters with high tariffs and nontariff barriers. We can no longer tolerate unfair trade practices, such as forced technology transfer and industrial espionage. And we can no longer tolerate complacency toward unfair and nonreciprocal trade that undermines America's potential.

Immediately after taking office, I began revising our Nation's trade policies to promote the interests of the American people. My Administration is in the process of improving the North American Free Trade Agreement and the Korea–United States Free Trade Agreement. In the coming year, we will also seek to negotiate new, better trade deals, and we will hold accountable any country that engages in unfair trade practices through tough and focused action.

With a tougher, smarter, and more clear-eyed agenda, we can rejuvenate our trade deals, boost our exports, and improve the economic prospects of our citizens and communities. By following through on this agenda, we will become a stronger and more secure Nation that can offer better opportunities to our people. For far too long, the United States put up with unfair trade policies that left our workers behind. Previous Administrations pursued unenforceable multilateral trade deals and let other countries get away with unfair practices. We will not perpetuate a trade agenda that exports our factories and jobs, weakens our manufacturing and defense industrial bases, and diminishes our economic and national security.

Innovation, Intellectual Property, and Cybersecurity

America has long been one of the most productive, innovative, and forward-thinking nations in the world. In recent decades, however, Government policy

has not properly recognized the importance of innovation for growth and the value of America's distinct entrepreneurial spirit. Renewed commitment to enforcing our intellectual property rules encourages innovation by signaling that inventions will be rewarded and protected, and it enables the United States to maintain its long-standing advantages in science and technology. Protecting our evolving technologies and ideas from theft and forced technology transfers, to which American enterprises are increasingly subject abroad, is not only in America's economic interest—it conveys our great pride in the capabilities of America's innovators and the value of their ideas.

Protecting the results of American ingenuity—such as new technology, research findings, and other forms of innovation—is crucial to our future economic and wage growth. The IP Commission estimates that stolen intellectual property reduces GDP by 1 to 3 percent a year—an annual loss in the range of \$185.7 billion to \$557.1 billion. Given this threat to our economy, my Administration is partnering with the private sector to protect American technologies, intellectual property, and innovators. We are striving to ensure an economic climate that values innovation, encourages the private sector to invent, and enables the private sector to protect itself from all forms of industrial espionage, including cyber theft. And we will take action when necessary. As the threats to our economy have become more complex and widespread, it has become increasingly important to empower our companies and citizens with tools that help protect against cyberattacks, cyber theft, and other malicious activities that endanger our citizens' privacy, our national security, and our economic success.

Investing in the Future Americans Deserve

My Administration is proud of the economic success that the United States has achieved over the past year, and we are dedicated to sustaining this progress. We are working hard to reverse policies that drove many businesses to other countries, taking jobs with them. In 2017, our strengthened economy created 2.2 million jobs, and the unemployment rate was at its lowest level in seventeen years. Maximizing growth and opportunity, however, must include two key priorities that did not receive enough attention for a very long time: workforce enablement and support for distressed communities. We are dedicated to ending the low labor force participation rate inherited from the previous administration, and to uplifting our Nation's communities that have borne the highest costs of bad policies, in the forms of poverty, despair, and drug addiction.

Within the communities that suffered the most when businesses left is a silent Nation of Americans who have dropped out of the workforce. Although our overall low rates of unemployment are encouraging, the labor force participation rate for prime-age men is lower now than it was in every year between 1948 and the start of the Great Recession. This means that as bad

policies ran their course, too many of our citizens lost hope, were discouraged by Government programs from working, or struggled to find opportunities and stopped looking. And while most of America is working and enjoying the benefits of our now-robust economy, we cannot forget that there are still millions of people who have been left behind. We are committed to addressing this deeply troubling situation by reversing the economic policies that disregarded so many of our citizens for so long and to creating new, focused remedies. My Administration's Rural Prosperity Task Force is working to solve problems such as disproportionately high rural poverty rates and inadequate broadband access. The Investing in Opportunity Act of the Tax Cuts and Jobs Act provides tax incentives to invest in low-income communities. Combined with our focus on job creation and workforce development, we are driving a renewed commitment to the communities in our Nation that have been neglected for far too long.

My Administration is not only concerned about the economic consequences of the dismal tax, trade, immigration, welfare, and regulatory policies of the past, which drove Americans from the labor force. We are also concerned that the low labor force participation rate excludes Americans from many other benefits of civil society.

To address this, we are committed to making it possible for all working-age, able-bodied Americans to contribute to our economy and society. Strengthening work requirements as a condition of welfare assistance will help more individuals experience the many benefits of work and vastly improve the financial situations of those receiving assistance. We are targeting for reform all Government programs that provide incentives to avoid work. Workforce development programs play a key role in helping individuals who are receiving assistance to find jobs and earn incomes that will enable them to move from dependency to self-sufficiency. For this reason, we are advancing programs that teach or update job skills, promote lifelong learning, offer training in trades, and better connect our industries with the future workforce. We are prioritizing greater availability of paid parental leave and affordable, high-quality childcare for the workforce in order to strengthen our families and enable more women to fully participate in the workforce. And we are committed to ensuring that America's elementary and secondary schools and institutions of higher education equip students with the skills they need to achieve lifelong success.

To boost our workforce and heal our society, we must also contend with crisis levels of drug abuse, addiction, and overdose. Drug overdose deaths numbered 63,632 in 2016. Partly because of this crisis, life expectancy in the U.S. dropped in 2015 and 2016—the first time it has fallen in consecutive years since 1963. Not only do drug addiction and overdoses take lives too soon; they leave traumatized family members and distraught communities in their wake. When we speak of investing in the future, those affected by addiction are some of our citizens who will need the most support.

To date, we have taken many measures to alleviate the opioid crisis. We are focused on addressing the vast, illicit supply of these drugs, particularly by investing in the infrastructure of interdiction. We are shoring up detection capabilities in international mail-processing centers, using fentanyl-detecting dogs and screening technologies, and attacking the light and dark webs where transnational criminal marketplaces operate. And we have increased funding and resources to the States to strengthen their responses to the opioid epidemic, including the creation of the State Targeted Response to the Opioid Crisis grant program. We have improved policies to make it easier to find and crack down on bad actors, to expand access to treatment for addicts, to invent new solutions for treating addiction, and to further develop nonaddictive pain management treatments through partnerships with innovative companies. We continue to prioritize solving this terrible crisis, alleviating the suffering it has caused, and preventing future anguish. As we discover the best ways to diminish drug abuse and addiction in our country, we must have an economy capable of giving opportunities to build a brighter future to the victims of the opioid crisis and similar kinds of adversity.

Fulfilling the promise of a brighter future must also include developing solutions to a concern shared by many Americans: the rising cost of healthcare. In the past, government attempts to improve healthcare gave rise to mandates, rules, and healthcare tax and spending programs that, perversely, increased what the average American family paid for healthcare. My Administration fought to repeal the individual mandate, no longer forcing the American people to buy the expensive plans that bureaucrats designed for them. My Administration is committed to providing Americans with more affordable health coverage options by promoting choice and competition in healthcare markets, and by addressing health behaviors that can promote a longer, healthier life—which insurance alone cannot do. Troubled by the growing unsustainability of the Federal-State Medicaid program, we are committed to improving the program for both its beneficiaries and the taxpayers who finance it.

We are also committed to preventing Government expansion from stifling innovation in the healthcare sector, and to preventing international free-riding that takes advantage of our pharmaceutical innovation. We are focused on correcting policies that hinder drug price competition, addressing a top concern of the American people: that they cannot afford the medications they need. We have made it a high priority to ensure that safe, generic alternatives to important drugs are approved on a faster timeline, making last year a record one for generic drug approvals.

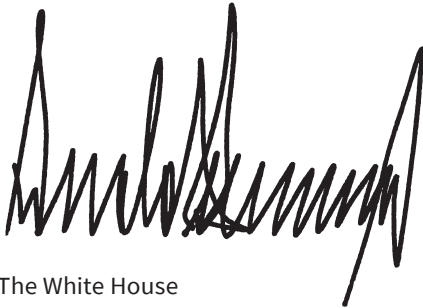

Finally, my Administration has worked to counter the disappointing history of the services that have been provided to our veterans. We are pursuing stringent accountability within the Department of Veterans Affairs and seeking to provide much stronger support and opportunities to our veterans. The brave

men and women who have served our Nation have made countless sacrifices. We owe them nothing less as they build their futures and plan for retirement.

We have made great strides in our first year, and we remain committed to policies that grow our economy and improve each citizen's chance to succeed. My vision for this term is to increase American families' prosperity; to encourage job creation and wage growth by regaining a competitive business climate with smarter tax and trade policy, and also deregulation; to capitalize on our resources and technology to achieve energy dominance; to invest in infrastructure to make commerce more vibrant and connect citizens with opportunities; to encourage innovation as one of our most powerful national security and economic tools; and to enable our distressed communities to prosper by combating workforce development issues and the opioid crisis.

To achieve this vision, we will not rely on the belief that the Government knows best and can solve every problem. Instead, we will continue crafting an economic program that lays the groundwork for the conditions that will enable our citizens to achieve success and prosperity. We will continue to take pride in making policies that honor the dignity and ingenuity of the American people, and in dedicating our work to the welfare of each of our citizens.

From the outset, my Administration has valued nothing more highly than bringing freedom, prosperity, and opportunity to all American families. To that end, we are dedicated to empowering them with a robust economy. The economic agenda outlined here is designed to make it possible for the American people to dream of, and to achieve, the bright future they deserve.

The Annual Report of the Council of Economic Advisers

Letter of Transmittal

Council of Economic Advisers
Washington, D.C., February 21, 2018

Mr. President:

The Council of Economic Advisers herewith submits its 2018 *Annual Report* in accordance with the Employment Act of 1946, as amended by the Full Employment and Balanced Growth Act of 1978.

Sincerely yours,

A handwritten signature in black ink, appearing to read "Kevin Hassett", with a long, sweeping horizontal stroke at the end.

Kevin A. Hassett
Chairman

A handwritten signature in black ink, appearing to read "Richard V. Burkhauser", with a long, sweeping horizontal stroke at the end.

Tomas J. Philipson
Member

Introduction

The purpose of the *Annual Report of the Council of Economic Advisers* is to provide the public and the economic policy community with a detailed account of the performance of the U.S. economy in the preceding year and with an analysis of the Administration's domestic and international economic policy priorities for the years ahead. In this *Report*, we thus review the salient policy developments of 2017 and preview policy aims for the coming years, in the context of the Administration's unified agenda to expand our economy and the economic prosperity of all Americans.

The U.S. economy experienced strong and economically significant acceleration in 2017, with growth in real GDP exceeding expectations and increasing from 2.0 and 1.8 percent in 2015 and 2016 to 2.5 percent, including two successive quarters above 3.0 percent. The unemployment rate fell 0.6 percentage point, to 4.1 percent, its lowest level since December 2000, while the economy added 2.2 million jobs, an average of 181,000 per month. Notably, manufacturing and mining—having lost 9,000 and 98,000 jobs, respectively, in 2016—added 189,000 and 53,000 jobs during 2017. Labor productivity grew 1.1 percent, compared with a decline of -0.1 percent in 2016, and average hourly earnings of private employees rose 2.7 percent, compared with average growth of 2.1 percent during the preceding 7 years. Reflecting the economy's outperformance of expectations, the January 2017 Blue Chip consensus forecast of 2.3 percent GDP growth in 2018 was revised upward in February 2018 to 2.7 percent.

The four quarters of 2017 thus marked a nontrivial trend shift. From 2010 through 2016, real output in the United States grew at an average annual rate of 2.1 percent, while labor productivity grew, on average, by less than 1 percent. The pace of economic recovery was slow by historical standards, particularly because recent research has confirmed Milton Friedman's original observation that in the United States, deeper recessions are typically succeeded by steeper expansions, and that this correlation is in fact stronger when the contraction is accompanied by a financial crisis. Since the nineteenth century, the recent recovery was one of only three exceptions to this pattern.

In the chapters that constitute this *Report*, we provide evidence that the historically anemic recovery from the Great Recession was not independent of policy choices, and accordingly we proceed to identify the exacerbating factors in the weakness of the post-2009 recovery and the current Administration's strategies and menu of policy options to address them.

First and foremost, in chapter 1, on the historic Tax Cuts and Jobs Act (TCJA), we find that investment and labor productivity have been inhibited in recent years by the coincidence of high and rising global capital mobility and an increasingly internationally uncompetitive U.S. corporate tax code and

worldwide system of taxation. This combination had the effect of deterring U.S. domestic capital formation, thereby restraining capital deepening, productivity growth, and, ultimately, output and real wage growth, with the economic costs of corporate taxation thereby increasingly and disproportionately borne by the less mobile factor of production—namely, labor. Indeed, the five-year, centered-moving-average contribution of capital services per hour worked to labor productivity actually turned negative in 2012 and 2013 for the first time since World War II. We estimate that by lowering the cost of capital and reducing incentives for corporate entities to shift production and profits overseas, the corporate provisions of the TCJA will raise GDP by 2 to 4 percent over the long run, and increase average annual household income by \$4,000.

Similarly, in chapter 2 we discuss a large body of academic literature indicating that an excessive regulatory burden can negatively affect productivity growth, and thus overall growth, by attenuating the flow of new firms' entries and established firms' exits, and also by amplifying the spatial misallocation of labor and creating employment barriers to entry. We furthermore highlight actions the Administration has already taken to eliminate inefficient and unnecessary regulations, with the effect of raising prospects for innovation, productivity, and economic growth.

In chapter 3, on labor markets, we find considerable evidence suggesting, as with regulation, that postrecession efforts to strike a new optimum on the frontier of social protection and economic growth may have sacrificed too much of the latter in pursuit of the former. We also find that while demographic shifts owing to the retirement of aging Baby Boom cohorts exerted strong downward pressure on the labor force participation rate, factors other than demography accounted for one-third of the overall decline in participation during the recovery, and half the decline since the cyclical peak in the fourth quarter of 2007 (also see chapter 8). For instance, we find that increases in fiscal transfers during the Great Recession intended to mitigate the demand-side effects of rising unemployment generated persistent negative effects on the prime-age labor supply. Meanwhile, structural unemployment coterminous with imperfect geographic mobility—exacerbated by regulatory restrictions (chapter 2), drug abuse (chapter 6), and inadequate investment in infrastructure (chapter 4)—have similarly intensified downward trends in labor force participation among prime-age workers.

These challenges, however, particularly those of low labor productivity growth and declining labor force participation, are not policy-invariant. As we highlight in chapters 1 and 8, for example, policies that incentivize highly skilled and experienced older workers to defer retirement, such as the marginal income tax rate reductions enacted by the TCJA, can have important implications not only for labor force participation but also for productivity. Moreover, by raising the target capital stock, we expect the TCJA to result in capital

deepening, again contributing to productivity growth and rising household earnings.

Relatedly, in chapter 4 we document the deficiencies of our current public infrastructure, and investigate the adverse effects of these deficiencies on economic growth and consumer welfare, as well as potential remedial policy options. In particular, we examine how the fundamental mismatch between the demand for and supply of public infrastructure capital could be ameliorated by utilizing existing assets more efficiently and by adjusting long-run capacity to levels best matched with local needs, which would allow local governments more flexibility in giving prices a larger role in guiding consumption and investment decisions, and in streamlining environmental review and permitting processes. Moreover, addressing the current inadequacies of our public infrastructure would help to attenuate the coincidence of structural unemployment with imperfect geographic mobility—again, exacerbated by the regulatory restrictions discussed in chapter 2—that has been a factor in the decline of labor force participation identified in chapters 3 and 8.

Chapter 5 covers issues in international trade policy and actions the Administration has taken and could take to generate positive-sum, reciprocal trade agreements with our trading partners. Specifically, in addition to reviewing the benefits of economic specialization and consequent gains from trade, we also demonstrate how instances of unfair trade practices by a subset of our partners have had the effect of limiting the potential gains from trade to the United States and the world, with particularly adverse consequences for the U.S. manufacturing sector. Addressing these issues would raise productivity by encouraging greater investment in sectors where the U.S. economy enjoys a comparative advantage, especially but not exclusively energy and agricultural products.

In chapter 6, we turn our attention to the health of the true catalyst of U.S. economic growth: the American worker. Although the Affordable Care Act (ACA) expanded insurance coverage to at most 6 percent of the U.S. population—through Medicaid, marketplaces, and the dependent coverage provision—we survey a large body of academic literature that estimates the effect of insurance coverage on health to be substantially smaller than commonly presumed. Indeed, for the first time in over 50 years, U.S. life expectancy declined in 2015 and 2016, suggesting that factors such as drug abuse, particularly of opioids, and obesity may have a larger impact than insurance coverage alone can redress. Instead, we find that increased choice and competition, along with a recognition by policymakers that the determinants of health are multidimensional, may constitute more efficient avenues for improving health outcomes, particularly among lower-income households. Fundamentally, it is the view of this Council that healthy people not only live longer, more enjoyable lives but are also an essential component of reversing recent trends in labor productivity and labor force participation, discussed in chapters 1 and 3.

Chapter 7 considers the emerging challenge of cybersecurity, particularly in the context of our ongoing transition to an information economy. Malicious cyber activity presents new threats to the protection of property rights, including rights to intangible assets and even information itself, and thus imposes large and real costs on the U.S. economy. Given the existence of positive externalities from investing in cybersecurity, we discuss policy options that might shift this investment to its socially optimal level, including public-private partnerships that promote basic research, protecting critical infrastructure assets, disseminating new security standards, and expanding the cybersecurity workforce.

Finally, in chapter 8 we examine the year in review and survey the years ahead. Acknowledging underlying strengths and challenges, the Administration's November 2017 baseline forecast, which excludes the effects of the TCJA, projects that output will grow by an overall average annual rate of 2.2 percent through 2028. The policy-inclusive forecast, however, which assumes full implementation of the Administration's agenda, is for average annual real GDP growth through 2028 of 3.0 percent. We expect growth to moderate slightly after 2020, as the capital-output ratio approaches its new steady state level and the pro-growth effect of the individual elements of the TCJA dissipate, though the level effect will be permanent. However, expected further deregulation and infrastructure investment will partly offset the declining contribution to growth of tax cuts and reforms toward the end of the budget window. The policy-inclusive forecast is conservative relative to those of previous Administrations, and in fact is slightly below the median of 3.1 percent. Moreover, the baseline forecast is precisely in line with the long-run outlook given in the 2017 *Economic Report of the President*, reflecting our view that nonimplementation of the current Administration's policy objectives will imply a reversion to the lower growth trend of recent years.

Preliminary indicators suggest that markets indeed detect a trend shift. In the weeks immediately following the TCJA's passage, over 300 companies announced wage and salary increases, as well as bonuses and supplementary 401(k) contributions of \$2.4 billion affecting 4.2 million workers, citing the new law. In addition, by the end of January 2018, this Council tallied \$190 billion in newly announced corporate investment projects that were publicly attributed to the TCJA, revealing that firms are responding to the TCJA as theory and empirical evidence predicted.

As a society, we hold many values and aspirations, including but not limited to expanding economic prosperity, that may not exist always and everywhere in complete harmony. It is the view of this Council that in recent years, the pursuit of alternative policy aspirations at the expense of growth has imposed real economic costs on the American people, in the form of diminished opportunity, security, equity, and even health. We therefore endorse an agenda for returning the American economy to its full growth potential.

Chapter 1

Taxes and Growth

In this chapter, we report evidence that the extensive use of itemized deductions in the U.S. income tax code can distort incentives, affect the distribution of the tax burden, and reduce Federal income tax revenue. Lowering individual income tax rates while simultaneously limiting use of distortionary deductions can therefore facilitate tax relief to middle-income households—with corresponding supply-side benefits—while at the same time partially offsetting short- to medium-term negative revenue effects.

In addition, because the magnitude of the corporate tax changes in the Tax Cuts and Jobs Act—particularly the international aspect of corporate taxation—marked a more substantial break from its antecedent, we focus in more depth on this part of the reform. In particular, we survey a large body of academic literature on the effects of taxing corporate income and demonstrate that the empirical evidence indicates that not only is capital highly responsive to changes in corporate taxation but also has become more so over time. The result is that not only have firms located less production and investment in the United States, and correspondingly more abroad, but also that the cost of this lower output has been increasingly and disproportionately borne by the less mobile factor of production—namely, labor. Using estimates from this literature, we then calculate that two salient corporate tax reforms—reducing the top marginal Federal corporate tax rate from 35 to 21 percent, and allowing firms to fully expense investments in nonstructure capital—would raise output by 2 to 4 percent over the long run, and furthermore boost average annual household wages by about \$4,000.

The evidence presented in this chapter strongly suggests that the U.S. economy, and in particular U.S. workers, have been substantially harmed by the convergence of two undisputed economic trends. The first is the high and accelerating international mobility of capital, and the second is the increasingly uncompetitive nature of U.S. corporate income taxation relative to the rest of the world. The result has been throttled capital formation in the United States, and consequently stagnant wage growth in the absence of capital deepening. Under the Tax Cuts and Jobs Act, the shift away from worldwide taxation toward a territorial system ends the penalty on companies headquartered in the United States, because they will no longer pay additional taxes when they bring overseas profits home. As a transition to the territorial system, income that has already accrued offshore will be subject to a low, one-time tax, thereby eliminating any tax incentive to keep funds offshore.

In December 2017, Congress passed and the President signed into law the Tax Cuts and Jobs Act (TCJA)—the most significant combination of Federal tax cuts and comprehensive tax reform the United States has experienced in decades. The TCJA had four goals: tax relief for middle-income families, simplification for individuals, economic growth through business tax relief, and repatriation of overseas earnings. On the individual side, several reforms were implemented in order to achieve these aims. The standard deduction was approximately doubled, with the result of lowering taxes for millions of families and simplifying tax filing because fewer households will itemize. In addition, marginal tax rates were lowered (see table 1-1) and the Child Tax Credit raised and expanded to apply to more families, among other changes. Moreover, a number of popular deductions, such as the mortgage interest and charitable contributions deductions were maintained, while certain deductions that primarily benefited higher income households were eliminated or capped. Meanwhile, a 20 percent deduction was introduced for pass-through business income, while on the corporate side, firms will now be able to fully deduct investments in equipment and intangible assets, and will benefit from a reduction in the top marginal Federal corporate tax rate from 35 to 21 percent. The corporate tax cuts were implemented in tandem with a shift toward a territorial system of taxation.

In this chapter, we report evidence that the extensive use of itemized deductions in the U.S. income tax code can distort incentives, impact

the distribution of the tax burden, and reduce Federal income tax revenue. Lowering individual income tax rates while simultaneously limiting use of distortionary deductions can therefore facilitate tax relief to middle-income households—with corresponding supply-side benefits—while at the same time partially offsetting short- to medium-term negative revenue effects.

In addition, because the magnitude of the changes on the corporate side—particularly the international aspect of corporate taxation—marked a more substantial break from its antecedent, we focus in more depth on this part of the reform. In particular, we survey a large body of academic literature on the effects of taxing corporate income and demonstrate that the empirical evidence indicates that not only is capital highly responsive to changes in corporate taxation but also has become more so over time. The result is that not only have firms located less production and investment in the United States, and correspondingly more abroad, but also that the cost of this lower output has been increasingly and disproportionately borne by the less mobile factor of production—namely, labor. Using estimates from this literature, we then calculate that two salient corporate tax reforms—reducing the top marginal Federal corporate tax rate from 35 to 21 percent, and allowing firms to fully expense investments in nonstructure capital—would raise output by 2 to 4 percent over the long run, and furthermore boost average annual household wages by about \$4,000.

The evidence presented in this chapter strongly suggests that the U.S. economy, and in particular U.S. workers, have been substantially harmed by the convergence of two undisputed economic trends. The first is the high and accelerating international mobility of capital, and the second is the increasingly uncompetitive nature of U.S. corporate income taxation relative to the rest of the world. The result has been throttled capital formation in the United States,

and consequently stagnant wage growth in the absence of capital deepening. Under the TCJA, the shift away from worldwide taxation toward a territorial system ends the penalty on companies headquartered in the United States because they will no longer pay additional taxes when they bring overseas profits home. As a transition to the territorial system, income that has already accrued offshore will be subject to a low, one-time tax, thereby eliminating any tax incentive to keep funds offshore.

We begin this chapter with a brief overview of U.S. taxation in historical and international perspective, focusing on the declining competitiveness of U.S. taxation of corporate income relative to other advanced economies. We turn next to the costs of taxation and a short review of the theory of tax incidence with two examples that are relevant to the TCJA—the incidence of corporate taxation and the mortgage interest tax deduction. Finally, we provide an in-depth review of the growth literature in the context of corporate taxation, focusing on the effects of the user cost of capital on optimal capital accumulation and long-run growth.

U.S. Taxation in Historical and International Perspective

Since before Independence, public taxation has been a contentious issue in the politics of what is now the United States. In the wake of the Seven Years' War, repeated attempts by successive British governments to raise revenue from the North American colonies to cover the costs of colonial defense—the Sugar Act, Stamp Act, and Townshend Acts—were met with increasing hostility from colonial taxpayers, culminating with the Boston Tea Party after passage of the so-called Tea Act in 1773. Within a decade of the Constitution's commencement, efforts by the Federal government to assess taxes on whiskey and property resulted in armed insurrections in the Whiskey Rebellion and Fries's Rebellion, the former of which required President Washington to lead a 13,000-strong army to confront the insurrectionists.

Perhaps not surprisingly, then, for the Republic's first 150 years, taxation at the Federal level remained a relatively small fraction of the nation's total economic output, as shown in figure 1-1. Before World War II, total Federal government revenue never exceeded 10 percent of gross domestic product (GDP) and—with brief exceptions during wartime and the Great Depression—never exceeded 5 percent of GDP. World War II thus marked a sharp discontinuity in Federal taxation—by the end of the war, Federal tax revenues had grown from 6.7 to 19.9 percent of GDP, and thereafter never fell below 14 percent.

Moreover, the world wars also marked sharp discontinuities in the composition of Federal tax revenues. Before World War I, the Federal government relied almost exclusively on excise taxes for revenue, and the single largest source of revenue was tariffs on imported goods. While the Administration of

Figure 1-1. Federal Tax Revenue as a Percentage of GDP, 1792-2017

Sources: Office of Management and Budget Historical Table 2.3 (2017); U.S. Census Historical Statistics of the United States (1975).

President Lincoln implemented a tax of 3 percent on income over \$800 in 1861 dollars (amended in 1862 to 3 percent on income between \$600 and \$10,000 and 5 percent on incomes exceeding \$10,000), the tax was poorly enforced, generated little revenue, and was ultimately repealed by the Revenue Act of 1870. A subsequent Federal income tax levied in 1894 was ruled unconstitutional by the U.S. Supreme Court a year later, in *Pollock v. Farmers' Loan & Trust Co.*

It was only after intense lobbying, particularly by the prohibitionist movement, that the Sixteenth Amendment to the U.S. Constitution was ratified in 1913, thereby granting the Federal government the authority to levy direct taxes on income. The prohibitionists' aim was to provide the Federal government an alternative source of funding, given that excise taxes on alcohol comprised 40 percent of revenue (Okrent 2010). Thereafter, the individual income tax grew steadily as a share of Federal government revenue, reaching a peak of 50 percent in 2001.

Taxation of corporate income, meanwhile, began in 1909, when Congress enacted an income-based tax on corporations. After ratification of the Sixteenth Amendment, this constituted the corporate portion of the Federal income tax. Though the statutory rate was initially a low 1 percent of corporate income, it was repeatedly raised throughout the Great Depression and after, eventually reaching a peak of 52.8 percent in 1968, with intermediate rates as high as 53 percent during World War II (IRS 2010). Thereafter, rates were gradually reduced and thresholds raised, settling at a top statutory rate of 35 percent in

1993. In the entire postwar period, the corporate tax contribution to Federal revenue peaked in 1952, at 32.1 percent, before steadily declining to just over 9 percent in 2016 (OMB 2017).

While the U.S. held steady at a top Federal statutory tax rate of 35 percent through 2017, the same was not true for other developed economies belonging to the Organization for Economic Cooperation and Development (OECD) that have experienced a steady downward trend in rates. Figure 1-2 shows the top U.S. statutory corporate tax rate versus the OECD average (combined national and subnational), excluding the U.S., since 2000. Though the latter declined from 32.3 percent in 2000 to 23.8 in 2017, the combined U.S. rate only declined from 39.3 to 38.9 percent, driven by reductions at the State level. During this time, the U.S. went from being the developed economy with the seventh-highest corporate tax rate to that with the highest.

Relative to the rest of the world, the United States had the fourth-highest combined statutory corporate income tax rate, after the United Arab Emirates, Comoros, and the U.S. territory of Puerto Rico. It was one of only 13 national jurisdictions levying corporate tax rates of 35 percent or more. Fourteen jurisdictions levy no tax on corporate income at all. The global distribution of corporate tax rates, moreover, has been consistently shifting toward a lower average rate since 1980. Unsurprisingly, then, Spengel and others (2017) calculate that a reduction in the *effective* average U.S. corporate tax rate from 36.5 to 22.7 percent (Federal plus State, assuming a 20 percent corporate income tax rate—the rate that was initially under consideration until it was amended to 21 percent)—compared with a European Union average of 20.9 percent—would substantially improve U.S. competitiveness, contributing to sharp shifts in foreign direct investment toward capital projects in the U.S. The effective average tax rate, a measure of the after-tax profit of an investment project over its lifetime, is a crucial determinant of investment location. Reflecting the declining competitiveness of U.S. statutory corporate tax rates, figure 1-3 reveals that before the TCJA's enactment, the effective average tax rate of the rest of the developed world was declining substantially relative to that of the United States.

Costs of Taxation in the United States

If there is one principle on which economists agree—and, indeed, that in large measure defines the profession—it is that people and firms respond to incentives. We may dispute the magnitudes of these responses, and sometimes even their direction, particularly in the aggregate, but their existence is universally acknowledged by economists of all stripes. The study of the economic effects of taxation is, fundamentally, the study of responses to such incentives and how these responses may offset—partly or, occasionally, totally—the benefits of taxation.

Figure 1-2. Top Statutory Corporate Tax Rates in OECD Countries, 2000–2017

Figure 1-3. Effective Average Corporate Tax Rates of OECD Countries, 1999–2017

Source: Centre for Business Taxation (2017).
 Note: Series combine national and subnational rates. Because there are alternative ways to compute the effective average tax rate, calculations may vary by source.

The concept that taxation has benefits is not particularly controversial. It allows for the provision of public goods and services—such as security, justice, and official statistics—as well as of goods and services—such as health and education—that may generate positive externalities and thus be prone to underproduction by markets alone. At the same time, taxation may also counteract the overproduction of goods and services that generates negative externalities, such as pollution and poor health. It is especially important that taxation further allows for the redistribution of resources in order to mitigate instances of absolute inequality.

The benefits of taxation, however, are not without costs. These include not only the direct costs of collecting taxes but also the opportunity costs of tax compliance, along with the costs of reduced economic activity, owing to the fact that taxation introduces a discrepancy—a “wedge”—between the prices producers receive and the prices consumers pay for goods and services. In markets where producers and/or consumers are highly responsive to small changes in prices, the magnitude of this effect on economic activity can be substantial. Taxation may also generate additional adverse distortionary effects by incentivizing the diversion of resources to less efficient economic activities.

The principle that efficient taxation minimizes the inducement to change behavior is not new. In 1776, in the *Wealth of Nations*, Adam Smith articulated four maxims regarding the administration of public taxation. In addition to the maxims of equity, certainty, and convenience, his fourth maxim was that of economy. “Every tax,” Smith writes, “ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state.” “A tax,” he elaborates, “may either take out or keep out of the pockets of the people a great deal more than it brings into the public treasury.” That is, not only may the cost of administering and levying the tax, along with the economic costs associated with the “vexation” of tax compliance, consume a substantial share of the revenue thus collected, but also the behavioral responses to tax incentives may impose additional costs, as economic activity that would otherwise occur is curtailed or moved underground or abroad for purposes of evasion.

To understand the scope of the issue, it is useful to think about the costs of taxation in terms of direct and indirect costs. The direct costs constitute the dollar amounts of taxes paid. The indirect costs, however, are twofold. First, the excess burden of taxation refers to the reality that it typically costs the economy more than \$1 in the aggregate to raise \$1 in tax revenue. Second, compliance costs measure the amount of hours spent on filing tax returns and provide an estimate of lost productivity. Inefficiently high costs of taxation can have the adverse effects of translating into lower productivity and economic growth. As noted above, before enactment of the TCJA, the U.S. tax code was burdened with the highest corporate tax rate among advanced economies and

an international tax system that encouraged capital outflows and the offshoring of profits.

The Excess Burden of Taxation

Tax rates affect incentives to work, save, and invest, and they can divert inputs from more to less productive activities. These distortions in economic decision-making and the resulting inefficient allocation of resources lead to a reduction in societal welfare beyond the amount of taxes collected. The more responsive taxpayers are to higher taxes, the more they change their behavior, thereby increasing the excess burden (or deadweight loss).

For instance, increases in marginal individual income tax rates induce changes in labor supply through both income and substitution effects. The income effect implies that hours worked would increase as tax rates increase as workers seek to maintain the same level of income. Conversely, the substitution effect implies that workers choose to work fewer hours as tax rates increase, substituting other activities for labor as labor has become more expensive (and leisure cheaper). Workers may also respond to changes in marginal income tax rates along the extensive margin; some may simply choose to exit the labor force altogether rather than adjust work hours. The labor economics literature finds that the labor supply behavior of male workers is typically less responsive to tax changes than that of females, especially if the former are married and primary earners (Pencavel 1986; Keane 2011). Elasticities of labor supply along the extensive margin are also typically larger than those at the intensive margin (Heckman 1993; Blundell and McCurdy 1999). Although females are more likely to respond at the extensive margin, they have also become less responsive to tax changes in recent decades. This is due to such factors as greater labor force participation rates and increased career orientation among married women (Blau and Kahn 2007; McClelland, Mok, and Pierce 2014).

In addition to whether and how many hours to work, changes in marginal tax rates can also affect the timing of retirement and the intensity and quality of labor effort. Retirement could come earlier than otherwise planned, and investments in human capital could decrease with higher tax rates. The decline in the labor force participation of older workers could have adverse effects due to an earlier loss of expertise and, along with diminished human capital investments, could contribute to lower aggregate productivity (Keane and Rogerson 2012, 2015). In addition to labor supply effects, individuals also increasingly seek to avoid taxes as taxes increase. Saez, Slemrod, and Giertz (2012), for example, find that tax avoidance increases with higher tax rates. Thus, by lowering marginal tax rates, enactment of the TCJA effectively reduces the incentive to avoid taxes by lowering the reward to doing so.

The U.S. tax code similarly affects corporate incentives. The deductibility of interest payments on debt, for instance—reduced by the TCJA—incinivizes debt over equity financing. Corporate income tax rates also affect choice of

investment location. As noted above, the top marginal statutory corporate tax rate in the U.S. before the TCJA was the highest among advanced economies, and much higher than the OECD average. However, the U.S. collected less in corporate taxes, relative to GDP, than the OECD average, due largely to high capital mobility and corporate profit shifting, the latter in response to tax rate differentials. In 2016, the average top statutory corporate tax rate (combined subnational and national) in OECD countries excluding the U.S. was 24.2 percent, and corporate tax revenue totaled 3.0 percent of GDP. In comparison, the combined (State and Federal) top statutory corporate tax rate in the U.S. was 38.9 percent, while corporate tax revenue was only 2.2 percent of GDP. Figure 1-4 plots top statutory corporate tax rates and corporate tax revenue (as a percentage of GDP) in all OECD countries since 2000. This figure shows that higher rates do not necessarily lead to higher revenue collected as a fraction of GDP.

In addition, before the passage of the TCJA, and unlike any other developed country, the United States operated a system of worldwide taxation that taxed U.S. corporations on their net income from any source, once repatriated. This system encouraged deferral of overseas profit reporting by U.S. multinationals, as firms were incentivized to hold large volumes of cash at their foreign subsidiaries in lower-tax jurisdictions. Other OECD countries instead follow either a territorial tax system, whereby corporations are taxed only on income generated domestically, or a hybrid tax system, whereby foreign income is taxed only if the foreign country's tax system is significantly different from that at home. Due to the worldwide tax system, deferral, and high domestic corporate tax rates, U.S. companies were highly incentivized to shift their reported income abroad, leading to lower domestic investment, to less physical and intellectual capital formation within the United States, and to lost productivity due to the offshoring of operations.

The Compliance Costs of Taxation

The compliance costs of the U.S. tax system are substantial. During the past century, the length and complexity of the Internal Revenue Code have grown considerably. While the tax code contained about 400,000 words in 1955, it reached roughly 2.4 million words by 2016 (Tax Foundation 2016). In addition to the tax code, an additional 7.7 million words of tax regulations are provided by the Internal Revenue Service just to explain the tax statutes. Benzarti (2017) estimates that the total cost of filing all schedules of the Federal income tax increased from \$150 billion in 1984 to \$200 billion in 2006 (1.4 percent of 2006 GDP).

In 2016, the Office of Information and Regulatory Affairs estimated that it took Americans almost 9 billion hours to file their tax returns (Tax Foundation 2016). The majority of these hours were spent complying with business returns (2.8 million hours) and individual returns (2.6 million hours). The hours spent on compliance could have instead been spent on other productive activities.

Figure 1-4. Corporate Tax Rates and Corporate Tax Revenue, 2000–2016

Source: OECD Statistics (2017).

Rather than hiring tax professionals to file highly complex returns, businesses could instead have invested in new plant and equipment. This opportunity cost of compliance can reduce productivity in the long run. Based on the Bureau of Labor Statistics' hourly compensation estimates of \$52.05 for professional workers and \$37.28 for all private sector workers in 2015, the hours spent on complying with the tax code cost the U.S. economy an amount exceeding \$400 billion, or 2.4 percent of 2016 GDP (Tax Foundation 2016).

Slemrod (2006) discusses the nature of compliance costs for corporations. Though compliance costs are higher for larger firms, the costs are regressive, in the sense that they constitute a relatively lower *percentage* of operating costs for larger firms. In other words, the burden of complexity falls disproportionately on smaller firms. Costs include audits, planning, research, appeals, litigation, and filing returns. Such costs also vary widely across industries, with the highest costs incurred by firms in the communication, technology, and media sectors, and the lowest costs by firms in the retail, food, and healthcare industries. Multinational companies face higher compliance costs, especially those with operations in multiple foreign countries. In addition, because larger corporations often have the resources to navigate tax complexity to achieve a lower effective rate, the recently enacted tax reform has the added benefit of leveling the playing field between large multinational firms and smaller domestic firms.

Unfortunately, while tax complexity is costly, it is sometimes a necessary consequence of the need to balance multiple objectives of tax policy, particularly efficiency and progressivity (economy and equity, according to Smith's maxims), that are not always in harmony. For example, the introduction of targeted tax deductions and credits for reasons of economic efficiency may also require the implementation of phase-outs at higher income levels so that low- and middle-income households benefit relatively as well as absolutely. While such provisions may add to complexity, they are nonetheless necessary for the maintenance of a progressive tax code.

Tax Incidence

It is well known in economic theory that the individual (or corporation) who makes a tax payment to the government is not necessarily the one who bears the burden of this payment; this burden is the *incidence* of the tax. Legally, the incidence of a tax is determined by who actually pays the tax to the government. For example, the statutory incidence of sales taxes is typically on the seller of the goods sold. This incidence, however, does not take into account the fact that markets adjust in response to the imposition of the tax—and it is this market reaction that determines who actually bears the burden or economic incidence of a particular tax. We illustrate this concept using a simple graph of demand and supply (figure 1-5). Absent any intervention in the market, q^* units would be sold at a price of p^* per unit. We illustrate the imposition of a per-unit tax by shifting the supply curve in by $\$t$ units.

An alternative to a per-unit tax is an ad valorem tax, such as a sales tax. Rather than shift the supply curve in by $\$t$ units, the supply curve would instead rotate by t percent. In addition, for simplicity, we focus on shifting the supply curve. The demand curve could, alternatively, shift in by the same number of units. Economic theory shows that it does not matter who bears the statutory incidence of the tax, as the economic incidence is the same in either case.

As figure 1-6 shows, even though the supplier is responsible for remitting the money to the government, the increase in price to the consumer means that the consumer is responsible for at least part of the tax. Crucially, the amount born by the consumer depends upon the relative elasticities of supply and demand. After the tax is implemented, consumers pay $p_b = p + t$ ($> p^*$) per unit, producers keep $p_s = p$ ($< p^*$), and the government collects $\$t$ per unit sold. Consider figures 1-6 and 1-7, which are variants of figure 1-5.

In figure 1-6, suppliers exhibit perfectly inelastic supply. That is, for a given change in price, suppliers continue to supply the exact same quantity of the good. In this case, the entire tax will be pushed onto them in the form of lower prices ($p_s = p - t < p^*$). This result is very intuitive; if suppliers are completely unresponsive to price then it makes sense to push the tax onto them. The after-tax price for consumers will stay the same as the pretax price.

Figure 1-5. The Incidence of a Tax on Sellers

Figure 1-6. Tax Incidence with Perfectly Inelastic Supply

A typical example of perfectly inelastic supply is land. The United States, for example, has a fixed amount of land. Likewise, geography can sometimes limit usable land, rendering its supply more inelastic. Local ordinances and regulations can also impact the supply of land available for building, making the supply of housing inelastic—an example we will turn to below. Under this scenario, suppliers will bear the burden of the tax. The after-tax price will not change from the pretax price for consumers. Because suppliers must remit the tax, they collect $\$p$ from the consumer, send $\$t$ to the government and are left with $\$(p - t)$. In figure 1-7, however, sellers exhibit perfectly elastic supply. That is, if the price falls below p^* , the supply falls to zero. Thus, in this case, the entire tax will be paid by consumers (the price they pay increases to $p^* + t$), and sellers continue to receive p^* .

One final detail in these figures is important in our subsequent discussion on tax incidence in the TCJA. Until now, we have considered the impact of a tax on prices. Now we consider the impact of a tax on the quantity of the good sold. Returning to figure 1-5, before the imposition of the tax, q^* units of the good were sold at a price of p^* . After the tax, only q_{tax} units are sold. The triangular area between the demand and supply curves between q_{tax} and q^* is known as deadweight loss or the excess burden, as discussed above. Because the competitive equilibrium at p^* and q^* maximizes social efficiency, any movement away from that caused by per unit or ad valorem taxation is an efficiency loss to society. This is the price that we pay for a redistributive tax system. Deadweight loss is higher when demand and/or supply are very elastic—that is, the imposition of a tax generates large behavioral responses. On the opposite side, when either demand or supply are perfectly inelastic—that is, when the imposition of the tax does not generate any movement away from the efficient quantity, deadweight loss is equal to zero. It is true that suppliers may bear the entire burden of the tax (in the case of perfectly inelastic supply) but, given that they still provide q^* , there is no loss to society overall—simply a transfer of income from suppliers to the government.

The incidence of a tax has important implications for the distributional aspects of tax reform. Much of the argument on whether particular tax reforms help or hurt certain groups depends upon how elastic we believe demand or supply to be. Here, we highlight two important elements of the TCJA whereby tax incidence has played a key role in our understanding of how taxes ultimately affect households. We first consider the corporate tax. Though corporations pay the tax, they do not ultimately bear its burden. A main tenet of public economics is that people—whether they are shareholders, the owners of capital, or workers—bear the burden of a corporate tax. Therefore, which people in particular pay the tax is an empirical question. A second example is the incidence of the mortgage interest deduction (MID), which is a subsidy for home ownership given to households that itemize their taxes. Though the MID is not eliminated in the new tax law, fewer households will claim the deduction

Figure 1-7. Tax Incidence with Perfectly Elastic Supply

because they will be better off claiming the higher standard deduction. This has the potential to have an impact on home prices, though evidence indicates that the impact will be quite modest.

The Incidence of the Corporate Income Tax

In analyzing where the burden of the corporate tax falls on capital relative to labor, it is important to distinguish between short-run and long-run burdens. In the short run, increases in the corporate tax are borne by current owners of corporate capital, through a drop in asset values, and by investors, through lower after-tax rates of return. In the long run, labor bears more of the burden of the corporate tax. This is because an increase in the effective tax rate on capital income from new saving and investment leads to a reduction in capital accumulation. The resulting decline in the capital-to-labor ratio decreases labor productivity and leads to a fall in wages.

Exactly how much of the burden labor bears is a subject of much academic research. Piketty and Saez (2007) assume that the burden of the corporate income tax falls on owners of capital income. Several think tanks and public research services—including the Tax Policy Center and Congressional Budget Office—assume in their current tax models that most of the corporate tax burden (about 80 percent) is borne by capital, and the rest by labor. The empirical literature places the corporate tax burden borne by workers at between 21 and 75 percent, with higher figures generally representing more recent studies that assume freer movement of capital across borders. These

incidence estimates can be interpreted as the share of the total burden of taxation borne by workers, where the total burden is the surplus eliminated from the private market by corporate taxation. The burden includes not only the government revenue raised but also the deadweight loss from imposition of the tax. With no deadweight loss, applying these incidence estimates to the static change in government revenue from corporate rate reductions would provide the lower bound on the additional surplus (or dollars) accruing to workers under the rate changes. The existence of a positive deadweight loss implies that the total burden would be more than 100 percent.

In a paper for the Federal Reserve Bank of Kansas City, Felix (2009) estimates an elasticity of workers' wages with respect to corporate income tax rates based on the variation in the marginal tax rate across the 50 U.S. States. In these estimates, a 1-percentage-point increase in the top marginal State corporate rate reduces gross wages by 0.14 to 0.36 percent over the entire period (1977–2005), but the dampening effects of corporate tax rates on wages are growing over time. For the most recent period in Felix's data (2002–5), a 1-percentage-point State corporate tax increase reduces wages by 0.45 percent. These estimates imply an elasticity of roughly -0.1 to -0.2 for the U.S. statutory corporate tax rate. Carroll (2009) corroborates Felix's results. Again, using data on changes in the corporate tax rate across States, Carroll (2009) estimates coefficients that are consistent with an elasticity of -0.1 to -0.2 for workers' wages with respect to the U.S. statutory corporate tax rate. Fuest, Peichl, and Siegloch (2018), studying nearly 6,800 tax changes in German municipalities between 1993 and 2012, identify the wage effects of municipal corporate rate changes. Their point estimates imply a wage elasticity of -0.14 with respect to the local business tax. An additional contribution of the study by Fuest, Peichl, and Siegloch (2018) is their analysis of the distributional consequences of the corporate taxation burden, which shows that low- and medium-skilled workers are differentially disadvantaged by higher tax rates. They find that these consequences, which are large enough to significantly affect tax progressivity, would decrease the U.S. tax system's overall progressivity by an estimated 25 to 40 percent.

Other country-based studies, like those assessing the effects of corporate income tax rate changes in Canada, may be more applicable to the United States. Still, labor union membership is higher in Canada, suggesting that there may be some limits to applying these estimates to the U.S. Using corporate rate changes across and within Canadian provinces between 1998 and 2013, Ebrahimi and Vaillancourt (2016) estimate the effects on workers' wages, analogous to the analyses by Felix (2009) and Carroll (2009) for U.S. States. The study finds that a 1 percent increase in the statutory corporate tax rate is associated with a reduction in workers' hourly wages of 0.15 to 0.24 percent. These results—which control for observable worker characteristics, including labor union membership—hold for both public and private workers. In new

research, McKenzie and Ferede (2017) also use changes in corporate tax rates within Canada to develop an estimate of the impact on workers' wages. The baseline elasticity estimate is -0.11 , with alternative estimates giving absolute values as large as -0.15 .

Looking at other countries with similar market-based economies, Dwenger, Rattenhuber, and Steiner (2013) estimate the effects on workers' wages of corporate tax rate changes in Germany. Their results imply a semielasticity of wages of about -1.24 with respect to the average tax rate, without accounting for employment effects, and of -2.36 when employment effects are included.

A cross-country study by Hassett and Mathur (2015), based on 65 countries and 25 years of data, finds that the elasticity of workers' wages in manufacturing after 5 years with respect to the highest marginal tax rate in a country is -0.5 in the baseline case, which includes the addition of spatial tax variables. An expanded analysis by Felix (2007) follows the strategy used by Hassett and Mathur (2006), but incorporates additional control variables, including workers' education levels and countries' degree of economic openness. Felix's estimates imply a semielasticity of between -0.7 and -1.23 . When she replicates Hassett and Mathur's specification, the semielasticity is -0.43 .

A set of recent papers also seeks to measure the rent-sharing, or "bargaining," channel directly, including papers by Liu and Altshuler (2013) and by Arulampalam, Devereux, and Maffini (2012). Liu and Altshuler measure an elasticity of between -0.03 and -0.04 for U.S. workers' wages with respect to effective marginal tax rates, which represent these workers' profit sharing with respect to their employers' tax liabilities. Research by Desai, Foley, and Hines (2004) also relies on wage data for U.S. multinationals to assess the relative share of the corporate tax burden borne by labor, measuring the labor share at between 45 and 75 percent, near the higher end of theoretical predictions. However, because these papers do not assess the economy-wide effects of corporate tax reform, they are excluded from figure 1-9, which summarized the studies discussed here.

Results from Azémar and Hubbard (2015) also utilize cross-country changes in the corporate tax rates of OECD countries (generally high-income, developed countries, like the U.S.) to measure the effects of corporate tax rate changes on workers' wages. The paper measures changes in workers' wages with and without controls for changes in value added (labor productivity). The results imply a semielasticity of -0.43 (-0.17 for the U.S.) for workers' wages with respect to the corporate tax rate, of which about three-fourths is related to the indirect channel and one-fourth to the direct channel. Azémar and Hubbard note that the estimates without value added (those corresponding to the combination of both direct and indirect channels) may be overestimates, given the correlation between value added and corporate tax rates. We include them in figure 1-8, but note this caution on interpretation.

Applying the results in each paper to the rate reduction in the TCJA, figure 1-8 summarizes the estimated changes in U.S. household wages implied by each paper. For results where semielasticities are reported, we multiply the semielasticity by the change in the statutory rate, a 14-percentage-point change (from 39.6 to 25.6 percent). This is the percentage change in wages implied by the point estimates. These changes are then applied to the mean value of household income reported by the U.S. Census in 2016, \$83,143, and multiplied by the share of average household income that is wage-and-salary income (78 percent) (BLS 2016, 2017). For results where elasticities are reported, we calculate the percent change in the tax rate in the U.S. as 0.14 divided by 0.396 (the U.S. statutory rate, including State taxes), or 35.4 percent.

What do these empirical results imply for the likely effects of corporate tax reform in the United States? Within each of the four estimation strategies shown in figure 1-8, there is a range of estimated worker wage effects. Overall, the estimated impact of the 14-point reduction in the U.S. corporate tax rate varies from \$2,400 (based on the cross-Canadian province results from McKenzie and Ferede 2017) to just over \$12,000 based on the longer-run effects of corporate tax rate changes observed in the Hassett and Mathur data. The average result is \$5,500. Removing the two lowest and two highest estimates gives a range of \$3,400 to \$9,900.

Cross-country estimates made by Felix (2007) and by Hassett and Mathur (2006, 2015) imply far larger effects on wages from corporate reforms, ranging from \$6,000 to \$12,000 for Hassett and Mathur (2015), who take into account the spatial correlation of corporate rate changes. Azémar and Hubbard's (2015) estimates are closer to \$4,000, although they caution that this number may be too high because the data suffer from omitted variable bias. For Hassett and Mathur, the larger estimates may partially reflect the intentional measure of longer-term wage outcomes; both Azémar and Hubbard (2015) and Felix (2007) measure cross-country differences in the cross section. This larger range of estimates is also consistent with estimates made by Dwenger, Kübler, and Weizsäcker (2013) of the wage effects of German corporate tax reforms, but the differing nature of wage bargaining across countries is an important limit on transferring these results.

In all cases, the corporate tax rate changes used for identification are smaller than the 14-percentage-point reduction proposed under the TCJA. If the effects of corporate taxes on wages are not linear, then the outcome for U.S. workers may be different from the estimates given in figure 1-8. One final consideration relates to changes in employment, which these wage estimates do not incorporate. If the effect of corporate tax reform is to raise U.S. workers' wages primarily through wage bargaining rather than through enhanced productivity, employers could reduce their demand for labor as a result. This seems far less likely to be the case in the U.S. than in countries with centralized

Figure 1-8. Average Income Increases for U.S. Households from a Corporate Rate Reduction, Using Literature Wage Elasticities

wage setting and stronger labor bargaining power. For a discussion of the German case, see Dwenger, Kübler, and Weizsäcker (2013).

As a whole, these estimates suggest that a U.S. Federal corporate rate reduction from 35 to 21 percent is likely to result in wage increases for U.S. households of \$4,000 or more. Though this is a long-run outcome, box 1-1 discusses how corporate investment and bonus announcements immediately following passage of the TCJA are consistent with estimated effects.

The Incidence of the Mortgage Interest and State and Local Tax Deductions

The U.S. Treasury estimates that in fiscal year 2017, the American taxpayers who used the mortgage interest deduction reduced their Federal tax liabilities by \$65.6 billion (U.S. Department of the Treasury 2017). The TCJA does not eliminate the MID. However, the law nearly doubles the standard deduction, making it likely that more households will achieve greater tax savings by claiming the standard deduction instead of itemizing. In addition, for new mortgages, the law reduces the amount of mortgage indebtedness for which interest can be deducted from \$1 million to \$750,000, so that less interest can be deducted on more expensive homes.

To determine the impact of these changes, it is useful to consider the theoretical exercise of eliminating the MID, which would provide an upper

Box 1-1. Update: Post-TCJA Corporate Announcements

In the weeks immediately following passage of the TCJA, more than 300 companies announced wage and salary increases, as well as bonuses and/or 401(k) match increases affecting 4.2 million workers, citing the TCJA. As of February 5, 2018, the Council of Economic Advisers tallied a total of over \$2.4 billion in new bonuses that have been publicly announced and explicitly attributed to the TCJA, as well as 46 employers announcing starting wage increases. In addition, by that date, the CEA counted \$190 billion in newly announced corporate investment publicly attributed to the TCJA.

Two of the most prominent examples are Walmart Inc. and Apple Inc. Walmart, the largest private employer in the United States, announced on January 11, 2018, that it was raising its starting wage by 10 percent, from \$10 to \$11, expanding maternity and parental leave benefits, introducing new financial assistance for employees looking to adopt, and providing a one-time cash bonus for eligible employees of up to \$1,000. Meanwhile Apple, as of December 2017 the largest publicly listed company in the world by stock market capitalization, on January 17, 2018, announced employee bonuses of \$2,500 worth of restricted stock units in response to the TCJA. The company also announced that it would be incurring a \$38 billion tax bill in order to repatriate offshore cash in order to invest \$30 billion in the U.S. In addition, JPMorgan Chase, the largest bank in the U.S. by assets, announced a \$20 billion investment program that will open 400 new branches and add 4,000 jobs. The bank also announced that it would be raising hourly wages for 22,000 full- and part-time U.S. employees.

Though subject to change and evolving circumstances, the immediate corporate response to the TCJA therefore offers provisional confirmation of the theoretical and empirical evidence on profit sharing, the link between corporate taxation and labor earnings, and the effect of corporate taxation on investment in the context of internationally mobile capital. Moreover, though the primary channel through which we expect corporate tax reductions to affect wages is that of long-run capital deepening raising labor productivity, it is also rational in a tightening labor market for forward-looking employers to raise wages and offer bonuses in the short run in order to retain similarly forward-looking workers.

bound on any potential effects from the TCJA. When considering the tax incidence of the MID, it may be that buyers gain and current homeowners lose (or are at least made no worse off). The opposite may also be true. The statutory incidence falls upon the potential homebuyer because he or she can no longer use mortgage interest to reduce his or her Federal income tax burden. In other words, the subsidy for housing is removed, and a subsidy is just a negative tax—the economic theory discussed above applies in the same way, except that the government, rather than collecting taxes, provides a financial

payment. Thus, both home buyers and sellers benefit to some extent from the subsidy—the subsidy allows sellers to receive a higher price and allows buyers to pay a lower price (assuming standard demand and supply curves, but, unlike figure 1-6, the demand curve shifts *out* with a subsidy for buyers.) Removing the subsidy (and moving back toward the competitive equilibrium) has the effect of potentially modestly lowering the price that sellers receive and raising the price that buyers pay. As always, the precise economic incidence is determined by the relative price-elasticities of demand for and supply of the housing stock.

There is a body of academic literature that has studied the effect of the MID on housing prices. Early studies found substantial effects on housing prices. For example, Poterba (1984) estimates that there would be a very large housing price response to the MID's elimination—a 26 percent decline. However, this result was estimated more than 30 years ago, in an environment of 10 percent inflation and may not be relevant in today's economic setting. Capozza, Green, and Hendershott (1996) estimate that eliminating the MID (along with ending the deduction for property taxes) would decrease house prices by an estimated 13 percent. Harris (2013) estimates that eliminating the MID would reduce home prices by 12 to 19 percent, depending upon the model.

Other contributions to the academic literature that consider the MID within the context of the larger economy find significantly lower price effects from its elimination. These studies examine a more flexible model of the housing market that allows demand and supply to respond to reductions in the demand for housing, or incorporate spillover effects in the rental housing market. Most recently, Sommer and Sullivan (2017) find that eliminating the MID would reduce home prices by 4.2 percent in the long run, although the effect is only half this size in an environment with the low interest rates observed today. In a similar model, Floetotto, Kirker, and Stroebel (2016) estimate that eliminating the MID would decrease home prices by only 1 percent in the long run. Given that the value of housing is equal to roughly 30 percent of total household wealth, a 4 percent fall in housing prices translates into about a 1.2 percent decline in total household net wealth (Federal Reserve Board 2017).

Recent research (e.g., Hilber and Turner 2014) also indicates that the impact of eliminating the MID would vary depending on the elasticity of supply of housing in different areas. In markets where supply is constrained, eliminating the MID is more likely to reduce prices because supply does not adjust downward in the long run and with little to no impact on homeownership rates. Rappoport (2016) uses a structural model, which allows housing supply elasticities to vary across areas, and he finds that eliminating the MID would decrease house prices by 6.9 percent on average, but with considerable variation across markets, again, depending on the elasticity of supply.

In sum, the most recent academic literature suggests that the impact of eliminating the MID on house prices is likely to be more modest than those in the earlier literature, and its magnitude in different areas will depend on the

Table 1-2. Percentage of SALT and MID Deductions by Income Bracket

Income bracket	Share of filers	Share of SALT deductions	Share of MID deductions
Under \$1	1.43	0.00	0.00
\$1 to \$9,999	14.46	0.61	1.19
\$10,000 to \$24,999	21.99	2.89	3.67
\$25,000 to \$49,000	23.43	12.52	12.43
\$50,000 to \$74,999	13.32	16.90	16.83
\$75,000 to \$99,000	8.63	16.45	16.38
\$100,000 to \$199,000	12.25	34.73	34.76
\$200,000 to \$499,999	3.62	12.76	12.15
\$500,000 to \$999,999	0.58	2.07	1.80
\$1,000,000+	0.29	1.07	0.78

extent to which housing supply can respond to reduced demand. Cities like San Francisco, where the housing stock is relatively inelastic, may experience greater price responses compared to cities with relatively few land-use restrictions, like Dallas.

As noted above, the TCJA does not eliminate the MID. As a result, any potential impact on housing prices is expected to be more muted than that suggested by this review of the literature. The proportion of households itemizing is estimated to decrease from 29.2 percent to 13.4 percent—that is, 23.1 million more filers taking the standard deduction as a result of the TCJA. Many of these households would have claimed the MID in the past, but after the enactment of the TCJA no longer find it beneficial to do so. In the same vein, other households with particularly large mortgage interest obligations may still find it in their interest to claim the MID. As such, the studies that consider the full elimination of the MID can be considered as upper bounds on the anticipated impact of the TCJA and, in all likelihood, ultimately will be far smaller. Nonetheless, the TCJA is likely to offset any potential harm by nearly doubling the standard deduction, lowering statutory tax rates and substantially increasing the Child Tax Credit.

Similarly, the extant academic literature suggests that capping the Federal income tax deductibility of State and local taxes at \$10,000 would have only modest, though potentially progressive, economic impacts. Feldstein and Metcalf (1987) find strong evidence that deductibility affects how State and local governments finance spending, and limited evidence that it affects overall levels of State and local government spending. Specifically, they find that States where Federal deductibility implies a relatively low cost of financing via deductible personal taxes (e.g., income, sales, and property taxes), rely more heavily on those taxes versus business taxes and other revenue sources.

Figure 1-9. Distribution of Mortgage Interest Deduction, by Adjusted Gross Income

Sources: Internal Revenue Service; CEA calculations.
 Note: Excludes those earning less than \$1 in adjusted gross income.

Inman (1989) and Metcalf (2011) observe similar outcomes. Inman finds that though eliminating State and local income tax (SALT) deductibility would increase the progressivity of the Federal income tax code, it could also result in higher local property taxation and lower fees in larger U.S. cities. Elimination would only reduce total local government spending in large cities if property taxes are constrained, in which case local government revenues and spending would be expected to decline by roughly 3 to 7 percent. Inman further finds that the Federal government would unambiguously collect more tax revenue from taxpayers in large cities. Metcalf, meanwhile, shows that deductibility leads to greater reliance on income and property taxes at the State and local levels, while having no observable impact on nondeductible taxes and fees. Though the deduction is significantly regressive at the Federal level, he finds some evidence that the SALT deduction may support progressive taxes at the subnational level.

The aim of the individual elements of the TCJA is, therefore, to simplify the income tax code and attenuate the distortionary effects of itemized deductions such as the SALT and MID by lowering marginal income tax rates while simultaneously limiting the applicability of such deductions. Table 1-2 shows that households that have adjusted gross income of at least \$100,000 constitute less than 17 percent of the population but claim about half of SALT and MID deductions. Thus, it is possible to partially offset the Federal revenue loss of marginal rate reductions, whilst still delivering tax relief targeting middle-income households. Moreover, figures 1-9 and 1-10 show how MID and SALT

Figure 1-10. Distribution of State and Local Tax Deduction, by Adjusted Gross Income

Sources: Internal Revenue Service; CEA calculations.
 Note: Excludes those earning less than \$1 in adjusted gross income.

deductions are concentrated at the upper end of the income distribution—higher income households disproportionately take advantage of such deductions. Accordingly, the nonpartisan Joint Committee on Taxation (2017a)—the official scorer of legislative bills—finds that by 2025, before the scheduled expiration of the individual elements of the TCJA, households earning between \$40,000 and \$100,000 will enjoy a net reduction in their total Federal tax liability of between 2 and 5 percent. Meanwhile, the share of Federal taxes paid by households earning more than \$1,000,000 is estimated to increase slightly, from 19.1 to 19.5 percent. The persistence of this middle-class income tax relief will then depend on whether Congressional representatives elect to extend the reforms enacted under the TCJA or allow them to expire.

Evidence on Taxes and Growth

A fundamental challenge to estimating the effects of changes in income tax rates on economic growth is that the timing of the tax changes are not random. Historically, legislators have tended to lower tax rates during periods of economic contraction and raise taxes during periods of expansion. This high correlation of tax changes with economic conditions can negatively bias estimates of the effect of tax rate reductions on investment and output. Estimated effects of tax changes may also be biased by the correlation of those changes with unobserved factors.

Recent empirical studies have employed two techniques to address these challenges. One is the approach called structural vector autoregression, following Blanchard and Perotti (2002), in which the identification of causal effects relies on institutional information about tax and transfer systems and the timing of tax collections to construct automatic fiscal policy responses to economic activity. In their original study, Blanchard and Perotti (2002) find an initial tax multiplier of 0.7 on impact, with a peak impact of 1.33 after seven quarters. In contrast, using sign restrictions to identify tax shocks, Mountford and Uhlig (2009) find a peak-to-impact multiplier that is substantially larger.

A second technique, originating with Romer and Romer (2010), uses narrative history from Presidential speeches and Congressional reports to identify exogenous tax changes with political or philosophical, as opposed to economic, motivations. These changes are unlikely to be correlated with other factors affecting output. Tax changes unrelated to the business cycle can be used as a quasi-natural experiment to estimate the effect on economic output; this matters because if tax cuts are a response to deteriorating economic conditions, the data will show a spurious negative correlation between taxes and growth. Romer and Romer estimate that a 1-percentage-point increase in the total tax share of GDP decreases GDP by 1 percent in the first year and up to 3 percent by the third year. They further find that a 1-percentage-point increase in the total tax share of GDP decreases investment by 1.5 percent in the first year and up to 11.2 percent by the third year.

Using Romer and Romer's (2010) series as an external instrument for changes in average individual marginal tax rates, Barro and Redlick (2011) similarly find that a permanent 1-percentage-point reduction in the average marginal tax rate raises real GDP per capita by 0.5 percent in the subsequent year, corresponding to a conventional tax multiplier of 1.1. Applying the narrative approach to U.K. data, Cloyne (2013) finds that a 1-percentage-point reduction in the total tax share of GDP increases GDP by 0.6 percent on impact and by 2.5 percent over three years, and raises investment by 1.2 percent immediately and by 4.6 percent by the third year. Hayo and Uhl (2014), using German output data, estimate a maximum response to a 1-percentage-point drop in total tax liability (as a percentage of GDP) of 2.4 percent. Applying a similar approach to fiscal consolidations (tax revenue increases) across the OECD countries, Leigh, Pescatori, and Guajardo (2011) find that a tax-based fiscal consolidation of 1 percentage point of GDP reduces GDP by 1.29 percent.

Mertens and Ravn (2013) develop a hybrid approach that combines both methods. Because narratively identified shocks may be prone to measurement error, and identification in a structural vector autoregression framework can require questionable parameter restrictions, Mertens and Ravn develop an estimation strategy that utilizes Romer and Romer's (2010) narrative tax shock series as an external instrument to identify structural tax shocks, avoiding the need to impose parameter restrictions. Utilizing this hybrid approach to

analyze U.S. data, they estimate that a 1-percentage-point cut in the average corporate income tax rate raises real GDP per capita by 0.4 percent in the first quarter and by 0.6 percent after a full year, with the effect persisting through 20 quarters. Mertens and Ravn additionally estimate that a 1-percentage-point cut in the average corporate income tax rate generates an increase in nonresidential investment of 0.5 percent on impact, with a peak increase of 2.3 percent after six quarters. Also employing a hybrid approach, Mertens and Montiel-Olea (2017) find that in the first two years following a tax decrease of 1 percentage point, real GDP is expected to be higher by about 1 percentage point.

On the individual side, meanwhile, Mertens and Ravn estimate that a 1-percentage-point cut in the average personal income tax rate raises real GDP per capita by 1.4 percent on impact and by a peak of 1.8 percent after three quarters. Though they find that a 1-percentage-point reduction in the average personal income tax rate has a negligible impact on inflation, short-term nominal interest rates, and government debt, they do find significant positive effects on employment, hours worked, consumption, and durable goods purchases and nonresidential fixed investment. In particular, they observe that a 1-percentage-point decrease in the average personal income tax rate results in a peak employment response of 0.8 percent after 5 quarters, and peak durable goods and nonresidential investment effects of 5 and 4 percent, respectively, beyond one year.

Though the estimated coefficients found in these studies are not directly comparable, the signs, sizes, and statistical significance of the estimates—combined with their replication across time and geography—provide strong evidence of a positive effect of tax cuts on economic growth. Although some of this literature relies on changes in overall tax liabilities, the most recent research allows us to specifically simulate the impact of corporate tax changes. Moreover, dynamic stochastic general equilibrium models of newer vintage—for example, research by Lizarazo Ruiz, Peralta-Alva, and Puy (2017)—are now generating growth effects from changes in income tax rates that are in the range of the findings of Mertens and Ravn (2013) and Barro and Redlick (2011), which suggests an increasing convergence of estimates derived under alternative modeling frameworks. This development is important, because some critics of the macroeconometric literature have asserted that the results are too large to be theoretically plausible.

Moreover, recent academic research suggests that labor supply effects among older workers may be contributing to observed growth effects of reductions in marginal individual income tax rates. Keane and Rogerson (2012, 2015) observe that the effect of work experience and on-the-job training on the net present value of lifetime earnings will vary with worker age. Because the net present value of additional human capital acquisition on the job is quite large for younger and relatively less experienced workers, labor supply responses to marginal income tax rates are low among these workers. In contrast, labor

supply responses to marginal income tax rates are much higher among older, more experienced workers, which implies potentially significant effects on productivity.

Effects on the Cost of Capital

A primary mechanism through which changes in corporate tax rates and depreciation allowances affect business investment is their effect on the user cost of a capital investment—which can be thought of as the rental price of capital, and is the minimum return required to cover taxes, depreciation, and the opportunity costs of investing in capital accumulation versus financial alternatives. A decrease in the user cost increases the desired capital stock, and thereby induces gross investment.

By increasing the after-tax return on capital assets, a decrease in the tax rate on corporate profits decreases the before-tax rate of return required for the marginal product of new physical assets to exceed the cost of producing and using these assets, increasing firms' desired capital stock. Conversely, by decreasing the after-tax return on physical assets, a decrease in the net present value of tax deductions for investment expenses increases the before-tax rate of return required.

Several factors may tend to bias empirical estimates of the user-cost elasticity of investment, and early studies (e.g., Eisner and Nadiri 1968) tended to find estimates that were considerably smaller than the benchmark unit elasticity of demand for capital of Jorgenson (1963) and Hall and Jorgenson (1967). First, a reliance on aggregate data potentially biases elasticity estimates downward, due to simultaneity between the user cost of capital and investment shocks. Second, aggregate data suffer from limited variation and unobserved firm heterogeneity, as demonstrated by Goolsbee (1998, 2004). Second, as Goolsbee (2000) and Cummins, Hassett, and Oliner (2006) demonstrate, Tobin's q -based empirical evaluations of neoclassical models will tend to suffer attenuation bias when the fundamentals that drive investment are mismeasured. Third, as noted above, estimates of the effects of changes in corporate taxes on economic output can be biased by the timing of tax reform. Historically, legislators have tended to lower corporate tax rates and raise investment tax incentives during periods of economic contraction, and to raise corporate taxes (and withdraw investment credits and other incentives) during periods of economic expansion. Insofar as investment is correlated with general economic conditions—for instance, in standard accelerator models, in which the change in the growth of output drives investment—estimates of the user-cost elasticity of investment will therefore be biased toward zero. Studies that fully address these biases therefore tend to exploit large tax events that differentially affect various types of firms or asset classes; in these instances, the change in tax “treatment” is plausibly uncorrelated with underlying economic conditions.

Exploiting instances of major corporate tax reforms, Cummins and Hassett (1992) estimate user-cost elasticities of investment of roughly -1.1 for equipment and -1.2 for structures. Auerbach and Hassett (1992) and Cummins, Hassett, and Hubbard (1994, 1996) exploit differences in the composition of investment across industries to identify user-cost elasticities, and they find an estimated long-run elasticity of the capital stock of -0.67 . Djankov and others (2010) find an elasticity of -0.835 at the mean, based on their own database of corporate income tax rates for 85 countries in 2004.

Using cointegration and plant-level microeconomic data, Caballero, Engel, and Haltiwanger (1995) report estimated long-run user-cost elasticities of investment by Standard Industrial Classification, two-digit industry codes ranging from -0.01 for transportation to -2.0 for textiles and -1.0 on average. These results imply a generally high long-run responsiveness of investment to changes in the user cost of capital. Schaller (2006) also uses cointegration techniques to estimate long-run user-cost elasticity. Assuming that user costs will largely be exogenous in a small, open economy, Schaller estimates a user-cost elasticity of -1.6 from quarterly Canadian aggregate data spanning 1962 through 1999. Using Bundesbank data to specifically estimate user-cost elasticities with respect to the German tax system, and employing generalized-method-of-moment techniques to instrument for potentially endogenous investment decisions, Harhoff and Ramb (2001) find a smaller user-cost elasticity of -0.42 .

More recently, Dwenger (2014) has used German panel data and a distributed lag model based on research by Chirinko, Fazzari, and Meyer (1999). Dwenger's baseline estimates are about twice as large as the elasticity of -0.25 estimated by Chirinko and colleagues. However, after properly accounting for the equilibrium relationship in the error correlation model, Dwenger (2014) finds point estimates of the user-cost elasticity of investment to be -0.9 ; and a two-sided, chi-square test suggests that the elasticity is not statistically different from the neoclassical benchmark of -1.0 .

Approaching the question from a somewhat different angle, Giroud and Rauh (2017) employ Romer and Romer's (2010) narrative approach to estimate the impact of U.S. State-level corporate taxes on establishment counts, employment, and capital. They find short-run statutory corporate tax elasticities of both employment and establishment counts of about -0.5 (-1.2 over a 10-year horizon), and short-run statutory corporate tax elasticities of capital of -0.24 to -0.25 . Exploiting quasi-experimental variation created by the Domestic Production Activities Deduction, which allowed firms to deduct a percentage of their "qualified production activities income" from their taxable income, Ohn (2017) finds that a 1-percentage-point reduction in the corporate tax rate increases investment by 4.7 percent of installed capital and decreases debt by 5.3 percent of total assets.

There is, therefore, a generally emerging consensus within the academic literature, as summarized by Hassett and Hubbard (2002) and Dwenger (2014), that places the estimated user-cost elasticity of investment at about -1.0 , consistent with the neoclassical benchmark. These estimates imply that a tax change that lowers the user cost of capital by 10 percent would raise demand for capital by up to 10 percent. The tax rate or deduction change required to affect a 10 percent reduction in the user cost of capital varies with the values of other relevant user cost parameters, which we discuss below.

As evidence of the need for increased capital investment in the United States, figure 1-11 shows that business equipment investment has weakened substantially since 2014. The figure shows the contribution to GDP growth from each of three business investment categories: equipment, structures, and intellectual property. Investment in equipment and structures, and their resulting contribution to real GDP growth, has slowed in recent years and was negative in 2016, as gross investment was less than depreciation, with the result that net investment turned negative. In contrast, growth in intellectual property investment remained positive in 2016. Reductions in the user cost of capital that spur equipment investment could reverse these trends and boost GDP growth.

Effects on Net Capital Outflows

One component of investment is foreign direct investment (FDI), and numerous empirical studies, which are discussed below, have observed that FDI is highly responsive to cross-border differences in tax rates. Furthermore, this responsiveness may have increased in recent years. These predictions are relevant to GDP estimates because, for a given level of domestic savings (S), any increase in inward FDI constitutes a decline in net capital outflows (NCO) and a corresponding decline in net exports (NX), in accordance with the national income accounting identity $S = I + NX = I + NCO$. Intuitively, a decline in the user cost of capital attracts capital inflows (both foreign firms investing more in U.S. capital stock formation and U.S. firms choosing domestic capital stock formation over foreign), leading to an exchange rate appreciation that lowers exports and raises imports, resulting in a decline in net exports. As a capital inflow, however, FDI is an important funding source for increased investment, because $I = S - NCO$.

De Mooij and Ederveen (2003, 2005, 2008) provide extensive literature reviews of the impact of tax rates on FDI. As most papers utilize different data and empirical specifications to isolate this impact, these literature reviews transform the coefficients in each study into a uniform semielasticity of FDI with respect to the corporate tax rate. In their 2003 paper, de Mooij and Ederveen average across 351 elasticity estimates, finding a mean elasticity value of -0.7 , which corresponds to a mean semielasticity (with respect to a percentage point on the tax rate) of -3.3 . In their 2005 paper, they extend the 2003 result by considering alternative classifications of literature and including new studies.

 Note: Business fixed investment contribution shows the net contribution of private nonresidential structures, equipment, and intellectual property spending to real GDP growth.

Instead of averaging across all studies, they estimate average semielasticities by study type: time series, cross-sectional, discrete choice, and panel. They find an average semielasticity of -2.61 across time series studies, -7.16 across cross-sectional studies, -3.43 across discrete choice models, and -2.73 across panel data studies. Across all 427 estimates, they find an average semielasticity of -3.72 . In their most recent paper (de Mooij and Ederveen 2008), they predict semielasticities based on study characteristics. For studies that use financial data such as FDI or property, plant, and equipment, they predict an effective marginal tax rate semielasticity of -4.0 , an effective average tax rate semielasticity of -5.9 , and a country statutory tax rate semielasticity of -2.4 . For count data, such as the number of new plants and/or plant expansions, they find an effective marginal tax rate semielasticity of -1.3 , an effective average tax rate semielasticity of -3.2 , and a country statutory tax rate semielasticity of 0.3 . Summarizing their work, table 1-3 contains semielasticities based on the coefficients within the described studies.

In the first study on taxation and FDI, Hartman (1984) examined aggregate inflows into the U.S. between 1965 and 1979 as a ratio of gross national product, leading to a mean elasticity of -2.6 , as calculated by de Mooij and Ederveen (2003). Several papers then extend Hartman’s analysis by using a longer time series and slightly adapting Hartman’s model (Boskin and Gale 1987; Young 1988; Murthy 1989), suggesting mean semielasticities of -5.8 , -1.1 , and -0.6 (de Mooij and Ederveen 2003). Newlon (1987) criticized the data on

Table 1-3. Summary Statistics for FDI Semielasticities

the rate of return for FDI used by Hartman and similar studies and highlighted spurious correlation in the data, but found a similar semielasticity of -0.4 (de Mooij and Ederveen 2003). Slemrod (1990) also criticized Hartman's use of FDI flows, raising concerns about using aggregate FDI flows to analyze the relationship between FDI and tax rates. Auerbach and Hassett (1992) then showed that different components of FDI respond differently to tax rates, with mergers and acquisitions constituting a particularly responsive form of FDI, moving researchers to use data on property, plant, and equipment (PPE).

Grubert and Mutti (1991) analyzed the distribution of plant and equipment in manufacturing affiliates in 33 countries, leading to a mean semielasticity of investment of -1.7 with respect to foreign effective tax rates (de Mooij and Ederveen 2003). Hines and Rice (1994) consider the distribution of PPE in all affiliates in 73 countries, and they estimate a much larger semielasticity of PPE ownership with respect to tax rates of -10.7 , though the mean significant semielasticity is -5.0 (de Mooij and Ederveen 2003; they estimate the mean significant semielasticities in their earlier working paper, De Mooij and Ederveen 2001). Altshuler, Grubert, and Newlon (2001) similarly compared the tax sensitivity of PPE and inventories in 58 countries between 1984 and 1992, finding that the elasticity of both to changes in after-tax returns increased between 1984 and 1992, leading to an estimated average semielasticity of -2.7 across both years (de Mooij and Ederveen 2003).

Another set of studies analyzes the impact of a host country's tax rates on firms' location choices using discrete choice models. For example, Bartik (1985) estimates the probability that a multinational chooses a given U.S. State for the location of new plants as a function of State statutory corporate income tax rates. De Mooij and Ederveen (2003) estimate that Bartik's mean semielasticity is -6.9 . Using the same concept, Papke (1991) also finds a negative relationship between U.S. States' corporate income tax rates and location decisions, with a mean semielasticity of -4.9 (de Mooij and Ederveen 2003). Devereux and Griffith (1998) expand the discrete choice model outside the United States, by looking at U.S. firms' decisions to locate in France, Germany, and the United Kingdom. De Mooij and Ederveen (2003) show that Devereux and Griffith's logit model implies an average semielasticity of -0.8 . Buettner; and Ruf (2004) and Stöwhase (2003) look at the location choices of German multinationals in the European Union's member countries. Buettner and Ruf find mixed results, while Stöwhase find that firms respond to effective tax rates but not statutory tax rates. The average semielasticity from Buettner and Ruf is -0.42 , compared with -7.36 from Stöwhase (de Mooij and Ederveen 2005).

Since de Mooij and Ederveen's (2008) meta-analysis, several notable studies have been published. Using a novel data set on corporate tax rates across 85 countries in 2004, Djankov and others (2010) find large effects of corporate tax rates on FDI where raising the effective tax rate by 10 percentage points reduces FDI by 2.3 percentage points after one year. Looking at affiliates

in low-tax jurisdictions, Dischinger and Riedel (2011) find a significant inverse relationship between the average tax differential to other group affiliates and a subsidiary's intangible (intellectual) property investment, with estimates suggesting a semielasticity of about -1.1 . Karkinsky and Riedel (2012), meanwhile, examine whether patent applications are more likely to be made by lower-tax affiliates, and find a semielasticity evaluated at the sample mean of -2.3 , meaning that a 1-percentage-point increase in the corporate tax rate differential reduces the number of patent applications by 2.3 percent.

The estimated tax elasticities and semielasticities of cross-border investment and of profit shifting (the latter are discussed below) are relevant to an analysis of the effects of changes in the user cost of capital on investment—not only because they have a direct bearing on investment financing but also because they help explain weak investment and the absence of capital deepening in the U.S. before the TCJA. Elasticities from this literature suggest that reducing the U.S. corporate tax rate will have two effects. First, U.S. net capital outflows (*NCO*) would decline. This is both because foreign firms would invest more in U.S. capital and because U.S. firms would invest less in capital abroad. Second, U.S. firms would be less incentivized to shift their profits abroad, as discussed below. The former effect will tend to result in a dollar appreciation, which will reduce net exports (*NX*). The latter effect will tend to raise net exports. Provisions of the Tax Cut and Jobs Act to reduce the abuses of a territorial tax system would be critical to the realization of these gains.

Effects on Profit Shifting

An additional margin along which changes in corporate tax rates are likely to affect growth is through profit shifting by U.S. firms to their foreign subsidiaries or by U.S. subsidiaries to their foreign parents, typically by mispricing sales of goods, services, and intangible capital between affiliates in high- and low-tax jurisdictions. (Profit shifting, otherwise referred to as base erosion and profit shifting, refers to tax avoidance strategies that exploit gaps and mismatches in tax rules to artificially shift profits to low- or no-tax locations. This is different from the legitimate earning of profits abroad from investment.) Guvenen and others (2017) focus their analysis on U.S. multinational enterprises, and argue that profit shifting by these enterprises leads to some economic activity being credited to their foreign affiliates, resulting in an understatement of U.S. GDP. This profit shifting has increased substantially since the 1990s. The authors correct for this mismeasurement by “reweighting” the amount of consolidated firm profits that should be attributed to the United States by apportioning profits according to the locations of labor compensation and sales to unaffiliated parties.

Applying these new weights to all U.S. multinational firms and aggregating to the national level, the authors calculate that in 2012, about \$280 billion in so-called foreign profits could be reattributed to the United States. Given

that the trade deficit was equal to about \$540 billion, this reattribution would have reduced the trade deficit by over half in that year. Extrapolating the 2012 findings to subsequent years, the CEA estimates that transfer pricing continued to account for at least half the trade deficit between 2013 and 2016.

Crucially, firms' propensity to engage in profit shifting is highly responsive to tax rate differentials. Hines and Rice (1994), using aggregate country-level data from the Bureau of Economic Analysis, estimate a tax semielasticity of profit shifting of -2.25 , indicating that a 1-percentage-point decrease in a country's corporate tax rate is associated with an increase of 2.25 percent in reported corporate income.

As discussed in a recent white paper on this topic, "Corporate Tax Reform and Wages: Theory and Evidence" (CEA 2017), the tendency of U.S. firms to hold corporate profits overseas reduces the wages of U.S. workers. Engaging in profit shifting is highly responsive to tax rate differentials, as discussed above, and corporate rate reductions are therefore likely to affect the share of profits that is repatriated. Under the assumption that U.S. workers would retain 30 percent of the 2016 profits of U.S. firms that were earned abroad and not currently repatriated, U.S. households could earn a raise of up to 1 percent, depending on the share of profits that was repatriated. (For an example of workers capturing 29 percent of firm operating surplus, see Kline et al. 2017.) The trajectory of foreign profits indicates that the value of these profit shifts for U.S. workers would increase in the future. Household income boosts from this channel may be additive to the estimated \$4,000 in household income discussed above, because the empirical literature is largely based on countries and time periods with less foreign profit activity, and less existing capital parked overseas as taxes changed.

In general, profits earned abroad show the willingness of U.S. firms to invest in production and business operations overseas, at the expense of domestic investment. Reductions in the corporate tax rate create an opportunity for U.S. firms to instead increase their domestic investment. Furthermore, these multinationals are among the class of high-paying employers in the United States. The rent-sharing literature discussed above implies that incentivizing these high-paying firms to locate more of their operations in the U.S. is again constructive for U.S. wage growth.

Effects of Crowding Out

Decades of research suggest that the long-term benefits of tax reform may be attenuated by the revenue changes in the Federal budget. Decreases in tax revenues that enlarge the government deficit and thus raise public borrowing may crowd out private sector investment, which reduces long-term economic activity. In the literature, crowding out occurs in both real and financial ways (Blinder and Solow 1973). There is real crowding out when increased public investment displaces private capital formation. This direct crowding out occurs

through public consumption and investment (Buiter 1990). Conversely, financial crowding out influences private behavior by altering budget constraints or by affecting prices through interest rates. Increased interest rates, a result of the Federal Reserve's bond-financing of fiscal deficits, can lead to the partial loss of private capital formation.

The effect of increasing public spending or lowering taxes on future national income is dependent on the return from public investment. Gale and Orszag (2004) examine three models of how fiscal policy affects the economy. The Ricardian equivalence theorem holds that government deficits will be offset by private saving through the purchase of public bonds, so that there are no resulting changes in interest rates or capital flows. The small, open economy view suggests private savings is less than the deficit, but that capital inflows make up the shortfall. This means that economic growth and interest rates remain stable. The conventional view is that private savings and capital inflows are less than the change in deficit, so that GDP falls and interest rates rise to induce more savings. If this holds, then public debt would be expansionary in the short term and contractionary in the long term. Using reduced-form models, they conclude that increases in the budget deficit by \$1 reduces national savings by 50 to 80 cents. This suggests that Ricardian equivalence does not hold.

Gale and Orszag (2004) also compare the small, open economy and conventional views by testing whether budget deficits affect interest rates. They find that larger projected budget deficits equivalent to 1 percent of GDP are associated with increases in long-term interest rates of 25 to 35 basis points. Calomiris and Hassett (2002), however, observe little evidence that modest temporary increases in government deficits have a significant effect on interest rates, and further provide evidence that the empirical counterfactual should account for the probability that a substantial portion of additional Federal tax revenue would be spent rather than saved.

Laubach (2009) controls for the business cycle and monetary policy effects on deficits by examining the relationship between the long-term forward rate and projected deficits projected by the Congressional Budget Office. He finds that a 1 percent increase in the projected debt-to-GDP ratio raises future interest rates by about 4 to 5 basis points. When the deficit increased by the same measure, interest rates increased by 25 basis points. Engen and Hubbard (2005) also find that when government's debt increased by the equivalent of 1 percent of GDP, interest rates rose by 2 to 3 basis points. They find that these results are sensitive to model specification. When the dependent variable is the change in the forward rate rather than the interest rate level, the result is statistically insignificant. Results from several economic studies suggest that a deficit increase over the long term would result in higher interest rates. Some researchers consider these results evidence that the conventional view is a more accurate model than a small, open economy view.

Figure 1-12. The Effect of an Exogenous Tax Cut on Nominal Interest Rates

Sources: Romer and Romer (2010); BEA NIPA; Board of Governors of the Federal Reserve System; CEA calculations.

More recent research by Traum and Yang (2015) finds that no systematic relationship exists between debt, real interest rates, and investment when using a New Keynesian model that accounts for the interaction between monetary and fiscal policies. Using data from the tax increases of the 1990s and the deficit-financed tax cuts of the early 2000s, they conclude that short-term private investment crowding in or out depends on the fiscal or monetary shock that leads to a deficit. Crowding in can occur when deficits result from lower capital tax rates or increased public investment, because both raise the net return to capital. In the long term, deficits can crowd out investment.

Utilizing their hybrid approach, meanwhile, Mertens and Ravn (2013) find that a 1-percentage-point reduction in the average corporate tax rate has no statistically significant effect on short-term interest rates (neither the Federal funds rate nor three-month Treasury bill), over any time horizon. Mertens and Ravn do, however, observe a significant short-run disinflationary effect of reductions in the average corporate tax rate, which they note “might instead have been expected to trigger a stronger monetary policy accommodation.” A simpler approach, following Ramey (2016), is to set Romer and Romer’s (2010) exogenous tax shock series as the impulse in a standard fiscal policy vector autoregression, which generates the impulse response function reported in figure 1-12. These results indicate that there is no statistically significant effect

on short-term nominal interest rates, and possibly even a slight negative effect over the first two years, which is consistent with Romer and Romer (2010), whose results are generally inconsistent with large interest rate effects of tax changes. In contrast, to completely offset our estimated long-run increase in GDP of 2 to 4 percent due to the corporate rate cut to 21 percent and the introduction of full expensing, discussed below, real interest rates would need to rise by between 300 and 400 basis points.

Estimating the Growth Effects of Tax Reform

The particular challenge in translating the Mertens and Ravn (2013) estimates into growth projections is that their estimated coefficients are based on an explanatory variable equal to Federal tax receipts on corporate income relative to corporate profits. Applying these estimates to a reduction in the statutory corporate income tax rate from 35 to 21 percent and the simultaneous introduction of full expensing for nonstructure investment requires calculating the effect these changes would have on Federal tax liabilities. As such, it is not valid to simply treat changes in average effective tax rates as changes in the relevant independent variable of Mertens and Ravn's model. Corporate profits in 2017 and preliminary estimates of the combined 2018 revenue effect (Joint Committee on Taxation 2017b) suggest a roughly 5.7-percentage-point decline in the ratio of Federal corporate tax liabilities to corporate profits in the first year of implementation. Mertens and Ravn's estimates suggest this could raise GDP per capita by as much as 3.4 percent. Their estimates further suggest that the proposed reduction in the average corporate tax rate would generate an increase in nonresidential investment of about 13 percent.

Alternatively, converting the estimated 2018 revenue effect (Joint Committee on Taxation 2017b) of the 14-percentage-point statutory rate reduction plus full expensing into a change in the total tax liability share of GDP of 0.8 percent, Romer and Romer's (2010) estimates suggest these two reforms will raise GDP by 0.8 percent in year one, and by 2.4 percent over three years. Romer and Romer's estimates also imply an increase in investment of about 9 percent by year three.

Approaching the question from a more structural angle, a primary mechanism by which changes in corporate tax rates affect business investment is through their effect on the user cost of capital. As discussed previously, by increasing the after-tax return on capital assets, a decrease in the rate of tax on corporate profits decreases the before-tax rate of return required for the marginal product of new capital assets to exceed the cost of producing and using those assets, thereby increasing firms' desired capital stock. By raising firms' desired capital stock relative to current stock, decreases in the user cost of capital thereby require positive net investment to offset depreciation, implying an increase in gross investment.

The user cost modeling is simple if expensing is permanent, and though the Administration expects Congress to eventually make the provision permanent, the TCJA as passed calls for 100 percent bonus depreciation to expire after five years. In a forward-looking, rational expectations model, firms would look ahead to the expiration of the provision and respond less to the tax change because their long-run target capital stock would be lower than for a permanent change in policy.

Accordingly, estimating the impact of an expiring provision necessitates estimating the impact of permanent expensing and the impact of the expiring expensing. The correct growth effect would then be between the two, depending on the extent to which firms expect the provision to be renewed in subsequent legislation.

We begin with the effect of permanent expensing. The emerging consensus in the academic literature places the user-cost elasticity of investment at -1.0 , which implies that a tax change that lowers the user cost of capital by 10 percent would raise demand for capital by 10 percent. Computing the effect on the average user cost of capital of reducing the statutory corporate tax rate to 21 percent and introducing immediate full expensing of nonstructure capital investment depends on the values of the relevant parameters. Calculations of these parameters—following Devereux, Griffith, and Klemm (2002); and Bilicka and Devereux (2012)—yield an estimated decline in the average user cost of capital of about 9 percent, though the percentage change in the user cost varies across asset types. Assuming a consensus user-cost elasticity of investment of -1.0 , a 9 percent decline in the average user cost of capital would induce a 9 percent increase in the demand for capital. Following Jensen, Mathur, and Kallen (2017), it is then possible to use the Multifactor Productivity Tables from the Bureau of Labor Statistics in a growth accounting framework to increment the Congressional Budget Office’s 10-year GDP growth projections by the additional contribution to output from a larger capital stock, assuming constant capital income shares, until we attain a new steady state.

Based upon user-cost elasticity estimates, our calculations show that a reduction in the statutory Federal corporate tax rate to 21 percent combined with full expensing of capital investment would raise long-run GDP by between 2 and 4 percent. Our estimates indicate a 0.4 percent increase over the baseline forecast by the Congressional Budget Office in year one and a 3.8 percent increase in the long-run steady state if full expensing is made permanent. If full expensing of nonstructure assets expires in year five as legislated, however,

the long-run steady state increase in GDP will be 2.9 percent. The economy will achieve the higher growth path if firms expect the policy to be continued.¹

Previous estimates of similar tax reform proposals yielded similar results. A report released by the President’s Advisory Panel on Federal Tax Reform (2005) evaluated a “Growth and Investment Tax Plan” that implemented a business cash flow tax, allowed for the immediate expensing of capital investment, and set a flat corporate tax rate of 30 percent. Analysis of this plan by the U.S. Treasury Department using a variety of alternative models found that these reforms would have generated an increase in the capital stock by 5.6 to 20.4 percent over the long run, raising output by 1.4 to 4.8 percent during the same period.

Financing of the additional investment implied by the reduction in the user cost of capital would depend, as noted above, partly on repatriation of previous profits and decreased profits attributed to foreign subsidiaries, and partly on changes in savings and capital flows. Our preliminary calculations suggest that funding the estimated increase in gross investment could potentially be achieved almost entirely by increased capital inflows by both U.S. and foreign multinational firms. Given that in 2016 private nonresidential fixed investment totaled \$2.3 trillion, a 9 percent change would constitute an increase of about \$207 billion in investment. The mean estimate of the tax semielasticity of FDI of -3.3 reported in de Mooij and Ederveen (2003), corresponding to a user-cost elasticity of 2.8 ($\Delta \log[I] = \alpha \log[\chi] = [\alpha / (1 - EMTR)] \Delta EMTR$), suggests that a 14-point reduction in the statutory Federal corporate tax rate along with the introduction of full expensing would raise FDI in the United States by \$121 billion and reduce U.S. direct investment abroad by \$79 billion, for a combined reduction in net capital outflows of \$200 billion. As noted above, increased capital inflows would result in an appreciation of the dollar, thereby reducing net export demand in tandem with the increase in net capital inflows.

Moreover, our calculations also indicate a positive contribution to growth from reduced profit shifting by U.S. firms to foreign affiliates. Applying Hines and Rice’s (1994) estimate of the tax semielasticity of profit reporting to a statutory corporate rate reduction of 14 percentage points suggests that reduced profit shifting could add up to \$142 billion to GDP (0.8 percent), based on 2016 numbers. Analyzing the TCJA specifically, private subscriber reports

¹ Devereux and Griffith (1998) have argued that marginal analysis like this may be less relevant for high-value, discrete projects that should be more responsive to average tax rates over time. They develop a measure of the effective average tax rate, EATR, and show that capital spending is highly responsive to it. Jensen, Mathur, and Kallen (2017) calculate the impact of moving toward full expensing and dropping the statutory corporate tax rate to 20 percent, finding that the EATR declines by about 11 percentage points. They estimate that, under the assumption that the move to full expensing remains permanent, corporate investment would increase as a result by up to 34 percent in certain asset classes, thereby raising GDP by 4.7 percent over 10 years and by 8.4 percent in the long run.

from Goldman Sachs and Deutsche Bank estimated in late 2017 that the reduced incentives to shift profits overseas could reduce the U.S. trade deficit by as much as 50 percent on impact, with a permanent level shift. Along with the lower corporate tax rate that would make profit shifting less attractive for many firms, the TCJA has also put in place a number of significant anti-base erosion measures such as the “global intangible low-taxed income” provision that imposes a minimum tax on foreign earnings, and the “base erosion anti-abuse tax.”

On the individual side, Barro (2018), using estimates from Barro and Redlick (2011), finds that the tax bill’s cut to the weighted-average marginal individual income tax rate will expand the economy by 1.6 percent through 2019, corresponding to additional growth of 0.8 percent a year. Barro notes that though the growth effect is temporary, the extra contribution to the level of GDP is permanent. Using the Joint Committee on Taxation’s (2017b) 2018 revenue score and applying Mertens and Montiel-Olea’s (2017), Romer and Romer’s (2010), and Mertens and Ravn’s (2013) estimates to the TCJA, meanwhile, suggest that the reductions in individual tax liability will raise GDP by 0.4 to 1.3 percent within three years.

Conclusion

We started this chapter with a look back at the United States’ tax system in a historical and international perspective and the major tax reform achievement of 2017—the enactment of the Tax Cuts and Jobs Act. On the individual side, we demonstrated that the extensive use of itemized deductions in the U.S. income tax code not only generates regressivity at the Federal level but also can distort incentives and reduce Federal income tax revenue. Lowering individual income tax rates while simultaneously raising the standard deduction and limiting the use of distortionary deductions—as the TCJA does—can therefore facilitate tax relief for middle-income households. These changes also provide supply-side benefits to economic growth, while at the same time partially offsetting short- to medium-term negative revenue effects. Specifically, we find that the net individual tax cuts of the TCJA can be expected to raise GDP by up to 1.6 percent by 2020.

On the corporate side, the TCJA is meant to address, in large part, the increasing uncompetitiveness of U.S. corporate income taxation relative to the rest of the world, due to a relatively high statutory rate and worldwide taxation. This, along with the observed high and increasing international mobility of capital in recent years, has deterred U.S. capital formation. An analysis of tax incidence also reveals that labor—as the relatively less mobile factor of production—has borne a disproportionate burden of high corporate taxation.

We have cited a wide range of academic studies demonstrating that reductions in corporate tax liabilities have significant, positive short- and

long-run effects on GDP growth and wages—in particular by lowering the user cost of capital and thereby inducing higher investment in capital formation, financed principally by increased capital inflows. On the basis of these studies, we have calculated that a reduction in the statutory Federal corporate income tax rate from 35 to 21 percent, simultaneously with the introduction of immediate full expensing of capital investment, would generate an increase in GDP of between 2 and 4 percent over time. We have also studied the impact of this growth on a typical household, and find that the average household would, conservatively, realize an increase in wage and salary income of \$4,000.

In addition, estimated user-cost elasticities of foreign direct investment suggest that the corporate tax changes of the TCJA will not only mitigate the migration of U.S. investment capital abroad but also will serve to attract inward capital investment by foreign companies, including overseas affiliates of U.S. companies that are currently holding an estimated \$2.6 trillion in unrepatriated profits. Increased international tax competitiveness will also contribute to the net export component of GDP—by as much as 50 percent—by attenuating corporate profit shifting through transfer pricing, and thereby partly offset the effects of increased capital inflows on exchange rates.

Chapter 2

Deregulation That Frees the Economy

By limiting the costs of unnecessary regulation, by reviewing and eliminating ineffective rules whose costs exceed their benefits, the Administration's agenda of deregulation is unleashing the talents of the American people and the true potential of American businesses. Although some regulation can be beneficial—for example, to protect the environment and health—when job creators must abide by overly burdensome rules, Americans lose opportunities to transform their own ideas into new businesses and into even more opportunities.

Regulation's dynamism-dampening effects are evident in empirical analyses of its influence on the economy. Increases in regulation decrease rates of new business entry, and newer firms tend to make greater contributions to economy-wide productivity, which in turn means higher wages for employees. Increased regulation may even explain a nontrivial portion of the productivity slowdown observed in recent years, which has exacerbated the stagnation of wages. Moreover, the effects of regulation extend beyond business dynamics.

For example, overregulation has a negative impact on people's ability to relocate to where jobs exist. Geographic mobility in the United States has ebbed to an all-time low, as regulatory barriers, especially at the State and local levels, make living in high-priced cities unattainable for many Americans. According to one estimate, for instance, the relaxation of restrictive land-use regulations in just the three cities of New York, San Jose, and San Francisco between 1964 and 2009 would have increased the 2009 U.S. gross domestic product (GDP) by 8.9 percent, and would have given more Americans the freedom of movement that has been such a tradition in the United States. Additional barriers to mobility

come from, among other things, State-level occupational licensing restrictions that prevent Americans from pursuing opportunities. These regulatory distortions of the labor allocation across borders also cause economic distortions, along with regulation's overall negative impact on job growth. In addition to preventing people from moving to new jobs, regulation may prevent jobs from being created in the first place, and can reduce the number of jobs in the overall economy.

To put the economic burden of regulation into context, consider a thought experiment: Imagine that each of the 9.8 billion hours devoted to compliance paperwork in fiscal year (FY) 2015, according to the Office of Management and Budget, were instead used by employees to create output equal to average hourly earnings. These earnings would total \$245.1 billion, equal to 1.35 percent of that year's GDP and 41.6 percent of that year's Federal national defense budget.

To prevent these unintended consequences, the Administration is dedicated to eliminating excessive regulation. In the Administration's first eight months, Federal agencies issued 67 deregulatory actions and only 3 regulatory actions, far outpacing the goal of 2 deregulatory actions for every regulatory action. This effort has created more than \$8.1 billion in present-value cost savings. Given the evidence regarding the impact of poor regulation on the economy, continued deregulatory efforts in the coming years can lead to further cost savings for both firms and consumers as the U.S. economy grows.

Government regulation affects firms and individuals pursuing various types of economic activity. Examples of firm-level activity influenced by government regulation include how and when one firm may merge with another, how public utilities set prices, the amount of pollutants a firm may generate in the course of producing its goods, and how much risk a firm in the financial sector can take on without endangering the wider financial system. Examples of the impact of regulation in the lives of individuals come in

the form of things like the seatbelts and airbags found in automobiles and in the insurance policies that individuals buy.

Regulations have intended as well as unintended consequences. In some cases, the intended and unintended benefits of a regulation outweigh its intended and unintended costs. The benefits of regulations that outlaw child labor, for example, outweigh the costs they impose. In other cases, however, the intended and unintended costs of a regulation may instead outweigh its benefits. And the quantity of regulations in the United States, regardless of how they are measured, has rapidly increased in recent decades. In light of the reality that regulations can impose costs that exceed their benefits, this proliferation of regulations underscores the importance of ensuring that existing regulations do not impose excessive costs.

The Trump Administration has prioritized the identification—and removal—of regulations that fail to generate benefits that outweigh their costs. This agenda of deregulation stands poised to increase economic growth and improve the economic opportunities available to American businesses and employees. Economists and other academics have, over the years, produced a body of literature on regulation that provides the economic rationale for the Administration’s current agenda of deregulation. After all, as Gayer and Viscusi (2016, 1) note, the intellectual basis of cost/benefit assessments of government regulation date back to Jeremy Bentham’s 1776 adage that “it is the greatest happiness of the greatest number that is the measure of right and wrong.”

To put this Administration’s regulatory priorities in context, this chapter first explores the theoretical justifications for regulation. Then it synthesizes the economics literature’s empirical documentation of the effects that regulations have on economic activity in places like the United States. These empirical analyses demonstrate the benefits that can be generated by deregulation along the lines of the Trump Administration’s agenda. Finally, the chapter describes the actions undertaken by the Administration so far in order to deliver these benefits to the American people.

Theories of Efficient and Inefficient Regulation and Deregulation

Classical economic theory argues that economic agents, whether firms or individuals, acting in their own self-interest (which they are in the best position to know) will, via voluntary trading, come up with the most efficient allocation of goods and services. Such an allocation of resources will maximize social welfare. In this theoretical world, the only role for the government is to protect property rights—no regulation of a market is necessary. So if this is the case, why do we have regulations?

Two broad and influential schools of thought lay out the economic basis for regulation. For the first school, regulations improve welfare by correcting

“market failures.” For the second one, in addition to correcting market failures, regulations can improve welfare by addressing “externalities,” which entails correcting individuals’ or firms’ failures to behave in their own (i.e., internal) self-interest.

Regulatory Benefits

The scope of benefits one counts in justifying the creation or the removal of a regulation varies between these two different views. The set of benefits generated by a regulation, after all, depends at least in part on the nature of the economic activity affected by the regulation.

In the first, and traditional, view of the conditions whereby regulations can improve economic welfare, they correct for the failures of markets to generate the socially optimal outcome (e.g., when they address market failures). The economics profession has identified the circumstances in which market failures can result. These include when firms have excessive market power, preventing competition within a market; when there are externalities imposed by one individual or firm on another; and when there are information asymmetries between different market participants. The textbook example of a market failure due to the existence of market power and the absence of competition comes from the leverage of the Standard Oil Company, a firm that once held a monopoly on the production of oil in the U.S. The textbook example of a market failure due to an externality that leads to overproduction in the absence of regulation may come from the example of pollution in the environment, because firms and the consumers of their products do not fully pay for the costs that the pollution they generate impose on others. An example of information asymmetry is the market for used cars, because a car dealer may know the defects of a car better than a buyer. As a result of this asymmetry, in the absence of regulation, the market for used cars may not produce efficient outcomes.

In all these cases, the measure of a regulation’s benefits and costs must be in accord with their effects on the entire economy, rather than vis-à-vis the specific firm or individual that produces or consumes the product that the regulation affects. The regulatory breakup of Standard Oil generated benefits for U.S. consumers and other U.S. producers that exceeded the costs to Standard Oil. U.S. citizens writ large have benefited from reduced pollution of the environment, despite the fact that reducing it has made both producers’ costs and consumers’ prices higher than they were in the absence of pollution regulations. Likewise, U.S. consumers, rather than used car dealers, benefit from steps to ensure that used car dealers do not exploit asymmetries of information by reducing the costs of information for buyers.

In contrast, the second set of economic rationales go much further than market failure rationales in determining the benefits of regulation. Rather than addressing the externalities discussed above, regulations can also improve

welfare by correcting for “internalities” that lead individuals to make decisions that do not serve their own best interests. Those who suggest that internalities can render regulation welfare-improving depend on evidence in the behavioral economics literature purporting to document cognitive biases in support of this proposition. (For a representative exposition of the internalities-based school of thought on regulation, see Allcott and Sunstein 2015; and for a representative exposition of its contrasts with the traditional view of regulation, see Mannix and Dudley 2015.)

The departure of the internalities-based approach to regulation from the approach that centers on the redress of market failure is not merely an abstraction. Indeed, some regulations in recent years have been justified on the basis of cost/benefit analyses that include internalities. An example comes from a regulation on energy conservation standards for commercial refrigeration equipment. As part of the Energy Policy and Conservation Act of 1975, this regulation set energy efficiency standards for commercial refrigerators, effectively circumscribing the type of commercial refrigerators that would be available on the market. From a decrease in the set of possible refrigerators available to choose from in the first place, the cost/benefit analysis assumes that those who operate commercial refrigerators would experience a decrease in the cost of operating them over the lifetime of the product. To assert that commercial refrigerator operators would benefit from a restriction on the set of available commercial refrigerators, one would need to assume that some subset of commercial refrigerator operators would choose some subset of commercial refrigerators that makes them worse off relative to what they could have chosen in the absence of the regulation. This regulation, then, appears to justify its benefits in part on the basis of its purported remedying of an “internality” suffered by the operators of commercial refrigerators.

Nonetheless, whether internalities render regulation welfare-improving as much as the proponents of this school of thought would suggest remains controversial. Some question whether the government regulators themselves suffer from behavioral biases that distort their decisionmaking (e.g., Viscusi and Gayer 2015). In this view, regulation serves to increase institutional behavioral biases rather than overcome them. Others question the reliability of the research that purports to document the existence of the cognitive biases that give rise to alleged internalities (e.g., Shrouf and Rodgers 2017).

The idea that a regulation may generate benefits that accrue directly to the actors that are the focus of the particular regulation, rather than to other participants in economic activity, is not as new as the internality-focused school of thought and the rise of the behavioral economics that is its foundation. At least since the 1990s, some have argued that the regulated experience net benefits from regulation, though the focus tended to be on firms rather than on individuals. This corner of the economics literature has focused, in particular, on the possibility that environmental regulations can incentivize

firms to innovate, offsetting compliance costs through increased efficiency and enhanced productivity (Porter 1991; Porter and Van der Linde 1995; Ambec et al. 2013). This is formalized in the economics literature as the Porter Hypothesis, which can be presented in several different forms.

The first, or “narrow,” form of the Porter Hypothesis distinguishes between market-based instruments and prescriptive regulation. The use of market-based instruments incentivizes firms to innovate by working within a competitive market, while prescriptive regulation discourages innovation by defining how activities should be undertaken. This form emphasizes that flexible regulatory policies are more efficient than prescriptive ones.

The “weak” form of the Porter Hypothesis claims that environmental regulation results in increased innovation. The “strong” form of the Porter Hypothesis not only claims that well-designed environmental regulation can increase innovation, but also can increase a firms’ competitiveness and productivity enough to offset compliance costs. However, empirical evidence supporting Porter’s view is anecdotal, and more rigorous empirical studies have provided mitigating and even contradictory results (Lanoie, Patry, and Lajeunesse 2008; Jaffe and Palmer 1997; de Vries and Withagen 2005; Brunnermeier and Cohen 2003). This lack of clear evidence in support of the Porter Hypothesis makes its use in the estimation of regulatory benefits and costs difficult to justify.

Regulatory Costs

Regulations can impose costs through a number of different channels. First, there is the cost of complying with a regulation that businesses pay, both in demonstrating that they are complying with the regulation and in changing their production processes to do so. Second, though these regulations are often placed on businesses, those who buy their products will pay part of the regulations’ costs. Increases in firms’ costs via regulation will increase the prices of products for consumers in a competitive market (as with the Fiduciary Rule; see box 2-1). Third, there are costs that accrue to would-be consumers who do not engage in a transaction, due to the effect of a regulation, or to would-be businesses that cannot enter a market or stay in operation due to the existence of a regulation. Fourth, costs can accrue to would-be employees if firms decrease hiring in response to a regulation. Of particular importance, for an externality like pollution, if these costs are equal to or less than the benefits of reduced pollution, then the externality is appropriately internalized and social welfare increases. But if this is not the case, the regulation does not improve social welfare.

Of all regulatory costs, an easily identifiable one is the cost of collecting information used by the government to determine compliance with a regulation. The Paperwork Reduction Act of 1980 was designed to reduce the total paperwork burden that the Federal government imposes on private businesses

Box 2-1. Determining the Future of the Fiduciary Rule

In 2015, the U.S. Department of Labor released an updated rule proposal to amend the definition of a fiduciary under the 1975 Employee Retirement Income Security Act, known as ERISA. This rule change would expand those with a fiduciary duty to include those providing investment advice to a retirement plan, participant, or individual retirement account owner. Imposing a fiduciary duty requirement has a clear benefit, in that financial advisers would be required to act in the best interest of their clients. Also, there is a large academic literature finding that conflicting investment advice imposes substantial costs on retirement savers (Chalmers and Reuter 2010; Christoffersen, Evans, and Musto 2013; Del Guercio and Reuter 2014; Foerster et al. 2017). However, the rule would also impose large costs.

The Fiduciary Rule would immediately make an entire class of retirement planning professionals comply with those responsibilities associated with being a fiduciary. Given the rule's ambiguous language, it also creates regulatory uncertainty as to whether the fiduciary duty exists for certain investment educators and investment advisers. This increases the costs to provide retirement investment advice, as advisers are now forced to comply with a whole host of new regulations. This cost will be passed onto consumers in the form of reduced availability of investment education and advice, or higher fees for said advice. The industry points out that the additional compliance costs may make it unprofitable to provide individual investment advice for small retirement accounts.

In response to these concerns, President Trump ordered the Department of Labor to study if the fiduciary rule harms investors by decreasing access to retirement savings products, information, or related financial advice. Additionally, the department is asked to determine if the Fiduciary Rule has disrupted the retirement services industry. The deadline for compliance with the prohibited transaction exemptions accompanying the Fiduciary Rule has been postponed until July 2019. For advisers, this delay will allow time to comply with the extensive requirements associated with being a fiduciary. Consumers of retirement investment advice should not see dramatic changes in the availability of retirement products or advice during this period. The Administration is continuing to review this rule, and hopes to tailor it more narrowly so it has a less dramatic impact on the retirement investment market.

and citizens. The act imposes procedural requirements on agencies that wish to collect information from the public, including an estimate of the hours necessary to collect the required information and an estimate of the personnel cost that reflects the burden of the collection. As part of the Paperwork Reduction Act, agencies must seek and consider public comment on proposed collections of information with 10 or more respondents, and receive approval

from the Office of Management and Budget before beginning to collect information from the public.

In spite of the Paperwork Reduction Act, the Office of Management and Budget's estimated paperwork burden for regulatory compliance has increased steadily over the years. This can be seen in the blue trend line in figure 2-1—but with one important caveat: the methods used to capture total paperwork burden changed between FY 2009 and FY 2010. Hence, it is not possible to compare values across these two periods. In fact, doing so would suggest that the burden barely changed between FYs 2009 and 2015. But when one looks at the hours before and after this break in the data, it is clear that the total burden increased in both. It went from 7.0 billion hours in FY 1997 to 9.8 billion hours in FY 2009—an average annual increase of 2.8 percent. It then went from 8.8 billion hours in FY 2010 to 9.8 billion in FY 2015—an average annual increase of 2.2 percent. The red trend line in figure 2-1 looks at the total paperwork burden coming from the Treasury Department alone. Paperwork from the Treasury, which accounts for more than 70 percent of the total burden every year between FYs 1997 and 2015, follows a similar trajectory during the two periods.

To put the economic impact of the paperwork burden into context, consider a thought experiment: Imagine that each of the 9.8 billion hours devoted to paperwork in 2015 instead were used by employees to create output equal to their average hourly earnings. These earnings would total \$245.1 billion, an amount equal to 1.35 percent of that year's GDP and 41.6 percent of that year's Federal national defense budget. One potential benefit of the Administration's deregulatory efforts will be to slow down the growth in costs related to the paperwork burden.

In some cases, regulators underestimate costs or additional, unanticipated costs arise. Although the original regulatory impact assessment may have estimated a net benefit from a regulation, rising costs over time could reduce or eliminate this benefit. This often occurs in situations where technology brings unanticipated change to a market that is heavily burdened by regulation. Such unanticipated or underestimated costs are often cited as a justification for instituting periodic retrospective reviews of existing regulation.

In addition, it is worth noting the distinction between the direct and indirect costs imposed by a regulation. A firm's direct costs are those that are attributed directly to complying with a regulation—for instance, its costs to hire a compliance officer to handle the regulatory paperwork. Its indirect costs are the opportunity costs of investing its funds in a regulatory compliance activity that could have been used for another part of its business. For instance, if a firm must invest \$1 million in a compliance activity, its indirect cost of compliance is the profit that the \$1 million could have generated if it had been invested in a revenue-producing activity. These costs are difficult to measure, given that it is difficult to know what a firm would have done with funds allocated to financing

Note: At the end of 2006, the Office of Management and Budget introduced an electronic system to process agencies' paperwork burden estimates. Because the system was not fully implemented until the end of 2007, values from about this time may contain errors, and comparison between prior values and values afterward may not be reliable. Between 2009 and 2010, values underwent a one-time adjustment, affecting all future values. The FY 2015 estimate will be updated in the FY 2016 report.

compliance activity if those funds had been used elsewhere. Nonetheless, indirect costs are imposed on the economy by regulation.

The Impact of Regulation

There is a sizable body of economics literature on regulation's impact on various measures of a country's economic health. Deriving a causal estimate of the effect of regulation is difficult, in part due to the difficulty of formulating a reasonable measure of regulation. Despite this, the economics literature does include efforts by researchers to overcome such difficulties and document the economic effects of regulation. Estimates of the effects' magnitude vary substantially, but this literature does highlight cases where regulation lowers the level and rate of economic activity and can harm firms, employees, and consumers.

Measurement

Many of the methods used by researchers to quantify the stock of current regulations or the flow of all regulations are imperfect. Nonetheless, in spite of these imperfections, these measures do allow one to draw at least some inferences about regulation and its effects. Moreover, measurement error in regulation measures will, in many cases, bias estimates of the impact of regulation toward zero. To the extent that the literature finds effects, then these effects should be notable to analysts.

One common variable used to study the impact of regulation is the number of pages in the *Federal Register* or the *Code of Federal Regulations*—two measures with known limitations. For example, one could object to measurements derived from either on the grounds that they fail to measure the semantic content of what the text says (e.g., a few paragraphs of text could prohibit a vast amount of economic activity, or vice versa). Even then, these caveats illustrate the specificity of the conditions in which measurement error invalidates attempts at statistical inference. For instance, whether measurement error causes an attempt at statistical inference to generate a “false positive” (e.g., the effect of regulation on growth) depends on how the measurement error correlates with the other variables relevant to the statistical technique at hand. Thus, the presence of measurement error requires careful consideration of appropriate statistical analysis but does not necessarily eliminate the usefulness of these imperfect measures of regulation.

As an alternative solution to a lack of a good measure of total regulation, researchers have introduced RegData, an index derived from a textual analysis of the *Code of Federal Regulations*, to more accurately measure the quantity and impact of regulation (McLaughlin and Sherouse 2017; RegData is maintained by the Mercatus Center at George Mason University). RegData breaks the data down by paragraph and by title, allowing analysis by different aggregation levels; and it then counts the number of keywords that are indicative of restrictions on the economy—such as “shall,” “must,” “may not,” “required,” and “prohibited.” RegData also closely tracks the number of pages in the *Code of Federal Regulations*, from which it is derived.

In spite of the imperfections of any one measure, measures of regulation in the United States as a whole seem to support the idea that regulation has increased in the country. Figure 2-2 illustrates the growth measures of total regulation—using the *Federal Register*, the *Code of Federal Regulations*, and the sum of all industry-relevant restrictions from RegData. Each series is represented as an index, such that 1976 is equal to 100. Series are set to begin in 1976 to reduce the impact of changes in the underlying construction of the *Federal Register* in earlier years. Despite their shortcomings, each measure shows an increase in the quantity of regulations of almost 2 to 2.4 times over the last 40 years.

Another alternative is to measure the subset of regulations that are classified as “economically significant”—which the 1993 Executive Order (EO) 12866 defines as those estimated to have “an annual effect on the economy of \$100 million or more.” Figure 2-3 highlights the economically significant final rules published by selected agencies and administrations. A total of 29 economically significant final rules were published in the first year of the George W. Bush Administration, and 45 were published in the first year of the Obama Administration. In the first year of the Trump Administration, agencies published only 18 final rules—most at zero net cost.

Figure 2-2. Estimated Measures of Regulation, 1976-2016

 Note: CFR = Code of Federal Regulations. FR = Federal Register. RegData index is the sum of all industry-relevant restrictions.

Figure 2-3. Published Economically Significant Final Rules by First Year of a Presidential Term

Sources: RegInfo; Office of Management and Budget.
 Note: A "Presidential term" is defined as starting on January 20 and ending on January 19. President Trump's term accounts for regulation through January 19, 2018. The George W. Bush Administration's counts began before an electronic system was implemented by the Office of Management and Budget in 2004 and should be compared with later Administrations' counts with caution.

Additional measures of the regulatory burden include survey-based indices that allow regulations to be compared across countries. For example, the World Bank's worldwide governance indicators measure six dimensions of governance, including regulatory quality. This measure captures "perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development" (Kaufmann, Kraay, and Mastruzzi 2011, 233). The World Bank also publishes Ease of Doing Business rankings, calculating each country's distance from benchmark economies (those that implement the best regulatory practices). Comparing these rankings over time and across countries highlights the relative changes of each economy's regulatory scheme. In the most recent data, the United States was 6th out of the 190 rated countries in the Ease of Doing Business ranking, lagging behind New Zealand, Singapore, Denmark, South Korea, and Hong Kong.

The Organization for Economic Cooperation and Development (OECD) also publishes a series of regulation-related indices, including the Indicators for Regulatory Policy Governance (known as iREG), Indicators of Regulatory Management Systems, Product Market Regulation indicators, Competition Law and Policy Indicators, Indicators for Employment Production, and the FDI [Foreign Direct Investment] Regulatory Restrictiveness Index. Each measures evaluates a different aspect of regulation. For example, the Product Market Regulation indicators assess how regulation affects competition in the product market, with the understanding that increased competition results in a more robust economy and greater economic growth. Meanwhile, the FDI Regulatory Restrictiveness Index measures statutory restrictions on FDI for more than 50 countries. This ranking relies on four measures: equity restrictions, screening and approval requirements, restrictions on foreign personnel, and such other restrictions as limits on land purchases and the repatriation on profits.

In one ranking in particular, the OECD Product Market Regulation indicator, the United States tends to be more-regulated than its OECD peers. The OECD's calculations place the United States 27th out of 35 countries, behind France, Chile, and the Czech Republic (Koske et al. 2015; see figure 2-4). This suggests that the United States has the opportunity to exploit the gains from deregulation in product markets.

Researchers typically use these indices to compare regulatory regimes across countries. As long as the measurement error of the index does not systematically vary across the countries included in the analysis, cross-country analyses that draw on these regulation indices to make inferences about growth will be as reliable as any other inference from cross-country data.

Aggregate Growth

Estimates of the impact of regulation on economic growth vary, not least because estimated effects will depend on the category of regulation considered,

Figure 2-4. Product Market Regulation, 2013 (35 OECD Countries)

Index scale from 0 to 6 (least to most restrictive)

Sources: OECD; Koske et al. (2015).

the nonrandomness of regulatory implementation or withdrawal, and possible general equilibrium effects that complicate identification. Nonetheless, there is evidence within the academic literature supporting the conclusion that higher levels of regulation in the aggregate can result in lower economic growth.

Djankov, McLiesh, and Ramalho (2006) estimate that moving from the 25th to the 75th percentiles on the World Bank’s Ease of Doing Business Index increases average annual per capita GDP growth across 10 years by 2.3 percentage points. Loayza, Oviedo, and Servén (2010) and Jacobzone and others (2010) similarly observe a negative relationship between regulation and economic growth. An OECD study by Egert and Gal (2016), meanwhile, estimates that a 0.31-point reduction in a country’s score on the OECD’s 6-point energy, transportation, and communications indicator of regulatory intensity in product markets is associated with a 0.72 percent boost to GDP per capita over 5 years. The estimated effect rises to 1.02 percent over 10 years, and 2.09 percent in the long run. Egert and Gal also estimate that 0.30-point reduction in a country’s score on the OECD’s 6-point employment protection laws indicator of regulatory intensity in labor markets is associated with a 0.22 percent increase in GDP per capita over 5 years, rising to 0.57 percent over 10 years and 1.83 percent in the long run.

Ciccone and Papaioannou (2007) measure the burden imposed by regulation across countries by constructing a proxy for regulation’s red tape, which

reflects the time it takes to start a new business in each country. They find that responsiveness to industry-specific global demand shocks, as measured by new firm entrants, increases as the volume of red tape decreases. Alesina and others (2005) also find that more stringent regulation of product markets has large and negative effects on aggregate investment. Finally, Justesen (2008) observes that, in contrast to other variables plausibly determined by governments, the level of regulation is correlated with subsequent economic growth in a panel of countries spanning the period from 1970 through 1999.

One primary channel through which increased regulation appears to affect growth is through its effect on productivity growth. Exploiting a new time series measure of the extent of regulation by the U.S. Federal government, Dawson and Seater (2013) find that regulation lowers total factor productivity (TFP) by distorting the mix of inputs in production, thereby adversely affecting overall output growth. Bailey and Thomas (2017), meanwhile, find that regulation may also affect productivity through its effect on firm entry and exit. Using a fixed-effects model, they observe that industries with more Federal regulation experienced fewer new firm births and slower employment growth between 1998 and 2011, and that large firms are less likely to exit more heavily regulated industries than small firms. More specifically, they estimate that a 10 percent increase in the intensity of regulation leads to a 0.47 percent reduction in new firm births.

At the more local level, Hsieh and Moretti (2017) estimate that with decreased zoning restrictions in three cities—New York, San Jose, and San Francisco—the growth rate of aggregate output could have increased by 0.795 percent to 1.49 percent a year between 1964 and 2009, thereby increasing GDP in 2009 by 8.9 percent. The authors find that zoning restrictions increased the spatial misallocation of labor, with the result of lowering labor productivity growth. Herkenhoff, Ohanian, and Prescott (2017) reach similar conclusions, finding that U.S. labor productivity and consumption would be, respectively, 12.4 and 11.9 percent higher if all states moved just halfway from their current land-use regulations to the current Texas level.

Although local zoning restrictions specifically may lie beyond the scope of Federal policy, we can apply estimates from the academic literature on regulation generally to create a back-of-the-envelope projection of the impact of the current Administration's deregulatory agenda. Because Égert and Gal (2017) suggest that decreasing a country's Product Market Regulation Index by 0.31 (the typical decrease in an episode of deregulation in OECD countries) would increase its GDP per capita by 1.02 percent within 10 years, we can apply their estimate to moving the United States from 27th in the Product Market Regulation Index to 1st. If the United States achieved the same level of product market regulation as the Netherlands from structural reform, U.S. real GDP would increase 2.2 percent over 10 years, assuming a constant population growth rate and constant inflation. If the United States instead implemented

the typically observed reform—decreasing its index by 0.31—U.S. real GDP would increase by 1.0 percent over 10 years. And if the U.S. moved up the ranking a few places to achieve Canada’s level of product market regulation, U.S. real GDP would increase by 0.5 percent over the same time frame.

Business Dynamics

Evidence across sectors indeed appears consistent with what one would expect if an increase in regulatory burdens were impeding the dynamism of American business. Regulations that impose fixed costs on businesses double as barriers that prevent new businesses from entering markets and competing with established firms.

Trends across a number of indicators of business dynamism appear consistent with what one would expect if regulatory burdens were increasing, in a trend that favored large, well-positioned businesses over newer and smaller firms. First, the net rate of new establishment creation in the United States has trended downward over time (e.g., Decker et al. 2014; Hathaway and Litan 2014). Second, the degree of competition appears to have decreased in most industries in the United States (Gutierrez and Philippon 2017). And this decrease coincides with an increase in firm profits coupled with stagnating investment; profits are rising, yet firms seem to be investing less in capital assets that produce their goods and services. In particular, for companies to invest in the United States, the break-even rate of return on a U.S. capital investment must be higher than in alternative, lower-regulation jurisdictions. If firms’ regulatory costs increase, fewer companies are likely to invest in the United States. The economics profession is only beginning to develop an understanding of the causes of these trends.

However, some evidence points to increases in Federal regulation as a causal mechanism that could explain the apparent decline in new firm creation and decrease in new firm dynamism. Bailey and Thomas (2017) exploit the variation in regulatory trends across industries at the level of the four-digit North American Industry Classification System code offered by the RegData database. The baseline specification of Bailey and Thomas (2017) includes year and industry fixed effects, allowing the isolation of variation in Federal regulations that are idiosyncratic to a given industry within a given year—and addressing the concerns raised by estimates of Federal regulations’ effects, based only on variation across time. And according to the results from this approach developed by Bailey and Thomas, an increase in Federal regulations tends to decrease rates of new business entry. Bailey and Thomas also note that large, established firms tend to be less likely to exit when their industry has more regulation. Though the complexity of trends in the dynamism of America’s businesses belies the possibility that any one piece of evidence could have the final word, Bailey and Thomas nonetheless points to a causal

link between the decline in U.S. start-up rates and competition and increased Federal regulation.

Even if evidence for the relevance of government regulation to contemporary business dynamics may be new, the possibility that government regulation would reflect the preferences of interest groups like those representing established businesses rather than merely maximize aggregate social welfare has a long history in the economics profession (Stigler 1971; Peltzman 1976; Becker 1976). Meanwhile, measures of policy uncertainty have trended upward over time since the 1960s, and additional research has documented that firms appear to vary their lobbying expenditures and political donations in response to fluctuations in political risk (Baker, Bloom, and Davis 2016; Hassan et al. 2017).

Also, according to new research, the existence of regulatory barriers to entry that influence rates of business formation would have an impact on more than the distribution of benefits between firms. Research suggests that the contributions of firms to productivity tend to decrease rapidly as firm age increases. Established businesses whose longevity may be prolonged by the existence of regulations tend to make less of a contribution to productivity than the new firms that could replace them, according to new research from Alon and others (2017). They estimate that the aging of established firms since 1980 had by 2014 lowered aggregate productivity to 3.1 percent below the level where it would otherwise have been. To the extent that government regulation has decreased start-up rates and prolonged the existence of established firms—as Bailey and Thomas’s (2017) results suggest—then regulation may have generated a causal contribution to the decline in productivity in the United States.

Productivity

The influence of regulation on business dynamics, however, is only one of the possible channels through which regulation can exert an effect on productivity. A useful measure for exploring these channels is TFP, which is the portion of output not explained by the quantity of inputs, measuring how efficiently and intensely inputs are used. Annual TFP growth for the private business sector averaged 1.7 percent from 1995 to 2005 but slowed down after the Great Recession, growing 0.05 percent on average annually from 2007 to 2016. This has been the slowest TFP growth rate of any recent business cycle expansion. In 2016, TFP decreased 0.1 percent for the private business sector, its first decline since 2009. Figure 2-5 illustrates these trends in TFP growth.

Although changes in productivity—both increases and decreases—have been explained by a wide variety of factors, regulation has been shown to be an important determinant of productivity (Baily 1986; Maddison 1987). Because TFP is measured as the output per combined inputs, an increase in regulatory

Figure 2-5. Total Factor Productivity Growth, 1990–2016

costs results in an increased level of total inputs for the same level of output, decreasing the ratio of output to inputs.

For example, hiring a compliance officer increases labor input, but may not increase a firm’s output, as hiring a worker in another role would do. Thus, the compliance burden lowers measurements of productivity by inducing firms to allocate funds to compliance that generate no output included in the TFP measure, rather than to output-generating activity included in the measure. And CEA analysis suggests that the allocation of funds toward compliance is nontrivial in magnitude. Using Bureau of Labor Statistics data on compliance officer wages (Ruggles et al. 2017), CEA estimates that businesses spent \$19.8 billion in 2016 on compliance officers’ wages—which constitutes a real increase of 202 percent since 2000, with compliance costs growing an average of 7.16 percent each year.

Regulation can also result in disincentives to invest and innovate, further decreasing TFP. If regulation diverts funding from otherwise productive uses like innovation, regulation then limits a firm’s ability to increase efficiency and output, and thus TFP. Finally, regulation can create barriers to entry that reduce competition between firms. And without competition, a profit-maximizing firm may not be incentivized to innovate and increase its TFP to maximize profit (Bloom, Draca, and Van Reenen 2016; Syverson 2004; Schmitz 2005).

The available empirical evidence suggests that regulation’s effect on productivity can help explain industry-level trends over fairly long time

horizons. For example, the regulations issued by the Occupation Safety and Health Administration and the Environmental Protection Administration (EPA) have been found to reduce productivity growth in the typical manufacturing industry by 0.44 percentage point per year, accounting for over 30 percent of the productivity slowdown in the 1970s (Gray 1987). These estimates are higher than others that look at industries beyond manufacturing (Denison 1979; Portney 1981; Norsworthy, Harper, and Kunze 1979; Christainsen and Haveman 1981; Crandall 1981). But they are in line with or smaller than results found studying pollution control expenditures (Siegel 1979), changes in productivity in the electric utilities sector from emissions regulation (Gollop and Roberts 1983), and the impact of occupational safety and health and environmental regulations on the rate of productivity growth in Quebec between 1985 and 1988 (Dufour, Lanoie, and Patry 1998).

Additional evidence from the implementation of the Clean Air Act suggests that regulation harms productivity. The act's stricter air quality regulations are associated with an almost 2.6 percent decline in TFP for manufacturing plants, though the impact of regulations specifically governing ozone is particularly large (Greenstone, List, and Syverson 2012). After controlling for confounding price increases, output declines, and sample selection biases, TFP decreases an estimated 4.8 percent due to the Clean Air Act, which is equivalent to roughly \$21 billion (in 2010 dollars) annually, or about 8.8 percent of the manufacturing sector's profits during the relevant period.

Although most contributions to the literature assessing the relationship between regulation and productivity have focused on environmental regulation, other types of regulation have also been shown to decrease productivity. For example, the Sugar Acts of 1934, and their repeal in 1974, illustrate how the rise and fall of regulation can influence productivity—productivity within the sugar industry appears to decline upon the introduction of these regulations and to rise upon their repeal (Bridgman, Qi, and Schmitz 2007, 2009).

Other research exploits variations across the OECD countries to examine the effects of regulations on growth and productivity. In a panel of OECD countries, Bourlès and others (2013) find that anticompetitive, upstream regulation in advanced economies causes a decrease in productivity in high-technology sectors. An analysis of OECD countries by Barone and Cingano (2011) suggests that less regulation leads to an increase in the value added to the economy by private firms. Nicoletti and Scarpetta (2003, 26) find “empirical results [that] seem to suggest sizable benefits from further progress in reforming the regulatory environment and in reducing the role of the state in business activities”—at least in part because of the productivity channel.

In addition, regulation-caused delays in bringing products to market can lead to decreases in investment in sectors with intensive research and development that may be disproportionately likely to generate productivity-enhancing innovations. For instance, policies limiting government uncertainty

about regulatory approval in the pharmaceutical drug context could have led to a more than doubling of medical research and development and could increase the current share of healthcare spending by more than 3 percent of GDP (Kojien, Philipson, and Uhlig 2016).

Employment

The impact of regulation on employment is, in theory, ambiguous. The burden imposed on businesses may decrease the number of individuals employed. But one can also imagine that compliance burdens may have an ambiguous employment effect—if a firm is required, for instance, to hire new employees in order to comply with new regulations. Indeed, some research has found little effect of regulation on employment. However, other research suggests that regulations can decrease employment, and some research even shows that deregulation can specifically increase employment.

Some of the evidence indicates that, in certain circumstances, the employment effects of regulation may be lesser in magnitude than one would expect on the basis of the overall burden imposed by a new regulation on business. For instance, Berman and Bui (2001a) find that though the particular regulations they study do impose large costs, the air quality regulations enacted by the South Coast Air Quality Management District, which includes and surrounds Los Angeles, have an effect on employment that is lesser in magnitude than the overall burden imposed on businesses. They find similar results regarding employment and larger effects of regulation on abatement investment when looking at oil refineries (Berman and Bui 2001b). These results are consistent with what one would expect if the regulations compelled firms to reallocate resources away from their most productive use and toward a less productive but labor-intensive use—the drop in employment is lesser in magnitude than the drop in productivity.

Other research, however, finds an effect of regulation on employment (List et al. 2003). For example, as a result of the Clean Air Act, pollutant emitters in counties above a certain standardized pollutant level are subjected to stricter regulatory oversight. These highly regulated counties, relative to less regulated ones, lost close to 590,000 manufacturing jobs (Greenstone 2002). As a result of the same act, the strengthening of emissions standards led to a 15 percent decline in the size of the newly regulated, pollution-generating sector within 10 years (Walker 2011).

A period of deregulation undertaken in Portugal directly addresses the effects of deregulation rather than increases in regulation on employment. Analyzing this period in Portugal, Branstetter and others (2014) document evidence of gains in employment and firm formation. They estimate that gains accrue disproportionately to small businesses and to businesses in bricks-and-mortar, low-technology sectors, such as agriculture, construction, and retail. These results are consistent with a standard model of regulation as a

fixed cost—the type of cost that larger firms can shoulder, but that drive small firms out of business or prevent them from entering in the first place. Small businesses suffer more from the costs of regulation, Branstetter and others’ (2014) results show. Portugal’s experience also demonstrates the benefits of deregulation for employees as well as business owners; Fernandes, Ferreira, and Winters (2014) document that Portugal’s deregulation increased the returns to skills as well as the returns to the possession of a university degree. To deregulate, this evidence shows, is to unleash the economic potential of employees and owners alike.

Labor Mobility

Regulations also are imposed at the State and local levels. When such regulations differ across localities or States, they can have a negative effect on labor mobility, making it difficult for labor supply to respond to geographic differences in labor demand. Examples of such regulations include those pertaining to land use and occupational licensing. Because regulatory barriers to labor mobility undermine labor’s capacity to be allocated toward its most efficient use, regulations of this type can have nontrivial macroeconomic effects.

Land-use regulations govern the private uses of land resources and include housing codes, zoning ordinances, and building codes. In cities experiencing high growth and productivity, land-use regulations often restrict housing availability, increasing housing prices and limiting the number of potential employees who can respond to the high labor demand. Exploiting variance in construction costs across housing markets, researchers use the ratio of price-to-minimum profitable construction cost to identify the impact of regulatory construction constraints. A higher ratio indicates that the price of the house cannot be explained by its physical construction costs and may be accounted for by the regulatory burden imposed. In 2013, 26.4 percent of a sampling of single-family houses were priced above minimum profitable production costs by more than 25 percent. When looking at production costs at a metropolitan-area level to account for unobserved variation, only three markets reported median ratios of greater than 2, while 11 percent reported ratios between 1.25 and 2. In comparison, in 1985, over 90 percent of metropolitan areas reported median ratios near or below 1, meaning that the share of the median price-to-cost ratios by area that were above 1.25 increased from 6.4 percent in 1985 to 15.4 percent in 2013. These high ratios suggest that physical construction costs cannot explain rising housing prices and instead point to the role of regulation in limiting the supply (Gyourko and Molloy 2014; Glaeser and Gyourko 2017).

In an efficient allocation of labor, potential employees will move from low-productivity regions to seek better opportunities in higher-paying, higher-productivity regions (Ganong and Shoag 2016). If people are unable to move to higher-productivity cities, low-productivity cities will have too many workers, leading to overall lower aggregate employee output across all U.S. cities.

Indeed, between 1965 and 2009, labor misallocation due to housing supply constraints ended up lowering aggregate growth by almost 50 percent (Hsieh and Moretti 2017). In addition to limiting aggregate employment inflows by limiting the housing supply, housing prices that are rising in productive areas due to regulation can then further deter low-skill migration by pricing houses above low-skill employees' budgets, leading to increased segregation based on skills (Ganong and Shoag 2016). American workers' proclivity to move is at an all-time low (see chapter 3), implying that they are increasingly unlikely to relocate in pursuit of labor market opportunities. Policy solutions to address this weak mobility could include adjustments to land-use regulations that would lower the price of housing and encourage a more robust alignment of employees with jobs.

Occupational licensing is another geographically based regulation that has an impact on labor mobility by varying licensing requirements by each State. Occupational regulation generally requires individuals to file registration paperwork, acquire certification, or receive a license, often referred to as "the right to practice" (Kleiner and Vortnikov 2017). All forms of occupation regulation can involve costs, but occupation licensing is typically the most intense form of regulation, given that governments evaluate the legal qualifications of a given potential employee. Licensing laws make it illegal to practice a given occupation without a license.

For example, California's Board of Barbering and Cosmetology requires 1,600 hours of education and hands-on training to take a licensing test for cosmetology. An additional 3,200 hours of apprenticeship and 220 hours of related training are required for licensing. The adjacent State of Oregon requires 1,450 hours of education and training for hair design licensing and 350 hours for nail technology, along with 150 hours of safety or infection control training and 100 hours of career development at a State-licensed career school. All potential licensees must then pass a practical examination at one of these schools. A California-certified cosmetologist is not authorized to practice in Oregon without receiving Oregon's certification, creating a barrier to mobility.

The share of the U.S. workforce in a licensed profession has steadily increased. In the 1950s, less than 5 percent of the workforce was licensed, compared with about 18 percent in the 1980s. By 2000, this had grown to at least 20 percent; and in 2003, more than 800 occupations required licensing in at least one State (Kleiner and Krueger 2013). In 2008, 35 percent of employees across the United States were either licensed or certified by the government, with 29 percent being licensed. A total of 85 percent of licensed employees were required to take an exam, while almost 70 percent were required to take continuing education courses (Kleiner and Krueger 2013).

Occupational licensing requirements impose both direct and indirect costs, discouraging labor mobility by creating barriers to entry. For example, if the costs of becoming licensed in a new State is less than the expected returns

from moving, people will not relocate. A recent study found that greater regulatory harmonization affecting the accounting profession across the European Union's member countries led to increased international labor migration in comparison with other professions (Bloomfield et al. 2017). In the United States, occupations that experienced a decline in employment from 1990 to 2000, such as librarians and dietitians or nutritionists, faced a larger decline in States where the occupations were licensed (Kleiner 2006). As with land-use regulation, this lack of mobility creates inefficiencies by preventing workers from moving to high-productivity areas.

These barriers to entry also create wage differences between licensed and unlicensed employees. As both Adam Smith and Milton Friedman observe in their descriptions of economic markets, occupational licensing creates barriers to entry by imposing a quantity restriction on the labor supply that in turn increases wages. An opposing view implies that wages increase because licensing imposes a quality restriction on the labor supply, meaning that the higher wage in this case reflects higher-quality employees. Although the evidence is not clear on the quality or quantity driver in increasing wages, there is strong evidence that wages increase as a result of licensing (Kleiner and Krueger 2013; Gittleman and Kleiner 2016). And though wage increases can signal a strong economy, wages that are artificially raised for some can come at the cost of other employees losing their jobs or being excluded from the local labor market.

The Trump Administration's Initiatives

The Trump Administration has committed to reducing the burden of regulation on the U.S. economy through the elimination of inefficient, duplicative, and obsolete regulations that prevent beneficial economic activity. Rather than suppressing the innovation and entrepreneurship that are central to America's economic growth, regulatory policy should instead simply administer the law with respect for due process and fair notice. Toward this end, in 2017 President Trump issued four EOs directing agencies to review current regulations. The first, EO 13771, instructed agencies to repeal two regulations for every new regulation and to ensure that the total incremental cost of all new regulations does not exceed zero. EO 13772 provided core principles for regulating the U.S. financial system that emphasized the priority of empowering individuals to make informed, independent financial decisions. EO 13777 required agencies to review all existing regulations in order to highlight excessive regulation. And finally, EO 13783 focused on energy regulations, requiring agencies to review existing regulations that potentially burden the development of domestically produced energy resources. These orders have led to the identification of economically beneficial deregulatory opportunities as well as a more careful

examination of future regulations, as is evident in the Fall 2017 Unified Agenda of Federal Regulatory and Deregulatory Actions.

The Unified Agenda—which is published by the Office of Information and Regulatory Affairs, a unit of the Office of Management and Budget—provides transparency to the public regarding anticipated Federal regulatory and deregulatory policy. In this agenda, more than 60 cabinet, executive, and independent agencies compile information on upcoming rules, long-term actions, and completed actions. The Fall 2017 Unified Agenda reports that agencies withdrew 635 proposed actions that had been included in the Fall 2016 Unified Agenda. In the Fall 2017 Agenda, agencies also reclassified another 944 active actions from the Fall 2016 Agenda as long term (700) or inactive (244). Inactive regulations include those that are still being reviewed or considered. All these actions reflect the Administration’s commitment to meaningful consideration of regulations.

Of the new proposed rules and rules already under review, the Administration published only 89 final rules (figure 2-6), about 42 percent of the average number of final rules published annually during the past 10 years.¹ Though these averages are inflated due to the fact that many administrations substantially increase regulation in their last year in office, the number of final rules published in 2017 is still about 46 percent of the average, when the counts for the years 2008 and 2016 are removed. Many administrations also see a decline in regulation in their first year. Still, the 2017 decline in the annual number of economically significant rules published was the largest percentage decrease since 2007, with 61 percent fewer than the previous year. The total number of published final rules also fell at a faster rate than any other year since 2007, signaling a dedication to eliminating excessive regulation.

The Fall 2017 Unified Agenda also outlines the regulatory goals for FY 2018 that reflect the regulatory outlook of the Trump Administration. For example, the Department of the Interior intends to finalize 28 deregulatory actions, leading to a reduction in costs of more than \$1 billion (in net present dollars). The Bureau of Land Management, a part of the Interior Department, has proposed repealing rules regulating hydraulic fracturing that duplicate State regulatory efforts. The Department of Labor plans to streamline its approval process for apprenticeship programs to help workers looking to participate in such programs. The Department of Transportation plans to issue a rule that would give passenger railroads increased flexibility in designing trains, including easing the regulatory burden for high-speed rail operation, which would increase competition in the passenger train market. These deregulatory initiatives are likely to reduce unnecessary burdens on individuals, businesses, and State and local governments.

¹ Because the Office of Information and Regulatory Affairs frequently updates its data on its website, www.reginfo.gov, these counts are estimated as of February 9, 2018.

Figure 2-6. Final and Economically Significant Rules, 2007-17

Sources: RegInfo; Office of Management and Budget.

In his first EO, 13771, addressing regulation, President Trump instructed administrative agencies to consider whether earlier regulations are unnecessary before creating new ones by repealing two prior regulations for every new regulation. For example, the Department of Housing and Urban Development recently announced a top-to-bottom review of its manufactured housing rules to evaluate whether the compliance costs of these rules are justified given the shortage of affordable housing. By requiring the removal of two regulatory actions to offset the implementation of each new regulatory action, the “two-for-one rule” limits future regulatory costs. In this way, agencies can ensure an overall outcome of zero net costs, or even cost savings.

Both Canada and the United Kingdom have implemented similar processes for administrative rulemaking. In 2012, Canada enacted a “One-for-One” for regulatory requirement, while the United Kingdom imposed a “One-In, One-Out” rule beginning in January 2011. Between 2012 and June 2014, Canada removed 19 regulations, reducing the annual burden on businesses by over C\$22 million. Meanwhile, the U.K. government’s statistics suggest that its initiative reduced business burdens by £963 million, and it has since changed the rule to “One-In, Three-Out” through 2020 (Renda 2017). The academic literature on the effectiveness of such efforts is limited, and both governments have documented mixed results.

In complying with EO 13771, U.S. agencies outperformed the two-for-one goal by issuing 67 deregulatory actions while only enacting 3 new regulatory actions, a ratio of 22:1. These actions achieved \$8.1 billion in cost savings

in present value terms, or \$570 million per year. The Administration aims to continue its deregulatory agenda in 2018, with Federal agencies planning to complete four deregulatory actions for every new regulatory action. Agencies anticipate that this will save \$9.8 billion, or \$686.6 million per year in every year that agencies adhere to the 2018 regulatory cost caps.

In response to EO 13772—which was signed on February 3, 2017—the Department of the Treasury has issued three reports and plans on issuing a fourth. The first report was released on June 12, 2017, and discussed regulation pertaining to the depository system, banks, savings associations, and credit unions of all sizes, types, and regulatory charters (i.e., the Banking Report). The second report was released on October 6, 2017, and discussed regulation pertaining to capital markets, including debt, equity, commodities and derivatives markets, central clearing, and other operational functions (the Capital Markets Report). The third report was released on October 26, 2017, and discussed regulation pertaining to the asset management and insurance industries, and retail and institutional investment products and vehicles (the Asset Management and Insurance Report). The final report will discuss the regulation of nonbank financial institutions, financial technology, and financial innovation.

The Banking Report outlined five reforms key to achieve a less burdensome regulatory system: improve regulatory efficiency and effectiveness by evaluating duplicative regulations across numerous agencies; better align the financial system to support the U.S. economy; reduce the regulatory burden by decreasing unnecessary complexity; tailor the regulatory approach to firms' size and complexity and better coordinate these efforts across regulations; and align regulations to support market liquidity, investment, and lending.² The report also makes specific recommendations to improve legislation, regulations, and policy that run counter to President Trump's core principles outlined in EO 13772. In keeping with these principles, therefore, the report emphasizes the need to refine, consolidate, and better define financial regulations across agencies to reduce the outsized costs imposed on smaller banks and create a more harmonized financial regulatory environment. As of December 2017, the Senate is considering legislation to raise the threshold to which many of the more onerous banking regulations apply.

The Capital Markets Report provides specific recommendations for changes in legislation, regulation, and policy in order to support U.S. capital markets. Recommended changes are intended to promote access to capital for

² The depository system is affected by regulations issued by, among others, the Financial Stability Oversight Council, the Board of Governors of the Federal Reserve System, the Office of the Comptroller of the Currency, the Consumer Financial Protection Bureau, the Securities and Exchange Commission, the Federal Deposit Insurance Corporation, the Commodity Futures Trading Commission, the Federal Housing Finance Agency, and the National Credit Union Administration.

all types of companies, including small and growing businesses, by reducing regulatory burdens and improving market access; fostering robust secondary markets in equity and debt; appropriately tailoring regulations on securitized products to encourage lending and risk transfer; recalibrating derivatives regulation to promote market efficiency and effective risk mitigation; enabling proper risk management for central counterparties and other financial market utilities in recognition of the critical role they play in the financial system; rationalizing and modernizing the U.S. capital markets regulatory structure and processes; and advancing U.S. interests by promoting a level playing field internationally.

The Asset Management and Insurance Report provides specific recommendations for changes in legislation, regulation, and policy in order to support the U.S. asset management and insurance industries. Recommended changes are intended to promote efficient regulation by adopting a principles-based approach to liquidity risk management rulemaking for registered investment companies; instituting a “plain vanilla” rule for exchange-traded funds that allows new entrants to avoid the cost and delay of obtaining individual exemptive orders; modernizing shareholder reports to permit the use of implied consent for electronic disclosures; realigning the Federal Insurance Office around five pillars, including the promotion of the U.S. State-based insurance regulatory system and the U.S. insurance sector; recommending that the Federal Reserve Board leverage the information that is received by State insurance regulators and the National Association of Insurance Commissioners from savings and loan holding companies, and recommending that the Federal Reserve Board harmonize its financial reporting and recordkeeping requirements with corresponding State regulatory requirements; encourage the States to expeditiously pass uniform legislation regarding data security and breach notifications for insurers; and improving coordination and collaboration among federal agencies and State insurance regulators on insurance issues.

On February 24, 2017, President Trump signed EO 13777, which requires Federal agencies to review all existing regulations and identify and revise those that meet criteria to isolate inefficient regulations. These include regulations that eliminate jobs, that are outdated or ineffective, that impose costs in excess of their benefits, that interfere with other regulatory reform initiatives, or that are the result of since-rescinded EOs. Agencies are asked to make recommendations regarding these regulations and consider combining overlapping regulations. For example, the Department of Defense identified approximately 500 regulations that are subject to review under EO 13777 and that apply to everything from real estate to flood control. A notice of these regulations was then published in the *Federal Register*, providing the public with the opportunity to comment on their effectiveness. These regulations are now being reviewed by a Department of Defense task force, which will then offer recommendations to the Secretary of Defense in the coming year. With his approval,

these recommendations—including actions to repeal, replace, or modify these identified regulations—will be implemented.

Similar actions are taking place in other U.S. Federal departments. Each component within the Department of Homeland Security has designated a senior official to oversee their component’s regulatory reform efforts and report to a task force that oversees the department’s deregulation efforts. Like the Department of Defense, the EPA issued a *Federal Register* notice evaluating existing regulations and received over 460,000 public comments. The EPA also created a Regulatory Reform Task Force to coordinate public input with regulation recommendations.

The Trump Administration has also applied its deregulatory philosophy specifically to energy production. EO 13783 encourages energy independence by both promoting the clean and safe development of U.S. energy resources and avoiding unnecessary regulatory burdens. This EO requires agencies to review all existing regulations and similar agency actions that could burden the development or use of U.S. energy resources, including natural gas, coal, and nuclear energy resources. After review, agency heads have been required to submit recommendations that could alleviate or eliminate any unnecessary regulation burden on domestic energy production. As with EO 13777, these recommendations have included suspending, revising, or rescinding unnecessary regulations. For example, the “Waters of the United States” rule, which would have greatly expanded the purview of the Clean Water Act and imposed significant regulatory burdens on both America’s farmers and ranchers and its energy producers, is also undergoing review and potential replacement.

In addition, the Administration has taken a number of steps to allow American firms to harness the economic value of America’s coal reserves for themselves and for their employees. Pursuing the energy dominance agenda of EO 13783, the department also revoked a previous moratorium on new leases for coal production on Federal land—estimated by the U.S. Department of the Interior (2017) to produce about 40 percent of America’s coal. Although there are many exacerbating factors besides changes in regulations, the coal industry has responded as expected. According to 2016 and 2017 data from the Energy Information Administration, coal mining employment increased 2.4 percent year-on-year from November 2016 to November 2017, and coal exports in the first two quarters of 2017 rose by more than 55 percent above their 2016 level.

The Department of the Interior has also worked to streamline the application and permitting process for oil and gas wells on Federal lands. In December, the Administration repealed a regulation covering hydraulic fracturing (“fracking”) on federal lands, on the grounds that it was unnecessary, burdensome, and duplicative of existing State and some tribal regulations. Other efforts include an ongoing review of new regulations for venting and flaring natural gas at well sites located on Federal lands. Other mechanisms

have also addressed regulatory burdens—a Department of the Interior solicitor’s opinion reversed Obama-era guidance on criminal penalties under the Migratory Bird Act, which removes a substantial risk for the development of wind energy resources.

Finally, fulfilling the pro-growth agenda envisioned in EO 13783, the EPA has taken multiple steps to evaluate and decrease its regulatory burden. In October 2017, the EPA proposed the repeal of the Clean Power Plan in order to alleviate the burden it would impose on America’s job creators and consumers (EPA 2017). The EPA estimates that this plan’s repeal could lower compliance costs in 2030 by as much as \$33 billion, with these cost savings passed along to businesses and consumers in the form of lower electric bills.

As part of the review process for EO 13783, and in coordination with efforts to address EO 13777, the EPA has also identified four key initiatives to reduce the unnecessary burden of these regulations: comprehensive New Source Review reform, National Ambient Air Quality Standards reform, evaluation of the employment effects of EPA regulations, and a sector-based regulatory outreach program. Specifically addressing EO 13783, the EPA created its Smart Sectors program to better coordinate its efforts with industry stakeholders on regulatory developments, with the understanding that smart regulation requires improved relationships with the regulated community. For example, as part of Smart Sectors, EPA sector liaisons are focusing on building relationships with sectors and improving customer service for them, improving expertise vis-à-vis industry’s specific factors, and using this information to better inform future regulatory directions. The overall goal is to engage stakeholders early in the development of policy through collaborative problem-solving—an approach that will improve environmental outcomes.

Along with EO 13783, this Administration has encouraged energy development by facilitating the construction of the Keystone XL pipeline, which would transport Canadian crude oil to U.S. refineries. In March 2017, the U.S. Department of State issued a Presidential permit to TransCanada, which enabled construction of the pipeline to proceed. This permit is necessary for the construction, connection, operation, and maintenance of facilities exporting or importing petroleum products between the United States and foreign countries. Though the Keystone XL Pipeline is far from complete, and regulatory hurdles at the State level remain, the final Presidential permit removed a cloud of uncertainty that had surrounded the project.

Through this Administration’s efforts, including its EOs and Federal agencies’ resulting actions, it has taken steps to reduce economically inefficient regulation. The Administration’s EOs discussed above require regulators to critically examine both existing and potential regulations. With the adoption of task forces and programs such as Smart Sectors, agencies are actively seeking to remove costly regulations and create new, beneficial regulations with the assistance and knowledge of field experts. The effects of this work are already

evident, with the significant slowing down of proposed regulations and increasing deregulatory efforts. In the coming year, the effects of the Administration's actions will continued to be felt, given that many agencies have only begun suspending, revising, or rescinding unnecessary regulations.

Conclusion

Government regulation pervades the lives of ordinary Americans, making an impact on decisions made by both firms and individuals. Regulations have intended benefits, along with expected and unexpected costs. Though individual regulations may be expected to generate net benefits when imposed, the economics literature contains a multitude of studies providing evidence that individual regulations can generate unexpected costs that are larger than the realized benefits. These costs accrue in the form of dampened growth, diminished capital formation, stunted business dynamics, hampered productivity, decreased employment, and lower labor mobility. As regulation in the United States has marched upward in recent years, many of these maladies have been manifested in the U.S. economy.

The Trump Administration, however, has prioritized the elimination of unnecessary regulations in the U.S. economy. The Administration's specific and far-reaching actions will ensure that only those rules that provide benefit in excess of their costs will be imposed on Americans. The record of the Administration's first year reflects these efforts, because the number of deregulatory actions that eliminate unnecessary and harmful regulations exceeds the number of new regulations. These actions will reduce the costs imposed on America's businesses and employees, significantly expanding economic opportunities.

Chapter 3

Labor Market Policies to Sustain the Middle Class

The Great Recession of 2007 to 2009 sharply reduced what the middle class earned from work. By 2016, the household labor earnings of the median American were still below their prerecession high of nine years earlier, despite the fact that the recession had officially ended in 2009. This unprecedentedly slow recovery, especially for middle-class labor incomes, is perhaps the primary economic problem our Nation faces. While labor incomes stagnated, a marked increase in net government transfers (government benefits received minus taxes paid) to some degree offset the decline in the median American's household income from all sources between 2007 and 2016, finally even surpassing its prerecession high in 2016. But without substantial increases in economic growth, this level of redistribution is unlikely to be sustainable. Clearly, the best possible outcome is for labor incomes to return to normal levels of growth. In the interest of guiding policymakers in their efforts to stimulate such a recovery, this chapter takes a deep dive into describing the recent failure of American labor markets to deliver the prosperity to which Americans had previously grown accustomed. The patterns this chapter describes will clarify the motivation of many of the Administration's policy initiatives that this *Report's* other chapters discuss.

Why have American workers had the worst labor earnings experience in modern history for the past nine years? As chapters 1 and 2 discuss, the Administration's actions on tax and regulatory reforms will stimulate lagging economic growth and increase the demand for workers, addressing this key factor—as will rebuilding our Nation's infrastructure, as outlined in chapter 4.

However, other factors are important as well, and these will become clear from the evidence this chapter presents. Reductions in the disincentives to work—alongside increased enforcement of work provisions and eligibility requirements in the country’s welfare programs—are also needed. Continued government transfers mean that some prime working age Americans find themselves facing a trade-off between staying on the sidelines, while continuing to receive government transfers, and coming back to work, which would result in a forfeiture of those entitlements.

This Administration is also deploying other supply-side tools. Policies that enable workers to get retraining to meet current market needs through apprenticeships and other programs will encourage work. Stemming the opioid crisis and enacting policies to better connect workers with jobs, including broadband access and improvements in geographic mobility, would also increase the labor supply. Other pro-work policies proposed by this Administration, such as paid family leave for new parents, should also raise the long-run probability of parental employment.

The experience of older Americans who are now staying in the workforce longer indicates that government policies can indeed affect decisions to work, and that demography need not be destiny. Public policies enacted since the 1980s with respect to retirement have played an important role in incentivizing work at older ages—for instance, by raising the age at which full Social Security benefits can be claimed and ending the earnings test at that age for those who wish to continue working while receiving benefits. Eliminating the earnings test for workers between age 62 and normal retirement age would likely also increase participation. Policy may also help nudge employers to fill the unmet demand of older workers for jobs with flexible, reduced hours as a gradual entry into retirement in lieu of full nonparticipation by these workers.

Finally, younger workers have become increasingly detached from the labor force. Although more teens are enrolled in school, evidence suggests this group, relative to 10 years earlier, spends more time on unproductive activities,

neither at work nor in school. Early employment can be especially critical for the life prospects of lower-income American teenagers, and policy efforts to encourage the integration of practical labor force training into high school programs may help stem this tide by providing teens with employment and occupational direction early on.

Because past public policies are responsible for some of the drag on employment growth, changes in these policies can be important mechanisms for getting workers off the sidelines and again fully participating in our economy and enjoying its benefits. A coordinated effort encouraging people to do this could—as the economics literature we describe below suggests—significantly reinforce the positive effects of labor demand policies, such as the major tax reform just passed.

Two measures of the United States’ economic success are its rate of real economic growth, and how this growth translates into resources for the average American.¹ This chapter begins by documenting trends in real GDP growth from quarterly U.S. National Accounts data. We measure the peak-to-trough-to-peak average rate of growth within each business cycle, starting with the first post-World War II cycle and continuing through the current one, which began in December 2007. This method disentangles cyclical changes in output from long-term, secular trends in economic growth.

To determine how these secular GDP growth patterns have translated into resources for the American middle class since 1948, we first follow the literature and use GDP divided by the total U.S. population, or per capita GDP, as a measure of individual well-being. GDP is the most common measure of aggregate economic growth, and GDP per capita has historically been the most common way to estimate how this growth is distributed to the average person (Jorgenson, Landefeld, and Schreyer 2014). But a growing body of literature (e.g., Atkinson, Marlier, and Guio 2016; Nolan, Roser, and Thewissen 2016) argues that the income of the median person (i.e., the person whose income is exactly at the 50th percentile—above half the population, and below the other

¹ We use the Bureau of Economic Analysis (BEA) GDP price deflator in all this chapter’s graphs that are related to aggregate GDP values. We use the Consumer Price Index Research Series (CPI-U-RS) (Stewart and Reed 1999) in all the graphs related to ASEC-CPS data. We do so because these are the standard deflators used in the income inequality literature. However, we test the sensitivity of our results using the PCE Price Index, which is a chain-type price index. We use this price index rather than the Chain CPI, which only begins in 1990, because it has been available since 1947. Our main findings are not sensitive to this deflator choice.

half) is a better way to estimate how yearly resources produced via GDP are distributed to “the middle class” (box 3-1).² This is especially true when, over time, systematic changes in income inequality across the entire income distribution could cloud interpretations of mean GDP.³

It is easy to envision where this middle (median) person is in the income distribution, but it is far more difficult to identify this person’s income using aggregate data. The share of GDP going to specific individuals and the households in which they live cannot be directly determined from aggregate data. To do so, the economics literature has turned to survey data.⁴

The longest continuous series of cross-sectional data providing information on the economic resources that, over a given year, flow to individuals and the households in which they live comes from the Annual Social and Economic (ASEC) Supplement to the Current Population Survey (CPS). It is a nationally representative annual survey of 60,000 households and approximately 200,000 individuals who live in them conducted by the U.S. Census Bureau. In this chapter, for each year since 1979, we show the sensitivity of trends in median income to alternative measures of income (e.g., wage earnings, market income, and disposable income), of the sharing unit over which that income is shared (e.g., only the individual who receives it, the tax unit, family, and household), and the unit of analysis (e.g., individuals, tax units) one uses to determine the median.

² “Middle class” is a term of art that potentially has many definitions. Here we focus only on two: the mean and median of the total population of the United States. Other measures are possible. The main results given in this chapter, in figures based on data from the Current Population Survey, are not sensitive to using the mean value of the middle quintile.

³ We use median income because it is not as sensitive as mean (per capita) income to both changes in the income distribution over time—e.g. substantial increases in the share of income held by the very top of the distribution—and to the under coverage of income at the two tails of the distribution in survey data. This latter point is important because the U.S. top income literature finds that insufficient income from top income groups is captured by the ASEC-CPS (see Atkinson, Piketty, and Saez 2011) and the U.S. poverty literature finds that this is also the case at the bottom of the distribution due to under coverage of government transfers (see Meyer, Mok, and Sullivan 2015). In addition, because a major task of this chapter is to provide better ways to measure how resources are distributed to the average American than by simply using GDP per capita, we focus on the median American rather than some subset of Americans by age in the first part of our analysis. We do, however, look at different labor force participation outcomes by age, sex, and education later in the chapter.

⁴ Efforts are now ongoing to do so by assigning aggregate data from the National Accounts to administrative tax record data; see Piketty, Saez, and Zucman (2016). However, as detailed later in the chapter, such efforts still rely on the tax unit as the sharing unit. They also do not follow the Canberra Group’s (2011) criteria with respect to capturing all persons in the tax unit, including dependents, so that a country’s entire population is accounted for. See Larrimore et al. (2017), as well as Auten and Splinter (2017), for recent critiques of the methods used by Piketty and Saez (2003) and Piketty, Saez, and Zucman (2016). In their critiques, the authors begin with the personal income tax record–based data used by Piketty and Saez (2003). But they then substantively add to these data. This allows them to first make like-to-like comparisons and then to show the sensitivity of Piketty and Saez–style results to alternative measures of income.

Box 3-1. Who Is in the Middle Class?

Despite its frequent use in policy debates, there is no universally agreed-upon definition of the term “middle class.” According to the U.S. Census Bureau, in 2016 the median household had \$59,039 in income (Semega, Fontenot, and Kollar 2017). That is, half of all U.S. households had incomes below this amount, while the other half had incomes above this amount. Meanwhile, in 2016 the average (mean) income of American households was \$83,143. This average is higher than the median income because the distribution is not symmetric, as is evident in figure 3-i.

Although the median identifies the household exactly in the middle of the income distribution, it does not identify which other households should belong to the middle class. One approach is to include the middle quintile—the 10 percent of households directly below the median and the 10 percent of households directly above it. In 2016, the middle quintile in the U.S. had roughly \$45,000 to \$75,000 in annual income; 40 percent of U.S. households had income less than the lower end of the range (\$45,000), and 40 percent had income more than the top end of the range (\$75,000).

It is notable that this statistical definition of the middle class is much narrower than Americans’ self-perceptions of their own economic situations. According to a study by the Pew Research Center (2015), almost 90 percent

Figure 3-i. U.S. Household Income Distribution in 2016

Source: U.S. Census Bureau.
 Note: Middle quintile range (shaded yellow) is an estimate. Data are right-censored at \$200,000.

of Americans consider themselves to be either lower-middle, middle, or upper-middle class, with almost half (47 percent) considering themselves to be exactly middle class (figure 3-ii). Only 1 percent consider themselves upper class, according to Pew, while 10 percent consider themselves lower class.

Figure 3-ii. Self-Reported Economic Class of Americans (percent), 2015

Source: Pew Research Center (2015).

Note: Responses of “do not know” are not shown (figure percentages add up to 98%).

We find that average growth in real GDP and real GDP per capita are lower during the current business cycle than during any other post–World War II cycle. The story for real median income is more nuanced. The fall in median labor earnings during the Great Recession (2007–9) was deeper than during all other recessions after World War II, but government tax and transfer policies greatly offset this decline. Using our preferred measure of median income—the household size-adjusted, after-tax and after-transfer income of persons (real disposable income)—we find that it took nine years (2007–16) before median income returned to its 2007 level, just before the start of the Great Recession. This feat, which has been achieved in each business cycle since 1979, was accomplished most slowly in the current cycle.

In contrast, our median income measure that only includes the income derived from work by all members of the median tax unit—the labor earnings of the median tax unit—is still well below its level at the start of the business cycle. This was also the case for this measure of median income during the

2000–2007 business cycle. Hence, in 2016, the labor earnings of the median tax unit remained substantially below its 2000 high point. This income measure, which uses the tax unit rather than the household as both its sharing unit and its unit of analysis, is commonly used in the tax record–based literature.

The failure of this tax record–based measure of median income to return to 2000 levels is somewhat muted when we use our preferred measure of median labor income—*the household size–adjusted labor earnings of the median person*. Using this survey–based measure of income which uses the household as its sharing unit and the person as its unit of analysis, median labor income was only slightly lower at the end of the 2000–2007 business cycle than at its beginning. And, thanks to substantial growth in 2015 and 2016, the household size–adjusted labor earnings of the median person in 2016 are now well above those for the Great Recession trough year of 2009 but still noticeably below the level at the start of the 2007 business cycle.

Using shift–share analysis, Larrimore, Burkhauser, and Armour (2015) account for changes in *the household size–adjusted after–tax and after–transfer income of persons* (i.e., real disposable income). In doing so, they show that unlike previous business cycles since 1979, the declines in the household size–adjusted labor earnings of persons during the recession periods of the first two business cycles of the 21st century predominantly came from declines in employment rather than declines in earnings conditional on employment. We come to a similar conclusion. Using aggregate statistics on employment from the monthly CPS and earnings from the Establishment Survey, both series maintained by the Bureau of Labor Statistics (BLS), we show that the Great Recession was a downturn with more substantial employment effects than previous downturns.

The lack of a return to the employment–to–population rates (where the population is age 16 years and over) that prevailed at the start of the Great Recession, even eight years after the end of the recession in 2009, is partially demography–driven. We provide perspective on the important changes in labor force participation rates by gender and age that account for declines in the overall employment–to–population rates of those age 16 and over that we are now observing. As the members of the Baby Boom generation, those Americans born in the post–World War II era through 1964, have moved into “retirement ages,” the overall participation rate has drifted downward. This movement of the Baby Boom generation into older ages has greatly increased the share of older persons in the overall population, and the employment rates of older persons remain below those of younger persons. The aging of this group first began to contribute to an overall decline of the participation rate in 2008; after the remainder of this cohort moves into retirement, the participation rate will stabilize. Partially offsetting the aging effect since 2008 are the increased employment rates of older persons, as discussed later in the chapter. Further, the incomplete recovery of overall employment rates to pre–2000

levels is not simply the story of the aging Baby Boom generation, because, unlike those over the age of 55, the labor force participation and employment rates of prime-age workers remain below those in 2007, immediately before the Great Recession.

Because of these factors, we expect that the negative contribution of the Baby Boom generation to GDP growth will wane over the next 10 years. Further, policies that increase the labor force participation rate of all workers would have a material impact on long-run economic growth. For example, a combination of policies and economic conditions that return the prime-age participation rate to the rate apparent in 2007 (still well below the rate apparent in 2000) would return about 1.7 million U.S. workers to the labor force over 10 years and raise the overall participation rate by 0.065 percentage point per year, resulting in a 0.1-percentage-point increase per year in the rate of GDP growth over the next 10 years.

In the rest of this chapter, we examine these employment dynamics more closely, separately analyzing the labor force behavior of the population 55 and over, of young persons (16–24), and of prime-age workers (25–54). We argue that demography is not destiny, and that the labor force participation rates of these groups are not only sensitive to economic growth and the accompanying cyclical changes in the demand for their services, but also to changes in tax and transfer policies that encourage them to increase or decrease their supply of labor to the economy.

Trends in GDP and GDP per Capita across the Business Cycles

Figure 3-1 reports real GDP by quarter and the average annual real GDP growth rate for each of the nine post-World War II business cycles, beginning in the fourth quarter of 1948 (hereafter, 1948:Q4, etc.). We collapse the double-dip recessions of 1953:Q2–1957:Q3 and 1957:Q3–1960:Q2, as well as 1980:Q1–1980:Q3 and 1981:Q3–1982:Q4, into single peak-trough-peak periods of the late 1950s and 1980s respectively. The average yearly GDP growth rate for each business cycle—as defined by the National Bureau of Economic Research (NBER)—is measured from peak to peak, and the shaded areas of figure 3-1 identify the beginning and ending peak of each business cycle. Although a rule of thumb for the start of a recession is often described as two or more consecutive quarters of negative GDP growth, the NBER committee’s procedure for identifying turning points differs from this rule in a number of ways. As the NBER (2010) committee states:

First, we do not identify economic activity solely with real GDP and real GDI [gross domestic income], but use a range of other indicators as well. Second, we place considerable emphasis on monthly indicators in arriving at a

Figure 3-1. Level of Real GDP and Peak-to-Peak Average Real GDP Growth, 1948–2017

Note: Shading denotes NBER business cycle. CEA collapsed the double-dip recessions of 1953:Q2–1957:Q3 and 1957:Q3–1960:Q2, as well as 1980:Q1–1980:Q3 and 1981:Q3–1982:Q4, into single peak-trough-peak periods of the late 1950s and 1980s, respectively. The BEA GDP price deflator is used to convert current to real dollars.

monthly chronology. Third, we consider the depth of the decline in economic activity. Recall that our definition includes the phrase, “a significant decline in activity.” Fourth, in examining the behavior of domestic production, we consider not only the conventional product-side GDP estimates, but also the conceptually equivalent income-side GDI estimates. The differences between these two sets of estimates were particularly evident in the recessions of 2001 and 2007–2009 (for more details, see NBER 2010).

Although GDP growth has been positive over all nine business cycles, the average yearly growth from peak to peak has greatly varied, as reported in figure 3-2. The greatest average growth in GDP occurred during the first post-World War II business cycle (1948:Q4–1953:Q2)—5.5 percent a year. But average growth fell to 2.6 percent during the 1950s business cycle (1953–1960:Q2). Average yearly GDP growth then rose to 4.5 percent during the 1960s business cycle (1960–69:Q4), far surpassing average growth in the 1950s. Growth fell to 3.7 percent during the 1969–73:Q4 business cycle of the early 1970s, and further still, to 2.9 percent, from 1973 to 1980:Q1. But then came two decades of economic growth greater than 3.0 percent. Average GDP growth increased to 3.1 percent during the 1980s business cycle (1980–90:Q3), and to 3.3 percent during the 1990s business cycle (1990–2001:Q1). Average GDP growth then fell

Note: CEA collapsed the double-dip recessions of 1953:Q2–1957:Q3 and 1957:Q3–1960:Q2, as well as 1980:Q1–1980:Q3 and 1981:Q3–1982:Q4, into single peak-trough-peak periods of the late 1950s and 1980s, respectively. The BEA GDP price deflator is used to convert current to real dollars.

to 2.6 percent during the 2001–7:Q4 business cycle, before collapsing to 1.4 percent over the current, ongoing business cycle (2007–present) that includes the Great Recession years (2007–9:Q2) and the long, but relatively slow, quarterly growth in GDP through 2017:Q4, the latest quarter of data at the time of this writing.⁵ As can be seen in figure 3-3, though there were several quarters of very small positive growth (under 1.0 percent), and even two quarters of negative growth, during the period from 2009:Q3 to 2014, quarterly economic growth has picked up since then, and especially in 2015 and 2017.

Figure 3-4 reports average annual growth rates in GDP per capita for each of the nine NBER-defined post–World War II business cycles described above. Annual growth rates are lower for GDP per capita because the United States’ population has increased each quarter since 1948. But the general trend in real growth in GDP per capita during business cycles over the nine business cycles is the same as that of real GDP. The highest post–World War II average business cycle growth rate in GDP per capita occurred during the first postwar business

⁵ The current business cycle, which began in 2007:Q4 and is ongoing as of the publication of this report (2017:Q4), is 9 years long, approaching the longest on record, the 9.5 year business cycle of the 1960s. The business cycle is not yet complete, and average growth rates for the cycle will rise provided growth in the upcoming years is higher than the 1.4 percent per year apparent in Figure 3-2. But the long cycle implies that each additional year of growth will have a more muted impact on the average than would be the case under a shorter cycle.

cycle (3.8 percent). It faltered in the 1950s, to 0.8 percent, before rising to its second-highest point (3.1 percent) during the 1960s business cycle. Average growth in GDP per capita again faltered in each of the two business cycles of the 1970s, and especially during the 1973–80 business cycle (2.6 and 1.8 percent, respectively). But it then rose from this late 1970s average low during both the 1980s (2.1 percent) and 1990s (2.1 percent) business cycles, before once again declining during the 2001–7 business cycle to 1.6 percent—and dramatically falling to 0.7 percent during the current, ongoing business cycle. This is the lowest average business cycle growth rate in GDP per capita during the postwar era.

Median Income Trends across Business Cycles

Economic growth, measured in aggregate or per capita terms, indicates progress in delivering more resources to a nation’s economy. How this progress translates into resources for the middle class, however, depends on how gains are distributed across the population. Household survey data are the usual source for monitoring income and its distribution—at the household, family, and individual levels. Each year the U.S. Census Bureau uses household survey data to derive its official statistics on income and poverty. (See Semega, Fontenot, and Kollar 2017 for the most recent available year in this series.) Household survey data are also the basis for cross-national comparative studies and are the source for most other distributional analyses, such as those done by the Organisation for Economic Cooperation and Development (OECD 2008, 2011, 2015). The definitions that underlie the way that income questions are asked in these household surveys provide best-practice measures of personal living standards.

The “income-sharing” unit that researchers choose when using these data is virtually always the household (all persons living in the dwelling), and the “income definition” is disposable (posttax, posttransfer) income, adjusted for differences in household size and composition using an equivalence scale.⁶ The “unit of analysis” is the individual (regardless of age). Hence, median income is based on the equivalized income assigned to each person in the

⁶ Size-adjusted household income accounts for economies of scale in household consumption by dividing income by the square root of household size. This income measure is commonly used in U.S. and cross-national studies of inequality (see, e.g., Gottschalk and Smeeding 1997; Atkinson and Brandolini 2001; Burkhauser et al. 2011), as well as by the OECD in its official measures of income inequality and poverty (d’Ercole and Förster 2012). It also closely matches the adjustments for household size implied by the Census Bureau’s poverty thresholds (Ruggles 1990). This measure assumes that income is shared equally among all household members, so each member receives the same amount for personal consumption.

population. Gottschalk and Smeeding (1997), d’Ercole and Förster (2012), and the Canberra Group (2011) make the case for this standard methodology.⁷

A long-standing challenge to survey-based estimates is that they do not provide a complete picture of the income distribution and its trends because they fail to fully capture the highest incomes. In contrast, the tax-based data used in the top income shares literature do a much better job of capturing the highest incomes. (For the seminal article on U.S. top incomes, see Piketty and Saez 2003; for a review of this literature, see Atkinson, Piketty, and Saez 2011.) However, this tax data benefit is gained at the cost of being constrained to use the definitions of income and income-sharing unit mandated by each country’s tax administration (definitions that differ from the survey-based ones), and being restricted to summary inequality measures that do not incorporate differences across the full income range (i.e., top income shares).

However, because we are focusing on the middle class and are using a median rather than a mean income measure to track changes in middle-class income, under coverage of income at the very top of the distribution is unlikely to affect the results we report. In addition, survey data allow us to consider various definitions of income and sharing units, and to consider different units of analysis (box 3-2). This is not possible when using tax record-based data. Likewise, those using tax record-based data in the standard labor economics literature are forced to focus on the median wage earnings of workers. As a result, they do not account for the fact that many workers live in households that share earnings and other resources, which can lead to a misrepresentation of the distribution of income available to all Americans.

The set of six measures of median income from the survey- and tax-based literatures we discuss in the next subsection are all derived, as noted above, from data contained in the unrestricted, public-use ASEC Supplement to the CPS. This is the most common cross-sectional survey-based source of data for those interested in measuring the incomes and income distributions of Americans. The supplement contains a detailed questionnaire on the sources of income for household members and is commonly used to evaluate levels and trends of income and income inequality (see, e.g., Gottschalk and Danziger 2005; Daly and Valletta 2006; Blank 2011; and Burkhauser et al. 2011).

Six Measures of Median Income

We document median income trends on the basis of six measures which we describe below. But in all cases we will compare trends in real median income

⁷ The International Expert Group on Household Economic Statistics (Canberra Group) was convened as an initiative of the Australian Bureau of Statistics under the auspices of the United Nations Statistical Commission. Its report was largely adopted as the standard for measuring household income by the International Conference of Labour Statisticians. In 2011, the United Nations Economic Commission for Europe provided an updated reference, outlining its latest standards and recommendations.

Box 3-2. The Use of Survey Data versus Tax Record Data to Measure Income and Its Distribution

This chapter argues that *the household size-adjusted posttax, posttransfer income of the median person measure*, based on U.S. household survey data, provides a better estimate of the levels and trends in the resources going to the American middle class than do studies that rely solely on tax record-based data. It nonetheless recognizes that household surveys do a poorer job of capturing the resources controlled by those at the very top of the income distribution than do tax-based studies. However, the most recent income distribution studies in other countries not only recognize the limitations of both tax record-based and survey-based data, but also overcome them. They do so by directly linking tax record data to survey data (see Burkhauser et al., forthcoming, a, b), or they use survey data to capture the bottom part of the distribution and tax record data to capture the top part, and then add these separate estimations together (e.g., see Atkinson 2007; Alvaredo 2011). Jenkins (2017) reviews this literature and provides an alternative method from that of Alvaredo (2011).

The major advantage of linking tax record data to data from a random sample household survey is that a tax unit is a subset of a household. So one can, for instance, assign the income values of the top 1 percent of tax units from the tax-based data to the top 1 percent of tax units that are subcomponents of the households in the survey. It is much more difficult to do this starting with the tax record data, unless one can link these tax units to the households in which they reside. Matching efforts of this sort are still at the experimental stage in the United States. See Larrimore, Mortenson, and Splinter (2017) for an attempt to use the mailing addresses on tax forms contained in Internal Revenue Service records to do so.

Another major way in which the top income literature based on tax record data differs from the survey-based inequality literature that is not resolved, even by linking data sets, is in the treatment of capital gains. Contrary to the Canberra Group's (2011) conventions, the top income literature not only includes capital gains as a source of income, but also does so by including taxable realized capital gains rather than Haig-Simons recommended accrued capital gains. Most household surveys follow the Canberra Group's conventions and do not provide information on capital gains. Armour, Burkhauser, and Larrimore (2013, 2014) and Larrimore and others (2017) discuss the merits of including taxable realized capital gains. They argue that if one chooses to use a measure of capital gains as a source of income, then it is preferable to include all accrued capital gains based on Haig-Simons principles.

using the Consumer Price Index Research Series (CPI-U-RS).⁸ The first is *the labor earnings of the median tax unit*. This income measure only looks at one source of market income, labor earnings (i.e., wages and salaries, self-employment income, and farm income), and uses the tax unit as both its sharing unit and its unit of analysis. Such a measure is in the style of the tax record-based literature because labor earnings are a component of market income and the sharing unit is the tax unit.

The second measure is *the household size-adjusted labor earnings of the median person*. Although this measure also only includes labor earnings, it expands the sharing unit to the household, estimates the equivalized value of those labor earnings, and assigns it to each person in the household. Burkhauser, Larrimore, and Simon (2012) first showed that because the number of tax units within households has grown over time, while the number of people in those households has fallen, these demographic characteristics will tend to increase this measure of median income over time relative to a tax unit-based measure of labor earnings.

The third measure is *the household size-adjusted market income of the median person*. This uses Piketty and Saez's measure of pretax, pretransfer market income. Its sources of income include labor earnings, interest, dividends, rents, trusts, and pension income received in retirement. But it excludes public transfers. It does so using the household as the sharing unit and the person as the unit of analysis. Although the level of median income of this measure will be greater than one that looks at labor earnings alone, its trend will also depend on the relative growth of other sources of market income.

The fourth measure is *the household size-adjusted pretax, posttransfer income of the median person*. This is the measure of income that the U.S. Census Bureau uses in its household income series (Semega, Fontenot, and Kollar 2017); it adds government cash transfers to the income measure used in the previous series. This includes income from cash transfer programs such as Aid to Families with Dependent Children and its successor, Temporary Assistance for Needy Families, as well as from social insurance programs such as Social Security and Workers' Compensation. It excludes, however, transfers directly tied to the tax system, such as the Earned Income Tax Credit (EITC). It also excludes any in-kind government transfers, such as food and housing assistance, and the value of Medicare or Medicaid insurance. The U.S. Census Bureau reports the "pretax, posttransfer income of households" in the first

⁸We do so since the CPI-U-RS is the standard deflator used in the survey-based income inequality literature. However, we test the sensitivity of our results using the PCE price index which is a chain-type (or Tornqvist) price index, so it does not systematically overstate inflation like the CPI-U and its variations, which are Laspeyres indices. Again, we use this price index rather than the Chain CPI, which only begins in 1990, because it has been available since 1947. See figure 3-22 in the appendix to this chapter, where we show that though this deflator slightly increases real growth in median income over each of the four business cycles we explore in this section, our main findings are not sensitive to this deflator choice.

figure of its annual report (Semega, Fontenot, and Kollar 2017); it is also the measure reported in box 3-1. But the U.S. Census Bureau, in its more sophisticated discussions of income trends, uses this fourth measure we define here, which takes into consideration the number of persons in the household and assigns them an equivalized income value. Because this measure adds government transfers but does not subtract government taxes, its level of median income will be greater than one that looks at market income alone, but its trend will depend on the relative growth of other sources of government transfers to market income.

The fifth measure is *the household size-adjusted posttax, posttransfer income (including some in-kind transfers) of the median person*. This disposable income measure more fully captures the importance of government tax and transfer policies for the resources of the median person. It uses NBER's TaxSim 9.3 (Feenberg and Coutts 1993) to estimate Federal and State taxes and liabilities, including Social Security and Medicare payroll taxes. In addition, it captures the market value of some in-kind transfers. The Census Bureau imputes the value of SNAP (the Supplemental Nutrition Assistance Program—food stamps), housing subsidies, and school lunches on an annual basis. We use these values in our estimates. All are now generally recognized as important resources that are primarily available to low-income households, and the Census Bureau now includes them as resources in its Supplemental Poverty Measure (Garner and Short 2012). Larrimore, Burkhauser, and Armour (2015) use this measure in their analysis. Because it both adds government in-kind transfers and tax credits (e.g., the EITC) but subtracts taxes, the level of median income of this measure could be higher or lower than the Census Bureau's median (pretax, postcash transfer) income values as well as median market income alone. Its trends will depend on the relative growth of net government transfers to market income.

The sixth measure is *the household size-adjusted posttax, posttransfer income (including in-kind transfers as well as the insurance value of employer provided health insurance and Medicare and Medicaid) of the median person*. Burkhauser, Larrimore, and Simon (2012) were the first to use the market value of health insurance in a disposable income measure, in order to show the growing importance of access to health insurance for explaining differences between survey- and tax record-based analyses of income and its distribution. The U.S. Congressional Budget Office (CBO), in 2012, was the first government agency to include the market value of both government- and employer-provided health insurance in their measure of income (CBO 2013). Larrimore, Burkhauser, and Armour (2015) include this measure in an appendix table. Lyons (2015)—as well as Burkhauser, Larrimore, and Lyons (2017)—show its importance for estimating the income of working age people with disabilities; and Elwell and Burkhauser (2017) show its growing importance for measures of median income that they estimate back to 1959. Due to the rapid growth

in employer- and government-provided health insurance, its median income values will be greater than all other measures in levels and trends.

Figure 3-5 reports the trends for these six measures of median income, normalized to 100 percent in 1979. The values given in this figure come from extensions of the findings of Larrimore, Burkhauser, and Armour (2015) and Elwell and Burkhauser (2017) to income year 2016 for all measures except the sixth which extends only to 2014. NBER's business cycles are denoted by alternated shading between business cycle peaks, as in figure 3-1.⁹ Note that, though the total population included in each of our six trend lines is the same, the median person in that population will not be the same person because the income sources and sharing unit used to capture income differ.¹⁰

There are a number of similarities in the trends of five of these six measures of income. The median value of all five income measures that use the household as their sharing unit and the person as their unit of analysis is greater at the ending peak of the 1980s and the 1990s NBER business cycles than at their starting peaks. During both cycles, median income falls from its prerecession high to a trough (with the year varying by measure). But in both cycles, strong postrecession growth increased median income well above its initial prerecession business cycle high.

This is not the case for the growth in *the labor earnings of the median tax unit*. The median value of this measure is noticeably lower at the end of the 1980s business cycle than at the beginning. Although it recovers somewhat from its 1984 trough, it is only at 94 percent of its 1979 high in 1989. During the 1990s cycle, postrecession growth is strong enough to lift median labor earnings above its prerecession high, but it only manages to return it to just above its 1979 prerecession high in 2000, well below the other five measures

⁹ CPS income values are annual. We convert to quarterly values by assigning annual values to Q4 and linearly interpolating. There are two important breaks in the CPS data during this period. The first is the well-known break in the data that occurs between income years 1992 and 1993. We follow Larrimore, Burkhauser, and Armour (2015) and adjust for this by assuming that the entire decrease in median income between 1992 and 1993 is caused by the improvement of CPS data collection efforts, and therefore we decrease median income in 1992 and in all preceding years by the same percentage. The second occurs for income year 2013. In that year CPS used past years methods for one part of the survey population and a new method for the other part, to test the impact of the new method on outcomes. We follow Elwell and Burkhauser (2017) and use the median value based on these new methods for 2013 and thereafter and raise median income in all preceding years by the ratio of median values in 2013 based on the new and the old methods.

¹⁰ The median individual for each measure will also change year-to-year. Substantial shifts in the composition of the population, such as through the immigration of low skilled workers or the aging of the population into retirement, may increase the share of the population living in households with low labor earnings, reducing the *household size-adjusted labor earnings of the median person* even when, over the same period, the median earnings of employed individuals is rising. Alternatively, the increase in the share of persons living in two or three earner households may reduce the share of the population living in households with low labor earnings, increasing the *household size-adjusted labor earnings of the median person*, even when over the same period the earnings of employed individuals is falling.

Figure 3-5. Alternative Measures of Trends in Real Median Income, 1979–2016

Sources: National Bureau of Economic Research (NBER); Elwell and Burkhauser (2017); Current Population Survey; Bureau of Labor Statistics; CEA calculations.

Note: Shading denotes new NBER business cycle. CEA collapsed the double-dip recessions of 1953:Q2–1957:Q3 and 1957:Q3–1960:Q2, as well as 1980:Q1–1980:Q3 and 1981:Q3–1982:Q4, into single peak-trough-peak periods of the late 1950s and 1980s, respectively. Annual data are linearly interpolated. Consumer Price Index Research Series is used to convert current to real dollars.

of income in 2000. Those focusing on the growth in *the labor earnings of the median tax units* will greatly understate the actual increase in labor earnings available to the median American during this period because that median American lives in a household that may contain more than one tax unit. The same is true for using growth in *the labor earnings of the median worker* to make inferences about the labor earnings available to the median American.

The other five measures all take into consideration the fact that workers live in households, not in tax units or by themselves, and that these household members share their individual labor earnings. Some of the measures also include other sources of market income, as well as the net returns of government taxes and transfers. All show substantially higher growth in the resources available to the median American over these first two business cycles than does the measure of *the labor earnings of the median tax unit*.

This income measure’s inconsistency vis-à-vis the other five measures continues during the 2001–7 business cycle. *The labor earnings of the median tax unit* dramatically falls from 2001 to 2004, and though it increases thereafter until 2006, it is substantially below its 2001 value by the end of the business cycle in 2007. It then falls precipitously during the Great Recession and does not turn upward until 2013. Since then, it has slowly recovered, but by 2016 it was well below its value at the start the current business cycle in 2007, and even further below its 2001 peak.

However, this measure fails to recognize the social insurance value of living in a household—which is the pooling of labor earnings over all household members. Thus, sharp reductions in earnings from one tax unit in a household are softened by the continued earnings of its other tax units. At the same time, the number of people living in each household falls during this period, so household resources are shared among fewer people. These are important distinctions. Although our preferred measure of median labor earnings, *the household size-adjusted labor earnings of the median person*, also falls at the start of the 2001 business cycle, during the recovery years, it increases and almost reaches its 2001 level by 2007. This measure then falls precipitously during the Great Recession and does not turn upward until 2012; it then increases and is closer to its 2007 peak level by 2016 than is the flawed measure *the labor earnings of the median tax unit*. More important, the pooling of labor earnings in households reduces the depth of the drop in median income in the years between the business cycle’s prerecession and postrecession peaks.

The household size-adjusted market income of the median person follows a very similar path within business cycles. Growth by the end of the 2001–7 cycle was not enough to raise median market income above its level in 2000, but because nonwage market income has grown faster at the median during the 2007 cycle, this measure of median income almost reaches its 2007 pre-Great Recession peak by 2016 and experiences a less severe drop in the years between the two cycle peaks.

The household size-adjusted pretax, posttransfer income of the median person, as used by the U.S. Census Bureau—which adds cash transfers to market income—closely follows the market income trends. Growth by the end of the 2001–7 business cycle was not quite enough to raise it to its level in 2000, but government transfers offset market income declines during the cycle, so its interim-year declines were smaller. Because government transfers have grown faster than market income during the current cycle, this measure of median income finally exceeded its pre-Great Recession high by 2016, greatly offsetting market income declines in the interim years. What is less clear is the degree to which this observed growth in net government transfers for the median American had negative effects on their employment, and hence on measures of labor and market income in the previous series.

The measure *household size-adjusted posttax, posttransfer income (including some in-kind transfers) of the median person*—which is recommended by the OECD, and is used by most European Union members—is also our preferred measure of median total income, because it more fully takes into consideration both government taxes and transfers. Doing so shows how effective government tax and transfer policy has been in increasing the median income of Americans and in offsetting the decline in their market income during both the 2001–7 business cycle and the present cycle. Although the growth of median income during the first two cycles is much greater than during the

last two, this fuller measure of income is the only one that shows growth over all four. More important, it shows that government tax and transfer policies since 2001 have largely offset the interim-year declines in median market income during this period.

The measure *household size-adjusted posttax, posttransfer income (including in-kind transfers as well as the insurance value of employer provided health insurance and Medicare and Medicaid)* of the median person is somewhat controversial, because it adds the market value of health insurance provided by employers and the government (i.e., Medicare and Medicaid) to the previous measure. However, this measure is now used by the CBO in its measures of income and in the economics literature (see Lyons 2015; Burkhauser, Larrimore, and Lyons 2017; and Elwell and Burkhauser 2017). Because of the rapid growth in health insurance provided by employers and the government since the mid-1980s, its median income trends are considerably greater than all the other such trends shown in figure 3-5 through 2006. Median values fall somewhat until 2008 and are flat through 2014, which is the last year of our data.¹¹

Figure 3-6 reports real median levels from 1979 to 2016:Q4 for our preferred measures of labor earnings and disposable income, as well as for the U.S. Census Bureau's pretax, posttransfer measure of income. All three use the same household sharing unit, with household income equivalized and the individual as the unit of analysis. All values are in 2016 dollars.¹² The only difference in these measures is in the sources of income considered.

When we only consider the labor earnings of all household members, median income was \$28,203 in 1979, and rose to a peak of \$33,663 in 2000, but was only \$32,320 in 2016:Q4—still below its 2000 peak. When we include other forms of market income as well as government cash income, median income levels increase, respectively, to \$32,696, \$40,148, and \$40,600. When we use our preferred disposable income measure, its 1979 median value of \$27,255 is less than the value of median labor earnings. This shows both the greater importance of labor earnings at the median and the fact that the median person lived in a household whose taxes paid to government were greater than

¹¹ The Census Bureau discontinued its series on the market value of Medicare and Medicaid in 2015. In addition, Burkhauser, Larrimore, and Lyons (2017) argue that the Affordable Care Act's rules regarding community ratings of health insurance, which came into effect in 2014, by law reduced the cost of private market health insurance to persons with above-average expected healthcare costs. This, in turn, reduced the market value of Medicare and Medicaid to their beneficiaries because they are now eligible for this less expensive community-rated private market health insurance.

¹² All these values are reported for the median person, and show this person's household size-adjusted income. Because we are using an equivalence scale of 0.5, if this person lived in a household of four persons, his or her household income would be the square root of 4, or two times the values reported in this figure (equivalence value = household income / square root of the number of persons in the household).

Figure 3-6. Alternative Measures of Real Median Income, 1979–2016

Note: Shading denotes NBER business cycle. CEA collapsed the double-dip recessions of 1953:Q2–1957:Q3 and 1957:Q3–1960:Q2, as well as 1980:Q1–1980:Q3 and 1981:Q3–1982:Q4, into single peak-trough-peak periods of the late 1950s and 1980s, respectively. Annual data are linearly interpolated. Consumer Price Index Research Series is used to convert current to real dollars.

transfers received in 1979. This no longer becomes the case as early as 1983. Although median disposable income continues to be at about the same level as median labor earnings for the rest of the 1980s, and somewhat above median labor earnings during most of the 1990s, by 2000, at \$33,950, it was only about \$300 above median labor earnings. However, thereafter, median disposable income grows much more than median labor earnings, especially after 2007, as taxes and transfers play a much more important role in sheltering the median person’s household equivalized income from losses in market income during and after the Great Recession. By 2016:Q4 median disposable income is \$35,152, exceeding its previous 2007 peak.

Decomposing Median Income Changes by Employment and Earnings

The slow rebound of *the household size-adjusted labor earnings of the median person* after the Great Recession, as reflected in figure 3-6, is remarkable—and it indicates a departure from the experience of individuals after previous, albeit weaker, recessions. What is the underlying source of this departure from previous experience? There are several possible answers, but one is the unprecedented increase in government social safety net programs. Although this increased use of tax and transfer policies to redistribute market income successfully cushioned the sharp decline in GDP during the Great Recession of

2007–9, as reported in figure 3-1, the subsequent negative employment effect of these transfers could to some degree be responsible for the remarkably slow pace of GDP growth in the recovery period since then.

For the last two business cycles pictured in figure 3-6, previous research using shift-share analysis highlights the primacy of employment declines over earnings declines in accounting for the drop in *the household size-adjusted posttax, posttransfer income (including some in-kind transfers) of the median person*. Larrimore, Burkhauser, and Armour (2015) calculate that declines in the employment of heads of households and their spouses alone account for 79 percent (–3.25 percentage points, out of –4.10 total percentage points) of the median recession-related income decline from 2007 to 2010, controlling for all other factors. Likewise, between the recession-related years 2000 and 2003, the employment declines of household heads and their spouses on their own would have caused median income to fall by 1.88 percentage points; it was only because of policies that changed tax liabilities that median income actually rose by 0.35 percentage point.

These declines in median income that are accounted for by the employment declines of household heads and their spouses in the 2001–7 and 2007–present business cycles are in contrast to earlier recessions, when such declines were completely accounted for by declines in the earnings of male household heads and their spouses conditional on employment.¹³ For example, 2.6 percentage points of the total recession-related 1989–92 fall in median income of 3.5 percentage points were accounted for by the earnings declines of male household heads and their spouses, while only 1.1 percentage point was accounted for by the decline in their employment. The respective numbers are 3.9 percentage points for earnings and 2.0 percentage points for employment, out of a total decline of 6.6 percentage points for the recession-related years 1979–82. Between both 1979 and 1982 and 1989 and 1992, median incomes fell, while the employment and earnings of both female household heads and their spouses rose. In the next section, we explore in more detail the possible explanations for the long-term decline in the employment and labor force participation of working age Americans.

¹³ In the CPS data, the head of a household (“the householder”) is defined as the household’s primary earner. The household can contain both its head’s family members—i.e., those related to the head by blood or marriage—and other unrelated individuals. One of the reasons to use the household as the sharing unit rather than the tax unit is that an increasing share of households contain two adults who share income and perhaps the parentage of their children but are neither blood relatives nor married and who file separate personal income tax forms.

Measures of Employment and Earnings Using Aggregate Data

The attribution of income reductions in the most recent recessionary periods to declines in the employment of working age Americans—detailed in Larrimore, Burkhauser, and Armour (2015)—are consistent with the aggregate employment statistics produced by the Bureau of Labor Statistics and derived from the monthly CPS. For each business cycle beginning with the 1980:Q1 peak, figure 3-7 gives the quarterly ratio of employment to population for those age 16 and over as a multiple of the ratio observed at the opening cycle peak. Thus, the value in quarter 0 is always 1, and as each recessionary period unfolds, the value falls below 1. Viewing the data in this way facilitates comparisons of employment and wage declines across business cycles.

For the business cycles beginning in 1980 and 1990, the ratio eventually returns to parity before the closing cycle peak, within 20 and 17 quarters, respectively. But for the 2001–7 cycle, the ratio of employment to population never recovered from its initial decline, and the employment declines during the Great Recession simply layered on to these still-depressed rates. As a result, not only is the ratio of employment to population in 2017:Q4 below the value in 2007:Q4, it also remains below the ratio at the beginning of the 2001 recession.

Figure 3-8. Prime-Age (25–54) Ratio of Employment to Population, Measured Relative to Opening Business Cycle Peak, 1980–2017

In addition to the sharp GDP declines during 2008 and 2009 that are shown in figure 3-1, the Great Recession coincided with the movement of the Baby Boom generation (those Americans born between 1946 and 1963) into older age. Although declines in the ratio of employment to population may have been spurred by GDP declines, the slow recovery over the ensuing years may also be partly accounted for by the front end of the Baby Boom generation moving past age 55 beginning in 2001 and past age 62 in 2008, ages at which average employment rates are below those for younger workers. Yet Baby Boomers’ aging into retirement cannot be the full story; the employment patterns for the prime-age population (25–54), shown in figure 3-8, parallel those given in figure 3-7. The members of this group saw slightly shallower employment declines in the first eight quarters of the 2008 recession, and though their employment rebound has been stronger, prime-age workers still have not reached parity after 40 quarters of the current business cycle. Just as with the full population age 16 and over, prime-age workers began the 2007 cycle with employment rates below those at the start of the 2001–7 cycle.

In contrast, conditional on employment, real average hourly earnings for private production and nonsupervisory workers (the longest continuous series available) in the BLS Establishment Survey weakened only slightly after 2007, and not at all during the 2001 recession, as indicated in figure 3-9. It is particularly important to note that these earnings values are only for employed

workers, and the disproportionate job loss at the lower end of the income distribution (Elsby, Hobijn, and Sahin 2010; Farber, Hall, and Pencavel 1993) implies a degree of selection into those reporting hourly earnings in the relevant surveys. Still, the return of average hourly earnings to their pre-recession level after only four quarters of the current recovery implies that the sluggish pace of median income growth since 2007 is—as Larrimore, Burkhauser, and Armour (2015) found—the outcome of sluggish employment patterns rather than earnings conditional on employment. This is in contrast to the failure of real average hourly earnings to ever return to their average level at the start of the 1980s business cycle and for the first 26 quarters of the 1990s business cycle.

Addressing America’s Employment Challenge

The employment patterns highlighted in figures 3-7 and 3-8, and the resulting weakness in the labor earnings of the middle class, are of critical policy importance. In the remaining sections of this chapter, we take a deeper look at the labor market attachment of the noninstitutionalized civilian population age 16 and over. Our analysis focuses on labor force participation rather than employment per se, in order to more closely match the academic literature. Participation rates also have the benefit of capturing job seeking as well as

Box 3-3. Women’s Labor Force Participation after World War II

The emergence of women from World War II with increased professional ambitions has been well documented (Mosisa and Hipple 2006; Shank 1988; Acemoglu, Autor, and Lyle 2004). The postwar rise in the female labor force participation rate—from 33 percent in 1948 to a high of 60 percent in 1999—thus represented a steady increase in women’s ability to manage both career and family. Indeed, this change was largely attributable to married women’s engagement with the labor force (Smith and Ward 1985; Costa 2000); previously, these women had left the labor force at the time of marriage or childbearing, rarely to return. In 1950, only 10 percent of married women age 15–64 with a child younger than five years participated in the labor force, compared with 28 percent without a young child (Costa 2000). However, by 1998 the share of married women age 15–64 with a child under the age of five who were in the labor force had risen to 64 percent; and for those without a young child, the labor force participation rate had risen to 76 percent.

In the postwar period, until the 1960s, the rise of women’s labor force participation was driven by their return to the workforce at the end of their childbearing years. However, starting in the 1960s, their overall rise in labor force participation is attributable not to their returning to work after their childbearing years but by their increasing participation during these years (Bailey 2006, 2013). In the 1960s, women’s increasing use of contraceptive technology, which gave them more control over the timing and frequency of births, was a critical part of these changes, as were changing social norms related to working mothers (Bailey 2006; Goldin and Katz 2002). Their access to family planning enabled women to pursue higher levels of education, invest in other forms of human capital (e.g., on-the-job training), and participate in traditionally male-dominated professions (Bailey 2013).

Although, through the end of the 20th century, women increasingly found their way into the labor force, and stayed there through their childbearing years, the female labor force participation rate peaked in 1999, at 60 percent. Since then, this rate has edged downward, to 57.0 percent in 2017, paralleling the trend for men. However, 2016 marked the first year since 2008 (during the Great Recession) that the labor force participation rate for women increased (by 0.1 percentage point from the previous year). The general decline over the past 20 years is partly attributed to Baby Boomers aging into age brackets with traditionally lower participation rates, along with increases in teenagers’ school enrollment (Toossi and Morisi 2017). But it is also due to declines in the probability of employment among married mothers (Cohany and Sok 2007), many of whom saw marginal tax rate hikes in recent years. Despite these declines, American women are far more likely than women in the other OECD countries to work full time and to be in higher-level positions, such as managers and professionals (Blau and Kahn 2013).

employment, providing a measure of labor force attachment beyond binary employment status. Labor force participation rates will be a bigger overstatement of employment early in business cycles, when GDP first begins to decline and unemployment grows, relative to later points in the same cycle, when unemployment rates have declined from their recessionary peaks.

The labor force participation rate of the U.S. noninstitutional civilian population in 2017 was 62.8 percent, the culmination of a multiyear decline beginning in roughly 1990, although the decline for men began much earlier (see figure 3-10); the overall rate has stabilized over the past three years. In earlier years, from 1948 through roughly 1998, the steady decline in the labor force participation rate of men was offset by a rapid increase in the rate for women (box 3-3). But after the late 1990s, the participation rate of women stabilized and then declined, serving to reinforce the decline for men and inducing a reduction in aggregate participation rate.

The aging of the U.S. population is an important factor in the labor force participation patterns shown in figure 3-10. The Baby Boom generation has aged into retirement, though increased life expectancies for men and women alike have served to increase the size of the postretirement population. A clearer vision of the employment crisis, therefore, requires examining participation within age groups. Beginning with 1970 (the opening year of the 1970–73 business cycle), figure 3-11 shows the annual participation rate by age group.

One clear pattern in the post-1969 data is the rise and then post-1988 fall in labor force participation for workers age 16–24. (This decline is discussed more fully below.) In contrast, prime-age workers, those between 25 and 54 years of age, steadily increased their participation rate through 1997, experiencing a rise after 1970 of 10 percentage points to a series high of 84.1 percent, matched again in 1998 and 1999. During this period, women continued to join and persist in the labor market, but after 1999, prime-age participation faltered, and the rate in December 2017 was 81.9 percent, reflecting a rate of 89.0 percent among prime-age males and 75.0 percent among prime-age females. Participation patterns for prime-age workers are discussed in more detail below.

Finally, the population age 55 and older, the fastest-growing group shown in figure 3-11 thanks to the effects of the Baby Boomers, has been the bright spot in the otherwise disappointing two decades of labor force participation since 1997. For this group, the 1990s and 2000s brought returns to participation rates not seen since the 1960s; in 2017, the rate for those 55 and older was 1.1 percentage points higher than in 1970. Some of the increase can be attributed to the aging of a cohort of women who experienced high rates of participation while they were of prime age during the 1990s. But these changes for older workers are also attributable to changes in policy toward older workers, and we discuss these policy choices and their implications for the labor force participation rate of older workers in the next section.

Labor Force Participation among the Older Population

Figure 3-11 presents a striking picture of changes in labor force participation over time for older workers: Since the mid-1980s, older workers have increasingly remained in the labor force, while younger workers have been leaving. The overall participation rates of these older population groups are substantially lower than those of prime-age workers, imposing a demographic drag on the aggregate participation rate as the U.S. population ages. Thus, the U-shaped pattern of decline, and then return, of participation among older workers that is observable in figure 3-11 serves to partially offset this demographic drag.

To further examine the change in labor force participation among older Americans, we use the CPS to subdivide participation rates for five-year age brackets, separately examining the participation of those age 55–59, 60–64, and 65–69. Our results extend through 2016, the latest year with the full set of monthly CPS samples available for public use. Indexing the value in each year to the observed participation rate in 1970 gives a measure of relative change for each group. Figure 3-12 indicates that the decline and recovery in participation has been dramatic for the 65–69 age group and, to a lesser extent, for the 60–64 group. By 1985, the participation rate for those age 65–69 was only 62.1 percent of its 1970 level. It then rose to 114.2 percent of its 1970 value by 2016. For those age 60–64, the decline was not as steep—a decline to 77 percent of its 1970 value in 1986, followed by a rebound to 102.9 percent of its 1970 value in 2016. Those age 55–59 experienced a milder decline through 1987, before seeing an upward trend through 2008 and a plateau thereafter. For all older age groups, the turning point for participation rates occurs sometime in the middle to late 1980s. And for all groups, the changes are driven by women, whose increased participation serves to mask weak participation for older men relative to 1970 (figures 3-13 and 3-14).

The changes in labor force participation among older workers are likely due, at least partly, to changes in policies to reduce explicit or implicit age discrimination against older workers and to changes in private pensions. For instance, the Age Discrimination in Employment Act of 1967 first prohibited firms from forcing their employees to retire before age 65; and in 1986, this act was further amended to prohibit mandatory retirement before age 70. But it was argued at the time that the actual influence of these mandates would have only a limited effect on the age when an employee would retire from a firm. More important were the rules governing employees' private pension plans (Burkhauser and Quinn 1983; Quinn, Burkhauser, and Myers 1990). In the 1970s and 1980s, the vast majority of workers participating in a firm-sponsored pension program were enrolled in a defined-benefit (DB) plan. These plans frequently discouraged continued work with the firm by providing less than actuarially fair yearly increases in benefits for those who postponed taking

their benefit beyond the earliest age it was offered (Burkhauser 1979; Kotlikoff and Wise 1987).

The introduction of the Employee Retirement Income Security Act in 1974, with new standards designed to better protect employees and ensure that they would retire with a pension, mandated that employers more “fully fund” their DB plans. Firms responded to this and other workforce changes by shifting to defined-contribution (DC) plans. These new DC plans were “fully funded” in the sense that employees received an employer-provided payment to their own personal retirement fund each year, but they shifted the investment risk of these funds to the employee. It is particularly important that unlike DB plans these DC plans had no built-in incentive for early retirement. In addition, in 1978 Congress allowed employee contributions to 401(k) DC plans to be paid with pretax dollars, which further encouraged the switch to DC plans. In 1977, 65.8 percent of active participants in employer-sponsored retirement plans were in DB plans and 34.2 percent were in DC plans. By 2014, the rates had more than reversed, to, respectively, 16.1 and 83.9 percent (U.S. Treasury 2010; U.S. Department of Labor 2017). This growth in DC plans may have significantly increased labor force participation rates over what they

would have been under a DB system (Leonesio et al. 2012; Purcell 2005; Juhn and Potter 2006).¹⁴

In like manner, it has been argued that the rules governing a country's government run pension system, for example the Social Security program (Old-Age and Survivors Insurance) in the United States, offer incentives to leave the labor force early even while providing protection against income loss in retirement (National Research Council 2001). As with private DB pension plans, public plans can have an important effect on work incentives. The age at which benefits are initially available, called the early retirement age, coupled with the patterns of benefit accrual, help determine the continuation of workers in the labor force. The key element of benefit accrual is the adjustment to benefits if a person works for another year; if the "actuarial" adjustment effectively offsets the fact that they are received for fewer years this will not have an added effect on labor force participation past early retirement age. However, if there is no adjustment, or if the adjustment is not large enough to offset the fewer years of receipt of benefits, the result is an incentive to leave the labor force. In many countries, disability and unemployment insurance programs effectively provide for early retirement before the explicit early retirement age. Gruber and Wise (1999) provide the first systematic evaluation of the incentives effects of major industrialized countries publicly provided pension systems.

In the United States, the 1983 Social Security Amendments initiated a plan to gradually increase the full retirement age from 65 to 67 years of age. Although early retirement at age 62 was still permitted, this increase in the normal retirement age effectively lowered the yearly benefits from doing so. Beginning with those born in 1938 or later, the full retirement age will gradually increase over 22 years until it reaches 67 for individuals born after 1959.¹⁵ The 1983 Social Security Amendments also phased in an increased reward (i.e., provided a larger "actuarial" adjustment) for delaying entitlement receipt (Delayed Retirement Credit) beyond the age of full retirement between 1987 and 2005, which further encouraged retirement delays (Gustman and Steinmeier 2006). Blau and Goodstein (2010) estimate that the combination of increases in the full retirement age and rewards for delayed entitlement-

¹⁴ Because the upturn begins around 1988, the upward trend in the labor force participation of older persons predates the welfare reform of the late 1990s, implying little ability of this policy change to explain the participation rates of the older population. Participation rates also appear to be continuous over the 2008–9 period, implying a limited role for increased participation as a result of retirement asset value destruction during the Great Recession. For further discussion, see Gustman, Steinmeier, and Tabatabai 2010; and Daly, Hobijn, and Kwok 2010.

¹⁵ The amendments implemented the increase in the full retirement age to 66 years in two-month increments annually for age cohorts born between 1938 and 1942, and the full retirement age of 66 years holds for the 1943–54 cohorts as well. For individuals born between 1955 and 1959, the age continues to incrementally increase by two months a year so that, for those born in 1960 and thereafter, normal retirement age will be 67. This later six year transition from a normal retirement age from 66 to 67 began in 2017 for those who reached age 62 in that year.

taking may have accounted for one quarter to one half of the increase in labor force participation for men age 55–69 since the 1980s, or an increase in their labor force participation rate of 1.2 to 2.4 percentage points. In addition, policy changes to the Social Security retirement earnings test enacted in 2000 may have further removed financial disincentives to work past normal retirement age. The Senior Citizens Freedom to Work Act eliminated the Social Security earnings test for individuals between the full retirement age and 70 years of age. This amounted to the removal of a tax on earnings in the form of lost Social Security benefits in each quarter worked. Its removal in 2000 would have further increased labor supply of older employees in the years before the actuarially adjustment over these ages fully offset the delay in taking benefits. Gustman and Steinmeier (2009) estimate that these various changes increased full-time employment for those age 65–67 by about 9 percent between 1992 and 2004, and that the changes in the Social Security rules may account for one-sixth of the observed increase in labor force participation for men age 65–67 between 1998 and 2004.¹⁶

Because the participation rates of older age groups were paralleled by those age 55–59, a group that is largely unaffected by changes in Social Security rules, nonpolicy causes are also likely to explain part of the overall participation increase for this older age group.¹⁷ For example, improved health among this population leads to both a greater physical and mental capacity to participate in the labor market, as well as a longer life expectancy, over which older Americans will need to fund living expenses during retirement. At the same time, the changing nature of work makes the physical health of America’s population less relevant for participation; even with no change in average health conditional on age, successive cohorts of Americans will find it more physically possible to continue working at older ages because their occupations are decreasingly dependent on physical work capacity (Maestas and Zissimopoulos 2010). An increasing rate of self-employment and part-time bridge jobs among older workers also gives them the flexibility they desire to gradually consume more leisure as they age while retaining their participation

¹⁶ Song and Manchester (2007) note that the impact of the test’s removal is uneven across the distribution of employees’ earnings. For example, the effect on incomes in lower percentiles is statistically insignificant, while for incomes in the 50th to 80th percentiles, the effect is both large and significant. This indicates that removing the earnings test only has an impact on earnings levels above a certain threshold.

¹⁷ However, two important caveats are in order in this regard. First, to the extent that partners make retirement decisions jointly, Americans age 55–59 may be affected by changes to Social Security through the effects on their partners (Coile 2004). Second, the economic return to working in any given period includes the option value over working in future years, given the State-dependence of labor force status; those who work today are more likely to be employed in the subsequent year. As a result, choices about whether to work at younger ages are not fully independent of changes in policy affecting the return to work at higher ages.

(Karoly and Zissimopoulos 2004; Maestas and Zissimopoulos 2010; Cahill, Giandrea, and Quinn 2013).

Policy Options to Promote Participation among Older Americans

Unlike younger age groups, the labor force participation rates of older age groups have increased substantially in recent decades, with policy changes playing an important role. Nonetheless, continued progress might be made with additional reforms. A combination of increasing the actuarial adjustment in benefits for those who delay taking Social Security benefits past normal retirement age and eliminating the earnings test for this age group effectively raised labor force participation beyond normal Social Security retirement age. While those who postpone retirement between age 62 and normal retirement age do receive an actuarial adjustment that is approximately actuarially fair, they still face an earnings test. The interaction of the earning test with the actuarial adjustment process over this age range is extremely complicated to understand. The test applies to individuals who (1) claim benefits before they reach the normal retirement age, (2) continue to work, and (3) earn above a certain limit. Individuals who meet these criteria face a temporary reduction in monthly benefits. The benefits withheld under the earnings test are deferred, not forfeited, and future payments are adjusted to be actuarially neutral. Additionally, each year after the initial claim for benefits, new income earned by the employee is reflected in a recomputation of the average indexed monthly earnings and a potential increase in the primary insurance amount.

A 2016 report by the Government Accountability Office (GAO 2016) finds widespread confusion about how the earnings test works and what purpose it serves. Survey results show that more than 70 percent of individuals aged 52–70 who were eligible for Social Security benefits incorrectly believe that the reductions in monthly benefits are permanent. These misconceptions likely lead individuals to incorrectly view the earnings test as an incentive to retire or reduce their earnings so they will stay below the test’s threshold. Indeed, the earnings of many claimants cluster around this threshold, suggesting that they believe any additional earnings will be permanently lost. The GAO suggests that more and better information should be provided to individuals to help overcome these misunderstandings. But entirely eliminating the test could be more beneficial to society overall since it would increase labor supply even if it meant more people would take Social Security benefits while doing so. Since the deferred benefits are approximately actuarially fair there should not be much of an effect of eliminating the earnings test on the Social Security Trust Fund.

Additional policy changes beyond Social Security rules might serve to further encourage work at older ages. Clark and Morrill (2017) provide one

policy option: employees who reach the normal retirement age and have sufficient work history could have the option of opting out of continued benefit accrual in the Social Security system. Individuals would receive Social Security (computed through the normal retirement age) and Medicare, but they would not pay further Social Security taxes into the system or receive enhanced benefits from additional work. These employees already paid their “fair share” into the system, and they would continue to receive benefits based on their work history before the normal retirement age. Still, any changes should be weighed against opportunities for tax expenditures to affect employment probabilities of other demographics, as well as the impact of the changes on the solvency of Social Security trust funds.

Other suggested changes could be more difficult to enact. For example, employers could be interested in retaining older employees in more limited work hours by changing their job and reducing their pay, including changes to the hourly rate, given productivity adjustments in part-time work and declining productivity at older ages. But these actions put employers in jeopardy of violating age discrimination laws, and employers could instead opt to encourage full retirement (Clark and Morrill 2017). But new research indicates that older employees who can find suitable work arrangements increasingly want to combine work with leisure at older ages (Ameriks et al. 2017). This suggests that policy nudges that induce employer-based changes to work arrangements could help encourage additional labor force participation among America’s oldest employees.

Labor Force Participation among Teenagers and Young Adults

Examining the labor force participation rates of teenagers and young adults is more nuanced than for older adults. Teens and young adults are at prime human capital-building ages. For some youth and young adults, investments in human capital via formal schooling will provide the greatest long-term return. But for others, and in particular lower-income youth, work experience may be a more valuable form of human capital development. Employment at younger ages has been shown to affect the aspirations of youth and their academic achievement, in addition to reducing their participation in violent or delinquent behavior and providing them with noncognitive skills (Duckworth et al. 2007; Heckman 2008; Lillydahl 1990; Mortimer 2010; Heller 2014; Modestino 2018; Kautz et al. 2014). For these and other reasons, early labor force attachment may serve to heighten longer-term labor market outcomes (Carr, Wright, and Brody 1996; Painter 2010; Ruhm 1997).

Compared with older workers, teens (age 16–19) and young adults (20–24) have exhibited much weaker patterns of participation relative to their participation in 1970, particularly during the past 20 years. As figure 3-15 makes

Figure 3-15. Annual Labor Force Participation Rate for Teens and Young Adults by Sex and Age Group, 1970–2017

Sources: Bureau of Labor Statistics; CEA calculations.

clear, the participation rates of teens and young adults (those age 16–24) rose steadily during the 1970s and remained steady through the 1980s, before experiencing a steady, 20-year decline that abated in 2010. Within this broader age group, the most dramatic declines have occurred for those age 16–19 and are particularly sharp for males; as a result, the rates for males and females in this youngest age bracket have fully converged.

Over the full post-1970 period, the labor force participation rate for young women age 20–24 has risen, although exhibiting a leveling off and a small decline during the past several years. Rates for males in this age range hovered between 84.5 and 86.4 percent from 1973 through 1989, before declining steadily to 74.1 percent in 2017.

The period from 2001 through 2017 represents a particularly sharp change in the labor force participation rates of young adults and, especially, teenagers. This period contains two substantial macroeconomic downturns which likely reduced the labor market attachment of teenagers. For young Americans without access to college, or without plans to attend college, work experience is a vital tool for human capital development, and the decline in labor force participation shown in figure 3-15 also suggests a weakening of those opportunities. But research has also indicated that the decline in participation among young Americans has been driven by noncyclical factors. The decline may reflect a crowding-out from an increased time investment in developing human capital in other ways, including extracurricular activities

(perhaps as a means to boost college application competitiveness) while in high school and increased college-going. In the analysis below, we find that the increased school attendance of teens has offset some, but not all, of the decline in working hours, while young adults appear to have seen no net change in time devoted to work over this period.

A substantial body of literature points to the “idle rate” of teens, in particular, as a way of controlling for school enrollment when examining employment rates (Neumark 1995; Modestino 2013). If members of this age group have reduced their attachment to the formal labor market, but they have simultaneously increased their investment in secondary or postsecondary education (the “crowding-out” effect), then no change in the idle rate would be apparent. And reduced labor force participation that comes with human capital development through schooling might be an optimal outcome from the perspective of lifetime welfare and, ultimately, for economic growth. The literature finds little evidence of an increase in the idle rate of teens; reductions in their employment have for the most part coincided with increases in their school attendance. Figures 3-16 and 3-17 show these changes for teens and young adults, separately, for the period from 2001 to 2016. The figures subdivide the teen and young adult population in each year into those employed, unemployed, not in the labor force but attending school, and a category for “idle” individuals who are neither in school nor participating in the labor force. (Individuals who are employed or unemployed while in school are categorized by their employment status.) As the figures make clear, the idle group has been a relatively constant share of young adults during the past 15 years; the idle rate rose minimally from 11.2 to 11.7 percent between 2001 and 2016. Teens exhibit more evidence of increased idleness; their idle rate in 2016 was 10.2 percent, compared with 8.8 percent 15 years earlier.

However, other data indicate that a relatively constant idle rate for young adults and an uptick in the rate for teens may not provide a complete picture of the time use of these Americans and may give the false impression that teens and young adults have fully replaced time spent working with education activities. One way to see this is to chart the labor force participation rate for this age group, *conditional on school enrollment*. Figure 3-18 provides the participation rates for those enrolled in high school, in college full time, in college part time, and unenrolled. Participation probabilities conditional on enrollment have declined substantially since 2001. The decline in the participation rate among those not enrolled in school, 10.1 percentage points between 2001 and 2016, was smaller than the drop among full-time college students (10.8 percentage points) and smaller than the drop among high school students (16.4 percentage points). Even for individuals in college part time, the fall in participation was 9.0 percentage points.

One possible way of explaining the contradiction between relatively stable “idleness,” as measured in figures 3-16 and 3-17, and a decline in labor

force participation conditional on school enrollment, as shown in figure 3-18, is a rising intensity of education-related activities conditional on enrollment. Although a declining participation rate conditional on enrollment would, *ceteris paribus*, indicate an increase in idle time for teens and young adults, students may be replacing the time they would have otherwise spent doing market work with additional time spent on educational activities conditional on enrollment. If so, teens and young adults have traded one set of human capital-enhancing activities for another.

These possibilities can be explored more fully using the BLS American Time Use Survey (ATUS) to estimate the weekly time spent on specific activities in order to directly capture changes in time allocated to different purposes. The ATUS data are a valuable source for understanding how Americans spend their time, but the data set has some important limitations; the ATUS data were first collected in 2003, and the sample sizes are small. The resulting estimates are therefore somewhat volatile year-to-year, and we combine years of data to achieve higher stability (BLS 2016a, 2016b).

Figure 3-19 details the changes in minutes per day spent on broad activity categories between 2003–5 and 2013–15, separately for teens age 16–19 and those age 20–24. Consistent with the differences by age group apparent in figure 3-13, the reduction in time spent working is far larger for teens than for young adults, who exhibit a slight increase in time spent on work during this period. For teens, the reduction is 16.4 minutes per day over these 10 years.

For those age 20–24, the greater reductions in time use (11.8 minutes per day) came in the “caring for others” category, which includes taking care of family members such as children. This decline is consistent with declining birthrates for females in this age range (Martin et al. 2017).

Both groups experienced declines in time spent on household and leisure activities, and teens, in particular, reduced their time spent on organizational, social, and religious activities. These minutes were replaced primarily with personal care activities, which include sleeping and grooming, and, to a lesser extent, with “other activities” (the set of activities that BLS does not specify elsewhere), eating and drinking, and educational activities. Teens and young adults dedicated an additional 6.6 minutes and 3.7 minutes to educational activities, respectively, over these 10 years.

Thus, between 2003–5 and 2013–15, teens substantially reduced the time they spent working and reallocated about 40 percent of that time to education, while the remainder has been dedicated to activities perhaps less critical for longer-term human capital development. Some caution is warranted here as increased time spent in personal care and other activities may well be productive in ways difficult to discern from the broad categorizations in these data and without knowing more about individual circumstances. During the same period, the population age 20–24 does appear to have made a net time investment in educational activities, even without a reduction in time spent

on work or work-related activities. This gain has been largely at the expense of time spent on leisure and caring for others in the household. The results for all young adults age 20–24, shown in figure 3-19, stand in contrast with those for males age 21–30 who are not enrolled full time in school, as documented by Aguiar and others (2017), who find that leisure time has grown for this subset of the population, and especially for video game playing, a subcategory of leisure time. The ATUS data do not allow for an easy identification of time spent on social media or surfing the Internet.

Policy Options to Promote Participation among Teenagers and Young Adults

Understanding the time use of teenagers and young adults is critical for advancing policy proposals that will encourage this population to become attached to the labor market. Declining work hours that have been replaced with other activities promoting human capital development signify a short-term loss in labor force participation that will lead to longer-term gains in employee productivity and likely reflect net positive trade-offs, both for individuals and the U.S. economy. Such investments should be encouraged. The ATUS data detailed above indicate that young adults are making a net investment in education, even without reducing time spent working. But for teens, where sharper drops in participation since 2001 are apparent, the evidence indicates a rising level of time spent in activities outside of education and work. These patterns are apparent across the distribution of parental income, indicating that labor force attachment is declining among populations where the benefits are likely highest.

An additional policy question is whether to encourage teens to increase their labor force participation or to nudge them to reallocate the recent decline in work hours towards formal schooling instead. But some policy levers may bridge the gap between these two competing options. In particular, vocational and technical education can smooth young people’s transition into the labor force by providing work experiences while they pursue secondary education. Since 1984, the Carl D. Perkins Career and Technical Education Act has been the main Federal program to encourage practical work training among secondary and postsecondary students; 60 percent of the total funding provided under the act goes to high school programs.

Research indicates that hybrid approaches combining formal learning and work experience may be even more valuable for students, although the evidence base is still thin. In particular, apprenticeships and work-based learning among secondary students may provide a strong boost to future labor market outcomes (Neumark and Rothstein 2005; Lerman 2014). In contrast to systems in other countries, the United States has few formal partnerships between secondary institutions and employers to promote apprenticeships

or other work-based learning, although interest in these programs has been growing. Perkins Act funds could be reallocated to develop these relationships, promoting employment for teens both while in high school and upon graduation.

Labor Force Participation among Prime-Age Adults

Finally, we turn to the decline in the labor force participation of prime-age workers, a topic which has already received much empirical attention. The decline in the participation rate for men is apparent in figure 3-20, where the participation rate for each year is again indexed to the rate in 1970. Between 1970 and 2017, participation rates fell almost continuously and were at 91.6 percent of their 1970 level for men age 45–54, 93.6 percent for men age 35–44 and 92.1 percent for men age 25–34.

In 1970, women had not yet completed their full integration into the labor force, and the labor force participation rate for all three of their age groups rose steadily, peaking in 1997 for women age 35–44, in 1999 for women age 25–34, and in 2000 for women 45–54, before commencing a multiyear fall. The declines in participation for women age 35–44 and 45–54 since 2000 have been steeper than for men in these age groups.

The weighted sum of the six age/sex trends shown in figure 3-20 produces the aggregate trend for all prime-aged workers over this period. The increase in the labor force participation of women more than offset the decline in the labor force participation of men from 1970 to approximately 1990 increasing overall labor force participation rates. For the next decade the increased in women's participation approximately offset the decline for men, resulting in constant labor force participation rates. But since then all age/sex labor force participation groups are below their 2000 levels, producing a fall in the prime-age participation rate over the past 17 years.

Because prime-age workers are historically the most productive age group, and the most likely to be employed, much attention has been paid to these patterns, especially regarding the causes of so-called missing men. But despite a large body of literature on this topic, considerable uncertainty remains about the underlying causes for these trends or the extent to which numerous factors have interacted. More important, there is little consensus regarding the policy remedies that could be pursued to abate this participation decline.

In this section, we present a brief review of the literature on the causes of the decline in labor force participation of prime-age workers, and refer readers to two previous CEA white papers related to this topic (CEA 2014, 2016). Our review indicates that the reduction in participation is likely multifactorial, including changes in government policy that have served to undermine labor

Figure 3-20. Annual Labor Force Participation Rate for Prime-Age Workers by Age and Sex, Relative to 1970, 1970–2017

supply, along with shifts in labor demand that have reduced labor market returns for low-skilled workers. The particular employment challenges of military spouses are explained in box 3-4.

Demand-Side Factors

Much attention has been paid to the hypothesis that there has been a fundamental change in the U.S. labor market via a reduction in the demand for workers with fewer years of schooling, resulting in a decline in their labor force participation (Autor and Duggan 2003; Juhn and Potter 2006; Daly, Hobijn, and Kwok 2010). Trade and technology may be partially responsible for this decreased demand in certain occupations, as discussed more fully in chapter 5. The relative contribution of trade and automation or technology to the decline in manufacturing employment is the subject of continued debate, but the net effect has been reduced demand for lower-skilled workers and a widening of the skill and education earnings gaps. The declining demand for less-skilled workers is apparent in lower wages, and several studies cite the decline or stagnation of wages for less-skilled workers as a significant factor in the decline in the labor force participation rate of men (CEA 2016; Juhn, Murphy, and Topel 2002; Blank and Shierholz 2006; Krause and Sawhill 2017; Daly, Hobijn, and Kwok 2010). Fifty years ago, participation rates for prime-age workers with

Box 3-4. Military Spouses in the Labor Market

Spouses of Americans who serve in the military face particular challenges in the labor market. In 2012, more than half of active duty service members were married, representing approximately 725,000 military spouses (GAO 2012). Although some of these spouses live abroad, the vast majority are participants or potential participants in the U.S. labor market; 92 percent are female (U.S. Chamber of Commerce Foundation 2017).

With military service comes frequent geographic relocation, and military families typically move every two to three years. With each move, military spouses become “trailing” spouses, those whose labor market engagement is constrained by the geographic mandates of their military spouse. Trailing spouses must reset their careers in each new location, or find employment which facilitates remote work, and employers may view military spouses as suboptimal hires due to turnover risk, even when these spouses are otherwise attractive job candidates. Alternatively, employers may agree to employ military spouses, but at a lower wage, in reflection of higher turnover expectations.

A survey conducted by the U.S. Chamber of Commerce Foundation indicates that military spouses experience both higher rates of unemployment and lower wages than their nonmilitary peers. In 2017, 16 percent of military spouses in the labor market were unemployed, more than three times the rate for all American labor force participants. Unemployment costs appear to be even higher for younger spouses, and an Institute for Veterans and Military Families report found that 18- to 24-year-old military spouses experienced unemployment rates of 30.3 percent in 2012. Adjustments for demographic characteristics reduce, but do not eliminate, the employment gaps between military spouses and other labor force participants (Lim and Schulker 2010). Evidence from Meadows and others (2016) indicates that military spouses earned substantially less than other labor market participants with similar characteristics.

The Trump Administration has made a priority of supporting those who serve both in and out of uniform. The Department of Defense houses a number of programs charged with facilitating the gainful, rewarding employment of military spouses. Military Spouse Preference provides employment preference for spouses of active duty military members of the U.S. Armed Forces (including the U.S. Coast Guard and full-time Reserve or National Guard) who are relocating to accompany their military sponsor on a Permanent Change of Station move. Relocating military spouses are also eligible for non-competitive appointment to positions within the Department of Defense or other Federal agencies. Military spouses also have access to individual career coaches at no charge; to scholarships that provide eligible junior spouses with up to \$4,000 to be utilized for the pursuit of licenses; to certificates or an associate degree in portable career fields; and the Military Spouse Employment

Partnership, which includes more than 360 companies and businesses that have committed to recruiting, hiring, and retaining military spouses.

Military spouses are more likely than other Americans to find themselves ensnared in this country's patchwork of State-level occupational licensing laws. Occupational licensing refers to mechanisms to impose minimum standards (often educational standards) for entry and the ability to continue working in an occupation. In 2016, 22.3 percent of all employed Americans held a job-related government license, according to the most recent survey from the BLS (2017b). About 35 percent of military spouses in the labor force work in professions that require State licenses or certification, and over 26 percent of military spouses work in healthcare or education, the most licensed industries. Variation in requirements between States raises the cost of cross-State mobility for workers in these occupations, and military spouses are roughly 7 times more likely to move across State lines than civilian spouses are. State-level licensing requirements imply military spouses face relicensing at every interstate move.

Progress is being made on these issues. The State Liaison Office in the Department of Defense works closely with many organizations, including the Council of State Governments, to promote license portability to facilitate the ability of military spouses to gain employment in their new State of residence for those professions that require licensing to practice a profession. The Administration is currently pursuing an Executive Order to strengthen this appointment authority and hold Federal departments and agencies accountable to exercise it to the maximum extent possible.

college degrees and high school degrees or less were similar; but there is now an 11-percentage-point gap in their participation rates.

Although the narrative of declining demand has more frequently been applied to "missing men," it is also consistent with the labor force participation of women starting in the late 1990s. According to the BLS, the female labor force participation rate is higher among those with more education; between 2000 and 2015, the participation rates of women who did not attend college fell by 7.9 percentage points, to 49.1 percent, compared with a decline of 0.6 percentage point, to 82.3 percent, for those with at least a bachelor's degree. Box 3-5 gives more detail on the participation of America's mothers.

Supply-Side Factors

The decline in labor force participation resulting from low-skilled employees dropping out of the workforce in response to falling labor demand is important, but this is an insufficient explanation for the full participation rate decline. Coglianesse (2016) summarizes the contribution of reduced labor demand for men, in particular, finding that about 50 percent of the decline in the male

Box 3-5. Paid Family Leave and the Challenges of Working Families

An increasing number of children in the United States live in households where both parents are employed, according to the BLS. American families often struggle to balance the demands of employment schedules against the time requirements of children, with women, in particular, experiencing dips in labor force participation during prime childbearing years. Between 2014 and 2016, labor force participation rates for young women peaked at age 28, and 74.9 percent of women of that age were in the labor force in those three years. But for women just four years older at the time, participation rates were 2.1 percentage points lower, likely reflecting childbearing; the average age of a first-time American mother is 26 (Martin et al. 2017). Declining rates of participation in those prime childbearing years eventually reverse, and by age 40, when children are older, 75.0 percent of women were labor force participants. The 30s decade employment dip is apparent in data from at least 1994, and the magnitude has remained relatively unchanged over this period. (There is no corresponding dip in male participation.)

Falling labor force participation rates for women in their 30s partially reflect the intense time and care needs of children. Data on child time coverage from the 2012 National Survey of Early Care and Education for 2012 indicate that between 63 and 70 percent of childcare for newborns to 4-year-olds in the United States was provided by parents in that year, with two-parent families and low-income families displaying higher rates of parental time coverage than other groups.

Parental time pressures are particularly acute in the first few weeks and years following a child's birth or adoption, as shown in figure 3-iii. In 2016, the labor force participation rate for women with a child under 6 was more than 10 percentage points lower than the rate for women whose youngest child was between 6 and 17. This latter group of mothers, which includes mothers of all ages, had participation rates remarkably similar to the rate for all prime-age women. The participation rate of women with young children has been remarkably steady since roughly 1997, varying between 62.8 and 64.9 percent for the entire period with the exception of a dip to 61.8 percent in 2004. The labor supply effects of young children for women are not apparent for men. Men with young children (under 6) have higher participation rates than those with a youngest child between 6 and 17, and higher rates than all prime-aged men.

In recognition of the high time costs of young children, the Family Medical Leave Act of 1993 gives American workers the right to 12 weeks of unpaid parental leave, with exceptions for worker tenure, employer size, and highly compensated individuals. The BLS estimates that 88 percent of Americans had access to unpaid family leave in 2016. Paid leave is rarer. Only 15 percent of U.S. workers had access in 2016, and workers in the highest income quartile were nearly four times more likely to have access to paid parental leave than workers in the lowest income quartile (BLS 2017a). For the

Figure 3-iii. Annual Labor Force Participation Rates for Women, by Age of Youngest Child, 1994–2016

Source: Bureau of Labor Statistics.
 Note: Prime-age women (25 to 54) are used as a comparison group. Women with children under 18, however, may not be prime-age.

workers themselves and their children, paid family leave has several benefits, including higher labor force attachment after the first year of a child’s life and higher rates of breastfeeding, which has been shown to be beneficial for child development (Rossin-Slater, Ruhm, and Waldfogel 2013; Huang and Yang 2015). These policies also assist parents in smoothing income over the postnatal weeks; for low-income families, this smoothing may carry benefits for all children in the household (Isaacs, Healy, and Peters 2017). Employers, for their part, must cover the costs of worker pay and benefits over the leave period, as well as perhaps replacing those absent workers, costs which may be easier for larger business to absorb.

The Trump Administration is committed to working with Congress to enact a working family agenda, including policies that would extend paid family leave to more American workers. Such an effort would have multiple benefits, including encouraging the labor force attachment of parents in the years following the birth of a child.

labor force participation rates is accounted for by low-skilled men, but only 20 to 30 percent of this fall is attributed to fewer market opportunities for low-skilled labor. Rather, the same study highlights a rising return to leisure time for nonparticipating men. The next subsections examine possible contributors

to higher returns to leisure, along with other supply-side factors depressing the labor supply among prime-age workers.

Government Transfers

As discussed earlier in this chapter, taxes and government transfers played an important role in sheltering the median person's household equivalized income from losses in market income during and after the Great Recession. The increased generosity of government transfers during economic downturns is an important source of household income smoothing over business cycles—but in the face of diminishing utility from income, government transfers also serve to reduce the incentive to work, and one possible explanation for the fall in labor force participation of prime-age workers is a rise in the value of government transfers available for those who are not in the labor force.

Mulligan (2015) finds evidence of a negative relationship between government tax and transfer programs and aggregate labor supply. Mulligan documents an increase in both earnings and employment taxes since 2007, including the effects of expanded unemployment benefits in 2008 and 2009 and the Affordable Care Act's employer penalty. For example, the level of benefits offered through food stamps (SNAP) were temporarily increased as eligibility requirements were relaxed and legislative changes to the Unemployment Insurance program allowed for an increased duration of benefits and an increase in the overall level of benefits while States were encouraged to adopt broader eligibility requirements. Other social safety net programs, such as Medicaid, also adopted more relaxed eligibility rules and became more generous beginning in 2007. Mulligan (2012) finds that the expanded safety net substantially increased the marginal tax on work, not only because some of these programs required new employer-provided benefits (like the Affordable Care Act) but also because they increased the tradeoff workers faced when transitioning from the social safety net into employment. Mulligan concludes that these expansions caused at least half the drop in hours worked between 2007 and 2009, effects concentrated at the lower end of the skill distribution.

Moffitt (2015) presents a counterpoint to Mulligan's analysis, arguing that the marginal tax rates faced by workers moving from the social safety net to employment in Mulligan's analysis are overestimated and that the actual rates imply much smaller reductions in labor supply as a result. Similarly, Moffitt's review of the literature on the labor supply effects of individual programs suggest much weaker labor supply responses to these changes, although Moffitt acknowledges that these effects are generally estimated outside recession periods.

Notably, other authors have highlighted the success of some transfer programs, including the Earned Income Tax Credit (EITC), in encouraging work among single parents by subsidizing employment (Meyer and Rosenbaum 2001; Eissa and Liebman 1996; Grogger 2003). Still, the program appears

to have served as a disincentive to work for married couples (Eissa and Williamson 2004). In addition, while a study by Barnichon and Figura (2015) on the impact of “welfare-to-work” reforms on low-income women during the 1990s—for example, the EITC’s expansion in 1993 and the introduction of the Temporary Assistance for Needy Families program in 1996 to replace Aid to Families with Dependent Children (AFDC)—finds evidence of increased labor force attachment for some workers following the reforms, they show that these reforms lowered the desire to work for some nonparticipants. This pattern may reflect a bifurcation among previous AFDC recipients: Those who were closer to employment responded to the enhanced work requirements and the EITC by moving into employment; but those previous AFDC recipients who faced higher employment hurdles moved into disability receipt—although the authors do not test for this directly.

There is somewhat more of a consensus about the depressive effects of Social Security Disability Insurance (SSDI) on labor force participation among prime-age workers (Maestas, Mullen, and Strand 2013; Autor and Duggan 2003; Autor et al. 2016; Gokhale 2014; Juhn, Murphy, and Topel 2002; French and Song 2014). The SSDI incidence rate for all age groups, including prime-age men, has increased during the last 50 years, and this increase cannot be fully explained by an aging workforce or other demographic factors. Autor and others (2015) identify two major channels through which SSDI reduces labor force participation rates: benefit receipt and long application times. SSDI applicants are not allowed to work while receiving SSDI benefits or waiting for their application to process. Applicants who are denied benefits endure wait times for the applications and appeals processes averaging 26 months. Upon denial, their return to the labor force is hampered by atrophied human capital and the negative signal to employers of 6 months of unemployment. At the peak of the Great Recession, approximately 2.3 percent of the prime-age population applied for SSDI. Autor and others (2015) estimate that the depressive effects of SSDI on employment range from 3 percent in the short run to 6.5 percent in the long run—*conditional on application*. The depressive effects of SSDI on labor force participation are particularly acute for prime-age workers, and Liebman (2015) estimates that reforms to reduce application waiting time for SSDI could have a benefit-to-cost ratio of 10 to 1.

Physical and Mental Health

Another explanation for the decline in prime-age participation is deteriorating health. A recent survey finds that taking pain medication and, presumably, physical pain, is highly prevalent among prime-age individuals not in the labor force (Krueger 2017). Prescription pain medication is taken regularly by 44 percent of the prime-age men not in the labor force, compared with 20 percent of those employed, and Krueger estimates that 40 percent of those men not participating in the labor force report that the pain they experience prevents

them from obtaining a job for which they would be qualified. For prime-age women, 35 percent of those not in the labor force report taking prescription pain medication, as opposed to 26 percent of those who are employed. These data imply that pain and physical limitations may be a serious barrier to work for both genders.

In addition to physical pain, mental health issues, such as depression and stress, have become increasingly common. Case and Deaton (2015, 2017) find that midlife mortality rates for white, prime-age males are rising, in conjunction with alcoholism, drug addiction, depression, and suicide. The authors do not indicate a direct link between decreased mental health and labor market inactivity; however, it may be beneficial to further explore these trends and possible relationships.

Beyond painkillers, several studies have concluded that the opioid epidemic, in particular, is related to declining prime-age labor force participation, particularly for men (Mericle 2017). Krueger (2017) explores the relationship between prescription opioids and participation rates for prime-age men and women using 2015 county-level opioid prescription rates and county-level labor force data from 1999 to 2001 and 2014 to 2016. He finds that prescription opioid consumption can account for 20 percent of the decline in participation for men and 25 percent of the decline for women. Anecdotally, employers report difficulty finding job candidates who can successfully pass a drug test, but data from employers on this topic are not readily available. According to information from the drug-testing company Quest Diagnostics (2016), between 2011 and 2015, the positivity testing rate for heroin increased 146 percent for the general U.S. workforce. For safety-sensitive employees facing mandatory Federal drug testing, positivity testing for heroin increased 84 percent over this period.

Ultimately, it is unclear to what extent Americans' opioid abuse, or prescription pain medication habits, causes them to exit the labor force (Mericle 2017). It is possible that other characteristics of these drug users drive their lower labor force participation. Moreover, drug abuse leads to other barriers to work, such as atrophied skills and other social issues. As a result, any estimate of the number of Americans who are absent from the labor force due to drug addiction is not the same as an estimate of the number of Americans who might find work if the illicit drug epidemic were to be fully curtailed. The follow-on effects of abuse would remain as barriers to labor force entry. That said, a curtailment of the illicit drug problem would reduce the flow of individuals into addiction, alleviating the long-term drag on labor force participation even if short-run effects persist.

Geographic Immobility

High levels of unemployment concentrated in particular locations may amplify exit from the labor force, especially when workers are unwilling or unable to

move to a location with a stronger job market. People move to improve their life circumstances, but the share of Americans moving has been declining, and is currently at its lowest value on record (figure 3-21).

In addition to family and social connections, deterrents to moving include (1) search time, (2) State-specific occupational licensing requirements, (3) local land use regulations that raise housing costs in places with the greatest potential growth, and (4) homeowners' limited ability to sell their homes. Such obstacles to finding better employment opportunities, coupled with high local unemployment rates, may lead employees to ultimately exit the workforce. More research is needed to determine the direct relationship between geographic immobility and labor force participation, specifically exploring whether obstacles to moving have increased over time, and how prime-age workers in particular have been affected.

Emerging technologies and investments that allow workers to access job opportunities without geographic relocation—including expanded access to broadband technology, telecommuting, Internet-based employment, and falling commuting times—may make geographic immobility less relevant for labor force participation.

Alternative Uses of Time

Another consideration for the decline in labor force participation, particularly for men, is that people may be choosing to spend more of their time outside the workforce, perhaps substituting their spouse's income for their own. Juhn and Potter (2006) find that this is an unlikely scenario to explain the labor force participation changes for prime-age men. Data on time spent doing housework show that these increases for men have been relatively small, while labor force losses are greater for single men or men whose wives are not employed. For example, participation declined nearly 5 percentage points from 1969 to 2004 for single men and 7.7 percentage points for men with nonworking wives. Conversely, men with working wives only experienced a drop of 3.4 percentage points during the same period.

Policy Options to Promote Participation among Prime-Age Workers

Given the myriad explanations for the decline in labor force participation for prime-age workers, there is no ready consensus on the policies most likely to affect change. But five main options are likely to garner more consensus than others.

First, the decline in demand for workers with fewer years of schooling should be met with a concerted effort to aid workers in their retraining efforts and to increase demand for these workers. Boosts to infrastructure spending would shore up demand for workers without college degrees and would likely

Figure 3-21. Share of U.S. Residents Who Moved during the Past Year, 1947–2016

Percentage of U.S. residents

Sources: U.S. Census Bureau; Current Population Survey.

Note: The one-year geographic mobility question was not asked between 1972 through 1975 and 1977 to 1980, so the value is interpolated.

result in higher wages for workers in the skilled trades, encouraging more entry into these occupations. The Administration's focus on apprenticeships is one method to help bridge the gap between the skills needed by expanded infrastructure activity and the skills of today's unemployed and labor force nonparticipants. Ensuring government financial support can be used for short-term retraining programs (programs that do not lead to a two- or four-year degree) may be another way to facilitate the re-entry of workers into employment. Given weak performance evaluations of Workforce Investment Act programs in recent years, however, demonstrated effectiveness of particular programs and institutions should be a precursor to receive further Federal support.

Second, the geographic immobility of workers is a conundrum with no easy solution. Encouraging internal migration is one possible tactic; but there has been little research on how the Federal government might do so. In addition, encouraging internal migration is likely to exacerbate the struggles of distressed communities. Indeed, the low proclivity of Americans to migrate points to the need for local economic development and labor market connectedness without relying on workers to change their residence. Place-specific private investment incentives, such as those proposed by Bernstein and Hassett (2015), would resolve issues of geographically concentrated labor force nonparticipation without requiring migration. The newly passed Tax Cuts and Jobs Act (TCJA) is a positive step in this direction. The TCJA allows would-be

for-profit investors to defer capital gains recognition, and the associated tax, from the sale of an appreciated asset if they invest the gains in Opportunity Zones located in “low-income community” census tracts. State governors have 90 days after the enactment of TCJA to designate their State’s Opportunity Zones. Similarly, well-designed infrastructure investments that enable workers to connect with jobs without moving would likely facilitate the reentry of some workers to the labor force.

Third, curbing the opioid crisis is of critical importance for ensuring a stable or growing employment rate among prime-age workers, and curtailing the supply of these substances would reduce addiction rates among Americans. Even with a curtailment of the illicit drug flow into the United States, individuals who are currently out of the labor force because of opioid addiction may struggle to reenter without additional investments in skill upgrading. Still, progress on the opioid addiction front might stem the tide of workers into nonparticipation and, over time, prop up the participation rate.

Fourth, there is likely a substantial opportunity to modify government transfers to more directly encourage, rather than discourage, work. One example of this is SSDI. Maestas, Mullen, and Strand (2013) show that SSDI applicants with similar profiles but whose applications are rejected by a “tough” evaluator are significantly more like to return to the labor force than are those whose applications are accepted by an “easy” evaluator, and who thus go onto the SSDI rolls. European countries have long since recognized that movement onto their long-term disability rolls should be a last resort, and thus have substantially reduced their disability beneficiary rates using “work first” reforms. Such reforms have raised eligibility standards and have increased the liability of employers for the disability insurance uptake of their former workers. These reforms have been successfully implemented, especially in Germany and the Netherlands, where the combination of tighter eligibility requirements and cost sharing with private employers has resulted in lower disability insurance uptake (Burkhauser and Daly 2011; Burkhauser, Daly, and Ziebarth 2016).

Fifth and finally, policies that encourage business formation and capital spending could, if successful, drive up the demand for labor and wages and increase labor force participation (CEA 2017). These policies are discussed in chapter 1.

Conclusion

Headline annual economic growth in real GDP and per capita real GDP during the current business cycle has been the slowest of all post–World War II business cycles. This unprecedentedly slow recovery, especially for middle-class labor incomes, is perhaps the primary economic problem facing our Nation. A marked increase in net government transfers offset to some degree the decline

in the median American's household income. But without substantial increases in economic growth, this level of redistribution is unlikely to be sustainable.

Clearly, the best possible outcome is for labor incomes to return to normal levels of growth. Public policies, as discussed in other chapters, have focused on increasing economic growth—and with it, increasing labor demand. We have argued in this chapter that policies to increase aggregate supply are also necessary to set the United States on a path of higher employment growth. Although demographic factors can account for part of the decline in overall labor force participation rates, they cannot account for it all, and we have shown that demography need not be destiny. Accordingly, a combination of policies and economic conditions that raise labor force participation rates can materially affect overall economic growth. As a simple benchmark, a return of the prime-age participation rate to the rate apparent in 2007 (still well below the rate apparent in 2000) would return about 1.7 million U.S. workers to the labor force over 10 years and raise the overall participation rate by 0.065 percentage point a year, resulting in an increase of 0.1 percentage point a year in the rate of GDP growth.

Because past public policies are responsible for some of the drag on employment growth, changes in these policies can be important ways to get workers off the sidelines and again fully participating in our economy and enjoying its benefits. A coordinated effort encouraging people to do this could significantly reinforce the positive effects of labor demand policies.

Appendix

As discussed in footnote 8 above, our results for income are not sensitive to the choice of price deflator. Here, the PCE chain price index is used in figure 3-22 in lieu of the CPI-U-RS in figure 3-5. The main conclusions from figure 3-5 are not affected under this alternative measure, despite the fact that the PCE index is a chain-type index while the CPI is Laspeyres index, which systematically overstates inflation and therefore would understate real income growth.

Figure 3-22. Alternative Measures of Trends in Real Median Income, Deflated Using PCE Chain Price Index, 1979–2016

Sources: National Bureau of Economic Research (NBER); Elwell and Burkhauser (2017); Bureau of Labor Statistics (BLS), Current Population Survey; BLS, Consumer Price Index; Bureau of Economic Analysis, National Income and Product Accounts; CEA calculations.

Note: Shading denotes NBER business cycle. CEA collapsed the double-dip recessions of 1953:Q2–1957:Q3 and 1957:Q3–1960:Q2, as well as 1980:Q1–1980:Q3 and 1981:Q3–1982:Q4, into single peak-trough-peak periods of the late 1950s and 1980s, respectively. Annual data are linearly interpolated. The six measures of nominal median income are deflated using the PCE Chain Price Index.

Chapter 4

Infrastructure Investment to Boost Productivity

Concerns about the state of our Nation’s infrastructure have become commonplace. We systematically face excess demand, quality degradation, and congestion when using our public assets—as, for example, on many of our urban roads and highways. Without price signals to guide the users and suppliers of our Nation’s infrastructure, we use our existing assets inefficiently, fail to properly maintain them, and do not invest to add needed capacity. Furthermore, complex, overlapping, and sometimes contradictory rules and regulations deter and delay investors from adding to or improving existing capacity.

The central infrastructure problem facing policymakers is how to resolve this mismatch between the demand for and supply of public sector capital, both by using our existing assets more efficiently and by adjusting long-run capacity to efficient levels. Allowing prices to have a larger role in guiding consumption and investment decisions will be key to achieving the positive growth and productivity effects that infrastructure assets can provide. We estimate that a 10-year, \$1.5 trillion infrastructure investment initiative could add between 0.1 and 0.2 percentage point to average annual real growth in gross domestic product under a range of assumptions regarding productivity, timing, and other factors.

To achieve growth at the higher end of this range, we suggest four key actions for policymakers to consider. First, the Federal regulatory structure must be streamlined and improved—while ensuring the achievement of health, safety, and environmental outcomes. Conflicting, unduly complex, and uncoordinated rules and regulations can impede investments in—and significantly delay—the delivery of needed infrastructure, an especially salient issue in the energy and

telecommunications sectors, as discussed in this chapter. Addressing these issues will take time but will generate significant public benefits, and several recent Federal actions have begun this process, including President Trump's August 15, 2017, Executive Order to reduce unnecessary delays and barriers to infrastructure investment.

Second, additional resources can be secured for infrastructure investment, turning to some combination of user charges, specific taxes, or general tax revenues. Although public resources are important, this chapter emphasizes the role of user fees based on marginal costs. Such user charges—which typically are set by States and local governments and are collected from those who directly benefit from publicly provided roads, water facilities, and other types of infrastructure—will encourage efficiency in use, provide signals from consumers and to suppliers about the value of future investments, and generate revenues. In the case of roads and highways, for example, fuel taxes have historically acted as imperfect user fees, but conventional funding models are now under pressure from rising fuel efficiency and the use of electric vehicles, and congestion costs are high and rising in many urban areas. Innovations such as user fees for vehicle miles traveled—as are being piloted in Oregon, for example—and highway tolls that vary with congestion can increase efficiency and raise needed revenues to pay for infrastructure improvements and additions to capacity.

Third, the Federal government can support the use of innovative financing options such as public-private partnerships that will more efficiently utilize the total capital available from the public and private sectors and lower its cost. Well-designed financial contracts, compared with conventional procurement methods, can result in lower project costs, shorter deadlines, higher-quality services, and decreased life-cycle costs of provision.

Fourth and finally, policymakers at all levels of government can improve project selection and investment allocations to ensure that the highest-value projects are chosen and funded. Expanding the role of competitive grant programs, such

as the Department of Transportation’s Infrastructure for Rebuilding America grant program, can increase the productivity impact of any given infrastructure investment. Further, giving State and/or local governments more flexibility in project choice can help ensure that local projects are aligned with local needs and preferences, and encouraging the use of cost/benefit analysis to inform project selection can also increase the efficiency of infrastructure investments. On balance—with appropriate regulatory policies and infrastructure funding, along with financing provisions, in place—the United States can look forward to a productive and prosperous 21st century.

Our Nation has been rightfully proud of its infrastructure—the roads, bridges, waterways, energy facilities, telecommunications networks, and other physical and technological underpinnings that make possible our economic activity, trade, and commerce, both domestically and abroad. However, recent decades have seen sustained growth in the demand for infrastructure services that has not been met with corresponding growth in and maintenance of their supply—so concerns about overuse, congestion, and poor service have become common. The supply of infrastructure has failed to keep up with increases in demand in part because much access to infrastructure is underpriced or, in many instances, provided free of charge to users, which systematically has led to excess demand, overuse, and congestion—as, for example, on many of our urban roads and highways.

In the private sector, congestion and excess demand for goods and services typically cause prices to rise, signaling to consumers that they should curtail their consumption, while these same high prices signal producers about the value of investing and expanding production. However, in the public sector, which funds and often directly provides much of the Nation’s infrastructure, investment and allocation decisions are made by tens of thousands of distinct governmental entities based on little or no price information; hence, they have inadequate information about the expected benefits and costs of proposed investments and allocations. Without price signals to guide the users and suppliers of our Nation’s roads, highways, waterways, and other infrastructure, we rely on inefficient, nonprice rationing of our existing assets; do not properly maintain existing assets or invest to add needed capacity; and instead often experience rising levels of congestion, delay, and quality degradation. Furthermore, complex, overlapping, and sometimes contradictory rules and regulations deter and delay investors from making capacity additions or improvements, exacerbating the imbalance between the demand and supply of infrastructure.

The central infrastructure problem facing policymakers is how to resolve this mismatch between the demand for and supply of public sector capital, both by using our existing assets more efficiently and by adjusting long-run capacity to efficient levels, a challenge made even more complicated by the fragmented roles of the Federal, State, and local levels of government, and private sectors. In many cases, this will mean expanding or relocating capacity to meet demand. However, in some cases, the opposite will be true: Infrastructure supply can exceed demand, either overall or regionally, and the challenge will be to reduce capacity to efficient levels while ensuring that all Americans have access to the 21st-century infrastructure services they deserve.

In this chapter, we propose features of a more efficiently financed capacity expansion of the infrastructure for the U.S. economy. We consider not only “core” assets—such as roads, bridges, railways, transit systems, and water and wastewater facilities—but also telecommunications and power sector assets. Allowing prices to have a larger role in guiding consumption and investment decisions will be key to achieving the positive growth effects that additional infrastructure assets can provide. We estimate that a 10-year, \$1.5 trillion infrastructure investment initiative could add between 0.1 and 0.2 percentage point to average annual real growth in gross domestic product (GDP), under a range of assumptions regarding productivity, timing, and other factors.

To achieve growth at the high end of this range, we suggest four key actions for policymakers to consider. First, the Federal government can take the lead in streamlining, developing, and updating the regulatory environment to pursue appropriate health, safety, and environmental goals without hindering innovation, especially in forward-looking technologies. As explored further below, regulatory impediments and barriers have figured prominently in the energy and communications sectors, and addressing these constraints will have a positive impact on productivity and growth.

Second, additional resources can be secured for infrastructure investment, turning to some combination of user charges, specific taxes, or general tax revenues. Although Federal resources are important, States and localities actually fund most of the Nation’s core infrastructure. Thus, increased funding support throughout our governments will be essential, in addition to attracting private sector capital in sectors where most assets are privately owned, such as telecommunications and energy. Additional general tax revenues at the Federal, State, and/or local government levels may be appropriate, especially for infrastructure facilities that provide benefits beyond the borders of the investing jurisdiction, but this chapter emphasizes the role of marginal cost-based user fees. Such user charges—which typically are set by States and local governments and are collected from those who directly benefit from publicly provided roads, water facilities, and other infrastructure—will encourage efficiency in use, provide signals to consumers and suppliers about the value of future investments, and generate revenues. Developing and incentivizing the

use of value capture programs would also increase available funding resources, as parties experiencing capital gains (e.g., increased property values) would be taxed to help pay for the costs of the infrastructure investment responsible for these gains.

Third, the Federal government can support the use of innovative financing options such as public-private partnerships that will more efficiently utilize the total capital available from the public and private sectors and promote more efficient infrastructure delivery. Well-designed partnerships can improve incentives to lower project costs, meet deadlines, provide high-quality services, and minimize life-cycle costs of provision compared with conventional procurement methods.

Fourth and finally, policymakers at all levels of government can improve project selection and investment allocations to ensure that the highest valued projects are chosen and funded. Using tools such as cost/benefit analysis can increase overall efficiency, because directing limited investment funds to their most valued uses will make any given infrastructure investment that much more productive. Further, maintaining project selection at the State and/or local government levels can help ensure that projects with limited spillover effects are aligned with local needs and preferences.

We also note that enhanced infrastructure spending may have implications for America's workers to the extent that labor demand rises in infrastructure construction and design occupations and related fields. Although it is difficult to predict the net employment impact of increased infrastructure investment, a demand shift toward these occupations may benefit workers in those fields. The current stock of infrastructure workers in the labor force is disproportionately drawn from the population with a high school degree or less, indicating that enhanced labor demand would disproportionately benefit those with fewer years of formal education, precisely the segment of the population where there is the most excess supply. The Federal government can minimize any remaining labor constraints by easing occupational licensing requirements for infrastructure workers on federally funded projects and by enhancing the retraining options for workers interested in transitions into these occupations.

The chapter proceeds as follows. The first section documents the status quo and the demand and supply imbalances in America's infrastructure, and the second section discusses the economic evidence for the value of increasing public sector capital. The third section considers the roles of Federal, State, and local governments in undertaking the needed capacity expansions or enhancements, with an emphasis on funding resources and financing arrangements. The fourth section examines particular aspects of the value of additional or enhanced capacity in the energy and telecommunications sectors and the inland waterways system. The fifth section concludes.

U.S. Infrastructure’s Growing Problem of Excess Demand

Although the Nation’s transportation network, water facilities, communications sector, and energy infrastructure are the envy of many, studies and media reports increasingly point to problems with congestion, service quality degradation, insufficient funding, fairness and affordability, and the lack of coordinated, forward-looking infrastructure management in the public sector (e.g., Rosenthal, Fitzsimmons, and LaForgia 2017; Gregory et al. 2017; Blakemore 2016). The American Society of Civil Engineers (2017) gave the Nation a grade of D+ in its most recent infrastructure report card, little changed from previous years, putting a \$4.6 trillion price tag on the needed upgrading of public assets across many sectors, including surface transportation, aviation, water utilities and water resource management, and energy. Though specific conditions vary across sectors and regions of the country, recent overall assessments have identified key infrastructure deficits with real consequences for U.S. consumers and businesses. For example, between 1980 and 2016, vehicle miles traveled in the United States more than doubled, while public road mileage and lane miles rose by only 7 and 10 percent, respectively (figure 4-1).

Unsurprisingly, queuing caused by traffic congestion has risen, imposing both direct and indirect costs on business and leisure travelers alike. The national average annual congestion delay per auto commuter reached 42 hours in 2014, according to the Texas A&M Transportation Institute (TTI 2015). TTI’s travel time index reached an all-time high value of 1.22 in 2014, meaning that a trip that would take 30 minutes without congestion (“free flow” conditions) takes 22 percent longer—between 36 and 37 minutes—when roads are congested. Once the value of extra travel time and wasted fuel costs are taken into account, TTI estimates that total congestion costs were \$160 billion in 2014, equivalent to 0.9 percent of GDP that year (figure 4-2). Left unaddressed, these estimated congestion costs would total over \$1.4 trillion over 10 years’ time.

Average highway congestion increased across the country, and congestion has worsened far more in some cities than it has in others. Table 4-1 indicates not only that the auto-commuter-weighted average hours of delay per auto commuter in the Nation’s 101 largest cities rose from 33 hours in 1990 to 52 hours in 2014, but also that the range across cities widened considerably during this period, from 61 to 76 hours.

Aside from roads and highways, congestion and service quality problems on our waterways are also evident. Average delays at locks along the inland waterways system have crept up, from under 1 hour per tow in 2009 to nearly 2.5 hours in 2016 (figure 4-3), despite a 9.2 percent decline in the number of vessels served during this period. Similarly, the share of vessels experiencing a delay has risen from a low of 34 percent during the Great Recession to a 2016

Note: A yearly sum of all the per-trip delays for those persons who travel in the peak period (6 to 10 a.m. and 3 to 7 p.m.). The developed area (i.e., with a population density of more than 1,000 persons per square mile) within a metropolitan region. The urban area boundaries change frequently (every year for most growing areas), so increases include both new growth and development that was previously in areas designated as rural.

high of 48 percent (USACE 2017a). Such delays can be costly; the American Society of Civil Engineers estimated annual delay costs of \$33 billion along the system in 2010; even if delays had not increased since then, that annual cost corresponds to a nearly \$300 billion cost over 10 years’ time.

Infrastructure needs in the water and wastewater sector are also considerable. The U.S. Environmental Protection Agency (EPA) estimates that \$655 billion will be needed over the next twenty years to upgrade and replace infrastructure in the water and wastewater sectors, comprised of \$271 billion for wastewater collection and treatment facilities and \$384 billion for drinking water facilities. Concerns include water loss from water main breaks, raw sewage discharges into local water supplies, and overall water quality. For example, the EPA estimates the annual cost of water main breaks to be \$2.6 billion, implying over \$20 billion in costs over 10 years’ time. More detailed needs assessments at the regional or local level confirm similar needs but also reflect significant heterogeneity, because some water and wastewater utilities face far greater challenges than that of others, especially in larger cities with declining populations (GAO 2016).

How Increasing the Supply of Infrastructure Supports Economic Growth

The value of adequate public infrastructure in terms of both quantity and quality comes from its role in strengthening the economy’s growth prospects. Increases in public capital intensity (public capital stock per worker) can affect productivity and growth through multiple channels. More generally, without sufficient, high-quality infrastructure allocated efficiently across sectors—and indeed, across the country—economic growth will be constrained. The simple, back-of-the-envelope estimates of 10-year costs from delays and quality problems discussed briefly above—\$1.4 trillion congestion costs on our roads, nearly \$300 billion from delays on our inland waterways systems, over \$20 billion lost from water main breaks—point to the value to users of improved

Figure 4-3. Inland Waterways System Lock Delays, 1993–2016

Source: U.S. Army Corps of Engineers, Public Lock Usage Report.

infrastructure in terms of its quantity, quality, and allocation. In general, the gross benefits of these improvements include any revenues users are willing to pay for the improvements as well as any consumer surplus they experience, recognizing that some of the benefits also accrue to nonusers. Assessing these ex ante benefits is relatively straightforward for a specific asset or project, but for the economy as whole, economists often lack direct welfare measures and instead consider the relationship between infrastructure and productivity or output. This section reviews recent trends in infrastructure investment spending and capital accumulation and summarizes the evidence for the links between infrastructure, economic growth, and productivity.

Recent Trends

Two key ideas emerge from a review of recent data. The first is that infrastructure investment spending, as a share of the economy, has remained fairly steady in recent decades; and the second is that States and local governments are more important than the Federal government with respect to the funding, ownership, and management of core infrastructure assets. The Congressional Budget Office (CBO 2015) reports that public spending on transportation and water infrastructure has averaged about 2.4 percent of GDP since the 1980s, with a temporary increase in 2009 and 2010 due to additional spending under the American Recovery and Reinvestment Act (figure 4-4). In 2016, nominal government fixed, nondefense investment spending was 2.5 percent

Figure 4-4. Public Spending on Transportation and Water Infrastructure, 1956–2014

Percentage of GDP

Sources: Congressional Budget Office; Bureau of Economic Analysis; Census Bureau; Office of Management and Budget.

Table 4-2. Average Public Nondefense Investment as a Percentage of Nominal GDP, 1980–2016

Time period	Federal nondefense	State and local	Total
1980–90	0.89	2.06	2.95
1990–2000	0.82	2.13	2.96
2000–2010	0.72	2.34	3.06
2010–16	0.72	2.02	2.74

Sources: Bureau of Economic Analysis; CEA calculations.

of nominal GDP, with the structures component accounting for 1.5 percent of nominal GDP.

Table 4-2 shows that average nominal nondefense public investment as a share of nominal GDP has averaged 2.74 percent since 2010, with States and local governments accounting for nearly three times as much spending as the Federal government. In fact, most of the Nation’s nondefense public infrastructure is owned by States and local governments; for every \$1 in non-defense capital stock owned by the Federal government, States and localities own more than \$6 worth of public infrastructure.

Economists typically model the role of public sector capital in the economy by treating it as one factor of production, alongside labor, private capital, and natural resources. Increased stocks of public sector capital mean increased flows of capital services available to the economy’s workers, fueling growth

Figure 4-5. Contribution of Public Capital Stock to Productivity Growth, 1947–2016

Sources: Bureau of Economic Analysis; CEA calculations.

through at least two channels. First, by raising the productivity of other factors of production—labor, private capital, and land—increased public capital services encourage firms to increase their own investments and expand economic activity. This indirect, or “crowding in,” effect has been identified in numerous studies (e.g., Aschauer 1989; Abiad, Furceri, and Topalova 2016). A second, direct effect works through increases in public capital services per employee hour, or public capital deepening, which typically accounts for between 0.05 and 0.20 percentage point of growth in labor productivity—not nearly as large as the impact of private sector capital accumulation, but nonetheless important.¹ Since 2007, public capital deepening has accounted for 0.15 percentage point of the 1.2 percent growth in labor productivity (figure 4-5).

¹ Recall that labor productivity growth comes from growth in capital deepening, or the amount of private capital services per labor input; growth in the skills of workers—often called a labor composition effect—and increased overall efficiency, calculated as a residual and called total factor productivity. Historically, in the United States, capital deepening has driven a significant share of labor productivity growth, though with a marked slowdown in the post–Great Recession period. From 1953 to 2010, capital deepening accounted for more than 0.9 percentage point of that era’s 2.2 percent labor productivity growth, but actually detracted from productivity growth from 2010 to 2015.

Evidence for the Growth Effects of Public Capital

The likely returns to prospective increases in public investment and capital stocks depend on many factors—including the responsiveness of output to increases in public capital, the economy’s initial level of capital intensity, depreciation rates, how quickly assets can be installed and brought into productive service, and even how the investments are financed.

Although the evidence discussed here is based on traditional types of infrastructure assets, it is important to note that technological innovation and change will also affect the value of specific infrastructure investments. Transformative and potentially disruptive technologies, such as those used for autonomous vehicles and unmanned aviation systems (or drones), may alter the future use of existing infrastructure, the organization of business activity, and even residential density and location patterns. Adapting the regulatory environment to remove barriers to investment and innovation in these technologies will be key to generating the greatest possible future benefits from their use, and recent regulatory actions move in that direction. In 2016, the U.S. Federal Aviation Administration issued operational rules (Part 107 of 14 the *Code of Federal Regulations*), providing a basic regulatory structure for drones. In addition, a Presidential memorandum issued on October 25, 2017, establishes a three-year pilot program to facilitate the integration of drones into the national airspace and permit more advanced operations of unmanned aviation systems that go beyond the limits set by Part 107, including flying beyond the visual line of sight of the operator and flying over people. The program is intended to facilitate coordination of and collaboration between regulatory authorities, a key step in adjusting regulation to limit barriers to private investment in this sector. Another example comes from autonomous vehicles and related technologies, which may affect future use of roads, highways, and public transit assets and have the potential to improve safety, decrease traffic congestion, and raise productivity (box 4-1). In this sector, too, regulators face challenges in adjusting to the new technology without discouraging innovation. To that end, the U.S. Department of Transportation issued guidelines in September 2017 regarding automated driving systems, establishing principles regarding safety, technological change, and technical issues of deployment. The guidelines are intended to assist Federal, State, and local regulatory authorities as well as industry and consumer stakeholders in maximizing the future benefits of the new technologies.

Turning now to conventional approaches to exploring the relationship between public sector capital, productivity, and output, we note that the CBO (2016b) estimated that a \$1 increase in public capital generated an output increase of about 8 percent, somewhat lower than other recent estimates (CEA 2016; Bom and Ligthart 2014). Our current preferred estimate puts the corresponding return at just under 13 percent, which is further explained below.

Box 4-1. Autonomous Vehicles: A 21st-Century Innovation

Autonomous vehicles provide a flexible and hands-free commute during which people can engage in activities apart from driving such as office work or entertainment. A key attraction of these vehicles is their ability to potentially reduce congestion in highways. This is because driverless vehicles would be able to drive much closer to other vehicles in a safe manner, and be able to accelerate and decelerate more quickly. And these vehicles would have the potential to prevent collisions and reduce regular and incident delays by creating a smoother traffic flow.

The widespread adoption of driverless cars in the U.S. can increase economic growth. Winston and Karpilov (2017) estimate that autonomous vehicles would spur growth in the U.S. by reducing congestion. They focus their analysis on California, which is home to 11 of the top 16 highway bottlenecks in the Nation, and then extrapolate their results to other areas of the Nation. They find that highway congestion had adverse effects on the GDP growth rate, wages, and commodity freight flows in California. Their findings corroborate similar results that congestion in the Nation's West Coast ports from 2014 to 2015 led to a 0.2-percentage-point decline in GDP (Amiti et al. 2015), and that highway congestion is associated with slower job growth in U.S. metropolitan areas (Sweet 2014; Angel and Blei 2015). Automobile commuting in congested conditions may also damage physical and emotional health (Fottrell 2015; Knittel, Miller, and Sanders 2016). The benefits of autonomous vehicles depend on market penetration. In a given year, a 50 percent penetration rate (i.e., half the vehicles in the U.S. would be driverless), could add more than \$200 billion to GDP, 2.4 million jobs, and \$90 billion in wages to the U.S. labor force.

These potential sizable macroeconomic effects of advances in transportation technology are not surprising in light of the historical evidence on the positive benefits to the U.S. of improvements in mobility. Krugman (2009) elaborates on how railroads, by reducing transportation costs, facilitated large-scale production and radically transformed the U.S. economy into differentiated agriculture and manufacturing hubs. Similarly, given their potential to reduce congestion and increase safety, autonomous vehicles are an exciting area of ongoing scientific research.

Calculating the marginal return to public capital requires an estimate of the elasticity of output with respect to public capital, which has been the subject of hundreds of studies since the late 1980s. Aschauer (1989) estimated a U.S. elasticity of about 0.4, suggesting that public sector capital accumulation was historically a key factor driving economic growth. More recent studies have confirmed the finding of a robust qualitative and positive relationship between infrastructure, output, and growth, though with considerable variation across geographies, time periods, and specific infrastructure assets studied. However,

most recent studies conclude that this elasticity is well below Aschauer's earlier estimates.

Bom and Ligthart (2014)'s meta-analysis of 68 studies covering the 1983–2008 period yields a short-run elasticity estimate of 0.083 and long-run estimate of 0.122. When restricting their analysis to studies focused on core infrastructure (transportation, water, and sewer facilities), the authors report slightly higher elasticities of 0.131 and 0.170 in the short and long run, respectively, highlighting the point that not all infrastructure is created equal. The authors also report evidence that output elasticities have declined over time, because studies using more recent data find smaller output elasticities. Another recent meta-analysis by Nunez-Serrano and Velazquez (2017) finds 0.13 and 0.16 for short- and long-run elasticities, respectively, somewhat larger than Bom and Ligthart's baseline results. However, Nunez-Serrano and Velazquez do not include more recent studies in their analysis, so their estimates may not reflect recent declines in the elasticity estimates found by Bom and Ligthart.

The CBO (2016b) assumes an elasticity of output with respect to public capital of 0.06, but this is likely to be too low in the present context, in which we consider increased investment in core infrastructure, exactly the asset types associated with higher elasticities (Bom and Ligthart 2014). Given a ratio of public capital to output of about 0.75, the CBO (2016b) estimates that the marginal return to public capital will be about 8 percent ($0.06/0.75$). However, using Bom and Ligthart's average elasticity estimate of 0.106 and an adjusted capital-output ratio that excludes Federal defense capital assets (0.645 in 2016), we estimate the return to be more than 16 percent. In fact, even Bom and Ligthart's lower short-run elasticity estimate for centrally provided public capital (0.083) still yields a return on public sector capital of 12.9 percent, well above the CBO's estimate of 8 percent. Below, we use 12.9 percent as our preferred estimate.

With these data in mind, we can assess the output consequences for a given increase in public sector capital. A marginal return of 12.9 percent suggests that \$100 billion in new public capital stock, when fully installed and productive, would raise output by \$12.9 billion, or just under 0.1 percent, each year it was in use; note that this \$100 billion in new infrastructure stock would generate decreasing annual returns each year as it depreciates. This supply-side channel for infrastructure investment can be used to estimate the impact of a longer-term, debt-financed program of \$1.5 trillion in infrastructure investment spending over 10 years' time. The CEA's analysis of several different models indicates that these supply-side effects alone would cumulatively add 0.2 to 0.4 percent to the level of GDP over 10 years, depending on the marginal return to public capital.

However, as the CBO (2016b) notes, several factors may cause actual output effects to be smaller than predicted. For example, delays in spending

additional funds, constructing infrastructure assets, or bringing those assets into productive service will decrease expected returns. Permitting and regulatory delays can also affect returns from infrastructure investments. To address such concerns, on August 15, 2017, President Trump issued Executive Order 13807, “Establishing Discipline and Accountability in the Environmental Review and Permitting Process for Infrastructure,” which pertains to projects in the transportation, water and wastewater, energy, and telecommunications sectors. This Executive Order aims to reduce unnecessary delays and barriers to infrastructure investment; and it outlines a number of steps to streamline regulatory and environmental review processes, establish meaningful deadlines for reviews and related permitting decisions, and clarify the roles of different governmental bodies.

Another potentially important factor affecting the output impact of an infrastructure investment program is the response of States and local governments to an infusion of additional Federal funds for infrastructure investment. Such an increase could lead to reductions in resources provided by States and local governments if Federal money serves to crowd out nonfederal support. The CBO estimates this crowding-out effect at about one-third; applying this value would lower the CEA’s predicted impact of a federally funded increase in infrastructure accordingly. Empirical evidence for the sign and size of this crowding-out effect has been mixed. For example, Knight’s (2002) study of the Federal Highway Aid program found nearly complete crowding out; under Knight’s preferred estimates, States and localities cut back by \$0.93 for every additional \$1 provided in Federal highway grants during the 1983–97 period. At a marginal return of 12.9 percent, this implies that a \$10 billion increase in Federal highway funding would ultimately yield only a \$0.09 billion impact on GDP. Although the exact magnitude of this crowding-out effect is uncertain, Federal policymakers may wish to set maintenance-of-effort provisions as a condition for receipt of certain Federal funds, to limit States’ ability to curtail nonfederal support in response to an infusion of Federal funds.

Other effects of increased infrastructure investment. Increased infrastructure investment can also have other important economic effects. Embarking on an ambitious infrastructure program may create improved employment opportunities for some U.S. workers (box 4-2). In addition, such a program could generate meaningful short-run effects that may vary cyclically. In the short run, deficit-financed additional infrastructure spending affects GDP in the year in which the spending occurs, generating direct and possibly indirect (“multiplied”) effects on GDP. Depending on the timing, the extent of possible crowding out—or, conversely, multiplier effects—and the marginal product of public capital, the CEA estimates that the 10-year, \$1.5 trillion infrastructure investment program discussed above would add an average of 0.1 to 0.2 percentage point to annual growth in real GDP. If investment is front-loaded, there is no crowding out, the fiscal multiplier is consistent with Zandi (2012), and the

Box 4-2. Labor Market Effects of Increased Infrastructure Investment

In addition to raising U.S. productivity and competitiveness, a boost to infrastructure spending may increase demand for the workers needed to build and construct these new public assets. Although it is difficult to predict the net employment impact of increased infrastructure investment, a demand shift to selected occupations may benefit workers in those fields. We term the set of 31 occupations that are most likely to experience an increase in demand “infrastructure occupations”; these occupations account for more than 1 percent of employment in at least one infrastructure-related industry’s total private wage and salary employment (as defined in the note to figure 4-i). These occupations include workers who design and carry out infrastructure projects, including engineers, pipefitters, construction laborers, and the like. But it also includes transportation and warehousing occupations, along with workers in installation, maintenance, and repair occupations.

Workers in these occupations are far more likely to have a high school degree or less than the overall U.S. labor force as shown in figure 4-i. The unemployment rate for workers is strongly correlated with educational attainment, and even in the current economic expansion, workers with fewer years of education are disproportionately likely to find themselves unemployed. As of December 2017, workers with a high school degree or less

Figure 4-i. Educational Attainment of Infrastructure versus Noninfrastructure Labor Force Participants, 2017

Sources: Current Population Survey; CEA calculations.

Note: The 4-digit North American Industry Classification System (NAICS) codes, defined as infrastructure industries, include civil engineering construction (all sectors falling under NAICS 3-digit code 237000); other specialty trade contractors (NAICS code 238900); and remediation and other waste management services (NAICS code 562900). Infrastructure occupations are those that make up at least 1 percent of employment in one of these 4-digit sectors.

had an unemployment rate 2.6 percentage points higher than those with a bachelor's degree—4.7 and 2.1 percent, respectively. Our estimates of the unemployment rate for workers who report an infrastructure occupation indicates an even greater disparity; in the Current Population Survey, 6.1 percent of labor force participants who report an infrastructure occupation reported being unemployed in 2017, reflecting an excess supply of nearly 350,000 infrastructure workers relative to the unemployment rate for workers in noninfrastructure occupations.

Despite this excess supply, the geographic footprint and skill needs of expanded infrastructure investments are unlikely to perfectly match those of currently unemployed infrastructure workers, and the Federal government could take an active role in easing the transition of workers into infrastructure employment. One impediment to the free movement of skilled workers into new infrastructure jobs is the country's patchwork set of occupational licensing requirements, which depress the movement of licensed workers across State lines (Johnson and Kleiner 2017). In 2016, 22.2 percent of all labor force participants reporting an infrastructure occupation in the Current Population Survey said they had an active professional license or certification; this is slightly fewer than the average for all participants (24.4 percent) but substantially more than would be expected—given the education distribution across infrastructure occupations, because the probability of occupational licensing increases with educational attainment. Tying infrastructure funds to the loosening of occupational licensing (or to reciprocal agreements between States) could help alleviate the depressive effects of these licenses on geographic mobility. This topic is discussed in greater detail in chapter 2.

Furthermore, the Federal government has additional tools to ensure a skilled workforce for expanded infrastructure activity. One clear disconnect between the needs of the labor market and the supply of America's workforce is the current subsidization of higher education through Pell Grants. These grants, which are generally only available to students without a bachelor's degree and who are enrolled in programs with more than 600 clock hours of instruction over 15 weeks, do not provide support to workers who require shorter-term investments. Workforce Innovation and Opportunity Act funds could be used for these short-term programs, but funds from this program are not dedicated to this purpose and are therefore subject to competing priorities. Although it would require Congressional approval, expanding Pell Grant eligibility to include investments in short-term training (or retraining) programs would help ensure that financial constraints do not prevent workers from pursuing infrastructure occupations.

marginal product of capital is as reported in the 2016 *Economic Report of the President*, we expect the average annual contribution to be at the upper end of this range. With crowding out, no multiplier, and assuming the CBO's estimate

of the marginal product of capital, we expect the contribution to growth to instead be closer to 0.1.

In general, the sign and magnitude of these “fiscal multipliers” remains a topic of active research, and recent evidence suggests that spending multipliers exceed zero, meaning that the net impact of additional government spending is positive (Auerbach and Gorodnichenko 2012; Ramey and Zubairy 2017). Auerbach and Gorodnichenko find that these multipliers are larger during recessions, while Ramey and Zubairy find no evidence that multipliers are higher during periods of slack. Abiad, Furceri, and Topalova (2016) and the International Monetary Fund (2014) find that increased infrastructure spending in particular during recessions can raise GDP through demand-side multiplier relationships. In fact, even a study of the Great Depression found that an additional \$1 in public works and relief spending per capita between 1933 and 1939 was associated with a 44 cent increase in retail sales in 1939 (Fishback, Horrace, and Kantor 2005)! These short-run demand-side effects of increased infrastructure investment are not unimportant, but infrastructure’s long-run effects on productivity and growth may be better guides to policymakers about the effects of future investment programs and policies.

Funding and Financing Needed Infrastructure

Both around the world and in the United States, governmental resources provide and support infrastructure investment to promote both efficiency and equity goals. On the efficiency front, the public goods nature of some infrastructure assets will lead the private sector to underproduce such assets relative to socially desirable levels. These goods are generally characterized by some degree of *nonexcludability*, meaning that it is difficult or very costly to exclude nonpayers from consuming the good; of *nonrivalry*, meaning that one person’s consumption does not hinder the ability of others to also consume it; or both. For example, flood control services provided by a system of dams, levees, and reservoirs may provide benefits to a wide geographic area. In this instance, excluding nonpayers from experiencing the benefits would be difficult, and the benefits experienced by one local resident do not impair the ability of other residents to experience benefits as well.

Infrastructure assets may also have other characteristics that lead to inefficient resource allocations under market provision. For example, many assets pertaining to transit, water and sewer utilities, water resource management, energy, and communications are characterized by increasing returns to scale, with high fixed costs and sometimes quite low marginal costs. In these situations, efficiency concerns suggest that the best industry configuration will include one or only a few suppliers. In some cases, these providers may have market power and can price at well above marginal cost, in opposition to efficiency goals; in other cases, these providers may price below marginal

cost, making cost recovery and efficiency goals hard to reach. Historically, in these types of situations, government officials have turned to government-run monopolies or regulated utilities to meet efficiency, equity, and revenue goals.

Other sources of market failure may also be present. Some infrastructure assets provide services that generate agglomeration effects, whereby efficiency gains arise from the spatial concentrations of firms and workers—because more efficient labor markets, better matching between firms and workers, and a quicker dissemination of ideas and best practices all increase productivity. Evidence suggests that such economies are present in the transportation, communications, and power sectors. Network effects also characterize infrastructure in transportation and communications, because the value of the network rises as other users join and more nodes and segments are added. A robust transportation network also makes it easier for workers and firms to locate near each other; thicker markets mean better matches between firms and workers, increasing efficiency. Again, these effects can mean that private actors lack the incentives to invest to the desired fully efficient level, motivating the public sector to offer support and/or invest. Given these considerations, the rest of this section describes the fiscal roles currently played by Federal, State, and local governments and explores issues in funding and financing infrastructure investment.

Fiscal Roles for Federal, State, and Local Governments

In the United States, infrastructure investment, operations, and maintenance responsibilities are shared across the Federal, State, and local public sectors, and in some cases, by private sector entities. The CBO (2015) reported that combined Federal, State, and local public spending on transportation and water and wastewater infrastructure was \$416 billion in 2014, with the Federal government accounting for 23 percent of the total, and State and local governments for the remaining 77 percent. The allocation of responsibility varied sharply, depending on the category of infrastructure assets. For example, the Federal government funded 28 percent of total highways spending, 23 percent of mass transit and rail spending, and only 4 percent of water utilities spending. Within sectors, Federal support also varies and typically focuses more on capital spending, not spending for operations and maintenance (figure 4-6).

Funding Infrastructure Investment

Given the desire to maintain, upgrade, and expand infrastructure investments in various sectors of the economy, policymakers must consider the best ways of funding these investments. Resources generally come from one of two principal sources: tax revenues or user charges (user fees). In this subsection, we discuss and analyze funding options available to policymakers at different levels of government, with a special focus on the role of user fees for use of

Figure 4-6. Public Spending on Mass Transit, Highways, and Water Infrastructure, 2014

 Note: O&M represents operations and maintenance.

selected infrastructure services, including roads and highways, transit, and water and wastewater services.

General tax revenues are often used to support projects and investments that provide benefits widely or are somewhat nonrivalrous or nonexcludable. Specific or dedicated tax revenues are also commonly used by Federal, State, and local governments—sometimes reflecting a goal of linking those who use the services to the funds collected to pay for them. Governments also rely on direct fees and charges paid by users and beneficiaries of a particular service. The economic incidence of these fees—that is, who actually pays them in the form of higher prices paid by consumers or lower net prices received by suppliers—varies by service, and the revenues collected can be considerable.

A distinct but related revenue source may sometimes also be appropriate. For example, a new transit project (e.g., a new or rehabilitated station along a rapid transit line) may increase economic activity and/or raise property values in the areas near the project. Using “value capture” techniques, such as tax increment financing (TIF), can enable the public sector to access some of the value generated by the public investment, making more revenues available to support the project (Chapman 2017).

User fees in theory. Setting and collecting user fees to fund infrastructure investments helps the government achieve two key goals: ensuring efficiency in the use of public assets, and collecting revenues to defray the costs of providing these assets. If users of the service experience a significant private

benefit from doing so, efficiency gains can be significant when user fees are set correctly. As discussed earlier in the chapter, underpriced access to public infrastructure will generate excess demand for use, leading to congestion and inefficient allocations. Without price signals to guide supply and consumption decisions, the public sector struggles to determine how much infrastructure to build and how it should be allocated.

The rationale for imposing user fees is especially strong when the services in question provide significant private benefits relative to the overall public benefits generated by use of the asset. For example, a shipper that sends barges full of grain through locks along the Mississippi River obtains private benefits from using the Nation's inland waterway system. Similarly, an airline that uses gate facilities at a particular airport and accesses the Nation's air-traffic control system is also receiving a private benefit. In these instances, user fees should be a significant part of the funding structure, though not necessarily the only revenue source. Note that though some user fees paid by businesses will eventually be paid by consumers in the form of higher prices, firms using public sector assets will recognize these charges as costs of doing business, thus encouraging efficient choices of production and allocation.

Setting specific fee structures to achieve multiple policy goals can be difficult, and trade-offs between goals are likely. Attaining efficiency goals usually means setting unit prices at the marginal cost of provision, but in sectors with high fixed costs (e.g., water and wastewater, and transit), the revenues generated may not be enough to cover fixed costs. Setting unit prices at average cost can improve revenue generation, but comes at the expense of decreased efficiency, as some users cut back consumption at the margin. Turning to "two-part" tariffs can help achieve efficiency and revenue goals though may raise affordability concerns. Under a two-part tariff, the customer is charged a fixed fee that does not vary with use and a unit price per unit consumed. Essentially, the fixed fee allows service providers to collect the revenues they need to defray their fixed costs, and the unit price acts as a signal to consumers, who will consume up to the point where their benefits and costs are balanced at the margin, contributing to efficiency.

There are many examples of this two-part tariff approach. Water utility customers pay a monthly connection charge, in addition to charges based on monthly water use; and in the power sector, electricity users pay monthly fees along with charges that vary with electricity use. Service providers may use increasing block tariffs, charging low unit prices for low ("lifeline") levels of consumption and higher unit prices for higher consumption levels, a structure that can preserve access for consumers with a low ability to pay. Alternatively, decreasing block tariffs offer a reverse approach, with unit pricing that falls as consumption levels rise; this structure allows offering quantity discounts, which are common in industrial settings. Simple unit pricing includes a constant per-unit charge for all levels of consumption.

In funding for roads and highways, State and local governments already rely on an informal two-part tariff system of quasi-user fees to raise funds to partially cover capital and operating expenses. For example, annual vehicle registration fees and driver's license fees can be viewed as fixed components that do not vary with road use, while gasoline taxes, tolls, and other charges are somewhat connected to usage levels, acting at the margin to affect drivers' choices about consumption.

User fees for roads and highways. With the increasing prevalence of electric vehicles and high fuel economy vehicles, and with some fuel-based revenue sources not being indexed to inflation, the existing financing mechanism is becoming increasingly unsustainable, with funding needs growing faster than dedicated revenues. Here, we explore current funding practices and alternatives, considering the efficiency, equity, and revenue effects of these choices.

At present, the Federal, State, and local governments rely heavily on dedicated fuel taxes and general taxes to pay for roads and highways, with a much smaller role played by direct user fees, such as tolls. Toll revenue collected by State and local governments in fiscal year (FY) 2015 was \$14.0 billion, accounting for 6.0 percent of total spending on roads and highways, a share that has crept up only slightly since 1993 (DOT 1993, IV-6; 2015, table HF-10), when the Federal gasoline tax, currently 18.4 cents per gallon, was last increased. Although the administrative costs of toll systems are significant, at between 8 and 13 percent of receipts (Kirk 2017, 7), the economic arguments in favor of using toll revenues to pay for roads and highways are solid. By collecting fees from the direct users of the assets (motorists, commercial carriers, et al.), governments acquire revenues needed to maintain, operate, rehabilitate, and expand the roads, and drivers use the roads up to the point at which their marginal benefits equal the marginal costs they impose when driving.

Federal gasoline and diesel taxes have some characteristics of user fees because the individuals and businesses that buy fuel for vehicles and drive on public roads and highways pay them. However, these taxes are imperfect because they fail to encourage efficient use of existing roadways and to signal the value of any potential additional capacity. Highly fuel-efficient vehicles (including electric vehicles) pay less than the marginal costs generated by their use of roads in terms of wear and tear, congestion, and other external costs. More generally, these taxes do not reflect the crowding or congestion costs generated by drivers. That is, driving 100 miles on low-use rural roads generates the same fuel tax revenues as driving that same distance on high-use urban roads—during rush hour. Furthermore, evidence suggests that heavy trucks in particular do not currently face taxes and charges that are aligned with the negative externalities they generate, which include pavement damage, traffic congestion, accident risk, and emissions. Even excluding emissions, these external costs are significant, with estimates ranging from 2.01 to 4.14

cents per ton-mile, which is equivalent to between 10 and 20 percent of the average price per ton-mile to ship by truck (Austin 2015).

More generally, because fuel taxes do not reflect congestion costs imposed by drivers, scarce road access is not allocated efficiently. Implementing congestion pricing would encourage only consumers with high valuations to use highly congested roads during peak demand times, improving efficiency but also potentially making some drivers worse off, particularly low-income drivers who may be priced out of the tolled lanes (CBO 2009). Using toll revenues to improve other travel options, particularly transit, can counteract this distributional effect, but most discussions of congestion pricing acknowledge its potential to create both winners and losers from the policy. Even so, the lack of appropriate congestion pricing mechanisms creates winners and losers as well, and some evidence suggests that at least some low-income drivers in practice find tolled lanes worth paying for (Federal Highway Administration, n.d.). Furthermore, Hall (2015) shows that congestion pricing can be Pareto-improving, not just potentially Pareto-improving, especially under conditions of bottleneck congestion, which occurs when the number of vehicles that can use the road per unit of time (its “throughput”) decreases. An example of bottleneck congestion is when traffic backs up at an exit ramp, slowing down through traffic on the roadway. Tolling a portion of the highway’s lanes (value pricing) serves to internalize both motorist travel time externalities as well as these bottleneck effects, raising speeds on both the tolled and nontolled highway segments. When drivers differ in terms of income and valuations of their time, partial time-varying tolls will raise welfare for drivers along both the tolled and nontolled segments as long as high-income drivers use the highway during rush hour. Under the policy, drivers “sort” into the road segments and are better off, even before accounting for how toll revenues are spent.

The recent introduction of dynamic tolling along Interstate 66 in Northern Virginia offers an example of how congestion pricing can improve travel times and raise revenues for transportation projects. Preliminary figures from the Virginia Department of Transportation indicate that morning rush-hour tolls averaged between \$8.20 and \$12.87 for the 10-mile segment but that peak tolls reached \$40.00 for a short time. Further, travel speeds in the tolled lanes were far higher than during a comparable period a year earlier, and travel speed in the nontolled lanes as well as parallel roadways were similar or improved.

In addition to falling short on efficiency grounds, fuel taxes have seen diminished revenue productivity in recent years, as the twin factors of inflation and increased fuel efficiency have sharply curtailed the growth of the Highway Trust Fund’s real fuel tax receipts. The Federal gasoline tax of 18.4 cents per gallon has not been raised since 1993, while construction prices have risen at a 3.9 percent annualized rate. Figure 4-7 shows that in 2016 real Federal fuel tax receipts were only 93 percent of their 1993 levels, even as nominal receipts more than doubled over that period.

These fuel tax revenues have failed to grow as quickly as appropriations for highway spending, putting pressure on the Federal Highway Trust Fund (HTF) used to finance highway and transit projects. As figure 4-8 shows, outlays from the HTF's Highway Account have regularly exceeded revenues since 2008, and the CBO (2017) projects that, absent any changes, the Highway Account's balance will fall below zero by 2021. Because, by law, the HTF cannot incur negative balances, Congress has authorized multiple transfers from general funds to shore up the HTF; the most recent one was in 2016, when \$70 billion was transferred—\$52 billion to the Highway Account and \$18 billion to the Mass Transit Account.

States, too, rely heavily on excise and sales taxes on fuels, with similar revenue pressures arising from inflation and increased fuel efficiency of vehicles. According to Quinton (2017), 26 States have increased their fuel taxes in the last four years to raise more transportation revenues for their roads and highways.

The declining revenue productivity of existing gasoline taxes has led policymakers to consider other options for funding highways. One innovative approach is to consider supplementing or replacing fuel taxes altogether with a user fee more closely related to a consumer's use of the system—such as, in the present context, a tax on vehicle miles traveled. Assessing a charge based on mileage instead of gasoline consumed would link consumers' choices more closely to the costs they impose, including congestion, emission, pavement damage, and so on. Such charges could also be structured to vary with the time of day, region of use, and other factors, including vehicle weight, which has a large impact on pavement wear-and-tear (Sorensen, Ecola, and Wachs 2012; TRB 2012; Kirk and Levinson 2016). Although the design and implementation of such taxes has many challenges, VMT taxes can raise needed revenues in a sustainable way while providing the right signals regarding the value of consumption and supply, helping public officials to understand the value of current uses of roads and highways and to plan for the future.

In the context of freight and commercial shipping, Austin (2015) estimated that a VMT tax on commercial trucks would decrease external costs by \$2.1 billion and raise \$43.0 billion in tax revenues; including vehicle weight as a factor in the tax and raising diesel taxes in tandem would achieve similar efficiencies but generate revenues of nearly \$70 billion annually (in 2014 dollars). Another recent study (Langer, Maheshri, and Winston 2017) finds greater efficiency benefits from a gasoline-tax equivalent VMT tax when the VMT tax is higher in urban areas than in rural areas, reflecting differences in external costs across regions. The intuition here is twofold. First, because the evidence suggests that congestion, accidents, and environmental externalities are higher in urban areas than in rural areas, the differentiated VMT tax gives urban drivers a stronger incentive to cut back on miles driven, improving efficiency. Second, as vehicles' fuel efficiency rises, the VMT tax does a better job than the gasoline

Box 4-3. Oregon’s Tax on Vehicle Miles Traveled

Oregon has long been a pioneer when it comes to transportation funding. Oregon was the first State to levy an excise tax on gasoline, setting a tax of 1 cent per gallon in 1919. More recently, Oregon has devoted considerable time and effort to exploring options to replace its excise taxes on fuel to fund its roads and highways. Its OReGO program, which started on July 1, 2015, charges volunteer participants a mileage fee of 1.7 cents per mile for travel on public roads inside the State and provides rebates or credits for State fuel taxes paid. Though small, the program offers tangible evidence that a tax on vehicle miles traveled (VMT) is a promising alternative to relying on fuel taxes (Oregon Department of Transportation 2017).

Motivation and recent history. Like other States throughout the country, Oregon has seen the revenue productivity of its motor fuel taxes diminish as the fuel efficiency of vehicles has improved; also, its State excise tax on gasoline, like that in most States, is not indexed to inflation. Figure 4-ii shows that since 1993, nominal motor fuels sales tax revenues have risen by 65.8 percent, but in inflation-adjusted terms, revenues have fallen by more than 30 percent during this period.

In recent years, the State has moved more aggressively than some others to increase its tax rates to make up for revenue shortfalls. Its excise tax on gasoline of 24 cents per gallon in 1993 was raised to 30 cents per gallon in 2011; and legislation passed in 2017 will increase the excise tax by 4 cents per

Figure 4-ii. Oregon Fuel Tax Revenues, 1993–2016

Index (1993 = 100)

Sources: U.S. Census Bureau; Bureau of Economic Analysis; CEA calculations.

gallon in 2018, with additional increases planned through 2024. Furthermore, the State has continued its exploration of using taxes on VMT to supplement and perhaps in the future replace the excise taxes now in place. In fact, the Oregon Department of Transportation (2017) estimated that continued reliance on motor fuel tax revenues over the next 10 years would lead to a \$340 million revenue shortfall relative to what could be raised by a “road usage charge” or a tax on VMT.

Pilot programs. In 2001, Oregon established the Road User Fee Task Force (RUFTF) to examine alternative revenue sources to fund construction, repair, operations, and maintenance of Oregon’s roads. The task force established criteria that a new revenue source or structure should meet, including the “user pays” principle discussed above. Revenue adequacy, system transparency, and enforceability were also important. Ultimately, the RUFTF recommended to the State legislature that Oregon develop and test mileage-based fees (i.e., road usage charges, RUCs) for this purpose, and the State created and ran its first pilot project in 2006. For 12 months beginning in 2006, 285 volunteers used on-board equipment to measure mileage traveled inside identified zones and to transmit data to fuel pumping systems where participants bought fuel. No specific location data were collected or transmitted, so only the general zone and accumulated mileage were recorded and used to determine fees. The fee was collected at the point of sale, as the current gasoline tax was collected, and participants received immediate credit for fuel taxes paid.

After concluding the program and reviewing its performance, the RUFTF began to develop a second pilot program, which ran from November 2012 to March 2013. The goals of the second pilot included using an open architecture, ensuring better and more flexible use of technologies then and in the future, giving motorists choices about how mileage was reported, and including private sector vendors as part of the administrative structure. Most important, however, the RUFTF also wished to provide motorists with the option of avoiding the usage of global positioning system-enabled devices if they desired, allowing users more control over their private information and data.

After concluding these two pilot programs, officials developed the small, voluntary OReGO program, which currently operates in the State. Initially, volunteer drivers were charged 1.5 cents per mile traveled on the State’s public roads, receiving credits/refunds for fuel taxes paid and for miles driven on nonpublic roads or out-of-State roads. For a car with fuel efficiency of 20 miles to the gallon, the charge amounted to 30 cents per gallon, the then-current State excise tax. As of January 1, 2018, the road user charge rose to 1.7 cents per mile, aligned with an increase in the State’s gasoline tax from 30 to 34 cents per gallon. The program enrolled 1,307 vehicles between June 1, 2015, and December 31, 2016, though only 669 vehicles remained active as of December 31, 2016. Note that the program restricts the number

of participating vehicles with low fuel efficiency (below 17 miles per gallon), whose drivers would be likely to pay less under a VMT than under a regular gasoline tax.

Lessons learned and future plans. Oregon officials have a program that allows consumer choice, is based on an open technological platform, and is administratively feasible. The program is small, however, and it is unclear how a scaled-up program would affect revenue generation, efficiency, and equity. McMullen and others' (2016) prospective analysis of a close-to-revenue neutral RUC found that the RUC was less regressive than the gasoline tax—and that restricting the RUC payment option to owners of new cars or high-fuel-efficiency vehicles would make the RUC even less regressive. McMullen and others also found that the effects of moving from the gasoline tax to the RUC varied across regions of the State; areas with drivers who drove more miles on average tended to fare worse under the RUC than under the gasoline tax. Although OReGo is not yet ready to bear the full burden of funding Oregon's road expenditures, it has given policymakers some real experiences on which to base future policy and program decisions.

tax in giving all drivers the right incentives about their use of the roads. In terms of distribution, Langer, Maheshri, and Winston (2017) find that the differentiated VMT tax imposes the largest welfare losses on high-income drivers compared with low-income drivers, because high-income drivers are more likely to live in urban areas (and are more likely to drive highly fuel efficient vehicles), mitigating concerns about the equity effects of VMT taxes.

Thus far, the actual U.S. experience with VMT taxes and other alternatives to gasoline and diesel fuel taxes has been limited. Concerns about privacy risks and administrative and implementation costs have hindered program development, despite technological advances that have made it easier to record, report, share, and manage the information that is needed to administer such taxes. Oregon has been a pioneer in this space, having conducted two pilot programs for VMT taxes on motorists and established an ongoing, small-scale program called OReGO (box 4-3). California, too, facing significant funding shortfalls for its roads and highways, has experimented with VMT taxes, testing a program with simulated, though not actual, road use charges of 1.8 cents per mile for volunteer drivers (California Department of Transportation 2017).

A few States—including Kentucky, New Mexico, New York, and Oregon—do impose alternative taxes on heavy vehicles, via weight-distance or ton-mile taxes. These taxes depend on distance traveled as well as vehicle weight. For example, Kentucky's "Weight Distance License" system imposes a tax of \$0.0285 per mile traveled on the State's roadways for all carriers with a combined license weight 60,000 pounds or more (TRB 2012); this tax generated \$79.1 million for the State in FY 2015, about 5.2 percent of all Road Fund

revenues that year. Thus, a truck weighing 30 tons would face a tax of 2.85 cents per mile, far less than Austin's (2015) estimates of unpriced external damages per ton-mile—at 3 cents per ton-mile, about the midpoint of Austin's estimates excluding emissions damages, a 30-ton vehicle would face a charge of 90 cents per mile.

Distance-based road user charges are more common in other countries, most of which levy such taxes only on freight traffic, not individual drivers. For instance, in 2001 Switzerland—motivated by concerns regarding traffic, wear and tear on roadways, and emissions—established a distance-based charge system for heavy commercial vehicles. Under this system, heavy vehicles pay fees for travel on all Swiss roads based on distance traveled, permissible total weight, and emission category, and the charges are substantial; in 2001, a 34-metric-ton truck (almost 75,000 pounds) faced charges ranging from \$0.90 to \$1.27 per mile, depending on the emission category. Luechinger and Roth (2016) estimate that the introduction of the tax decreased truck traffic in Switzerland by between 4 and 6 percent, with some evidence suggesting a corresponding mode shift to rail. Direct estimates on external effects were mixed, with evidence suggesting significant declines in nitrous oxide emissions but no impact on accidents. Kirk and Levinson (2016) report that the administration costs of this fee system are between 5 and 6 percent of total receipts, which compares favorably with the costs of toll collections.

Germany also taxes heavy commercial trucks using its main highways. The charges, called *LKW-Maut*, vary only with distance, not weight, but are assessed and collected in real time using a complex system of on-board units, global positioning system technology, web payment portals, and payment kiosks at gas stations and highway rest stops (Kirk and Levinson 2016). Some empirical evidence suggests that the introduction of the charge in 2005 was followed by improved efficiency, as shippers adjusted by routing fewer empty trucks and by loading trucks up to their maximum allowable weight. Doll and others (2017, 33) report that the costs of running the charging system were 12.4 percent of its revenues in 2015.

User fees for transit. Public transit sector ridership and fare revenues have come under increasing pressure from the entry and expansion of ride-sharing services, low gasoline prices, and other factors. Transit services are primarily provided by local governments and agencies, but funding comes from all levels of government, and public subsidies are significant. Direct user fees, primarily in the form of farebox revenues, do not cover total operating expenses, let alone contribute to covering capital costs. Passengers are typically charged fares far below the true marginal operating cost of providing service, leading to inefficiency in the form of congestion, overuse, and queueing as well as revenue shortfalls. In 2016, passenger fares covered 32.0 percent of operating expenses, with the next largest shares coming from localities (31.6 percent) and States (24.4 percent). Federal support was modest, at 7.2 percent of

operating expenses. Capital expenditures, however, receive significant Federal funding, which covers 40.7 percent of capital expenditures; passenger fares and other revenues directly generated by transit agencies themselves cover only 11.7 percent of all capital expenditures. In a few cases, new transit projects have been funded with value capture (e.g., TIF) funds; for example, the Chicago Transit Authority plans to combine Federal grant funds with TIF revenues as the primary funding sources for its Red–Purple Line Modernization project, with the TIF revenues directed toward repaying debt issued to finance the project. Other value capture examples are described in the EPA’s (2013b) study of several recent large-scale, transit-oriented development projects across the country.

Overall, the sector faces significant challenges, facing long-deferred maintenance needs, changing transit use patterns, and continued reliance on public subsidies. Raising passenger fares significantly, especially for expensive rail service, would improve both efficiency and cost-recovery but, in principle, present affordability problems for some low-income users. In practice, many transit riders are not low-income, so equity concerns regarding fare increases may be overstated. For example, the American Public Transportation Association (APTA 2016) reports that high-income households (those with incomes of \$100,000 or more) make up 12 percent of all bus users but 29 percent of all rail users.

At least one transit agency has implemented ORCA LIFT, an income-based transit fare system. The program was introduced in March 2015 in Seattle, and it now operates in both the city (via King County Metro Transit) and the wider metropolitan area (via Sound Transit), charging reduced fares to adults with household incomes below 200 percent of the relevant Federal poverty threshold. Because previous evidence suggested that low-income riders were more likely to ride in off-peak hours, officials had few concerns about increasing peak hour congestion. In effect, these reduced fares offered a way to engage in peak-load pricing, which can increase revenues and improve allocative efficiency. Overall, Sound Transit (2016) reports that passengers paying ORCA LIFT fares accounted for 1.4 percent of system fare revenues and 2.8 percent of all boardings, with an average fare paid of \$1.00 (table 4-3). In contrast, reduced fare passengers, who qualify based on categorical measures (age, disability status, etc.), accounted for 2.3 percent of revenues but 6.4 percent of boardings, paying an average fare of \$0.70 per trip. Pursuit of equity objectives costs revenues, as the average fares paid indicate.

The biggest risks and opportunities facing the transit sector, however, likely come from the rapid technological change and disruptive entry of new transportation services and providers in cities across the country. The introduction of autonomous vehicles and “smart” road and highway infrastructure will surely influence transit use and patterns in the years ahead, and the entry and expansion of ride-sharing services presents another challenge. Transit use

Table 4-3. Sound Transit Fare Revenues and Boardings, 2016

Aspect	Ticket fare category				Total
	Adult	Youth	Reduced fare	Low income	
Revenues (\$)	75,251,549	2,268,649	1,877,999	1,162,107	80,560,304
Boardings	36,230,074	1,825,594	2,682,736	1,165,727	41,904,131
Revenue per boarding (average, \$)	2.08	1.24	0.70	1.00	1.92
Percentage of revenues (%)	93.4	2.8	2.3	1.4	100.0
Percentage of boardings (%)	86.5	4.4	6.4	2.8	100.0

Note: Figures represent sums over three principal transit programs: ST Express, Sounder, and Link.

and farebox revenues are under pressure in many cities. The Federal Transit Administration (FTA 2017) reports that 2016 transit ridership was 10.2 billion unlinked passenger trips, down 3.7 percent from its peak in 2014, and ridership in the first 10 months of 2017 was down 2.5 percent from that same period in 2016. At the same time, some local agencies report far larger declines in ridership and revenues. Some observers have argued that the entry and expansion of ride-sharing services by firms such as Uber, Lyft, and others are to blame.

More generally, the entry of these firms has had wide-ranging welfare and transit effects across the country. Some evidence suggests that the services provided by Uber, Lyft, and other firms have made consumers better off with the introduction of more affordable and reliable transportation options, especially in traditionally underserved areas of cities (Hall, Palsson, and Price 2017), and at least one city, Boston, has piloted a paratransit program with Uber and Lyft. In principle, ride-share services could complement transit's fixed-route, fixed-schedule service by extending its reach and flexibility, making transit more attractive and increasing ridership. On the other hand, these services could directly substitute for transit trips, as consumers can enjoy taxi-like service at reduced prices. Systematic evidence to date is limited, but Hall, Palsson, and Price 2017 find that Uber's entry into metropolitan statistical areas (MSAs) across the country does not have a statistically significant impact on transit ridership. However, over time, as Uber's presence grows, transit ridership slowly increases, suggesting that Uber acts as a complement, not substitute, for transit service. However, these effects differ by size of the MSA and transit agency: Uber reduces transit ridership in smaller MSAs, where transit's inflexibility makes Uber an attractive substitute, but Uber increases ridership in larger MSAs, where its ability to extend the transit system's reach makes it a good complement to transit. The researchers also find that smaller

transit agencies, especially those in large cities, saw increased ridership after Uber's entry. For larger transit systems, Uber's impact was to decrease transit use by an estimated 2 percent.

Ultimately, Uber's overall effects on welfare will include multiple effects on consumer surplus, transit use and farebox revenues, congestion and safety, and public officials will need to monitor and respond to these technologically driven forces. Further, States and localities may need to adjust their tax and regulatory regimes to insure that all users of public roads and transportation infrastructure pay for congestion costs generated, including ride-sharing companies (Povich 2017). Chicago, Portland, and Seattle are among the cities who have already begun regulating and taxing ride-sharing services, which should aid in internalizing congestion effects as well as providing revenues for transit system improvements.

User fees for water, wastewater, and storm water utilities. Although customers of water and wastewater utilities are accustomed to paying for the services they receive, user fees and charges have often fallen short of raising adequate revenues and/or giving customers the right incentives regarding their consumption levels (Stratton et al. 2017). The sector is characterized by high fixed costs, and pricing structures typically rely heavily on volumetric charges. Without significant fixed monthly customer charges in place, providers often cannot earn enough revenues to cover their fixed costs. Furthermore, the sector is highly fragmented, with most individuals in the United States being served by one of 50,259 community water systems. Most of the systems are very small and serve only a few customers; the 431 largest systems, those serving 100,000 or more, serve 142.2 million individuals.

Overall, the sector faces three key challenges. First, because users rarely face the true marginal costs of their water use, consumption decisions are distorted, water is directed to low-valued uses, and providers do not perceive the true value of additions or improvements to water and wastewater infrastructure. The second challenge, mentioned above, is the sector's significant infrastructure needs, without corresponding sustainable revenues to pay for them. Finally, though providers have raised rates in recent years to better cover their costs and incentivize customers to use less water in some service areas, higher rates have become burdensome in some communities, leading to increased affordability concerns.

Culp, Glennon, and Libecap (2014) argue that charging water and wastewater utility customers true marginal costs of provision will increase incentives to use water efficiently. They propose improvements in the definition and enforcement of property rights in water to allow transfers between parties, directing water to its more valuable uses, a key step in addressing ongoing drought conditions in the American West. The authors also note wide variations in water pricing across regions of the country, with agricultural use often priced below urban use and few instances of full cost recovery. In complementary

work, Ajami, Thompson, and Victor (2014) argue that full-cost, increasing block pricing will help expand water supplies via innovation, as water suppliers will respond to high customer valuations by increasing investments in research and development in “smart water,” purification, desalination, conservation, and other technologies. They further propose implementation of a usage-based “public benefit charge” whose revenues would be directed toward innovation and research in the sector. Furthermore, both the studies by Culp, Glennon, and Libecap (2014) and by Ajami, Thompson, and Victor (2014) emphasize the role played by Federal, State, and local government regulations, recommending revisions to simplify and streamline rules and to allow markets for water rights to function more smoothly.

In practice, water and wastewater pricing structures are often variations on two-part tariff structures. Using data from the 2014 survey conducted by the American Water Works Association, Mack and Wrase (2017) report that most utilities use either an increasing block structure (50 percent) or uniform volumetric charges (29 percent), with the rest using a decreasing block structure or some other tariff structure. Water and wastewater rates have increased significantly in recent years. The U.S. Department of Energy reported average annualized growth rates of 4.1 percent for water rates and 3.3 percent for wastewater rates between 2008 and 2016, compared with annualized growth of only 1.4 percent in the Consumer Price Index for All Urban Consumers but 5.6 percent in the Consumer Price Index’s subindex for water and wastewater.

As residential rates have increased, affordability concerns have increased as well. Mack and Wrase (2017) find that meeting the EPA’s affordability guidelines would require household income of at least \$32,000, based on average monthly water consumption of 12,000 gallons. They estimate that as of 2014, 13.8 million households, or 11.9 percent of all households, would face bills higher than this affordability threshold. Both the Bipartisan Policy Center (2017) and the Government Accountability Office (GAO 2016) have identified similar patterns and concerns. In addition, the GAO found that utilities in shrinking large and midsized cities utilities had responded to financial stress in part by raising rates, deferring maintenance, and “right-sizing” their water facilities to match their shrinking populations—by decommissioning plants, for example. Such efforts to align capacity with demand may entail disinvestment in some areas.

Many water and wastewater service providers have responded to affordability concerns by establishing or expanding a variety of customer assistance programs. The EPA (2016b) reports that 228 of 795 water and wastewater utilities reviewed had one or more such programs in place, with wide variation in program features such as eligibility criteria and structure of assistance. In some cities, utilities are moving toward explicitly linking rates to income, so that low-income users face a low or even zero marginal cost for increasing consumption (Circle of Blue 2017; Philadelphia 2017).

User fees and equity/efficiency trade-offs. Charging user fees linked to income instead of marginal cost of service provision can improve equity but comes at the expense of efficiency and, in some cases, cost recovery, as seen above in the context of roads, transit, and water utilities. On one hand, encouraging efficiency in use requires that consumers face true marginal costs, along with possible fixed charges to help defray fixed costs. On the other hand, high volumetric and/or fixed charges may discourage low levels of consumption at the intensive or even extensive margin, detracting from efficiency, equity, and cost recovery goals. Resolving these tradeoffs can be difficult, and preferred options may differ by the service at issue.

For example, policymakers may be willing to impose road usage charges for their substantial efficiency and revenue effects, because there are often close substitutes such as nontolled roads or transit that are available to serve transportation needs, and, as Hall (2015) has argued, in some cases, time-varying road tolling does not even create a tradeoff between efficiency and equity. Similarly, increasing transit fares would improve efficiency and cost recovery in addition to providing valuable signals to policymakers about optimal capacity. In the water sector, some policymakers may prefer below-marginal cost pricing for lifeline residential water consumption, giving up some efficiency and revenue gains in exchange for increased equity; the sensitivity of users to price will determine the efficiency “price” of achieving equity goals. On balance, policymakers wishing to maximize social surplus may wish to limit price distortions by encouraging true marginal cost pricing and addressing equity concerns via pro-growth policies and progressive tax and transfer programs as needed, recognizing that residential mobility will limit the ability of local and sometimes State governments to engage in too much redistribution.

Financing Infrastructure Investment

Once revenue sources are identified to support particular infrastructure projects or categories, financial plans must be developed. Creative financial structures do not negate the need to identify adequate and appropriate funding resources, but they can be used to better allocate risk, align incentives, and lower costs of infrastructure investments and service provision. Recall that overall, States and localities own, fund, and manage most of the Nation’s infrastructure assets, contributing 77 percent of all public spending on transportation and water infrastructure (CBO 2015). This suggests that the Federal role, though important, is limited. That said, Federal support for infrastructure spending takes several forms, including grant funding for States and localities; access to subsidized credit through direct or indirect loan programs; and the favorable tax treatment of municipal securities. In this subsection, we briefly discuss these three tools.

Federal grant funding for States and localities is a key financing source for their infrastructure programs, and direct Federal spending is quite limited.

For highways, most grant funds are distributed based on statutory formulas, which can include factors such as population, lane miles, and other factors. The 2015 Fixing America's Surface Transportation (FAST) Act authorized \$207.4 billion in grants under the Federal-Aid Highway Program for the FY 2016–20 period, all of which are apportioned by statutory formula (FHA 2017). States must generally contribute \$.20 for every \$.80 provided in Federal funds, but less (\$.10 for every \$.90 in Federal funds) for interstate highways. Substantially less Federal grant funding is allocated on a competitive basis; Lew (2017) estimates that the U.S. Department of Transportation's (DOT's) largest competitive grants accounted for less than 2 percent of DOT's budget. In fact, only \$4.5 billion was authorized for FY 2016–20 for the competitive Infrastructure for Rebuilding America (INFRA) grants program, which is intended to provide assistance for projects of national or regional significance, far less than the amount directed to formula highway grants. Another competitive grant program, DOT's Transportation Investment Generating Economic Recovery program, known as TIGER, which seeks to support projects having a "significant impact on the Nation, a metropolitan area, or a region," is also relatively small, with a \$500 million appropriation for FY 2017.

For water and wastewater infrastructure, the Federal government's primary support has come through EPA grants to the States to capitalize State-administered revolving loan funds, which in turn provide low-cost loans to service providers for infrastructure projects. Federal appropriations for the revolving loan funds have been essentially flat for nearly 20 years; in FY 2017, the Clean Water State Revolving Fund allotments totaled \$1.394 billion and the Drinking Water State Revolving Fund allocations totaled \$824 million. Like the highway grant programs, these EPA programs typically require a 20 percent match against federally provided funds (Vedachalam and Geddes 2017). The loans themselves are repaid with revenues raised from customers along with general tax revenues collected from local taxpayers.

Because grant funding is such a big component of resources used by States and localities to fund infrastructure projects, the Federal government has great opportunity and scope to shape nonfederal decisionmaking in several ways. One obvious way is through the strategic choice of matching requirements. Grant programs requiring a 20 percent matching of Federal funds essentially offer cheaper funding than those requiring, say, a 50 percent matching of Federal funds, and Federal officials can require grant recipients to meet certain conditions—for example, a maintenance-of-effort provision—to receive more generous matches. Alternatively, Federal officials could require grant recipients to devote some minimum amount of resources to maintenance and repair, or to resiliency and disaster recovery planning, as conditions of receiving Federal support.

Another option is to incentivize better project selection by grantees and direct more grant dollars to competitive instead of formula-based programs,

which could in principle increase the effectiveness of any given amount of Federal grant funding. For example, the INFRA competitive grant program requires the preparation of a cost/benefit analysis of the proposed project, but the amount of funding at issue is relatively small. The CBO (2016a) also highlights the importance of directing Federal dollars toward projects with the greatest returns, as evidenced by cost/benefit analysis. In some instances, the CBO (2016a) indicates that such a redirection would entail spending more on major road and highway repairs, especially in urban areas, and less on overall system expansion. Kahn and Levinson (2011) and Glaeser (2017) all emphasize the value of maintenance spending and the importance of applying cost/benefit analyses to project selection at the State level.

Finally, policymakers should recognize the potential costs that come with accepting Federal grant support for projects. Federally funded highway projects, for example, come with Federal requirements related to environmental reviews, prevailing wages, and Buy America provisions, and Federal aid dollars cannot be used on local roads (urban or rural) or rural minor collector roads. Some States have established programs in which local governments can exchange, at a discount, some of their Federal grant funding from the Federal Highway Administration for less encumbered state funding. Kansas, for example, established its “Federal Fund Exchange” program in 2010, allowing local public agencies to exchange \$1 in Federal funding for 90 cents of state funding. This gives these agencies more flexibility in project selection, and the State uses the Federal funds for projects on State-owned roads and highways. Other States (e.g., Indiana, Nebraska, Oregon, and Utah) have similar programs, with exchange rates ranging from 75 cents to 94 cents on \$1. The existence of these programs and similar “after markets” for Federal grant funding indicates that the cost of accepting Federal funds can be material and that local officials value flexibility so they can direct funding to the projects best for local constituents.

In addition to providing grants to States and localities, the Federal government also provides a variety of credit resources to States and localities, ranging from direct loans to loan guarantees and other instruments intended to facilitate low-cost access to capital markets. DOT’s Transportation Infrastructure Finance and Innovation Act (TIFIA) program provides secured loans, loan guarantees, and/or standby letters of credit for projects of regional and national significance. The FAST Act authorized up to \$1.4 billion in TIFIA funding over the FY 2016–20 period. TIFIA loans must be secured by “dedicated revenue sources,” which can include tolls, user fees, TIF revenues, and other tax revenues pledged to repayment.

The Federal government took a similar approach in the area of water infrastructure when, in 2014, the Water Resources Reform and Development Acts established a pilot program called the Water Infrastructure Finance and Innovation Act. Under this program, the Federal government may provide direct loans and loan guarantees for eligible borrowers, aiming to support larger

Figure 4-9. New U.S. State and Local Government Debt Issues, 2004–16

Source: Federal Reserve Board.

projects than are usually funded by State revolving fund loans. Vedachalam and Geddes (2017) argue that the program can lower debt service costs for participating borrowers. Eligible projects related to drinking and clean water must have costs exceeding \$20 million for large community projects (areas with more than 25,000 people) and \$5 million for small community projects (areas with less than 25,000 people).

The third key Federal support for infrastructure investment involves the tax treatment of municipal debt. State and local governmental entities rely heavily on borrowed funds to finance their public investments—and in doing this, they benefit from the preferential tax treatment of municipal bonds issued for governmental and qualified private purposes. In brief, the tax payments made to owners of such debt are not taxable for Federal income tax purposes, allowing municipal bond issuers to pay lower interest rates in equilibrium than they would otherwise need to pay. The rationale for this exemption is that some infrastructure provides benefits beyond the boundaries of the jurisdiction making the investment. Without a mechanism to internalize these externalities, States and localities could underinvest relative to efficient levels.

The tax exemption for municipal bonds cost the Federal government \$28.9 billion in forgone tax revenues in 2016 on an outstanding stock of over \$3 trillion in securities issued by States and local governments (Federal Reserve 2017). Figure 4-9 shows that State and local bond issuance has risen in recent years, reaching \$431.3 billion in 2016. Revenue bonds, which are secured

Box 4-4. Public-Private Partnerships

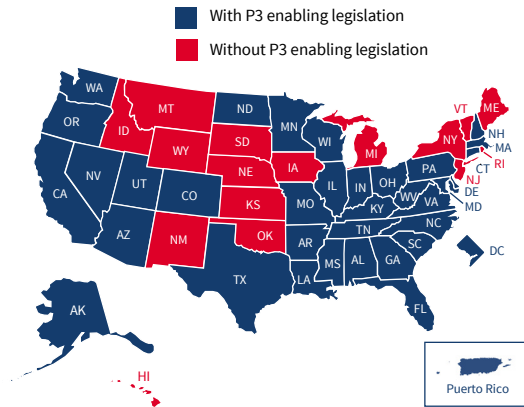

Public-private partnerships (P3s) allow for innovative and efficient, though not free, procurement of infrastructure projects. When State and local government leaders work with private partners to address infrastructure deficiencies, there are potential synergies for both parties. Large, complex projects with dedicated funding sources supported by tax revenues, user charges, or other revenue sources can be provided more efficiently using P3s rather than traditional procurement methods. Projects that offer meaningful opportunities to decrease life cycle costs by combining design, build, operate, maintain, and sometimes finance services into one contractual relationship are good candidates for P3s, as private partners can contribute capital, project management expertise, and risk management in return for revenues from the government partner.

Traditional procurement deals typically give private contractors little incentive to consider the lifetime costs of a project, whether monetary or opportunity. Under traditional procurement methods, for example, a design team contracted for a project would typically not be responsible for building, operating, or maintaining the facility over its lifetime, thus would have little incentive to consider processes that would streamline the construction process, accelerate project delivery, or minimize maintenance needs over the project's lifetime. In a P3 partnership, the private partner could be responsible for designing, constructing, and maintaining the project. Therefore, incentives are aligned for efficiencies throughout the process, for both private and public sector parties.

P3s can also decrease risk related to uncertain future demand, cost overruns, construction delays, and the like, though it is important to note that reducing public sector risk will be priced into the P3 agreement. More generally, P3s allow risk to be borne by the party best equipped to handle that risk. For example, regulatory risk (the risk that a project may be scuttled due to regulatory or permitting actions) is likely best borne by the governmental partner, while the private partner likely has greater project management and construction expertise and is therefore in the best position to manage that risk. Demand, or revenue, risk may be shared or borne in full by one party or the other, depending on the project's particular features.

Despite these benefits, P3 partnerships are uncommon in the United States. A report published by the U.S. House of Representatives' Transportation and Infrastructure Committee finds that from 1989 to 2013, 98 highway P3 projects totaling \$61 billion were completed. These projects equal only 1.5 percent of approximately \$4 trillion spent on highways during that period by all levels of government. Currently, 34 U.S. States, the District of Columbia, and one U.S. territory have enacted statutes that enable the use of various P3 approaches for the development of transportation infrastructure, as shown in figure 4-iii.

Figure 4-iii. P3 Enabling Legislation, by U.S. State and Territory

Source: U.S. Department of Transportation, Federal Highway Administration.

Moreover, a 2016 report from Moody's Investors Service finds that though growth of infrastructure P3s in the United States has been slow and fragmented, the market remains positioned to become one of the largest in the world. One key provision in accomplishing this target is the recently passed FAST Act, which created the Build America Transportation Investment Center, intended to cultivate P3s by helping them access Federal credit and navigate Federal permitting and procedural requirements.

Examples of P3s. In 2012, the General Assembly of the Commonwealth of Pennsylvania amended Act 74 to Act 88, which allows private entities to develop and operate qualifying transportation facilities and to submit solicited and unsolicited proposals; encourages investment by private entities; and enables the procuring agency to accept offers above the lowest price offer. Additionally, the act allows terms of up to 99 years for P3 agreements; authorizes user fees for the subject transportation facility; and requires that public bargaining unit covered employees displaced by the P3 project be offered employment with the development entity on terms essentially identical to those in the relevant collective bargaining agreement for its duration.

Through this new mechanism, in 2014, Pennsylvania formed a partnership with Plenary Walsh Keystone Partners (PWKP) to replace 558 structurally deficient bridges across the commonwealth. As of 2016, 19.8 percent of all bridges in Pennsylvania were considered structurally deficient (compared with 9.1 percent across the United States). The Pennsylvania Department of Transportation (PennDOT 2014) chose the P3 structure to accelerate the replacement of the bridges and facilitate efficiencies in design and the

construction of bridge components; the selected bridges could be replaced using a limited number of standardized sizes, designs, and components, making this bundled approach an efficient one. PennDOT estimated that this approach will speed up project completion and save 20 percent over the life of the concession period, compared with PennDOT’s replacing the bridges itself.

The P3 agreement calls for PennDOT to make milestone payments during the construction phase of the project and availability payments during the concession period, with clear standards in place for keeping the bridges in good operating condition; noncompliance with the standards results in deductions from the payments made to PWKP. To provide the revenues needed for these payments, the Commonwealth of Pennsylvania laid the groundwork in 2013, when it enacted Act 89 (HB 1060). When fully implemented, this law is intended to raise an additional \$2.3 billion per year, including \$1.6 billion for roads and bridges highways and at least \$476 million for transit, primarily by increasing the sales tax on gasoline as well as a number of registration and licensing fees.

The financial structure of the agreement is depicted in figure 4-iv. Including financing costs, the total cost of Pennsylvania’s Rapid Bridge Replacement Program is \$1.1 billion, which includes a record \$721.5 million in private activity bonds (PABs), which are discussed in this chapter’s main text.

Another noteworthy P3 has been the partnership between the City of Phoenix and American Water Enterprises, Inc., executed to build a new water treatment plant designed to serve 400,000 homes. The Lake Pleasant Water

 Note: All values are in nominal U.S. dollars. PAB represents private activity bonds.

Treatment Plant was completed in 2007 and has a capacity of 80 million gallons per day, with a potential capacity of 320 million gallons per day (UNC Environmental Finance Center 2016). The P3 agreement was structured as a design-build-operate contract, which required Phoenix to pay \$228.8 million for the design and build phases and regular service fees during the 15-year life of the agreement. The city issued tax-exempt bonds to finance its payment to the private partner, secured by the revenues generated by the water system from user fees and charges. Through this P3, the city largely met its goals of reducing project risk and achieving life-cycle savings and efficiencies. Furthermore, the city was ultimately able to renegotiate the contractual agreement when lower-than-anticipated water demand and consumption left the city collecting less water system revenues than planned.

The Path Forward. The future is clear with regard to P3s. There is not one single actor; instead, the success of P3s depends on coordination and shared responsibility among multiple entities. States and local governments may wish to adopt broad P3 enabling legislation and establish offices to provide technical and administrative assistance for private investors as well as local governments. Well-structured P3s that provide incentives for efficiency, allocate and price risk appropriately, and protect the public interest can be an effective way to leverage the skills and resources from the private sector to accomplish public sector infrastructure goals that would benefit all Americans.

by identified revenue streams—such as specific taxes, user fees, and other charges—made up more than 60 percent of total bonds issued in 2016, with general obligation bonds, backed by the issuer’s faith and credit, accounting for the rest.

The favorable tax treatment of municipal bonds is only available to debt that serves governmental (public) purposes or qualified private purposes. Bonds that pass both the “use test” and the “security test” are governmental bonds that can be issued without Federal limitation (Congressional Research Service 2016). Municipal bonds that fail one or both of these tests are not eligible for the Federal tax exemption. However, Congress has long recognized that some infrastructure projects provide both private and public benefits, and since 1968, bonds used to fund certain eligible types of projects and activities are deemed “qualified” private activity bonds (PABs), which can and do receive the Federal tax exemption. Currently, 22 categories of projects may be funded with qualified PABs, and Congress caps the total amount of debt capacity available each year, with different caps applying to different project categories. Qualified private activities include exempt facilities projects (airports; water, sewage, and solid waste facilities; educational facilities; and surface transportation), industrial development bonds, and student loans. In 2016, States and

Box 4-5. Bridging America’s Digital Divide

During the past decade, high-speed Internet service has transformed the global economy and changed how Americans live their lives. Access to broadband—defined by the Federal Communications Commission as a download speed of at least 25 megabits per second—is increasingly necessary for modern commerce, community engagement, job creation and matching, education, healthcare, and entertainment. Today, many of even the most common household Internet tasks require a high-speed connection, due to the rising sophistication and heavy graphics content of many websites; paying bills, online banking, shopping, research for homework assignments, and registering a car can be worse than frustrating for those who rely on dial-up access.

However, though just 4 percent of urban Americans lack access to broadband speeds via fixed terrestrial service, 39 percent of rural Americans cannot obtain it, as shown in figure 4-v. Low population density, challenging geographic features like mountainous terrain, and exposure to harsh weather in certain areas increase the per-customer cost of service delivery, acting as a disincentive for broadband providers to expand service into rural communities. In addition, broadband providers often face bureaucratic obstacles to building a network, including arduous application processes and burdensome regulatory reviews.

Even when broadband service is available, rural Americans in general face a more limited choice set of service providers than their urban counterparts, and tend to adopt at lower rates. According to the Congressional

Figure 4-v. Access to Fixed Terrestrial Broadband Service, 2014

Source: Federal Communications Commission.

Research Service (Kruger 2016, table 4), though 44 percent of urban Americans reside in areas that offer a choice between providers, just 13 percent of rural Americans do. A Pew Research Center survey of home broadband usage identified several persistent disparities in broadband adoption, including the fact that rural Americans tend to adopt broadband at lower rates; 63 percent of adults in rural areas said they have a high-speed broadband connection at home, compared with 73 percent of Americans in urban areas. (Similar gaps in adoption are reported by the National Agricultural and Rural Policy Development Center, and by the Department of Commerce; Kruger 2016, 6.)

Nonadopting respondents cited cost—of computers and of the service—as an important reason for not subscribing. And the GAO found that nonadoption is principally driven by unaffordability, a lack of perceived relevance, and low computer skills. Interestingly, the Pew study also showed that between 2013 and 2015, the share of urban Americans with terrestrial broadband service declined moderately. This trend toward fixed-line disadoption was accompanied by an uptick in smartphone adoption; 13 percent of Americans now rely on the smartphone for online access at home (Kruger 2016, 6–7).

This gap in e-connectivity not only prevents many rural Americans from participating in the global marketplace but also restricts their ability to improve other parts of their lives, from their job prospects, placement, and training, to education and healthcare. Access to broadband is key for modern private enterprise, and a lack of available infrastructure prevents investment in rural communities. Several studies show that broadband availability confers important economic benefits on a community (Kruger 2016, 9). Recognizing that rural America’s economic recovery from the Great Recession has been far slower than that of the rest of the country, in April 2017 President Trump established the Interagency Task Force on Agriculture and Rural Prosperity via Executive Order. In its final report, the task force identified the expansion of e-connectivity as an important path to prosperity for rural America, and prioritized identifying funding sources, streamlining the broadband deployment process, and reducing barriers to high-speed infrastructure buildout.

Provision of broadband in the United States is largely privately organized. Private firms of today face many of the same basic problems that hindered infrastructure development to expand electrification and telephone service to rural areas during the early part of the last century: challenging geographical features and a lack of scale economies in regions with low population densities. The Federal government currently uses two vehicles to direct funds to broadband deployment: the Universal Service Fund programs of the Federal Communications Commission, and the broadband and telecommunications programs of the U.S. Department of Agriculture’s Rural Utilities Service (Kruger 2016, 12).

There are many options for improving the deployment and adoption of high-speed Internet connections to unserved and underserved areas, but

a key consideration is striking the right balance between providing Federal assistance where private options are unavailable or unaffordable and minimizing the detrimental effects that government intervention can have in the private marketplace. A wide array of instruments are available to policymakers—from loans and loan guarantees, to infrastructure grants and universal service reform, tax incentives, direct assistance to taxpayers, and regulatory and deregulatory measures (Kruger 2016, 23). In deciding on the appropriate method(s), however, it is important to proceed with an understanding of the availability of next-generation and mobile broadband technologies, because these may prove less costly and more desirable to consumers in the long run. To advance the goal of increased access, the Federal government recently announced that the Department of the Interior will make some of its real property assets available for deployment of rural broadband assets.

Box 4-6. Transitioning to the 21st Century: The Case of 5-G Wireless

Maintaining a competitive economy into the 21st century will require not only upgrading, expanding, and enhancing conventional infrastructure assets but also investing in new, innovative, and potentially disruptive technologies. These technologies have the potential to profoundly alter economic relationships and increase productivity throughout America and across industries, thereby supporting economic growth. Although the private sector is likely to lead investments in many of these technologies, the public sector will shape future investment choices made via its regulatory and other policies. The example of 5G wireless technology highlights some of the risks and opportunities of these technological innovations.

Industry analysts project that the 5G market will develop rapidly. Deloitte expects 5G trial markets to materialize by the end of 2017 and develop into a “full, mass market” by 2020. Whereas the cellular infrastructure of the past relies in its entirety on large towers, this new 5G cellular infrastructure will require the deployment of smaller cellular transmission devices (often referred to as “small cells”) to augment traditional cellphone towers (Gupta and Kumar Jha 2015). Due to the nature of wireless transmission, the addition of these smaller cellular devices will enhance the capacity of wireless networks to transmit data. With improved capacity and speed that improve connections of digital technologies, 5G may support the flourishing of the “Internet of Things”—including driverless cars and high-technology healthcare systems. Such technologies are projected to boost connectivity, productivity, and output. By 2035, IHS (Campbell et al. 2017) projects that 5G could support \$12.3 trillion in global economic activity.

Industry analysts also expect 5G to boost high-wage employment, lowering job search, match, and telecommuting costs, perhaps of special value in distressed communities with limited job opportunities. In addition, various traditional infrastructure sectors may benefit from the deployment of 5G service, including energy and utilities (e.g., energy-consuming devices in a grid) and transportation (e.g., 5G-powered traffic management systems), as well as public safety (e.g., integration of video surveillance).

There are two main challenges for 5G development. The first challenge is standards. Attracting private sector investments will require clarity about the future path of the technology itself. Setting specific technological standards for 5G wireless facilities and operations enables interoperability and compatibility and will shape future investment choices by firms. Directly, a country with a dominant industry share may crowd out similar telecommunications exports from other countries because of compatibility and standards issues. Given the high fixed costs in the industry, the countries and their companies that initiate the standard may gain first-mover advantage, making it difficult for new entrants with different standards to enter. For example, industry sources indicate that the adoption of China's Polar Code Error Connection technology for encoding 5G in November 2016 is a symbol of China's rising leadership in 5G technology (Rogers 2016; Lucas and Fildes 2016). Indirectly, the dominating nation may have preferential access to foreign intellectual property that is using the 5G network, which could enable theft of this property, an issue that is discussed in chapter 7.

Standards for 5G technologies are developed by multistakeholder organizations, such as the 3rd Generation Partnership Project (3GPP), and are ultimately codified at the International Telecommunications Union, a United Nations agency that coordinates global telecommunications operations and services. To date, the U.S. has pursued a standard-setting approach led by the private sector, whereby product standards are generally set through voluntary, private organizations. In contrast, many other countries engage in active governmental direction of standard-setting activity. For example, the Organization for Economic Cooperation and Development (OECD 2010) notes that there is active participation by European governments in the Global System for Communications' mobile phone standard. Similarly, in the context of the telecommunications industry, Linden (2004) notes that China maintains rights "to involve government in all standard-setting decisions." Heavy government involvement in international standard setting may be concerning if it crowds out private actors due to governments' larger economies of scale and capital or if such involvement is coordinated to disproportionately benefit particular nations.

The second challenge for 5G development is regulation. Establishing a flexible and adaptive regulatory structure will be needed to support future 5G deployment, with coordination across Federal, State, and local government levels. Specifically, the April 2017 Notice of Proposed Rulemaking, issued

by the Federal Communications Commission (FCC) regarding “accelerating wireless broadband deployment by removing barriers to infrastructure development,” sought comments on two sections of the Communications Act, Sections 253 and 332. Section 253 delineates the rights of State and local authorities to collect “fair and reasonable compensation from telecommunications providers” but also prevents any State or local government from prohibiting “intrastate or interstate” telecommunications service. Local authorities can stymie rapid deployment of infrastructure by delayed disposition of requests for local rights of way and siting approvals. Section 332 requires that State and local governments not discriminate between service providers who want to site cellular infrastructure, refrain from setting prices, and respond to such requests within “a reasonable period of time.” However, many local authorities may not be equipped to understand the impact of small cell deployment, which does not disturb the public rights of way as traditional wireless infrastructure, such as cell towers. Though the FCC has solicited input on the subject, it has yet to implement decisions about how it will balance the interests of the different stakeholders involved in the physical rollout of 5G.

Governments may also ensure that 5G service providers have access to the appropriate spectrum, or the radio frequency waves over which the signals are transmitted. Unlike the large cell towers of traditional wireless infrastructure, 5G’s “small cells” transmit electromagnetic waves at a variety of frequencies, ranging much higher than those on which previous wireless data services have relied. To generate economic value from 5G infrastructure, providers must have access to appropriate spectrum frequencies. To ensure the availability of spectrum, the FCC voted in July 2016 to authorize the use of spectrum bands in the millimeter wave ranges relevant to 5G. These bands may eventually become available through overlay auctions and the secondary market and will benefit both 5G operators and current owners of these rights.

Thus, though investment funding and asset ownership in this sector are currently dominated by the private sector, Federal officials have opportunities to make policy decisions that will shape the environment for future private investment in this sector, allowing the United States to take best advantage of the benefits offered by this new technology.

localities issued \$20.4 billion in qualified PABs, of which about two-thirds were directed toward affordable multifamily housing projects (CDFA 2017, 9).

PABs have proven to be especially valuable in projects structured as public-private partnerships (P3s). The Safe, Accountable, Flexible, Efficient Transportation Equity Act of 2005 authorized the issuance of up to \$15 billion in PABs for use in transportation P3s. As explained in box 4-4, P3s offer an alternative to traditional project procurement, whereby a private sector entity or consortium contracts with the relevant State and/or local governmental bodies

to design, build, finance, operate, and/or maintain infrastructure facilities. Allowing private entities to issue tax-preferred PABs to finance such projects is simply the equivalent of allowing the public sector to issue governmental purpose bonds.

On balance, the Federal government has a key, if limited, role to play in both funding and financing of infrastructure investments. Increasing investment to address infrastructure needs will take additional resources from Federal, State, and local government taxpayers as well as the direct beneficiaries of the assets. On the funding side, reliance on user fees to pay for investments has its limits, but significant efficiency gains can still be achieved through careful expansion of their use. On the financing side, the Federal government can use grant funding as an incentive to encourage States and localities to be more efficient when undertaking infrastructure investments and can promote the use of bonds to support additional infrastructure investment. The Federal government can also continue to support the use of innovative financing structures such as P3s to reduce the overall costs of infrastructure investments.

How Core Infrastructure Ensures a Competitive Economy

The U.S. economy of course also depends on services from assets in sectors other than surface transportation and water and wastewater. Maintaining a competitive and productive economy for all Americans requires a reliable, robust, and resilient energy sector, multiple transportation modes and systems, and an advanced, productive telecommunications sector. These infrastructure sectors support trade and economic activity and display significant economies of scale and network effects; yet infrastructure is primarily privately owned in some instances but publicly owned in others. Therefore, as this section explains, it is not surprising that barriers to needed infrastructure expansion and upgrades differ across sectors, with regulatory issues appearing paramount in some cases but funding challenges being the key issue in others.

For example, consider the telecommunications sector, for which most infrastructure is privately owned. In some segments of the market, the key issues are the costs of service relative to revenues collected from users, along with regulatory concerns, and box 4-5 explores the market for rural broadband service from this perspective. In the case of 5G wireless technology and investment, issues of regulatory barriers, technological standards, and international competition are more salient. Box 4-6 explores these issues in greater detail, and highlights recent regulatory actions serving to simplify and clarify regulatory roles of States and local governments in the wireless broadband industry and to facilitate markets in which spectrum and transmission rights can be bought and sold. Aligning regulatory policies with the Nation's growth

objectives will help ensure that these technologies provide the greatest possible boosts to productivity and growth for all Americans in the years ahead.

In the rest of this chapter, we discuss recent developments in the energy sector and the inland waterways system, identifying opportunities and challenges for getting the right infrastructure assets in the right places. We particularly explore the roles of regulation and funding in shaping investment decisions in these sectors—and, subsequently, America’s competitiveness and productivity in the 21st century.

The Energy Sector

Energy infrastructure in the United States is the envy of the rest of the world, for both fuels and power—if for no other reason than its sheer extent. The United States has over 2.5 million miles of natural gas pipelines and 207,000 miles of petroleum pipelines, according to 2017 data from the Pipeline and Hazardous Materials Safety Administration. By some estimations, the North American electricity grid is the largest such facility in the world. It has 697,000 miles of high-voltage transmission lines and 6.4 million of miles of feeder and distribution wires (Giles and Brown 2015). These giant networks have been built piece by piece over a long period, under a range of prevailing market and regulatory conditions. Addressing the economic and regulatory constraints on infrastructure investment ensures that future expansions and modernizations of the U.S. energy networks will be both prudent and timely.

Because energy infrastructure is long-lived, the United States lives with the legacy of the past. Its electricity grid—which was built by regulated, vertically integrated utilities—differs from the grid that would be built in a restructured market that depends heavily on intermittent generation by renewable sources, like wind and solar power. Changing market conditions, such as the restructuring of electricity markets, are an important consideration for infrastructure investments. Restructuring has aimed at aligning investment incentives, but risks remain for new projects. For instance, when it opened in 2009, the Rockies Express Pipeline (REX) was heralded as a bold, new 1,663-mile link in the U.S. natural gas system, delivering abundant Western gas to hungry Eastern markets (Carr 2013). Five years later, the flow in the Eastern reaches of the \$3 billion REX pipeline was reversed to allow newly discovered Eastern gas to flow to the West.

The REX experience underscores the specificity problem of infrastructure—once it has been built, it cannot be moved. Specificity could lead to concern about underinvestment, but it also opens the door to natural monopoly power. The high fixed costs and low marginal costs mean that it is socially optimal to have a single network rather than competing ones. The natural concern is that the operator would charge high prices to take advantage of monopoly power, and the traditional remedy has been rate regulation—with Federal oversight only when infrastructure crosses State lines.

Most energy infrastructure—power lines and pipelines, along with the necessary plants and terminals to serve them—is privately owned; as of 2015, 3.5 of the 6.4 million miles of distribution lines were owned by private utilities, while the remaining 2.9 million were owned by Federal, State, and municipal utilities (Giles and Brown 2015). Pipeline infrastructure for both gas and oil is further skewed toward private ownership; in 2016, 91 percent of pipelines, by capacity, were owned by corporations. Energy infrastructure is excludable—enabling suppliers to charge customers for services and access provided; oil producers to pay for pipeline capacity, electric consumers to ultimately pay for power to be delivered via wires, and exporters to pay port fees and lading charges. These user fee revenues ultimately provide the resources needed to maintain, upgrade, and add capacity, so funding resources are rarely the limiting factor in energy infrastructure investment. Instead, regulatory oversight has often proved to be the greater hurdle to modernizing and expanding infrastructure (Borenstein, Bushnell, and Wolak 2000).

Pipelines and transmission infrastructure. New technical abilities to extract natural gas and oil from previously unprofitable regions and States, such as North Dakota, have increased demand for new pipeline capacity. In the short term, the lack of available pipeline capacity has increased demand for alternative forms of transportation, including rail. In the electricity sector, the falling cost of renewable generation technologies, like wind and solar power, has increased installations and required transmission facilities that can accommodate the intermittent nature of these technologies. For both fuel and power infrastructure, the demand for more transmission capacity in new regions has made issues related to gaining regulatory permission more salient. For example, the Keystone XL and Dakota Access crude oil pipelines were delayed, at least temporarily, by regulatory and legal challenges (see chapter 2 for a related discussion). Significant investments are currently on hold, awaiting regulatory action; at the end of October 2017, Federal approvals for new or expanded natural gas pipelines were pending for 15 billion cubic feet per day across a total of 1,630 miles of pipe (FERC 2017).

In the renewables segment of the sector, production and investment tax credits as well as State-level renewable portfolio standards have encouraged investments in solar, wind, and geothermal power. With the adoption of these incentives, as well as improvements in generation technologies, renewables' share of total generation capacity has risen considerably since 2005 (figures 4-10 and 4-11). Renewable growth accounted for 54 percent of new capacity additions in 2017, and it has averaged 55 percent of all new capacity additions since 2005. The share of electric generating capacity contributed by renewables has climbed from 12 to 22 percent since 2005, and the Energy Information Administration predicts that this trend will continue through 2050, when renewable capacity will exceed 35 percent of installed capacity. Falling costs for renewable electricity generation have triggered an increase in demand

Figure 4-10. Renewable Energy’s Current and Projected Share of U.S. Generation Capacity, 2005–50

Figure 4-11. Renewable Energy’s Share of Annual Generation Additions, 2006–17

Source: U.S. Energy Information Administration, 860 Detailed Data.

for complementary electricity transmission infrastructure. The United States completed or began construction of 9,277 miles of transmission power lines between November 2016 and November 2017 (EIA 2017).

Historically, the primary tax incentives for renewables have been the Renewable Energy Investment Tax Credit, which was introduced in 1978, and the Renewable Energy Production Tax Credit. Currently, a 30 percent tax credit is available for investments in solar energy property, fuel cells, and small wind systems, while a 10 percent tax credit is available for geothermal systems, microturbines, and combined heat and power property. The Tax Cuts and Jobs Act of 2017 limits some of the benefits of these credits, however, so their future value is uncertain.

Port infrastructure. Increasing energy exports is an integral part of the Nation's energy dominance vision, but this requires additional infrastructure. Although shipments to Canada and Mexico are possible using pipelines and rail, port facilities are required for exporting to other countries. Port facilities require shoreside links—pipelines for natural gas and petroleum, and rail for coal. Also, for the pipelines and transmission infrastructure facilities discussed above, regulatory concerns shape the investment environment.

One example is the struggle to construct a West Coast coal exporting facility so that U.S. coal producers can gain access to the Asian market. Without such a terminal, expanding exports to Asian markets is effectively out of reach. In a nutshell, too little of the relevant port infrastructure is on the Nation's West Coast and too much is on the East Coast, whose Atlantic ports accounted for 90 percent of the coal exported by the U.S. to China through the first half of 2017 (EIA 2017). Several coal companies have expressed interest in sites in Washington and Oregon for a new, privately funded coal terminal. The prospect of local tax revenues and employment from such a facility has not yet overcome State and local opposition to the local disamenity of a coal terminal and broader environmental opposition to facilitating increased coal usage.

This geographic misallocation of port-related infrastructure limits opportunities to expand coal exports. Figure 4-12 shows how both volume and revenue from U.S. coal exports have declined over the past several years. No significant expansions of coal exporting facilities in the United States are currently under construction, despite the opportunities to increase exports to Asian markets from West Coast facilities.

U.S. natural gas producers face a similar problem in gaining access to Pacific markets. There are currently no liquefied natural gas (LNG) export facilities in the Northwest, despite significant commercial interest in building such facilities. Environmental groups and landowners have opposed a proposed LNG export facility and an associated pipeline in Oregon, and although development has continued, some of the required permits have not yet been acquired. Thus, though natural gas exports and capacity utilization rates rose significantly between 2007 and 2016, future growth in exports, capacity, and

Figure 4-12. Total Coal Exports by Weight and Revenue, 2002-17

Sources: U.S. Department of Commerce, Census Bureau.

Figure 4-13. U.S. Annual Natural Gas Exports, 2001-17

Source: U.S. Energy Information Administration.

capacity utilization is constrained by a lack of facilities needed to export, especially in the rapidly growing LNG market segment (figure 4-13). (The Federal Energy Regulatory Commission has approved several LNG export facilities, which are currently under construction, but none yet are on the West Coast.) Export capacity utilization was at 59 percent of potential as of 2017, up 7.5 percentage points from the previous year. LNG's share of total gas exports has expanded rapidly in the past decade. In the 2001–10 period, LNG averaged less than 0.5 percent of total U.S. natural gas exports; by August 2017, LNG accounted for 20 percent of total gas exports. There remains a large international market for LNG, in which the United States has not yet carved out a share proportional to its production capabilities. According to data from the Energy Information Administration, the United States accounted for 1.2 percent of global LNG exports in 2016, despite being the largest gross extractor of gas in 2015 among all nations. The U.S. is drastically underrepresented in the global LNG market; and by expanding its LNG export capabilities, it most likely could rapidly gain market share.

Modernizing America's Waterways

The Nation's inland waterways system (IWS) is a crucial component of its transportation network, linking the producers of agricultural and energy commodities to domestic and international markets. But this system is aging, and its users are suffering from increasing lost transportation time. Unlike other freight modes, where the costs are mostly borne by system users, for historical reasons the government pays almost the entire cost of operating the IWS. The existing funding structure actually disincentivizes making timely repairs and does not align system costs with the parties that most benefit from IWS usage. A more robust system of user fees—possibly in the form of multipart tariffs that include licenses, location-specific fees, congestion fees, and fuel taxes—is the most promising approach to achieving revenue adequacy and sustainability, facility reliability, and economic efficiency. By providing signals of system component value, such fees would also guide operators and policymakers in deciding where to focus capital expenditures and how to prioritize repair efforts.

The IWS includes more than 36,000 miles of navigable rivers, channels, and canals across the United States, and directly serves 41 States (Clark, Henrickson, and Thomas 2012; TRB 2015). Upstream and downstream movement of cargo is enabled by lock infrastructure managed by the U.S. Army Corps of Engineers (USACE). Movement of goods and people over inland waterways was an important factor in the Nation's early economic growth, and the system remains a small but stable part of the United States' commercial transportation system, accounting for between 6 and 7 percent of all ton-miles (TRB 2015). Water transportation contributes about \$15 billion in value added to U.S. GDP, about 0.1 percent of the total size of the economy. According to DOT, inland waterways support more than 270,000 jobs.

For many commodities—particularly those that are heavy and transacted at relatively low prices—the waterways system is an important component of their transportation network, including coal, petroleum, chemicals, and agricultural products. For example, grain is shipped via rail from the interior, loaded onto waterside grain elevators along the Upper Mississippi River, transloaded first onto barges, and then moved downstream to southern Louisiana, where it is then transloaded onto deepwater vessels that sail to export markets around the globe. Compared with truck or rail, water transportation is in many cases a less costly means of moving goods (USACE 2016).

Freight traffic across the system is highly variable; about 22 percent of the total waterway miles account for about 76 percent of the cargo ton-miles transported (USACE 2013). However, low-use tributaries can be critical sources of transportation for freight systems that are organized around the low-cost water transportation of bulk commodities on these segments; few economical alternatives exist for these industries if low-use segments are no longer operable for commercial navigation (TRB 2015, 42). The Upper Mississippi, Illinois, and Tennessee-Tombigbee rivers, and the Gulf Intracoastal Waterway, have high-use locks in moderate or even low-use waterway sections, due to seasonal peaks in the movement of certain commodities, like harvested agricultural commodities, or because of seasonal navigation closures (due to recurring weather conditions like ice and flooding).

The cost of poor infrastructure. According to USACE (2014), waterways' infrastructure in the United States is operating at an overall satisfactory level. However, the average age of system locks is increasing, even when adjusted for date of last major rehabilitation (TRB 2015, 44). Furthermore, though systemwide traffic is flat or declining, delays and scheduled lock outages (to proactively address maintenance issues) are actually increasing, as shown in figure 4-14. Shipping delays and lost service are positively correlated with tonnage handled, indicating that investments are necessary to improve this transportation system.

Delays are typically longer at locks with greater demand for transportation during the harvest period for U.S. agriculture, so these are in part driven by seasonal congestion; in addition, locks experiencing the largest number of delays are concentrated along medium- and high-use segments of the system (TRB 2015).

Several studies have estimated significant cost effects of shipping delays and outages. The University of Tennessee's Center for Transportation Research and the Engineering Center for Transportation and Operational Resiliency at Vanderbilt University (CTR 2017) have estimated the effects of unscheduled lock outages on additional transportation costs, and focused on four locks. Calcasieu Lock is critical for inland navigation between Texas and Louisiana, and the vast majority of its traffic is dominated by petroleum and chemical products. CTR estimated that an unscheduled outage at Calcasieu would

Figure 4-14. Lost Transportation Time across the Inland Waterways System, 2000-2016

Source: U.S. Army Corps of Engineers.

increase transportation costs for these products by more than \$1.1 billion. LaGrange Lock and Dam and Lock & Dam 25 are both primarily dominated by Gulf-destined, down-bound flows of corn and soybeans; 20 million tons of farm products flow through these two locks each year, six times greater than the volume of farm products that are moved by rail through the same corridor. CTR estimates the cost of an unscheduled closure at either LaGrange or Lock & Dam 25 at \$1.5 billion. Yu, English, and Menard 2016 estimate that a one-year closure of Lock & Dam 25 would reduce economic activity from corn and soybean production by \$2.4 billion, leading to the loss of 7,000 jobs and \$1.3 billion in labor income. Traffic at Markland Lock is primarily composed of short-haul coal movements, chemicals, and petroleum products; CTR estimates that an unscheduled closure of the lock would increase the shipping costs of these commodities by \$1.3 billion.

Funding the Inland Waterways System. The Federal government’s role in managing and funding the IWS is far larger than it is for other freight modes. Although it is responsible for about 28 percent of highways spending and almost none of the cost of pipelines and railroads, the federal government contributes about 90 percent of the IWS’s cost (TRB 2015). Waterways costs are mainly funded via the USACE budget. Operations and maintenance (O&M) costs constitute \$631 million (69 percent) of the total FY 2017 budget of \$917 million, with only \$243 million (26 percent) devoted to construction (USACE 2017a). The Trump Administration’s inland navigation system’s FY 2018 budget

Figure 4-15. Inland Waterways Trust Fund Balance, 2009–16

Source: Inland Waterways Users Board Annual Report, December 2016.

requests that 77 percent of projected expenses be devoted to O&M expenses, which include repair costs up to \$20 million and are fully funded from Federal general revenues. Construction costs, including repairs over \$20 million, are funded through a combination of a direct tax on barge fuel and matching general funds from the Federal government.

The current funding framework presents challenges in several dimensions. On the capital front, tax revenues have not kept up with increased needs to substantially rehabilitate facilities, echoing the situation in highway funding. In 2015, the barge fuel tax—which is not indexed to inflation—was raised from 20 cents per gallon to 29 cents per gallon (the first increase since 1995), leading to an increase in fuel tax revenues and reversing a several-year decline in end-of-year balances of the Inland Waterways Trust Fund (Inland Waterways Users Board 2016) (figure 4-15). Even so, the revenues generated by the fuel tax are estimated to be only \$112 million annually, compared with total annual IWS expenses of nearly \$1 billion and an estimated \$4.9 billion projects backlog.

O&M spending is supported by general funds and must compete with other priorities in the Federal budget. System managers have an incentive to delay repairs until they reach the point of being classified as capital expenses—because those can be covered by fuel tax revenues—reducing system reliability by leading to delays and closures. Eliminating the funding wall between fuel tax revenues and O&M expenditures is an obvious step that would both improve

the reliability of O&M funding streams and counter the incentives problem that now serves to exacerbate the deterioration of facilities.

Beyond improving revenue generation and permitting the system to cover its own costs, imposing increased fees on barge operators for using the IWS and its facilities would enhance its economic efficiency. Ideally, these fees would be set to match the marginal costs generated by usage of the existing system. With facilities already in place, short-run marginal costs are those associated with operating and maintaining locks and dams, and maintaining channel depths. However, because new construction in the system is characterized by high fixed costs, short-run marginal cost pricing would likely not be sufficient; fees could need to be set higher to cover current and expected total system costs.

Such charges could take the form of additional fuel taxes, lockage fees (charges for passing through individual locks), segment fees, annual license fees, and/or congestion fees (TRB 2015). Fuel taxes are aligned to usage, but they apply equally across the IWS, even though some sections are more costly to operate than others; so if used alone, they would create complicated cross-subsidies. Variable, location-specific fees can be designed to better match actual marginal costs, but facility-based pricing by itself may not be sufficient to cover the O&M costs of the shared components that are deemed to be essential to the national freight transportation system; in this case, systemwide user fees or licenses can be employed. Finally, congestion charges can act as a demand-management tool similar to peak-load prices in other settings, helping to ration access to the existing infrastructure more efficiently at times when seasonal use of the system rises—as in the case of agricultural harvests; congestion fees also signal system operators and policymakers about the normal and seasonal value of the facilities.

In fact, similar issues of fees, cross-subsidies, and revenue adequacy arise in the context of maintenance and operation of the Nation's coastal and inland harbors. Dredging and other costs are covered by the Harbor Maintenance Trust Fund, which is largely supported by shippers, which pay harbor maintenance taxes of 0.125 percent of the value of cargo loaded or unloaded from commercial vessels; these taxes made up 88.5 percent of all the Trust Fund's revenues in FY 2017. Fund balances have risen over time, reaching \$9.1 billion by September 30, 2017, as annual appropriations have consistently fallen short of revenues despite significant dredging needs in many harbors and ports. Further, tax revenues generated have little connection to the costs required to maintain the harbors, leading to concerns about the distribution of tax burdens across harbors. As in the case of the IWS, policymakers must assess the impact of collecting user fees or taxes on those who pay them but also on the Nation's transportation system as a whole.

More generally, the willingness of users to pay charges for access to different segments or facilities of the inland waterways system can signal

their appropriateness for investment, guiding future decisions about which segments or facilities managers should upgrade, maintain, and/or abandon. Indeed, given funding constraints, the Transportation Research Board (TRB 2015, 80) indicates that more consistent application of systemwide cost/benefit analysis—including ranking projects in order of urgency—would better prioritize construction projects. In practice, combining these options in the form of multipart tariffs may be the most promising approach to achieving revenue adequacy and sustainability, facility reliability, and economic efficiency. The President’s FY 2018 Budget includes a proposal to “reform the laws governing the Inland Waterways Trust Fund, including by establishing a fee to increase the amount paid by commercial navigation users of inland waterways.”

Conclusion

Policymakers have considerable scope and opportunities to shape the Nation’s growth prospects by improving its infrastructure. Making more efficient use of increased, higher-quality capacity can make meaningful contributions to economic growth. Under a range of assumptions, we estimate that a 10-year, \$1.5 trillion infrastructure investment initiative could raise average annual real GDP growth by between 0.1 and 0.2 percentage point. Although more funding may be needed from both public and private stakeholders to conduct such a program, this chapter has also discussed other levers and options available to policymakers, who must confront and manage the threats and opportunities around conventional uses of public infrastructure and sources of funds across varied sectors. For example, technological change and disruption in the transportation sector threaten conventional funding models for roads and transit services, and increased congestion and overuse of some assets suggests that the efficiency and revenue benefits of more creative and consistent implementation of congestion pricing will be considerable.

More generally, governments should be encouraged to generate needed revenues from user charges on those who benefit from publicly provided roads, water facilities, and other infrastructure. These user fees should reflect the true marginal costs of service provision, serving to increase allocative efficiency, provide signals about the value of future capacity additions and improvements, and raise needed revenues to defray the costs of provision. Policymakers should be sensitive to possible trade-offs among efficiency, equity, and revenue goals but recognize that nonmarginal-cost pricing distorts incentives and decreases overall surplus. Developing and incentivizing the use of value capture programs where appropriate would also increase available funding resources for infrastructure investment, as parties experiencing capital gains (e.g., increased property values) would help pay for the costs of the infrastructure investment responsible for these gains.

The Federal government also has other tools at its disposal. It can support the continued use of innovative financing options such as public-private partnerships and private activity bonds to increase the availability of investable dollars and lower the cost of debt service. And it can enhance the capabilities of State and local governments to allocate scarce investment funds efficiently by encouraging the use of cost/benefit analysis and continuing project selection by States and local governments whenever possible, allowing local officials to make infrastructure investments of greatest benefit to their constituencies. Better project selection will be important in driving growth throughout the country.

Finally, the Federal regulatory structure must adapt to ensure the pursuit of health, safety, and environmental goals without distorting investment incentives. Conflicting, unduly complex, and uncoordinated rules and regulations can impede investments in needed infrastructure and limit the productivity of existing assets, as described above in the context of water markets, rural broadband and 5G-wireless technologies, and the energy sector. Addressing these issues will take time but generate significant public benefits, and several recent Executive Orders and other regulatory actions begin that process.

On balance, with appropriate infrastructure funding, financing, and regulatory policies in place, the United States can look forward to a productive and prosperous 21st century.

Chapter 5

Enhancing U.S. Trade in a Global Economy

Trade across international borders has motivated economic analysts since at least the 19th century, when the economist David Ricardo invoked the example of wine in Portugal and wool in England to illustrate the principle of comparative advantage. But the economy, both in the United States and around the world, has changed since the days of David Ricardo and Adam Smith. Although the economics profession has converged toward a consensus on certain principles, the Administration's trade agenda also stands poised to update existing trade relationships in order to maximize the benefits that America's trade with the world generates for our citizens in the 21st century and beyond.

The United States, for instance, faces higher barriers on its exports in markets abroad than producers abroad face on their exports to the U.S. Nothing about the principle of comparative advantage would lend itself to a defense of a status quo that imposes higher barriers to exports on America's producers than on foreign producers.

The global trade system has come under strain due to the influence of countries, like China, that violate market principles and distort the functioning of global markets. When America's businesses and workers can compete in the global economy on a level playing field, however, our underlying dynamism will allow our economy to flourish. The Administration prioritizes its attempt to create the conditions that, according to the consensus principles in the economics literature, would maximize the benefits accruing to the United States—and produce gains for our trading partners as well.

Throughout America's history, trade has produced costs as well as benefits. In recent years, the economics literature has identified portions of the American population for whom the costs of recent trade expansions have exceeded the benefits. Even if fair and reciprocal international trade as a whole leaves the U.S. better off in the aggregate, this does not necessarily mean that the benefits of expanding trade flows leave all Americans better off. Indeed, new empirical evidence suggests that certain trade flows with China may have left some Americans worse off.

As the Administration continues to strengthen and update trade agreements and to pursue its trade agenda, however, the United States stands poised to capitalize on opportunities to reap the gains from trade that it has historically enjoyed. This Administration's focus on improving trade agreements will benefit American businesses and American workers across a variety of sectors—in particular, the U.S. energy and agriculture sectors possess comparative advantages and may be able to increase their exports to the rest of the world.

Analyzing the causes and consequences of trade across national borders has interested those who study economic activity for centuries. In the early 19th century, David Ricardo used hypothetical trade in English cloth and Portuguese wine to illuminate the principle of comparative advantage—the idea that by specializing and trading, both nations could be made better off, even if one were more efficient at making both products. Historically, international trade as a whole has on net increased American productivity, standards of living, and American economic growth. At the same time, however, international trade has imposed costs on some Americans.

In contemporary economics, trade is a mainstay field. Though questions persist about international trade, as in any other active field of economics, when it comes to the causes and consequences of trade, the economics profession has converged toward a consensus—in certain respects. This chapter starts by reviewing the sources of gains from trade and the central importance of comparative advantage, which are areas of universal professional agreement. U.S. trade is then placed in the context of the global economy, including an economic perspective on international trade balances.

The chapter's second section examines how the gains from trade are divided between countries. Trade flows are primarily determined by economic fundamentals like comparative advantage and geography, but policy can also play an important role. Trade agreements are the major set-pieces of modern trade negotiations and, as such, deserve analysis and consideration. Bagwell and Staiger (2001) assert that trade agreements exist to allow nations to commit to a positive-sum approach to trade; Grossman (2016) enumerates the possible political economy incentives of trade agreements, including efficiency gains among parties, improved terms of trade between parties relative to nonmembers, facilitation of multilateral trade liberalization, and provision of rents to special interests. The commitment embodied in agreements is multi-dimensional. In addition to formal trade barriers such as headline tariffs and import quotas, terms of contemporary international trade also depend on such instruments as nontariff barriers. Trade agreements can have an impact on these measures and can offer an important opportunity to create and maintain foundational ground rules in important areas, including intellectual property rights, labor, and environmental protections. These areas can be critical insofar as international trade can cover several areas that complement and also go beyond the reach of national law, so trade agreements offer an opportunity for trade to operate under rules that promote a level playing field.

In addition to the division of economic surplus between countries, evolving trade patterns can affect the division of gains within countries. Even if a given country has strong trade agreements and experiences positive net gains from trade as a whole, these conditions do not necessarily imply that all its citizens are better off from trade; for instance, though consumers may enjoy lower prices and greater product variety, workers for firms that fail to withstand import competition may find themselves displaced from the labor force. This displacement can have dramatic distributional effects on workers and geographies. The third section identifies the impact of trade on U.S. consumers and workers. A primary concern about trade and trade policy is how the economic surplus created by trade is shared between different segments of the population.

The fourth section examines specific existing trade opportunities for the U.S. in the agricultural and energy sectors. U.S. farmers—benefiting from access to plentiful land, rapid technological development, and well-functioning capital markets—have long exported their excess production. Thanks largely to our Nation's world-leading technology, its refined petroleum products, crude oil, and now increasingly natural gas are available for export around the hemisphere and the globe. The United States also has the largest coal reserves in the world, and could increase its international shipments. Energy exports are a crucial component of the Trump Administration's vision of energy dominance.

The United States is now actively improving its trade agreements to ensure that its trade with its international partners maximizes the net benefits

for the United States. The chapter's fifth and final section thus discusses how new and renegotiated agreements can help shape and improve trade policy.

The Economics of Trade

The international trade literature has highlighted many circumstances in which trade leaves both nations better off. Consider the elegance of the insight expressed in the principle of comparative advantage: People and nations are not equally skilled at all things; but, by specializing in the activities at which they are *relatively* most productive, individuals and nations can enrich themselves by trading the surplus generated from higher productivity for a share of the other goods and services they desire.

In selecting international trading partners, firms are likely to choose their nearest neighbors to minimize transportation costs. Larger nations also make desirable trading partners, because they can produce a wide variety of goods and services that might be attractive and they offer larger markets for exports. These observations are the basis of the “gravity” model of trade—nearer and larger objects exert greater gravitational force on each other (Melitz 2003). Thus, nearer and larger nations are likely to have more trade with one another, all else being equal. We may import exotic goods from the far reaches of the globe, but most trade is likely to be with our neighbors and other large economies.

Expanding the United States' links abroad can offer the advantages of competition: increased productivity, greater economic growth, increased innovation, lower prices, and more variety. New markets may not only provide domestic firms with more potential customers than are available in the local market and a chance to build economies of scale; they also offer the ability to purchase lower-cost inputs—so each can enhance their competitive position. Consumers—and disproportionately, low-income consumers—may benefit as import competition fosters innovation and product differentiation, as well as drives down the prices of goods and services.

The United States has long maintained a policy of encouraging greater economic freedom for all people of the world, with opportunities for free trade as a central tenet of this policy. But not all nations maintain these same policies, and this can distort global markets. Today, for instance, China challenges this U.S. policy and the world order it has engendered through its simultaneous maintenance of a growing domestic market and market-distorting initiatives, like industrial policies.

U.S. Trade in the World Economy

The scope for trade policy is constrained by the natural economic forces that determine trade flows, like geography, resource endowments, and comparative advantage. Although a nation cannot choose its neighbors, its government

can serve the interests of its citizens by shaping a trade policy that respects inherent economic forces. Trade agreements play an important role in allowing nations to commit to specific policies. Two countries might use a trade agreement to mutually obligate to lower tariff schedules, improving their joint welfare. Without the agreement, each would face a unilateral incentive to impose tariffs on the other, potentially to prohibitive levels that would leave the gains from trade unrealized. By the same logic, the agreement provides the partners with opportunities to negotiate over other, nontariff measures that can be substantial impediments to trade. Agreements are legal instruments that facilitate and establish the institutional underpinnings of exchange, including important considerations such as respect for property rights.

The United States is endowed with factors that provide a comparative advantage for a number of products. But this advantage can and does evolve, and technological change is an important driver of its evolution. Consider a hypothetical situation faced by a State supplying its own energy needs with oil and exporting the excess. When a neighboring State discovers a new oil deposit with lower production costs, it could make sense for the first country to quit extracting oil and buy it from the second one (and thereby save its remaining oil deposits for future generations).

The U.S. economy has changed markedly over time. In the early years of the Republic, agricultural colonies struggled to establish manufacturing for a domestic market. Later, the products of these manufacturers became exportable. In recent decades, the economy has shifted again, as figure 5-1 shows, away from manufacturing and toward service provision industries. Buera and Kaboski (2012) find that the rise in the services share of the U.S. economy has been driven by greater demand for the high-skilled labor that is associated with the country's rising income per capita. Developing economies, including China and India, are likewise making a rapid transition to service dependence as their income per capita also increases. Economists sometimes call service industries "nontradable," because a physical presence is generally required; for example, it is difficult to trade internationally in snow plowing. But technological change is opening new frontiers in service trade, both through online platforms and also via the expanding range of tradable services, like in financial management, consulting, and engineering. Perhaps in the future, satellite-controlled drones will plow snow, creating a new opportunity for international trade.

Traded goods and services have constituted a growing share of U.S. gross domestic product (GDP) over time. From 1970 to 2015, the U.S. economy grew threefold, but the total value of goods and services traded internationally increased nearly eleven times in real terms. Indeed, trade and economic growth are strongly and positively correlated. Frankel and Romer (1999) estimate that a 1-percentage-point increase in the ratio of trade to GDP raises per capita income by between 0.5 and 2 percent. This increasing economic reliance on trade makes trade policy critical to the future economy. It also means that

Figure 5-1. Goods versus Services Value Added and Employment

Percentage of GDP/private nonfarm employment

Sources: Bureau of Labor Statistics; Bureau of Economic Analysis; CEA calculations.

the health of the global economy now matters more to the U.S. economy than it did historically; rising GDP among our trading partners promotes U.S. export growth. Although, in comparison with other major industrialized countries, the United States has an economy that is less dependent on trade, the trends apparent in figure 5-2 reflect a general increase in international trade among developed economies.

The United States' stance on trade has evolved throughout its own history. In the late 19th century, the United States relied on high tariffs by today's standards—in the neighborhood of 30 percent. Tariff revenue accounted for roughly half of Federal revenue from the time of the Civil War until the income tax was imposed in 1913 (Irwin 2010). The Tariff Act of 1930 has a legacy of unintended consequences stemming from limited policy and monetary instruments at that time, lower economic integration than today, exchange rate frictions, and unilateral trade policy (Irwin 2011). For the last 70 years, the United States has advocated freer trade around the world, originally through the General Agreement on Tariffs and Trade (GATT) framework, and later the World Trade Organization (WTO).

Assessing the Gains from Trade

Economists agree that trade can deliver net gains for all nations involved, but debate continues about the best way to identify and to assess these gains, as well as to diagnose opportunities for improving trade policy. Trade affects a

Figure 5-2. Trade Relative to GDP for the OECD and the United States, 1970–2015

wide variety of outcomes—from national income accounts and trade balances, to customs receipts and deliveries of foreign merchandise. One way to assess the distribution of gains between trading partners is to examine the balance of trade. If a country exports more than it imports, it runs a trade surplus; but if it buys more foreign goods and services than it sells, that surplus becomes a deficit. This is true for each bilateral trading relationship, as well as for the aggregate across all trading partners.

Exports and imports of goods and services are components of the U.S. balance-of-payments accounts, which are also known as international transactions accounts. There are three accounts: the current account, the capital account, and the financial account.¹ The current account includes international transactions in goods, services, and income. The income component includes primary income transactions like investment income, employee compensation, and income from reserve assets, as well as secondary income transactions that consist of transfers between U.S. residents and nonresidents. These transfers include government transfers and foreign remittances. The current account balance of the United States reflects earnings on U.S. corporations' foreign direct investment, whether repatriated or reinvested abroad.

¹ The United States closely adheres to international standards (BPM6) for balance-of-payment accounts, with some subtle differences. One salient difference is not adopting new guidance to account for value added on goods in integrated supply chains as service imports, due to data availability concerns. See BEA (2014) for the details. Some readers may recall previous standards (BPM5 and earlier), which merged the capital and financial accounts.

The capital account includes capital transfers and transactions of nonfinancial assets. Capital transfers involve transfers of assets (other than cash or inventories), whereas nonfinancial asset transactions largely cover intangibles such as sales of trademarks or other contracts. The financial account includes several types of investment and monetary reserves: direct and portfolio investments, and currency reserves. Financial account transactions, unlike those in the current account, can change the value of a tradable asset without changing the income or savings for either trading partner.

How can a country afford to run a trade deficit? Because the current account balance largely reflects the trade balance, the current account deficit largely reflects the trade deficit. To sustain a current account deficit, the country must be able to attract investment that offsets the currency depreciation that would normally make imported goods more expensive and exported goods cheaper in foreign markets. To sustain a trade deficit, a country must attract foreign investment to help finance the cost of buying foreign goods. The currency provided by foreigners for investment—for example, in the form of government bonds—comes from net imports of goods and services, which is equivalent to a bilateral trade deficit. The United States has been able to sustain a trade deficit in part because of the role of the U.S. dollar in the global economy (McKinnon 2001); foreigners are happy to hold U.S. dollars and dollar-denominated assets, which they obtain by selling more goods and services to Americans than they buy.

Through the third quarter of 2017 (hereafter, 2017:Q3, etc.), the United States ran a current account deficit of \$338 billion. The trade deficit during the same period was \$414 billion, chiefly made up of the \$597 billion deficit in goods alone; the trade surplus in services was \$183 billion, and the nontrade elements of the current account (income balances) had a surplus of \$75 billion.

Figure 5-3 shows the evolution of the goods-alone trade balance since 1976, a period when the balance has always been a deficit. GDP has grown more than trade flows over time, resulting in the merchandise trade deficit as a share of GDP stabilizing below peak historic levels, near 6 percent.

The largest share of the current account deficit is goods trade; the United States has imported more goods than it exported in every quarter since the first quarter of 1976. This contrasts sharply with the period from 1960:Q1 to 1976:Q1, when the United States ran a merchandise trade surplus in 52 out of 65 quarters.

The sustainability of a country's external position with respect to the world, and consequently trade and foreign policy, depends on the source of the deficit and on whether current account balances are perceived to be sustainable. If the current account is in deficit because foreign debt is being funneled into high-return domestic investment, then the external deficit may not be of much concern. But an overvalued exchange rate or an excessive level of public or private consumption—which could indicate fiscal profligacy or a

Figure 5-3. U.S. Goods-Along Trade Balance and Share of GDP, 1976–2017

Source: Bureau of Economic Analysis.
 Note: SAAR = seasonally adjusted annual rate.

consumption binge—are sources of current account deficits that are of more concern. Fortunately, policy can address the latter set of issues to bring the resulting trade deficit more into line, because the books have to balance.

One important corrective mechanism for persistent current account imbalances is the adjustment of exchange rates, that is, the value of foreign currency that can be purchased for \$1. Continual deficits should result in a depreciation of the U.S. dollar relative to other currencies, all else being equal. This depreciation would naturally make imports more expensive for U.S. purchasers and would make U.S. exports less expensive for foreign buyers, bringing the current account back closer to balance by increasing U.S. exports and decreasing U.S. imports. However, the U.S. dollar is the world’s reserve currency, which appreciates the dollar and dampens the natural correction to trade balances (McKinnon 1982). Reserve currency status offers important benefits that should be weighed against the monetary costs for trade policy.

The aggregate trade balance is an important component of the current account balance, which reflects the excess of domestic savings over domestic investment. If a country invests more than it saves, or imports more than it exports, it finances the resulting deficit through foreign borrowing. Such borrowing appears in the financial account, which must balance the current and capital accounts. Because the relationship is definitional, policies that try to affect the trade balance without considering the broader current account balance, or vice versa, will be hard-pressed to succeed in the long run. Trade

policy focused on trade balances must be linked to current account policies (figures 5-4 and 5-5).

A contributing factor to the U.S. goods trade deficit is the strength of the dollar against other major currencies, which places downward pressure on demand for U.S. exports. The contemporary large trade deficit is not entirely unprecedented historically; as recently as the 1980s, the United States faced “twin deficits” of concern—trade and the government’s budget—as have weaker European economies in recent years (Trachanas and Katrakilidis 2013). The current account reflects the balance of government, private, and corporate deficits; as any of these components expands, the current account reflects the change.

Earlier historic periods, including the gold specie standard era before World War I and the times of the oil shocks of the 1970s, have been characterized by large trade imbalances around the world. Even today, the United States is not alone in concern over structural imbalances. Fiscal and monetary policies may be more important than trade policies in determining the magnitude of trade balances (Bracke et al. 2010). The distribution of trade balances across trading partners is attributable to a variety of factors that are idiosyncratic to individual countries.

Figure 5-6 illustrates the distribution of goods and services balances across major U.S. trading partners in 2016. All countries show a services surplus offsetting a goods deficit, with the U.S. running a net bilateral surplus only with Canada and the United Kingdom.

The United States has a bilateral goods deficit and a services surplus with many of its major trading partners. Overall, the United States has a goods deficit and a services surplus with the world. The services surplus is consistent with the structure of the private sector, which has evolved during the last few decades toward more services output as a share of GDP. Many other advanced economies have seen a similar evolution. Among its bilateral trade balances in 2017, the U.S. had the largest goods deficit (through 2017:Q3) with China, at \$277 billion (1.44 percent of U.S. GDP); and it had the largest services surplus (through 2017:Q3) with the European Union, at \$36.6 billion (0.2 percent of U.S. GDP). Comparing the first three quarters of 2017 with the same period of 2016, the bilateral U.S. goods and services trade deficit narrowed with Brazil, India, Singapore, and South Korea.

U.S. Trade Balances in Perspective

Figure 5-7 illustrates the U.S. trade balance from 1790 to the present, expressed as a share of GDP. From 1790 through 1873, the U.S. trade balance was volatile, in part due to the low trade volumes (Lipsey 1994). The trade balance swung back and forth between surplus and deficit, but was mostly in deficit. From 1873 through the 1960s, the trade balance was mostly in surplus. The largest historic surpluses were during the years 1916–17 and 1943–44, as wartime

production and trade with allies predominated. Since 1976, the trade balance has been continually in deficit. The largest deficit as a share of GDP was nearly 6 percent in 2006, a share exceeded in only six other years in U.S. history and not seen since 1816.

Trade policy is not randomly assigned but evolves endogenously; the United States is more likely to reach trade agreements with countries with which it has large trade volumes (Baier and Bergstrand 2007, 2009). Although trade agreements are associated with about twice as much overall trade, the causal impact on the trade balance is unclear, in part because agreements are more likely with countries that would otherwise have higher trade volumes. Nor does the presence of an agreement predict the balance of trade. The United States has free trade agreements (FTAs) with a number of countries—some of which represent net trade surpluses for the United States (Canada and Singapore), and some of which represent deficits (Mexico and South Korea).

This becomes immediately evident when comparing other countries' trade balances with their volume of total trade with the United States. In 2016, the United States ran a trade surplus of \$2.6 billion with Canada on a balance-of-payments basis. The U.S. trade deficit with Mexico was \$52.2 billion in 2017 through the third quarter, a deficit similar to countries further afield and without FTAs—including Japan (\$42.1 billion), Germany (\$51.7 billion), and India (\$21.0 billion)—over the same quarters. Figure 5-8 illustrates the distribution of trade balances between major U.S. trading partners. The horizontal axis is

Figure 5-7. Trade Balance as a Share of GDP, 1970–2016

the trade balance, and the vertical axis is the trade balance as a percentage of bilateral trade. The plotted countries account for 98 percent of the United States’ total trade balance and 84 percent of the goods-alone trade balance.

Services Trade

In contrast to goods, the United States’ trade in services contributed a surplus of \$183.1 billion through 2017:Q3. The U.S. economy has grown more dependent on private service-producing industries, which accounted for 68.9 percent of U.S. economic output value added during the same quarters in 2017. Focusing only on the trade in goods alone ignores the United States’ comparative advantage in services, which rose as a share of U.S. exports to 33.5 percent through 2017:Q3. Travel (including that for educational purposes) has constituted the largest share of U.S. services exports. Services trade between countries has continued to grow—given declining travel costs, improvements in telecommunications, and growth in online services that allow, for example, computer coding to take place in remote locations. This allows the United States to export high-skilled services to other countries that do not share our expertise and training advantages.

There are important limitations in the evaluation of service trade data, both because of the intangibility of services and data-related issues. Although goods trade exists in a physical form that is inherently quantifiable—for

Figure 5-8. U.S. Bilateral Trade Balances with Major Trading Partners, 2016

Sources: Bureau of Economic Analysis; CEA calculations.
 Note: Trade data are on a balance-of-payments basis. Red points indicate parties with bilateral or multilateral free trade agreements with the United States.

example, using customs records and shipping manifests—services trade is harder to measure because there is no similar record produced as the service is provided. It can also be difficult to assign industries in the service sector because services can often fall into multiple industry categories, given that services trade data are called by the type of service traded rather than the industry of the supplier.

The Bureau of Economic Analysis (BEA) collects services trade data, primarily using data from surveys of U.S. companies and data from other government agencies. BEA does not publish data for all bilateral service trade relationships, largely because of source data limitations on geographic detail and data confidentiality laws.

Services trade data produced in different countries are difficult to compare because the use of different definitions and estimation methods can result in incompatible bilateral trade balances. Both the United States and the European Union reported a trade surplus with each other from 2010 through 2015; in 2016, both reported a U.S. trade surplus, though there was a discrepancy in the level of \$54.8 billion on a balance of payments. This asymmetry was largely due to differing measure of financial and other business services. The United States reported \$67.6 billion in service exports to the United Kingdom in 2015, while the U.K. reported \$21.2 billion in service imports from the United States. Some of the discrepancy is definitional, as the United States includes the Channel Islands and the Isle of Man, which the United Kingdom omits.

This difference on asymmetries is likely small for most services, but could be larger for financial services, because offshore financial centers are located on the Channel Islands (BEA 2017b). However, the Channel Islands are unlikely to account for the difference of \$46.4 billion.

The Department of Commerce, in coordination with the Office of the U.S. Trade Representative and the International Trade Commission, is working with America's foreign counterparts to develop the next generation of trade statistics. This effort aims to fill the need for more complete measures of services trade flows as services grow in relevance for the United States, complementing other efforts to regularize services trade.

Dividing the Pie: Defining Fair Trade between Countries

The United States is the most innovative and dynamic economy in the world, which can provide an enormous advantage in trade. Nonetheless, the question of whether existing trade policies are beneficial to the United States is a question distinct from the question of the underlying dynamism of the U.S. economy. But before considering how trade agreements might be amended to level the playing field and maximize the benefits of trade for the United States, the first task is to identify how current trade patterns are attributable to policies that disadvantage the United States.

The United States has played a leading role in building and maintaining the modern international trade architecture that reduces barriers to trade through both multilateral and bilateral channels. The United States is a founding member of the World Trade Organization, which now includes 164 member economies, which together represent 98 percent of global GDP and 95 percent of global trade. Under the WTO, the United States is party to a wide variety of agreements on trading rules regarding agriculture, antidumping, civil aircraft, customs valuation, dispute settlement valuation, government procurement, import licensing, intellectual property (i.e., under the Agreement on Trade-Related Aspects of Intellectual Property Rights, TRIPS), preshipment inspection, protocol of accession, rules of origin, safeguards, sanitary and phytosanitary measures, services (i.e., the General Agreement on Trade in Services, GATS), subsidies and countervailing duties, technical barriers to trade, and trade-related investment measures. WTO member countries generally set tariffs no higher than negotiated most-favored-nation rates and apply nontariff measures subject to these agreements.

The United States is party to two plurilateral FTAs encompassing eight countries in total—including the North American Free Trade Agreement (NAFTA) with Canada and Mexico; and the Dominican Republic–Central America FTA (CAFTA-DR) with Costa Rica, the Dominican Republic, El Salvador, Guatemala, Honduras, and Nicaragua. These plurilateral trade agreements

virtually eliminate tariffs on trade among partner countries and set standards to reduce nontariff measures. The United States is party to a further 12 bilateral FTAs, including with Australia, Bahrain, Chile, Colombia, Israel, Jordan, Morocco, Oman, Panama, Peru, Singapore, and South Korea. These FTAs virtually eliminate tariffs over time and set standards to reduce nontariff measures. Among the United States' FTA partners, Canada, Mexico, and South Korea were the top U.S. export destinations in 2016, constituting over 29 percent of U.S. exports, as shown in red in figure 5-9.

The United States also has in place bilateral investment treaties (BITs) with 40 countries, which aim to “protect private investment, develop market-oriented policies in partner countries, and promote U.S. exports” (USTR 2017b). The United States also participates in two sector-specific trade agreement negotiations: (1) Trade in Services Agreement (known as TiSA), an FTA that focuses on services, with 23 countries representing 70 percent of the world's services market and (2) the Environmental Goods Agreement, which seeks to eliminate tariffs on environmental goods such as wind turbines and solar water heaters, with 17 parties representing 90 percent of global exports in environment goods.²

Outside the WTO, FTA, and BIT systems, the United States also provides preferential tariff treatment to promote international development goals. The General System of Preferences (GSP) offers duty-free access to the U.S. market for 120 designated countries and territories, covering at least 20 percent of the tariff schedule for all GSP beneficiaries. This access is conditional on compliance with eligibility criteria including adequate and effective protection of intellectual property rights, taking steps to afford internationally recognized labor rights, and assurances of access to markets for U.S. goods and services. In 2016, U.S. imports under GSP were valued at \$19.0 billion, accounting for 0.7 percent of total U.S. imports of goods and services. India, Thailand, Brazil, Indonesia, and the Philippines exported the largest amount of GSP goods by value in 2016, while smaller countries such as Georgia, Armenia, Lebanon, and Tunisia relied most heavily on GSP as a share of their exports to the United States. The list of GSP beneficiary countries periodically changes based on factors such as countries' compliance with GSP criteria or through “graduation” from the program as beneficiary countries achieve high-income status. For example, in 2017, the U.S. announced its intention to terminate Ukraine's benefits under the program and to reinstate some of Argentina's benefits (*Federal Register* 2017). The GSP program expired on December 31, 2017. As a result, imports that were previously eligible for duty-free treatment under GSP are now subject to regular duties.

² The negotiating parties to the Environmental Goods Agreement are Australia, Canada, Chile, China, Costa Rica, the European Union, Hong Kong, Iceland, Israel, Japan, New Zealand, Norway, Singapore, South Korea, Switzerland, Taiwan, and Turkey.

Figure 5-9. U.S. Exports of Goods and Services, by Destination, 2016

Sources: Bureau of Economic Analysis; CEA staff calculations.
 Note: U.S. FTA partners in red; export levels (billions of dollars) are shown above the bar.

The GSP list is not the only trade “preference” program to benefit less-developed countries. The United States also offers duty-free entry for almost all goods to designated sub-Saharan African countries under the Africa Growth and Opportunity Act (AGOA). These countries accounted for \$20.1 billion of total U.S. goods imports, 0.9 percent of total U.S. imports in 2016. AGOA is set to expire in 2025. A third program, the Caribbean Basin Initiative, offers duty-free treatment for goods imported from eligible Caribbean island and littoral countries and territories. A fourth program for Nepal was launched in 2017.

The United States also maintains bilateral and multilateral dialogues on trade and investment issues with trade partners under Trade and Investment Framework Agreements (TIFAs). In the absence of FTAs with these countries, TIFAs or equivalent agreements offer a forum to discuss trade-related issues such as on market access, labor, the environment, intellectual property right protection and enforcement, and capacity building. The United States currently has 18 TIFAs with Asian countries, 14 with Middle Eastern countries, 12 with African countries, five covering 19 North and South American countries, and five with European countries.

These agreements cover a broad range of countries and issues. But what do trade agreements do? How do they become so important to American firms, consumers, and workers? To consider these questions, it is helpful to focus on several dimensions of trade policy that are fundamental to trade agreements: formal trade barriers are one important lens, but contingent antidumping

and countervailing duties are also illustrative. Increasingly important over time are non-tariff barriers that include technical barriers to trade and other provisions that are implemented “behind the border.” A third area of focus is on institutional frameworks that create the “rules of the game” to bridge trade gaps between national and international law, like intellectual property rights.

Trade Barriers

Barriers to trade block the access of foreign producers to domestic markets. Common examples include tariffs (i.e., taxes levied on imports), quotas, import licenses, and other mechanisms that limit access to the domestic market. By altering the marginal costs of domestic and foreign production, trade barriers can distort the free allocation of capital and prevent producers from specializing in areas of comparative advantage. Under WTO rules, tariffs can be imposed on all goods arriving in a country, regardless of where they originate, subject to members’ commitments. Trade barriers can also be set contingently, in response to unfair trade practices. For example, dumping occurs when a foreign firm exports at less than its manufacturing cost, undercutting domestic producers. Government support through subsidies can provide an unfair advantage to foreign producers and thereby place domestic producers at a disadvantage. In response, U.S. law allows for antidumping or countervailing duties in order to address unfair trade practices like these, depending on the cause of the injury, and they are an important tool for modern trade policy.

The United States has led contemporary multilateral efforts to promote trade liberalization. Eight rounds of trade negotiations under the GATT and its successor, the WTO, have contributed to the reduction in average applied tariffs in the world’s major industrial economies from more than 20 percent in the late 1940s to about 4 percent today.

In general, countries do not have one tariff rate for all products, instead using tariff schedules that differentiate between products. There are exceptions. Chile and the United Arab Emirates, for example, levy the same tariff on almost all imported products—but most countries discriminate by product. This practice is WTO-admissible, provided that the tariff applies uniformly to all members. The average tariff rate across thousands of products for any given economy can be used to measure the degree of protectionism. Average tariff rates, while often less than 5 percent in industrialized economies, are much higher in less-developed economies. This gap may be partly attributed to nonreciprocal preferential tariffs offered to less-developed economies and the relatively greater importance of trade policy to generate revenue for lower income countries (UN 2016).

Within the WTO system, tariffs can be classified into two broad categories: most-favored-nation (MFN) and preferential. MFN tariffs are levied by WTO member countries in a non-discriminatory manner—all other member states pay the same tariff for the product, unless they belong to a shared preferential

trade agreement. Lower preferential tariffs are determined in trade agreements outside the WTO. Members of certain preferential agreements—such as the South African Customs Union, the European Community, and NAFTA—pay tariff rates close to zero in their joint trade of all products.

Although the United States imposes among the lowest barriers to trade in the world, substantial formal barriers remain in place elsewhere—especially in developing countries—despite the progress the international community has made to open markets.³ Figure 5-10 uses estimates from Kee, Nicita, and Olarreaga (2008, 2009) to compare the trade barriers different regions face and impose by calculating the uniform tariff rate consistent with observed trade flows. The indices account for both tariffs and selected non-tariff measures, and thereby capture a richer dimension of trade policy than tariffs alone.

As shown in figure 5-10, U.S. exporters face formal barriers nearly three times higher than those the United States imposes on importers, and nontariff barriers imposed on U.S. exporters are 36 percent higher than those faced by importers to the United States. The United States imposes lower trade barriers than other high-income, emerging, and developing countries as a group, and U.S. exporters face higher barriers to trade than exporters in those countries; taken together, these indices summarize the prevailing imbalance the United States faces regarding trade restrictions. The figure also shows that emerging and developing economies in the figure impose higher tariffs than the markets their exporters target.

Given that tariffs differ across countries, one pertinent policy question is what is the “right” level of tariffs? The disparity between formal barriers for U.S. imports and exports could imply that the United States should erect higher trade barriers, or could imply that other countries should lower theirs. Multilateral institutions have developed with the ostensible goal of moving all countries closer to the example of the United States and other industrialized countries. But terms of trade are not equal, and tariffs are one way to equalize those imbalances. As an example, countries impose tariffs that average 9 percentage points higher for imported products for which the quantity varies little with price (Broda, Limao, and Weinstein 2008). In comparison with the average rates shown in figure 5-10, 9 percentage points is a large change. The economic intuition is straightforward—if exporters are not price-sensitive, then they will bear a greater share of economic costs of imposing the tariff, rather than domestic consumers. Higher barriers may be met by higher barriers in retaliation, or they may be met by horizontal integration and less trade.

³Contemporary U.S. tariff rates are low compared with historic norms. As a point of comparison, the average ad valorem rate for imports into the United States in 1913, the last year when tariffs remained the major source of U.S. Federal revenue, was 41 percent; in 1931, after enactment of the tariff-raising Smoot-Hawley Act, the average ad valorem rate was 53 percent.

Figure 5-10. Trade Barriers around the World

Sources: World Bank; World Trade Indicators; other high-income G20 and emerging G20 nations are listed in table 5-1.
 Note: NTM = nontariff measures. Developing countries refers to selected non-G20 countries with pop 50 million and with sufficient data available to calculate trade restrictiveness: Egypt, Ethiopia, Nigeria, Pakistan, the Philippines, Thailand, and Tanzania.

Tariff Overhangs

WTO member countries negotiate bound tariff rates, or the maximum allowed tariff rates, across products. They can (and do) apply lower tariff rates in practice, provided that all member countries receive the same treatment. Non-WTO members can apply whatever tariff rates they choose, but their exporters do not benefit from the market access rights and formal dispute-settlement provisions available to members.

Table 5-1 summarizes tariff policies of selected economies; countries are split into three groups: high-income members of the Group of Twenty, emerging economies of the G20, and other less-developed nations with populations of more than 50 million in 2016. Table 5-1 displays the degree to which tariff rates and trade barriers vary across individual countries and products. Agricultural goods remain among the most protected in the world, while the treatment of nonagricultural goods typically varies by type.

Two categories of MFN tariff rates can affect the flexibility of trade negotiations. The *bound* tariff rate is the maximum tariff rate allowable under WTO agreements that can be levied on a given product. The *applied* tariff rate is what is actually levied, and is generally equal to or lower than the bound rate. In practice, applied rates are often much lower than bound rates—particularly when members commit only to high bound rates—with the difference between these two called the “binding overhang.” The binding overhang provides a

measure of the negotiating room countries have within international trade agreements to gain concessions through altering formal trade barriers.

As shown in table 5-1, the United States—as a founding member of both the GATT and WTO—applies a “simple average” MFN tariff of 3.5 percent to imports from other WTO members, almost the same as the simple average bound rate, according to WTO tariff data. On a simple average basis, the United States has effectively zero overhang, and therefore very little flexibility to negotiate on trade barriers within the existing WTO architecture. (This situation is similar to that of the EU, which applies a simple average tariff rate of 5.0 percent, the same as its simple average bound rate, according to the same WTO data.) As shown in table 5-1, binding overhangs are typically larger for even other advanced economies, and much larger for emerging and developing countries, affording them more negotiating room. The table also confirms that binding coverage, or the share of tariff lines that are bound at the WTO, approaches or equals 100 percent for most of the world’s major industrialized economies.

Observed differences in protectionism are at least in part explained by differential rates of liberalization over time. The United States has historically led by example, binding nearly all its tradable goods at the WTO at very low levels. Other countries—including India and Brazil, both GATT signatories since 1948—have been far less open, preserving high bound rates and avoiding universal binding coverage. Another reason for heterogeneity in tariff policy is the WTO practice of permitting developing and emerging economies to apply higher trade barriers. Tariff liberalization has not kept pace with rapid industrialization among emerging economies, suggesting the need for a serious reconsideration of permissible tariff differentials. More simply, it could be that U.S. leadership has failed to convince other countries to follow suit with respect to liberalization. Unilateral tariff reductions, used rarely in the United States, might be a superficially good way to establish a globalized order, but it leaves the United States with less leverage to renegotiate formal trade barriers that remain quite high in certain corners of the world.

Trade barrier policies among high-income countries *do* display a considerable amount of heterogeneity with respect to tariff peaking, or instances where MFN rates on certain products exceed 15 percent. Among other high-income members of the G20, only Australia and Saudi Arabia display fewer instances of applied tariff peaking than the United States, although both have higher bound levels and tariff overhangs. In an extreme example of tariff peaking, South Korea applied an MFN base tariff of 800.3 percent to imports of “cereals, groats, [and] meal” before the signing the Korea-U.S. FTA (USDA Foreign Agricultural Service Agricultural Tariff Tracker). In another extreme example, Egypt applies a 3000 percent tariff on alcoholic beverages (U.S. Department of Commerce 2017). Binding coverage tends to be far lower for countries in the developing

Turkey	10.9	28.5	50.3	43.2	2.6	5.5

world and is even relatively low for India. Tariff peaking likewise tends to be higher among emerging and developing economies.

Responses to Unfair—and Not-So-Unfair—Trade Practices

Antidumping and countervailing duties (AD/CVD) are targeted measures imposed by countries in response to unfair trade practices that lower prices below market value, harming the domestic industry. Most recently formalized in the Uruguay Round Agreement in 1994, AD/CVD orders have been widely applied in particular by low-tariff advanced economies like the United States and EU member states (Prusa 2001), although India has been the most frequent user of antidumping measures, according to the U.S. International Trade Commission (USITC 2010). The WTO Anti-Dumping and Subsidies/Countervailing Measures Agreements establish discipline regarding AD and

Note: This framework follows Bagwell, Bown, and Staiger (2016). All data pertain to year 2016, except where indicated by parentheses. *Selected other developing countries chosen as those with 2016 populations greater than 50 million. **Indicates nonuser (or unreported user) of the policy instrument. NA = not available. G20 = Group of 20. † Indicates WTO nonmember. MFN applied rate may be higher than the bound rate because of measurement issues arising from aggregation of HS codes and conversion of specific duties.

CVD actions, permitting the imposition of duties when there is evidence of dumping or unfair subsidies

Safeguard actions are likewise contingent, but do not require any allegation of unfair trade practice. Rather, safeguards—which are covered under the WTO Safeguards Agreement and U.S. law—are meant to afford domestic industry a period of adjustment to an environment of increased imports, via temporary import restrictions.⁴ In January 2018, President Trump approved U.S. Trade Representative (USTR) recommendations for two new safeguard measures—one for certain crystalline solar photovoltaic products and a second

⁴ The Tariff Act of 1930 allows the United States to impose AD/CVD orders. In the United States, AD duties are calculated using the difference between the actual price and the market value price. Countervailing duties address government assistance/subsidies and are calculated to equal the value of the subsidy (U.S. Customs and Border Protection 2017). As of January 23, 2018, the United States had 427 AD/CVD orders in place—the largest share of them targeted China (157), or concerned iron and steel products (222).

for large residential washing machines—the first completed safeguards investigations in the United States in 17 years.

Patterns of contingent trade cases provide insight into which countries' practices are most at odds with established rules. Since 1995, WTO records show that member countries have filed 344 AD and 50 CVD cases against China; indeed, as shown in figure 5-11, from 2001 to 2015 China was named as the respondent in over 29 percent of all such cases, the highest of any WTO member. In addition, between 2002 and 2015 China has also been subject to 32 specific safeguard actions at WTO. These statistics suggest that other WTO members recognize that China often uses trade tactics that others find objectionable.

Economic studies find that AD/CVD orders are effective insofar as targeted imports tend to decline after measures are imposed (Prusa 2001; Besedeš and Prusa 2017). However, despite their wide and targeted use, AD/CVD actions do not always have the desired effect. For example, investigations into the trade in crystalline solar photovoltaic (CSPV) cells and modules have resulted in two sets of AD/CVD being imposed on China and one AD duty on Taiwan in the past five years. Similarly, the U.S. government imposed import restrictions on large residential washer imports from South Korea (2013), Mexico (2013), and China (2017). As evidenced by the recent safeguard cases, neither set of actions sufficiently decreased import penetration. (Box 5-1 gives further details about the solar case.) Still, AD/CVD actions can have real repercussions. In retaliation to AD/CVD orders for solar products, China imposed a retaliatory set of duties on imports of solar-grade polysilicon from the United States, South Korea, and subsequently the EU; this polysilicon is a key input in the manufacture of solar cells, and retaliatory duties directed toward U.S. exports were at least 53.30 percent.

Nontariff Measures

Even though they attract the most attention, tariffs are just one type of trade barrier. Returning to figure 5-10, in many cases they account for less than half of the total trade restrictiveness of a given nation. As multilateral, regional, and bilateral efforts around the world have succeeded in lowering headline tariff rates, other types of barriers have emerged as significant impediments to international trade. These include a broad array of measures, interchangeably referred to as nontariff barriers and nontariff measures. According to the United Nations Conference on Trade and Development (UNCTAD), they are generally defined as policy measures other than customs tariffs that can have an economic effect on international trade, a broad classification that is further grouped into technical and nontechnical measures.

Technical measures include technical barriers to trade (TBT) and sanitary and phytosanitary (SPS) measures. TBT measures cover technical regulations and procedures that assess conformity with technical regulations and

Figure 5-11. Antidumping Measures, 2001–15

Number of measures as respondent country

Source: World Bank, Global Antidumping Database.

standards, except those covered by the SPS Agreement (UNCTAD 2012). They establish labeling requirements, standards on technical specifications and quality (e.g., product weight and size), other measures protecting the environment, and a conformity assessment with those measures. SPS measures seek to protect humans and animals from risks in additives, contaminants, toxins, and disease-causing organisms in their food; humans from plant- or animal-carried diseases; and animals and plants from pests, diseases, or disease-causing organisms, biodiversity, and/or to prevent or restrict “damage to a country from pests” (UNCTAD 2012).⁵ These also cover conformity-assessment measures related to those restrictions including certification, testing/inspection, and quarantine. Nontechnical measures include finance measures; special preferences affecting competition; investment restrictions including local content requirements; distribution and post-sales service restrictions;

⁵ In the WTO Agreement on the Application of Sanitary and Phytosanitary Measures, an SPS measure is defined as follows: “Any measure applied: (a) to protect animal or plant life or health within the territory of the Member from risks arising from the entry, establishment or spread of pests, diseases, disease-carrying organisms or disease-causing organisms; (b) to protect human or animal life or health within the territory of the Member from risks arising from additives, contaminants, toxins or disease-causing organisms in foods, beverages or feedstuffs; (c) to protect human life or health within the territory of the Member from risks arising from diseases carried by animals, plants or products thereof, or from the entry, establishment or spread of pests; or (d) to prevent or limit other damage within the territory of the Member from the entry, establishment or spread of pests.”

Box 5-1. Global Safeguards for Solar Products

In 2017, a Section 201 global safeguards case was brought in front of the USITC for the first time in 15 years, asserting that imports of crystalline silicon photovoltaic (CSPV) cells and modules injured the domestic industry. Solar cells are assembled into modules, which are commonly used in both utility-scale and residential or commercial installations. This Section 201 complaint followed earlier antidumping actions in 2012 and 2015 that were widely viewed as ineffective. In September 2017 the USITC unanimously determined that an injury had occurred. The petition was filed on behalf of Suniva Inc. and SolarWorld Americas, two U.S.-based solar panel manufacturers. A primary goal of the petitioners is to maintain an integrated cell and module manufacturing industry in the United States.

This Section 201 action follows on the heels of years of the AD/CVD efforts to curtail Chinese undercutting of U.S. producers. The first investigation focused on Chinese imports during the years 2009–11, but the subsequent investigation during 2014–15 expanded the scope to Taiwan as well. The first investigation resulted in imposition of a dumping duty of between 14.78 and 15.97 percent on cooperating Chinese firms. All other imports were subject to a 165 percent duty in February 2015. An additional CVD between 27 and 50 percent ad valorem was required from all Chinese importers at that time. Antidumping duties with an average margin of 19.50 percent were applied on all Taiwanese imports. Yet Chinese firms relocated production facilities to other countries, including Malaysia and Vietnam, to avoid these duties. The level of imports increased. So U.S. firms decided to pursue a global safeguard strategy, which also does not require the allegation of unfair trade practices, rather than a targeted AD/CVD approach.

The petitioners' amended filing with the USITC proposed a remedy consisting of both a quota and a tariff for imported CSPV cells and a separate quota and tariff for imported modules. Solar cells and modules are differentiated products, with imported products dominating the low-cost segment of the market, which is particularly attractive to utility-scale installations. The petitioners claim that the volume and price instruments are needed to provide relief to an integrated cell and module manufacturing industry from cheaper imports that have captured much of the market. None of the USITC commissioners agreed with the petitioners, and individual commissioners made three different proposals. These included a combined quota for cells and modules, and a tariff-rate quota for cells paired with a tariff for modules. The different proposals have slightly different tariff levels and phase out differently over the course of the remedy.

CSPV prices have fallen markedly in the past decade, largely driven by technological change. Module prices fell by 84 percent between 2008 and 2014, and continued to under \$0.40 per watt in 2017 (figure 5-i). This price decline has helped push the cost of installed solar generation capacity lower; between 2015 and 2017, the cost of 1 watt of utility-scale generation capacity

Figure 5-i. CSPV Module Prices, 2010–18

fell from \$1.80 to \$1.03. This cost decrease has made solar power competitive in many markets around the country, and this has boosted demand for solar modules.

The United States currently relies heavily on trade to purchase most of its solar panels. In 2016, domestic manufacturers' market share was 11 percent of the total solar generation hardware market on a value basis. After the initial imposition of AD/CVD duties in 2013 and again in 2015, Chinese solar manufacturing was offshored to other locations, including Malaysia and Vietnam. As a result, the import shares by country of origin have changed noticeably in recent years, but domestic manufacturers have consistently been crowded out.

A factor in this rapid import penetration are allegations of forced technology transfer by Chinese parties. Though the Section 201 process was initiated by affected manufacturing firms, the interrelationship between the policy instruments highlights the interconnectedness of trade issues.

The President elected to impose a four-year remedy incorporating a tariff-rate quota for CSPV cells and a tariff for modules. The cell component is a tariff-rate quota, with a 2.5 gigawatt quota for cells and a tariff imposed beyond that level of imports. The tariff for assembled modules and for imported cells above the quota will start at 30 percent ad valorem in the first year and decrease over the duration of the remedy (USTR 2018).

and behind-the-border policies, including subsidies, government procurement restrictions, and restrictions on rules of origin.

Some nontariff measures protect health, safety, and the environment. In these cases, the imposition of rules helps to minimize the risks associated with certain products, and multilateral frameworks facilitate their adoption by governments. Others amount to deliberate, anticompetitive trade restrictions that act to increase costs for those subject to the barrier. Measures identified as primarily protectionist, or devised with the intent to undermine international competition, may be challenged and addressed through the WTO. Resolving disputes about these issues often takes substantial effort; identifying whether nontariff measures are justified is far more complicated than simply comparing tariff rates against an accepted international norm.

Economists have studied tariffs and formal trade barriers for decades, so their effects are well understood. Nontariff measures are less visible and more difficult to document, yet they are increasingly important as the WTO architecture helps erode formal trade barriers. Extra labeling, licensing requirements, unnecessary standards compliance, or duplicative health certificates clearly raise the cost of doing business and place foreign firms at a disadvantage relative to domestic producers. The literature indicates that nontariff barriers may distort trade even more than tariffs, and that as countries become richer, the trade restrictiveness of their nontariff barriers increases relative to tariffs. Because of their inherent flexibility, nontariff measures can present even greater barriers in certain sectors, including agriculture. Moreover, subjecting questionable nontariff measures to dispute resolution is in many cases a time-consuming process, during which U.S. firms suffer the loss of revenues and market share, as discussed further below.

Nontariff Barriers to Automobile Trade

The automobile sector is illustrative of the types of nontariff barriers faced by U.S. companies. A variety of these barriers are imposed by U.S. trading partners that affect automobile trade. The range and scope of these behind-the-border restrictions in just the automobile industry provides good insight into the importance, effectiveness, and breadth of such measures for restricting trade.

China. Since before China joined the WTO in 2001, it restricted the ability of foreign companies to manufacture automobiles in China by requiring them to form joint ventures with Chinese enterprises, with the foreign partner's ownership share capped at 50 percent. New regulations in 2009 extended this same requirement to the manufacturing of new energy vehicles (NEVs; e.g., electric-, biofuel-, or hydrogen-powered cars). These joint venture requirements raise concerns that foreign manufacturers are being coerced into transferring ownership of their technologies to their Chinese venture counterparts. In the case of NEVs, the USTR reports that China has pursued a variety of additional policies that, among other things, appear to discriminate against imported

NEVs and have generated serious concerns in light of China's WTO obligations. Similar concerns have been raised in connection with imported NEV batteries.

South Korea. Under the U.S.-Korea (KORUS) FTA, both parties agreed to eliminate their respective automotive and light truck headline tariff rates, some of which have already been eliminated, while others are currently scheduled to be phased out in future years. However, the USTR notes that there have been significant problems in implementing KORUS, and the U.S. government is currently seeking to improve the agreement by rebalancing it, including with respect to the auto trade. KORUS also contained provisions nominally designed to address nontariff barriers, most notably allowing for 25,000 cars per U.S. manufacturer per year that are built to U.S. automotive safety standards to be deemed as meeting South Korea's safety standards when imported (USITC 2011). Korea also streamlined its motor vehicle taxes based on engine size so that South Korea's taxes did not disproportionately disadvantage larger-sized vehicles, including U.S.-manufactured vehicles sold in Korea. Additionally, through the Autos Working Group under the KORUS Agreement, the United States has continued to seek progress on a range of additional issues, including Korea's fuel economy standards.

South Korea is considering implementing draft regulations that would require all automobile manufacturers to report vehicle repair histories to purchasers to account for any damage taking place between the manufacturing site and sale to customer. Although this is also regulated in some American States, the USTR reports that these regulations differ in important ways, so as to "create obstacles for imports, as vehicles arriving for overseas often undergo minor reconditioning prior to sale." Given the greater distance that the imported vehicles must travel from the manufacturing plant to the consumer, the USTR has urged South Korea to modify its damage disclosure regulations so that they are reasonable and consistent with international practices. The Korean Ministry of Land, Infrastructure, and Transportation has been requested to draft changes that would recognize American predelivery inspection in Korea rather than at U.S. manufacturing plants as the conclusion of the manufacturing process, so as not to duplicate already-existing robust inspection procedures and not unduly burden foreign automakers. In June 2016, the ministry proposed a rule imposing a floor on damage of more than 3 percent of the manufacturer's suggested retail price for the vehicle required to mandate reporting, which U.S. industry has argued is unreasonably low.

Japan. The United States has expressed strong concerns with the overall lack of access to Japan's automotive market for U.S. automotive companies. A variety of nontariff barriers impede access to Japan's automotive market, and overall sales of U.S.-made vehicles and automotive parts in Japan remain low, ultimately leading one major U.S. automotive manufacturer in January 2016 to cease all operations in Japan.

In recent years, nontariff barriers have included issues such as unique safety and other standards, an insufficient level of transparency, a lack of sufficient opportunities for input in developing regulations, hindrances to the development of distribution and service networks, and the lack of opportunities for U.S. vehicle models imported under the preferential handling procedure certification program to benefit from programs on the same terms as domestic models. These barriers have had the long-term effect of excluding and disadvantaging U.S. manufacturers in the Japanese market.

Colombia. Colombia's policy concerning the registration of trucks over 10.5 metric tons, both imported and domestic, before March 2013 required registrants to either pay a "scrappage fee" to the government or to scrap an old freight truck of equivalent capacity on a one-for-one basis. In March 2013, Colombia changed this policy so that companies could legally register new freight trucks only by scrapping an old freight truck of equivalent capacity—importers and other buyers no longer had the option to pay the fee. Within the first year of the policy's implementation, imports of new freight trucks fell by 65 percent and importers' reported sales-related administration costs rose by \$60 million. In the first few years, sales of U.S. exporters fell by \$600 million. In September 2016, Colombia announced the termination of the "one-for-one" scrappage policy by December 31, 2018. The existing policy remained in place until February 2017, when Colombia announced a new interim system that requires applying for a scrapping certificate in order to register a new truck. Importers and other registrants must pay 15 percent of the value of the new truck as a fee for the certificate. The number of available certificates will depend on the number of vehicles scrapped. Although this scrapping certificate is not a formal trade barrier, it closely resembles an in-quota ad valorem tariff of 15 percent, subject to a variable quota determined by certificate availability.

Nontariff Barriers to Agricultural Trade

Nontariff measures, especially SPSs and TBTs, are particularly prevalent in the agriculture and food sectors. Given the importance of domestic agricultural production to many countries—and the many different forms of environmental, food, and health concerns—these issues can be particularly contentious. This subsection discusses several examples of how these measures are imposed and become barriers to trade.

Indonesia: import licenses. Indonesia applies restrictive and complicated import licensing to a variety of products, including horticultural and animal products. For example, seasonal restrictions prevent the importation of oranges during Indonesian harvest periods. Beef importer licenses are issued only for specific countries of origin, so importers cannot change sourcing to respond to evolving market conditions. Separately from this issue but also relevant, meat imports are only permitted from approved facilities, but the approval process requires on-site inspection and the inspectors do not in

practice have the resources to inspect all interested U.S. facilities. Beef must be sold at set prices in Jakarta's traditional markets as a condition for continuation of import licenses. Indonesian regulations prevent the importation of poultry parts, an important market for U.S. exporters. After bilateral efforts to address the problems were unsuccessful, the United States began official WTO dispute settlement in January 2013. In December 2016, the WTO found in favor of the United States and New Zealand on 18 out of 18 claims against Indonesia's import restrictions and prohibitions. Indonesia's appeal of that decision was rejected in November 2017

The EU's ban on beef hormones. The European Union bans and restricts the importing of meat produced using various hormones, beta agonists, and other growth stimulants. Therefore, U.S. exporters that do not participate in a verification program for assuring the absence of such banned substances cannot enter the EU market. Scientific evidence has shown that the banned substances may not be harmful to consumers. The EU ban has led to WTO disputes. For example, in 1996, the United States brought a WTO dispute settlement proceeding against the European Communities by saying that the EU beef ban did not comply with its WTO obligations. Although a WTO dispute settlement panel determined that the beef ban was in fact inconsistent with the EU's WTO obligations, the EU declined to remove the ban. The United States retaliated by imposing 100 percent ad valorem tariffs on certain imports from the EU. In September 2009, the United States and the European Commission came to a compromise and established a new EU duty-free import quota for grain-fed, high-quality beef, but U.S. shipments under the quota must still comply with the EU's hormone ban. However, Argentina, Australia, Canada, New Zealand, and Uruguay have begun to compete with U.S. exporters by also shipping under the quota.

Chile's food labeling. Chile currently requires that all prepackaged food and beverage products display a front-of-package black octagonal "stop" sign if the product contains levels of sodium, sugar, calories, or saturated fats that exceed specified thresholds. The threshold is set based on quantities of 100 grams or 100 milliliters, and does not take into account the serving size of the food or beverage product. In addition, if a product is above the threshold level in more than one of these nutrient categories, then multiple stop signs must be displayed. Furthermore, the law restricts the advertising of products that require one or more stop signs, including by prohibiting the use of images deemed appealing to children under the age of 14. This prohibition, in particular the interpretation by Chilean authorities of registered trademarks that constitute advertising to children on product packaging, has been inconsistent. These measures have resulted in costs related to delays, shortages, and repackaging that have proven expensive for U.S. firms. The United States has raised concerns with these measures, both bilaterally and within the framework of the WTO Committee on Technical Barriers to Trade.

Agricultural biotechnology approval. Delays in the approval of agricultural products derived from biotechnology in China, the European Union’s members, India, and other countries result in increased market uncertainty among technology providers, farmers, and traders of U.S. corn, soy, cotton, and alfalfa—leading to reduced exports of these products. For example, delays in the EU’s approval process for biotechnology crops have prevented these types of crops from being placed on the EU market, even though the biotechnology events have been approved (and safely grown) in the United States. Moreover, the length of time taken for the EU to approve new biotechnology crops appears to be increasing. The EU’s own legally prescribed approval time for biotechnology imports is about 12 months—six months for review by the European Food Safety Agency, and six months for the political committee process (i.e., “comitology,” in the EU’s parlance). However, in practice, total approval times are averaging 47 months.

India: poultry and avian influenza. Since 2007, India has restricted various U.S. agricultural products—including poultry meat, eggs, and live pigs—supposedly to prevent the entry of avian influenza into India. The United States has maintained that, as reflected in relevant international standards, no scientific basis supports this wholesale ban. In March 2012, the United States initiated a WTO dispute by requesting consultations with India. The panel found that India’s ban was not based on science and breached several obligations of India under the Agreement on the Application of Sanitary and Phytosanitary Measures. The WTO Appellate Body subsequently upheld the panel’s findings in 2015. India has failed to revise its requirements for poultry in a manner that would allow for U.S. imports, and the case continues to be litigated in the WTO.

Defining the Rules of the Game for Trade

In addition to lowering barriers to trade, trade agreements can provide a forum to raise and address trade concerns through dispute settlement mechanisms, including those between one nation-state and another nation-state, and between an investor and a nation-state. Such mechanisms can act as commitment devices that may deter parties from transgressing an existing agreement. In doing so, these mechanisms may overcome the incentive to cheat in order to maximize individual gains. In addition, they can help reduce the policy uncertainty associated with trade relationships by ensuring that parties to trade agreements may formally raise concerns about trade practices. Consequently, the United States has actively pursued cases through the WTO dispute settlement mechanism, and U.S. firms have used mechanisms between an investor and a nation-state in trade agreements like NAFTA.

WTO dispute settlement. The WTO dispute settlement mechanism serves as a process for addressing a variety of tariff and nontariff barriers pursuant to a variety of agreements under the WTO, including safeguards, rules of origin, agriculture, intellectual property, and government procurement. Dispute

settlement became more legalistic when the WTO replaced the GATT procedures with a reformed dispute settlement understanding that ended the right of a responding party to block the adoption of a report and added a standing Appellate Body of Members to review panel decisions. Before that, under GATT, trade disputes were at first addressed using informal consultations, or discussions, between concerned parties; within less than a decade, however, an independent panel process coalesced to examine the evidence and issue rulings in response to complaints about noncompliant trade practices (Davis 2012). The GATT system's dispute procedures were invoked in over 200 cases, and member states generally complied with findings (Hudec, Kennedy, and Sgarbossa 1993).

The efficacy of WTO dispute settlement mechanism remains an area of active debate. Davis (2012) finds that the United States gets better outcomes via formal WTO adjudication than negotiation, increasing the probability that the complaint will be resolved and decreasing the time it takes to remove the barrier in question. Mayeda (2017) finds that the United States has won 85.7 percent of the cases it has initiated before the WTO since 1995, compared with a global average of 84.4 percent. In contrast, China's success rate is just 66.7 percent. Most U.S. WTO cases target China (21) and the European Communities (19). When the United States is the respondent, it still wins 25 percent of the time, a rate that is better than the global average rate of 16.6 percent (Mayeda 2017). In comparison, the EU and Japan have won 0 percent of the cases brought against them, while China has won only 5.3 percent of the time (Mayeda 2017). Nonetheless, because countries may initiate or decline to initiate cases based on their perceived probability of obtaining a favorable outcome in the WTO dispute process, comparisons of WTO dispute statements between countries should be taken with at least some skepticism.

The TRIPS Agreement sets a minimum level of intellectual protection that each government provides and is subject to the WTO dispute settlement mechanism (WTO 2017c, 2017d). Of the 115 cases that the United States has initiated since 1995, 17 have been TRIPS cases, most of which have targeted practices by European countries.

Intellectual property rights. Secure intellectual property rights foster innovation and growth (North 1989; Mokyr 2009). Though it can take years of numerous trials and failures to invent a product and bring it to market, duplication of an invention typically requires significantly less effort. U.S. patents, trademarks, and copyrights typically grant the owners of intellectual property exclusive rights only on a territorial basis—within the United States.

The United States currently leads the world in innovation, due in no small part to a strong legal system that confers exclusive rights and privileges on the owners of intellectual property. The World Intellectual Property Organization, an agency of the United Nations, defines intellectual property (IP) as “creations of the mind, such as inventions; literary and artistic works; designs; and

symbols, names and images used in commerce.” U.S. IP can be voluntarily dif-fused overseas in cases in which U.S. firms provide their IP to overseas partners or participate in joint ventures. In other cases, U.S. firms may agree or be pres-ured to submit to technology transfer conditions in order to access foreign markets or for other reasons, such as taking advantage of tax preferences, subsidies, and preferences in government procurement. But even firms with-out international operations may experience theft of their IP or technology by or on behalf of overseas entities. Such theft represents an involuntary transfer of IP abroad through theft, an involuntary transfer of IP that costs the United States between \$227 and \$599 billion annually, according to the IP Commission (Blair et al. 2017). By way of comparison, the OECD and the EU’s Intellectual Property Office have estimated that the global trade in counterfeit and pirated goods alone cost as much as \$461 billion in 2013, 2.5 percent of world trade.

Virtually every industry in the United States either produces or uses IP, but certain IP-intensive industries are an important and growing share of the U.S. economy. These include pharmaceuticals, aerospace, computer hardware and software, electronics, medical equipment, chemicals, and automobile manufacturers. With their high rates of innovative research and development, these industries are special targets for IP expropriation.

Lost IP prevents firms from generating a return on investment in their research-and-development (R&D) costs, thus discouraging them from continu-ing to invest in R&D and hampering U.S. innovation. As shown in figure 5-12, the theft of trade secrets annually represents \$180 billion to \$540 billion in value; and pirated software and counterfeit goods combined account for about \$47 billion of the costs of IP theft. Precise figures are difficult to come by, in part because firms may not be aware that their property has been stolen, or may be hesitant to publicize a theft that has been detected.

Technology transfer. Technology transfers can occur if governments require a company to transfer its IP in order to access markets in that govern-ment’s country. For example, Chinese industrial policy includes provisions specifically calling for the acquisition of foreign technology and innovation. In August 2017, the U.S. government launched a Section 301 investigation into China’s alleged acts, policies, and practices related to technology transfers. U.S. firms may seek to enter China for reasons including taking advantage of lower unit costs of labor, gaining access to its large domestic market, and mak-ing use of integrated supply chains for other markets. To access the Chinese markets, however, stiff entry costs in the form of mandatory IP and technology transfer requirements are sometimes imposed. Among other things, Chinese policies and practices selectively require foreign firms to transfer their tech-nologies to Chinese subsidiaries or joint venture partners to gain access.

The ongoing investigation seeks to assess whether and how four types of Chinese practices hurt U.S. firms: (1) Chinese joint venture and other approval processes that force U.S. companies to transfer technology or

Figure 5-12. Estimated Annual Cost of IP Theft to the U.S. Economy

otherwise compromise IP; (2) acts, policies, and practices that prevent U.S. businesses from establishing market-based terms in licenses and negotiations with Chinese companies; (3) Chinese government-supported acquisitions or investment in U.S. companies to “obtain cutting-edge technologies and generate large-scale technology transfer in industries deemed important by Chinese government industrial plans”; and (4) Chinese government-supported “intrusions” in U.S. computer networks or “cyber-enabled theft of intellectual property, trade secrets, or confidential business information.”

Labor and environmental standards. Because labor and environmental rules are such an important part of domestic regulation, the United States has led the way in including enforceable labor and environmental standards into its trade agreements. The bipartisan Trade Promotion Authority calls for strong, enforceable labor and environmental provisions in all U.S. trade agreements. For example, most recently, the Trump Administration has proposed high-standard labor and environmental chapters as part of NAFTA’s renegotiation. By including minimal environmental provisions in a trade agreement, a country like the United States can ensure that its firms and workers compete on more comparable terms with foreign producers.

Typically, these standards include cooperation arrangements and general commitments. For example, U.S. FTAs with Central America and the Dominican Republic, Australia, Bahrain, Chile, Colombia, Jordan, Morocco, Oman, Panama, Peru, Singapore, and South Korea include dedicated labor and

environmental chapters. The United States also requires GSP beneficiaries to comply with specified labor provisions regarding workers' rights.

Enforcement of such labor and environmental standards is difficult, partly because of measurement issues. The Trump Administration has prioritized enforcement of these provisions. For example, in October 2017 the United States took an unprecedented enforcement action pursuant to the Annex on Forest Sector Governance of the United States–Peru Trade Promotion Agreement, and blocked future imports from a Peruvian harvester because of illegally harvested timber found in its supply chain. The Trump Administration will continue to use trade agreements to level the playing field and to improve labor and environmental practices, and it will continue to prioritize enforcement.

Domestic Gains and Losses from Trade

In the pursuit of gains from trade through comparative advantage, international trade can increase total economic surplus, and trade agreements can help determine how that surplus is divided between partners. That said, trade agreements do not necessarily improve the lives of everyone within a country party to that agreement; even when an increase in trade boosts national welfare in the aggregate, there is no guarantee that all residents will be better off because of the change in trade flows.

These distributional implications of trade raise equity issues that demand consideration in the debate over trade policy. Differing empirical findings about the impact of NAFTA offer a helpful example. Hakobyan and McLaren (2016) identify the concentrated job and income losses stemming from the U.S. accession to NAFTA, and contrast those with the gains that the agreement has delivered to the U.S. economy. Meanwhile, other studies suggest the existence of net positive gains from NAFTA for U.S. GDP and employment (Dixon and Rimmer 2014; Cipollina and Salvatici 2010; Hufbauer, Cimino, and Moran 2014), even as they knowledge that there are mixed findings on industry-specific effects. While acknowledging these dispersed benefits, Hakobyan and McLaren (2016) note that a segment of manufacturing workers with low educational attainment lost 8 to 16 percent in wage growth between 1990 and 2000. Conversely, De La Cruz and Riker (2014) found small but positive effects on the wages of skilled and unskilled workers in the years 1994–2013. Though these empirical results differ, the point remains that trade can have differential types of effects across workers and between workers and consumers, underscoring the magnitude of trade's distributional effects.

Domestic Gains

Because trade agreements can expand overseas trading opportunities, they can raise the volume of domestic goods demanded by overseas consumers,

boosting domestic output, employment, and wages in exporting industries. In addition, domestic consumers may find they face lower prices on imported goods and services, lowering the cost of their consumption bundles and leaving them with excess disposable income to fund additional consumption or savings. These effects may be partially countered by a reduction in the demand for domestically produced goods and services in which trading partners have a comparative advantage, reducing the output of these goods and the corresponding employment and earnings in these industries.

Although empirical estimates of the effect of reducing barriers to trade on the domestic economy are positive, they are often modest in size (USITC 2016), because the U.S. economy is very large, and trade with any single partner (or group of partners) is a relatively small share of GDP. Examining regional trade agreements entered by the United States under Trade Authorities Procedures after 1984 (including NAFTA, the Uruguay Round, CAFTA-DR agreements, and several bilateral agreements), the USITC finds substantial increases in imports and exports resulting from their collective implementation, so that the change in aggregate trade flows over all agreements in their analysis sum to about 3 percent. The USITC (2016) estimated their joint effect on U.S. GDP at 1 percent, amounting to an additional \$186 billion in U.S. production, or roughly \$600 in additional wages and salaries per household, based on the current labor share. Resulting shifts in trade volumes suggest that these agreements generated a significant reshuffling of workers across industries, and led to net employment gains of approximately 1 percent. The report further estimates that regional trade agreements saved consumers up to \$13.4 billion in goods pricing in 2014 while providing an expanded variety of goods for purchase.

Domestic Losses

Despite the potential of trade agreements to reduce market prices for tradable goods and expand consumption opportunities of American consumers, workers displaced by trade may experience substantial welfare losses. Trade-based worker displacement occurs when an industry faces new import competition and cannot compete with the flow of international goods and services. Even if workers hold general human capital and are readily employable in a shifting economic landscape, the transaction costs of job loss, job search, and reemployment may be larger than the reduction in market prices for that individual's consumption basket. If workers have skills that are less valuable after trade patterns shift, the welfare costs are more substantial.

Manufacturing Job Losses

A prominently cited impact of increased trade and import competition is that manufacturing employment in the United States has fallen. As a share of total nonfarm employment in the United States, figure 5-13 demonstrates its steady, marked decline during the last 50 years—the result of technological change

and automation, economic recession, and evolving consumer tastes. But international trade also contributes to the demand for manufacturing workers, both through access to foreign markets boosting U.S. exports, and foreign access to the U.S. market increasing import competition.

Although employment in the sector has long exhibited procyclicality, it has seen changes since 2000. In the expansionary period from the end of 2000 through 2007, the economy failed to recover the manufacturing job losses it experienced during the previous recession years. Likewise, the current business cycle, which began at the end of 2007, corresponded to a reduction in manufacturing employment of 2.2 million jobs at the trough. The addition of nearly 200,000 manufacturing jobs in the first year of the Trump Administration contributed to a partial recovery of 1.0 million jobs since manufacturing reached its trough at the beginning of 2007.

According to evidence presented in the next subsection, manufacturing employment declines since 2001 were related to changes in international trade and also to the Great Recession and the macroeconomy. Regardless of the causes, rapid losses of manufacturing jobs have large negative consequences for the affected communities and can cause harm with long-lasting effects. Currently, the United States coordinates worker-adjustment policies based on the cause of displacement, though workers displaced by all causes may face similar issues after displacement.

Trade's effects on U.S. manufacturing employment. The adverse employment and wage implications of direct or indirect Chinese import exposure to U.S. industries, particularly the manufacturing sector, have been well recognized (Autor 2010). The literature emphasizes the effects of China's accession to the WTO in 2001 and the corresponding reduction in tariff rates on Chinese imports to the United States, the "China shock," as a defining moment in the history of domestic manufacturing employment. Acemoglu and others (2016) estimate that domestic job losses from Chinese import competition over the 1999–2011 period were in the range of 2.0 to 2.4 million, with manufacturing accounting for 41 to 49 percent of this loss. Caliendo, Dvorkin, and Parro (2015) indicate that China's export growth caused the loss of about 0.8 million U.S. jobs from 2001 to 2007. Kimball and Scott (2014) find that China's accession to the WTO caused 3.2 million Americans to lose their jobs between 2001 and 2013.

These estimates of the effects of import competition on American manufacturing employment show the relatively weak ability of gains from export growth to offset the China shock *within a specific sector*. Although the U.S. also gained access to the Chinese market following WTO accession, relatively lower levels of development in China at the time of its accession implied limited Chinese consumer spending power and weaker export opportunities for the United States. However, other export markets have opened for the United States in recent years, and the job gains from these export opportunities have

Figure 5-13. U.S. Manufacturing Employment, 1965–2017

tempered the net effect of job losses due to Chinese import competition. Feenstra, Ma, and Xu (2017) use exogenous variation in exports to measure the increase in employment attributable to expanded export penetration. Weighing job gains due to increased exports to the entire world against jobs lost due to increased import competition from only China during the period spanning 1991 to 2007, they estimate net job losses of 0.2 million to 0.3 million; however, these authors estimate no net change in employment (e.g., that job gains attributable to exports to the rest of the world offset the job losses due to imports from China) when they extend this analysis from 1991 through 2011.

Permanent normal trade relations with China. Other authors focus on the establishment in the United States of permanent normal trade relations (PNTR) with China as an explanation for reductions in U.S. manufacturing employment during the early 2000s. PNTR, notably, resulted in no change in U.S. tariff rates for Chinese imports. But the status change brought certainty that potential future tariff hikes were now low-probability events; low tariffs that were in place and subject to annual renewal were now in place, indefinitely. Pierce and Schott (2016) identify a significant and robust decrease in employment concentrated in industries that were the most exposed to the change in U.S. trade policy toward China to low normal tariffs. The authors hypothesize that PNTR gave U.S. firms the certainty they needed to increase the value of imports from China, resulting in greater import competition facing the U.S. manufacturing sector and a reduction in the demand for U.S. manufacturing workers.

Regardless of whether WTO accession or establishment of U.S. PNTR with China is the proper signal event, Asquith and others (2017) demonstrate that the China shock reduced manufacturing employment from 1992 to 2011 primarily due to firm exits in the aftermath of higher import pressures, and that workers displaced from exposed industries were reabsorbed into sectors that were not exposed to Chinese competition, mainly due to births of new firms.

Who are the displaced workers? A broad trade policy might consider the fate of individuals who bear the heaviest costs of increased import competition. A supplement to the Current Population Survey (CPS) measures the demographics and labor market fortunes of displaced workers, defined as those workers who were rendered at least temporarily jobless in the 36 months preceding the survey because of an establishment closing, a layoff, or insufficient work. CPS survey years 2008–16 capture the period before, during, and after the Great Recession, without the early years of the WTO or PNTR changes with respect to China. The sample includes wage and salary workers not employed in agriculture. During these survey years, manufacturing workers constituted about 18 percent of all displaced workers on average—as shown in figure 5-14, more than in construction; finance, insurance, and real estate; or wholesale trade; but less than in services and retail trade.

Figure 5-15 shows that displaced manufacturing workers during that period were, on average, less educated, and older than (1) displaced workers in other parts of the economy, and (2) nondisplaced workers. These distinctions suggest that it may be physically and psychologically more difficult for displaced manufacturing workers to find new work opportunities. Additionally, a substantially higher share of displaced manufacturing workers were male. Given the declining prime-age male labor force participation rate in the United States, this result suggests that displaced manufacturing workers may be particularly vulnerable to leaving the labor force, a hypothesis we explore in more detail below.

The geographic agglomeration of displacement. When trade patterns change for exposed, geographically concentrated industries, the types of impact—both positive and negative—can also be geographically concentrated. This is the flip side of industry agglomeration that allows firms to take advantage of being near a skilled workforce and being able to imitate competitors. The sharp downturn in U.S. manufacturing employment that has occurred since 2000 largely had an impact on the Southeastern States that have a large manufacturing presence. At the same time, some U.S. border States have benefited disproportionately from NAFTA, given the reduced shipping costs for their producers. Indeed, seven States—California, Florida, Illinois, Michigan, New York, Texas, and Washington—made up more than half of all U.S. exports in 2016.⁶

⁶ State-level trade data from the Bureau of the Census is based on origin of movement, making the results skewed toward border States.

In theory, the efficient firms that thrive in the face of import competition or take advantage of new export markets have the potential to generate new employment opportunities for workers who are displaced due to trade. But regional concentration presents geographic barriers that may delay this reallocation of labor, and recent evidence on geographic mobility indicates that Americans are less likely to move than at any point in the recent past (see chapter 3). The CPS data show that only a small minority of displaced workers, both inside and outside manufacturing, reported moving in response to being displaced, while a far larger share reported finding employment in a different, broad industry category than their predisplacement industry (figure 5-16; industries are defined in figure 5-14). On this dimension, manufacturing workers were 9 percentage points more likely to change industries after job displacement than workers in other sectors.

What happens to displaced workers? Displaced workers may face a variety of obstacles to rejoining the workforce. First, because displacement may occur in agglomerated industries, relocation may be necessary to recover previous earnings levels. Second, displaced workers may face information asymmetries, lacking information on job matches, both local and further afield, that are specific to their particular skill sets. Third, displaced workers may be disadvantaged by a negative signal of quality or skills due to a layoff and therefore face difficulty competing with other job applicants in the labor market. Finally, displaced workers may lack appropriate skills to meet remaining labor market demand as the economy changes. Automation and trade shifts both change the mix of skills demanded in the United States, and the skill-biased nature of these changes implies that less-skilled workers in particular may struggle to find new jobs.

What can we say empirically about the reemployment prospects of workers displaced by trade? The CPS data do not allow us to specifically identify those workers displaced due to import competition, to automation, or to any other change in the economic fortunes of their former employers. Still, these data give a holistic picture of the reemployment patterns of workers, independent of the cause of their displacement, along with the challenges that displaced workers face in returning to the labor force.

Figure 5-17 provides the reemployment prospects of private displaced workers by industry (excluding government and military workers), highlighting the differences in reemployment and labor market exit probabilities by sector of previous employment. The values in figure 5-17 represent the probabilities of reemployment and labor force exit after controlling for year fixed effects, an important consideration, given the uneven effects of the Great Recession, and after controlling for worker age. Each probability is relative to the outcome for workers in finance, insurance, and real estate (FIRE), whose unconditional reemployment rates are the highest following displacement.

Figure 5-14. Displaced Workers by Industry, 2005–15

Source: Bureau of Labor Statistics, Displaced Workers Survey.

Note: "Other industries" includes agriculture; mining; construction; transportation, communications, and utilities; wholesale trade; government; and military workers.

Figure 5-15. Characteristics of Displaced Compared with Nondisplaced Workers, 2005–15

Sources: Bureau of Labor Statistics; Current Population Survey.

A striking conclusion from figure 5-17 is the substantial labor market disadvantage faced by workers in construction, agriculture, and retail trade industries after displacement. Agriculture and retail trade workers, relative to workers in FIRE industries, were greater than 3 percentage points more likely to exit the labor force following job loss. Construction workers remained in the labor force at rates similar to FIRE workers, but their disadvantage in reemployment was high, at 8 percentage points, compared with 14.3 percentage points in agriculture and more than 5 percentage points for retail trade workers. Again, these differences are after controlling for differences in the year of displacement and age at displacement.

Employees in the manufacturing, wholesale trade, transportation, communication, and utilities sectors fared somewhat better than those in construction, retail trade, and agriculture, experiencing differences in labor force participation rates after displacement of 1.1 percentage points or less relative to FIRE workers. But their reemployment prospects were still far weaker, a disadvantage of between 3.2 and 5.7 percentage points. At the same time, the employment and participation outcomes for workers in services were similar to FIRE workers, as were outcomes for mining workers.

These data are somewhat consistent with the results of Autor and Dorn (2013), who find that workers with abstract skills are substantially more likely to be reemployed after displacement and substantially less likely to exit the labor force. Using years of education as a proxy for abstract skills, the industry categories given in figure 5-17 are sorted from highest average years of schooling to lowest for displaced industry workers in the CPS sample. (FIRE has the highest average.) Thus, the blue bars in the figure demonstrate that reemployment prospects are increasing with the educational attainment of displaced workers. In this sense, displaced mine workers are real outliers, experiencing higher reemployment prospects than their ordering in the average educational attainment of industries would indicate. The ranking of labor force nonparticipation for formerly displaced workers in figure 5-17, however, does not as clearly conform to Autor and Dorn's predictions; no clear pattern of eventual nonparticipation by industry average education level is apparent.

Current solutions: trade adjustment assistance. Trade Adjustment Assistance (TAA) provides job training, job search, and relocation assistance to U.S. workers displaced by trade. Although TAA has been in place since 1962, analyses of the program's efficacy provide notably mixed results. Schochet and others (2012) note that TAA participation hurts workers' financial prospects, relative to similarly displaced workers who did not participate in TAA. A 2007 evaluation of the TAA program by Reynolds and Palatucci (2012) found that only 1.4 percent of TAA participants used relocation allowances. Additionally, a 2010 evaluation by Dolfin and Beck (2010) found that the number of TAA participants who received relocation allowances was not significantly different than the number of TAA nonparticipants who received reallocation allowances

Regressions include age fixed effects and year of displacement fixed effects. All values are relative to employment and nonparticipation probabilities of workers in finance, insurance, and real estate.

from sources such as unemployment insurance claims, an indicator that relocation allowances were not a highly utilized part of the TAA program.

In the newest literature on this topic, Hyman (2018) relies on quasi-random assignment of TAA cases to different investigators and employer-employee matched Census data on 300,000 displaced workers, to assess TAA's effects on labor market outcomes. Hyman finds that the program fails to facilitate long-term adjustment. Although training under the program leads to large initial returns—\$50,000 in additional cumulative earnings over a decade—such gains do not persist past 10 years. Hyman attributes the initial gains to both rising incomes and increased labor force participation. But TAA-trained workers tend not to participate in other Federal retraining efforts that would result in further formal education (e.g., Workforce Innovation and Opportunity funds, or WIOA), depressing longer-run returns. However, the nature and length of training may be different among these programs. Geographically, depreciating returns are concentrated in States with shorter training programs. Unsurprisingly, returns are concentrated in the most affected regions, where workers are likelier to switch industries and move in response to TAA training.

Other possible solutions. Beyond worker retraining efforts in TAA or WIOA, what other possible solutions to the labor market adjustment costs facing displaced manufacturing workers are available? We do not attempt an exhaustive list here, but we note that the Administration's emphasis on apprenticeship models for worker training are well positioned to assist displaced manufacturing workers.

One particular challenge for displaced workers, who are older and more likely to face short-term household budget pressures, is funding their retraining efforts while still making household financial deadlines. Designing Federal programs to deliver financial support to displaced workers during their retraining efforts would help relieve these pressures and allow workers to make more strategic long-term investments in their financial security through apprenticeships (which are sometimes, but not always, paid) or other medium-length training programs. Without financial support, some workers will find it necessary to quickly take a new job, even if it is not in their long-term best interest. TAA Trade Readjustment Allowances are payable during approved retraining periods for workers determined to be TAA-eligible. (For more on related issues, in the context of the Tax Cuts and Jobs Act of 2017, see box 5-2.)

Trade Opportunities for the United States

Trade can create opportunities for both producers and merchants in the United States to export products to the rest of the world. And U.S. policy can help to ensure that these opportunities come to fruition and deliver economic gains to Americans.

Box 5-2. Distressed Communities and the Tax Cuts and Jobs Act

As pressures from trade and technology have reduced the economic viability of American manufacturers, factory closings have left communities that relied on their jobs in distress. Job losses in distressed communities have had obvious negative effects on income and economic well-being, but also on health and mortality, including mortality from suicide (Sullivan and von Wachter 2009; Classen and Dunn 2009). Effects on the children of unemployed workers are also apparent (Schaller and Stevens 2011). Also, job loss effects are not confined to former manufacturing workers and their households; local aggregate demand falls with plant closings, inducing further consequent job losses—for example, in the service sectors. Housing markets also suffer, affecting the tax base for schools and other public goods.

In the years after the Great Recession, labor markets recovered in most of the country, even as some communities were left behind. Uneven recovery motivates households to consider migration as a way out of local unemployment and underemployment. But migration is not costless, and the overall declining proclivity of Americans to move (see chapter 3) implies the need for a rejuvenation of local job growth as one component of any policy strategy to address local employment losses. The agglomeration of trade-dependent industries makes local retraining and revitalization projects an important domestic dimension of trade policy.

The Federal government has an active set of policies to encourage investment and job creation in distressed communities, including Empowerment Zones, Enterprise Communities, Renewal Communities, and New Market Tax Credits (NMTC). The NMTC—arguably, the most successful of these programs—is structured to induce “patient” capital, providing substantial investment incentives if assets are held over a full seven years. As a result, although the majority of NMTC recipients would not have otherwise invested in the benefiting community, real estate has been the investment of choice, both because real estate returns are naturally long-run and because these investments clearly complied with NMTC regulations (Bernstein and Hassett 2015). But real estate is likely not the most effective tool for job growth, and the program is reportedly difficult for entrepreneurs to navigate.

During the past two years, bipartisan support has developed for a new program to encourage investment in distressed communities, and the Tax Cuts and Jobs Act of 2017 greenlighted the designation of Opportunity Zones to drive this investment. The Investing in Opportunity Act—original, bipartisan legislation sponsored by Senator Tim Scott (R-SC) and Senator Cory Booker (D-NJ) and Representative Pat Tiberi (R-OH) and Representative Ron Kind (D-WI), alongside nearly 100 additional cosponsors—has three key features. Opportunity Zones are limited to low-income areas that have recently experienced unemployment due to business closures or relocation. States designate particular Census tracts as Opportunity Zones, subject to particular socioeconomic criteria. They are meant to establish an investment

vehicle that pools assets from a group of investors, much like a venture capital or mutual fund for distressed community investment, to spread risk and increase the scale of investment. Finally, to incentivize investors to place capital in Opportunity Funds, the Opportunity Zone program provides investors with the option to temporarily defer and modestly reduce capital gains taxes if they keep capital in an Opportunity Fund for a period of time.

U.S. Agricultural Trade

The United States enjoys comparative advantage in many types of agricultural production thanks to ample land, favorable climate, and smooth integration of human, financial, and intellectual capital into production. Export markets are crucial to U.S. agricultural producers because American farmers produce more than American consumers can eat. The United States leads the world in agricultural exports, and runs a trade surplus for agricultural goods. The top three export markets for U.S. agricultural products in 2016 were China, Canada, and Mexico; together, these three countries accounted for 44 percent of all agricultural exports (ERS 2017a). Exports are especially important for certain products. The Department of Agriculture (USDA 2017a) estimates that American producers will export on average 76 percent of the cotton, and virtually half of all the wheat, soybeans, and rice they grow to the rest of the world, from the fiscal year 2016–17 through 2026–27 crops. In general, the United States is a major exporter of bulk agricultural commodities like coarse grains and meat, and a net importer of consumer-oriented, processed goods that provide Americans with variety, like wine, beer, and out-of-season fresh fruits and vegetables. The USDA (2017b) forecasts agricultural exports at \$140 billion for fiscal year 2018. This includes \$33.1 billion in oilseeds and products (including \$24.1 billion in soybeans); \$29.4 billion in grain and feed (including corn); \$29.7 billion in beef, poultry, and animal by-products; \$34.5 billion in horticultural products; and \$4.8 billion in cotton.

Export markets present a growth opportunity for U.S. agriculture. Agricultural exports have grown substantially over time, as shown in figure 5-18, consistently contributing to a trade surplus for decades; today, they account for about a third of American farmers' gross cash income (Schneep 2017), up from less than 20 percent before the mid-1970s, and less than 10 percent before the mid-1940s. By 2050, population growth and increasing standards of living are expected to require global agricultural production to increase 60 percent from the level of 2005–7 (Alexandratos and Bruinsma 2012). U.S. agriculture is well positioned to supply a large share of this rising demand, provided productivity improves and trade barriers do not prevent U.S. farmers from expanding their access to new markets and consumers.

Agricultural trade is distorted worldwide. Governments around the world have long intervened in agricultural and food markets. Interventions distort price signals and draw resources into inefficient forms of production, shifting them from areas where they could be used more productively. Figure 5-19 shows that even as high-income economies have reduced government interventions in markets for nonagricultural goods, their history of interventions in agriculture is much more heavy-handed.

Interventions in agriculture include domestic supports like production, insurance, and income subsidies, and directed trade policy like import restrictions and export controls. Both sets of policies transfer wealth between domestic consumers and producers. Governments offer several reasons for the special protective treatment of agriculture:

- to make sure enough food is available to meet domestic demand,
- to shield agricultural producers from volatile weather and market conditions, and
- to preserve rural society.

But by restricting trade and warping market signals, these policies also amplify international price spikes (Martin and Anderson 2012; Carter, Rauser, and Smith 2011), undermining living conditions of people around the globe. Anderson, Cockburn, and Martin (2010) estimate that agricultural market interventions accounted for 70 percent of the global welfare cost of all goods-market distortions, even though the sector represents just 6 percent of world trade and 3 percent of world GDP.

Under the WTO architecture, tariffs for nonagricultural goods have fallen steadily worldwide, but agriculture has not liberalized at the same pace. Despite efforts aimed at their reduction, higher barriers to trade persist, through direct restrictions like tariffs, along with a variety of nontariff measures. Figure 5-20 recreates figure 5-10 for only agricultural products, and presents tariff and overall trade restrictiveness for agricultural goods among the United States, other high-income members of the G20, emerging nations in the G20, and select countries in the developing world. Like figure 5-10, it depicts a similar overall pattern in terms of differential trade restrictiveness for agricultural products: the United States applies lower tariffs and trade barriers to agriculture than the average high-income nation, emerging economy, and developing country—however, the restrictiveness magnitudes are much higher. U.S. exporters also face notably higher barriers to trade for their agricultural exports, compared with exporters from the average high-income or emerging member of the G20. While further liberalization of agricultural trade will benefit consumers around the world, it would likely also benefit U.S. exporters.

The U.S./EU discrepancy in agricultural market protection. One example of the discrepancy in agricultural market access between even high-income countries is illustrated by the varying levels of import restrictions applied by the United States and the EU, two of the world's major producers that together

account for close to 40 percent of global agricultural trade. Agricultural trade between the two has decreased over time, due in part to the relatively high trade barriers that the EU places on U.S. agricultural exports (ERS 2016)—as shown in figure 5-21—even as overall trade between the United States and the EU has grown. In terms of simple averages for all traded goods, the United States levies a tariff of 3.5 percent on EU exports, while the EU charges 5.5 percent for U.S. exports. For agricultural commodities alone, however, the comparable rates are 4.7 percent and 13.7 percent, respectively. Many goods, including dairy and meat products, face far higher tariffs from the EU than vice versa (Beckman et al. 2015). These rates do not include EU nontariff measures that combine with tariffs to present significantly higher barriers to U.S. exports of meat products, corn, soybeans, and fruits and vegetables (Arita, Beckman, and Mitchell 2016).

Investing in productivity and negotiating trade agreements. Increases in American agricultural production are mainly due to innovations and advances in technology, in areas such as crops, livestock breeding, fertilizers, pest management, farm practices, and farm equipment and structures (Clancy, Fuglie, and Heisey 2016). Productivity-enhancing innovations rely on funding from both the public and private sectors. Although public investment in agricultural research has resulted in large economic benefits with annual rates of return between 20 and 60 percent (Fuglie and Heisey 2007), real public research investment in the United States is declining. The United States accounted for 20 to 23 percent of global public sector funding for food and agricultural R&D between 1990 and 2006, but fell behind China beginning in the late 2000s (Clancy, Fuglie, and Heisey 2016) and has since remained behind. By 2013, the United States' share of worldwide research funding fell to just 13 percent.

Market access supports U.S. farmers. Free trade agreements help expand U.S. agricultural exports into foreign markets. The United States' 20 current FTA partners represent 10 percent of the world's GDP and 6 percent of its population, but account for 43 percent of U.S. agricultural exports, an increase of 29 percentage points since 1990 (FAS 2016). Even though farming accounts for a relatively small share of the U.S. economy, agricultural trade makes significant and outsized contributions to GDP. Based on 2015 data, USDA's Economic Research Service estimates that each \$1 billion in U.S. agricultural exports supports approximately 8,000 jobs throughout the economy, and each \$1 in agricultural exports stimulates an additional \$1.27 in business activity (ERS 2017b). These indirect activities include facilitating the movement of exports to their final destination. ERS (2017b) reports that U.S. agricultural exports in 2015 supported over 1 million jobs both in and outside agriculture, and also generated \$302.5 billion in total economic activity.

U.S. Energy Dominance Relies on Trade

Current trends indicate that the United States may become a net energy exporter by 2026. Historical U.S. dependence on crude oil imports makes this vision seem farfetched—as recently as 2005, net imports accounted for 60 percent of domestic oil and petroleum product consumption. Even a decade ago, when over 40 percent of the total trade deficit was attributable to petroleum imports, a future where the United States was relatively independent of energy imports was inconceivable. The outlook today is decidedly different. As shown in figure 5-22, the petroleum trade balance was 12.4 percent of the total trade deficit in 2016, the lowest observation since 1991.

Between 2008 and 2017, domestic petroleum production nearly doubled and natural gas production increased by one-third, facilitated by technological improvements that enabled profitable production from resources once considered too costly to exploit. Widespread private ownership of mineral resources in the United States is unique in the world, and the willingness of mineral owners to form partnerships with developers has contributed to the observed rapid increase in production. Realizing the goal of increased exports requires specific infrastructure investments to allow for increased capacity, but also the security provided by enhanced FTAs that expressly address energy trade.

All fuels have a role to play in U.S. energy dominance. In 2017, coal exports expanded by nearly 60 percent year on year, and the industry’s prospects are looking up. In natural gas, the United States is the world’s leading consumer and among its leading producers, so gains can be had in increasing extraction and domestic distribution. But increasing its international trade by transporting liquefied natural gas (LNG) requires more liquefaction capacity to permit increased exports, and an expansion of pipeline links to Mexico and eastern Canada to allow more terrestrial exports. Increasing American exports of crude oil and refined products will further exploit the U.S. comparative advantage and lock in the manufacturing value-added characteristic of oil refining. Continued integration of renewable electric generation technologies into the American grid would allow for low-cost, resilient domestic electric generation. Finally, the United States has been a historic leader in civil nuclear technology, and opportunities for exporting these technologies may arise in coming years.

Coal. The United States has the largest coal reserves of any country in the world. Until the Trump Administration took office, the economic prospects for coal in the U.S. appeared bleak in the years after 2008, when U.S. coal production reached an all-time high before steadily declining. Coal-based energy production peaked in 2007, and no new coal plants for domestic utility electricity production have been built since 2014. Reducing reliance on coal is a long-term trend. From the beginning of 2002 to the end of 2016, the maximum generating capacity of coal-fired power plants in the United States fell from 306 to 270 gigawatts. Over that 14 year period, 531 coal generating units were retired,

with nameplate capacity of 59 gigawatts (new units brought online explain the difference). In 2016, coal-fired power plants made up 25 percent of nameplate generation capacity in the United States, and supplied about 29 percent of the electricity generated. Both figures are down, from 35 percent and 50 percent in 2002, respectively.

From 2015 to 2016, domestic coal production declined by 18.8 percent, to its lowest level since 1978. Contemporary employment in the coal-mining industry fell from 69,000 in January 2015 to just 49,000 by the end of 2016, a decline of 29 percent. Total U.S. coal distributions for 2016 were 737 million short tons, 17 percent less than the level of distributions in 2015.

Coal-powered steam generation has declined steadily, due to the falling price of natural gas in the past decade. Between 2008 and 2015, the use of natural gas to generate electricity grew 51 percent. Culver and Hong (2016) compared the monthly price of gas with that of coal from January 2012 to January 2016 and found that for nearly 90 percent of the months in this period, natural gas was more competitive than Appalachian coal. Natural gas was also less expensive than Appalachian, Illinois, and Rockies coal for 57 percent of the months studied.

Despite this long-term trend for domestic coal production and usage, metallurgical coal exports were a bright spot in 2017. Exports of metallurgical coal from East Coast ports expanded dramatically that year, with over 25 million short tons of coal exported through the second quarter alone—an increase of roughly 27 percent from the same period in the previous year.

Wolak (2016) examines the potential impact on the world coal market of increasing coal export capacity from the West Coast. The net effect increases U.S. exports to the Pacific Basin and reduces Chinese domestic production. Increased Chinese access to less expensive, cleaner-burning U.S. coal would drive up coal prices and accelerate the switch to natural gas-fired generation in the United States. The environmental dividend of this conversion is double—U.S. emissions would fall as cleaner-burning natural gas substituted for coal, and global emissions would also decrease as higher grades of U.S. exported coal would substitute for the poorest Chinese grades. Environmental economists often worry about emissions leakage as energy trade increases, but Wolak's result suggests that leakage from U.S. coal exports to Asia could well be negative. Currently, one project expanding Pacific export capacity is involved in litigation over rejected State permits in Washington State. The current capacity for coal exports to the Pacific is limited—barring a new terminal in Washington, the only outlet in the Pacific Northwest relies on transshipment through Vancouver, in Canada.

There is unlikely to be significant short-term change in coal consumption outside the United States, due to limited opportunities for international electricity sectors to substitute away from coal in the short and medium terms (Wolak 2016). Power plants have life spans that last decades; once they are

Figure 5-22. U.S. Petroleum and Total Goods Trade Deficits, 1991–2016

Source: U.S. Census Bureau.

built, they lock in fuel demand. Wolak notes that current low natural gas prices make it unlikely that many regions of the world would expand their installed capacity of coal-fired generation in response to increased U.S. exports. This limited flexibility in global demand for coal may cause the potential gains to be short-lived. U.S. exporters are likely to be inframarginal suppliers to the Asian market as marginal Asian production is displaced. International coal trade has been price-sensitive historically; figure 5-23 shows how U.S. coal exports have fluctuated with coal prices since 2002.

Natural gas. Thanks to the technological transformation of the Nation’s oil and gas sector enabling exploitation of unconventional resources (commonly termed “fracking”), U.S. natural gas production and net exports expanded over the past decade, as shown in figure 5-24. Between 2007 and 2016, annual gross natural gas withdrawals expanded by 32.3 percent. Apparent consumption of natural gas rose across all sectors during this period, with total U.S. consumption, in trillion cubic feet, rising from 23.3 in 2007 to 27.5 in 2016. The United States is the world’s largest consumer of natural gas, and has been its largest producer since 2006.

Thanks in part to new infrastructure investments, U.S. natural gas exports have expanded as well; between 2007 and 2016, U.S. exports of natural gas increased by 184 percent, totaling over 2.3 trillion cubic feet in 2016. This has moved the United States from being a net importer to a net exporter of natural gas. Both major forms of exports expanded—natural gas transported

in pipelines, and LNG that can be transported by ship. Figure 5-25 shows the expansion of these exports since 2000. Export capacity utilization was 59 percent in 2017, up 7.5 percentage points from the previous year. LNG exports have the advantage in that they can be delivered to any country with an LNG-unloading terminal, as opposed to pipeline connections, which are limited to Canada and Mexico.

The United States exported nearly 410 billion cubic feet of LNG through August 2017, doubling the quantity exported in all of 2016. Until 2016, the only LNG capacity in the continental U.S. was configured for imports, as opposed to exports. More than 60 percent of all current export capacity came online in 2017—a total of 2.15 billion cubic feet per day. It is particularly important that four additional LNG export facilities are now under construction, in addition to expansions of two existing facilities. In the years 2001–10, LNG averaged 8.3 percent of total U.S. natural gas exports because only one export facility existed (in Alaska). As of August 2017, LNG accounts for 20 percent of total U.S. natural gas exports.

One important question is whether U.S. natural gas producers can manage to supply exports while also satisfying domestic demand. Since the shale revolution took hold in the mid-2000s, the U.S. natural gas market has been isolated from the global market by limited export capacity. New LNG capacity changes this dynamic, and U.S. exporters can sell relatively cheap U.S. natural gas on the world market. Natural gas supply is now more elastic than it was previously, and it responds to price movements more quickly (Newell, Prest, and Vissing 2016). This flexibility may be used to deepen relations in existing markets as well as in emerging markets abroad, including Latin America, Africa, and Asia. Even though Mexico has the benefit of direct natural gas pipeline links with the United States, it was also the largest market for U.S. LNG in 2017, receiving 126 billion cubic feet through October. Deeper U.S. export penetration may provide these regions with increased energy security while also helping to grow U.S. exports.

A critical factor that facilitated the ascension of the United States' natural gas market was the structuring of commodity transportation within the country. Pipeline transporting capacity is divorced from pipeline ownership, allowing competitive bidding for any producer to access transportation for the fuel generated, regardless of size (Makholm 2012). When ownership of products and capacity is bundled (along with this infrastructure being vertically integrated with larger producers), in the case of many other markets, larger, integrated firms are often able to exercise market power in lieu of regulation.

Petroleum. The same suite of technological innovations that spurred natural gas production contributed to higher U.S. crude oil production, which rose by about 5 million barrels per day between 2008 and 2015. Oil production is poised to surpass 10 million barrels per day in 2018. This windfall stands to benefit Americans even more than abundant natural gas, because oil is more

Figure 5-23. U.S. Monthly Coal Exports, 2003–2017

Sources: Energy Information Administration Quarterly Coal Report; CEA calculations.

transportable than natural gas. After a 2015 decision to remove a 40-year-old crude export ban, crude oil exports ended 2017 at a monthly average of over 4,000 barrels per day. In addition to crude oil, refined product exports began to increase before the crude export ban was lifted, and the trend continued through 2017. For example, exports of refined products to Latin America have grown; over the past two decades, Latin America on average accounted for 34 percent of the consumption of U.S. petroleum product exports, and for 28 percent of the growth in these exports.

Continuing this trend and expanding U.S. capacity to export crude oil and refined products will be critical for the U.S. to reach the status of net energy exporter by 2026. New projects to expand capacity are under way; crude oil exports are expected to start from the Louisiana Offshore Oil Port (known as LOOP) in early 2018, at about 2 million barrels per month.

Renewables. Electricity is a tradable product for the United States. In 2016, the United States imported a net of 60,000 gigawatt-hours of electricity, mostly from Canada. The amount of electricity trade is small—the net imports were about 1.4 percent of total generation in 2016. So though electricity trade is not itself significant, the recent developments in the U.S. electricity sector have proven disruptive and have freed up U.S. fuels for export.

Figure 5-24. U.S. Monthly Natural Gas Withdrawals and Net Imports, 1973–2017

Figure 5-25. U.S. Natural Gas Exports by Pipeline and LNG, 2000–17

In recent years, renewable energy’s share of generation capacity has grown substantially. The historic mainstay of renewable generation, hydroelectric power, has contributed to nearly constant installed capacity since the early 2000s. At the end of 2016, 8.4 percent of U.S. nameplate electric generation capacity was powered by nonhydroelectric renewables. Wind power grew from 1 percent of the generation mix in 2008 to 5.6 percent in 2016. More than 8,000 megawatts of new wind capacity was installed in 2016, an increase in cumulative wind capacity of 11 percent from the prior year. Texas alone installed 2,611 megawatts of capacity, and in 14 States wind generation exceeded 10 percent of total generating capacity.

Solar photovoltaic (PV) capacity has also grown rapidly since the late 2000s, contemporaneously with falling hardware and installation prices during this period. Installed capacity has grown from less than 1 gigawatt in 2008 to over 47 gigawatts in 2017. This expansion has occurred across all forms of installations, with increased solar PV implementation in the residential, non-residential, and utility sectors (figure 5-26). An additional 22 gigawatts are currently under contract (those with signed power purchase agreements) in the United States for 2017, with another 36 gigawatts announced. State Renewable Portfolio Standards, declining technology costs, Federal tax credits and subsidies, voluntary and retail procurement, the Public Utility Regulatory Policies Act, and a new third-party ownership model for residential PV systems have all been credited as drivers of renewable growth. According to a 2012 report on

the impact of tax policies of renewables, Energy Investment Tax Credits and Production Tax Credits combined led to more than \$1.7 billion in cumulative tax cuts toward developing PV infrastructure (Sherlock 2012).

Updating American Trade Policy

Historically, the United States has exercised leadership in pursuit of a policy of lowered trade barriers and increased market access. The gains from these actions have, as a whole, served to boost income in the U.S. as well as around the world. But U.S. trade with the world has also, at least in some cases, imposed costs on some Americans.

Congress delegates trade negotiating power to the President, which gives the President considerable control over the outcome of a disagreement with a trading partner. This power can be exercised without relying on a third-party arbiter such as the WTO, which ensures that the United States maintains its sovereignty with respect to economic issues.

In its first year, the Trump Administration has used all available tools to address imbalances. Section 201 of the Trade Act of 1974 seeks to protect U.S. industries faced with serious injury from import competition through the increasing imports of competing merchandise. Section 201 cases may be initiated by private petitioners that believe that imports have caused or are likely to threaten serious injury. Import competition must be a “substantial cause” of the serious injury. Two Section 201 investigations concluded in 2017 with positive injury findings by the USITC, and both resulted in Presidential proclamations of new import restrictions—one for crystalline solar photovoltaic products, and a second for large residential washing machines. These are the first Section 201 cases filed in 15 years.

Section 337 of the Tariff Act of 1930 provides possible remedies against unfair methods of competition and unfair acts in the importation of articles. Section 337 is most commonly invoked against articles that infringe on U.S. patents or trademarks, or that are made according to misappropriated trade secrets; a total of 20 cases have been completed since January 2017, and an additional 51 are under way. The primary form of remedy is an exclusion order against imported goods.

Although the President does not have a direct role, AD/CVD proceedings, which firms rather than the government typically initiate, are the most common trade action, with 33 completed investigations since January 2017, and another 30 under way.

Conclusion

This chapter began by recapitulating the consensus toward which, over time, the economics profession has converged: that trade across international borders will virtually always generate net gains for all the nations involved. The

distribution of the gains from trade within a country are also important to consider. Although efforts to expand trade have historically provided gains in the form of higher incomes and living standards in America (and around the world), trade exposure has imposed costs on certain segments of American society.

The evolving U.S. and global economies provide opportunities for the U.S. to gain from trade. The United States enjoys a comparative advantage in agricultural production, innovative goods, and many other products. Meanwhile, U.S. energy production, boosted by technological breakthroughs in recent years, has increased to the point where the United States could become a net energy exporter in the coming years. The United States remains a large and vibrant economy with many comparative advantages, and it stands poised to gain from trade agreements that allow it to maximize the benefits of its underlying dynamism while removing barriers to trade imposed by other nations that disproportionately harm American producers.

Chapter 6

Innovative Policies to Improve All Americans' Health

There are many determinants of health, but recent U.S. government health policy has mainly focused on one: expanding health insurance coverage through implementation of the Affordable Care Act (ACA). The ACA expansion covered fewer people than anticipated, and most of them gained coverage through Medicaid, which provides small, uncertain benefits and limited access to care. Moreover, the ACA imposed costly mandates and regulations that raised costs, diminished people's choices, and forced them to buy insurance they neither wanted nor needed.

Health insurance is a positive factor in the lives of Americans, providing financial protection and peace of mind in case of serious illness. But the evidence shows that health insurance provided through government expansions and the medical care it finances affect health less than is commonly believed. Determinants of health other than insurance and medical care—such as drug abuse, diet and physical activity leading to obesity, and smoking—have a tremendous impact and have exacerbated recent declines in life expectancy, despite the ACA's increased coverage.

Health policy that is predominantly focused on expanding insurance coverage risks missing other policies that can improve the health of our citizens. This Administration is focused on reversing the harm caused by the ACA by fostering competition, choice, and innovation while also addressing the many factors beyond insurance that influence health. The Administration is particularly concerned about the opioid crisis that exploded during the ACA expansion. The CEA finds that the economic cost of the opioid crisis—as much as \$504 billion

in 2015, or 2.8 percent of gross domestic product—is far higher than previous estimates. The Administration has taken substantial steps to decrease the supply of prescription and illicit opioids and to increase treatment options. Additional government actions and private innovation may be needed to make further progress against opioid abuse and other behavioral health problems such as obesity and smoking.

Innovation often reduces the price of health over time by providing previously unavailable treatments at patent-protected prices that fall as competing brands, and eventually generic products, come on the market. Nevertheless, as the prices of new specialty drugs have demonstrated, the initial prices of innovative products can sometimes be so high that people struggle to pay for them. The Administration is committed to bringing down the price Americans pay for healthcare, especially drug prices, while preserving and improving incentives to innovate. This chapter outlines the Administration’s efforts to move beyond government insurance expansions that provide uncertain benefits to only a small segment of the population and instead pursue initiatives that lower costs and improve the health of all Americans.

Health is an extremely valuable good, because it is a prerequisite for fully enjoying life’s many activities. Although improving health is an important goal in itself, it is also important because better population health will increase productivity and economic growth. This chapter discusses the Administration’s initiatives to enhance Americans’ health and how these efforts differ from previous policies.

Over the last eight years, health policymakers focused on expanding insurance coverage, primarily through the Medicaid expansion and exchange subsidies in the Affordable Care Act (ACA). Health insurance is a positive factor in the lives of Americans, providing financial protection and peace of mind in case of serious illness. But the ACA expansion had a limited effect on health and many downsides. The ACA only expanded coverage to, at most, an additional 6 percent of the population. In addition, most of these people gained coverage under Medicaid, which provides limited access to care and uncertain, and at most modest, health benefits. Moreover, the ACA imposed costly and

cumbersome mandates and regulations that raised costs, decreased people's choices, and forced them to buy insurance that they neither wanted nor needed. The lack of competition and choice inherent in the ACA approach was not the most efficient way to provide coverage and medical care for the poor and uninsured, and thus resulted in higher health insurance premiums and spending.

By focusing primarily on expanding insurance coverage through the ACA, the health policy community lost sight of other important policies that can improve the health of a larger share of our citizens. Extensive economic and medical literature shows that while public insurance coverage expansions increase the amount of healthcare used, they generally improve health less than is commonly believed. Indeed, there is substantial evidence that other determinants of health outside of insurance and medical care, such as diet and physical activity, smoking, and drug abuse, impact health enormously. For example, for the first time in over 50 years, life expectancy in the United States declined for two consecutive years—in 2015, and again in 2016 (CDC 2016a, 2017a). This negative health outcome occurred despite the ACA coverage expansion, suggesting that other factors are causing population health to deteriorate.

This chapter focuses on the Administration's goal of reversing the harm caused by the ACA while taking a broader perspective—with a focus on fostering competition, choice, and innovation—in order to improve the health of the entire population in the most cost-effective way possible.

We first assess the evidence about the small and uncertain, positive effect that government insurance expansions have on health. Government expansions in general, and the ACA in particular, often replace uncompensated care with insurance coverage that provides limited access to low-benefit care and imposes requirements that are ineffective. The ACA exacerbated this by imposing mandates and price controls that resulted in an unstable market and rapidly rising premiums. We document the policies the Administration has adopted to restore competition and choice to the insurance market.

We next discuss three important determinants of health other than insurance and medical care—opioid abuse, obesity, and smoking—that have an outsized influence on the most common and costly illnesses. The Administration has focused on confronting the opioid epidemic, which exploded through the period of ACA expansion, leading to immense social and family disruption along with loss of life and human dignity. The Surgeon General lists substance abuse, including the opioid epidemic, among the nation's top health priorities (HHS 2017). The opioid problem has reached crisis levels in the United States, and is partly responsible for declining life expectancies—in 2016, over 42,000 Americans died of a drug overdose involving opioids. We highlight a study by the Council of Economic Advisers (CEA 2017), which finds that previous estimates greatly underestimate the economic cost of the opioid crisis by

undervaluing the lives lost to overdoses. This study found that in 2015, the economic cost of the opioid crisis was as much as \$504 billion, or 2.8 percent of gross domestic product (GDP) that year. We enumerate the Administration's efforts to address the crisis and its negative health effects.

For some behaviors that drive population health, private sector medical innovation may be a more effective way of decreasing the negative consequences of these health behaviors than traditional government interventions like public health measures and raising prices through taxation. In particular, the private sector has recently delivered many innovative new products and procedures to treat everything from HIV, heart disease, cancer and hepatitis C. These innovations can be seen as lowering the effective price of better health by providing previously unavailable treatments—and thus, from an economist's perspective, prohibitively expensive treatments—at patent-protected price levels that decline over time as competitors, and eventually generic substitutes, come to market.

But innovations that improve population health are unhelpful if people cannot afford them. The Administration is focusing on two essential goals: first, to decrease the price Americans pay for healthcare and especially expensive drugs; and second, to keep lowering the effective price of better health in the future by spurring medical innovation. We discuss how these two goals can be achieved through a combined strategy to reduce inefficiently high prices at home while at the same time reducing free-riding abroad.

Administration policies that promote market competition and choice will deliver innovative solutions to these and other health problems, as opposed to top-down, government approaches. A more holistic approach to health policy beyond a singular focus on low-quality coverage expansions for a small part of the population will improve health, increase productivity, and lead to greater economic growth.

Healthcare Insurance and Spending, and the ACA

During the last eight years, the health policy community focused on the Affordable Care Act, which set out to improve health by expanding health insurance coverage while also decreasing healthcare spending. The ACA failed on both fronts: it ended up insuring fewer additional people than projected (CBO 2017)—only 6 percent of the population, most of whom gained coverage under Medicaid (Uberoi, Finegold, and Gee 2016), a program with historically small and uncertain effects on health outcomes and limited access to care. The remainder of newly insured people were forced to buy more expensive and elaborate insurance than many wanted, or else be subject to a penalty. Not only were the ACA's ostensible cost control features ineffective, but they also led to market consolidation, decreased competition, higher premiums, and a clear increase in inefficient healthcare spending.

The Impact of the ACA and Health Insurance on Health

Expanding health insurance coverage provides protection against financial catastrophe in the case of serious illness. Mazumder and Miller (2016) found that personal bankruptcies declined and credit scores improved when Massachusetts expanded health coverage in 2006. Other research indicates that fewer medical bills went into collections and fewer people went into medical debt after expansions of Medicaid coverage (Baicker et al. 2013; Hu et al. 2016). Insurance coverage also provides covered people with the peace of mind that comes from alleviating the fear of possible financial distress.

Although increasing financial security is important, most initiatives to expand health insurance coverage and access to healthcare are undertaken with the goal of improving the health of insured people. Though the evidence is clear that gaining health insurance increases healthcare utilization and spending, it is less clear that government coverage expansions improve people's health.

One of the first attempts to study the effect of health insurance on health was the RAND Health Insurance Experiment. In the 1970s, participants were randomly assigned to multiple levels of coinsurance, ranging from free (no coinsurance) up to 95 percent coinsurance. The study found that as the amount of coinsurance decreased, utilization of medical care rose. However, with the exception of improved hypertension control, dental care, and vision care for the poorest patients assigned free care, there were no health improvements for the average person receiving more generous insurance (Newhouse 1993; Brook et al. 2006). Hanson (2005) observes that because the researchers conducted 80 tests by health indicators, 4 positive health results could appear by chance alone, given a 5 percent significance level. Unfortunately, the RAND study did not compare insurance with not having any insurance.

A careful examination of the literature by Levy and Meltzer (2008) found that although many studies purport to find that insured people have better health outcomes than uninsured people, most of these studies did not establish a causal relationship between health insurance and health. Observational studies, which make up the vast majority of studies, did not adequately address the problem of the endogeneity of health insurance—that observed differences in health outcomes might be driven by unobserved differences between the insured and uninsured. Results from quasi-experimental studies, where endogeneity is less of a problem, were inconclusive. Levy and Meltzer concluded that increases in health insurance increased the consumption of medical care and might modestly improve self-reported health. Although insurance can improve some health measures for some population subgroups, especially vulnerable ones like children, there is little evidence that insurance significantly affects the health of most people.

Perhaps the best recent evidence of the effect of insurance on health comes from the Oregon Medicaid expansion experiment (Baicker et al. 2013). People selected at random for Medicaid coverage from a waiting list of uninsured people were compared with a control group of those who were not selected. Both groups were followed for two years. The covered group gained improved financial security, which was reflected in less medical debt as well as less borrowed money to pay bills or skipped payments. They increased their use of medical care—ambulatory care, emergency department visits, preventive visits and services, prescription drugs, and hospitalizations all increased. Medicaid enrollees also reported an improved sense of physical and mental health. Yet, other than improved depression outcomes, the group gaining coverage did not show improvement in health outcomes. There was no significant improvement in blood pressure, cholesterol level, diabetes control, or mortality.

In a recent review of the effect of insurance coverage, Sommers, Gawande, and Baicker (2017) asserted that insurance improves health. They cited a single quasi-experimental study showing that insurance improves health outcomes. That study (Cole et al. 2017) only found improvement in four of eight “quality measures,” and three of the four were process measures, not outcome measures. Blood pressure control was the only outcome improvement, a finding that is contrary to the finding of no improved blood pressure control in the randomized Oregon experiment. Sommers, Gawande, and Baicker (2017) also claimed that insurance lowers mortality. They cited two quasi-experimental studies showing a 6 percent reduction in mortality over 5 years in three States that expanded Medicaid in the early 2000s as compared with neighboring States that did not expand Medicaid (Sommers, Baicker, and Epstein 2012), and reductions in mortality in Massachusetts after its 2006 health reform as compared with mortality in demographically similar counties nationally (Sommers, Long, and Baicker 2014). These studies, as the authors acknowledged, were susceptible to unmeasured confounding. Finally, they asserted that the positive effect on self-reported health seen in the Oregon study predicts reduced mortality over a period of 5 to 10 years. They relied on two earlier studies (Miilunpalo et al. 1997; DeSalvo et al. 2006) that reported a correlation between perceived poor health at a point in time and mortality. These studies may be accurate, but neither one sought to answer how changes in self-reported health brought on by gaining insurance affect eventual mortality.

Multiple studies cited by Sommers, Gawande, and Baicker (2017) had short-term follow-up. In contrast, a recent 20-year observational study of the near elderly (age 50–61 years), which took pains to counteract the deficiencies of earlier observational studies by using a more complete set of covariates, found that insured people use more healthcare services, but there was little or no effect of insurance on health and mortality (Black et al. 2017).

A study by Richard Kronick (2009)—who worked on ACA implementation as HHS Deputy Assistant Secretary for Health Policy (2010–13) and as Director of the Agency for Healthcare Research & Quality (2013–16)—found that on almost every characteristic measured, uninsured people have higher risk factors compared with privately insured people; this study had a follow-up period of 16 years. When adjustment was made for high-risk characteristics, being uninsured was not associated with an increased risk of mortality. Although cautioning about the difficulties of inferring causality from an observational analysis, Kronick concluded that “there would not be much change in the number of deaths in the United States as a result of universal coverage.”

Why the ACA Expansions May Have Limited Health Effects

There are at least four reasons why health insurance, particularly through government coverage expansions, may have a smaller effect on health than anticipated. The first three of these reasons—that the uninsured were often able to obtain care before coverage, access problems for patients who gain Medicaid coverage, and mandated insurance benefits that have a minimal impact on health—are particularly salient when examining the results of the ACA coverage expansion.

First, care has been available for many who have no insurance coverage. The 1986 Emergency Medical Treatment and Labor Act requires anyone coming to a hospital emergency department to be stabilized and treated, regardless of their insurance status or ability to pay. Moreover, physicians in private practice have historically been willing to care for some uninsured or poorly insured patients, although recent increases in operating costs and declines in insurance reimbursements have decreased willingness to provide charity care (Zinberg 2011). Finkelstein and McKnight (2008) explained their finding that in its first 10 years after passage in 1965, Medicare had no discernible impact on elder mortality, in part because before Medicare, elderly individuals with life-threatening, treatable conditions sought care even if they lacked insurance. Finkelstein, Hendren, and Luttmer (2015) found that in the Oregon experiment, Medicaid enrollees only valued each additional \$1 of government Medicaid spending at \$0.20 to \$0.40. Most of the benefit went to doctors and hospitals, who would have otherwise provided uncompensated care to these enrollees. Similarly, a study of how many enrollees dropped out when charged higher premiums for Medicaid-like coverage on Massachusetts’ low-income health insurance exchange found that most enrollees valued coverage at less than half the cost of coverage. The availability of uncompensated care for low-income uninsured people explained the gap between enrollee value for Medicaid below the program cost (Finkelstein, Mahoney, and Notowidigdo 2017). In fact, the ability of low-income, uninsured people to declare bankruptcy serves as an implicit form of high-deductible insurance (Mahoney 2015).

Second, about three-quarters of the ACA's net coverage increase came from people who were newly covered by Medicaid (Uberoi, Finegold, and Gee 2016), a type of insurance that is associated with limited access to care. When there are public coverage expansions, demand prices (copays and premiums) fall for those who are subsidized, but supply prices set by the government (reimbursements) are usually lower than commercial rates. This leads to excess demand and a limited supply of willing providers to serve those covered by the low reimbursement rates under the public expansion. The Kaiser Family Foundation (2016) reported that State Medicaid programs pay physicians an average of 72 percent of Medicare fees, and Medicare fees are often lower than commercial rates. The reimbursements are even lower (66 percent of Medicare) for primary care physicians who are regarded as the key points of access into the healthcare system. Low Medicaid reimbursement rates mean relatively low physician participation in the program (Decker 2013). A study of appointment availability found that every \$10 change up or down in Medicaid fees led to a 1.7 percent change in the same direction in the proportion of patients who could secure an appointment with a new doctor (Candon et al. 2017).

Office-based physicians' willingness to accept new patients varies, depending on a potential patient's type of insurance. Nearly 85 percent of physicians will see a new patient if they have private insurance, and 84 percent will see a patient with Medicare; but just 69 percent will accept new Medicaid patients (CDC 2015). Moreover, the percentage of physicians accepting Medicaid varies vastly among States. Three of the most populous States in the Nation have significantly lower percentages of accepting physicians than the 69 percent national average—California (54 percent), New York (57 percent), and Florida (56 percent) (CDC 2015). If Medicaid coverage did not improve outcomes in the Oregon experiment, where the proportion of physicians accepting Medicaid (77 percent) was higher than the national average, it suggests that expansion in these States would have only a marginal effect. Not surprisingly, Miller and Wherry (2017) found no difference in the health outcomes of individuals in States that expanded Medicaid under the ACA compared with nonexpansion States, no significant improvement in self-reported health status, and an increased probability of delay in obtaining care because no appointments were available or waiting times were too long for those in expansion States.

The third reason public coverage expansions have a small effect on health is that government rules, associated with public expansions, may produce inefficient healthcare utilization. The ACA, for example, mandated that preventive care and annual office visits be covered at no cost to the patient, even though the benefits of preventive care and screening are modest. A review by the Stanford Prevention Research Center of randomized trials and meta-analyses of the efficacy of available screening tests for diseases where death is a common outcome found that “reductions in disease-specific mortality are

uncommon and reductions in all-cause mortality are very rare or nonexistent” with these tests (Saqib, Saqib, and Ioannides 2015). Cancer screening can generate health benefits when used for appropriate populations, but it is performed far more commonly in this country than elsewhere and is often overly intensive, of low value, and potentially harmful (Zinberg 2016). Even Dr. Ezekiel Emanuel (2015), one of the ACA’s architects, acknowledged that routine annual physicals—visits for general healthcare that are not prompted by any specific complaint or problem—do not decrease mortality, waste resources, and may lead to harmful additional testing and unnecessary treatments. By mandating the provision of low-value medical care measures at little or no cost, the ACA may inefficiently allocate scarce medical resources, because low-value measures could crowd out high-value ones.

Fourth and finally, public coverage may have limited or possibly negative effects on health because of its long-run impact on innovation. Many governments, particularly in Europe, have paired large coverage expansions with the imposition of price and spending controls. These centralized controls may have an adverse impact on medical innovation and make healthcare less effective and more costly to obtain in the future. Therefore, a complete assessment of the impact of government insurance expansions on health requires a long-run perspective. In sum, though health insurance is undoubtedly a major positive factor in the lives of many Americans, health policy focused predominantly on expanding insurance runs the risk of crowding out other policies that could better contribute to improved health outcomes for our citizens. Box 6-1 describes the Administration’s initiatives to restore choice and competition to healthcare in America.

The ACA’s Impact on Spending

The share of GDP attributable to healthcare expenditures has increased sharply over time, rising from 5 percent of GDP in 1960 to 17.4 percent in 2010, when the ACA was enacted (CMS 2017a). This spending growth represents increased quantities of services, increased prices for these services, or a combination of both. Economic research finds that factors contributing to spending growth include increasing income, the aging of the population, and the increased extent of insurance coverage. However, new technologies have perhaps been the central driver, contributing between 27 and 48 percent of spending growth since 1960 (Smith, Newhouse, and Freeland 2009). The growth in real per capita health expenditures slowed worldwide after 2002, well before the enactment of the ACA in 2010, largely as a result of the two recessions in the last decade (Sheiner 2014), but has recently turned upward.

Despite promises to “bend the cost curve” and purported cost control provisions in the ACA, real national health spending per capita rose 3.0 percent a year, on average, from 2013 to 2016, compared with 1.5 percent from 2003 to 2013, according to the Centers for Medicare and Medicaid Services (CMS

Box 6-1. The Trump Administration’s Actions to Restore Choice and Competition to Healthcare

The ACA imposed costly benefit requirements and regulations on the insurance market that limited people’s options and raised premiums. The individual mandate required people to buy insurance whether they wanted it or not, and the ACA’s minimum essential benefit requirement mandated a more costly and comprehensive package of benefits than what many people preferred. This requirement, combined with the ACA’s restrictions on premium variation, has driven premiums up in the insurance market for individuals and small groups. Far fewer people signed up on the ACA exchanges than expected (CBO 2017). Young, healthy patients have largely shunned the overpriced insurance coverage—in effect, refusing to subsidize lower premiums for elderly, sick patients (Antos and Capretta 2016). As a result, many insurers have incurred substantial losses and have fled the exchanges (Cox et al. 2016). In 2018, 51 percent of counties had only one carrier participating in their healthcare exchange (CMS 2017d). The average number of insurers participating in each state’s ACA marketplace declined from 5.0 in 2014 to 4.3 in 2017 and to 3.5 in 2018. In 2018, eight states have only a single ACA insurance provider (Semanskee et al. 2017). Insurers that have remained in the market increased premiums by 25 percent, on average, for benchmark silver plans for plan year 2017 (rates were determined during the fall of 2016), and by even more for 2018 (figure 6-i).

The President has addressed the ACA's key problems from the beginning of his tenure. Within hours of being sworn in on January 20, 2017, he signed Executive Order 13765, directing the Secretary of Health and Human Services and the heads of other agencies to take all actions consistent with the law to minimize the ACA's economic and regulatory burdens, to provide greater flexibility to the States, and to promote the development of a free and open interstate health insurance market.

President Trump also signed Executive Order 13813 to promote health-care choice and competition by expanding affordable coverage options. The order directs the Department of Labor to lower the barriers preventing small businesses from forming Association Health Plans (AHPs), so these firms can gain the regulatory benefits that large employers now receive. For example, as AHP members, small businesses would gain bargaining power to negotiate more affordable insurance and avoid some of the ACA's costly requirements, as large companies already do for their employees. A total of 11 million Americans lack employer-provided insurance because they or a loved one work for a small business or sole proprietorship that does not offer insurance. On January 4, 2018, the Department of Labor proposed a rule on AHPs that would give employers greater ability to form AHPs and to allow sole proprietors to join these plans.

Executive Order 13813 also calls for the consideration of new regulations to expand the availability, duration, and renewability of Short-Term Limited Duration Insurance. These plans are exempt from the ACA's rules, offer greater choices of coverage, and are significantly cheaper than ACA exchange plans. They were previously available for terms of up to one year, but were limited to 90 days without renewability by a late 2016 regulation. The Executive Order also seeks to expand the availability and the use of Health Reimbursement Arrangements—employer-funded, tax-advantaged accounts that reimburse employees for deductibles, copayments, premiums, and qualified medical expenses in plans or other arrangements that best suit them.

Finally, Executive Order 13813 directs the Secretary of Health and Human Services to provide a report detailing how existing State and Federal statutes and regulations limit Americans' healthcare options, decrease competition, and raise costs. State rules and regulations—such as certificate of need laws, narrow scope of practice rules, and restrictions on telemedicine—are government-erected barriers to entry that benefit established providers, allowing them to charge higher prices and reducing incentives for them to produce higher-quality, lower-cost goods and services. This spring, HHS will release a report detailing recommendations to reduce government-erected barriers to entry, thereby expanding choice and competition in healthcare markets.

On the legislative front, the Administration's tax reform will eliminate the ACA's individual mandate.

2017a). In part, this was due to a rapid rise in Medicaid spending, as enrollment rose from 54 million in 2010 to 71 million in 2016 (CMS 2017a). In addition, spending per expansion enrollee in Medicaid expansion States was far higher than projected (CBO 2017). By 2016, health expenditures accounted for 17.9 percent of GDP (CMS 2017a).

In addition, the ACA's signature cost control provisions were ineffective and had unintended consequences. Accountable Care Organizations (ACOs) were supposed to give providers incentives to become more efficient, but they have not produced overall savings as implemented. In fact, after accounting for bonus payments to ACOs that were awarded for keeping costs down—and for the fact that most ACOs were in one-sided risk arrangements, whereby they shared savings but were not liable to the government for losses—the Medicare Shared Savings Program ACOs actually increased Medicare spending by \$216 million in 2015 and by \$39 million in 2016 (Capretta 2017). The initial belief that ACOs would curb spending growth, and their subsequent failure to do so, follows a long history of such payment reforms not altering spending growth. The market essentially was taken over by health maintenance organizations and their more generous cousins, preferred provider organizations, while spending kept growing at the same rate. The same was true for capitation payments and disease management programs.

The ACA also imposed a penalty on hospitals that have high rates of readmissions within 30 days of discharge, in an effort to cut costs and improve quality. Although hospitals cut readmissions, part of the effect was due to hospitals' decreasing admission rates for returning patients, whom they would normally have admitted, in order to avoid penalties (Gupta 2017). A study of Medicare patients hospitalized for heart failure found that implementing the hospital readmission reduction program was associated with a subsequent increase in 30-day and 1-year risk-adjusted mortality (Gupta et al. 2018).

Instead of relying on consumer choice and competition to control costs, the ACA encouraged healthcare providers to combine into larger health systems and to take on financial risk, based on the unproven assumption that this would incentivize providers to decrease unnecessary services, cut costs, and improve outcomes. However, excessive consolidation in the market may enable producers to use their market power to raise prices, lower quality and innovate less than they would in a competitive market.

ACA-mandated cuts in hospital payments and new regulatory burdens made it difficult for smaller institutions to go it alone. Small physicians' groups and solo providers could not afford to purchase and maintain electronic medical records and comply with government reporting requirements. As a result, hospital mergers are booming, leading to horizontal integration, and large hospitals are buying up physicians' practices and outpatient service providers to form large, vertically integrated healthcare networks. Hospital mergers and acquisitions averaged 97.8 per year (ranging from 88 to 102 a year) in the

five years after the ACA was enacted (2011–15), compared with 58.8 per year (ranging from 38 to 83 a year) during the 10 years preceding the ACA (2001–10) (AHA 2016). After significant consolidation, Cutler and Morton (2013) found that almost half of hospital markets are highly concentrated, with one or two large hospital systems dominating many regions across the country. Cooper and others (2015) found that hospital prices in monopoly markets are 15 percent higher than those in markets with four or more hospitals, after controlling for several demand and cost factors. Baker, Bundorf, and Kessler (2014) found that vertical integration led to an increase in market share, which was associated with higher prices and increased spending. These cost increases due to consolidation are exacerbated by many State regulations, such as certificate-of-need laws and rules about narrow scopes of practice, that serve as barriers to entry, particularly for lower-cost alternatives.

To free the market from these mandates and constraints on competition—pursuant to the President’s October 12, 2017, Executive Order—the Administration will release a report in the spring of 2018. It will identify Federal and State government policies that reduce competition and increase consolidation and provide recommendations to mitigate these policies. The literature is clear that hospital competition leads to lower prices and higher quality (Gaynor and Town 2012). This is consistent with the Administration’s deregulatory agenda, which has already withdrawn, made inactive, and delayed hundreds of economically destructive regulations.

Improving People’s Health by Limiting the Effects of Unhealthy Behavior

In industrialized countries, health behaviors—actions and inactions by individuals that affect their own health or the health of others—are more important determinants of health than insurance coverage and the medical care it finances. A review of the literature has identified five key determinants of health in industrialized countries: health behaviors, genetics, social circumstances, environmental and physical influences, and medical care. Health behaviors appear to be the most important, making a relative contribution of 30 to 50 percent to health, according to various studies, while medical care accounts for only 10 to 20 percent (Gnadinger 2014). The second most important relative contribution to health, at 20 to 30 percent, is made by genetics. The government cannot and should not directly affect people’s genomes, but here it does have an important function: to set ethical and regulatory guardrails for the development and use of genetic testing and therapies.

Using mortality as an indicator of health, Schroeder (2007) finds that up to 40 percent of premature deaths in the United States are due to unhealthful behaviors like smoking, poor dietary habits, and sedentary lifestyles. Now, deaths resulting from the escalating opioid abuse crisis are adding to this

self-inflicted toll. Although life expectancies in different geographic areas have a negative correlation with poor health behaviors like smoking, they are not correlated with access to healthcare (Chetty et al. 2016).

Poor health imposes economic costs in three ways: direct health care spending; the costs of premature deaths resulting from poor health; and productivity losses from illnesses that keep people out of the labor force or cause absenteeism and “presenteeism”—that is, decreased worker productivity while at work—for those who are in the labor force. The Commonwealth Fund estimated that in 2003, 18 million people between the age of 19 and 64 were out of the labor force because of illness, and that if their lost work time was valued at the minimum wage, the nation lost \$185 billion in economic output (1.6 percent of GDP) (Davis et al. 2005). Another 69 million workers lost 407 million sick days, which cost \$48 billion, if valued at actual wages. Finally, they estimated there were 478 million days when illness reduced workers’ productivity, resulting in a loss of \$27 billion if they were working at “half capacity.” The share of prime-age employees citing poor health as the main reason for staying out of the labor force has increased significantly during the past two decades, and it is higher among those with less education. During the second quarter of 2017, 5.4 percent of prime-age individuals (those age 25 to 54) reported being too sick or disabled to work in the labor force, 1.6 percent more than two decades ago. If this trend were reversed, it could increase the workforce by up to 4 million people and add about 2.6 percent to GDP (Terry 2017).

In this section, we focus on three behaviors—opioid abuse, poor diets and sedentary lifestyles that lead to obesity, and smoking—that severely exacerbate our most costly illnesses and impose enormous related economic and social costs.

Improving Health by Combating the Opioid Epidemic

As debates focused on expanding health insurance coverage during the past eight years, an opioid epidemic was ravaging the country, devastating the lives of those struggling with addiction, and the lives of their loved ones. The consequences for the health of Americans—most important, a skyrocketing death toll—have been enormous (see figure 6-1). In 2016, almost as many people died of an opioid-involved drug overdose (42,249) as died of HIV (43,115) at its peak in 1995 (Mendell, Cornblath, and Kissel 2001). And since 1999, over 350,000 people have died of opioid-involved drug overdoses, which is 87 percent of the 405,399 Americans killed in World War II (DeBruyne 2017). The staggering opioid death toll has pushed drug overdoses to the top of the list of leading causes of death for Americans under the age of 50 and has cut 2.5 months from the average American’s life expectancy (Dowell et al. 2017). This subsection documents the immense economic toll the opioid epidemic has taken on the United States, and thus, the importance of Administration actions that have been undertaken to reduce these costs and save lives.

Figure 6-1. Opioid-Involved Overdose Deaths, 1999–2016

The opioid epidemic evolved with three successive waves of rising deaths due to different types of opioids, with each wave building on the earlier one (Ciccarone 2017). In the late 1990s, in response to claims that pain was under-treated and assurances from manufacturers that new opioid formulations were safe, the number of opioid prescriptions skyrocketed (CDC 2017b). What followed was an increase in the misuse of and deaths related to these prescriptions (figure 6-2). As providers became aware of the abuse potential and addictive nature of these drugs, prescription rates fell, after peaking in 2011. Deaths involving prescription opioids leveled off, but were followed by a rise in deaths from illicit opioids: heroin and fentanyl. Heroin deaths rose first, followed by a rise in deaths involving fentanyl—a synthetic opioid that is 30 to 50 times more potent than heroin and has legitimate medical uses but is increasingly being illicitly produced abroad (primarily in Mexico and China) and distributed in the U.S., alone or mixed with heroin. In 2015, males age 25 to 44 (a core group of the prime-age workers whose ages range from 25 to 54) had the highest heroin death rate, 13 per 100,000. Fentanyl-related deaths surpassed other opioid-related deaths in 2016.

The CEA estimates that the opioid epidemic’s economic cost was \$504 billion in 2015, or 2.8 percent of that year’s GDP (CEA 2017). This estimate dwarfs estimates from previous studies for several reasons—most important, previous studies undervalued the cost of the lives lost to drug overdoses. For example, some studies focus mainly on healthcare costs and find that prescription opioid abusers utilize significantly more healthcare resources

Figure 6-2. Overdose Deaths by Type of Opioid Involved, 1999–2016

than nonaddicted peers (e.g., White et al. 2005, 2009; McAdam-Marx et al. 2010; McCarty et al. 2010; Leider et al. 2011; Johnston et al. 2016; Kirson et al. 2017). Others account for additional costs, including forgone earnings from employment and higher costs for the criminal justice system (e.g., Birnbaum et al. 2006, 2011; Hansen et al. 2011; Florence et al. 2016). A recent estimate by Florence and others (2016) found that prescription opioid overdoses, abuse, and dependence in the United States cost \$78.5 billion in 2013; but they did not account for the costs of illicit opioids.

Although previous estimates are informative about certain types of costs, they only partially account for the damage caused by the opioid epidemic. They do not account for the costs associated with the escalating abuse in recent years of illicit opioids, such as heroin and fentanyl, and the resulting increase in deaths. Evidence also suggests that fatality statistics understate the number of opioid-related deaths (Ruhm 2017). But most important, previous studies fail to fully account for the value of the lives lost to overdoses. Studies that only include healthcare expenditures typically capture none of the value of the lives lost, and studies that account for earnings losses among those who die account for only a fraction of the loss from such mortality. Extensive research indicates that people value fatality risk reduction far beyond the value of lost earnings due to premature death, because earnings do not take into account other valuable activities in life besides work. Using conventional estimates of the losses induced by fatality routinely used by Federal agencies—in addition

Table 6-1. Comparison of Estimated Costs of Opioid-involved Overdose Deaths, CEA and Other Studies

Study	Study year	Opioids included	Fatal costs	Adjustment for under-counting	Cost (billions, 2015\$)	Ratio of CEA estimate to study estimate
Birnbaum et al. (2006)	2001	Prescription	Earnings	No	11.5	43.8
Birnbaum et al. (2011)	2007	Prescription	Earnings	No	61.5	8.2
Florence et al. (2016)	2013	Prescription	Earnings	No	79.9	6.3
CEA (2017)	2015	Prescription and illicit	VSL	Yes	504.0	1.0

Sources: Birnbaum et al. (2006); Birnbaum et al. (2011); Florence et al. (2016); CEA (2017).
 Note: Each of the studies listed includes healthcare, criminal justice, and employment costs in nonfatal costs. CEA nonfatal costs are calculated by applying Florence et al. (2016) estimates of the per-person average nonfatal costs of prescription opioid disorders to individuals with prescription opioid and heroin disorders in 2015. CEA fatal costs are calculated by applying the age-dependent value of statistical life to drug overdose deaths involving any opioid in 2015.

to making other adjustments related to illicit opioids, more recent data, and the underreporting of opioids on drug overdose death certificates—the CEA study found that the overall loss imposed by the crisis is several times larger than previous estimates (table 6-1). (The CEA uses an age-adjusted value of statistical life measure to estimate the cost of lives lost to opioid-involved overdoses; see CEA 2017.)

It is important to note that though the fatal costs of the opioid epidemic (\$432 billion) are the major component of its total costs, its nonfatal costs (\$72 billion) are also important. Florence and others (2016) estimate that in 2013, prescription opioid misuse increased healthcare and substance abuse treatment costs by \$29.4 billion, increased criminal justice costs by \$7.8 billion, and reduced productivity among those who do not die of an overdose by \$20.8 billion (in 2015 dollars). To arrive at our nonfatal cost estimate of \$72 billion, the CEA adjusts these costs upward, adding in illicit opioid use and also the greater number of opioid abusers in 2015. Other research has shown that opioid abusers miss twice as many days of work compared with other employees (Benham, Goplerud, and Hodge 2017; Ruetsch 2010). They are also significantly less productive while at work because the drugs can induce drowsiness, cause mental confusion, impair attention and focus, and reduce creativity or reliability.

By any measure, the opioid epidemic is exacting a massive and growing toll on the United States. Death rates continue to skyrocket, while nonfatal

Box 6-2. The Trump Administration's Actions on Opioids

The Administration has taken a series of actions, including creating the President's Commission on Combating Drug Addiction and the Opioid Crisis and declaring a public health emergency under the Public Health Service Act. These additional actions have been taken:

To prevent prescription opioid abuse:

- The Centers for Disease Control and Prevention (CDC) launched the Rx Awareness Campaign to increase awareness of the risks of prescription opioid use by telling the stories of people recovering from addiction.
- The CDC awarded \$28 million in new funding for prescription drug monitoring programs, so prescribers and pharmacists can monitor how many opioid prescriptions patients have received and prevent duplicate prescriptions, diversion, and abuse.
- The Food and Drug Administration (FDA) has worked to educate prescribers about safer pain management to reduce unnecessary prescribing.
- The Centers for Medicare and Medicaid Services (CMS) delinked pain management scores from provider evaluations to decrease pressure to prescribe opioids.
- The Department of Justice (DOJ) established an Opioid Fraud and Abuse Detection Unit to crack down on prescription opioid use for nonmedical reasons.
- The Department of Health and Human Services (HHS) and DOJ conducted the largest ever healthcare fraud enforcement action, by the Medicare Fraud Strike Force, in 2017. More than 120 people were charged with fraudulently billing public and private insurance programs for prescribing and distributing opioids.

To improve access to and quality of treatment for those already addicted:

- HHS awarded \$485 million to States for prevention, treatment, and recovery services under the newly created State Targeted Response to the Opioid Crisis grant program.
- Another \$144 million was awarded for treatment and other opioid-related costs by the Substance Abuse and Mental Health Services Administration.
- Significant funding has also been directed to mental health and substance abuse service centers, rural health organizations, physician training programs, and other entities that will support treatment and recovery using evidence-based practices.
- The Administration is cutting the red tape that hinders States' ability to use Federal funding as effectively as possible. The CMS announced in November 2017 that Medicaid would grant waivers from a decades-old statute so funds can be used to pay for treatment in facilities with more than 16 beds.

To encourage innovation in addressing the opioid epidemic:

- The National Institutes of Health (NIH) is partnering with innovative companies to develop nonaddictive pain therapies, new addiction treatment regimens, and overdose-reversal drugs.
- The Advancing Clinical Trials in Neonatal Opioid Withdrawal Syndrome study will evaluate neonatal abstinence syndrome treatments for opioid-dependent newborns.
- An \$81 million research partnership between HHS, the Department of Defense, and the Department of Veterans Affairs was announced to support pain management research for the military and veterans.

To disrupt the supply of illicit opioids:

- President Trump signed the Interdict Act in January 2018 to equip Border Control Agents with better technology to intercept illicit, synthetic opioids at the border.
- DOJ shut down AlphaBay, the largest online criminal marketplace and major source of illicit drugs and indicted two Chinese manufacturers of illicit fentanyl.
- The U.S. Postal Inspection Service seized increased amounts of fentanyl shipped through the mail, and the Department of State is working with international partners in reducing the production and shipment of fentanyl from abroad.

costs to productivity and the healthcare and criminal justice systems increasingly hurt the economy. This does not mean that opioids themselves have no beneficial effects—they are largely effective for their main prescribed uses of reducing acute pain and as anesthesia during surgery. But the epidemic of misuse and abuse—along with their often deadly consequences—is a health crisis many years in the making that requires urgent attention. Fortunately, the Administration has taken concrete steps to begin to stem the costs of this epidemic, and with sustained action, can make continued progress in addressing it (see box 6-2).

Obesity

Obesity has become a major health problem, leading to large direct medical expenditures, significant premature mortality, and large productivity losses.¹ It raises the risk of all-cause and cardiovascular mortality (the leading cause of death in the U.S.) and the risk of morbidity from hypertension, dyslipidemia, type 2 diabetes, coronary heart disease, stroke, gallbladder disease, osteoarthritis, sleep apnea and other respiratory problems, and some cancers (Jensen

¹ Obesity is medically defined as the height-adjusted weight measure—Body Mass Index (BMI)—greater than 30. BMI is defined as a person’s weight in kilograms divided by the square of his or her height in meters.

et al. 2014). Stewart and others (2009) estimated that an 18-year-old with a BMI increasing by the historical average, 0.5 percent a year, would lose 1.02 years in life expectancy due to obesity alone.

The Centers for Disease Control and Prevention's National Center for Health Statistics reports that obesity rates among U.S. adults 20 and older rose from 22.9 percent in the years 1988–94 to 38 percent in 2013–14 (CDC 2016b). Another 33 percent of U.S. adults were overweight (i.e., have a BMI between 25 and 30). Obese patients incur 46 percent higher inpatient costs, 27 percent more physician visits and outpatient costs, and 80 percent higher prescription drug spending than normal-weight patients (Finkelstein et al. 2009). In 2006, they spent an average of 42 percent more (an average of \$1,429 a year) than normal-weight patients, resulting in a total cost of medical care associated with obesity in the United States of \$147 billion in 2008 dollars (Finkelstein et al. 2009).

Obesity also decreases the productivity of those still in the workforce through absenteeism and presenteeism (Goettler, Grosse, and Sonntag 2017). An estimate of annual obesity-related absenteeism and presenteeism costs among full-time U.S. employees in 2008 was \$59 billion, in 2015 dollars (Heidenreich et al. 2011).

Rising obesity is an unintended consequence of technological progress (Philipson and Posner 1999). Welfare-improving technological change has lowered the cost of consuming calories through improved agricultural production, while raising the cost of expending calories by making work, both on the job and at home, more sedentary. People now need to pay for gym memberships to exercise and forgo leisure to replace decreased physical activity at work and in the home. Unfortunately, people do not exercise enough during their leisure time to make up for the exercise they formerly obtained at work and home—which, when combined with increased calorie intakes, has resulted in rising obesity (Lakdawalla, Philipson, and Bhattacharya 2005).

The U.S. government inadvertently contributed to this problem beginning in the 1970s when it, along with major professional nutrition organizations, recommended that Americans eat a low-fat/high-carbohydrate diet. During the succeeding decades, Americans, adhering to these recommendations, replaced fat calories with even more carbohydrate calories. Total calorie intake increased substantially, and the prevalence of obesity rose, in part, as a consequence. Researchers eventually recognized that fat was less of a problem, and by 2015, the U.S. Department of Agriculture's Dietary Guidelines for Americans essentially removed the upper limit on the recommended fat intake (Ludwig 2016).

Smoking

Tobacco use is the leading cause of behaviorally induced disease and death in the United States, even after recent declines in tobacco use during the last few

decades. Cigarettes are the most commonly used tobacco product among U.S. adults, partly causing more than 480,320 deaths per year in the United States, including more than 41,000 deaths resulting from secondhand smoke exposure (CDC 2017c). They account for about 30 percent of all cancer deaths in the United States, including about 80 percent of all lung cancer deaths—the leading cause of cancer death for both men and women (American Cancer Society 2015). Smoking is also a risk factor for cancers of the mouth, larynx, pharynx, esophagus, kidney, liver, bladder, and stomach. It is also strongly associated with many significant diseases other than cancer, including cardiovascular and respiratory diseases. The largest numbers of smoking-attributable deaths were from lung cancer (124,800), coronary artery disease (82,000), and chronic obstructive pulmonary disease (64,700) (Kiszko et al. 2014).

Goodchild, Nargis, and d’Espaignet (2017) estimate that the total economic cost attributable to smoking is between \$418 and \$514 billion. Only 40 percent of the cost is due to direct spending on healthcare, with the remaining amount due to indirect costs of the economic loss of morbidity and mortality due to diseases attributable to smoking. They estimate indirect economic losses using the human capital method, which calculates the present value of labor productivity lost due to morbidity and mortality. This estimate, like others, suggests that health spending attributable to smoking amounts to between 5 and 10 percent of national health expenditures. This is consistent with earlier estimates that smoking accounted for about 7 percent of total annual healthcare spending for noninstitutionalized U.S. adults from 2000 to 2008 (CBO 2012) and 8.7 percent of annual U.S. healthcare spending, nearly \$170 billion, in 2010 (Xu et al. 2015).

A 2014 report by the U.S. Surgeon General found that, for the years 2005–9, the value of lost productivity attributable to premature death from smoking, based on the 19 diseases associated with smoking, was \$107.6 billion annually—with cancers accounting for \$44.5 billion, cardiovascular and metabolic diseases accounting for \$44.7 billion, and pulmonary diseases accounting for \$18.4 billion. Using all-cause mortality, the value would be \$150.7 billion—\$105.6 billion for men and \$45.1 billion for women (HHS 2014). Additionally, the value of lost productivity due to premature deaths caused by exposure to secondhand smoke was estimated to be \$5.7 billion. Because these figures account only for lost productivity due to premature mortality and not for lost productivity due to morbidity that living smokers and former smokers experience, they significantly underestimate the full value of lost productivity from smoking.

Bunn and others (2006) found that current smokers and former smokers both had higher losses from absenteeism and presenteeism than people who had never smoked, suggesting that former smokers have lingering health problems. Using an average hourly rate of \$34.25, the annual amount of health-related absenteeism was estimated to be \$1,206 for nonsmokers, \$1,343 for

Box 6-3. The Administration's Actions to Combat Smoking

Despite significant reductions in the number of smokers, smoking remains the Nation's largest behavioral source of premature death. The Trump Administration, through the FDA, has taken the following measures:

- The FDA is exploring initiatives to lower nicotine levels in cigarettes to nonaddictive levels (FDA 2017).
- The FDA continues to investigate the safety and health effects of e-cigarettes and vaping (NASEM 2018).
- On December 11, 2017, the FDA announced "Every Try Counts," a two-year education and advertising campaign to encourage adult smokers to quit, even if they have been unsuccessful in the past.

former smokers, and \$1,836 for current smokers. Health-related presenteeism was estimated to be \$1,466 for nonsmokers, \$1,918 for former smokers, and \$2,620 for current smokers. In total, absenteeism and presenteeism cost employers \$2,672 for nonsmokers, \$3,261 for former smokers, and \$4,456 for current smokers (see box 6-3).

Policy to Address Health Behaviors

Public health measures and higher tobacco taxes have cut the number of smokers and decreased tobacco's toll on health (Mader et al. 2016). Excise taxes (both State and Federal) raised the monetary cost of smoking, and time and place restrictions raised the nonmonetized cost by making smoking more inconvenient. Taxes effectively raise tobacco's price, although smuggling can avoid some of the higher State taxes. Because many smokers were used to smoking throughout the day, time and place restrictions could effectively limit their consumption (Fichtenberg and Glantz 2002) and nonsmokers' exposure to secondhand smoke (Hartmann-Boyce et al. 2016). The health and economic gains from reducing smoking were enormous. It is estimated that tobacco control efforts led to 8 million fewer tobacco-related premature deaths than were expected if smoking had continued unabated. Life expectancy in the 50 years since the Surgeon General's 1964 report on smoking and health increased 7.8 years for men and 5.4 years for women, of which tobacco control is associated with 2.3 years of the increase for men and 1.6 years for women (Holford et al. 2014). These gains dwarf any health improvements resulting from increased insurance coverage. Nevertheless, although the smoking rate has plummeted (figure 6-3), smoking remains a leading cause of death and morbidity.

It is less clear that the behaviors that are factors in causing obesity can be addressed through taxes and public health measures. Studies of the economic and social approaches to preventing obesity that have been employed to date—such as taxes on sugary foods, wellness programs, menu labeling, and financial rewards for weight loss—are inconsistent and show only modest,

Figure 6-3. Smoking Rates and the Price of Cigarettes, 1995–2015

long-term effects on weight (Cawley 2015). A recent review of the literature concluded that “there is an abundance of evidence that suggests calorie labeling, as it is currently being implemented, has no impact on overall food purchases or consumption for the population as a whole” (Kiszko et al. 2014). This is not that surprising when we consider that eating is an ingrained behavior, food is readily available for most people, and it is hard to pass up pleasurable foods or engage in difficult physical activity now for the promise of lower weight and better health sometime in the future.

Wellness programs have the potential to reduce healthcare costs and productivity losses from absenteeism (Baicker, Cutler, and Song 2010). Unfortunately, not every employee is willing to participate, and current incentives may be inadequate. The ACA encouraged employers to offer workplace wellness programs but limited the incentives that could be offered. There has been rapid growth in these programs, which now cover about 50 million people. However, a new, large randomized study found that the workers who chose to participate in the workplace wellness programs that sprung up after the ACA tend to be self-selected—they had lower medical expenditures and healthier behaviors before joining the program than nonparticipants. Moreover, the study did not find significant causal effects of participation on total medical expenditures, health behaviors, employee productivity, or self-reported health in the first year (Jones, Molitor, and Reif 2018). Relaxing the limitations on incentives that can be offered may attract a wider range

of participants, including those who could benefit the most, and make these programs more effective.

It may be difficult for taxes to significantly affect opioid abuse, particularly because the recent spike in deaths is being fueled by illicit opioids (heroin and fentanyl) that defy conventional approaches. Forty-nine States and the District of Columbia have started Prescription Drug Monitoring Programs—Statewide electronic databases to monitor opioid prescriptions and dispensing—which have had some success in limiting prescription opioid diversion and abuse (Reifler et al. 2012). Unfortunately, initiatives that have decreased prescription opioid abuse have led some abusers to turn from prescription opioids to cheaper, more available heroin (Muhuri, Gfroerer, and Davies 2013). For example, a 2010 reformulation of a commonly abused prescription opioid to make it more abuse-resistant had the unintended consequence of increasing heroin deaths (Evans, Lieber, and Power 2017; Alpert, Powell, and Pacula 2017). The increased availability of cheap, ultrapotent fentanyl and fentanyl analogues, used alone or mixed with heroin, has exacerbated this problem. Hence, future policy will need to continue and strengthen the programs that have limited prescription opioid abuse and add new efforts to deter and control illicit opioid abuse. NIH and HHS have announced efforts to improve access to opioid reversal agents, support research on pain and addiction and on developing new addiction treatments, and improve access to treatment and recovery services (NIDA 2017a). (Box 6-2 above outlines other Administration initiatives.)

Intensive, State-based efforts to increase treatment availability and social supports have ameliorated the effects of addiction (Brooklyn and Sigmon 2017; Rembert et al. 2017), but they do not deter new abusers. Accordingly, a key policy focus for the Administration is to interrupt the supply chain to decrease availability and effectively increase prices in order to deter new users and make it more difficult for current abusers to continue abuse.

On January 10, 2018, President Trump signed the Interdict Act, which will increase the number of chemical-screening devices available to U.S. Customs and Border Protection officers in order to intercept imports of fentanyl and other synthetic opioids. This should decrease the supply and increase the prices of these opioids, and, when combined with the other measures described in box 6-2 above, will lead to decreased abuse and fewer deaths.

Improving People’s Health through More Access to Medical Innovations

People’s health can also be improved through new technologies. Innovations produced by the private sector, aided by public policy, may be the most efficacious way to make cost-effective progress against the behavioral determinants of health that have resisted more standard tools like public health measures

Figure 6-4. U.S. Male Deaths Caused by HIV Disease, 1987–2015

and taxation. Although some raise a concern that new technologies increase healthcare spending, it is important to distinguish the price of healthcare from the price of health. Some new treatments have high initial prices, but they often bring down the price of health over time.

To illustrate, consider the history of HIV/AIDS (figure 6-4). Despite much publicity about the cause and transmission of HIV and public health measures, the infection and death toll continued to rise until 1995, when the Food and Drug Administration (FDA) approved the first protease inhibitor and ushered in the era of highly active antiretroviral therapies. Before the new drugs, longer life could not be purchased at any price. Once new innovative and effective treatments were approved, the price of health for HIV-positive individuals decreased to the price of the new, patented drugs. The price of health fell even further as competing drugs and cheaper generics became available. More than 100 antiretroviral therapies have been approved since then, including generic drugs in 2005 (HHS 2016). The lower price of health for HIV-positive individuals increased spending on healthcare, but beneficially so, because the gain in health was much larger than the new spending.

Valuable medical innovations can reduce the current and future real prices of health. Profitable new drugs attract competitors into the market. Prices fall closer to costs as patents expire and generic medicines come on the market. The FDA data show that when generics become available, prices will fall below 50 percent of branded prices after the second generic is approved and to 20 percent of branded prices when large numbers of generics are approved

(FDA 2015). Future populations will use generic versions of today's high-priced therapies. The vast majority of the World Health Organization's Essential Drugs today are off patent, allowing poor people here and around the world to enjoy what were innovations in the past. Generic drugs now account for 9 out of 10 prescriptions dispensed in the U.S., and saved the U.S. healthcare system \$1.68 trillion from 2005 to 2014 (Woodcock 2016).

Innovations, whereby mortality and morbidity gains exceed costs, are not always expensive. Cutler and McClellan (2001) found that the value of decreased morbidity and mortality rates resulting from technological changes in the treatment of heart attacks, low-birthweight infants, depression, and cataracts far exceeded the increase in spending on these conditions. The costs of treatment of heart attacks rose by \$10,000 in real terms, but life expectancy increased by about a year—in other words, a bargain. Similarly, survival gains across all cancer patients in the U.S. between 1983 and 1999 cost on average only \$8,670 per year of life gained (Philipson et al. 2012).

In recent years, however, many of the breakthroughs have been specialty drugs—large, complex molecules—many of which are efficacious but initially very expensive. The 2013 introduction of novel drugs to treat hepatitis C (HCV)—a chronic viral infection that leads to cirrhosis, liver failure, liver cancer, and death—helps to further illustrate the dramatic reduction in the price of a healthier life. In 2012, therapies to treat HCV were expensive, had low cure rates, and resulted in various side effects. In contrast, new drugs have cure rates well over 90 percent and fewer side effects. Although the list price for a course of the first available treatment was \$84,000, negative public reaction to the high price led to discounting and rebates (Bruen et al. 2017). Within a few years, several competing drugs from multiple companies came on the market, further driving down prices (Toich 2017). Medicaid officials report discounts and rebates of 40 to 60 percent off HCV drug list prices (Bruen et al. 2017). The most recently approved drug is highly effective, treats all six genotypes of the virus, and has a list price of \$26,400 for a course of treatment (Andrews 2017), less than the discounted prices of the earlier drugs. Prices will fall further when generics become available.

Of course, not every new drug or technology is more cost-effective than older treatments. Utilizing robotic surgery as opposed to standard laparoscopic surgery for rectal cancer surgery and kidney surgery, for example, was not associated with any improvement in outcomes but was associated with prolonged operating time and higher hospital costs (for the kidney surgery) (Jeong et al. 2017). Additionally, physicians often overuse cancer drugs that have small marginal benefit but high financial, physical, and psychological costs (Zinberg 2015). Physicians, hospitals, and both private and public payers are increasingly recognizing the importance of evaluating the value of treatments both new and old (Porter 2010) and utilizing these assessments in treatment decisions.

Chandra and Skinner (2012) organize healthcare technologies into three groups: high-cost, “home run” innovations that are cost-effective for nearly everyone, for example, the HIV medications discussed above; treatments that are highly effective for some but have declining marginal benefits for others, such as coronary angioplasty and stents; and “gray area” treatments with modest or uncertain clinical value, such as arthroscopic surgery for osteoarthritis of the knee. Even home run technologies span the price spectrum; HIV medications were initially expensive, sterile surgical gloves are cheap, and antibiotics, possibly the biggest home run of them all, range from cheap to moderately expensive.

It often takes time to establish the value of new technologies and treatments as compared with other treatments, especially when it is in an area of active research and product development. For instance, coronary artery bypass grafting (CABG) was popularized in the years following 1967. Despite being expensive (\$20,000–25,000 per operation in 1983; Stason and Weinstein 1985), CABG, as compared with the best medical therapy of the time, completely or partially relieved angina (chest pain on exertion) in patients with severe angina (McIntosh and Garcia 1978; Rahimtoola 1982) and improved longevity in patients with a particular type of coronary artery occlusion—severe left main artery disease (Takaro et al. 1982). For patients with severe angina, the estimated net cost per quality-adjusted year of life gained from CABG ranged from \$3,800 for left main disease to \$30,000 for single vessel disease. For patients with left main disease, life expectancy increased by 6.9 years (Weinstein and Stason 1982). Not every patient with coronary artery disease benefited from CABG. Improvements in medical therapy shortly after the popularization of CABG meant that patients with stable angina and coronary artery disease less severe than left main coronary artery disease (e.g., single- or two-vessel disease) had equivalent survival rates from medical and surgical treatment. The subsequent introduction of newer techniques—such as percutaneous coronary artery angioplasty, coronary artery stents, and drug eluting stents—made cost-effectiveness determinations for coronary artery disease a moving target.

Unfortunately, policymakers and potential innovators do not know what will prove successful in advance. It is imperative to preserve the incentive to innovate so new treatments will become available for evaluation, and, if they represent a good value, can be adopted. Innovators and entrepreneurs are motivated to undertake research and development (R&D) by the potential return on investment provided by temporary, patent-protected prices. High patent prices are also linked to the cost of capital to fund R&D for the pharmaceutical industry. Large pharmaceutical firms do not typically borrow to finance R&D, probably because capital markets are reluctant to invest in lengthy and risky drug development—only 1 in 10 drug candidates are eventually approved, the process takes over a decade, and the total cost per drug approval (inclusive of failures and capital costs) is about \$2.6 billion (DiMasi, Grabowski, and

Box 6-4. The Administration's Efforts to Facilitate Innovation

The Administration is committed to rolling back regulations that impede innovation and competition. One of President Trump's earliest actions—on January 30, 2017—was issuing Executive Order 13771, Reducing Regulation and Controlling Regulatory Costs. Shortly afterward, on February 24, he issued another Executive Order directing agencies to appoint regulatory reform task forces to determine which rules and regulations are too expensive, burdensome, or unnecessary so that they can be simplified or repealed.

The new tax law allowing immediate expensing and lowering the corporate tax rate will increase investment and innovation, including in the health-care field. Current profits encourage R&D by signaling future profits and by providing the current capital on which many pharmaceutical firms rely (U.S. Department of Commerce 2004). Chapter 1 of this *Report* reviews the evidence that a decrease in taxes on corporate profits decreases the before-tax rate of return required for the marginal product of new physical assets to exceed the cost of producing, increasing firms' desired capital stock. Grabowski and Vernon (1990) found that the return on R&D for new drugs is equivalent to the industry's cost of capital. Lowering the cost of capital will increase R&D intensity, given that projects would require lower return on investment. The ability of innovative pharmaceutical, biotechnology, and medical device firms to immediately expense equipment and pay a lower marginal tax rate will increase spending on capital, which in turn will increase innovation.

The FDA has moved to facilitate the approval of new, innovative therapies to improve health and hold down prices by increasing competition. In 2017, the FDA approved the highest-ever number of generic drugs (1,027), the most-ever novel drugs and biologics (56), the most-ever novel medical devices (95), and the first-ever gene therapies (Gottlieb 2018).

Hansen 2016). Instead, they mostly rely on internal funds—in short, profits—to finance R&D (U.S. Department of Commerce 2004) (see box 6-4).

Encouraging Innovation, and Making It Affordable

Innovations are of limited utility if people cannot afford them. As noted above, many of the newest treatments are high-priced specialty drugs. Table 6-2 provides a range of annual per-patient costs for treating a condition with some of these high-priced drugs. As an extreme example, the annual cost of drugs that treat genetic diseases can reach almost \$800,000 for a single patient (AHIP 2016).

The affordability of healthcare and biopharmaceutical drugs is a top concern for Americans, regardless of political party (figure 6-5). It is often asserted

Table 6-2. Summary of Annual Per-Patient Drug Expenditures, 2015

Condition	Range of annual per-patient drug expenditures (\$)	
	Low	High
Genetic diseases (including hereditary hypercholesterolemia)	73,431	793,632
Cancer, hemotological malignancies	12,897	540,648
Immune system disorders (including Multiple Sclerosis)	12,856	462,384
Cystic Fibrosis	40,546	368,688
Infectious Diseases	13,440	226,800
Cancer, solid tumors	27,144	220,320
Pulmonary Arterial Hypertension	103,464	196,560
Hereditary Angioedema	14,292	98,040
Cancer, supportive care agents	14,183	41,576
Growth hormone deficiency	30,064	38,944
Organ transplant	15,528	38,765
Ophthalmic disorder	13,320	29,256

Note: Based upon average wholesale prices as of September 30, 2015; the "Low" entries above represent the medication with the lowest annual per-patient expenditure for the disease state while the "High" entries represent the medication with the greatest annual per-patient expenditure.

that promoting innovation and affordable drugs are conflicting goals. New innovations, however, often provide improved health that was not previously available at any price or obviate the need for more costly care. They thereby lower the effective price of health down to the price of the patented drugs, and later down to the price of generic drugs. Federal policies that affect drug pricing should satisfy two goals. First, domestic drug prices paid by Americans should be reduced. Second, the price of better health in the future should also be reduced by spurring medical innovation. This section considers policy options to simultaneously advance these two seemingly conflicting goals.

Reducing the drug prices that Americans pay means recognizing that many artificially high prices result from government policies that prevent, rather than foster, healthy price competition. Drug prices, for example, are sometimes artificially high due to government regulations that raise prices. This section discusses changes to the Medicare and Medicaid programs that could help lower domestic prices, as well as reforms to the FDA that could encourage more robust price competition.

Preserving incentives for biopharmaceutical innovation can be achieved while still promoting lower prices for Americans. Global financial returns from product development drive innovation. But these returns are unfairly low today. This is because most foreign governments, which are the primary

Figure 6-5. Politico / Harvard Polling on Americans' Top Priorities for Congress, 2017

 Note: Poll of U.S. adults open August 30 to September 3. ACA is the Affordable Care Act.

buyers in their respective pharmaceutical markets, force drug manufacturers to comply with pricing rules to gain market access. Through this leverage, foreign governments are able to set drug prices below those that prevail in the United States and erode the returns to innovation that manufacturers might otherwise see from selling in their markets. Among the OECD's members, the United States accounts for only 34 percent of the OECD's combined GDP (at purchasing power parity), yet the CEA estimates that Americans pay more than 70 percent of patented biopharmaceutical profits (CEA 2018; OECD 2016). In short, pharmaceutical innovators—and foreign governments—around the world rely on America's patients and taxpayers to finance critical research and development.

The objective of government in biopharmaceutical policy is to ensure that the private sector competes and invests in meaningful innovations that lower the price of healthcare, rather than incentivizing market exclusivity and high prices for products. The two goals of reducing American prices and stimulating innovation are consistent, and they can be achieved through a combined strategy that corrects government policies that hinder price competition at home while at the same time limiting free-riding abroad.

Why Americans Pay High Prices for Biopharmaceutical Products, and How to Lower Them

In a well-functioning, competitive market, the price of a good is driven down to the cost of production of the firms producing it. This principle applies to

all markets, including the market for pharmaceutical drugs. However, various factors often preclude competition from driving down prices in U.S. pharmaceutical markets.² In the case of patent-protected monopolies for new drugs, the lack of competition and associated higher prices are necessary to preserve incentives for innovation. What has been less emphasized is that government policies and public insurance programs have unintended consequences that prevent, rather than foster, healthy price competition and induce artificially high prices. To promote patient welfare, government policy should induce price competition. However, in the two main Federal insurance programs, Medicaid and Medicare, current policies dampen price competition, thereby artificially raising prices.

Medicaid. Manufacturers that choose to enter the Medicaid Drug Rebate Program are required to offer State Medicaid programs their prescription medications at a price that either includes a minimum rebate or, if lower, the best price the manufacturers offer to any other purchaser. In exchange for these discounted rates, States are then required to cover the manufacturer's drugs in their Medicaid programs. The practice of tying public prices to private ones is partly beneficial, because it allows the private market to set market prices, based on value and competition, that then get imported into the government reimbursement. Although this basic approach of using market prices is sound as currently implemented, the Medicaid Best Price program can create artificially high prices in the private sector under certain conditions. If a large share of a given drug's market is enrolled in Medicaid (e.g., for HIV or mental health drugs), a pharmaceutical firm has an incentive to inflate prices in the private sector so that it can collect higher postrebate prices from its large Medicaid customer base. Similarly, the mandated price discrimination implicit in this program prevents price discounts for lower-income patients in the private sector. Lower-income, private patient populations cannot be charged low prices, because they would jeopardize the Medicaid price. Reforms could help prevent the inflated private sector prices the program induces while at the same time allowing the government to use pricing information from the private sector to determine value (see box 6-5).

Medicare. As the Federal program providing health insurance for the elderly and the disabled, Medicare delivers outpatient drugs administered by health providers through Part B and prescription drugs through Part D. In the Medicare Part B program, drugs are reimbursed based on a 6 percent markup (now 4.3 percent, due to the sequester) above the Average Sales Price (ASP) that manufacturers receive, net of any price discounts. As is true in any cost-plus reimbursement environment, this mutes the incentive for providers to

² It should be noted that there are various prices of pharmaceutical drugs, including the manufacturer price, pharmacy sales prices, and patient price. Even within these categories, prices can vary depending on rebates, markups, and insurance coverage. Each price is important, and we focus on these different prices throughout this section.

Box 6-5. The Trump Administration’s Improvements to Medicaid

The Trump Administration has proposed a demonstration to allow up to five State Medicaid programs to use more competitive drug formularies and negotiate with drug manufacturers. Meanwhile, patients will be able to appeal for access to nonformulary drugs when medically necessary.

prescribe cheaper drugs and, therefore, for manufacturers to engage in price competition. Though there may be higher costs to providers for prescribing more expensive drugs—such as storing expensive drugs and the lower probability of collecting reimbursement—these costs are routinely handled in other healthcare markets without resorting to distorted cost-plus reimbursements. And though some private payers have responded to this type of perverse incentive problem with alternative reimbursement procedures for drugs delivered in clinics, similar reforms have not been made for the Medicare Part B program (see box 6-6).

Medicare Part D has several provisions that artificially raise costs for patients. The government has previously interpreted the Social Security Act’s requirement to include drugs within each therapeutic category and class to mean the inclusion of at least two drugs. This requirement eliminates the ability of Part D sponsors to negotiate for lower prices when there are only two drugs on the market because drug manufacturers know that the CMS must cover both. Changing this requirement could lower prices for taxpayers and patients.

Another problem resulting from Medicare Part D is the inefficient overpricing of low-value drugs. The Social Security Act §1860D-14A stipulates cost-sharing amounts for low-income subsidy enrollees that vary by income and are adjusted by projected program cost growth. The use of formulary tier-based cost sharing is prohibited for low-income enrollees, which eliminates the ability of plan sponsors to price and discount drugs according to their value to patients. Low-income subsidy enrollees and plan sponsors should have incentives to use high-value drugs. The Medicare Payment Advisory Commission (MedPAC 2016) has highlighted this problem by reporting that 17.3 percent of low-income subsidy enrollees are high-cost, compared with just 2.8 percent of other enrollees.

Another problem occurs because the Medicare Part D program breaks payment liability into three phases that incentivize beneficiaries to utilize expensive brand drugs over generics. In the initial phase, beneficiaries are responsible for 25 percent of drug costs up to an initial coverage limit (\$3,750), at which point they enter the coverage gap, popularly known as the donut hole. The Coverage Gap Discount Program requires drug manufacturers to provide a 50 percent discount to enrollees on brand name drugs while in the coverage

**Box 6-6. The Trump Administration’s
Improvements to Medicare Part B**

To improve Medicare Part B and lower drug prices for patients, the Trump Administration will remove perverse incentives for prescribing higher-priced drugs and instead provide an incentive for doctors to prescribe less expensive drugs, putting competitive pressure on manufacturers to reduce their prices. Thus, the Administration will:

- Provide the Secretary of Health and Human Service with the authority to cover certain drugs in Part D that are currently covered under Part B, where there are savings to be gained through increased price competition.
- End the “gaming” in reporting drug price data that is driving up Part B prices for patients. This is important because not all drug makers are required to report data on all the price concessions they offer, which results in Medicare setting payment rates higher than would otherwise apply under statute. For new drugs that do not have much sales data, the provider’s payment will be cut to attenuate the incentives.

gap. The plan sponsor pays 15 percent. Even though the beneficiary pays no more than 35 percent of the price for a brand name drug, 85 percent of the price (35 percent plus the 50 percent discount) is counted as a beneficiary out-of-pocket payment toward reaching the out-of-pocket threshold (\$5,000) and entering the catastrophic plan phase. In contrast, beneficiaries pay 44 percent of drug prices for generic drug prices used in the coverage gap and only the amount beneficiaries actually pay counts toward reaching the out-of-pocket threshold and the catastrophic phase. Once in the catastrophic phase, the beneficiary only pays 5 percent, the plan’s sponsor pays 15 percent, and Medicare pays 80 percent. With such discounts, beneficiaries may have an incentive to use brand name drugs and reference biologics to get through the coverage gap to the catastrophic phase as quickly as possible, despite less expensive generics and biosimilars being available, because the 50 percent manufacturer discount counts toward the true out-of-pocket costs.

This Part D benefit structure creates perverse incentives for plan sponsors, which often receive large discounts from branded drug manufacturers, to generate formularies that favor high-price, high-rebate branded drugs that speed patients through the early phases of the benefit structure where plans are most liable for costs. Revisions to the benefit structure that eliminate the inclusion of manufacturer discounts from the calculation of beneficiaries’ true out-of-pocket costs would eliminate this misaligned incentive. Additionally, increasing plan liability in the catastrophic phase from 15 to 80 percent would provide the appropriate incentives for plans and pharmacy benefit managers to manage beneficiary drug costs throughout the entirety of the benefit (see box 6-7).

Box 6-7. The Trump Administration's Improvements to Medicare Part D

The Medicare Part D program has unintended consequences that have resulted in higher drug prices for consumers. Solutions to overcome these problems include:

- Requiring plans to share some of the drug manufacturers' discounts with patients at the point of sale. The remainder of the discount would help offset plans' costs and help keep premiums low, as has been the case under the current law.
- Allowing plans to manage formularies to negotiate better prices for patients.
- Eliminating copayments on generic drugs for low-income beneficiaries.
- Increasing Part D plan sponsors' liability in the catastrophic phase of coverage.
- Discouraging plan formulary design that speeds patients to the catastrophic coverage phase of the Part D benefit and increases overall spending.

Cutting High Prices Resulting from Price Manipulation

The high prices of many drugs are a result of monopoly power controlling the production of drugs that treat severe diseases with price-insensitive demand. Being the sole supplier allows monopolists to set high prices due to the inelastic demand often associated with more severe or life-threatening diseases. Monopoly pricing in a class is as damaging to patients who cannot afford the drug as having no innovation at all. The problem is not confined to branded, patent-protected drugs. Several recent episodes have illustrated the ability of firms to legally take advantage of their position as the sole source for old but important drugs by rapidly increasing prices. Competitors that want to produce drugs that are off patent still face economic, regulatory, and temporal barriers to market entry.

Unlike most markets, where new products can enter easily and cut prices, in the biopharmaceuticals market, the FDA acts as a strict government gatekeeper for new pharmaceutical products. The evidence is clear that generic drug competition rapidly drives down the cost of drugs. After the 1984 Hatch-Waxman Act went into effect, researchers found that market entry of generic manufacturers resulted in generic prices falling to between 17 and 25 percent of the pre-expiration patented price within 24 months (Caves et al. 1991; Grabowski and Vernon 1992). A more recent study by Berndt and Aitken (2011) estimates that U.S. generic prices fell to 6 percent of patented prices after 24 months of generic entry. Olson and Wendling (2013) account for the endogenous entry of new generic competitors and find even larger decreases in drug prices after two and three competitors enter the market. Yet even generic drugs face barriers to entry. Generic drug applications to the FDA

(known as Abbreviated New Drug Applications, or ANDAs) to make the same drug can cost applicants millions of dollars and can take several years. The FDA reports that it is devoting more resources to lessening review times and this backlog (Woodcock 2016).

A valuable policy option might be changing the criteria for expedited reviews to include new molecular entities that are second or third in a class, or second or third for a given indication for which there are no generics. This would serve as a new pro-competition pathway that would enhance therapeutic price competition by providing expedited entry into monopoly markets. To avoid imposing policies retroactively on the industry, this policy change could be phased in slowly, so the current manufacturers of single-source drugs would retain the value of their efforts to be the first in a given therapeutic space.

In later subsections, we discuss FDA reforms that may enhance faster drug price competition. The FDA Reauthorization Act of 2017 currently authorizes the FDA to designate a drug as a “competitive generic therapy” upon request by an applicant when there is “inadequate generic competition”—that is, when there is no more than one approved abbreviated new drug application (ANDA) for the patented reference product (not including discontinued products).³ This designation allows for improved communication, advice from the FDA, and a 180-day exclusivity period with no additional ANDA approvals available for other applicants.

Enhancing Price Competition in the Pharmacy Benefit Manager Market

Pricing in the pharmaceutical drug market suffers from high market concentration in the distribution system and a lack of transparency. Pharmacy benefit managers (PBMs) act as buying intermediaries between drug manufacturers and health insurance plans and their beneficiaries. They negotiate rebates off manufacturers’ list prices and then pass on some of the benefit to health insurance plans and beneficiaries. However, the PBM market is highly concentrated. Three PBMs account for 85 percent of the market, which allows them to exercise undue market power against manufacturers and the health plans and beneficiaries they are supposed to be representing, thus generating outsized profits for themselves. More than 20 percent of spending on prescription drugs was taken in as profit by the pharmaceutical distribution system (Sood et al. 2017). The size of manufacturer rebates and the percentage of the rebate passed on to health plans and patients are secret. The system encourages manufacturers to set artificially high list prices, which are reduced via manufacturers’ rebates but leave uninsured individuals facing high drug prices. Policies to decrease

³ ANDAs or generic drug applications generally do not have to include preclinical and clinical data to become approved. A generic drug is one that is comparable to a novel drug product in intended use and effectiveness.

concentration in the PBM market and other segments of the supply chain (e.g., wholesalers and pharmacies) can increase competition and further reduce the prices of drugs paid by consumers (Sood et al. 2017).

Raising Innovation Incentives and Decreasing Free-Riding to Reduce the Price of Better Health

It is important to continue cutting the price of health by encouraging innovation. This can be accomplished by increasing the reward for innovation by limiting inefficient underpricing, both in foreign countries and at home, and by decreasing the cost of R&D through FDA policy.

Limiting underpricing and free riding in foreign countries. Worldwide profits drive innovation incentives, but when worldwide profits are partially determined by centralized pricing by governments, this induces unique free-riding issues (Egan and Philipson 2014). Drug prices in the United States are less publicly financed than in other countries; governments set prices in most foreign countries. It is in each country's interest to have other countries provide the returns to fund innovation through generous reimbursement. Smaller markets that do not significantly affect world returns, such as those in Europe, have an incentive to set low prices without a discernible impact on the flow of new products their citizens enjoy. The problem is that in the aggregate, these free-riding actions of many small countries have a substantial negative impact on worldwide profits. Put simply, providing innovative returns is a global public good problem that leads to classic underprovision through government free-riding.

The United States is the engine of worldwide pharmaceutical innovation, accounting for an estimated 46 percent of OECD patented pharmaceutical sales. Figure 6-6 shows patented pharmaceutical sales by country. The U.S. market for pharmaceuticals is about three times larger than the second-largest country for both total sales (China) and patented sales (Japan). Although the U.S. market provides a disproportionately large share of global pharmaceutical sales, it accounts for an even larger share of world pharmaceutical profits because profit margins are much larger in the United States. In a white paper, "Reforming Biopharmaceuticals at Home and Abroad," the CEA (2018) estimates that the variable profit margins of patented pharmaceuticals sold in the U.S. are 4.1 times higher than in other developed countries.⁴ Using the estimated profit margins and sales, the CEA estimates that the share of OECD-patented pharmaceutical profits earned in the United States is about 78 percent, despite the fact that the United States makes up only 34 percent of the OECD's GDP at purchasing power parity (CEA 2018; OECD 2016).

⁴ The developed countries included were the United Kingdom, Canada, France, Germany, Italy, Spain, Japan, Brazil, and Mexico.

Figure 6-6. OECD Patented Pharmaceutical Sales, 2016

Sources: U.S. Department of Commerce, Business Monitor International.

In a study using data from the late 1990s, Vernon (2003) found a similar ratio of profit margins for patented pharmaceuticals between the U.S. and other developed nations. Using a different method with novel firm-level data that reflect the margins of the world's top 20 firms for products sold in the United States and the rest of world, Vernon found that drugs sold in the United States had pretax operating profit margins that were, on average, 3.9 times those of the more regulated markets of France, Germany, Italy, Japan, and the United Kingdom. With this estimated profit margin ratio, the CEA estimates that the United States has a 77 percent share of OECD profits. More recently, Goldman and Lakdawalla (2018), using a different methodology, estimated the U.S. share of world profits to be 71 percent (midrange), as opposed to OECD profits. The fact that this world share estimate is only modestly smaller than the OECD share estimated by the CEA may potentially be due to the fact that the OECD countries account for almost all world profits. Taken together, these studies suggest a conservative profit share of the United States among the OECD countries above 70 percent.

Although U.S. consumers and taxpayers finance more than 70 percent of estimated OECD profits on patented biopharmaceuticals during a single year, this does not account for the fact that these drugs are often sold in the United States before they enter other markets. Drug manufacturers usually pursue market access in the United States before other markets due to the higher

Box 6-8. The Trump Administration’s Steps to End Global Free-Riding in Biopharmaceuticals

Reforms are needed to address the global free-riding that takes unfair advantage of American innovation, through enhanced trade policy or policies that tie public reimbursements in the United States to prices paid by foreign governments in foreign free-riding countries. To combat this unfair free-riding by foreign markets, the Trump Administration will:

- Analyze the drug prices in the United States compared with those in the other OECD member countries, to better understand the unfair disparity and support the U.S. Trade Representative.
- Make regulatory changes and seek legislative solutions to put American patients first.
- Change the incentives for foreign, developed nations that can afford to pay for novel drugs, to price novel drugs at levels that appropriately reward innovation.

prices in the United States. Danzon, Wang, and Wang (2005) find evidence that the United States gains access to drugs sooner and has earlier drug launches compared with other developed countries. For example, the United States had several times more drug launches than Japan in the 1990s, and those launches that occurred in the United States were on average 19 months earlier. This implies that if the U.S. government pays for the initial years of sales (i.e., those discounted across fewer periods and therefore producing a higher present value), an even larger share of the return on innovation is paid for by the United States.

Because the OECD countries do not face a trade-off between prices and innovation, given that innovation is not substantially affected by their pricing, most OECD nations employ price controls in an attempt to constrain the cost of novel biopharmaceutical products—for example, through cost-effectiveness or reference pricing policies. In essence, in price negotiations with manufacturers, foreign governments with centralized pricing exploit the fact that once a drug is already produced, the firm is always better off selling at a price above the marginal cost of production and making a profit, regardless of how small, than not selling at all. Thus, the foreign government can insist on a price that covers the marginal production cost—but not the far greater sunk costs from years of research and development—and firms will continue to sell to that country (see box 6-8).

Limiting underpricing domestically. Reducing inefficient pricing domestically could help to realign incentives for pharmaceutical firms to innovate. The Medicaid Drug Rebate Program, discussed above, had the unintended consequence of far fewer voluntary discounts from drug manufacturers to certain safety net health providers because the discounted price would become the

**Box 6-9. The Trump Administration's
Improvements to the 340B Program**

The goal of the 340B Drug Pricing Program is to provide affordable pharmaceutical drugs to low-income patients, not to pay economic rents to hospitals. In November 2017, CMS reduced the amount Medicare pays hospitals for drugs acquired through the 340B program. It will lower Medicare beneficiaries' coinsurance and save them an estimated \$320 million in 2018 alone (CMS 2017e). The Trump Administration will create more precise eligibility criteria and modify hospitals' payments for drugs acquired through the 340B drug discount program to reward them based on the charity care they provide and to reduce payment if they provide less than 1 percent of their operating expenses for uncompensated care. When facilities do not provide charity care, they should not get a discount for serving the most vulnerable populations in society.

"best price" for all remaining Medicaid patients. Congress created the 340B Drug Pricing Program, in part, to exempt discounts for safety net health providers from the Medicaid best price formula. The 340B Drug Pricing Program requires manufacturers that want to have their drugs covered under Medicaid to sell outpatient drugs at a discount to safety net healthcare providers serving vulnerable populations (Baer 2015).

The 340B program has expanded dramatically in recent years due to loosened eligibility requirements under the ACA (Stencel 2014). Safety net providers and their affiliated sites spent more than \$16 billion to purchase 340B drugs in 2016, six times the amount spent in 2005 (Vandervelde and Blalock 2017). Two significant problems have emerged in the 340B program. First, the imprecise eligibility criteria have allowed for significant growth of the program beyond its intended purpose. Second, providers can earn significant profits by qualifying for the program, buying heavily discounted drugs, and then selling them to Medicare and private patients at higher prices. Furthermore, there is no requirement that hospitals use the money they earn from the 340B discounts to benefit low-income patients. These large incentives distort provider organizations' decisions in attempts to qualify for the program, which is simply a form of rent seeking (see box 6-9).

Reducing the cost of innovation through change at the FDA. The fixed costs of developing and bringing a drug to market are typically large compared with the small marginal costs of producing additional pills or doses. Thus, the incentive to innovate is driven by whether expected profits exceed these fixed R&D costs, and FDA policies have a major influence on the size of these fixed costs.

It is widely accepted that the fixed cost of bringing a new, patented drug to market has risen rapidly over time. The Tufts Center for the Study of Drug

Development has estimated that the average pretax industry cost in 2013 dollars per new prescription drug approval (inclusive of failures and capital costs) is about \$2.6 billion (DiMasi, Grabowski, and Hansen 2016). Moderating this cost growth requires an understanding of the drug development process.

The most time-intensive steps for developing drugs are clinical trials involving human subjects (80.8 months) and the FDA review (16 months), which has fallen with each reauthorization of the Prescription Drug User Fee Act.⁵ Because clinical trials and FDA review are the most time- and resource-intensive steps, reforms that significantly reduce the fixed costs of entry must focus on these areas. Although the FDA's drug review and approval times have generally been shorter than those of regulatory agencies in other countries, over the years the FDA has attempted to speed up the process (Downing et al. 2012; CIRS 2014). In particular, the FDA has four separate programs to expedite the development and approval process for drugs that address an unmet medical need in the treatment of a serious or life-threatening condition. Although these programs have been put in place to speed up market entry for therapeutic drugs, there is still room for improvement—an average time of more than 10 years for the development and entry of new drugs is too long.

Reforms reducing the cost of innovation raise price competition. Drug development reforms could lower the cost of entry and enhance price competition vis-à-vis new innovations. Reforms that lower prices after patents expire are also important. Generic drugs have been highly successful in driving down drug prices—as more generics come on the market, prices drop rapidly, to nearly half after just the second generic introduction. Faster generic drug approvals could decrease the cost of entry, and thus lower drug prices even further. The current approval process for generic drugs is based on the 1984 Drug Price Competition and Patent Term Restoration Act (also known as the Hatch-Waxman Act). Generic drugs go through an abbreviated approval process, in which applicants are only required to prove bioequivalence (showing that the active ingredient is absorbed at the same rate and to the same extent as the patented drug) to an already-approved drug. Tests to prove bioequivalence are much less costly than tests to prove safety and efficacy. In addition, the Hatch-Waxman Act allows applicants to start clinical testing before the patent on the original drug expires. The result was that after the act took effect, the lag between patent expiration and generic entry for top-selling drugs dropped from more than three years to less than three months (CBO 1998). Nevertheless, the time until approval (and associated cost) for most generic drugs is far greater. As several recent, well-publicized episodes have shown—the rapid price increase for epinephrine auto-injectors, for example—some manufacturers are willing to exploit their monopoly positions. The FDA is undertaking needed regulatory actions to streamline and speed up the process

⁵ PDUFA, reauthorized in 2017, allowed the FDA to collect fees from manufacturers during fiscal years 2018–22 to fund the new drug approval process.

Box 6-10. The Trump Administration Expedites Drug Approvals

In August 2017, President Trump signed the Food and Drug Administration Reauthorization Act (FDARA) into law, reauthorizing the Generic Drug User Fee Amendments (GDUFA) to empower the FDA to collect user fees for generic drug applications and consistently process applications in a timely manner. In 2017, a record number of generic drugs were approved.

The Trump Administration has prioritized the approval of more generic drugs to bring down the cost of pharmaceuticals (FDA 2018). Last year, the FDA announced the Drug Competition Action Plan (DCAP) to expand access to safe and effective generic drugs. Efforts have focused on three key priorities to encourage generic drug competition: (1) preventing branded companies from keeping generics out of the market, (2) mitigating scientific and regulatory obstacles in gaining approval, and (3) streamlining the generic review process. The FDA has already released guidance that outlines for companies and FDA staff members the specific steps to reduce the number of review cycles and shorten the approval process. Some of the actions that the FDA has taken under the DCAP include:

- New policies to expedite review of ANDAs where there are limited approved generics for a given product.
- Publication of a “List of Off-Patent, Off-Exclusivity Drugs without an Approved Generic,” which will receive expedited review if an ANDA for the product is submitted.
- New guidance for industry on submitting ANDAs.
- Product specific guidance to support generic development of small-molecule complex generics.
- Guidance for the industry for evaluating the abuse deterrence of generic solid oral opioid drug products.

President Trump’s fiscal year 2019 budget proposal will end so-called first-to-file gaming. When a first-to-file generic application (and therefore one eligible for 180 days of exclusivity) is not yet approved due to application deficiencies, the FDA would be able to tentatively approve a subsequent generic application, which would start the 180-day exclusivity clock, rather than waiting an indefinite period for the first-to-file applicant to fix its application. Triggering the start of this 180-day exclusivity period for first-to-file applicants who “park” their exclusivity would speed the delivery of generic drugs and provide substantial cost savings to American patients.

whereby generics are approved. Inefficient gaming of the regulations that distort the industry away from the intended goals of the regulations of lowering drug prices for patients can be further reduced.

The Trump Administration also supports increasing competition for biologics—complex biological treatments made in living cells—by encouraging the approval of competing biologics, known as biosimilars, that have the

same clinical safety and efficacy as the first FDA-approved biologic. As more biosimilars are approved, it is estimated that the price for these advanced treatments could decrease, saving an estimated \$44 billion over 10 years (Mulcahy, Predmore, and Mattke 2014). Unlike conventional and easily replicated small-molecule drugs, biologics and biosimilars are highly sensitive to the living systems in which they are created, requiring significant scientific expertise (Palmer 2013). Biosimilars can take 8 to 10 years and hundreds of millions of dollars to gain approval (FTC 2009); see box 6-10. The FDA approved five new biosimilars in 2017, more than the approvals during the two previous years, which include novel treatments for cancers (FDA 2018).

The Government's Role in Reducing Prices and Stimulating Innovation

The two seemingly inconsistent goals of reducing American prices and stimulating innovation can be achieved only with a combined strategy to reduce high prices at home while at the same time reducing free-riding abroad. The role of government is to ensure that firms invest in meaningful innovations that lower the price of healthcare, rather than provide incentives that dampen competition between firms pursuing innovations. It is also government's role to help solve international problems, such as global free-riding on drug innovation, that harm U.S. citizens. The Administration's policies as outlined in this chapter can lower prices in the United States, foster innovation, and limit foreign free-riding on the U.S. biopharmaceutical industry and American consumers and taxpayers. Preserving the U.S. biopharmaceutical industry and encouraging it to innovate, while making drugs that are more available and affordable for all Americans, is an attainable goal.

Conclusion

A vital role of government is to promote a healthy and productive society. A main premise of the ACA—if not its central premise—was that more insurance would mean better health. For years following the ACA's passage, proponents measured the success of the law by the number of people who were covered by health insurance. Unfortunately, the ACA never expanded coverage as much as anticipated—only about 6 percent of the population gained coverage—and its gains largely came through expanded Medicaid coverage, which gives limited access to care. Moreover, the ACA imposed costly and cumbersome mandates and regulations that raised costs, decreased people's choices, and forced them to buy insurance that they neither wanted nor needed.

The Trump Administration is committed to reducing the harm caused by the ACA by decreasing unnecessary regulations and mandates, and by restoring competition and choice to the insurance markets. Instead of focusing solely on insurance expansion, which the evidence indicates has less

impact on health than commonly believed, the Administration plans to take a more holistic approach by addressing all the determinants of health, including individual behaviors that greatly influence health. Despite the increase in insurance coverage during the last several years, life expectancy in the United States declined in 2015, and again in 2016 (CDC 2016a, 2017a). Such a decrease in life expectancy has not occurred since the early 1960s, suggesting that health behaviors are causing people's health to deteriorate. The poor health and illnesses resulting from these behaviors impose significant economic costs through direct medical spending, premature deaths, and reduced productivity. Effectively addressing these behaviors can improve health, productivity, and economic growth.

The Administration has already taken important steps to address the opioid epidemic that has ravaged our society and led to skyrocketing deaths while the ACA expansion was ongoing. The Administration has declared a public health emergency under the Public Health Service Act and has taken concrete actions to prevent prescription opioid abuse, interdict the supply of illicit opioids, improve access to treatment for those already addicted, and encourage innovative new treatments. Additional government actions and private innovation will be necessary to further address the opioid epidemic and other important problems, such as smoking and the lack of physical activity and poor diets that lead to obesity.

Medical innovations that improve people's health can be expensive initially, but they have the potential to bring down the price of healthcare over time. Yet innovations are unhelpful if people cannot afford them. The President shares the American people's concern over high drug prices. The Administration has laid out a strategy to accomplish the two seemingly inconsistent goals of reducing American drug prices and stimulating innovation by correcting government policies that hinder price competition at home while reducing free-riding abroad.

Chapter 7

Fighting Cybersecurity Threats to the Growing Economy

Information technology creates enormous value for the U.S. economy. However, it also exposes U.S. firms, the government sector, and private individuals to new risks that originate and are often effectuated entirely in cyberspace. Due to the difficulty of identifying and punishing malicious actors, and the ever-greater interconnectedness stemming from the intensified use of the Internet, malicious cyber activity is becoming more and more widespread. Malicious actors range from lone individuals to highly sophisticated nation-states, and they pose a potential threat to all Americans using any information and communications technologies.

Malicious cyber activity imposes considerable costs on the U.S. economy. Some costs are more immediate and include the value of sensitive information and intellectual property stolen by hackers, as well as the loss of revenues, data, and equipment due to disruptive cyberattacks and data breaches. Other costs are longer term, such as the slow rate of adoption of new, productivity-boosting information technologies and the underinvestment in research and development stemming from poor protection against cyber theft. The ongoing costs could escalate considerably in the event of an attack with large-scale consequences—for example, an attack on critical infrastructure sectors that are crucial for the smooth functioning of the U.S. economy.

Cybersecurity is a common good. A firm with weak cybersecurity imposes negative externalities on its customers, employees, and other firms tied to it through partnerships and supply chain relations. In the presence of externalities, firms would rationally underinvest in cybersecurity relative to the socially optimal

level. Therefore, it often falls to regulators to devise a series of penalties and incentives to increase the level of investment to the desired level.

The marketplace is responding to the growing level of cyber threats. Firms are increasingly outsourcing cyber protection functions to the blossoming cybersecurity sector. The emergence of the cyber insurance market helps firms share the risk of cybersecurity compromises. However, these positive developments are hampered by firms' reluctance to share information on past malicious cyber activity directed at them, along with the cyber threats they currently face. This resistance stems from a variety of concerns, such as the fact that investors will respond negatively, causing the stock price to plunge, that the firm will suffer reputational damage and be exposed to lawsuits and regulatory actions, or that the revelation of potential vulnerabilities could lead to additional cybersecurity exposure. Despite the regulatory requirement that material cybersecurity events be reported by publicly traded firms, there is a general agreement that underreporting is pervasive. As a result of this underreporting, the frequencies and costs of various types of malicious cyber activity directed at firms are largely unknown, and this lack of information hampers the ability of all actors to respond effectively and immediately.

In addition, the scarcity of information may be slowing down the development of the cyber insurance market. Further, the use of common technologies among otherwise unrelated firms may impede the development of the cyber insurance market. Common vulnerabilities in these technologies cause cybersecurity risks to be correlated across firms in complicated and little-understood patterns, which makes it difficult for insurance companies to construct properly diversified portfolios of insured firms.

Continued cooperation between the public and private sectors is the key to effectively managing cybersecurity risks. The ongoing efforts by the private sector involve making information technology more secure, providing timely defenses to new threats, and further developing platforms for anonymous information sharing on cybersecurity threats. The government is likewise

important in incentivizing cyber protection—for example, by disseminating new cybersecurity standards, sharing best practices, conducting basic research on cybersecurity, protecting critical infrastructures, preparing future employees for the cybersecurity workforce, and enforcing the rule of law in cyberspace.

This chapter examines the substantial economic costs that malicious cyber activity directed at firms imposes on the U.S. economy. As the U.S. economy relies more and more on information technology (IT) and greater interconnectedness, cybersecurity threats pose an increasing challenge. A malicious cyber activity is defined as an activity, other than one authorized by or in accordance with U.S. law, that seeks to compromise or impair the confidentiality, integrity, or availability of computers, information or communications systems, networks, physical or virtual infrastructure controlled by computers or information systems, or the information resident thereon.

The theft and destruction of private property are not a new problem in economics. Economists have long understood that the effective enforcement of property rights, for both IP and physical property, underlies economic growth by encouraging investment in physical assets, in research and development, and in putting these assets to productive uses. A law enforcement system that efficiently identifies and punishes criminals, and also actively patrols against criminal activity, reduces crime. Law enforcement actions to disrupt and deter cyber-enabled crime are important components of cybersecurity. Law enforcement has deployed massive resources towards combatting cybercrime, including an entire division of the Federal Bureau of Investigation (FBI) and hundreds of trained Federal prosecutors. However, cybercrimes present particular challenges for law enforcement. The identification of cybercriminals is difficult, because the Internet presents opportunities for user anonymity.

Moreover, the proliferation and sharing of malicious computer code intended to damage or destroy computer systems—malware—makes it difficult to tie particular malware to particular people. Sophisticated actors are able to obfuscate origin and pathways for malicious activities. Even when criminals are identified, punishing them is often difficult because cybercriminals often reside in countries with unfriendly political regimes. In fact, malicious cyber activities are sometimes authorized by such unfriendly regimes. Nonetheless, despite the difficulties, in a significant number of cases cybercriminals have been arrested abroad, including in countries with unfriendly political regimes, to face charges related to cybercrime.

The responsibility for protecting against cybersecurity threats falls largely on individuals and economic entities and not on law enforcement—that

is, unless cyberattacks are directed at critically important infrastructure sectors that are deemed to be crucial for the smooth functioning of the U.S. economy. Firms and private individuals are often outmatched by sophisticated cyber adversaries. Even large firms with substantial resources committed to cybersecurity may be helpless against attacks by sophisticated nation-states.

Further exacerbating the problem, firms may be rationally underinvesting in cybersecurity relative to the socially optimal level because they do not take into account the substantial negative externalities imposed by cyberattacks and data breaches on private individuals and on other firms. For example, as we show later in the chapter, a data breach experienced by Equifax also negatively affected other similar firms, along with Equifax's corporate customers. The firms that own critical infrastructure assets, such as parts of the nation's power grid, may generate pervasive negative spillover effects for the wider economy.

For these and other reasons, cybersecurity risks have increased significantly, and malicious cyber activity imposes substantial costs on the U.S. economy. The Council of Economic Advisers (CEA 2018) estimates that malicious cyber activity cost the U.S. economy between \$57 and \$109 billion in 2016, which amounts to between 0.31 and 0.58 percent of that year's gross domestic product (GDP). However, this number could pale in comparison with the potential cost that would be incurred by the U.S. economy in the event of a large-scale cyberattack, in which IT is used to disrupt services provided by the government to its citizens and businesses. The additional costs that malicious cyber activity imposes on economic growth are (1) underinvestment in research and development and information assets, due to insufficient protection of property rights; and (2) the slow rate of adoption for new, productivity-boosting IT, for fear that it is insufficiently secure.

One glaring problem that impairs effective cybersecurity is firms' reluctance to share information on cyber threats and exposures. Although the Cybersecurity Information Sharing Act of 2015 made significant progress toward the exchange of threat and vulnerability data between the private and public sectors, firms remain reluctant to increase their exposure to legal and public affairs risks. The lack of information on cyberattacks and data breaches suffered by other firms may cause less sophisticated small firms to conclude that cybersecurity risk is not a pressing problem. In addition, insufficient data on the frequency and costs of cybersecurity events make it difficult for firms to determine the appropriate level of resources to manage the cyber risk. In addition, the lack of data may be stymying the ability of law enforcement and other actors to respond quickly and effectively and may be slowing the development of the cyber insurance market.

Another impediment to a quick development of a competitive market for cyber insurance is insurers' insufficient understanding of their common vulnerabilities to various types of cyber threats. These vulnerabilities could arise

at the level of software, hardware, or cloud computing. Without the ability to properly quantify how cybersecurity risks are correlated across firms, insurers may find it challenging to construct well-diversified portfolios of insured firms.

In response to growing cyber threats, both the public and private sectors are actively working on solutions. The private sector is moving to a more cost-efficient model for cyber protection by outsourcing it to the growing cybersecurity sector. The private sector is also responding by developing IT solutions and by improving information sharing. Also, the cyber insurance market is expanding to meet the growing demand. However, despite this progress, cooperation between the public and private sectors is crucial to effectively respond and to limit the overall risks. As the frequent target of cyberattacks and data breaches, the government can be a valuable contributor to sharing threat information. The government can also create educational programs to ensure that there is a robust pipeline of domestic employees for the cybersecurity workforce. Through a system of penalties and regulations and other levers, the government can incentivize the private sector to increase its investment in cybersecurity to the socially optimal level. Furthermore, the government sector is nearly unmatched in its ability to identify and neutralize cyber threats. Finally, only the government has the authority to punish cybercriminals and thus reduce their incentives to commit future crimes.

The chapter proceeds as follows. The first section gives an overview of cybersecurity risks and cyber threat actors. The second section estimates the costs that cybersecurity events impose on individual firms. The third section discusses the externalities that weak cybersecurity imposes on a firm's customers and on other firms. The fourth section describes how firms' use of the same software, hardware, and cloud computing services makes seemingly unrelated firms vulnerable to the same cyber threat vectors. The fifth section highlights the problems imposed by insufficient data. The sixth section considers the problem of dark cyber debt. The seventh section examines the growing market for cyber insurance. The eighth section describes the costs of malicious cyber activity for the U.S. economy. The ninth section discusses devastating scenarios for cyberattacks and data breaches. The tenth section explains the risks posed by the rise of quantum computing. And the eleventh section describes the ongoing efforts by the private and public sectors to reduce cyber risk.

Malicious Cyber Activities and Cyber Threat Actors

Malicious cyber activities directed at firms can take multiple forms, and they compromise at least one component of what is known as the "CIA triad": confidentiality, integrity, and availability. For example, a distributed denial-of-service (DDoS) attack—which is defined as making an online service

unavailable by overwhelming it with traffic from multiple sources—falls under the “availability” category of the triad because it interferes with the availability of a firm’s Web-based services. A theft of funds from a bank customer’s account through cyber means violates the integrity of the bank’s transactions data. A cyber-enabled theft of the personally identifiable information (PII) of a firm’s customers or employees compromises data confidentiality.

We next give the definitions of the terms we use in this chapter. According to the definition proposed by the National Institute of Standards and Technology (NIST), a cybersecurity incident is defined as a violation of “an explicit or implied security policy” (Cichonski et al. 2012). In turn, for NIST, cybersecurity incidents include but are not limited to (1) attempts, either failed or successful, to gain unauthorized access to a system or its data; (2) DDoS attacks; and (3) unauthorized changes to system hardware, firmware, or software. We further distinguish between two types of “successful” cybersecurity incidents: a cyberattack and a data breach. As defined by the Director of National Intelligence, a cyberattack intends to “create physical effects or to manipulate, disrupt, or delete data.” According to this definition, a cyberattack interferes with the normal functioning of a business. Thus, DDoS attacks, cyber-enabled data and equipment destruction, and data-encryption attacks fall into the category of cyberattacks. In contrast, a data breach may not necessarily interfere with normal business operations, but it involves unauthorized “movement or disclosure of sensitive information to a party, usually outside the organization, that is not authorized to have or see the information,” according to the Department of Homeland Security (DHS 2017d). (To draw a parallel to the property rights terminology, a cyberattack destroys property or makes it unavailable for use, and a data breach amounts to property theft.) In this chapter, we also refer to cyberattacks and data breaches as “malicious cyber activity,” “adverse cyber events,” or simply as “cyber events,” and we sometimes refer to data breaches as “cyber theft.” When a malicious cyber activity is attributed to a criminal group or when it is directed at private individuals, we sometimes also refer to it as “cybercrime.”

According to government and industry sources, malicious cyber activity is a growing concern for both the public and private sectors. Between 2013 and 2015, according to the Office of the Director of National Intelligence (DNI), cyber threats were the most important strategic threat facing the United States (DOD 2015a)—they “impose costs on the United States and global economies” and present “risks” for “nearly all information, communication networks, and systems” (DNI 2017). For more on cyber threat actors, see box 7-1.

Attribution of cyber incidents is difficult, but expert analysis of the malicious code and the attack techniques combined with law enforcement and intelligence collection can identify responsible actors. Verizon’s Data Breach Investigations Report notes that 75 percent of recent security incidents and breaches were caused by outsiders, while 25 percent were performed by

Box 7-1. Cyber Threat Actors

Cyber threat actors fall into six broad groups, each driven by distinct objectives and motivations (CSO 2017):

Nation-states: The main actors are Russia, China, Iran, and North Korea, according to the DNI (2017). These groups are well funded and often engage in sophisticated, targeted attacks. Nation-states are typically motivated by political, economic, technical, or military agendas, and they have a range of goals that vary at different times. Nation-states frequently engage in industrial espionage. If they have funding needs, they may conduct ransom attacks and electronic thefts of funds. Nation-states frequently target PII in order to spy on certain individuals. Furthermore, nation-states may engage in business destruction involving one or more firms, potentially as a retaliation against sanctions or other actions taken by the international community, or as an act of war (based on interviews with cybersecurity experts). Cybersecurity experts like to say that in an act of war or retaliation, the first moves will be made in cyberspace. A growing consensus indicates that cyberspace is already being used by nation-states for retaliation against policies/measures, such as sanctions, imposed on them by individual nations or the international community.

Corporate competitors: These are firms that seek illicit access to proprietary IP, including financial, strategic, and workforce-related information on their competitors; many such corporate actors are backed by nation-states.

Hacktivists: These are generally private individuals or groups around the globe who have a political agenda and seek to carry out high-profile attacks. These attacks help hacktivists distribute propaganda or to cause damage to opposition organizations for ideological reasons.

Organized criminal groups: These are criminal collectives that engage in targeted attacks motivated by profit seeking. These groups collect profits by selling stolen PII on the dark web and by collecting ransom payments from both public and private entities by means of disruptive attacks.

Opportunists: These are usually amateur hackers driven by a desire for notoriety. Opportunists typically attack organizations using widely available codes and techniques, and thus usually represent the least advanced form of adversaries.

Company insiders: These are typically disgruntled employees or ex-employees looking for revenge or financial gain. Insiders can be especially dangerous when working in tandem with external actors, allowing these external actors to easily bypass even the most robust defenses.

internal actors (Verizon 2017). Overall, 18 percent of threat actors were state-affiliated groups, and 51 percent involved organized criminal groups. The DNI (2017) notes that Russia, China, Iran, and North Korea, along with terrorists and criminals, are frequent cyber threat actors.

A PricewaterhouseCoopers (PwC 2014) report—based on a survey of more than 9,700 C-level executives, vice presidents, other administrators, and directors of IT and security practices, with 35 percent of the surveyed firms based in the North America—states that malicious cyber activities by nation-states are the fastest-growing category of malicious cybersecurity incidents. Actors who are attacking on behalf of nation-states are among the most technically skilled actors, and attacks by nation-states often go unnoticed by firms. Although, historically, nation-states have sought to steal IP, sensitive financial plans, and strategic information, nation-states are becoming increasingly motivated by retaliation goals, and thus are engaging in data and equipment destruction, and in interrupting business (FBI 2014). The most recent publicly confirmed attack by a nation-state was a destructive WannaCry malware attack initiated by North Korea that is estimated to have cost the world economy billions of dollars (Bossert 2017).

A cyber adversary can utilize numerous attack vectors simultaneously. The backdoors that were previously established may be used to concurrently attack the compromised firms for the purpose of simultaneous business destruction.

Ultimately, any organization is fair game for cyber threat actors, though at different times a different set of firms may face higher risks. For example, corporate competitors typically target firms in their industry. So-called hacktivists, motivated by ideological considerations, may pile on to attack a different set of organizations at different times, typically because these organizations have offended hacktivists' worldviews. We have conducted interviews with a number of cybersecurity experts and, anecdotally, news organizations are among hacktivists' frequent victims. When a nation-state faces sanctions targeting a certain industry, the nation-state may use cyber-enabled means to target firms in that same industry in the country or countries that imposed the sanctions. That said, any firm is a potential target, independent of its age, size, sector, location, or employee composition.

At this time, there is no common taxonomy for categorizing malicious cyber activities. Some cybersecurity experts believe that it is helpful to focus on the motive and associated threat actors. For example, Verizon's 2017 "Data Breach Investigations Report" uses three broad classifications that encompass both motive and threat actor categories: (1) FIG (fun, ideology, grudge, or activist group threat actors); (2) ESP (espionage motive, or state-affiliated or nation-state actors); and (3) FIN (financial motivation, or organized criminal group, actors). A former special adviser on cybersecurity to the White House, Richard Clarke, used a slightly different set of classifications: (1) hacktivists; (2) cybercriminals; (3) cyber espionage; and (4) large-scale cyberattacks (Verizon 2017; Hughes et al. 2017). As the field of cybersecurity evolves, the Council of Economic Advisers believes that it will be helpful to develop a common lexicon with which to delineate categories of malicious cyber activity.

The Costs of Adverse Cyber Events Incurred by Firms

A survey of firms located in the United States and in other countries, representing different industries and firm sizes, conducted by Ponemon (2017a) revealed that a typical firm experiences 130 security breaches each year.¹ If not addressed, a security breach may evolve into materially damaging cyber event. Because many firms employ security procedures that help detect and neutralize cyber threats (e.g., by employing tools for detecting and containing security breaches as well as procedures for quick recovery), security breaches do not necessarily result in a material impact such as a business disruption, data theft, or data or property destruction. When a firm does fall victim to an exploit or other attack, it may face a range of loss categories, some of which are easy to observe and quantify, and some of which are not.

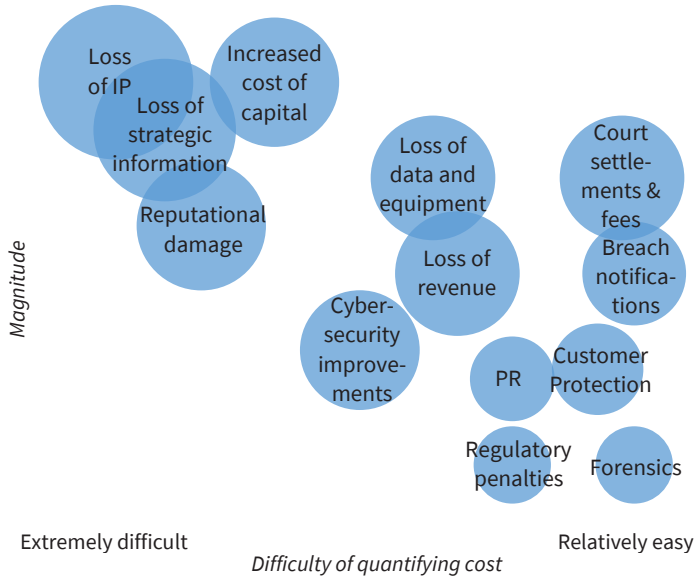

Figure 7-1 illustrates the costs associated with materially damaging cybersecurity events. These costs vary across firms and categories of cyberattacks or data breaches. Depending on the nature of their operations, firms are generally exposed to different cyber threats. Consumer-oriented firms with a prominent Web presence, such as online retailers, are more likely to be targeted for a DDoS attack, while firms engaging in research and development, such as high-technology companies, are more likely targeted for IP theft.

To provide context for this figure, consider potential costs of a DDoS attack. A DDoS attack interferes with a firm's online operations, causing a loss of sales during the period of disruption. Some of the firm's customers may permanently switch to a competing firm due to their inability to access online services, imposing additional costs in the form of the firm's lost future revenue. Furthermore, a high-visibility attack may tarnish the firm's brand name, reducing its future revenues and business opportunities.

The costs incurred by a firm in the wake of IP theft are somewhat different. As the result of IP theft, the firm no longer has a monopoly on its proprietary findings because the stolen IP may now potentially be held and utilized by a competing firm. If the firm discovers that its IP has been stolen (and there is no guarantee of such discovery), attempting to identify the perpetrator or obtain relief via legal process could result in significant costs without being successful, especially if the IP was stolen by a foreign actor. Hence, expected future revenues of the firm could decline. The cost of capital is likely to increase because investors will conclude that the firm's IP is both sought-after and not sufficiently protected. In addition, an adverse cyber event typically triggers a

¹ In the absence of a centralized data set on cyberattacks and data breaches, many statistics reported in this chapter come from surveys. The usual limitations of survey data apply, such as that the set of reporting firms may not be representative, or the reported results may not be accurate. Due to the reluctance of firms to report negative information, discussed later in the chapter, the statistics may be biased down due to underreporting.

Figure 7-1. Cost Components of an Adverse Cyber Event

Sources: McKinsey; CEA calculations.

range of immediate and relatively easily observable costs, such as expenditures on forensics, cybersecurity improvements, data restoration, legal fees, and the like.

Using survey data from 254 companies, Ponemon (2017a) computes estimates of what share of the total immediately observable, cyber-driven loss each individual cost component represents: (1) information loss, 43 percent; (2) business disruption, 33 percent; (3) revenue losses, 21 percent; and (4) equipment damages, 3 percent. Moreover, the case studies provided in this chapter’s boxes illustrate how firms, by limiting their consideration to only immediately observable losses when evaluating the impact of malicious cyber activity, may drastically underestimate the total losses they could suffer.

Estimating the Costs of Adverse Cyber Events for Firms

The least subjective method for estimating the impact of a cybersecurity events on a publicly traded firm is to quantify its stock price’s reaction to the news of such events. For a publicly traded firm, its market value reflects the sum of (1) the value of its current assets and (2) the present discounted value of all future cash flows that the firm is expected to earn over its life span. In efficient capital markets, the market value will adjust quickly to reflect a new valuation following any news that affects the firm value. We use an event study methodology to calculate how market prices react to news of cyberattack or a data breach to

quantify the impact the exposure on a firm's value. All the costs shown in figure 7-1 are automatically accounted for in this calculation, reflecting the market's view of how the sum of these costs lowers the firm's value.

In this analysis, we rely on the newsfeed from Thomson Reuters for public news of cyberattacks and data breaches suffered by specific firms. The main readerships of the Thomson Reuters newsfeed are institutional traders and investors, who rely on it for breaking news on firms and markets. From this newsfeed, we separate out news of cyberattacks and data breaches suffered by individual firms. We identify news of such events by searching news headlines for key words such as "cyberattacks," "hacking," "data breach," and the like, including spelling and syntactic variations of these keywords. To isolate the impact of the events on stock prices, we remove announcements of cyberattacks and data breaches that fall within seven days of a quarterly earnings announcement. Moreover, we exclude news stories concerning cybersecurity firms, isolating only those firms that have been victims of malicious cyber activity. Because malicious cyber activity is a relatively new phenomenon, we start our analysis in January 2000 and run it through the last month of the available data, January 2017.

To estimate the impact of an adverse cyber event on a firm's value, we estimate the reaction of its stock price over the event window that begins on the day that the adverse cyber event was publicly disclosed in the news and ends seven days later. We employ the methodology used in prior event studies (e.g., Neuhierl, Scherbina, and Schlusche 2012). We consider two widely used models, the market model and the Capital Asset Pricing Model, to estimate baseline returns. Both models produce similar results, and we report only results based on the market model. In the market model, the market return is subtracted from the stock return in order to calculate the abnormal stock return on each event day. These values are then summed over the event window to calculate a cumulative abnormal return (CAR). Moreover, because Thomson-Reuters frequently issues closely spaced updates on prior adverse cyber events, we require that each subsequent news articles be at least seven days removed from the previous news—which effectively removes updates on a previously reported news item.

Our final data set contains news of 290 adverse cyber events committed against 186 unique firms. Because institutional customers of newsfeeds typically trade large and liquid stocks, newsfeeds disproportionately cover large firms. As a result, the firms in our data set have relatively high market capitalizations. The market capitalization of a median firm in our data set is \$12 billion, which is as large as that of a firm belonging to the ninth-largest size decile of all firms trading on the New York Stock Exchange (NYSE) (and firms trading on the NYSE tend to be larger than firms trading on other exchanges). The market capitalization of an average firm in our sample is even higher than that of a median firm—equal to \$65 billion.

We find that the stock price reaction to the news of an adverse cyber event is significantly negative. Firms on average lost about 0.8 percent of their market value in the seven days following news of an adverse cyber event, with the corresponding t statistic of -2.35 . This t statistic is statistically significant and makes a researcher highly confident that the underlying stock price's reaction to the news of an event is negative. (Also, this t statistic implies that there is less than a 2 percent chance that a researcher would have obtained this particular negative estimate if stock price reactions to the cybersecurity event were distributed around the mean of zero.) We estimate that, on average, the firms in our sample lost \$498 million per adverse cyber event. The distribution of losses is highly right-skewed. When we trim the sample of estimated losses at 1 percent on each side of the distribution, the average loss declines to \$338 million per event. The median loss per event is substantially smaller, and equals \$15 million. By comparison, PwC (2014) reports that in 2014, the average cost attributed to cybersecurity incidents was \$2.7 million. Another industry source, Ponemon (2017a), uses a survey sample of 254 relatively large companies (hence, the size of the firms is closer to that in our sample) and estimates that an adverse cyber events cost these firms \$21 million per event, on average.

The number of cyberattacks and data breaches reported by Thomson Reuters has been increasing over the years, likely for these reasons: (1) More firms experienced adverse cybersecurity events in later years, (2) investors started to pay more attention to and demand reports on such events, and (3) more advanced technology has improved breach detection and allowed for a better deflection of DDoS attacks. Of the 290 events in our sample, only 131 were reported in the 13 years before 2014, and 159 were reported after 2014.

Previous studies and reports speculated that the market was not entirely rational, or perhaps was too slow when evaluating the costs of adverse cyber events because of the lack of data on past events (e.g., Kvochko and Pant 2015). Table 7-1 presents CARs to the news of adverse cyber events, by sample period.

The table shows that though in the earlier subperiod, the average stock price reaction is negative, the corresponding t statistic indicates that it is statistically indistinguishable from zero. In the second subperiod, the stock price reaction is significantly negative; there is less than a 1 percent chance that researchers would have obtained the negative CAR estimate purely because of noise in the data if stock prices did not reliably drop in response to news of a cyberattack or a data breach. These results suggest that the market has gained a better understanding of the costs of adverse cyber events and thus has started reacting to news of such events more quickly.

Our study improves on earlier ones with respect to the costs of adverse cyber events, in that it both uses a longer and more complete data set of such events and in that it estimates the costs from stock price reactions. We obtain markedly more negative estimates of the impact of adverse cyber events on

Table 7-1. Cumulative Abnormal Returns (CARs) Following News of an Adverse Cyber Event, 2000–2017

Sample period	Number of events	CAR (%)	t statistic
2000–2013	131	–0.53	–0.8
2014– Jan. 2017	159	–1.01	–3.42

firm values than earlier studies (e.g., Hilary, Segal, and Zhang 2016; Kvochko and Pant 2015; Romanosky 2016), for four reasons. First, our sample includes a wider variety of adverse cyber events, whereas earlier studies (e.g., Hilary, Segal, and Zhang 2016) mainly used reported data breaches that involved PII. Second, our estimations analyze market reactions to the news of adverse cyber events, whereas some of the earlier studies consider only a subset of measurable and observable costs that would be covered by cyber insurance. Third, our sample extends to a more recent period, during which stock price reactions to cyber news became more immediate. Fourth, our sample of cyber events is newsworthy enough to warrant a report in the Thomson Reuters news feed, and, therefore, may be worse in terms of the damage caused than cyberattacks and data breaches that are not covered in the business press.

We next analyze whether firms of different sizes react differently to the news of cyber events. If a cyberattack or a data breach causes the same dollar damage for two firms of different sizes, the event would have a smaller impact on a larger firm than on a smaller firm. For example—as illustrated by the case of SolarWorld, which is discussed later in the chapter—smaller firms, and especially those with few product lines, can easily go out of business if they are attacked or breached. (Note that going out of business translates into a –100 percent return on equity.) We form firm size bins based on the NYSE size deciles, but because our sample contains very few small firms, we further aggregate several size deciles into a single bin for smaller firms. The results, illustrated in figure 7-2, show a U-shaped relation between firm size and the stock price reaction to the news.

Specifically, figure 7-2 shows that firms in the 8th NYSE size decile experience the lowest CARs in response to the news of adverse cyber events, equal to –1.72 percent. Firms in the 9th and 10th NYSE size deciles have CARs equal to –1.12 and –0.89 percent, respectively. We believe that the CARs associated with such cyber events experienced by smaller firms, those in deciles 1 through 7, may be less negative, for three reasons. First, the reported events may have been less devastating. Second, the costs may have been largely covered by cyber insurance. And third, perhaps most important, stockholders of smaller firms are typically retail investors rather than more sophisticated institutions, so they may take longer than seven days to react to news about cyber events

Figure 7-2. Cumulative Abnormal Return by Firm Size

 Note: Number of observations is in parentheses.

involving firms whose stocks they hold. Hence, the full price impact of the adverse cybersecurity events will not show up within the seven-day time frame.

Despite the small sample size, we further subdivide the adverse cybersecurity events into different categories using key word searches. We attempted to make these categories consistent with the cybersecurity industry classifications, but because the news media use varied naming conventions, the resulting categories are somewhat different. For example, some adverse cyber events are only described in the news headline as having been attributed to nation-states with no additional information on the types of events. Hence, we include a category classified simply as “nation-state.” All categories of adverse cyber events are made to be mutually exclusive; each incident in our data set may have exactly one classification.

We began by identifying data breaches that may involve the theft of PII. This category of adverse cyber events received the most attention from State regulators, as indicated by various State laws that mandate firms to disclose instances of PII theft. (As of April 2017, 48 States, the District of Columbia, Puerto Rico, Guam, and the Virgin Islands have put in place legislation mandating that government organizations and/or private businesses “notify individuals of security breaches of information involving personally identifiable information” (National Conference of State Legislatures 2017).) We identified

Figure 7-3. Cumulative Abnormal Return by Type of Adverse Cyber Event

Sources: Thompson Reuters; CEA calculations.
 Note: Number of observations is in parentheses.

35 adverse cybersecurity events that fall under this classification. From the remaining sample, we identified cyberattacks that were reported to result in the destruction of data or equipment, ultimately finding only one attack of this nature. Using the rest of the sample, we identified the news of DDoS attacks; we found a total of 5 observations in this category.

Next, headlines that mentioned the use of malware, spyware, ransomware, and the like had 15 observations; we classified this category as “malware.” Of the remaining news, 5 involved espionage and and/or the theft of IP; we classified this category as “IP theft.” Using the remaining observations, we next searched for the mention of “nation-states,” and specifically Russia, China, Iran, or North Korea. We were able to identify 14 attacks in this category, and we classified them as “nation-states.”² Of course, nation-states may also have been involved in the previously classified four categories of adverse cyber events. Finally, we searched for the mention of wire fraud, the type of malicious cyber activity that predominately affects financial firms. This category has the highest number of headlines, 56. The remaining unclassified observations were assigned to the category “other.”

Figure 7-3 shows the average seven-day CARs associated with the various categories of cyber events in our sample, with the number of observations per

² It is important to note that a reference to nation-state in the news media does not necessarily reflect the attribution made by the U.S. government.

each category reported in parentheses. We show only the categories with at least five observations and, therefore, excluded the category involving destructive attacks because it had only one observation.

Although based on a small sample, the figure shows that the market perceives cyber events involving IP theft to be the most damaging, with the victim firms losing, on average, 6.32 percent of their market value. DDoS attacks are a distant second in terms of the damage caused, with attacked firms losing 2.41 percent of market value due to a DDoS attack. As discussed above, DDoS attacks on those consumer-oriented firms that have a heavy online presence have the potential to cause business disruptions that result in lost customers and reputational damage. Moreover, according to our interviews with cybersecurity experts, while contemporaneously using a DDoS attack to distract cyber protection resources, threat actors often engage in malicious intrusions in the victim firm's network. Malware attacks are a close third in harm caused, with an associated average drop in market value of 2.37 percent. Cybersecurity experts have related to us that a number of malware attacks in our sample had an objective of data destruction rather than ransom, and that this destruction of data could have been extremely damaging for the affected firms.

News of adverse cyber events that mention nation-states in the headline, on average, led to a 1.11 percent drop in market value. "Fraud" events involving monetary theft, which typically targeted financial firms, caused average losses of 0.69 percent of a firm's market value. Events that involved data breaches are relatively less damaging for victim firms, on average causing losses of only 0.56 percent. We believe that the theft of PII data on firms' customers and employees mainly represents an externality, for which firms are not excessively penalized by the market. Finally, the "other" catchall category of cyber events is the least damaging on average, with the typical event resulting in a 0.33 percent drop in a firm's market value.

Although it may be informative to study the longer-run effect of announcements of cyberattacks and data breaches on stock prices, in case stock prices underreact or overreact in the short run,³ such an analysis would need to be done at the portfolio level (by combining together into a portfolio multiple firms that experienced these adverse cyber events at about the same time) rather than at the individual stock level and would, therefore, require more observations of news of such events than what we have in our data set in order to be

³ E.g., the academic literature on the post-earnings announcement drift has shown that stock prices tend to underreact to earnings surprises, and the stock price drifts in the direction of the initial reaction for up to several months in the future.

convincing (for a description of this econometric approach, see, e.g., Mitchell and Stafford 2000).⁴

The effect of adverse cyber events on small and medium-sized businesses. Due to the nature of our sample, small and medium-sized firms were excluded from our analysis. However, such events may be more devastating for smaller firms because, for example, for a business that is focused on a single product, IP theft could wipe out the firm's entire livelihood. Similarly, a business disruption that lasts several days could cause customers to permanently abandon a small firm. Finally, the fixed costs of dealing with a breach or attack—such as the cost of cybersecurity improvements and legal fees—would represent a larger fraction of a small firm's operating budget. The 2015 *Year-End Economic Report* of the National Small Business Association (2015) estimated that, based on survey evidence from 884 small-business owners, 42 percent of respondents experienced a breach or an attack. Small and medium-sized businesses are at a high risk of being attacked by ransomware, which renders a firm's files inaccessible until a ransom is paid, along with attacks that exploit weaknesses in email systems in order to trick firms into transferring large sums of money into the perpetrators' bank accounts. According to the survey, an adverse cyber event costs the victim company over \$7,000 on average. For small businesses whose business banking accounts were hacked, the average loss was \$32,000. For the median company in the same study, in terms of revenues, these numbers represent, respectively, 0.28 percent and 1.28 percent of firm revenue. Although these are fairly low numbers, events are typically underreported, and the firms in the survey likely only quantify immediate and easily observable losses.

According to anecdotal evidence and various industry sources, a non-trivial number of small businesses go bankrupt as a result of a breach or attack. In so-called perfect capital markets, corporate bankruptcies are not costly because the corporate assets are reallocated toward best uses. However, in the real world, corporate bankruptcies are associated with deadweight losses; some ongoing projects will be permanently abandoned, the output of the research and development efforts will be lost, and firm-specific hard assets may be abandoned or sold at deep discounts.

Case studies of various types of cybersecurity incidents. We next examine in greater detail the various categories of cybersecurity events that occur in the United States and abroad. Most of the firms in case studies are not in our sample, either because the events happened outside our sample period

⁴ Several recent studies find that stock prices of firms that experienced a cybersecurity incident completely recover in the long run. However, the results of these studies should be interpreted with caution. A number of these studies lack a proper control group of otherwise similar firms that did not experience an event. In other studies, the high longer-run returns may be explained by positive idiosyncratic (firm-specific) news that occurred subsequent to the announcement of the breach or attack. Interestingly, many firms affected by cyber incidents subsequently announce increased investments in cybersecurity. Possibly, the return on this type of investment is very positive. The return on investment in cybersecurity needs to be studied more closely.

or because the firms were either privately held or listed on a foreign stock exchange. These case studies, along with cyberattacks and data breaches experienced by specific firms described in the text, are based entirely on media reports and our own calculations using public sources, not on an investigation by any government agency, and this report should not be taken as an authoritative description of the events, or as an accusation of criminal conduct. These case studies are designed to illustrate that different firms may be targeted for different reasons, and that malicious cyber activity can easily cause substantial material damage to firms.

The first case study is of a PII data breach at Equifax (box 7-2), which illustrates that a breach involving PII data can be devastating for a firm if its business model is predicated on mass collection of PII.

The second case study is an attack by a nation-state on Sony (box 7-3). The Sony case illustrates an attack by a nation-state. It is one of the few cyberattacks or data breaches publicly attributed to a nation-state actor by the U.S. government.

The Sony attack had adverse effects on the relationship between the United States and North Korea, and it influenced U.S. cybersecurity policy. In response to what it called “the Democratic People’s Republic of Korea’s numerous provocations,” the Obama Administration filed sanctions against various individuals and organizations tied to the North Korean military and technology sectors, barring them from access to the U.S. financial system. President Obama also announced additional legislative proposals in response to the attack, highlighting the need for greater cybersecurity information sharing and a modernization of law enforcement’s response to malicious cyber activities.

The third case study is on IP theft. According to figure 7-3, IP theft is the costliest type of malicious cyber activity. Moreover, security breaches that enable IP theft via cyber often remain undetected for years, allowing the periodic pilfering of corporate IP. Box 7-4 illustrates that the theft of IP and other sensitive information can have a devastating effect on an IP-centered, narrowly focused firm.⁵

⁵ Cyber-enabled IP theft is a subset of the pervasive problem of IP theft that imposes a substantial cost on the U.S. economy. Frequently, IP is stolen by noncyber means. For example, pirating and counterfeiting of IP-protected products typically involves copying an observed design. According to the Commission on the Theft of Intellectual Property (2017), China accounts for 87 percent of counterfeited goods sized coming to the United States. Additionally, trade secrets may be stolen using noncyber means, such as by employee raiding. Finally, the transfer of IP may result from unfair trade practices, and U.S. firms operating in China may be particularly vulnerable to such practices.

Box 7-2. PII Data Breach at Equifax

The September 7, 2017, public announcement that disclosed the magnitude of the data breach experienced by Equifax came after a series of notable events. Equifax first detected the breach that compromised over 140 million personal records (e.g., names, addresses, and Social Security numbers) in July 2017, and it contracted Mandiant, an independent cybersecurity firm, to assist with forensic analysis (Equifax 2017a). Contemporaneously to these investigations, but before the details were publicly disclosed, Equifax executives exercised their stock options and sold shares worth nearly \$2 million (Equifax 2017b). Upon finally announcing that it had been the victim of a data breach and sharing the magnitude of the breach, Equifax's share price declined by 13.7 percent over the course of the following trading day. Equifax's executives were later formally investigated for insider trading, and the then-CEO ultimately resigned (Equifax 2017c).

The data breach impelled calls for government action, with multiple Federal agencies launching investigations in the weeks following the breach (Nasdaq 2017). The breach thus put Equifax's entire business model at risk (CNBC 2017). The breach prompted a large downward move in the value of Equifax stock, with share prices falling by as much as 34.9 percent of pre-breach prices (CEA calculations). Cumulative abnormal returns for the seven days after the breach totaled -41 percent, with a *t* statistic of -15.8 (figure 7-i).

Figure 7-i. Equifax's Cumulative Abnormal Returns After Its September 2017 Data Breach Announcement

Sources: Bloomberg; CEA calculations.

The implied volatility of Equifax's one-year option increased by 184 percent, indicating that investors perceive the future of Equifax to be largely uncertain over the next year (CEA calculations). This high perceived uncertainty about Equifax's future will likely negatively affect the firm's ability to raise new capital and make new investments.

Box 7-3. Cyberattacks by a Nation-State: Sony Pictures Entertainment

Sony Pictures Entertainment (SPE) is a U.S. based subsidiary of the Sony Corporation of Japan. SPE's global operations encompass film, television, and digital content production. In 2013, SPE generated \$7.77 billion in sales (at end-of-period dollar/yen exchange rates), accounting for 11 percent of the Sony Corporation's total revenue (Sony 2014).

SPE officials and employees, and the general public, first learned of the attack on November 24 (Richwine and Finkle 2014). Hackers identifying themselves as the "Guardians of Peace" claimed to have gained entry to SPE's servers and had stolen over 100 terabytes of confidential information, including employees' Social Security numbers and health records, private emails, and unreleased films such as *Still Alice* and *Annie* (Ignatius 2015). At this point, SPE executives completely shut down computer systems, communicating solely in person or over the telephone. During the following weeks, portions of the stolen SPE data, including personal and sensitive emails between top executives, were repeatedly dumped on public websites and circulated by members of the press.

On December 8, the group posted more confidential SPE data and demanded that the company "stop immediately showing the movie of terrorism which can break the regional peace and cause the War" (Richwine and Finkle 2014). This was widely interpreted as a reference to SPE's *The Interview*, a comedy about a journalist's attempt to assassinate North Korean dictator Kim Jong Un. On December 16, this threat became explicit, when the group threatened 9/11-style consequences for moviegoers attempting to see the film. After the threats against moviegoers, the major theater chains announced that they would not show *The Interview*, and Sony canceled its theatrical release. SPE subsequently announced that *The Interview* would be made available via its online streaming platforms and would be shown in 300 small, independent theaters (Stelter 2014).

Immediately after the attack occurred, Sony officials reached out to the FBI to determine the source of the cyberattack. On December 1, 2014, the FBI released a Flash Alert related to the attack to a limited distribution group (Finkle 2014). In a subsequent report released on December 19, the FBI publicly attributed the attack to North Korean hackers (FBI 2014). According

to the FBI, technical analysis of the data deletion malware used in the attack revealed links to other malware that the FBI had previously attributed to North Korean actors. The attack also used the same tools as previous cyberattacks on South Korean banks and media outlets, which were carried out by North Korea. These findings were supported by a later report from a leading cybersecurity firm, concluding that the attack had the same signatures as previous attacks on South Korean and American targets and thus were unlikely to be the work of hacktivists or a disgruntled employee (Novetta 2016).

Although the share prices increased during the period of the attack, SPE incurred significant costs, including those related to investigation and remediation. Press reporting indicates that the \$41 million was damage that SPE may have incurred in March 2015 (Sony 2015), but even one such article notes: “But there are a lot more costs to come. In addition to expenses for investigation of the attack, IT repairs, and lost movie profits, Sony faces litigation blaming it for poor cybersecurity that exposed employees’ private information” (Elkind 2015).

Box 7-4. Cyber Theft of IP and Sensitive Corporate Information: SolarWorld

SolarWorld AG is a German company that manufactures and markets products for harvesting solar energy. Between May and September 2012—at about the same time that SolarWorld was an active litigant in trade cases against Chinese solar manufacturers, alleging that they were dumping products into the U.S. market at prices below fair value—SolarWorld’s network was the target of IP theft. In May 2014, Federal prosecutors indicted five Chinese nationals on charges of espionage, trade secret theft, and computer fraud for hacking the networks of six U.S. companies, including U.S. subsidiaries of SolarWorld AG, over a period of eight years (DOJ 2014). In a series of approximately 13 intrusions, thousands of emails and files were stolen from seven executive-level employees. Among the stolen data was information on SolarWorld’s financial state, production capabilities, costs, business strategy, and strategy related to the ongoing trade litigation (*United States v. Wang Dong* 2014).

By breaching SolarWorld, Chinese competitors were able to gain access to information that provided them an unfair advantage on multiple fronts (DOJ 2014). A stolen cash flow spreadsheet allows a competitor to know exactly how long SolarWorld would be able to survive a shock. Additionally, production or manufacturing information can be copied without investing time and money into research, and the information on SolarWorld’s costs would allow a competing firm to price its products at a rate that would make SolarWorld financially unviable (*United States v. Wang Dong* 2014). The access to the SolarWorld’s trade litigation strategy would provide an unfair

advantage to Chinese respondents. SolarWorld has since testified that the cyber theft allowed Chinese manufacturers to use its proprietary research to accelerate their own production timelines, resulting in a long-term loss of competitive advantage and return on investment (USTR 2017). As the result of the cyber theft, which became widely known and reported on in the aftermath of the highly publicized charges, SolarWorld AG (traded on the German DAX) lost 35 percent of its market value (with the corresponding t statistic of -1.9) (figure 7-ii; day 0 in the figure is the day on which the charges were announced), which amounted to a loss of €178 million (CEA calculations).

In May 2017, SolarWorld AG filed for insolvency, and SolarWorld America, the American subsidiary, was put up for sale to help cover the parent company's debt obligations (Steitz 2017; SolarWorld 2017).

Figure 7-ii. SolarWorld's Cumulative Abnormal Returns After Its Data Breach Become Publicly Known

Sources: Bloomberg; CEA calculations.

The Distribution of Adverse Cyber Events across Sectors

How are adverse cyber events distributed across sectors? Based on the results of the 2014 survey of 9,700 firms, PwC (2014) reports that nation-states often target critical infrastructure providers and suppliers in order to steal IP and trade secrets as a means to advance their political and economic advantages (we describe the 16 designated critical infrastructure sectors later in the chapter). At the time of the report, cyber incidents that involve nation-states

Table 7-2. Number of Security Incidents and Breaches by Victim Industry and Organization Size, 2016

were most frequent in the energy, aerospace and defense, technology, and telecommunication sectors.

According to Verizon (2017), the finance sector, both public and private, saw the most security breaches in 2016, summarized in table 7-2. Manufacturing, government, finance, and healthcare, which made up among the largest shares of U.S. GDP in 2016, also saw the highest shares of security breaches in Verizon’s sample. Like NIST, Verizon (2017) defines a security incident as an event that compromises the CIA triad of a corporate asset, while a breach is “an incident that results in the confirmed disclosure—not just the potential exposure—of data to unauthorized authority.” Large companies saw the most incidents, while small companies reported the highest number of breaches relative to incidents, suggesting that small companies are not as well equipped to neutralize such security intrusions as large companies. Verizon

Figure 7-4. Distribution of Security Breaches by Industry

Source: Bureau of Economic Analysis; Verizon; CEA calculations.

(2017) defines large companies as those with more than 1,000 employees, and the rest as small companies.

Figure 7-4 plots the share of total cyber breaches and the sector share of the 2016 GDP, in the order of the declining GDP share. The figure shows that finance, healthcare, education, and accommodation suffer a disproportionate number of breaches relative to their contribution to GDP. These sectors are particularly attractive to malicious cyber actors because they possess valuable PII data of their customers.

Externalities from Weak Cybersecurity and Underinvestment in Cyber Protection

In this section, we describe how the presence of externalities creates incentives for private firms to underinvest in cybersecurity relative to the socially optimal level of investment. Cybersecurity is a common good. Thus, weak cybersecurity carries a cost not only to the firm itself but also to the broader economy through the negative externalities imposed on the firm’s customers and employees and on its corporate partners. When the PII of a firm’s employees and customers is stolen, in the absence of penalties and mandatory customer protections, the burden of the costs falls on customers. A malicious cyber activity directed against a particular firm could also have a negative spillover effect on other

firms connected to the firm through the supply chain, business partnerships, or other firms with similar business models. Because the costs are not borne by the compromised firm, they represent negative externalities. We describe these externalities in detail in the next subsection.

Spillover Effects to Economically Linked Firms

Due to the immense scope of Equifax's data breach and Equifax's centrality in the consumer credit sector of the economy, its data breach caused multiple spillover effects across similar firms and firms tied to it through the supply chain, such as companies that issue credit cards. Scherbina and Schlusche (2015) argue that co-mentions in the news media provide information on economic linkages between firms. By doing news searches of Bloomberg, and by noting firm co-mentions with Equifax over the month preceding the announcement of the breach, we determined the firms that would face the largest spillover effects due to the economic linkages and analyzed the price reactions of these firms to the news of the Equifax data breach.

There are at least two companies that have similar business models: TransUnion and Experian. Contemporaneous with the ongoing Equifax breach, representatives from these specific firms were urged to testify before Congress. These firms were adversely affected by the attack on Equifax, most likely due to the immediate consumer response of freezing credit across all three agencies and to common concerns about the regulatory response. In addition to investigations currently being undertaken by the Federal Trade Commission, the Senate Finance Committee, and other organizations, the Consumer Financial Protection Bureau announced in September 2017 that it will implement "a new regulatory regime" for credit-rating agencies, requiring that each firm host regulators, who would be embedded at the firm, in order to prevent future breaches. Moreover, the data breach probably caused investors to lose confidence in the agencies' cyber protection to revise up the probabilities of future data breaches. An equal-weighted portfolio of TransUnion and Experian experienced negative CAR of over 18 percent in the seven trading days following the announcement, with a t statistic of -4.7 (figure 7-5).

We also observed the breach's negative impact on corporate customers. As consumers freeze credit, the data breach would have a negative impact on firms that use the credit rating agencies' ratings to provide consumer credit. The economically linked firms that we identified through news searches include Fair Isaac Corporation, Synchrony Financial, Fidelity, and Virtu. An equal-weighted portfolio of these firms experienced a negative CAR of more than 9 percent in the seven-day window (figure 7-6).

Attacks through the Weakest Link in the Supply Chain

A firm's security flaw can put its customers, suppliers, and corporate partners at risk. PwC (2014) states that "sophisticated adversaries often target small and

Figure 7-5. TransUnion's and Experian's Cumulative Abnormal Returns After Equifax's Data Breach Announcement

Sources: Bloomberg; CEA calculations.

Figure 7-6. Portfolio of Finance Firms' Cumulative Abnormal Returns After Equifax's Data Breach Announcement

Sources: Bloomberg; CEA calculations.

Box 7-5. Supply Chain Attack: Home Depot

The Home Depot data breach occurred from April to September 2014, and it compromised the information of roughly 56 million unique payment cards and 53 million email addresses (Home Depot 2014a, 2014b). The hackers entered Home Depot's payment systems through the use of a third-party vendor's login information and then unleashed malware to gain access to the company's point-of-sale devices (Home Depot 2014b).

The data breach had a long-term negative impact on Home Depot, and also on other firms that were exposed to the hacked point-of-sale devices. Since 2014, Home Depot has incurred losses of roughly \$300 million due to the data breach (Home Depot 2017). Net of insurance payments, the company has spent \$200 million to provide credit monitoring for affected customers, and it also had to hire additional staff for its call center, investigate and upgrade its security network, and pay fines and legal fees related to the breach (Home Depot 2017). The breach also affected card issuers, whose customers had to be reimbursed for fraud and whose cards had to be reissued. The Credit Union National Association (CUNA 2014) estimates the cost of these remedies at \$8 per affected credit card, thereby placing the direct cost incurred by the industry as the result of the data breach at \$440 million.

medium-sized companies as means to gain foothold on the interconnected business ecosystems of larger organizations with which they partner.” This type of breach, which is known as a supply chain attack, is one of three main vectors whereby hackers penetrate system defenses, accounting for over 60 percent of all adverse cyber events suffered by companies in 2016 (*Wired* 2015; Accenture 2016). By exploiting a weakness in a relatively small and weakly protected supplier, hackers can bypass even robust cybersecurity measures. An advantage of this attack vector is that cybercriminals can blend in with regular network traffic, including by using legitimate credentials harvested from the vendor. A large-scale data breach suffered by Home Depot is an example of a supply chain attack (box 7-5).

Realizing the importance of the safety of the entire supply chain, the industry is finding solutions to ensure supply chain safety. McAfee (2017) notes that multiple authentication methods—such as a second factor authentication using a hardware token or mobile app, including for vendor access—may help prevent cyber breaches across the supply chain. After facing a cyber breach originating from a supplier, Target announced several supply chain security measures in line with NIST standards, such as limiting vendors' access to the network and improving authentication methods, in addition to broader cybersecurity measures, such as improving the monitoring of the cyber network (Target 2014). As part of the conditions for its 2017 settlement with the affected credit unions, Home Depot committed to industry standard risk

Box 7-6. Exploiting Cyber Vulnerabilities to Attack a Third Party: Mirai Botnet

A high-profile example of hackers exploiting cyber vulnerabilities came in 2016, when cybercriminals began using the Mirai source code to launch broad-ranging DDoS attacks on various targets. According to an analysis published by the Institute for Critical Infrastructure Technology, Mirai exploited devices that work with the Internet of Things with factory default or hardcoded user names and passwords and used them to create and build a botnet (an army of computer devices), which then overwhelmed numerous targets with traffic (Scott and Spaniel 2016). In October 2016, the Mirai Botnet was deployed against the Internet infrastructure company Dyn, which provides critical technology services for websites including Twitter, Amazon, Tumblr, Reddit, Spotify, and Netflix (Krebs on Security 2016). For much of the day, access to each of these websites was curtailed, as Dyn's servers were repeatedly overwhelmed by malicious traffic launched from hacked devices that work with the Internet of Things (Krebs on Security 2016). In a statement made after the attack, Dyn described the Mirai botnets as the primary source of malicious attack traffic that halted Internet use (Dyn 2016).

exception processes, as well as periodic security compliance assessments of those vendors with access to card payment information. This reflects broader trends within the market, such as the establishment of platforms like CyberGRX (www.cybergrx.com), which serve as clearinghouses of information on the risks posed to downstream firms by the underlying cybersecurity weakness of their upstream partners (Patterson Belknap 2017). In addition, the American Bar Association has created a Vendor Contracting: Cybersecurity Checklist to inform information security concerns in the procurement process (ABA 2016). As another example of reducing cyber risk in the supply chain process, a consortium of financial services companies—including Bank of America, JPMorgan Chase, Wells Fargo, and American Express—established a company, TruSight, to standardize the risk assessment of third-party suppliers and partners, including of their information security (Trusight 2017).

Using Cyber Vulnerabilities to Usurp Resources and Launch Attacks on Other Firms

A cyber threat actor may exploit inadequately protected devices to launch external attacks against a third party. Devices that work with the Internet of Things are notoriously insecure, because their manufacturers aim to speed up adoption by cutting costs, and the most commonly cut cost is that of security protection. The Mirai Botnet attack, described in box 7-6, is an example of a cybercriminal using an existing security vulnerability to launch an attack against a third party.

Economy-wide Spillover Effects from Firms with Critical Infrastructure Assets

Finally, and perhaps most important, if a firm owns a so-called critical infrastructure asset, an attack against this firm could cause major disruption throughout the economy. The 2013 Presidential Policy Directive-21 (PPD-21), “Critical Infrastructure Security and Resilience,” notes that 16 critical infrastructure sectors that are critically important to both the U.S. economy and national security. These sectors include chemical, commercial facilities, communications, critical manufacturing, dams, defense industrial base, emerging services, energy, financial services, food and agriculture, government facilities, healthcare and public health, IT, nuclear reactors, materials, and waste, transportation systems, and water and wastewater systems (DHS 2017b). On January 6, 2017, DHS designated the U.S. election systems as a subsector of the existing government facilities critical infrastructure sector (U.S. Election Assistance Commission 2017). Insufficient cybersecurity investment in these sectors exacerbates the risks of cyberattacks and data breaches. The economic implications of attacks against critical infrastructure assets are described in more detail later in the chapter.

The presence of externalities would lead firms to rationally underinvest in cybersecurity. Left to their own devices, firms will choose their optimal level of investment by conducting an analysis of private costs and benefits without taking externalities into account. In light of this market failure, regulators are likely to devise a scheme of penalties and incentives that are designed to make firms internalize the externalities and thereby help raise levels of cybersecurity investment to the socially optimal level. For example, certain mandatory disclosure requirements were previously shown to incentivize firms to adopt better business practices (see, e.g., Gordon et al. 2015, who conduct an analysis of externalities resulting from weak cybersecurity).

Common Vulnerabilities

In this section, we explore how shared usage of technologies creates common vulnerabilities across firms. These common vulnerabilities create a high likelihood that multiple firms may be compromised by a bad actor taking advantage of the same vulnerability in several firms. Common vulnerabilities create high correlations in firms experiencing adverse cyber events. This matters for two reasons. First, when news of one firm experiencing a cyberattack or a data breach become public, very likely other firms have experienced the same compromise, even though they may not have revealed it publicly. Second, the high correlation in adverse cyber events creates difficulties for insurers in constructing diversified portfolios of insured firms; we will discuss this point later in the chapter.

Corporate computer systems and networks are vulnerable to compromise at multiple layers, including software, firmware, and hardware. When a vulnerability in one of these layers is discovered and subsequently exploited by cybercriminals or other malicious actors, it is highly probable that other firms that use the same technology may be similarly vulnerable. Malicious actors often target a vulnerability wherever it exists, not necessarily focusing on a single firm or industry. In what follows, we explain how common technologies can create common vulnerabilities across multiple firms.

Software

A computer's software is any data or computer instructions stored on a computer's hardware. Software is encoded in a binary basis and forms the tools by which computers execute tasks and manipulate information. In vulnerable systems, unbeknownst to the end user, software can be modified or otherwise abused by malicious actors to run unwanted processes on a given system, allowing the actors to affect adverse outcomes for a system's users. If undetected, these processes may allow an adversary to obtain or manipulate information on a computer system without the end user's permission. The goal of these adverse actors is often to enable unauthorized access to secure systems for the purpose of stealing, encrypting or destroying private data and information, or for modifying industrial control processes in order to cause harm to a company's physical assets and/or its employees.

Software vulnerabilities often stem from simple errors in software coding. Unbeknownst to developers, innocent coding errors may make a program vulnerable to software exploits. In a typical software code, there are an average 25 errors per 1,000 lines of code (NIST 2016). NIST has stated a goal for a "dramatic reduction" in software vulnerabilities. The stated goal is to reduce the error rate to 25 errors per 100,000 lines of code (NIST 2016). Systems with near-zero errors are produced routinely today in the aerospace industry, but at several times the cost of ordinary software. This objective will have substantial costs associated with its implementation, but ultimately will hopefully pay off through a sufficient reduction in software vulnerabilities.

We now discuss the particularly harmful so-called zero-day vulnerabilities, for which a security solution does not yet exist, and the "backdoor" methods that malicious actors exploit to gain entry into a seemingly secure system.

Zero-day vulnerabilities. So-called zero-day vulnerabilities are a particular subset of vulnerabilities characterized by being unknown to the hardware/software vendor and end users prior to being discovered and/or exploited. "Zero" days refer to the amount of time in which a producer or cybersecurity firm has from the time of discovery to provide the users with a patch to eliminate the vulnerability.

Zero-day vulnerabilities are often exploited with the help of the so-called exploit kits, primarily available for purchase on the so-called dark web—which

refers to the large portion of the Internet whose contents are not indexed by standard search engines. An exploit kit is a web-based application centered on a zero-day vulnerability that streamlines the vulnerability's exploitive application; these kits provide easy to use, replicable templates to exploit individual vulnerabilities on a large scale. A typical kit contains mechanisms to profile potential victims, identify compromised systems, and subsequently deliver "payloads" (exploitative or malicious software).

Once a patch is written and released by the architects, the vulnerability is no longer deemed a zero day. However, it is ultimately up to the end users to update their systems in order to be considered immune to a given zero day vulnerability. Lloyd's of London (2017) notes that it can "take anywhere from days to years" before a developer is made aware of the vulnerability. This allows illicit discoverers of vulnerabilities ample time to explore angles of compromise, develop the necessary software for exploitation, and potentially market this exploitation technique to interested third parties.

"Backdoor" access. A backdoor is defined as a "hidden entrance to a computer system that can be used to bypass security policies"; it may allow one to gain access to a network a computer system or a connected device, unbeknownst to the end user (OWASP 2006). It is common for a commercial software package to have a backdoor to enable developers to modify the systems they oversee. A backdoor may take the form of a hidden aspect of a program, a separate program, a part of an operating system, or even be coded into the firmware already installed on a system's hardware. Threat actors may gain access to pre-installed backdoors or install their own backdoors with the end goal of taking control of the systems or inserting malicious modification at any time that they wish. Many hardware products have backdoor methods of access and may be vulnerable to security compromises using these backdoors methods of entry, regardless of the software programs that are being run on the hardware in question.

Firmware

Firmware constitutes the next step above hardware in a traditional system stack. System firmware is usually software that boots or initiates systems, along with running baseline-level tasks, such as power management and end-user controls (e.g., mice or keyboards). This software is often unique to or integrated with individual firms' hardware, thus earning the moniker "firmware" due to being hardware specific to a given firm's technology. USB drives, hard and solid-state drives, memory cards, and digital power chargers all typically utilize firmware.

Firmware is a prime target for compromise because it resides below the operating system and may not be protected by the security software that runs on an operating system. These firmware vulnerabilities, which allow attackers to take control of a system during its booting phase, have been identified in

USB devices (e.g., memory sticks), network cards, embedded and keyboard controllers, baseboard management controllers, modems, central processing units batteries, home routers, office printers, IP phones, and many other devices. McAfee has identified several instances of hacking groups, industrial espionage teams and organized crime groups, utilizing firmware exploits in order to commit cyberattacks and cyber theft.

Hardware

A computer's hardware are the physical components of a computer. Hardware components can be either active (internally powered) or passive (driven by an external power source). Typical components include, but are not limited to, monitors, keyboards, hard and soft drives, graphics cards, sound cards, processors, and motherboards. Although traditionally harder to attack externally, hardware vulnerabilities can completely undermine an entire system stack's security. Hardware threats undermine a system's software security measures because software inherently assumes that hardware on which it runs is not compromised. The discovery of a hardware-based exploitation may force system infrastructure to be replaced entirely as hardware compromises typically cannot be fixed by software patching alone.

Hardware is a less frequent target of hackers than software for a number of reasons: hardware is typically less easily accessible, it is not as well understood, and attacks against hardware often must be highly specialized. However, once discovered, hardware vulnerabilities can be highly damaging: Hardware vulnerabilities may cause compromises independent of operating system or software security measures.

A striking recent example of a hardware vulnerability was recently discovered by the Project Zero (2018) research team at Google in certain processors manufactured by Intel, AMD, and ARM. Specifically, Google found and reported three unique vulnerabilities usable against these processors to the processors' respective manufacturers on June 1, 2017.⁶ The vulnerabilities could allow malicious actors to steal information stored in a processor's memory, affecting virtually all computing devices, such as personal computers, cloud servers, and smartphones.

Cloud Computing

Cloud computing has allowed companies to achieve economies of scale by outsourcing various tasks—such as data storage, services, and analytics—to outside providers. McAfee (2017) cites that 93 percent of organizations utilized some form of cloud computing for software, platform, or infrastructure services.

⁶ These vulnerabilities are registered as CVE-2017-5753, CVE-2017-5715, and CVE-2017-5754 with the National Vulnerability Database's Common Vulnerabilities and Exploits list.

Cloud computing platforms use the virtual machine archetype; a virtual machine simulates a physical computer system (hardware, operating system, and applications) on top of an underlying operating system. A cloud can be running any number of virtual machines simultaneously on top of its underlying operating system, allowing for providers to utilize the same hardware for different customers without usage conflicts between end users. The programs overseeing this delegation of space for different virtual machines are called “virtual machine monitors” or hypervisors.

Cloud computing has its own inherent vulnerabilities, which can create common risks among end users. If the underlying hypervisor overseeing a cloud network is compromised, it can be assumed that all systems being hosted on the network will in turn be vulnerable to exploitation. This leads to a great degree of risk correlation between firms from cyber threats that otherwise would not exist if the firms’ data and services were located locally. Furthermore, if a hardware replacement or hard-software update (a software update that requires a power reset) is needed to resolve these problems, computing jobs need to be interrupted, which upsets customers and in turn discourages hosts from running these time-consuming updates or patches.

Managed service providers (MSPs) are similar to cloud computing providers, but they typically provide additional IT services, such as network connectivity, data security solutions, and general IT strategy management. According to a 2017 report by PwC, multiple MSPs were targeted from 2016 onward by a single adverse actor, APT10 (PwC 2017). (According to FireEye, a cybersecurity firm, APT10, is a Chinese cyber espionage group that FireEye has tracked since 2009.) PwC (2017) further states that as a result of its activities, APT10 has potentially gained access to “the intellectual property and sensitive data of those MSPs and their clients globally” (PwC 2017).

The Problem of Insufficient Data

In today’s data-driven world, important investment decisions are based on sound empirical analysis. However, the field of cybersecurity is plagued by insufficient data, largely because firms face a strong disincentive to report negative news. Cyber protection could be greatly improved if data on past data breaches and cyberattacks were more readily shared across firms.

There are multiple reasons for insufficient disclosure. To begin with, many cybersecurity breaches go undetected by firms. Citing data from cybersecurity firms, PwC (2014) reports that as many as 71 percent of cyber compromises go undetected. Furthermore, according to industry reports, the U.S. government can frequently observe an attack. For example, the Center for Strategic and International Studies (2014) reports that in 2013 U.S. government notified 3,000 companies that they had been hacked. Even when a firm is aware that it had experienced an adverse cyber event, it would frequently refrain

from reporting the event for fear of negatively affecting its market value and its relationships with corporate partners. For example, the Center for Strategic and International Studies (2014) reports that when Google was hacked in 2010, another 34 *Fortune* 500 companies were hacked at the same time (that fact eventually became public knowledge through WikiLeaks), but only one of these companies reported publicly that it had been hacked.

Data on adverse cyber events that involve breaches of PII and a subset of other security breaches are slowly becoming available, partly due to disclosure requirements. Countries around the world are adopting mandatory data breach disclosures, for compromised PII on firms' customers (though at different levels of coverage), such as the General Data Protection Regulation (GDPR) in the European Union. The U.S. government also imposes sector-specific cyber disclosure legislation. The Health Insurance Portability and Accountability Act (HIPAA), pursuant to Public Law 104-191, sets disclosure requirements on personal data protection, though studies have raised concerns about compliance with, exemptions to, and the lack of, "standardized technology requirements" in the regulations (Chang 2014; Koch 2017). Banks and certain financial institutions are subject to regulatory examinations that include review of their safeguards for protecting the security, confidentiality, and integrity of consumer information, which include disclosure requirements in the event of a breach. The Department of Energy also requires disclosure of events—including those that are cyber-related—that may have an impact on the electricity system, through the OE-417 Electric Emergency Incident and Disturbance Reports, pursuant to Public Law 93-275. These reported incidents are posted on the Department of Energy's website, which gives information on the event's date, date of restoration, areas affected, alert criteria, event type, demand loss, and number of customers affected. Of 141 events reported in 2016, 5 were cyber-related. Of the 127 events reported in 2017, two were cyber-related, though these events were not reported to affect customers or result in the loss of demand (DOE 2017).

For publicly traded firms, public disclosure of materially important adverse cyber events is mandated by the Securities and Exchange Commission's (SEC) 2011 Guidance, and also by the requirements that trigger the filing of the SEC's Form 8-K. Specifically, the 2011 Guidance mandates that publicly traded firms disclose "material" cybersecurity risks and cyber incidents. However, the effectiveness of the SEC's 2011 Guidance is frequently questioned. There are concerns that companies underreport events due to alternative interpretations of the definition of "materiality" (Gordon et al. 2006, 2015). There are also concerns that the disclosure requirements are too general and do not provide clear instructions on how much information to disclose, and that they therefore "fail to resolve the information asymmetry at which the disclosure laws are aimed" (Ferraro 2014). For example, according to the 2017 survey of 2,168 individuals who were involved in both cyber risk and enterprise risk management

activities in their firms, 36 percent of survey participants said that a material loss of information assets does not require a disclosure on the firm's financial statements. At the same time, 43 percent of respondents stated that their firm would disclose a loss of property plant and equipment on its financial statements (Ponemon 2017b). According to these studies, more comprehensive and mandatory disclosure guidance, such as through legislative endorsement (Ferraro 2014) or endorsement by the SEC (Gregory 2014), may help overcome these issues.

If, between quarterly reports, a cyberattack or a data breach triggers an event that would mandate the filing of Form 8-K (e.g., bankruptcy, departures of corporate directors, entry into or a termination of a "material definitive agreement"), then victims must disclose the cyber event under the requirement that the firm file the form within four business days of the event. If a materially important cyber event is privately disclosed by the affected firm to a financial intermediary—such as a buy- or sell-side analyst, an investment manager, a broker dealer, or an investment adviser who could generate a profit for themselves or their clients from having this informational advantage—Regulation Fair Disclosure requires that the event must be disclosed to the public promptly.

Other countries also mandate disclosures of cyber breaches, and some countries have stricter disclosure requirements than the United States does. For example, in April 2016 the European Union adopted GDPR, which becomes effective in May 2018 and mandates companies to disclose data breaches. This regulation expands the scope of the EU's 1995 data protection regulation to all companies that process the data of EU-based subjects, regardless of the company's location. Past regulations only applied to companies based on their physical location, and the new regulation will also affect United States-based firms as long as they have European customers. Companies subject to this regulation must notify their customers and other affected parties of breaches where "a data breach likely to result in a risk for the rights and freedoms of individuals" (GDPR 2017). The breach must be disclosed to the government, customers, and controllers within 72 hours of the firm's becoming aware of the breach. This new rule will further increase the number of publicly reported data breaches.

Even if cyber events are not being disclosed by firms, the news media can find out about such events through journalist investigations. For example, Verizon (2017) reports that 27 percent of data breaches were discovered by third parties. These third parties may notify the news media in addition to notifying the affected firms, creating another channel for the spread of information.

The lack of a representative data set for cybersecurity incidents poses a number of challenges to firms and policymakers. For policymakers, it makes it next to impossible to accurately measure the cost of cybersecurity incidents for the U.S. economy and to determine whether more active government

involvement is needed to limit cybersecurity risk. Likewise, for firms, the lack of data makes it difficult to correctly assess the expected costs of cybersecurity exposure and to determine the optimal level of investment in cybersecurity. Moreover, when negative information is underreported for incentive reasons, agents may erroneously assume that the negative information/events simply do not exist (see, e.g., Scherbina 2008). In case of adverse cyber events, underreporting may lead the less sophisticated managers to assume that the risk is not significant and consequently to underinvest in cybersecurity. Industry sources speculate that less sophisticated smaller firms underinvest in cybersecurity for this reason.

Unlike firms and private individuals, cyber insurance and cybersecurity providers have the advantage of being able to collect data on cyberattacks and data breaches through their business operations. However, these entities are reluctant to share their data with the public because of privacy concerns for their clients and also because these data represent a source of competitive advantage in providing security services for cybersecurity companies and in pricing cyber insurance products for insurance companies.

A more robust data set on cyber incidents and cyber threats that could be updated in real time would greatly help firms improve their cybersecurity. And still another negative effect of the paucity of publicly available data is that it may slow the development of a more competitive market for cyber insurance.

Dark Cyber Debt

As discussed above, firms are reluctant to reveal cyber breaches to the public for fear of lowering their valuations; even when a firm's management does report a breach, it often underreports its scope. Most likely, the information about the breach will eventually become public, at which point the value of the firm will decline to reflect the resulting monetary losses. In this section, we introduce the concept of "dark cyber debt" to describe the future negative valuation impact of a breach that a firm hid from the public. It is "dark" because it is currently hidden, and it is a "debt" that eventually would need to be paid before investors are paid.

Consider the latest illustration of the concept. In October 2016, the personal data of approximately 57 million customers and drivers was stolen from Uber Technologies Inc. (Newcomer 2017). The data were then ransomed back to Uber in exchange for an illicit payment of \$100,000 to the hackers by Uber's security chief and one of his deputies (Newcomer 2017). The compromised data included some 600,000 driver's license numbers for Uber's drivers, which were linked to their identities (Newcomer 2017). Though Uber has admitted it had a legal obligation to disclose the attacks on a timely basis to regulators and also to the drivers whose identities were compromised, it instead chose to hide the news and to pay the perpetrators to delete the stolen sensitive information

(Newcomer 2017). Further attempts to conceal the damage manifested themselves through Uber’s executives writing off the \$100,000 as a “bug bounty,” a practice whereby technology companies hire external parties to attack their software in order to test for vulnerabilities (Isaac, Benner, and Frenkel 2017). It is now clear that these breaches were the work of criminals rather than firms hired to test Uber’s cybersecurity. The timing of Uber’s hack was particularly unfortunate, because the firm had been planning to go public. In the aftermath of the news, SoftBank, a Japanese firm, and a group of Uber’s shareholders agreed to a deal valuing the company at \$48 billion, a notable decline in the \$70 billion that Uber commanded just over a year ago (Reuters 2017b). Although not all the decline in value can be attributed to the data breach, given that Uber also faced other types of negative publicity, offers following the hack were substantially lower than pre-breach figures.

This particular nondisclosure is far from the only example of dark cyber debt. For example, in 2016 Uber faced a \$20,000 fine for its failure to disclose a 2014 breach (New York State Office of the Attorney General 2016).⁷

Cyber Insurance

The rise in malicious cyber activity directed at firms over the past decade gave an impetus to a quickly growing market for cyber insurance. The global cyber insurance market is estimated to be worth roughly \$3.5 billion today, up from less than \$1 billion in 2012, and is projected to grow to \$14 billion by 2022 (Lloyd’s of London 2017; Allied Market Research 2016).⁸ North America, particularly the United States, accounts for roughly 90 percent of the global cyber insurance market. In 2016, property and casualty insurers wrote \$1.4 billion in direct premiums for cyber insurance, up 35 percent from the previous year (Lloyd’s of London 2017). This figure, however, is only a minuscule fraction of the roughly \$530 billion in premiums for the entire insurance market. Although the U.S. market is more developed than markets in other countries, only about a third of U.S. companies have purchased some sort of cyber insurance, with large variation across sectors (Romanosky et al. 2017). Though supply and demand for cyber insurance continues to grow, the cyber insurance market faces a number of challenges that slow down its pace of development.

Compared with other risks covered by insurance—such as wind, flood, and fire—cyber risk is perhaps the fastest-evolving and least understood. A big challenge faced by the market is the scarcity of data on past incidents. The importance of modeling cannot be understated when it relates to pricing risk,

⁷ Attorney General of the State of New York, Internet Bureau, Assurance No. 15-185. We must note that even when a company takes all reasonable cybersecurity measures and makes appropriate disclosures, its stock price will likely decline when a data breach becomes public.

⁸ Our discussion of cyber insurance and cyber insurance policies only includes specialized cyber insurance policies marketed as such. It does not include other broader policies that may cover losses from a cyber event.

and the lack of historical data and unpredictability of risk make it difficult to model and therefore underwrite. There is a significant qualitative aspect to pricing that insurers rely on when pricing policies. As a result, policies for cyber risk are more customized than other risk insurers taken on, and, therefore, more costly (NAIC 2017). Insurance firms also need to be able to assess the correlation in risks and losses across firms in order to form diversified portfolios of insured firms. Cyber insurance, like most insurance products, distinguishes between two loss categories, first party and third party. First-party losses are those that directly harm the insured, while third-party liability relates to claims undertaken by external parties who experience losses due to the insured's actions. Without good data, it is very difficult to quantify the potential spillover effects to third parties. Firms that got into the cyber insurance market early clearly have a data advantage over new entrants by having collected historical data of past cyber insurance claims from client firms. However, the "data barrier" makes the market less competitive by deterring new entrants.

Some insurers utilize information from policyholders' self-assessment forms to place a firm's risk into a generic high, medium, or low level. The varying levels of information that insurers possess on each of their clients determines the size and sophistication of their respective policies and explains the differences in coverage among firms. Some insurers have admitted to relying on other insurance companies' premiums to determine pricing, due to a lack of their own data. The adverse effect of insufficient data is that insurance firms struggle to price cyber risk. Underpricing cyber risk could result in insurers being unable to cover claims. Overpricing cyber risk could lead to underinsurance on the part of the firms.

A systematic collection of data on past cyberattacks and data breaches would be a big push for a quicker development of the cyber insurance market. Currently, companies are required to publicly report data breaches that expose personally identifiable information, payment data, or personal health information. However, there are no mandatory reporting requirements for other types of cyber events, such as those involving IP theft, ransoms, data and equipment destruction, or business disruption. Though publicly traded firms are required to report cyber events that have the potential to materially affect the firm's value, there is substantial underreporting, as firms are free to determine themselves whether an event is "materially important" (Jin 2015). The absence of data on cyber risk and the difficulty of monitoring firms' behavior have resulted in insurability challenges for the cyber insurance market. Because of this, general challenges to all insurance markets (adverse selection and moral hazard) exist as companies that have been victim to a serious malicious cyber activity are more likely to buy insurance, and having insurance fosters a lack of incentive to invest in self-protection measures.

Another major reason the cyber insurance market is relatively small in size is due to the relatively high premiums for relatively limited coverage.

Box 7-7. Target's Cyber Insurance Policy

In 2013, Target experienced a data breach in which payment information and customer data were stolen. Between 2013 and 2015, Target's cumulative losses for this incident were \$290 million (Target 2017). These expenses included legal and other professional services related to the data breach, but did not include insurance compensation for the potential reputational damage. Insurance coverage offset only \$90 million of the losses, resulting in a net pretax loss of \$200 million (Target 2017). Thus, Target's cyber insurance only provided coverage for about 30 percent of the easily quantifiable data breach costs. Of course, because the out-of-pocket costs were used to lower Target's tax liability, the after-tax losses were somewhat lower (SEC 2017).

Typically, only costs that can be easily quantified are covered by insurance. The most frequent type of cyber insurance coverage today relate to data breaches, including first-party coverage for costs such as crisis management and identity theft response and third-party coverage related to privacy liability. Other common types of first-party loss coverage include costs related to investigations of the attack, restoring business services, credit-monitoring services, notifying affected parties, ransom payments, and other losses associated with business disruption. It is uncommon for cyber insurance to cover reputational harm, loss of future revenue, costs of improving cybersecurity systems, losses from IP theft, and nation-state attacks.

The ambiguity of coverage for cyber insurance products, which is also limited, coupled with the heterogeneity of offerings across insurance firms, is another challenge faced by the burgeoning cyber insurance market. The lack of standardization of insurance products makes it difficult for firms to compare coverage across insurance firms. This, in turn, is another reason for the slow adoption of cyber insurance coverage.

As a result of underreporting of cybersecurity incidents and the associated costs, firms may underestimate their own risks, and the demand for insurance may be lower than optimal. Moreover, insurance firms themselves may be unwilling to provide sufficient limits for cyber insurance. The case study given in box 7-7 describes how only a small portfolio of losses stemming from Target's 2013 data breach was covered by insurance (Naked Security 2015).

Luckily, the passage of time will allow insurance companies to collect sufficient data from their clients to better price insurance products and to expand coverage. A competitive cyber insurance market that offers a wide array of efficiently priced products would become an important contributor to economic growth. Though publicly traded firms enjoy a diversified set of investors, who do not demand to be compensated for the idiosyncratic risk associated with cybersecurity breaches and attacks, the cyber insurance

market should allow private firms to cross-insure their cyber risk and lower their cost of capital. Cyber insurance will help reduce the deadweight losses that are associated with corporate bankruptcies driven by cyberattacks and data breaches. Another advantage of the cyber insurance market is that through the underwriting process, it may encourage the adoption of better cybersecurity practices. The insurance provider's ability to assess whether a potential policyholder has adequate cybersecurity incentivizes the firm to undertake cybersecurity investment. Premiums would generally be higher for firms that do not have any substantial cybersecurity measures. This mitigates moral hazard in the marketplace.

However, the cyber insurance market will continue to face challenges. Cyber threats are ever evolving. Increasing reliance on information, increasing interconnectedness, and the adoption of new technologies will bring about new cyber threats. Thus, even after collecting sufficient data on past cybersecurity events, predicting risks and correlations will remain a challenge.

By offering protection against theft, cyber insurance will reinforce firms' incentive to invest in IP and proprietary data. However, it will be difficult to achieve complete protection, for two reasons. First, as discussed above, firms may often be unaware that they have been breached. Second, coverage of third-party losses will continue to be limited, due to firms' reluctance to admit that they have been breached.

The Costs of Malicious Cyber Activity for the U.S. Economy

The losses suffered by the corporate sector as a result of cybersecurity breaches and attacks extend beyond the direct losses suffered by firms that are targeted. These additional costs arise from (1) spillover effects to economically linked firms, (2) the ever-increasing expenses for cybersecurity, and (3) the drag on economic growth caused by cyber threats. We describe these costs in more detail in this section.

A cyberattack or data breach experienced by a firm is likely to have significant spillover effects on its corporate partners, employees, customers, and firms with a similar business model. As we highlighted in the case of the Equifax attack, stock prices of firms that have a similar business model and of firms that rely on Equifax data also declined in response to the news of the data breach.

Firms also incur nonnegligible costs associated with preventing cyber incidents, and they must acquire security products (spam filters, antivirus protection), offer services for consumers (training), and engage in other fraud detection / tracking efforts (Anderson et al. 2012). The investment bank Morgan Stanley (2016) estimates that the global IT security product and services market will grow by 18 percent each year between 2015 and 2020, to become a

\$128 billion market by 2020. We estimate that the Equifax data breach resulted in significant share price increases for cybersecurity firms. This implies that market participants revised up their expectations of the cybersecurity firms' future revenues. We are reluctant to ascribe the cost of cybersecurity protection to a deadweight cost to the U.S. economy. Employment and output in the cybersecurity sector contribute to economic growth. Innovative technology solutions developed by the sector may generate positive spillover effects elsewhere in the economy. A sophisticated cybersecurity sector could become a reliable source of exports for products and services many years to come.

Finally, malicious cyber activity imposes a drag on economic growth by enabling theft of IP and by slowing the speed of the adoption of new technologies. Lacking sufficient protection, firms will underinvest in research and development, slowing the pace of innovation. Additionally, ever-evolving cyber threats slow down the rate of development and adoption of new types of information and communications technology, and thereby lower the efficiency gains that can be achieved with these new technologies (for a detailed discussion and analysis of this and related issues, see Hughes et al. 2017).

When estimating the total economic costs of cybersecurity incidents against the U.S. economy, one should not overlook the substantial direct cost imposed on the government sector. Using a data set of cyber incidents from Advisen, a for-profit organization that collects and resells data from the commercial insurance industry and public news sources, Romanosky (2016) estimates that government agencies are at a highest risk for a cyber incident (risk is defined as the number of cyber incidents divided by the number of firms/agencies in a sector).

According to the Government Accountability Office (GAO 2017), Federal agencies reported a 58.9 percent increase in the number of cyber incidents between fiscal years 2012 and 2015 (the most recent year available). In a highly publicized incident, between 2014 and 2015, the Office of Personnel Management (OPM 2015) suffered a system breach, in which security data from submissions of Form SF-86 were breached for 21.5 million individuals, including 5.6 million sets of fingerprints. Another separate cyber incident involving personnel records occurred in 2015, which affected 4.2 million individuals (OPM 2017).

The government incurs substantial, though not easily quantifiable, costs of IP theft and theft of information pertaining to national security. The case study of the IP theft for the F-35 fighter plane described in box 7-8 illustrates a very costly cyber theft from the U.S. government (Capaccio 2017).

Evidence from State and local governments suggests that cyber risks are also pervasive at these levels. Data breaches or compromises have the potential to affect thousands or even millions of individuals through the release of personal or sensitive information or disruptions of government service provision. Responses to a 2013 survey of State and local government officials

**Box 7-8. The Theft of U.S. Military Secrets
through Cyber Means: the F-35**

The F-35 is a single-seat, single-engine fighter aircraft that was developed primarily by Lockheed Martin to be used by the U.S. armed forces, as well as allied countries. The plane is optimized for use as a multirole fighter, with the ability to perform air-to-air; air-to-ground; and intelligence, surveillance, and reconnaissance missions. Program development officially launched in 2001, and deliveries began in 2011. The program's cost to complete is estimated at more than \$400 billion (*Wall Street Journal* 2014).

It has since been verified that these malicious cyber activities were carried out by foreign agents, with the Chinese national Su Bin pleading guilty in 2016 to stealing data related to the F-35 and seeking financial gain by selling the illegally acquired data (DOJ 2016c). As noted by Department of Defense Undersecretary Frank Kendall, these breaches could “give away a substantial advantage” and “reduce the costs and lead time of our adversaries to doing their own designs” (DOJ 2016c). This appears to have been the case, because observers have noted that the J-31, a Chinese stealth fighter introduced in 2014, appears to have been modeled on the F-35 (Weisgerber 2015). If the Chinese did use designs stolen from U.S. contractors, it could have allowed them to cut down significantly on the \$350 billion spent by the United States through fiscal year 2017 on the F-35's development and production (DOD 2015c).

suggested that officials often underestimate the prevalence and potential severity of adverse cyber events (Center for Digital Government 2014), and Security Scorecard's 2016 Cybersecurity Report ranks government (Federal, State, and local) at the bottom of 18 major industries in terms of cybersecurity (Security Scorecard 2016). Data on the number of data breaches at government entities do not show rates of increase that give particular cause for concern, but trends in the affected numbers of individuals could potentially be quite different. According to a recent survey of IT and security management professionals in State and local government, 40 percent of respondents indicated that the number of cyber incidents associated with malware had increased over the preceding year (Center for Digital Government 2014).

Cyber threats impose significant costs on private individuals. Cyber intrusions that steal PII from the corporate and government sectors generate welfare losses for those uninsured individuals whose private information is stolen. Attacks against State and local governments, furthermore, have a negative impact on households that rely on the services provided by the government entities. Finally, individuals are frequent direct targets of cybercrimes committed via email and the Internet. The FBI's Internet Crime Complaint Center provides the public with a mechanism to report Internet-facilitated criminal

activity. In 2016, this center received nearly 300,000 individual complaints of cybercrimes, with an estimated total cost in excess of \$1.3 billion. Among the most costly crimes targeted at individuals were confidence and romance frauds. These attacks cost victims \$220 million in 2016, and were carried out by criminals posing as a close family member or romantic partner for the purpose of convincing victims to send money or personal information. Moreover, the agency also estimates that only 15 percent of cyber-related criminal activity is reported each year, so actual damages are likely significantly higher.

It is difficult to estimate how much malicious cyber activity costs the U.S. economy because, as discussed above, many events go undetected—and even when they are detected, they are mostly unreported or the final cost is unknown. After accounting for the negative spillover effects, the CEA (2018) estimates that breaches and attacks cost the U.S. economy between \$57 billion and \$109 billion in 2016, which amounted to almost 0.31 percent to 0.58 percent of that year’s GDP. The Center for Strategic and International Studies (2014) computes the global cost of malicious cyber activity as between \$375 billion and \$575 billion. The report further estimates that the cost of malicious cyber activities directed at U.S. entities was \$113 billion in 2013, which represented 0.64 percent of GDP that year. Aggregating information from a variety of industry studies, MIT (2015) comes up with an estimate of a similar magnitude for the global cost of adverse cyber events, about \$400 billion a year.

Devastating Cyberattack Scenarios

Cybersecurity professionals, in both the private and public sectors, stress that the potential costs of malicious cyber activity could far exceed the ongoing costs suffered by the U.S. economy. After the worst terrorist attack in U.S. history, the 9/11 Commission (2004) concluded that the attacks revealed a failure of imagination—stating that “it is therefore crucial to find a way of routinizing, even bureaucratizing, the exercise of imagination.” Much effort is being expended by the cybersecurity community to proactively anticipate the most devastating vectors for cyberattacks. Government agencies are particularly concerned about cyberattacks on the 16 critical infrastructure sectors, described earlier in this chapter. Attacks on these sectors would cause considerable hardships for U.S. citizens, and would create significant spillover effects to multiple sectors of the U.S. economy. Of these 16 sectors, we focus in detail on the financial services and energy sectors—more specifically, on the power grid. These sectors are the most internally interconnected and interdependent with other sectors as well as most robustly connected to the Web, and are thus at risk for a devastating cyberattacks that would ripple through the entire economy. In this section, we describe the current concerns and ongoing efforts to secure these sectors.

The Financial Sector

Attacks on the financial sector can reduce confidence in the financial system and affect a great number of public and private entities, which rely on the smooth functioning of financial markets and global payment systems for the supply of capital and the transfer of funds. In recent years, certain aspects of the global financial system have proven to be vulnerable to cyber threats. For example, the Bank of Bangladesh reported that over \$81 million had been stolen from its account at the Federal Reserve Bank of New York, and more than half the stock exchanges worldwide have reported experiencing breaches and attacks (Anand 2017; Lema 2017). Moreover, in 2011 and 2012, 46 American entities, primarily in the U.S. financial sector, faced DDoS attacks by Iranian individuals in Iran-based computer companies that conducted work “on behalf of the Iranian Government.” The attacks resulted in as much as 140 gigabits of data per second and hundreds of thousands of customers preventing from online access to their bank accounts (DOJ 2016b).

A number of attempts have been made to exploit vulnerabilities in cybersecurity infrastructure in order to create desired movements in stock prices. To be clear, an attack does not need to target the financial sector to have financial market effects. The majority of these incidences have been small in scale and directed at specific companies. For example, in 2015 actors posted a fraudulent story that Twitter was in talks to be acquired for \$31 billion. This story, posted on a website designed to mirror Bloomberg, drove Twitter’s share prices up by over 8 percent before further investigation revealed that the story and website were fraudulent.

False news reporting has also moved the broader market. In 2013, members of the Syrian Electronic Army gained access to the Associated Press’s official Twitter account, and subsequently tweeted that the President had been injured in two explosions targeting the White House. This tweet caused the Standard & Poor’s 500 Index alone to lose \$136.5 billion in market capitalization; however within 6 minutes, the losses were erased when the Associated Press and other sources noted that the tweet was a hoax (Domm 2017). The three members of the Syrian Electronic Army were ultimately charged with multiple conspiracies related to computer hacking by the Department of Justice (DOJ 2016a), with the hack of the Associated Press’s Twitter account used as evidence.

Cyberattacks on the financial sector could impose substantial costs on the U.S. economy. If investors could no longer trust that traded securities were priced efficiently, financial assets would lose their attractiveness as investment vehicles. In turn, firms would no longer be able to rely on the stock market as a reliable means for raising capital. As a result, the cost of capital would increase, reducing economic growth. Investors, having moved into other investment assets, would likely incur higher costs associated with information gathering,

and would lose the benefits associated with liquidity and risk sharing facilitated by well-functioning financial markets.

The Defense Advanced Research Projects Agency (DARPA 2017), a part of the U.S. Department of Defense, runs a pilot program to identify and help mitigate the risks to the financial sector that could be posed by cyber threat actors. So far, DARPA has identified several areas of concern. Among them is the risk of so-called flash crashes, named after the 2010 Flash Crash. To achieve flash crashes, sell orders can be manipulated to cause a rapid decline in the stock market index. Though the mispricing corrects quickly, it creates economic costs for market participants, because wealth is being redistributed across traders in an arbitrary manner, and it causes investors to lose trust in the stock market. If flash crashes become a frequent occurrence, high-frequency traders could be forced to exit the market, potentially leading to lower liquidity levels.

Another area of concern is an attack on the order-matching system, which would cause a random fraction of trades to be left unmatched and would result in unwanted exposures to risk factors that the trader tried to hedge with a combination of long and short positions in securities. Manipulations of data feeds and news feeds, on which the automated trading systems employed by institutional traders frequently rely without human input, could pose another set of challenges to price efficiency. If the intrusions in the data feeds were small in scale and in scope, they would make it difficult to verify the starting and ending times of an intrusion in order to eventually certify that the data feeds are no longer contaminated. DARPA's efforts focus, among other things, on constructing simulated trading environments and then attacking these environments with various attack vectors in order to evaluate which defense solutions work best.

The Power Grid

A cyberattack on the power grid could have devastating consequences for firms and private citizens. Lloyd's of London and the University of Cambridge's Centre for Risk Studies lay out a scenario for how hackers could attack power grids with malware that could lead to large-scale blackouts in the United States. At the basis of this scenario are real-world examples of attacks on power grids (Lloyd's of London 2015). Such examples include the December 2015 and 2016 attacks that cut power in Ukraine. Cybersecurity companies involved in the investigation of the Ukraine attack found a piece of software capable of ordering industrial computers to shut down electricity transmission (Reuters 2017a). As electrical systems become more intelligent, they become an easier target for cyberattacks and data breaches.

A cyberattack on the electrical grid would have large-scale economic effects, because infrastructure damage, loss of output, delayed production, spoiled inventory, and loss of wages all decrease productivity and earnings for the duration of the blackout. In addition to the economic effects of a

large-scale power outage, there are concerns related to health and safety and national security. DARPA is performing a large-scale study of how to best prevent and mitigate cyberattacks on the power grid. Among other things, DARPA is building grids that are isolated from the power grid network, and it is using various attack vectors and other methods of defense to determine the most effective form of defense against possible cyberattack scenarios.

A cyberattack launched against the electric grid could affect large swaths of the U.S. economy, because most economic activity is dependent on access to electricity. Economic analysis conducted by various industry studies estimates that cyberattacks against critical infrastructure assets could cause up to \$1 trillion in damage (Tofan 2016; Lloyd's of London 2015, 2017). The tail risk scenarios described in this section indicate that cyberattacks on critical infrastructure sectors could result in escalating cyber costs that eclipse the ongoing costs of doing business in an interconnected world.

The Rise of Quantum Computing and the Need for Better Encryption

A final potential threat to the existing cyber infrastructure is the rise of quantum computing and the possibility that a malicious actor may have access to a powerful quantum computer. Cybersecurity depends to a large extent on public key encryption technologies, such as the widely used algorithm named RSA. With RSA encryption, a message is encoded using a public key, and then decoded using a key known only to the private user. The connection between the two keys often is a complicated and time consuming math problem, such as prime number factorization, which could in principle be solved, but may take hundreds or even thousands of years of computing time to do so.

A traditional digital computer relies on bits, which can take on a value of 0 or 1. Newly developed quantum computers instead rely on quantum bits, or “qubits,” that are not constrained to a binary nature. A quantum computer can take advantage of the possibility that a quantum variable, such as the spin of an electron, can probabilistically occupy more than one state simultaneously (i.e., be both 1 and 0 at the same time). Different particles can have states that are correlated with one another, allowing small numbers of correlated quantum bits to express distributions that would require far more normal bits to express. In some cases, algorithms, such as that introduced by Shor (1997), have been developed that utilize these processes to allow the computer qubits to multitask. This increased processing efficiency could allow quantum computers to develop solutions to problems in much less time than would be necessary for a traditional computer.

A world with quantum computing would not necessarily be less secure than today's world. Cryptographies that rely on alternative approaches such as lattices, multivariate polynomial equations, or even those that use current

approaches but rely on larger prime factorizations may well be secure in the quantum computing world.

The problem lies in the transition to that world. If quantum computing advances faster than anticipated, a large amount of data could be incorrectly believed to be secure, when in fact it is not. A malicious agent who moves the fastest in this space could potentially subject the economy to large-scale security breach. Moreover, the agents who anticipate the eventual emergence of powerful cyber computers that can decrypt currently safe files may have an incentive to steal and archive today's encrypted files so they can be decrypted in the future. Things that are safe today may not be in retrospect, which raises a host of pecuniary and nonpecuniary concerns. Thus, the economic costs of cyberattacks and data breaches may well increase sharply relative to our current estimates if malicious actors gain an upper hand during the transition period.

Given such costs, cybersecurity will continue to be a high-priority national-security issue for many years to come. The private sector and the U.S. government have a number of ongoing efforts to reduce the cyber risk. We describe these efforts next.

Approaches to Reducing Cyber Risk

Defending against cyber threats requires building effective and evolving cybersecurity capabilities that span all entities in the U.S. economy, and no single solution is expected to permanently resolve the cyber problem. Current efforts across the public and private sectors to address cyber concerns are already under way. They are a step in the right direction, but the ever-evolving nature and scope of cyber threats require continued efforts. Effective cyber protection will require the cooperation of the private and public sectors to report and mitigate cyber threats.

Public Sector Efforts

As discussed earlier in the chapter, cybersecurity is a common good, and therefore government involvement in cybersecurity efforts may be beneficial. The U.S. government is actively facilitating cybersecurity solutions on multiple fronts. Because no single private entity faces the full costs of the adverse cyber events, the government can step in to achieve the optimal level of cybersecurity, either through direct involvement in cybersecurity or by incentivizing private firms to increase cyber protection. When the adversary is as formidable as a nation-state, the government may be the only defender with the adequate resources and technology to meet this challenge. Additionally, as a frequent target of attack, the government sector is already actively involved in cyber protection. For example, one of the tasks of the Department of Homeland Security is to protect the dot-gov domain (U.S. Congress 2017b), and a number

of other government agencies are tasked with protecting various critical infrastructure sectors against cyber threats. Because the government is able to achieve economies of scale in its responses to cyber threats, it is cost-efficient for the government to take an active role in aggregating information, monitoring cyber threats, engaging in defensive action, disseminating knowledge, and devising effective policies.

Information sharing and transparency. Information sharing is crucial for coordinating cybersecurity efforts, informing public and private entities of cyber vulnerabilities, determining appropriate levels of defense investments, and facilitating the effective functioning of the cyber insurance market. However, private sector firms face a strong disincentive to voluntarily disclose cyber vulnerabilities because of business and reputational concerns. To overcome these dynamics in the market, the government may facilitate information sharing through a variety of channels. For example, government-monitored information-sharing platforms for anonymous disclosures of adverse cyber events are designed to increase the real-time awareness of cyber vulnerabilities and facilitate timely and publicly shared security solutions. The Automated Indicator Sharing (AIS) Program at DHS (2016a) facilitates the sharing of “commercial data feeds, internally generated analytic products, analytics tools, threat indicators and warnings, real time incident, and continuous monitoring data.” Additionally, the FBI issues Joint Indicator Bulletins, Joint Analysis Reports, Private Industry Notifications, and FBI Liaison Alert System (FLASH) reports that inform public and private entities about cyber threats (FBI 2017c). Other mechanisms to increase transparency about cybersecurity breaches that were discussed earlier in the chapter are the SEC’s 2011 Guidance, the HIPPA disclosure requirements and the Department of Energy’s OE-417 Electric Emergency Incident and Disturbance Report. U.S. Congress has also proposed legislation on cybersecurity disclosure; for example, the Cybersecurity Disclosure Act of 2017 (proposed by the Senate Committee on Banking, Housing, and Urban Affairs), which seeks to ensure disclosure on cybersecurity expertise and measures taken by qualifying firms (U.S. Congress 2017a).

Cyber protection investments. Basic research on cybersecurity generally underlies investment in cybersecurity. Though this research may benefit from economies of scale if data and resources are pooled across organizations, companies generally do not have incentives to share this basic research with each other, and this may result in duplicative investment efforts across companies. Therefore, direct government investment in this research may be a way to leverage economies of scale that ultimately benefit private firms across industries. Firms may then take the responsibility to adapt this research to the needs and risks of the companies in question. Also, it is often argued that market forces provide firms with little incentive to invest in basic research because the nontrivial nature of knowledge makes it difficult for firms to appropriate the resulting returns. Government support for basic research can overcome

the lack of incentives and generate critical discoveries that will benefit society writ large.

Indeed, the Federal government has made investments in cybersecurity basic research and threat analysis, particularly through DARPA. In fiscal year 2018, DARPA's budget allocated about 10 percent (\$41.2 million) to research in the cyber sciences, most of which went to the Transparent Computing program, which seeks to create technologies that will allow for better security policies in distributed systems, such as distributed surveillance systems, autonomous systems, and enterprise information systems (DARPA 2017). Such government investment in basic cyber research benefits from economies and scale and may reduce private firms' duplication of research efforts. For example, DARPA's basic research investments in unmanned aerial vehicles have spurred innovation in the private aerospace industry (DARPA 2015). According to the Office of Budget and Management, Federal IT spending, which includes cybersecurity, has been on an upward trajectory since 2013 (OMB 2017).

The public sector may also incentivize private sector investment in cybersecurity firms to increase the availability and growth of cybersecurity products and services. For example, Maryland's government provides a refundable income tax credit to qualified Maryland cybersecurity companies. These companies receive a credit of 33 percent of an eligible investment, though the credit is limited to \$250,000 for each investor during each fiscal year (Maryland Department of Commerce 2017).

Cybersecurity standards. Standards for cybersecurity are also important ways to ensure that companies are aware of proper cyber practices. Standards are effective to the extent that they enable a risk-based approach to cybersecurity, which naturally varies across sectors and firms. For example, such cybersecurity standards may create a common lexicon for cybersecurity, including the definition of what constitutes a cyberattack or a data breach, which currently is not standardized across government and private organizations. The 2013 U.S. Executive Order 13636 "Improving Critical Infrastructure Cybersecurity" encourages the U.S. government's IT agencies to adopt "The Framework for Improving Critical Infrastructure Cybersecurity," as developed by NIST, in order to enhance risk management. For example, the Financial Services Sector Coordinated Council (FSSCC 2017), which seeks to "strengthen the resilience of the financial services sector against attacks and other threats," in collaboration with the Department of Treasury, has developed an automated cybersecurity assessment tool. Though standards can be beneficial for addressing cyber threats, if they are not properly coordinated across government agencies and are too prescriptive, they could be very costly to implement and thus lead companies to use a compliance-based rather than risk-based cybersecurity approach.

The NIST cybersecurity framework is an example of a standards tool that was originally targeted for critical infrastructure, then adopted by the broader

government community (both inside and outside the United States, e.g., in Italy), and increasingly by the private sector (NIST 2017b). It is a voluntary, broad-based set of standards that seeks to “identify effects of cybersecurity on business; align and de-conflict cybersecurity requirements; prioritize cybersecurity outcomes; organize, authorize, task and track work; express risk disposition; and understand gaps between current and target.” The framework is made up of five functions: to identify, protect, detect, respond, and recover from cyber risks. It also establishes a common lexicon to discuss cybersecurity issues across stakeholders, and it is meant to be adaptable to changing cyber technologies and threats. All 16 critical infrastructure sectors adopted NIST’s cybersecurity framework in fiscal year 2016 (U.S. Department of Commerce 2017; NIST 2017a).

Industry-wide cybersecurity standards may also ensure the security of supply chains by providing a baseline of risk management and other security mechanisms across firms. NIST has established standards for a risk management process to ensure the cybersecurity of supply chains, known as the Cyber Supply Chain Risk Management process (NIST 2018).

International efforts. Cyber risks may also result from foreign government actions or weak cyber defenses across countries, which may be addressed through international diplomatic and enforcements efforts. For example, the United States initiated the “Section 301 Investigation of China,” pursuant to the Trade Act of 1974, to assess Chinese practices, including cyber practices, which may weigh on U.S. commerce. Also, the United States annually discusses problematic cyber practices that could put IP property in the country at risk and affect U.S. commerce in the annual Special 301 reports. The World Trade Organization’s Agreement on Trade-Related Aspects of Intellectual Property Rights (known as TRIPS) could also be a tool for addressing unfair cyber practices abroad; however, at this point, it seems to be primarily focused on other, non-cyber-related forms of IP theft. International bodies—such as the G-7, G-20, and Financial Stability Board—have also provided forums to address cybersecurity issues in the financial sector. For example, in October 2017, the G-7 adopted the “Fundamental Elements of Cybersecurity for the Financial Sector” which sets “non-binding, high-level fundamental elements” for private and public actors in the financial sector to customize to their specific regulatory landscapes and cyber risks (Department of Treasury 2017). In the same year, G-20 Finance Ministers and Central Bank Governors released the “Roadmap for Digitalization: Policies for a Digital Future,” which included a provision to “strengthen trust in the digital economy,” including through “exchanging experiences” on “guidelines and best practices to identify, assess, and manage security risks” (German Federal Ministry for Economic Affairs and Energy 2017). Finally, the international Financial Stability Board has facilitated communication between international public and private sector actors on cybersecurity in the financial sector (FSB 2017).

Governments can also pursue bilateral measures. For example, in September 2015 the U.S. and China signed the nonbinding Cyber Agreement (referred to as the Xi Agreement), whereby the two countries agreed to (1) “timely responses” regarding “malicious” cyber activities; (2) cooperation on cybercrime investigations, and provision of updates, “consistent with their respective national laws and relevant international obligations”; (3) ensuring that neither government would “conduct or knowledge support” cyber-enabled theft of IP, including “trade secrets or other confidential business information for commercial advantage”; (4) promoting norms for nation-states’ cyber behavior within the international community; and (5) creating a high-level joint dialogue to “fight” cybercrime and related issues (White House 2015; CRS 2015). It has been noted that the number of suspected network compromises by 72 China-based groups in the U.S. and in 25 other countries has declined since mid-2014, since the Xi agreement, from a peak of over 70 compromises in August 2013 to fewer than 5 in May 2016.⁹ In his 2017 Worldwide Threat Assessment, the Director of National Intelligence confirmed that the volume of cybercrimes committed by China has declined since the September 2015 commitments, but noted that China continues to actively target U.S. firms and government for cyber espionage (DNI 2017).

Developing a cybersecurity workforce. There is a significant skills gap in the cybersecurity field, which is reflected in a shortage in the number of American workers left to fill cyber positions. Almost 210,000 cybersecurity jobs went unfilled in the United States in 2015 alone (McAfee 2016). Projections estimate that the global shortage will increase to 1.5 million unfilled positions by 2020.

Cybersecurity jobs are a subset of IT jobs; however, the number of cyber job occupations is expected to grow by 28 percent between 2016 and 2026, “much faster than the average for all occupations.” In comparison, the growth rate for all computer-related jobs is projected to be 13 percent, while the growth rate for all other occupations is projected to be only 7 percent during this same period (BLS 2017).

One possible source of the cybersecurity workforce shortage is that access is lacking to education in science, technology, engineering, and mathematics (STEM), and particularly to computer science (CS)—a field within which cybersecurity falls—for schools from kindergarten through grade 12. For example, more than half these schools do not offer computer programming coursework (Gallup 2016; Code.org 2016), and almost 40 percent of high

⁹ The 25 other countries and economies, in order of the frequency of incidents, are the United Kingdom, Japan, Canada, Italy, Switzerland, Germany, the Netherlands, India, Australia, Denmark, Philippines, Sweden, Taiwan, Brazil, China, Colombia, Colombia, Egypt, France, the Hong Kong Special Administrative Region, Israel, South Korea, Norway, Saudi Arabia, Singapore, and Tunisia. Of the 262 compromises that occurred during the 2013–14 period, 182 (69.5 percent) occurred on U.S. entities’ networks, and 80 (30.5 percent) occurred on networks in the other 25 countries.

schools do not offer physics (U.S. Department of Education 2016). Greater access to STEM and CS programs for younger students would likely increase the number choosing to pursue these fields at a higher level. This is especially important for the cybersecurity labor force, given that many of the available cyber positions require significant educational credentials and experience. About 84 percent of cybersecurity postings require a bachelor's degree at a minimum, and 83 percent ask for at least three years of previous experience (Burning Glass Technologies 2015). Meanwhile, almost 79 percent of students in the United States pursuing a master's degree in CS are citizens of other countries (NFAP 2017).

These numbers indicate a dependence on foreign workers and foreign companies to help meet much of the United States' domestic cybersecurity needs. An example portraying the necessity of decreasing our dependence on foreign cybersecurity expertise is the case of Kaspersky Lab, a prominent Russian cybersecurity research firm founded in 1997 and headquartered in Moscow (Subcommittee on Oversight 2017). Kaspersky's antivirus software has been sold throughout the United States, and was even being used in the computer systems of some two dozen Federal agencies. As with most security software, Kaspersky's antivirus products require access to everything stored on a computer, which allows it to search for viruses or other malware. By conducting scans for malicious software, the program removes any risks and sends back a report to the company. Though this is a routine procedure, in 2017, suspicion grew that the software was in fact providing an all-too-perfect tool for Russian intelligence to access content of interest on American computers, especially those utilized by the government.

DHS issued a directive on September 13, 2017, for Federal Executive Branch departments and agencies ordering them to remove and discontinue use of Kaspersky products (DHS 2017c). In the press release DHS stated that "the risk that the Russian government, whether acting on its own or in collaboration with Kaspersky, could capitalize on access provided by Kaspersky products to compromise Federal information and information systems directly implicates U.S. national security." The case of Kaspersky demonstrates the critical need to increase the domestic supply of cyber workers, and reduce American dependence on foreign cyber products, which cannot always be trusted, and instead develop our own cyber expertise.

Meanwhile, another source for the cyber workforce shortage is the lack of diversity in the field, particularly the underrepresentation of women. The share of CS degrees awarded to women by higher education institutions has fallen over the past 30 years. In 1985, the proportion of women earning CS degrees for all levels of education was approximately 36 percent. By 2015, this share had dropped to about 22 percent (NCES 2016). The reasons for the decline in female CS degree enrollment are not well understood, though there are a number of

competing explanations (e.g., Roberts 1999; Irani, Kassianidou, and Roberts 2002; Wang et al. 2015).

Corresponding to the low percentage of women studying CS, the share of women in CS occupations was only 24.5 percent in 2015 (NSF 2017), well below the rate of 34 percent in 1990 (U.S. Census Bureau 2013). For comparison, in 1990 women represented 45 percent of the labor force, compared with 47 percent in 2015 (DOL 2017). For cybersecurity positions specifically, which typically require a CS background, a 2017 study conducted by the Center for Cyber Safety and Education found that the number of women working in the cybersecurity field in the United States is a mere 14 percent. Other studies suggest that women make up as little as 10 percent of the U.S. cybersecurity labor force. Increasing the domestic cybersecurity workforce will crucially rely on attracting more U.S. women to CS coursework—and thus to the cybersecurity profession.

Although many technology companies already offer STEM-related scholarships to women, the government should continue to promote grants offered to women studying CS (and cybersecurity) through various avenues, such as the National Science Foundation. It is equally important to provide female-to-female mentoring to help encourage women to study CS. By offering structured opportunities for mentorship, women can better understand the field while interacting with female leaders and role models (Bohnet 2016).

Additionally, universities need to consider the impact of professors' genders on the gender gap in the sciences (Carrell, Page, and West 2010; Vilner and Zur 2006). Though a professor's gender has little effect on male students, it can play an important role in the performance of female students in math and science, and can affect their likelihood of pursuing STEM degrees. Research suggests that the gender gap in academic performance and STEM majors can be eliminated, specifically for high-performing female students, when introductory math and science courses are taught by women.

Overall, the Administration is playing a leading role in the STEM movement, attracting both women and men to the cyber field by offering more opportunities for exposure to STEM concepts earlier in life. The Administration is already spearheading a movement to promote greater access to computer science education in elementary and high schools (see White House 2017a), directing the Department of Education to invest at least \$200 million in annual grants to help fund the expansion of STEM and CS in schools across the country. Additionally, Executive Order 13800: "Strengthening the Cybersecurity of Federal Networks and Critical Infrastructure" aims to foster the "growth and sustainment of a workforce skilled in cybersecurity and related fields" in the public and private sectors, beginning with an assessment of current cybersecurity workforce development programs in the U.S. and in cyber peers.

Raising cybersecurity awareness. Governments may inform consumers of cyber risks to ensure that demand-side factors internalize cybersecurity

risks. For example, governments—at the Federal, State, and local levels—may also educate consumers about cybersecurity, including current vulnerabilities and best practices, to ensure that consumers demand secure products and therefore incentivize businesses to supply such products. For example, DHS initiated the Stop.Think.Connect Campaign to increase public awareness of cyber threats—which includes toolkits customized for students, parents, young professionals, the elderly, government, industry, small business, and law enforcement—discussing topics such as reporting a cybercrime complaint, recognizing and reducing cybersecurity risk, online privacy, and phishing. The campaign also disseminates instructional videos and audio materials on cybersecurity (DHS 2017a).

Protecting critical infrastructure. Cyber protection is particularly important for critical infrastructure, given the potential for both physical and virtual damage to systems that may affect many people and organizations at once—for example, in the case of a disruption in the electricity grid or power plant. The public sector is particularly important in preventing and addressing such breaches because of the magnitude of negative externalities that are possible with such a breach. In line with this, Executive Order 13800, “Strengthening the Cybersecurity of Federal Networks and Critical Infrastructure,” seeks to strengthen cybersecurity risk management in critical infrastructure sectors.

Several executive orders over the last several years have addressed protection and coordination concerns about critical infrastructure cyber networks. The 2013 Presidential Policy Directive-21 (PPD-21), “Critical Infrastructure Security and Resilience,” notes the above-mentioned 16 critical infrastructure sectors that are important for both the U.S. economy and national security, for which cyber protection is particularly essential. That same year, Executive Order 13636, “Improving Critical Infrastructure Cybersecurity,” expanded the Enhanced Cybersecurity Services program that enables real-time sharing of cyber threat information, and ordered NIST to develop a cybersecurity framework. Most recently, in May 2017, Executive Order 13800, “Strengthening the Cybersecurity of Federal Networks and Critical Infrastructure,” includes efforts to improve cybersecurity risk management across the government (White House 2017b). It is too early to assess the effectiveness of these orders, but their implementation is an important step toward limiting cyber risks.

Law enforcement in cyberspace. Effective law enforcement is critical for discouraging cybercrime, and its continued success is predicated on coordination among various law enforcement agencies. The FBI Cyber Shield Alliance, initiated by the FBI’s Cyber Division, engages in partnerships with U.S. State, local, territorial, and tribal law enforcement agencies to synchronize efforts against cybercrime. Law enforcement agencies and private entities may report cyber incidents through the FBI’s online portal system.

Law enforcement has had major successes bringing charges against criminals in cyber space and helping dismantle their criminal operations,

Box 7-9. Law Enforcement's Role in Mitigating Cyber Threats: The Kelihos Botnet

The Kelihos botnet was a malicious operation that started in 2010 as a global network of tens of thousands of infected computers running on Microsoft's Windows operating system (DOJ 2017a). The botnet was used to steal the login credentials of infected users and send hundreds of millions of spam emails that included malicious software and ransomware (DOJ 2017a). At its peak, the botnet grew to over 100,000 infected computers, ordering them to carry out various cybercrimes including password theft, pump-and-dump stock schemes, and the advertisement of counterfeit drugs.

The DOJ led the effort to free the infected computers from the botnet (DOJ 2017a). Specifically, the DOJ obtained warrants under Rule 41 of the Federal Rules of Criminal Procedure, allowing it to establish substitute servers into which to redirect Kelihos-infected computers, and also to collect the Internet Protocol addresses of the computers that connected to the servers (DOJ 2017a). This was done to provide these addresses to those who can assist victims in removing the malicious software from their computers (DOJ 2017a). And this operation also blocked all commands sent in an attempt to regain control of the victimized computers.

The DOJ, in partnership with a private security firm who provided technical analysis and aid, provided the legal means necessary for successful execution. In addition to liberating the already infected devices, the DOJ pledged to continue to share samples of the Kelihos software with all the major players in the cybersecurity industry, thereby training the antivirus software to detect and remove the botnet, should it resurface (DOJ 2017a). Microsoft's Safety Scanner is one example of an antivirus software now programmed to do this, thanks to the efforts of the DOJ.

including many that were located abroad. For example, in April 2017, DOJ played an active role in disrupting the Kelihos botnet and later extradited him to the U.S. This operation is described in detail in box 7-9. This and other successful operations demonstrate the important role of law enforcement in reducing cyber threats and discouraging future cybercrime.

Private Sector Efforts

Although the government can help address some elements of cyber protection, ultimately, the most direct cybersecurity actions are in the hands of the private sector. These include direct investments in cyber protection, emergency preparedness, and information sharing, among others. Together, these efforts strengthen a firm's ability to prevent, address, and recover from security breaches.

Investments in cyber protection. Although the public sector may have a comparative advantage in basic research that depends on economies of scale, cyber risks for particular industry-specific factors are most efficiently addressed by private firms because they own and operate most critical infrastructure. One indicator of cybersecurity investment is venture capital funding for and major industry spending on services from cybersecurity firms. This funding has recently more than doubled, from \$108 billion in 2010 to \$336 billion in 2015 (Nasdaq 2016). And Morgan Stanley (2016) estimates that spending on cybersecurity products and services will again more than double, from \$56 billion in 2015 to \$128 billion in 2020, though spending on these products will remain below spending on other IT hardware, software, equipment, and services (figure 7-7). Moore (2016) notes that in a survey of 40 executives, mostly at the level of chief information security officer, most respondents (88 percent) reported that their cybersecurity budgets have increased. The survey revealed that frameworks, compliance obligations, and direct engagement with business units on cyber threats were common ways for executives to gain greater budgets for cybersecurity. The survey noted that the most frequently cited response for investment was “perceived risk reduction,” followed by compliance and industry best practices.

Private investments in cyber protection can come in the form of cyber services and technologies. At the service end, Ernst & Young (EY 2014) emphasizes the importance of strong security operations centers, aligned with business concerns, that stay informed about impending threats. Such a center could embody a “cyber threat intelligence capability” addressing questions such as “What is happening out there that the organization can learn from [the experience]? How can organizations become “target hardened,” and is this required? How are other organizations dealing with specific threats and attacks? How can the organization help others deal with these threats and attacks? Which threat actors are relevant?” (EY 2014). According to EY’s survey, 36 percent of respondents attested to not having a threat intelligence program, suggesting that some companies either perceive low cyber threats or are underfunding cybersecurity.

There are also a variety of security technologies that may be used to reduce exposure to cybersecurity risk. Ponemon (2017a) notes that the most common ones in its sample of 254 companies are security intelligence systems (67 percent), which also have the highest reported costs savings and returns on investments (\$2.8 million and 21.5 percent, respectively); these are followed by advanced identity and access governance, advanced perimeter controls, extensive use of data loss prevention, and deployment of encryption technologies, among others (figure 7-8). Morgan Stanley (2016) projects that companies will move away from “a la carte solutions” to “more-efficient platforms,” resulting in greater consolidation in the cybersecurity industry, with the five largest

Figure 7-7. Investment Projections in Cybersecurity

Source: Morgan Stanley (2016).

security vendors growing from 26 percent market share to 40 percent in the short to medium terms.

The use of distributed ledger technology to ensure data integrity. Distributed ledger technology (DLT) is an innovative technology-based solution to address cyber threats and provide data integrity. DLT entails having a database of transactions decentralized across multiple sites in order to eliminate the need for an intermediary to process, validate or authenticate peer-to-peer transactions. Blockchain is a well-known example of DLT that creates a historical record of ledgers that containing every transaction that has taken place among users.

Third-party institutions, such as banks or credit card companies, historically have helped to validate transactions and establish identities. To establish identities, third parties require that users divulge significant, confidential information, which is then stored in a centralized database. As discussed above, centralized PII repositories pose significant risks that the PII data will be stolen by cybercriminals. The additional contribution of DLT to improved cybersecurity is that it is better able than traditional record keeping to ensure data availability and integrity by recording transactions in multiple cryptographically secured public ledgers that are verified in large peer-to-peer networks (Tapscott and Tapscott 2016). The ledgers are distributed around the world

Figure 7-8. Frequency and Cost Savings, by Technology

Sources: Ponemon (2017); CEA calculations.

on computer servers supported by volunteers. Therefore, if any location that holds a copy of the ledger is compromised, other uncompromised ledgers may be used.

Bitcoin is the most popular form of cryptocurrency that uses its own DLT protocol called blockchain. Box 7-10 gives an example of how this technology is implemented.

Better authentication procedures. The relevance and importance of creating and utilizing better authentication methods has intensified in response of the PII incident on Equifax in 2017. Better authentication procedures may prevent cyberattacks and data breaches by ensuring that proper personnel are operating cyber networks. McAfee (2017) notes that “legitimacy tests for every transaction” may identify improper use of network systems. There are other ways of enhancing cybersecurity through authentication improvements. Beyond usage of one-time passwords, individuals and private firms can employ biometrics or two-factor authentication. Two-factor authentication provides an additional layer of security and makes it harder for cybercriminals to gain access to another’s account, because knowing the victim’s password alone is not enough to pass the authentication check.

In addition, biometric authentication (e.g., using fingerprints or retina scanners) could enhance security as verification is determined by an individual’s unique characteristics that are extremely difficult to fake. Network

Box 7-10. Bitcoin

Bitcoin is a piece of open source software that allows for the creation of a secure public ledger of transactions that keeps track of how much bitcoin (the unit of account on the ledger) different users of the system own. At a very high level, there are two key components that allow the system to function. First, Bitcoin uses public/private key cryptography to ensure that transfers of bitcoin recorded on the ledger have in fact been authorized by the owner of the relevant account (Nakamoto 2008). Second, Bitcoin uses blockchain technology to achieve and record consensus on the order and legitimacy of transactions so as to prevent double spending (Nakamoto 2008). These two mechanisms as implemented through the Bitcoin software seek to allow a secure decentralized peer to peer digital payment system to function.

The key technological advance underlying Bitcoin stems from its ability to achieve consensus in a decentralized system. This occurs through a six-step process that was outlined in the original Bitcoin paper (Nakamoto 2008), and is given here, with additional explanations added in brackets:

1. New transactions are broadcast to all nodes. [Nodes can be thought of as individuals or businesses running the Bitcoin software.]
2. Each node collects new transactions into a block. [A block can be thought of as a collection of transactions.]
3. Each node works on finding a difficult proof-of-work for its block. [The proof-of-work is the solution to a computationally intensive mathematic problem that is generated using information embedded in the last accepted block; see step 6.]
4. When a node finds a proof-of-work, it broadcasts the block to all nodes.
5. Nodes accept the block only if all transactions in it are valid and not already spent. [This involves checking the proof of work, verifying the public/private key cryptography to be sure transactions were authorized by the relevant account holders, and verifying that the sender both previously received the funds and has not already spent them.]
6. Nodes express their acceptance of the block by working on creating the next block in the chain, using the hash of the accepted block as the previous hash. [The hash can be thought of as the solution to the computationally intensive math problem, and by using the solution to the last problem to help generate the next one, blocks are linked together in a chain.]

The process described above creates consensus on a decentralized system and de-incentivizes fraud (such as creating multiple accounts or double-spending) by increasing computationally costs (via the proof-of-work requirement). Specifically, fraud requires consistently providing proofs of work faster than the rest of the network, which in turn requires having a majority of the processing power on the network. Bitcoin incentivizes users to participate in the network and produce the proofs-of-work that make the system secure by rewarding users that produce a proof-of-work for a block on

the blockchain with newly issued bitcoin. As time passes, the system increasingly relies on transaction fees to incentivize computational work. Either way, by incentivizing users to do computational work, and by tying the viability of fraud to the amount of computational work being done on the network, the system makes it extremely difficult for fraud to take place. This in turn creates confidence on the part of users that the system and the ledger of transactions it creates is in fact secure and can be used as a payment system.

The bitcoin protocol specifies that only a finite amount of bitcoin will ever be issued (21 million), a significant proportion of which have already been issued (over 16 million). The inherent scarcity of bitcoin is important as it has helped many people to see bitcoin not only as a unit of account and medium of exchange in the decentralized payment system described above but also as a store hold of value. In fact, many see bitcoin as a potential competitor to gold, whereby it serves as an inflation hedge asset that can also be relied upon in a time of crisis. However, similarly to other investment assets, especially those with short trading histories and unclear valuation models, bitcoin may be vulnerable to price bubbles driven by investor sentiment.

Looking forward, bitcoin faces a number of challenges, some stemming from the underlying technology itself and some from the regulatory environment. On the technological front, the bitcoin protocol over time will have to adapt to allow more transactions to go through the system more quickly and with lower average transaction costs. Many competitor crypto-currencies have sprung up seeking to make technological improvements, and this too poses a risk to bitcoin. Additionally, the work of transaction validation is energy-intensive: Böhme and others (2015) estimate that blockchain proof-of-work calculations require more than 173 megawatts of electricity, equivalent to about \$178 million per year at average U.S. residential electricity prices. On the regulatory front, a number of regulatory ambiguities also will need to be addressed and the development of broader market infrastructure such as exchanges and ETFs will be important.

In addition, the potential use of bitcoin for illicit transactions—such as money laundering, terrorist financing, tax evasion, and fraud—raises additional regulatory concerns. Some governments like Japan have taken steps to embrace bitcoin, while others like China have sought to limit its use, while many more have taken a piecemeal approach to regulating the technology by applying existing law to entities engaged in regulated activities like running an exchange. For example, in the United States, bitcoin exchanges have to register with the Financial Crimes enforcement Network (FinCEN) as a money services business. Finally, the digital nature of the underlying technology presents cybersecurity risks for bitcoin (Böhme et al. 2015).

segmentation may also reduce unauthorized access to sensitive information on networks. Multiple authentication methods—such as a second factor using

a hardware token or mobile app, including for vendor access—may help to prevent cyber breaches across the supply chain.

Facilitating information sharing. As mentioned above, information sharing is critical for raising awareness of rising cyber threats and solutions across industries. In addition to government-led efforts, industry-led channels may also enable the dissemination of information across private firms, despite reputation and competitor concerns. These channels have the potential to be particularly relevant in addressing industry-specific risks that broader government-enabled channels may not be able to isolate. For instance, across sectors, there are now industry-led information sharing and analysis centers (ISACs), which “collect, analyze, and disseminate actionable threat information” on cyber threats to their members (National Council of ISACs 2017). ISACs span a variety of sectors—including automotive, aviation, communications, defense industrial base, defense security information exchange, downstream natural gas, electricity, emergency management and response, financial services, healthcare, IT, maritime, multistate, national health, oil and natural gas, real estate, research and education networks, retail cyber intelligence, supply chain, surface transportation, public transportation and over-the-road buses, and water.

In general, ISACs have been an important step in promoting information sharing in the industry, partly overcoming the disincentives to share information on vulnerabilities with competitors. However, there is room for improvement to make the information shared in these units actionable by ensuring that cyber breaches are shared in real time. Complementary to ISACs, though not critical infrastructure sector specific, Information Sharing and Analysis Organizations (ISAOs) are facilitated by DHS pursuant to 2015 Executive Order 13691, “Promoting Private Sector Cybersecurity Information Sharing.” They are intended to create “transparent best practices” addressing the needs of all industry groups through an “open-ended public engagement” led by the Standards Organization. ISAOs may share information with ISACs (DHS 2016b).

Emergency preparedness and risk management. Companies may minimize the costs associated with cyberattacks and data breaches by ensuring that their organizations have proper response mechanisms in place to recover from attacks, which requires understanding and managing cyber risks. Risk management assessments are a critical way to determine whether systems are protected against cyber threats, and they allow firms to determine whether their level of investment is proportionate to the cyber threats facing them. A risk-based approach takes a customized account of a firm’s specific factors—associated with the supply chain, industry, product, region, and the like—to determine the level of cyber threat. Such an approach differs from what some consider a “compliance-based” approach, which involves only following basic guidelines set by regulators.

Once risks are determined, the next step is to ensure that firms are prepared to address and recover from potential cyber breaches. The Federal government lays out several guidelines that may inform such emergency preparedness, including checking whether systems are infected through security scans, disconnecting devices if problems are found, and reporting incidents. Third-party cybersecurity services may also offer risk and emergency preparation tools—although, ultimately, to be effective such preparedness must happen autonomously at the firm level (FireEye 2017).

Outsourcing cyber protection to domestic cybersecurity firms. Some firms may choose to hire security companies to manage cybersecurity risks, both preventing cyberattacks and data breaches and mitigating successful attacks. For prevention, cybersecurity companies offer risk assessments, red-teaming exercises, mergers-and-acquisition risk assessments, and security program assessments, among others. For detection, cybersecurity firms offer incident response services and compromise assessments (FireEye 2017). Outsourcing cybersecurity may be especially valuable for small firms, which typically cannot afford to hire a security professional on staff.

Employee training. Training for employees may be a useful preventive mechanism—for example, training employees on filtering emails and reporting “phishy” emails, and also deterring shared logins (Verizon 2016). Such types of training may build general awareness of the cybersecurity risks associated with daily tasks, such as password protection and information sharing. The NIST Framework includes “awareness and training” in the cybersecurity framework, which requires ensuring that all users are informed and receive training on cybersecurity risks and that stakeholders all understand their roles and responsibilities—including privileged users and third-party stakeholders, which include suppliers, senior executives, and physical and information security personnel.

Other methods. Another way for private firms to improve cybersecurity is by increasing the cost of cyberattacks and data breaches to deter future attacks. One proposal has been to deploy “honey pots” to attract adversaries and distract them from more valuable assets (McAfee 2017). Monitoring internal networks, devices, and applications also may improve detection and recovery from future attacks; this may be done through account monitoring, audit log monitoring, and network / intrusion detection system monitoring (Verizon 2016).

Conclusion

Cyber threats are likely to remain a reality that has an impact on individuals, firms, and the government. Cooperation across the public and private sectors on cybersecurity is ultimately critical as the economy advances to a new era

of technology. Therefore, comprehensive approaches that pool the resources of the private and public sectors are necessary to address the evolving nature of cyber threats. The public sector may enable the reduction of cyber risks by supporting basic research, overseeing cybersecurity standards, engaging in cyber education and awareness, protecting the critical infrastructure sectors, devising methods to overcome barriers to information sharing, and incentivizing private investment in cybersecurity. Meanwhile, the private sector has a comparative advantage in devising technology-based solutions, information sharing, emergency preparedness, and employee training. Effective cybersecurity solutions will contribute to the growth of the U.S. economy.

Chapter 8

The Year in Review and the Years Ahead

The U.S. economy experienced a strong and economically notable acceleration in 2017, with growth in real gross domestic product exceeding expectations and increasing to 2.5 percent, up from 1.8 percent during the four quarters of 2016, and the unemployment rate falling 0.6 percentage point to 4.1 percent, the lowest since 2000. Over the course of 2017, the economy added 2.2 million nonfarm jobs, averaging 181,000 per month, with particular strength in the manufacturing (+189,000 jobs) and mining (+53,000) sectors, which had lost 9,000 and 98,000 jobs, respectively, in 2016. Challenges remain, however, because the combination of strong employment growth and modest output and real earnings growth in recent years reflects low labor productivity growth, due in part to historically low levels of capital deepening—an issue that the recently enacted Tax Cuts and Jobs Act was intended to address (see chapter 1 of this *Report*). In addition, long-term downward trends in labor force participation due to the aging Baby Boom generation will require fresh policy ideas to offset (see chapter 3).

Acknowledging these challenges, the Administration’s baseline forecast for the longer term is for output to grow by an overall average annual rate of 2.2 percent through 2028, excluding the effects of the December 2017 Tax Cuts and Jobs Act. The full, policy-inclusive forecast, however, which assumes implementation of the Administration’s agenda, is for real gross domestic product to grow by 3.0 percent a year, on average, through 2028. We expect growth to moderate slightly after 2020, as the capital-to-output ratio approaches its new, postcorporate tax reform steady state, and as the pro-growth effects

of the individual elements of the Tax Cuts and Jobs Act dissipate (though the level effect remains permanent). The current Administration's long-run, policy-inclusive forecast is conservative relative to those of previous administrations, and is in fact slightly below their median of 3.1 percent. Moreover, the baseline forecast is exactly in line with the long-run outlook given in the 2017 *Economic Report of the President*, reflecting our view that nonimplementation of the Administration's policy objectives would simply result in a reversion to the lower growth expectations of recent years. But if these objectives are implemented, the expected contribution to long-run growth of the resulting deregulation and infrastructure investment will offset the declining contribution to growth of corporate and individual tax cuts and reforms near the closing of the budget window. On average, through 2028, the Administration expects deregulation and infrastructure investment to each contribute to GDP growth beyond 2020 (as discussed in chapters 2 and 4, respectively). Consistent with growth slowing slightly in the latter half of the budget window, from 3.2 percent in 2019 to 2.8 percent in 2028, the Administration expects unemployment to gradually return to its natural level, which will also stabilize inflation.

From 2010 through 2016, the United States' real gross domestic product (GDP) grew at an average annual rate of 2.1 percent. The pace of economic recovery was slow by historical standards; indeed, recent research finds that deep recessions are typically followed by strong recoveries in the United States, and that the correlation is in fact stronger when the contraction is accompanied by a financial crisis (Bordo and Haubrich 2017). Since 1882, there have been only three exceptions to this observation—the Great Depression, the recession of 1990–91, and the aftermath of the Great Recession of 2007–9.

As discussed in chapter 1, on tax reform, factors in this historically weak recovery included the coincidence of high and rising global capital mobility with an increasingly internationally uncompetitive U.S. corporate tax code and worldwide system of corporate taxation. This combination had the effect of deterring U.S. domestic capital formation, thereby restraining capital deepening, labor productivity growth, and, ultimately, output and real wage growth. The five-year, centered-moving-average contribution of capital services per

hour worked to labor productivity actually turned negative in 2012 and 2013 for the first time since World War II. Moreover, as demonstrated in chapters 2 and 3 on, respectively, deregulation and labor, an increased regulatory burden on businesses and recession-era labor policies had additional negative effects on productivity growth, particularly through the effect of regulation on firm entry and exit, and labor force participation among prime-age workers.

During the four quarters of 2017, real GDP grew by 2.5 percent; and annualized quarterly growth rates rose from 1.2 percent in the first quarter of 2017 (hereafter, 2017:Q1, etc.) to, respectively, 3.1, 3.2, and 2.6 percent in 2017:Q2, 2017:Q3, and 2017:Q4. The year 2017 therefore constituted a positive surprise to expectations. After four-quarter growth of 2.0 and 1.8 percent in 2015 and 2016, expectations for 2017 were subdued. The 2017 *Economic Report of the President* anticipated four-quarter real GDP growth of 2.4 percent, while in January 2017 the Blue Chip panel of professional forecasters predicted four-quarter growth of 2.3 percent (figure 8-1). With 2017 thus surpassing expectations, the January 2017 Blue Chip consensus forecast of 2.3 percent for 2018 was revised upward in February 2018 to 2.7 percent, while “nowcasts” from the Federal Reserve Banks of New York and Atlanta have projected 2018:Q1 growth above 3 percent.

Consider the expenditure-side components of GDP in turn: During the four quarters of 2017, real consumer spending growth of 2.8 percent exceeded real disposable income growth, such that the personal saving rate fell, which could in part reflect the effect of a \$7.7 trillion rise in household wealth during the four quarters of 2017, driven primarily by rising equity prices. Business fixed investment grew 6.3 percent during the four quarters of 2017, up from only 0.7 percent during 2016, the strongest four-quarter growth rate since 2014:Q3. Residential investment increased 2.3 percent during the four quarters of 2017, similar to the 2.5 percent growth in 2016; this was a somewhat surprisingly modest rate, given the solid fundamentals: low mortgage interest rates, rising real income, and rising house prices. Inventory investment—one of the most volatile components of GDP—subtracted 0.3 percentage point from average growth during the four quarters of 2017, and accounted for much of the quarterly fluctuations. Government purchases were roughly neutral in their effect on overall GDP during the four quarters of 2017. Exports contributed 0.6 percentage point to real GDP growth during the four quarters of the year, a notable increase from the average contribution of -0.1 percentage point in the years 2015–16, which partly reflected emerging economic growth among the United States’ trading partners.

Over the course of 2017, the U.S. economy added 2.2 million nonfarm jobs, averaging 181,000 per month, thereby extending the streak of positive nonfarm employment growth to 87 consecutive months (or 88 consecutive months, through January 2018). There was particular strength in the manufacturing (+189,000 jobs) and mining (+53,000) sectors, which lost 9,000 and

Figure 8-1. Evolution of Blue Chip Consensus Forecasts for Real GDP Growth During the Four Quarters of 2017 and 2018

Sources: Blue Chip Economic Indicators, published September 2016 to February 2018.

98,000 jobs, respectively, in 2016. By the end of 2017, the unemployment rate had fallen to 4.1 percent, the lowest rate since 2000 and down 0.6 percentage point since December 2016 (figure 8-2). The unemployment rate for African Americans was down 1.1 percentage points during the 12 months through December 2017, to 6.8 percent—the lowest rate recorded in a series that began in 1972. Meanwhile, after falling from 2008 through 2015 due to factors including the retirement of Baby Boom generation cohorts, an atypically slow recovery from the 2007–9 recession, and additional supply-side factors (see, e.g., Mulligan 2012), in 2016 and 2017 the annual average labor force participation rate edged up slightly as a tightening labor market offset negative demographic trends.

The conjunction of a falling unemployment rate and output growth below historical averages reflects slow labor productivity growth during this business cycle’s expansion relative to its long-term average. The slow growth of labor productivity, along with falling participation rates, have accounted for a decline in growth of real GDP per capita from a 1953:Q2–2007:Q4 average of 2.1 percent a year to 0.7 percent a year since the business cycle peak in 2007. As discussed in this chapter and chapter 1, on tax reform, one factor holding down labor productivity growth has been slow growth in business fixed investment during the 10 years since the 2007 business cycle peak (1.7 percent at an annual rate, down from 4.8 percent during the preceding 54 years since the 1953 business cycle peak). Notably, business fixed investment picked up to 6.3 percent and labor productivity in the nonfarm business sector picked up to 1.1 percent

Figure 8-2. Unemployment Rate, 1975–2017

during the four quarters of 2017, and the reduction in the cost of capital by the Tax Cuts and Jobs Act (TCJA) was specifically conceived to promote increased investment and capital deepening.

Despite low and declining unemployment, inflation remained low and stable, with consumer price inflation, as measured by the consumer price index (CPI), only 2.1 percent over the 12 months through December, the same pace as a year earlier. Low import prices continue to restrain overall inflation. The core CPI, which excludes volatile food and energy, increased 1.8 percent over the 12 months through December. Over the same period, personal consumption expenditure (PCE) inflation increased 1.7 percent, remaining below the Federal Reserve’s 2 percent target. Real average hourly earnings of nonfarm private sector employees rose 0.6 percent during the 12 months through December, as nominal wage growth continued to exceed the subdued pace of price inflation, building upon the 0.6 percent gain during 2016.

Challenges remain for 2018 and the longer term, including increased opioid dependence (see chapter 6 on health), the recent low rate of labor productivity and real wage growth, and downward pressure on the labor force participation rate from demographic shifts. However, these challenges are not policy-invariant, as is discussed in chapters 1 and 3, on tax reform and the labor market, respectively. Capital deepening, a key driver of labor productivity, has been lackluster in recent years, in large part due to the combination of increasing capital mobility and an internationally uncompetitive corporate tax code, headwinds that the TCJA was designed to counteract. Meanwhile, though

demographics are a principal determinant of long-run trends in labor force participation, this participation is not policy-invariant, and demographics are not destiny. Policy has affected participation in the past and can do so again. For example, as demonstrated in chapter 3, policies designed to mitigate the demand-side effects of rising unemployment during the Great Recession and other structural factors—such as regional variation in unemployment and geographic immobility (see chapters 2 and 4, on regulation and infrastructure, respectively)—have had persistently negative effects on the labor supply of both prime-age and young adults. Chapter 1 also demonstrates that the supply-side effects of reductions in marginal income tax rates through the TCJA may be concentrated at the upper end of the age distribution, with important implications both for labor force participation and labor productivity, as highly productive, near-retirement workers with higher elasticities of labor supply are incentivized to defer retirement.

Accordingly, the Administration expects real GDP to grow at 3.1 percent during the four quarters of 2018, and 2.8 percent in the long term, a forecast that assumes enactment of the President's policy proposals. In 2018, consumer spending and exports are expected to continue to sustain solid growth, with a lift from a pickup in business fixed investment and a sharp decline in corporate profit shifting. The unemployment rate is expected to fall slightly from its projected 2017:Q4 rate of 4.1 percent to 3.7 percent in 2019:Q4. Inflation, as measured by the price index for GDP, is expected to rise from its projected rate of 1.6 percent during the four quarters of 2017 to 2.0 percent during the four quarters of 2021, and to continue at that pace thereafter. Yields on 10-year Treasury notes are expected to edge up from their projected rate of 2.3 percent during the four quarters of 2017 to 3.6 percent in the mid-2020s, due partly to increasing inflation and partly to term premiums returning to more historically normal levels.

Output

Real GDP grew by 2.5 percent during the four quarters of 2017, somewhat above its pace in recent years. Real gross domestic output—an average of GDP and gross domestic income that is generally a more accurate measure of output than GDP—grew at a similar 2.4 percent annual rate during the first three quarters of 2017, up from 1.2 percent during the four quarters of 2016. The overall composition of demand during the four quarters of 2017 shows that most of the growth was accounted for by strong increases in consumer spending and business fixed investment. These were partially offset by a decline in inventory investment, while contributions from net exports and other sectors were generally small.

Real GDP accelerated to a 2.5 percent rate of growth during the four quarters of 2017, from a 1.8 percent pace during 2016. The 2017 acceleration

Figure 8-3. Real Growth in GDP, Private Domestic Final Purchases (PDFP), and Gross Domestic Output (GDO), 2000–2017

was largely accounted for by business investment and exports. Within business investment, the step-up in growth was due to equipment investment, which grew 8.8 percent (contributing 0.5 percentage point to overall real GDP growth) during 2017, after shrinking 3.7 percent a year earlier. The faster pace of export growth during 2017 reflects the emerging strength among our trading partners, as discussed below. Real consumer spending grew 2.8 percent during the four quarters of 2017, the same pace as 2016.

The aggregate measure of consumption and private fixed investment, known as private domestic final purchases (PDFP), rose 3.3 percent during the four quarters of 2017 (faster than overall output), up from 2.5 percent in 2016 (figure 8-3). Real PDFP growth is typically a better predictor of future real GDP growth than is real GDP growth itself (possibly because it aggregates the best-measured components of demand). The strength of PDFP suggests somewhat better growth prospects for 2018 than might be inferred from GDP alone.

Consumer Spending

Consumer spending, which constitutes 69 percent of GDP, was the major demand-side contributor to real GDP growth during 2017. Real consumer spending grew faster than disposable income (1.8 percent), so the personal saving rate fell from 3.6 percent in 2016:Q4 (and an average 4.9 percent during 2016) to 2.6 percent by 2017:Q4 (and an average 3.4 percent during 2017) (figure 8-4). Real consumer spending outpaced real income, probably because of large increases in household net worth attributable to the substantial gains

Figure 8-4. Personal Saving Rate, 1990–2017

Source: Bureau of Economic Analysis, Personal Income and Its Disposition.
Note: Shading denotes recession.

in the stock market, continued increases in housing wealth, and a stable household debt-to-income ratio. Low interest rates and improving access to credit also supported consumer spending. In general, real consumption growth and the wages-and-salaries component of real income growth tend to track one another well, as was the case in 2017 (figure 8-5). The low saving rate is consistent with the elevated level of employment expectations, which in 2017:Q4 was at the 87th percentile of its historical distribution (according to data from the University of Michigan’s Surveys of Consumers), indicating that consumers are optimistic about the economic future and thus are not engaging in precautionary “buffer stock” savings (Carroll 1997).

During the past four quarters, growth was strong for real household purchases of durable goods (7.4 percent) and nondurable goods (3.2 percent), while services purchases grew moderately (1.9 percent). Light motor vehicles sold at an annual rate of 17.1 million units during the 12 months of 2017, down slightly from the 17.5 million units sold during 2016, which was the strongest selling pace on record. Domestic automakers assembled 10.8 million light vehicles in 2017, down from 11.8 million units, on average, during the two preceding years.

Consumer sentiment increased in 2017, due in part to a strong labor market, low inflation, and the stock market highs (figure 8-6). In 2017:Q4, the two major indices of consumer sentiment—the University of Michigan’s Index of Consumer Sentiment, and the Conference Board’s Index of Consumer Confidence—reached their highest quarterly averages since 2000:Q4.

 Note: Shading denotes recession.

Meanwhile, U.S. household debt relative to income was stable during the first three quarters of 2017 (figure 8-7). Before the financial crisis, household debt relative to income rose dramatically, largely due to rising net mortgage originations, and then declined sharply after the crisis through 2016, a pattern known as “deleveraging,” which entailed declines in new mortgage originations and less consumer borrowing. Charge-offs of delinquent mortgage debt also played a role (Vidangos 2015). The level of mortgage debt relative to income edged down during the first three quarters of 2017, while the level of consumer credit (including credit cards, automobiles, and student loans) relative to income increased slightly.

Moreover, with low interest rates, the amount of income required to service these debts has fallen dramatically. Still, it needs to be noted that estimates based on aggregate data could mask higher debt burdens for some families, because the health of personal finances varies substantially among households. Nonetheless, in the aggregate, deleveraging has brought levels of debt relative to income and ratios of debt service to income back to the comfortable proportions of the early 2000s.

Gains in nominal household net worth (i.e., assets less debts, also referred to as household wealth) during 2017 were accounted for by increases in equity wealth of about 19 percent and in real estate wealth of roughly 9 percent. These gains in wealth were only slightly offset by increases in liabilities that were in line with income. By the end of 2017, household wealth had reached a value equivalent to seven years of income, the highest ratio of wealth

Figure 8-8. Consumption and Wealth Relative to Disposable Personal Income (DPI), 1952–2017

to income since records began to be kept in 1947 (figure 8-8). These gains in wealth supported consumer spending growth in 2017 because the consumption share of income tends to increase along with increases in net worth. Because the saving rate is the inverse of the consumption-to-income ratio, high levels of the wealth-to-income ratio can support a low saving rate, such as the 2.6 percent rate in 2017:Q4.

Three caveats need to be added about this correlation between net worth and the consumption rate. First, changes in net worth have been spread unevenly across households, and these disparities may have implications for families and macroeconomic activity. Second, in the Federal Reserve’s Financial Accounts of the United States, the household sector includes the endowments of nonprofit institutions. And third, stock market wealth is volatile, so this picture could change quickly.

Investment

The main types of investment include business fixed investment, residential investment, and inventory investment. This subsection considers each in turn.

Business fixed investment. Business fixed investment was a bright spot in 2017, after two years of little growth. It grew by 6.3 percent during the four quarters of 2017, an acceleration from an annual rate of 0.5 percent during the years 2015–16. And its three major subcomponents also grew during the four quarters of 2017 (figure 8-9): Equipment investment grew by 8.8 percent, up from a 3.7 percent contraction in 2016; intellectual property products grew by

Figure 8-9. Composition of Growth in Real Business Fixed Investment, 2010–17

Sources: Bureau of Economic Analysis, National Income and Product Accounts; CEA calculations.
 Note: Components may not sum to total due to rounding. Growth rate computed using Q4-to-Q4 changes.

4.8 percent, down slightly from 5.2 percent growth in 2016; and nonresidential structures grew by 3.7 percent, similar to 3.5 percent growth in 2016.

Net investment (gross investment less depreciation) is required to increase the capital stock. It is a matter of concern that net investment has been generally falling as a share of the capital stock during the past 10 years, which limits the economy’s productive capacity. In 2016, net investment as a share of the capital stock fell to a level previously seen only during recessions (figure 8-10). The Tax Cuts and Jobs Act is designed to increase the pace of net investment. As discussed further below, the slowdown in investment has also exacerbated the slowdown in labor productivity growth.

The rate of payouts to shareholders by nonfinancial firms, in the form of dividends together with net share buybacks, has been gradually trending higher for several decades, although it fell in 2017 (figure 8-11). Nonfinancial corporations returned nearly half the funds that could be used for investment to stockholders in 2017. In a well-functioning capital market, when mature firms do not have good investment opportunities, they should return funds to their stockholders, so the stockholders can invest these funds in young and growing firms. Although it may be admirable for individual firms to thus return funds to their shareholders, the rising share of paybacks to shareholders suggests that investable funds are not being adequately recycled to young and dynamic firms. Gutiérrez and Philippon (2016) find that firms in industries with more concentration and more common ownership invest less.

Note: Shading denotes recession. Series shown is the four-quarter moving average of the ratio of dividends plus share buybacks relative to profits plus depreciation minus taxes.

Residential investment. Residential investment was one of the driving sectors of demand during 2015, before it slowed in 2016 and 2017. It slowed from 10.3 percent growth during the four quarters of 2015 to 2.5 percent during 2016, and to 2.3 percent during 2017. Even with this slowing growth, many housing indicators reached their highest levels during this business cycle expansion, including sales of newly constructed single-family homes and single-family housing starts.

Although the housing market has continued its recovery since the recession, several structural challenges remain, including a constrained housing supply, low affordability in some areas of the country, and persistently muted household formation for 18- to 34-year-olds. Housing supply is constrained: the inventory of homes available for sale was below its historical average during 2017, and vacancy rates of owner-occupied homes for sale, another indicator of excess supply, have fallen to levels that had prevailed before 2004 (figure 8-12). Sales volumes of the most affordable new single-family homes, particularly those sold for less than \$200,000, are lower than before the crisis. The share of young adults living with their parents remains above its long-run historical average, stifling household formation. These challenges may explain why housing starts (at about 1.2 million units during 2017) are below their projected long-run, steady state pace of about 1.6 to 1.8 million units per year (Herbert, McCue, and Spader 2016).

House prices continued to rise in 2017, similar to the pace in 2015 and 2016. National home prices increased 6.2 to 7.0 percent (depending on the index) during the 12 months ending in November 2017, up slightly from 5.2 to 6.5 percent a year earlier. (National home price indices from Zillow, CoreLogic, Federal Housing Finance Agency Purchase-Only, and S&P CoreLogic Case-Shiller were used.) Although price increases are above their pre-bubble historical average, they are not as rapid as the increase of 6 to 11 percent during the 12 months of 2013. Nominal house prices are 1 to 13 percent above their prerecession peak (figure 8-13). However, in real terms (adjusting for inflation with the PCE chain price index), house prices remain 4 to 16 percent below their prerecession peak.

Continued house price increases have improved owners' equity relative to their mortgage debt. As of 2017:Q3, homeowners' equity equaled slightly more than half the total value of household real estate (59 percent), which was 22 percentage points higher than the recessionary trough and near the post-1975 average of roughly 60 percent. Rising home prices in 2017 helped lift many households out of negative equity positions, reducing the overall share of single-family homeowners with an underwater mortgage (i.e., when mortgage debt exceeds the value of a house) to 4.9 percent in 2017:Q3, down from 6.3 percent a year earlier (figure 8-14). In addition, in 2017:Q2, the share of mortgages that were delinquent (when the homeowner misses at least one monthly payment) reached its lowest level in 17 years, though the share of

 Note: Seriously delinquent mortgages are more than 90 days past due, but are not in in foreclosure. A foreclosure is started in the quarter when the foreclosure process is initiated.

mortgages that were seriously delinquent (with payments more than 90 days overdue, and the bank considering the mortgages to be in danger of default) remained above its historical average. The overall mortgage delinquency rate increased in 2017:Q3, possibly due to hurricanes Harvey, Irma, and Maria. Falling delinquencies support overall economic growth because homeowners with underwater or delinquent mortgages are less likely to spend or relocate in search of better-paying jobs (Ferreira, Gyourko, and Tracy 2012).

Single-family homes were still more affordable in 2017 than the historical average, as rising incomes and low and stable mortgage rates partially offset the effect of rising house prices on the cost of homeownership (figure 8-15). Nevertheless, affordability has decreased somewhat during the past five years because median existing home prices have, on average, grown roughly 4 percentage points faster than median family incomes each year.

The national homeownership rate was 64 percent in 2017:Q4, lower than the 66 percent historical average since 1980, due to demographic and financial trends. The decline has been concentrated among young households. The homeownership rate of those age 18 to 34 years averaged 35 percent during the four quarters of 2017, lower than the 39 percent historical average since 1994 (when the series began). The decline in homeownership for young people reflects the fact that young adults are waiting longer to get married or form households. As a result, first-time homebuyers are older, on average, than they were in the 1980s. Second, credit availability remains tight for borrowers with credit scores below 620.

Figure 8-15. Housing Affordability Index, 1990–2017

Sources: National Association of Realtors; CEA calculations.

Note: Shading denotes recession. A value over 100 means that the median-income family has more than enough income to qualify for a mortgage on a median-priced home. Index is 100 when the median-income family can exactly qualify for a mortgage on a median-priced home.

The overall rate of household formation (e.g., when a young adult leaves home to set up a new household) has been weak since 2007. On average, 1.0 million additional households were formed each year from 2013 to 2017, according to the Current Population Survey, which collects household data in March of each year. This is the same pace as in the period 2008–12, but down from the average 1.4 million additional households formed each year from 1980 to 2007.

Housing starts also remained well below the projected rate of 1.6 to 1.8 million that is consistent with long-term demographics and the replacement of the existing housing stock (Herbert, McCue, and Spader 2016). The 1.2 million starts during 2017 represented an increase of 2.5 percent relative to 2016 as a whole, but remained below their historical average (figure 8-16). Furthermore, because the rates of homebuilding have been below that pace since the recession, pent-up demand for housing may be playing a role in supporting further recovery in the housing market. However, an increase in housing demand, if not accompanied by an increase in housing supply, would not bring about a full recovery in the housing market.

The accumulation of State and local barriers to housing development—including zoning, other land-use regulations, and unnecessarily lengthy development approval processes—have reduced the ability of many housing markets to respond to growing demand (Glaeser, Gyourko, and Saks 2005). Although land-use regulations sometimes serve reasonable and legitimate purposes, they can also give extranormal returns to entrenched interests at

Figure 8-16. Housing Starts, 2000–2017

 Note: Shading denotes recession. Housing units are seasonally adjusted at an annual rate.

the expense of everyone else (see box 2-6 of the 2016 *Report* for an in-depth discussion of constraints on the housing supply).

Inventory investment. Real inventory investment—the change in the inventory stock—subtracted from output growth during the four quarters of 2017, concentrated in the first and fourth quarters. Although inventory investment is volatile, and can greatly affect quarterly GDP growth rates, its contribution to output growth generally averages close to zero over four- or eight-quarter horizons, aside from recessions and their immediate aftermath (figure 8-17).

Government Purchases

Real government purchases—Federal, State, and local consumption, plus gross investment—contributed 0.1 percentage point to real GDP growth during the four quarters of 2017, roughly the same contribution as 2016 (figure 8-18). Real Federal purchases increased 1.1 percent, after decreasing slightly (0.3 percent) during 2016. Defense purchases—defense consumption and gross investment—contributed modestly, increasing 2.4 percent during the four quarters of 2017, after decreasing 1.4 percent in 2016. State and local government purchases—consumption plus gross investment—contributed slightly to real GDP growth during the four quarters of 2017, edging up 0.5 percent during 2017, after increasing 0.8 percent during 2016.

State and local purchases as a share of nominal GDP fell from their historical peak of 13.0 percent in 2009 to 10.8 percent in 2017, a share not seen

Figure 8-17. Contribution of Inventory Investment to Real GDP Growth, 2010–17

Percentage points (annual rate)

Sources: Bureau of Economic Analysis; CEA calculations.

since the mid-1980s, as State and local governments cut their purchases in the face of budget pressures.¹ Even so, State and local government purchases as a share of nominal GDP have exceeded the Federal share since 1984 (figure 8-19). The roughly 90,000 State and local governments employ about 13 percent of nonfarm workers, and they added about 31,000 jobs during 2017. See box 8-1 for a discussion of some of the challenges facing the State and local sector.

Net Exports

Real U.S. exports of goods and services rose 4.9 percent during the four quarters of 2017, up from 0.6 percent in 2016—the strongest rate of growth since 2014:Q2. Exports contributed 0.6 percentage point to real GDP growth during the four quarters of 2017 (figure 8-20). The pickup of U.S. export growth was supported by the pickup in global growth and the pickup in global demand that has come with it. Real exports tend to reflect trade-weighted global growth rates, and, as global growth seems to be stabilizing, real export growth rates have begun to rise as well (see figure 8-39 in “The “Global Macroeconomic

¹ A total of 49 of the 50 states have constitutions or statutes mandating a balanced budget, and many local governments have similar provisions (National Conference of State Legislatures 2010). This does not prevent them from running deficits. Many of those balanced budget statutes apply only to the operating budget, while deficits may be allowed on their capital accounts. Also, spending from “rainy day funds” appears as a deficit in the National Income and Product Accounts.

Box 8-1. Challenges in the State and Local Sector

During the current expansion, growth in State and local purchases has been the weakest of any business cycle recovery in the post-World War II period (figure 8-i). Although State and local spending tends to grow quickly during a typical recovery, during the current business cycle, this spending has sharply contracted and, after eight years, still has not rebounded to its precrisis levels.

Real State and local government consumption expenditures and gross investment (particularly investment in structures) remain below their precrisis levels (figure 8-ii). Real State and local government consumption expenditures—which consist of spending to produce and provide services to the public, largely public school education—remain 1.3 percent below their peak in 2009:Q4. Real State and local government gross investment—which consists of spending for fixed assets that directly benefit the public, largely highway construction and maintenance—remains 20.2 percent below its peak in 2003:Q3.

Despite some recovery in 2017, there are still factors likely to restrain the growth of spending by State and local governments. These governments continue to spend more than they collect in revenues, and their aggregate deficit during the first three quarters of 2017 amounted to about 1 percent of GDP (figure 8-iii). During this period, their expenditures (including transfers and interest payments, as well as purchases) were roughly flat, at about 14 percent of GDP, and their revenues held at about 13 percent of GDP. Until 1990, these governments only ran deficits during recessions.

Figure 8-iii. State and Local Government Surplus as a Share of Nominal GDP, 1947–2017

Percent

Sources: Bureau of Economic Analysis, State and Local Government Current Receipts and Expenditures; CEA calculations.
 Note: Shading denotes recession.

Unfunded pension obligations—the shortfall between benefits promised to government workers and the savings available to meet these obligations—place a burden on the finances of many State and local governments.

Unfunded liabilities, measured on a net-present-value basis, equal the difference between liabilities (the amount the governments owe in benefits to current employees who have already accrued benefits they will collect in the future) and assets held in public pension funds, and indicate the amount of benefits accrued for which no money is set aside.

The size of these unfunded pension liabilities relative to State and local receipts ballooned immediately after the recession—driven by a combination of factors, including underfunding and lower-than-expected investment returns—and remain elevated, at a level that was about 70 percent of a year’s revenue in the first three quarters of 2017 (figure 8-iv). Assets may fall short of liabilities when governments do not contribute their full Actuarially Determined Employer Contribution (ADEC), when they increase benefits retroactively, or when returns on investments are lower than assumed. (The ADEC replaced the Actuarially Required Contribution when new reporting standards were established by the Governmental Standards Accounting Board; see GASB 2012.)

Additionally, unfunded liabilities can grow if actuaries’ assumptions do not hold true. For example, if beneficiaries live longer than anticipated, they will receive more benefits than predicted, even if the government has been consistently paying its required contributions. Unfunded liabilities will eventually require the government employer to increase revenue, to reduce benefits or other government spending, or some combination of these.

Situation” section below). (Trade-weighted global growth is calculated as a weighted average of real GDP growth for 25 foreign economies and the euro zone, using those economies’ share of U.S. goods exports as weights.)

At the same time, real U.S. imports increased 4.6 percent during the four quarters of 2017, more slowly than exports. Taken together, net exports subtracted 0.1 percentage point from real GDP growth during the four quarters of 2017, after subtracting 0.3 percentage point from overall growth during 2016 (figure 8-21).

The Labor Market

The labor market continued to improve in 2017, as many measures of labor market performance recovered to their prerecession levels or surpassed them. During 2017, the U.S. economy added 2.2 million nonfarm jobs, continuing its longest streak of total job growth on record (figure 8-22). The unemployment rate fell to 4.1 percent in December 2017, down 0.6 percentage point from a year earlier. And despite the low and falling unemployment rate, nominal wage inflation for private workers was fairly stable, at 2.7 percent during the 12 months of 2017, the same pace as the year earlier.

Private employment increased by 2.2 million jobs during the 12 months of 2017, after rising by 2.1 million jobs in 2016. During the 12 months of 2017, 43 percent of the gains in private sector jobs came from professional and business services and from education and health services, even though these services make up only about 35 percent of the economy’s private sector jobs. During the 12 months of 2017, 11 percent of private sector job gains came from manufacturing and from mining, a reversal from 2016, when both sectors suffered job losses.

The labor market’s improvement was apparent in the continued decline of the unemployment rate. By December 2017, the unemployment rate had fallen to 4.1 percent, the lowest level since 2000, and 0.6 percentage point below its level a year earlier. The unemployment rate for African Americans was down 1.1 percentage points during the 12 months through December, to 6.8 percent, the lowest rate recorded in a series that began in 1972. The unemployment rate for Hispanics was down 1.0 percentage point during the 12 months through December, to 4.9 percent, near the lowest rate on record. With growth prospects remaining strong, further declines in the unemployment rate are expected—it is projected to fall to 3.7 percent by 2019:Q4.

Although the overall unemployment rate was below its prerecession average during the 12 months of 2017, other indicators showed relatively more labor market slackness, in the sense that they had not fallen below their prerecession levels until the fourth quarter. For example, the long-term unemployment rate remained at or just above its 1.0 percent prerecession average

Figure 8-22. Monthly Nonfarm Payroll Job Growth, 2007-17

Monthly job gains or losses (thousands, seasonally adjusted)

Sources: Bureau of Labor Statistics, Current Employment Statistics; CEA calculations.

(December 2001–November 2007) for much of 2017—although, by December 2017, it had fallen to 0.9 percent (figure 8-23).

Similarly, the share of the labor force working part time for economic reasons (i.e., those working part time who would prefer to work full time), fell 0.4 percentage point during the 12 months of 2017, to 3.1 percent in December (figure 8-24).²

The relatively elevated rate of part-time work for economic reasons—that is, compared with other measures of slackness—is largely responsible for the relatively elevated U-6 “underemployment” rate. U-6, the broadest measure of unemployment, includes both people who have stopped looking for a job and part-time employees who want to work full time—and it was the last of the alternative measures of unemployment to reach its prerecession average, falling to that rate in March 2017. By December 2017, the U-6 rate had fallen to 8.1 percent, 1.0 percentage point lower than a year earlier and below its prerecession average (figure 8-25).

² Care must be taken when comparing the share of employees who work part time for economic reasons before and after the 1994 redesign of the Current Population Survey. The CEA used the multiplicative adjustment factors reported by Polivka and Miller (1998) in order to place the pre-1994 estimates of those who worked part time for economic reasons on a comparable basis with post-redesign estimates. For the part-time series for which Polivka and Miller do not report suitable adjustment factors, the pre- and post-redesign series were spliced by multiplying the pre-1994 estimates by the ratio of the January 1994 rate to the December 1993 rate. This procedure generates similar results to Polivka and Miller’s factors for series for which multiplicative factors are available.

Figure 8-23. Unemployment Rate by Duration, 1990–2017

Figure 8-24. Rates of Part-Time Work, 1960–2017

After falling continuously since 2007, the 12-month moving average of the labor force participation rate edged up in 2016 and 2017. Between 2007 (as a whole) and 2016 (as a whole), the participation rate fell 3.3 percentage points. A CEA analysis found that most of this decline was attributable to aging cohorts of the Baby Boom generation entering retirement (CEA 2014). However, Fernald and others (2017) find that forces other than demography nonetheless accounted for one-third of the overall decline in participation during the recovery, and about half the decline since the cyclical peak in 2007:Q4. They note that “although demographic shifts are and will continue to be an important part of the decline in the participation rate, demographics provide only a partial explanation. The complete explanation will also consider changes in family structure, real wages, taxes, benefits, and the value of time spent outside the labor market.”

In the years immediately after the financial crisis of 2007–9, cyclical factors—specifically the lack of job opportunities during the Great Recession and its aftermath—exacerbated the decline in the labor force participation rate, though by 2017 the effect of cyclical factors had flipped from negative to positive. In addition, nondemographic structural factors were therefore also important in observed declines in participation after 2007. For instance, as demonstrated in chapter 3, on labor markets, increases in fiscal transfers during the Great Recession to mitigate the demand-side effects of rising unemployment have also had persistent negative effects on the labor supply, while structural unemployment coincident with limited geographic mobility, an opioid crisis (see chapter 6), and shifting time use have similarly exacerbated downward trends in participation among prime-age workers and young adults. As discussed in chapter 3, there are policy options to counteract these adverse nondemographic trends.

Though demographic-related downward pressures in labor force participation will become steeper in the near term as the peak of the Baby Boom generation retires, the -0.25 -percentage-point effect of demographic trends on participation in 2017 was partially offset by rising participation rates among those in their 60s, and by a tighter labor market encouraging discouraged workers to reenter it. Moreover, reductions in marginal income tax rates, as implemented by the Tax Cuts and Jobs Act, can have economically important effects on participation at the upper end of the age distribution, as highly productive near-retirement workers are incentivized to defer retirement (for more on this, see chapter 1, on tax reform). That is, there is evidence that older workers are more responsive to changes in marginal income tax rates than younger workers. Yet, though demographic trends will again become more decisive as positive short- and medium-term cyclical factors dissipate, neither the decision to retire nor longer-term trends among prime-age workers and young adults are policy-invariant.

Figure 8-25. Alternative Measures of Labor Force Underutilization, 2007–17

Policy Developments

Principal developments in the realm of policy pertain to fiscal and monetary matters. This section considers each of these in turn.

Fiscal Policy

In December 2017, the Tax Cuts and Jobs Act was enacted with four main goals: tax relief for middle-income families, simplification of individuals' taxes, economic growth through business tax relief, and repatriation of overseas earnings. The Joint Committee on Taxation (JCT 2017) estimated that the TCJA's static effect (i.e., without macroeconomic feedback) would lower revenues by \$136 billion in fiscal year (FY) 2018 and by \$280 billion in FY 2019. Macroeconomic feedback (the effect of faster economic growth on revenues) can be expected to dynamically offset some of these revenue losses. As discussed in chapter 1, the TCJA's individual provisions are projected to raise GDP by 1.3 to 1.6 percent over two to three years, while the corporate provisions are estimated to raise GDP by 2 to 4 percent over the long run, and furthermore boost average annual household wages by about \$4,000.

In FY 2017, the Federal fiscal deficit increased by 0.3 percentage point, to 3.5 percent of GDP, after an increase a year earlier of 0.7 percentage point, to 3.2 percent of GDP (figure 8-26). In FY 2016, outlays as a share of GDP rose by 0.4 percentage point, partly reflecting the temporary \$80 billion in sequester relief included in the Bipartisan Budget Act of October 2015, along with the

Figure 8-26. Federal Budget Deficit as a Share of Nominal GDP, FYs 1950–2017

Sources: Office of Management and Budget, Federal Budget Projections; Bureau of Economic Analysis, National Income and Product Accounts; CEA calculations.
 Note: Budget deficits/surpluses are calculated for fiscal years (FYs).

Fixing America’s Surface Transportation (known as FAST) Act, signed into law in December 2015, which authorized \$305 billion over five years for surface transportation, including roads, bridges, and rail. In FY 2017, with spending governed by continuing resolutions (in which Federal spending is reauthorized at the previously authorized level), outlays as a share of GDP edged down by 0.1 percentage point. (Timing issues with certain outlays—delayed from weekends to weekdays—also suppressed FY 2017 outlays slightly, by 0.2 percentage point, according to the Congressional Budget Office.) The increase in the deficit was also accounted for by falling revenues, which, as a share of GDP, fell by 0.4 percentage point in both FYs 2016 and 2017. The FY 2016 decline in revenues may be partly accounted for by the PATH (Protecting Americans from Tax Hikes) Act, signed into law in December 2015, which retroactively made permanent several tax credits that had “expired” at the beginning of 2015 (tax incentives for research and experimentation, and a 50 percent bonus depreciation). This retroactive continuation of previously existing tax provisions may have led to overpayments in FY 2015 and refunds in FY 2016. The FY 2017 drop in revenues was unexpected, and does not appear to be accounted for by any major provisions of tax policy, although minor tax-reducing developments included a \$34 billion drop in taxes paid on Federal Reserve Bank profits and a one-year moratorium on the Affordable Care Act’s fee on health insurance providers, which depressed revenues by about \$12 billion. The deficit-to-GDP ratio of 3.5 percent is slightly larger than the 3.1 percent average during the preceding 40 years.

Monetary Policy

As of December 2017, the Federal Open Market Committee (FOMC; the monetary policy body within the Federal Reserve System) was targeting a range for the Federal funds rate of 1.25 to 1.50 percent after three rate hikes of 25 basis points each during 2017. In the wake of these rate hikes, the FOMC stated (with some slight variation after its December meeting) that “the stance of monetary policy remains accommodative, thereby supporting some further strengthening in labor market conditions and a sustained return to 2 percent inflation.” In October, the FOMC also announced its intention to follow through on its plan (outlined at its June monetary policy meeting) to “gradually reduce the Federal Reserve’s securities holdings by decreasing its reinvestment of the principal payments it receives from securities held in the System Open Market Account. Specifically, such payments will be reinvested only to the extent that they exceed gradually rising caps” (FRB 2017a, 2017b, 2017c).

Unlike the previous few years, the Federal Reserve’s realized pace of raising rates in 2017 was in line with the median forecasted pace of FOMC participants at the close of the previous year—December 2016. In December 2016, the median of FOMC participant projections was three 25-basis-point rate hikes in 2017. In 2017, the target range for the Federal funds rate increased from 0.50-to-0.75 percent to 1.25-to-1.50 percent. The rate hikes were decisions made by the committee reflecting the fact that the “labor market has continued to strengthen and that economic activity has been rising at a solid rate,” and the FOMC continues to believe that “inflation on a 12-month basis is expected to remain somewhat below 2 percent in the near term but to stabilize around the Committee’s 2 percent objective over the medium term.” The FOMC’s decisions frequently noted that “the Committee expects that economic conditions will evolve in a manner that will warrant gradual increases in the Federal funds rate; the Federal funds rate is likely to remain, for some time, below levels that are expected to prevail in the longer run.” Throughout the year, the market-implied Federal funds rate for the end of 2017 was below the median forecast of FOMC participants at the time. It is particularly important that the FOMC emphasized throughout 2017 that monetary policy is not on a “preset course” and that the projections of FOMC participants are only an indication of what they view as the most likely path of interest rates, given beliefs on the future path of the economy. The FOMC raised its median economic forecast for real GDP growth by 0.4 percentage point, to 2.5 percent, during the four quarters of 2018; and by 0.1 percentage point, to 2.1 percent, in 2019—keeping long-term projections unchanged at 1.8 percent (FRB 2017a, 2017b, 2017c).

The Federal Reserve declared that, in October 2017, the FOMC would initiate the balance sheet normalization program announced in June. In November 2008, at the depth of the Great Recession, faced with a zero lower bound on nominal interest rates, the FOMC had started buying long-term securities. This unconventional monetary policy tool to lower medium- and longer-term

Figure 8-27. Federal Reserve Total Assets, 2000–2017

Sources: Board of Governors of the Federal Reserve System (FRB), Consolidated Statement of Condition of all Federal Reserve Banks; FRB, Factors Affecting Reserve Balances of Depository Institutions and Condition Statements of Federal Reserve Banks; CEA calculations.

interest rates has been referred to as quantitative easing (QE). This led to the largest expansion of the Federal Reserve’s balance sheet since World War II, which, as of December 2017, stood at \$4.45 trillion (figure 8-27).

The initial round of QE, which began in November 2008 and ended just over a year later, consisted of \$1.25 trillion in purchases of mortgage-backed securities, \$200 billion in Federal agency debt, and \$300 billion in long-term Treasury securities. The Federal Reserve’s stated goals for purchasing mortgage-backed securities in round one of QE were to “reduce the cost and increase the availability of credit for the purchase of houses, which in turn should support housing markets and foster improved conditions in financial markets more generally.” The purpose of increasing credit availability by buying Treasuries was to “promote a stronger pace of economic recovery and to help ensure that inflation, over time, is at levels consistent with its [the Fed’s] mandate” (FRB 2008, 2010). Later rounds of QE led to the disposition of assets shown in figure 8-27.

The Federal Reserve’s System Open Market Account, its domestic and foreign portfolio, was \$4.2 trillion in December 2017, almost six times its size in January 2005. Initially, the decline in this account’s securities holdings was capped at \$6 billion per month for Treasury securities and \$4 billion per month for agency debt and agency mortgage-backed securities. These caps will gradually rise to maximums of \$30 billion per month for Treasury securities and

\$20 billion per month for agency debt and agency mortgage-backed securities during the process of normalizing the balance sheet. Furthermore, beginning in January 2018, the Federal Reserve is rolling over maturing Treasury securities in excess of \$12 billion per month (doubled from the 2017 threshold of \$6 billion per month). Similarly, maturing agency debt and agency mortgage-backed securities will be rolled over only when they exceed \$8 billion per month, up from the previous threshold of \$4 billion per month (FRB 2017a, 2017b, 2017c).

In recent years, FOMC participants have tended to lower their projections of the longer-run level for the Federal funds rate. As of December 2017, the median of FOMC participants' projections of the long-run Federal funds rate was 2.8 percent, down from 3.0 percent a year earlier and from 3.5 percent in December 2015. These downward revisions are consistent with long-term, downward trends in short-term interest rates in U.S. and global financial markets.

Productivity

In the decade before 2017, growth in labor productivity, defined as nonfarm output per hour worked, grew at historically low rates. Productivity growth slowed first in about 2005 and then further after 2011, averaging just 0.5 percent over the five years ending in 2015:Q4—the slowest five years during an expansion in postwar data. Labor productivity growth picked up, however, during the four quarters of 2017, growing 1.1 percent, though it remains below its 2.2 percent average during the years 1953–2007 (figure 8-28). Productivity movements during recessions and recoveries reflect a variety of factors besides technology, such as the ease in varying output relative to hiring and firing workers and variation in the quality of the pool of available workers during the course of a recovery. Over longer periods of time, the growth in labor productivity reflects capital services and technology, and the growth in real output and real wages depends on rising productivity, so the slowdown since the 2007 business cycle peak has been a cause for concern.

A useful way to analyze labor productivity is to decompose its growth into three factors: increased capital services per hour worked (capital deepening); increased skills per worker (labor composition); and increased technology or efficiency, which is technically termed “total factor productivity” and is measured as a residual. Labor productivity slowed from a 2.23 percent annual rate of growth before 2007 to 1.17 percent thereafter. Of this 1.1 percentage point slowdown in labor productivity growth, 0.7 percentage point was accounted for by the slowdown in total factor productivity, while 0.4 percentage point was accounted for by slower capital deepening. The contribution of labor composition increased 0.1 percentage point (figure 8-29).

In the period from 1953 to 2007, about 0.9 percentage point (40 percent) of labor productivity growth was attributable to additional capital services per

Figure 8-28. Nonfarm Business Productivity, 1953–2017

Log (index, 2009 = 100)

Sources: Bureau of Labor Statistics, Productivity and Costs; CEA calculations.

Note: 1953 and 2007 are NBER business-cycle peaks.

worker, but this slowed to 0.5 percentage point during the nine years 2007–16. Even as the recovery was under way from 2010 to 2015, the role of capital deepening vis-à-vis labor productivity growth was actually negative; in 2014 and 2015, a worker had fewer capital services at his or her disposal than five years earlier—the first time this had occurred during any five-year period since the end of World War II. As noted above, these data suggest that net investment (i.e., gross investment less depreciation) has not sufficed to grow capital services in line with the increase in hours worked.

However, on the positive side, the contribution of labor composition to labor productivity growth has increased since 2007, relative to its long-run average. With Baby Boomers continuing to move into their 60s, the contribution of labor composition to productivity growth may be a target for policy. Specifically, policies that incentivize highly skilled and experienced older workers with relatively high elasticities of labor supply to defer their retirement—such as the marginal income tax rate reductions enacted by the TCJA—could also have important implications for both labor force participation and productivity growth (Keane and Rogerson 2012, 2015).

Longer-standing declines in the economy’s fluidity and dynamism could also be exacerbating slower productivity growth. As documented by Davis and Haltiwanger (2014), the entry of new firms has been slowing for decades, and to the extent that these young firms drive both investment and productivity

Figure 8-29. Sources of Labor Productivity Growth, 1953–2016

Percent change or percentage points (annual rate)

Sources: Bureau of Labor Statistics, Net Multifactor Productivity and Cost; CEA calculations.
 Note: 1953 and 2007 are NBER business-cycle peaks. Productivity is calculated for the private nonfarm business sector.

growth, their decline is important. The lack of business dynamism may also underlie the incomplete recycling of investment funds into young and growing firms.

A pessimistic view put forward by the economist Robert Gordon is that the global economy may have simply run through the best productivity-enhancing innovations—such as the steam engine, the telephone, and indoor plumbing—and thus more recent innovations may not have the same impact on output (Gordon 2012). But this pessimistic view of the future is not universally held; it has been critiqued by, among others, Mokyr (2014a, 2014b, 2014c) and Mokyr, Vickers, and Zeibarth (2015). The world has more educated and connected people than at any time in history. Investment in intellectual property products has been strong throughout the recovery. In particular, spending on the research-and-development component of investment has risen to almost its highest share of GDP on record, which suggests that innovations will likely continue. Many new technologies—such as robotics, e-learning, and the use of big data—promise strong productivity growth in the near future. Taken together with the globalization of invention, whereby all countries benefit somewhat from innovations anywhere, one can argue for higher labor productivity growth in the next 10 years than in the recent past (Branstetter and Sichel 2017).

In the future, a number of the President’s proposed and recently enacted policies would and should contribute to increasing productivity growth. Reductions in excessive regulations, as discussed in chapter 2, would improve economic efficiency by boosting investment and increasing production and

labor productivity—in particular by facilitating the entry of new, more innovative firms. Infrastructure spending would lift public investment, thereby raising effective capital services per worker, and would also address the challenges of structural unemployment, declining labor force participation, and regional variation in total factor productivity by improving geographic mobility (for an in-depth discussion of the benefits of infrastructure spending, see chapter 4 of this *Report*). Broader policies would aid as well—supportive entrepreneurship policies would encourage both investment and firm dynamism; and the recently enacted business tax reform will stimulate domestic investment in plants, equipment, and innovation. There is no silver bullet for improving productivity growth. But sound policy across a range of initiatives could support it, raising real wages and living standards in the process.

Wage and Price Inflation

Nominal wage inflation was stable in 2017, even as the labor market continued to grow stronger amid robust job growth (figure 8-30). Average nominal hourly earnings for all private sector employees increased by 2.7 percent during the 12 months of 2017, the same pace as in the period a year earlier. Nominal hourly compensation for private sector workers, as measured by the employment cost index, increased 2.6 percent during the 12 months of 2017, up from 2.2 percent during 2016.

Consumer prices—as measured by the price index for personal consumption expenditures, shown in figure 8-31—increased 1.7 percent during the 12 months of 2017. The inflation rate was elevated by energy price increases. Core PCE inflation—which excludes energy and food prices, and tends to be a better predictor of future inflation than overall inflation—was also less than the 2 percent target for overall PCE inflation, at 1.5 percent during 2017.³ Lower prices for imported goods likely weighed on core inflation in 2017. The pass-through of low import prices and uncertain energy prices will be two keys to the economy’s inflationary pressures in 2018.

The low rates of consumer price inflation were unexpected. For example, the November 2016 forecast by the Survey of Professional Forecasters of the core PCE price index was 1.9 percent over the four quarters of 2017 (above the 1.5 percent realized value). The low rate of price inflation is puzzling because

³ The Federal Reserve defines its inflation objective in terms of the PCE price index. The CPI is an alternate measure of prices paid by consumers and is used to index some government transfers, such as Social Security benefits. Largely because of a different method of aggregating the individual components, but also because of different ways of measuring some components, PCE inflation has averaged about 0.3 percentage point a year less since 1979 than the measure of inflation called the “Consumer Price Index for All Urban Consumers Research Series” (CPI-U-RS). The CPI-U-RS is a research version of the CPI that revises the historical series using current methods. During the 12 months ending in December 2017, core CPI prices increased 1.8 percent, more than the 1.5 percent increase in core PCE prices.

 Note: Shading denotes recession.

the primary measure of economic slackness, the unemployment rate, was low for the entire year, falling from 4.7 percent in 2016:Q4 to 4.1 percent in 2017:Q4. The unemployment rate is just one factor affecting the path of inflation. Another important reason for low inflation has been international competition in the form of low import prices. Periods of high or low import prices (relative to business prices) can be seen in figure 8-32, where both the business price and import price series have been reindexed so that their entire historical series average to 100. As can be seen in figure 8-32, the reindexed level of import prices has been well below the reindexed level of U.S. business prices since 2014, holding down U.S. rates of inflation.

Real wage growth fluctuates primarily because of the variation in the volatile components of prices rather than of nominal wages. During the 12 months of 2017, for example, the official measure of real wages of all private sector employees increased 0.6 percent, similar to 0.5 percent in 2016, but down from 1.9 percent in 2015. In contrast, an alternate measure of real wages, one that is deflated by the core consumer price index, rose 0.9 percent, up from 0.4 percent in both 2015 and 2016 (figure 8-33). During the past three years, nominal wage growth has been stable in the range of 2 to 3 percent, while the alternate (core CPI deflated) measure of real wages has been stable in the range of 0 to 1 percent. The large and mostly unanticipated changes in food and energy prices have driven the volatility in the official measure of real wages.

This calculation of real wages follows the Bureau of Labor Statistics' practice of deflating by the official CPI, although it tracks a fixed market basket,

Figure 8-33. Growth in Real and Nominal Average Hourly Wages of Private Sector Workers, 2007–17

Sources: Bureau of Labor Statistics (BLS), Establishment Survey; BLS, Consumer Price Indexes (CPI); CEA calculations.

Note: Nominal average hourly earnings for all private sector workers are deflated using the CPI and core CPI for all urban consumers.

without recognizing consumers’ response to changes in relative prices. The bureau’s research series “the chained CPI” adjusts for this bias and shows lower inflation (averaging 0.23 percentage point per year since 2002). If the market basket is allowed to vary with consumer choices—as is done with the chained CPI—then real wages would be growing 0.23 percentage point faster, on average.

The Financial and Oil Markets

During 2017, equity indices reached all-time highs, government bond yields were mixed, and credit spreads evolved to a lower level. Oil prices dipped in the first half of the year, but increased in the second half ending with the December prices of West Texas Intermediate Crude Oil at more than \$60 per barrel, up about \$7 from 12 months earlier. Tax reform plans solidified during the year with the TCJA’s enactment in late December, and the anticipated cuts in the corporate tax rate were one factor boosting the stock market. Throughout 2017, the Standard & Poor’s (S&P) 500 Index rose 19.4 percent, reaching an all-time nominal high in December, an upward movement that continued into January 2018 but was reversed in early February. The perceived volatility of the financial markets—as measured by the Chicago Board Options Exchange’s Market Volatility Index (VIX), which translates prices for stock options into a

Figure 8-34. S&P 500 and VIX (Chicago Board Options Exchange) Indices, 2017-18

measure of volatility—was roughly stable through the end of 2017, but spiked in early February 2018.

Equity Markets

The S&P 500 Index rose 19.4 percent in 2017, reaching an all-time high in nominal terms (figure 8-34). In real terms, the S&P 500 Index also reached an all-time high (deflated by the official consumer price index), and increased by about 16 percent in December from a year earlier. In 2017, the index experienced fairly steady growth, with gains in 11 of the 12 months. Increases continued in January 2018, but were reversed in early February, and the index was essentially unchanged after the final trading day in 2017 (up 0.8 percent, through February 6). The VIX, which uses the prices of options to uncover investors' expectations of volatility for the S&P 500, fell 21.4 percent during 2017, to a year-end value of 11.0 (VIX levels below 15 are generally considered low). The VIX jumped in the first week of February 2018, and closed at 30 as of February 6. The VIX has not seen these heights since August 2015.

Small-cap stocks, which typically are those with a market capitalization under \$2 billion, experienced similar gains in 2017 as well. The Russell 2000 Index, which measures the performance of small-cap equities, increased by 13.1 percent during 2017. The Russell 2000 has since reversed some of its gains in 2017, falling nearly 2 percent on net in the first five weeks of 2018.

Figure 8-35. Nominal Long- and Short-Term Interest Rates, 2017-18

Sources: Bloomberg; CEA calculations.

Cryptocurrencies, in particular bitcoin, experienced massive gains in 2017. At the end of 2017, the total world value of bitcoin was more than \$240 billion, when the price per bitcoin was more than \$14,000. The current bitcoin-dollar cross stands at nearly \$8,000, and has fallen about 46 percent in 2018 as of February 6. (To read more about the technology behind bitcoin, see chapter 7 of this *Report*, on cybersecurity.)

Interest Rates and Credit Spreads

During the course of the year, short-term yields on Treasury notes (of two years or less) generally edged higher, following the lead of the Federal Reserve, which raised the Federal funds rate three times during the year (figure 8-35). The yield on 10-year Treasury notes, in contrast, was essentially unchanged during the 12 months of the year, after falling through September and then rebounding thereafter. The 10-year yield finished 2017 at 2.41 percent. Through February 6, the 10-year yield increased by almost 40 basis points in 2018, with the majority of the increase following the January 2018 labor market report. As of February 6, 2018, the yield on a 10-year Treasury stands at 2.8 percent for the first time since April 2014. Market participants' perceptions of default risk, as measured by credit default swap (CDS) spreads, fell steadily during the year, reaching new lows. An aggregate of North American investment-grade CDS spreads fell 19 basis points over the year, to their lowest levels on record. Moreover, North American high-yield CDS spreads fell 48 basis points. Though

both investment-grade and high-yield CDS spreads increased sharply in early February (through February 6), they remain below their historical averages.

At the same time, consensus forecasts of long-run U.S. interest rates fell during 2017. The long-term forecast by the Blue Chip consensus of professional forecasters fell from 2.9 percent in March 2017 to 2.7 percent in October 2017. Similarly, the market-implied expectation for the 10-year Treasury yield (10 years from now) fell during the year, to 2.99 percent, although it moved upward in early 2018.

The yield curve for U.S. Treasury notes flattened during the 12 months of 2017, as yields on short-term debt increased while yields on long-term debt were little changed (figure 8-36). The 10-year U.S. Treasury yield ended the year at 2.41 percent, 3 basis points below its level on December 31, 2016. During the 12 months of 2017, the spread between the 10-year and 2-year yields fell 73 basis points. (In January and early February 2018, however, some of the preceding year's flattening was reversed, so the roughly 13-month drop in the spread was 56 basis points.)

A substantial body of literature documenting the slope of the yield curve for U.S. Treasury notes helps predict economic activity, with much of the history reflecting periods when Federal Reserve tightening was designed to suppress inflation (e.g., Estrella and Mishkin 1996). At this moment, however, there are reasons to believe that different, unusual factors are causing the flattening. During previous episodes of tightening, inflation was above the Federal Reserve's desired rates, but inflation is now below its target. Despite the past year's narrowing, the 10- to 2-year spread on February 6, 2018, was not particularly small (at 70 basis points), at about the 40th percentile of its historical distribution. The rise in short-term yields reflected the Federal Reserve's three 2017 hikes in the Federal funds rate, and also expectations of future rate hikes during the years 2018–19. The small yield decline during 2017 at the long end (i.e., for 20- or 30-year Treasury notes) may partly reflect lower long-run inflation expectations, or some spillover from unconventional monetary policies in the euro zone and Japan, although declining expectations of real GDP growth cannot be ruled out.

Interest rates increased at maturities of two years or longer during the first two months of 2018, likely reflecting the TCJA's late-December enactment, together with the related perception of emerging economic strength in 2018. Since the last trading day of 2017, the yield curve has steepened, as the yield on 2-year Treasury notes rose 22 basis points through February 6, while the 10-year yield rose nearly 40 basis points. The implicit forecast of the 10-year rate 10 years forward has increased 28 basis points since the last business day of 2017, to 3.27 percent on February 6, 2018.

The mortgage rate for 30-year fixed rate contracts was down 21 basis points during 2017, finishing at 3.85 percent, and reflected the stability of long-term Treasury yields, which are still low relative to their long-term averages.

Figure 8-36. U.S. Treasuries Yield Curve, 2016-18

Source: U.S. Department of the Treasury.

Note: December dates represent the last trading day of each respective year.

The 30-year mortgage rate rose in the first five weeks of 2018 after substantial increases in long-term Treasury yields. Unusually low interest rates are not unique to the United States; relatively low interest rates were common among the Group of Seven economies in 2017.

Market measures of risk perception eased during 2017. Borrowing costs for BBB-rated companies decreased more than 10-year U.S. Treasury yields did in 2017, with the BBB spread over 10-year U.S. Treasuries declining from 150 basis points at the end of 2016 to 128 basis points at the end of December 2017. The BBB spread in December 2017 was well below its average postrecession level of 190 basis points. This downward trend has continued into 2018, with spreads tapering even further. Narrowing corporate credit spreads relative to Treasury notes mean that the market is requiring less compensation for the credit risk of corporate debt, consistent with the downward movement of CDS spreads for corporate debt over the year. Because CDS spreads are the cost of insurance against the default of a corporate borrower, falling CDS spreads mean that the market perceives corporate debt defaults as less probable now than at the start of the year. With risk perceptions down, corporate bond issuance has been proceeding at a robust pace; in 2017, corporate bond issuers issued \$1.7 trillion in debt, the largest amount on record.⁴

⁴ This measure was provided by the Securities Industry and Financial Markets Association, and it includes all nonconvertible corporate debt, medium-term notes, and Yankee bonds, but excludes all issues with maturities of one year or less and certificates of deposit.

Figure 8-37. Brent Crude and West Texas Intermediate (WTI) Prices, 2016–18

Oil Prices and Production

Oil prices edged down in the first half of the year, with a more-than-offsetting increase in the second half (figure 8-37). Prices of West Texas Intermediate (WTI)—a benchmark grade of U.S. crude oil—increased nearly \$7 per barrel during 2017, ending the year at more than \$60 per barrel. Prices of Brent Crude Oil increased by almost \$12 per barrel during 2017, ending the year at nearly \$69. Some of the increase in oil prices in the second half of the year was attributable to Hurricane Harvey, which temporarily shut down many oil rigs in the Gulf of Mexico, along with Texas refining operations. An announcement in November 2016 by the Organization of the Petroleum Exporting Countries, stating that it would cap production, also put upward pressure on prices during the year. As of February 6, 2018, the prices of WTI and Brent were \$63.50 and \$67.00, respectively, with WTI adding over \$3 a barrel since the end of 2017 but Brent adding only \$0.19.

Crude oil production in the United States has increased dramatically in recent years, and the increase in domestic production has replaced U.S. demand for net imports (figure 8-38). Much of the increase in domestic production reflects technological advances in extracting “tight” oil from unconventional formations. Although the 2014–15 decline in world oil prices resulted in a 2015–16 decline in domestic production, 2017’s oil price increase has led to a partial rebound in petroleum extraction.

The Global Macroeconomic Situation

Exports are a key contributor to economic growth in the United States, nearly doubling as a share of GDP over the past three decades. As figure 8-39 shows, U.S. export growth has closely followed the growth of foreign GDP.⁵ This section provides an overview of the macroeconomic situation among the United States’ major trading partners. It also discusses several major ongoing global trends that affect the demand for U.S. products, including (1) the global slump in productivity growth; (2) the low wage growth in advanced economies, despite strengthening labor markets; and (3) the increasing pockets of financial vulnerability across certain emerging market and developing economies.

Developments in 2017

The global recovery continued in 2017, with a slight increase in growth from the 2016 pace of 3.2 percent. In its October 2017 *World Economic Outlook* (IMF 2017d), the International Monetary Fund forecasted that global growth will continue during the four quarters of 2018 at 3.7 percent, a bit higher than the forecasted 2017 pace. Growth in 2017 was supported by pickups in investment and industrial production, and was facilitated internationally by a pickup in international trade. Downside risks remain for the longer-term growth

⁵The CEA calculates trade-weighted global growth as a weighted average of real GDP growth for 25 foreign economies and the euro zone, using these economies’ share of U.S. goods exports as weights.

Figure 8-39. Foreign Real GDP and U.S. Real Export Growth, 2000–2017

Sources: Bureau of Economic Analysis; national sources; Haver Analytics; CEA calculations.
Note: 2017:Q3 GDP data are unavailable for Argentina and Saudi Arabia.

outlook, however, for reasons including geopolitical tensions and rising public and private debt levels across several developed and developing countries. These risks are exacerbated by continuing low productivity growth in several advanced economies, along with limited conventional monetary policy space, due to already-low interest rates.

In advanced economies and regions—such as Germany, France, Japan, the United Kingdom, and the European Union—output gaps are closing as real GDP growth rates exceed potential growth rates (i.e., the rate at which the economy would grow with full employment and stable inflation). Most advanced economies, however, face medium-term growth rates that are below their precrisis rates. Inflation is below or barely at target levels in most advanced economies, despite a decade’s worth of accommodative, unconventional monetary policy measures—such as quantitative easing, credit easing, forward guidance, and negative interest rate policies. Inflation is arguably picking up slowly in the EU, although it remains below target rates, while inflation in Japan remains barely positive. Recent economic indicators for Europe are promising (figure 8-40), however, suggesting that these economies might be emerging from this low-growth environment.

The banking sector in Europe remains weak due to lingering concerns about factors such as the continued low profitability of banks, depressed valuations, and the large stock of nonperforming loans. Although progress has been made in improving the quantity of capital, much remains to be done to improve the health of banks, including the introduction of the European bank

Figure 8-40. European Union Consumer and Industrial Confidence Indicators, 2002–18

deposit insurance system in the euro zone—an important step toward creating a banking union. The creation of a banking union has been touted as integral to maintaining stability in a common currency area such as the euro zone, where debt-ridden banks and debt-ridden governments prone to dragging each other down due to the close links between public sector finances and the banking sector. Uncertainty also remains in European markets as the Brexit negotiations unfold.

In emerging and developing economies—such as Brazil, China, India, Russia, and certain other countries in Africa, Asia, and Latin America—strengthening the external environment continues to help output growth recover (IMF 2017a). There are, however, certain risks to future growth. As monetary policy normalizes with higher interest rates in advanced economies, emerging and developing economies could face an outflow of capital. Financial stability risks are also increasing due to the increase in nonperforming loans on the private sector balance sheets of two of the biggest and fastest-growing emerging market economies, China and India. Credit growth in China has arguably also become excessive, as it continues to shift from growth led by exports and investment to an economy led by internal demand.

Growth in India has slowed due to the effects of its structural economic reforms. India’s demonetization of large-denomination notes in November 2016 invalidated 86 percent of the cash in circulation in an economy where more than 90 percent of transactions were cash based. The introduction in July

2017 of a single, countrywide sales tax replaced a vast number of different state and local tax rates, and has created short-term uncertainty.

Growth in emerging and developing economies in Latin America is gathering steam as recessions in a few countries in the region—notably Argentina and Brazil—are abating. Among other policy actions, Brazil has been pursuing an accommodative monetary policy stance, and Argentina passed a tax reform bill in December 2017 designed to reduce inefficient taxes and the tax burden (IMF 2017f). Growth in commodity-exporting economies, in general, is picking up somewhat as commodity prices slowly recover from the slump in mid-2015, but the adverse effects of lower commodity revenues linger, especially for fuel exporters (IMF 2017a).

The Global Productivity Slowdown

Labor productivity growth has been slowing in the major advanced economies (figure 8-41), driven by an estimated decline of 0.3 percent in annual multifactor productivity growth relative to average precrisis growth of 1 percent a year. This slowdown is broad-based, also affecting developing and emerging market economies. Although the causes of this productivity slowdown are unclear, a number of hypotheses have been offered—including financial crisis legacies, such as weak demand and lower capital investment; the trade slowdown; the aging of the post-World War II Baby Boom generation in its various forms around the world; the rising share of low-productivity firms; and a widening gap between high- and low-productivity firms.

The Organization for Economic Cooperation and Development (OECD) finds that the survival of abnormally low-productivity firms may have contributed to the slowdown in productivity growth (Andrews, Crisculo, and Gal 2016; McGowan, Andrews, and Millot 2017). During the 2000s, a substantial gap in labor productivity growth emerged between frontier firms and laggard firms around the globe in manufacturing—with frontier firms defined as the 100 most productive firms in a given sector. The frontier firms grew at an annual rate of 3.5 percent, compared with 0.5 percent for nonfrontier firms. Despite the huge resulting difference in productivity today, the nonfrontier firms continue to survive. Such businesses, termed “zombie” firms by the OECD, often have trouble meeting their interest payments (Andrews, Criscuolo, and Gal 2016). Not only does this dampen aggregate productivity growth; the rising share of nonviable firms is also increasingly crowding out growth opportunities for more productive firms (McGowan, Andrews, and Millot 2017). The low-productivity firms could be surviving due to the permissive legacies of the financial crisis—including accommodative financial and monetary policies such as bailouts, low interest rates, and asset purchases. Also, increased regulatory burdens can depress the flows of new firms entering the market and established firms exiting it (this is discussed in chapter 2, on regulation).

Figure 8-41. Average Annual Labor Productivity Growth in Selected Advanced Economies, 1996–2016

Advanced Economies’ Sluggish Increase in Wage Inflation

Although unemployment rates are generally back at precrisis levels and other labor market indicators have improved, nominal wage growth remains sluggish. In the European Union, nominal wage increases have been stable, at about 2.1 percent, during the four years through 2017:Q3 (figure 8-42), even as the unemployment rate fell to 7.4 percent in October 2017, just short of the precrisis low point of 6.9 percent in 2008:Q1. In Japan, wages during the four quarters through 2017:Q3 increased just 0.4 percent, the same as the increase a year earlier, despite an unemployment rate of 2.8 percent, lower than any rate during the 2000s. Several reasons have been offered for these trends. Increasing global integration could be putting downward pressure on wage growth because firms can more easily substitute cheaper labor available in foreign economies. As discussed below, cyclical factors, such as labor market slackness (aside from what is measured by the unemployment rate), and structural factors, such as the slowdown in productivity growth, are also contributing to tepid wage growth.

Although unemployment rates have fallen to low levels in most of the advanced economies, other labor market indicators suggest some enduring slackness. One of these, involuntary part-time employment, remained higher as of the end of 2017 in most advanced economies compared with precrisis levels (IMF 2017d). Although involuntary part-time employment rose during the recession and then fell during the ongoing expansion, it remains higher now than before the crisis in advanced economies, including France (7.8 percent in

Figure 8-42. Nominal Wage Inflation in Selected Economies, 2005–17

Sources: National sources; CEA calculations.
 Note: U.S. data are for production and nonsupervisory employees.

2017, compared with 5.3 percent in 2007) and the United Kingdom (3.9 percent in 2017, compared with 2.4 percent in 2007). In addition, temporary employment contracts in most advanced economies are also more prevalent now than in the years before the financial crisis. More part-time and contractual jobs are one reason why the hours per employee continue to decline in advanced economies, despite low unemployment levels. These could be due to weak demand for labor, which in turn reflects the fact that aggregate demand for final goods has not yet fully recovered. Besides the cyclical changes in the labor market, structural changes, such as low growth in labor productivity (mentioned above), directly lower both real and nominal wage increases.

Too-Low Price Inflation in Advanced Economies

Like wage inflation, price inflation has also remained low—and lower than might have been expected, given the high and improving rate of resource utilization, and lower than what key central banks have targeted (figure 8-43). As noted above, the Federal Reserve has endeavored to raise the inflation rate to its target of 2 percent, but the actual rate remains shy of this target. The shortfalls from target inflation rates are larger in the euro zone and Japan. In the euro zone, core consumer price inflation was 0.8 percent during the 12 months of 2017, and has not been higher than 1.1 percent since mid-2013. These inflation rates are well below the European Central Bank’s inflation cap of 2 percent for overall consumer prices, despite unconventional monetary policies, such as asset purchases and negative interest rates. Still, some economic slackness

Figure 8-43. Central Bank Inflation Measures for Selected Economies, 2001-17

Sources: National sources; CEA calculations.

Note: The horizontal dashed line represents the 2 percent inflation target or cap for each central bank. The inflation measures used are the overall Harmonized Index of Consumer Prices for the euro zone, the overall PCE for the U.S., and the overall CPI excluding fresh food for Japan.

appears to persist in the euro zone; the unemployment rate fell to 8.7 percent in November 2017, a bit higher than the 8.5 percent that it averaged during the six years through 2008. In Japan, core consumer prices inched up just 0.1 percent during the 12 months of 2017, far below the Bank of Japan’s target of 2 percent for nonfood consumer price inflation. Except during the years 2013–15, when Japan’s consumer price inflation was boosted by the anticipation and actual implementation of a sales tax, core inflation (excluding food and energy) has been negative or near zero for the past decade.

Financial Vulnerability in Emerging Market Economies

Despite the improvement in macroeconomic fundamentals across emerging market economies over the past couple of decades, pockets of financial vulnerability remain. According to the Federal Reserve’s emerging and developing economies vulnerability index (Powell 2017, figure 6), while economic and financial vulnerability in emerging and developing economies is lower now than in the 1990s, it has been trending up over the past decade. Excessive credit growth and nonperforming loans (NPLs) in influential emerging market economies such as China and India, along with rising corporate debt levels, are sources of concern. And although many of the NPLs are at state-owned enterprises, and can be rolled over, this rolling over will begin to starve the rest of these economies of new capital.

Since the financial crisis, the debt of the nonfinancial sector across 15 emerging market economies nearly tripled, to \$25.6 trillion, or more than 100

Figure 8-44. Emerging Market Credit to Nonfinancial Corporations, 2008-17

 Note: Emerging market economies include Argentina, Brazil, Chile, China (including Hong Kong), Hungary, India, Indonesia, Malaysia, Mexico, Poland, Russia, South Africa, South Korea, Thailand, and Turkey.

percent of combined GDP, in the second quarter of 2017.⁶ China is driving up the average, with corporate debt at a high 159.0 percent of GDP, as shown in figure 8-44.

Rapid credit growth in China, the world’s second-largest economy, poses further risks. Its total nonfinancial sector debt reached about 235 percent of annual GDP in 2016, and the International Monetary Fund projects it to increase to almost 300 percent of annual GDP by 2022 (IMF 2017c). Lending to the private sector grew by 16 percent in 2016, twice as fast as nominal GDP. Historically, such rapid increases in credit growth have been associated with sharp growth slowdowns and financial crises.⁷ Rapid credit growth has contributed to China having one of the world’s largest banking sectors, which further amplifies risks through possible contagion and cross-border spillovers. China’s banking sector is now nearly three times the average banking sector size in other emerging and developing economies, and it is also above the advanced economy average of 283 percent of annual GDP. Banking sector growth has been accompanied by a rise in NPLs, which, though roughly stable for the past six quarters (at about 8 percent of annual GDP), have more than doubled as a share of GDP since 2012 (figure 8-45).

⁶ The emerging market economies include Argentina, Brazil, Chile, China, Hungary, India, Indonesia, Malaysia, Mexico, Poland, Russia, South Africa, South Korea, Thailand, and Turkey.

⁷ The aggregate gap between private sector credit and GDP is a useful indicator to gauge the buildup of banking sector risk (BIS 2010).

Figure 8-45. Nonperforming Loans and Return on Assets for China's Commercial Banks, 2011-17

The increasing share of NPLs in India’s banking sector poses further risks. According to country-sourced statistics provided to the IMF, NPLs as a share of all loans (i.e., the NPL slippage ratio) in India stood at 9.7 percent in the third quarter of 2017, compared with 1.7 percent in China (IMF 2017e). NPLs have increased at an alarming rate in recent years, with the current NPL slippage ratio in India almost double that in FY 2014/15 (IMF 2017b). Public sector banks, with the State Bank of India as a leading example, account for the lion’s share of NPLs in the banking sector. The Reserve Bank of India (India’s central bank) predicts that gross NPLs as a proportion of all loans will increase to 10.8 percent in the first quarter of 2018, and to 11.1 percent by September 2018 (RBI 2017). However, the stress of India’s banking sector may be ameliorated in the future, given that the government recently announced a \$32.4 billion package to recapitalize publicly owned banks.

The Outlook

Historically, policy-inclusive Administration economic forecasts have not exhibited a stellar track record of correctly predicting actual long-run macroeconomic outcomes, either in absolute terms or relative to alternative forecasts. Figure 8-46 plots the 10-year (5-year before 1996) average annual GDP growth rate forecasted by the so-called Troika—the Council of Economic Advisers, Office of Management and Budget, and Treasury Department—against the 10-year forecasts of the Federal Reserve Bank of Philadelphia’s Survey of

Figure 8-46. Projected Real GDP Growth Rate, 1975–2016

10-year average annual growth rate

Sources: Bureau of Economic Analysis, National Income and Product Accounts; Federal Reserve Bank of Philadelphia, Survey of Professional Forecasters; Office of Management and Budget; Department of the Treasury; CEA calculations.

Note: Before 1996, 5-year annual averages are used for the Troika forecast.

Professional Forecasters (SPF), a simple random walk model, and the actual subsequent 10-year average growth rates.⁸ Not only have the Administration’s forecasts underperformed the SPF, but they have also underperformed against a simple random walk model, in which the next 10-year average growth rate is a function of the previous 10-year (5-year before 1996) average growth rate plus a random error.

Though the random walk model generates slightly higher variance than the Troika, the mean absolute error and root mean-squared error of the random walk forecasts are smaller, and the random walk has a lower maximum absolute forecast error than the Troika. Moreover, both the Troika’s and SPF’s forecasts tend to suffer from optimism bias; whereas the Troika and SPF overestimate growth 74 and 73 percent of the time, respectively, the random walk overestimates it only 51 percent of the time. These findings are consistent with an earlier analysis by McNees (1995).

The evident underperformance of the Administration’s forecasts owes in large part to the Knightian uncertainty inherent in forecasts that must account for the effects of policy objectives—the implementation of which is the outcome of a fundamentally unpredictable political process. Indeed, we would expect Presidential administrations to attach high probabilities both to the implementation of their policy objectives and to the success of these objectives in delivering economic growth—though the political contingency

⁸ Before 1990, the SPF survey was conducted by the American Statistical Association and the National Bureau of Economic Research.

of policy outcomes means that realization is not guaranteed. But their underperformance owes also to the general difficulty of macroeconomic forecasting. As Reis (2010) points out, if an applied microeconomist were asked to translate a point estimate of a randomly administered treatment effect into an unconditional 10-year forecast, the performance of this exercise would likely be abysmal. Predicting the path of a random variable differs fundamentally from estimating a parameter, a difference that can render forecasting more challenging than policy analysis—for instance, when estimating the effect of an exogenous fiscal shock.

The CEA, therefore, views greater forecasting transparency as a desirable aim. More transparency permits, among other things, making a clear distinction between a baseline forecast and additional estimated policy effects. A clear, replicable baseline can then focus dialogue—and, if necessary, debate—on what should constitute the primary subject of public discourse: the issue of estimating the effects of proposed policy and the probability of implementation. This distinction can also enable private firms that are affected by official forecasts to independently evaluate the weight they should attach to these forecasts in formulating long-term plans.

Although the development of more sophisticated and richly specified dynamic macroeconomic models, including a growing variety of dynamic stochastic general equilibrium models, is arguably the most promising branch of macroeconomic modeling (Wieland et al. 2016), richer and more dynamic models also require an expanding set of parameter assumptions. Moreover, this requires enhanced judgment by modelers, even when those parameters are informed by data. Partly for this reason, such models not only continue to perform poorly in absolute terms but also struggle to consistently match or outperform in horseraces against simpler, reduced-form autoregressive models—in particular vector autoregressions (VARs) informed by a Bayesian prior (Wieland et al. 2012; Edge and Gurkaynak 2010; Del Negro and Schorfheide 2013; Edge, Kiley, and Laforte 2010).

Regardless of the current state of macroeconomic modeling, however, a common benchmark alternative against which new vintages of structural models are evaluated remains, as it has since Sims (1980), the workhorse VAR. As n -equation, n -variable linear models in which each variable is explained by its own lagged values, as well as lagged values of the remaining $n - 1$ variables, VARs provide a simple yet powerful tool for capturing dynamics in multiple co-moving, macroeconomic time series. Moreover, though the usefulness of VARs for structural inference and policy analysis is more contentious, due to identification challenges, where identification is of secondary importance—for example, in the context of multistep-ahead forecasting—VARs have consistently proven to offer reliable multivariate benchmark forecasts without the imposition of often unsettled theory.

Figure 8-47. The Administration's Forecasted Real GDP (Growth Rate), 2018–28

The challenge for employing a VAR for a forecast over any time horizon, but particularly over a long-term forecasting window, is that as a mean-reverting model, it is highly sensitive to sample period selection. Longer sample periods, however, tend to exhibit persistent low-frequency movements in some or all of the included variables (Stock and Watson 2012, 2016). Ignoring these low-frequency movements introduces misspecification errors into forecasts due to mean reversion of what are in fact nonstationary variables. One solution to this problem, adapting the approach of Fernald and others (2017), is to decompose growth rates into trend, cyclical, and higher-frequency components using deviations from Okun’s Law and a partial linear regression model with a frequency filter in order to estimate the long-run growth rate. One can then estimate the VAR using detrended values, and then add the trends back in. This is the approach employed for the Administration’s baseline forecast.

As a baseline forecast of GDP growth over the next 11 years, therefore, the CEA estimated an unrestricted, reduced-form VAR on real GDP, the unemployment gap, the yield spread of 10-year over 3-month Treasuries, the labor force participation rate, and real personal consumption expenditures, specified in detrended growth rates. Postestimation, we then add back in the data-based trends. Optimal lag length was determined by satisfaction of the Akaike and Hannan-Quinn information criteria.

Because VAR forecasts extrapolate from present data, a VAR baseline incorporates current expectations about future policy, and these expectations may be manifested in the selected variables in the model. Given the required

Figure 8-48. The Administration's Forecasted Real GDP (Level), 2018–28

Real dollars (billions, \$2009)

Sources: Office of Management and Budget; Department of the Treasury; CEA calculations.

finalization of the forecast in November 2017, however, the Administration’s forecast was only able to incorporate data through 2017:Q3. The baseline forecast is therefore estimated only on the basis of data received before what press reports throughout the first three quarters of 2017 indicate should plausibly be considered an unanticipated individual and corporate income tax shock arriving at the end of 2017:Q4, as reflected in the pattern of private forecasted revisions reported above in figure 8-1. Therefore, this baseline forecast does not include the expected effect of the Tax Cuts and Jobs Act. The baseline forecast from 2018 through 2028 is plotted as the lower line in figure 8-47, and in levels as the lower line in figure 8-48.

Similarly, though the mean expected probability of successful implementation of the Administration’s other policy objectives may have been revised upward following the 2017:Q4 passage of the Tax Cuts and Jobs Act, general pessimism throughout 2017 about the legislative success of the Administration’s agenda suggests that other post-2017:Q3 policy shocks should likewise be considered unanticipated. Accordingly, to generate the Administration’s full, policy-inclusive forecast, we then add to our baseline forecast the estimated growth effects of the Administration’s policy goals, as reported and discussed in the preceding chapters.

GDP Growth during the Next Three Years

As illustrated in the top line of figure 8-47 and reported in the second column (“Real GDP”) of table 8-1, the Administration expects economic growth to

increase to 3.1 percent in 2018, and to remain above 3.0 percent through 2020. Though the baseline GDP forecast, plotted as the lower line in figure 8-47, is 2.1 percent a year for the next three years, there are also substantial front-loaded growth effects from individual and corporate income tax cuts and reforms, as well as a further boost to net exports, owing to a reduction in corporate profit shifting, as reported in chapter 1 (tax reform). (Baseline GDP forecasts are also consistent with a range of simple AR(p) models.)

Consistent with the evidence presented in chapter 1, and in particular the results of Mertens and Ravn (2013), the Administration also expects the labor market to continue to strengthen in the near term, with the unemployment rate falling to 3.7 percent in 2019:Q4 (see the fifth column, “Unemployment rate,” of table 8-1). Declining unemployment is a predictable consequence of the coincidence of demographically driven trends in labor force participation and strong growth expectations. Although inflation expectations remain low and close to the Federal Reserve Board’s 2.0 percent target for the PCE price index, the Administration does expect a strengthening labor market to put slight upward pressure on inflation by 2020, as shown in the third column (“GDP price index”) of table 8-1.

In addition, consumer spending is expected to remain strong as a result of a positive wealth effect due to recent rising household wealth. A large body of academic literature generally estimates that the marginal propensity to consume out of wealth is on the order of \$0.03 to \$0.05 on \$1.00 of wealth (Poterba 2000), as shown in figure 8-8 above. More recently, Juster and others (2006) find that a \$1.00 capital gain in corporate equities increases spending by \$0.19 in a five-year period. Carroll, Otsuka, and Slacalek (2011), meanwhile, find that a \$1.00 gain in financial wealth in a given quarter raises spending by about \$0.01 in the immediately subsequent quarter, and by \$0.04 to \$0.06 over a few years. Recent gains in household wealth therefore suggest near-term strength in consumer spending.

GDP Growth over the Longer Term

Over the longer term, the Administration’s baseline forecast is for output to grow by an overall average annual rate of 2.2 percent through 2028 (see figure 8-47, lower line). The full, policy-inclusive forecast, which assumes implementation of the Administration’s agenda, is that, on average, real GDP will grow by 3.0 percent annually through 2028 (see figure 8-47, top line, and the second column of table 8-1). We expect growth to moderate slightly after 2020, as the capital-to-output ratio asymptotically approaches its new, postcorporate tax reform steady state, and as the pro-growth effects of the Tax Cuts and Jobs Act’s individual elements dissipate (though the level effect remains permanent). As shown in figure 8-49, the current Administration’s long-run, policy-inclusive forecast is conservative relative to those of previous administrations, and is in fact slightly below the median of 3.1 percent. Moreover, the baseline forecast

Table 8-1. Administration Economic Forecast, 2016-28

Year	Percent change (Q4-to-Q4)				Level (calendar year)		
	Nominal GDP	Real GDP (chain-type)	GDP price index (chain-type)	Consumer price index	Unemployment rate (percent)	Interest rate, 91-day Treasury bills (percent)	Interest rate, 10-year Treasury notes (percent)

 Note: Before 1996, the long-run forecast was for five years.

is exactly in line with the long-run outlook given in the 2017 *Economic Report of the President*, which projected real output growth returning to its long-term trend rate of 2.2 percent a year after a brief period of above-trend growth of 2.4 and 2.3 percent in 2017 and 2018, reflecting our view that nonimplementation of the Administration’s policy objectives would simply result in a reversion to the lower growth expectations of recent years.

Partially offsetting the declining contribution to growth of corporate and individual tax cuts and reforms near the closing of the budget window, however, is the expected contribution to long-run growth of deregulation and infrastructure investment, as reported in chapters 2 and 4, respectively. Also—as discussed in chapter 1, on tax reform, and in chapter 3, on labor markets—we expect an additional contribution to growth from policies designed to offset recent trends in labor force participation, both among near-retirement and prime-age workers. Overall, the Administration therefore expects full policy implementation to cumulatively raise real GDP over the baseline by between 5 and 6 percent over the budget window, as illustrated in figure 8-48. Consistent with growth slowing slightly in the latter half of the budget window, from 3.2 percent in 2019 to 2.8 percent in 2028, the Administration expects unemployment to gradually return to its natural level, which will also stabilize inflation (see the fifth column of table 8-1).

As shown in table 8-2, the Administration anticipates that the primary contributor to increased growth through 2028 will be higher output per hour worked. This chapter and chapter 1 explain that U.S. labor productivity growth

Table 8-2. Supply-Side Components of Actual and Potential Real Output Growth, 1953–2028

Note: Gross domestic output (GDO) is the average of GDP and gross domestic income. Population, labor force, and household employment have been adjusted for discontinuities in the population series. Nonfarm business employment, and the workweek, come from the Labor Productivity and Costs database maintained by the BLS.

has been disappointing in recent years owing to a lack of capital deepening. By substantially raising the capital stock and attracting increased net capital inflows, including investment by both foreign firms and overseas affiliates of U.S. multinational corporations, we expect enactment of corporate tax reform to considerably increase capital per worker, and thus labor productivity.

Upside and Downside Forecast Risks

As noted above, macroeconomic forecasting is difficult, given that it is subject not only to normal forecasting error but also to the realities of a Knightian world with fundamentally immeasurable risks. Some downside risks, including adverse geopolitical shocks and cyberattacks and cyber thefts, may be difficult if not impossible to quantify—though we have attempted to do so for the latter in chapter 7, on cybersecurity. Similarly, the legislative process is difficult to

predict; insofar as the Administration's policy aims are diluted or otherwise throttled during this process, growth estimates may need to be revised downward accordingly. High public and private debt levels in several developed and developing economies also constitute potential downside risks.

On the upside, international capital mobility has increased in recent decades, which suggests that the Administration's forecast may underestimate the effects of corporate tax reform and infrastructure investment on capital formation and, consequently, growth, due to diminished crowding out of private investment. Similarly, because recent academic studies have shown that individual marginal income tax rates may have differential effects across the age distribution, estimated trends in labor force participation may overstate the growth-detracting effect of demography.

Finally, the growth estimates presented throughout this *Report* have generally been derived from standard exogenous growth models. Endogenous growth models, however, suggest that institutional factors that incentivize investment in human capital may generate positive externalities and spillover effects not captured by exogenous models. Ehrlich, Li, and Liu (2017), for example, find that a 10-percentage-point increase in investment in entrepreneurial human capital raises the growth rate of per capita income by 0.5 to 1.1 percentage points. Tax reform that incentivizes investment in intangible assets and human capital more generally, regulatory reform that removes prohibitive barriers to entry for innovative firms and entrepreneurs, and infrastructure and health investments that enhance human capital accumulation therefore could yield higher growth dividends than estimated here.

Conclusion

As discussed in chapter 1, the U.S. economy, and in particular U.S. workers, have been substantially harmed in recent years by the coincidence of the high and increasing international mobility of capital and the declining competitiveness of U.S. corporate income taxation relative to the rest of the world. The result has been diminished capital formation in the United States, and consequently low labor productivity growth in the absence of capital deepening.

However, by lowering the cost of investing in the United States for both corporations and pass-through businesses, raising the after-tax return of remaining in the workforce, reducing the regulatory burden on U.S. firms, attenuating the adverse effect on U.S. net exports of corporate profit shifting, and investing in vital infrastructure projects, the Administration expects economic growth to improve on its lackluster performance in recent years. Moreover, the estimated positive effects on output and labor market outcomes are not exceptional, but rather suggest a return to historical rates of economic growth.

Appendix A

**Report to the President
on the Activities of the
Council of Economic Advisers
During 2017**

Letter of Transmittal

Council of Economic Advisers
Washington, D.C., December 31, 2017

Mr. President:

The Council of Economic Advisers submits this report on its activities during calendar year 2017 in accordance with the requirements of the Congress, as set forth in section 10(d) of the Employment Act of 1946, as amended by the Full Employment and Balanced Growth Act of 1978.

Sincerely yours,

Kevin A. Hassett
Chairman

Report to the President on the Activities of the Council of Economic Advisers During 2017

The Council of Economic Advisers was established by the Employment Act of 1946 to provide the President with objective economic analysis and advice on the development and implementation of a wide range of domestic and international economic policy issues. The Council is governed by a Chairman, who is appointed by the President and is confirmed by the United States Senate; and has two Members, who are also appointed by the President.

The Chairman of the Council

Kevin A. Hassett was confirmed by the U.S. Senate on September 12, 2017, and was sworn in as the 29th Chairman on September 13, 2017. Before becoming Chairman of the CEA, he was an economist for almost 20 years at the American Enterprise Institute. His most recent positions at AEI included James Q. Wilson Chair in American Culture and Politics and Director of Research for Domestic Policy. He also served as Director of Economic Policy Studies and Resident Scholar from 2003 through 2014. Before joining AEI, he was a senior economist for the Board of Governors of the Federal Reserve System and an associate professor of economics and finance at Columbia University's Graduate School of Business. He has also served as a visiting professor at New York University's Law School, as a consultant to the U.S. Treasury Department, and as an adviser to presidential campaigns. A noted expert in the field of public finance, he has written peer-reviewed articles for leading economics journals and has served as a columnist for leading media outlets. He received his B.A. from Swarthmore College and his Ph.D. in economics from the University of Pennsylvania.

The Members of the Council

Richard V. Burkhauser is Emeritus Sarah Gibson Blanding Professor of Policy Analysis and Management at Cornell University. Before coming to Cornell, he was a tenured professor in the Department of Economics at Syracuse University and at Vanderbilt University. Most recently, before joining the CEA, he was a professorial research fellow at the Melbourne Institute of Applied

Economic and Social Research, and a senior research fellow at the Lyndon B. Johnson School of Public Affairs at the University of Texas at Austin. A former president of the Association for Public Policy Analysis and Management, his professional career has focused on how public policies affect the economic behavior and well-being of vulnerable populations. He has published widely in peer-reviewed economics and policy analysis journals. He received degrees in economics from St. Vincent College (B.A.), Rutgers University (M.A.), and the University of Chicago (Ph.D.).

Tomas J. Philipson is on leave from his position as Daniel Levin Professor of Public Policy Studies at the University of Chicago's Harris School of Public Policy and from serving as the Director of the Health Economics Program of the Becker Friedman Institute at the University. With a research focus on health economics, he has twice won the highest honor in his field, the Kenneth Arrow Award of the International Health Economics Association, and he has published extensively in many leading academic journals. He founded the consulting firm Precision Health Economics LLC and has held senior positions at the Food and Drug Administration and the Centers for Medicare and Medicaid Services. In addition, he was appointed to the Key Indicator Commission created by the Affordable Care Act, served as an adviser to Congress on the 21st Century Cures legislation, and was on the steering committee of the Biden Foundation's Cancer Moon Shot Initiative. He received his B.S. in mathematics from Uppsala University in Sweden and his M.A. and Ph.D. in economics from the Wharton School of the University of Pennsylvania.

Areas of Activity

Macroeconomic Policies

As is its tradition, the Council devoted much time during 2017 to assisting the President and the White House staff in formulating economic policy objectives and in fulfilling its obligation under the Employment Act of 1946 to apprise the President and senior White House staff of “current and future economic trends.” In this regard, the Council kept the President and senior White House staff members informed, on a continuing basis, about important macroeconomic developments and other major policy issues through regular macroeconomic briefings. The Council prepares for the President and White House senior staff memoranda that report key economic data and analyze current economic events.

In addition, the Council, the Department of the Treasury, and the Office of Management and Budget—the Administration's economic “troika”—are responsible for producing the economic forecasts that underlie the Administration's

budget proposals. The Council, under the leadership of the Chairman and the Members, initiates the forecasting process.

In 2017, the Council took part in discussions on a range of additional macroeconomic issues. An important part of the Council's ongoing work involved monitoring economic data, including the labor market, as well as how economic data may demonstrate the impact of current and prospective Administration policies. To this end, Chairman Hassett testified before the Joint Economic Committee of the U.S. Congress on the state of the economy and the labor market. The Council also produces regular Web posts that highlight trends in economic data.

The Council participated specifically in the analysis of corporate tax reform along the lines of the Unified Framework that served as the basis for the legislation passed as the Tax Cuts and Jobs Act. The Council released a report to the public that analyzed the effect of a corporate tax reduction on wages, much like the one featured in the Tax Cuts and Jobs Act, in addition to a report on the effect of this same set of changes on output. The Council looks forward to engaging in the analysis of future Administration policy.

The Chairman and Members also regularly met to exchange views on the economy with the Chairman and Members of the Board of Governors of the Federal Reserve System.

Microeconomic Policies

The Council actively participated in discussions on topics as varied as agriculture, energy policy, financial reform, health care, housing policy, pharmaceutical drug pricing, regulatory reform, and the opioid epidemic.

On the opioid epidemic, in particular, the Council participates actively in the Opioid Cabinet that coordinates the Administration's response to the epidemic across components of the Executive Office of the President as well as other parts of the Federal government. The Council also released a report on the economic cost of the opioid crisis, which concluded that previous estimates may have underestimated this cost by a factor of six.

On deregulation, the Council released a report that assessed the costs of excessive regulation for the economy.

The Council has, in addition, prospectively assessed the benefits and costs of policy options on infrastructure.

The Council also played a role in advising the President and White House senior staff on the likely effects of the natural disasters that afflicted communities in America this year, including Hurricane Irma and Hurricane Maria, the forest fires in California, and others.

International Economic Policies

The Council was involved in the analysis of numerous issues in the area of international economics.

The Council interacts with a number of international organizations. The Council is a leading participant in the Organization for Economic Cooperation and Development (OECD), an important forum for economic cooperation among high-income industrial economies. The Council coordinated with other agencies to provide information for the OECD's review of the U.S. economy. Chairman Hassett also serves as Chairman of the OECD Economic Policy Committee, and Council Members and staff actively participate in working-party meetings on macroeconomic policy and coordination, and contribute to the OECD's agenda. Chairman Hassett has also met with the representatives of many foreign governments in order to facilitate dialogue on issues of shared interest between the United States and other governments.

In addition, the Council analyzed a number of the proposals under consideration by the Administration in the areas of international trade and intellectual property. The Administration has explored a number of options to respond to developments with regard to the U.S. international trade position, and the CEA has assessed a number of these options. The CEA has also analyzed various issues related to cybersecurity, including cybercrime and new networks.

The Council also engages in the analysis of policies that could influence flows of foreign investment in the United States.

Public Information

The Council's annual *Economic Report of the President* is an important vehicle for presenting the Administration's domestic and international economic policies. It is available for purchase through the Government Publishing Office, and is viewable on the Internet at www.gpo.gov/erp.

The Council frequently prepared reports and blog posts in 2017, and the Chairman and Members gave numerous public speeches. The reports, posts, and texts of speeches are available on the Council's website, <https://www.whitehouse.gov/cea/>. Finally, the Council publishes the monthly *Economic Indicators*, which are available online at www.gpo.gov/economicindicators.

The Staff of the Council of Economic Advisers

Executive Office

DJ Nordquist	Chief of Staff
Dr. Joel M. Zinberg	General Counsel and Senior Economist
Joseph W. Sullivan	Special Assistant to the Chairman
Paige F. Willey	Special Assistant to the Chief of Staff
William B. Hallisey	Staff Assistant

Research Staff

Alexander C. Abajian	Research Assistant; Energy, Cyber, and Trade
Michael K. Adjemian	Senior Economist; Agriculture, Rural, and Finance
Steven N. Braun	Director of Macroeconomic Forecasting; Macroeconomics
Blake P. Connolly	Research Assistant; Finance, Cyber, and Labor
Kevin C. Corinth	Senior Economist; Poverty, Health, and Housing
William O. Ensor	Research Economist; Tax, Trade, and Macroeconomics
Naomi E. Feldman	Senior Economist; Tax and Housing
Amy K. Filipek	Economist; Macroeconomics and Housing
Grace E. Finley	Research Economist; Labor, Poverty, and Agriculture
Timothy Fitzgerald	Senior Economist; Energy and Environment
Tyler B. Goodspeed	Senior Economist; Tax and Macroeconomics
Tara Iyer	Economist; Macroeconomics, Tax, and Trade
Nataliya Langburd	Staff Economist; Trade, Cyber, and Financial Technology
Robert B. Porter	Chief Financial Economist; Finance and Housing
Anna D. Scherbina	Senior Economist; Financial Technology, Cyber, and Finance
Hershil B. Shah	Research Assistant; Domestic and International Macroeconomics, Infrastructure, and Agriculture

Julia A. Tavlás Research Economist; Labor, Education,
and Poverty
Marianne H. Wanamaker Senior Economist; Labor and Education
James H. Williams Research Economist; Health, Finance,
and Tax
Paula R. Worthington Senior Economist; Finance,
Infrastructure, and Regulation

Statistical Office

Brian A. Amorosi Director of the Statistical Office
Jennifer S. Vogl Economic Statistician

Administrative Office

Tomeka R. Jordan Director of Finance and Administration
Doris L. Searles Operations Manager

Interns

Student interns provide invaluable help with research projects, day-to-day operations, and fact-checking. Interns during the year were Jackson Bednar, Jake Bochner, Alexis Cirrotti, Erin Deal, Danielle DiQuattro, Ian Dunne, Peter Ferrara, Neil Filosa, A. J. Glubzinski, Daniel Gold, Jenny Grimberg, Maria Hussain, Ayesha Karnik, Paul Keady, J. T. Kirk, Jee Young Kim, Nicole Korkos, Grace Lafaire, Adina Lasser, Alex Magnuson, Megan Maloney, Akbar Naqvi, J-L. Picard, Jules Ross, Danielle Sockin, Sharan Subramanian, Brian Trainer, Laura Wilcox, and Michael Zhou.

Appendix B

**STATISTICAL TABLES RELATING TO
INCOME, EMPLOYMENT,
AND PRODUCTION**

Contents

GDP, Income, Prices, and Selected Indicators

B-1.	Percent changes in real gross domestic product, 1967–2017	532
B-2.	Gross domestic product, 2002–2017	534
B-3.	Quantity and price indexes for gross domestic product, and percent changes, 1967–2017	536
B-4.	Growth rates in real gross domestic product by area and country, 1999–2018	537
B-5.	Real exports and imports of goods and services, 1999–2017	538
B-6.	Corporate profits by industry, 1967–2017	539
B-7.	Real farm income, 1953–2017	540
B-8.	New private housing units started, authorized, and completed and houses sold, 1974–2017	541
B-9.	Median money income (in 2016 dollars) and poverty status of families and people, by race, 2008–2016	542
B-10.	Changes in consumer price indexes, 1949–2017	543

Labor Market Indicators

B-11.	Civilian labor force, 1929–2017	544
B-12.	Civilian unemployment rate, 1974–2017	546
B-13.	Unemployment by duration and reason, 1974–2017	547
B-14.	Employees on nonagricultural payrolls, by major industry, 1974–2017	548
B-15.	Hours and earnings in private nonagricultural industries, 1974–2017	550
B-16.	Productivity and related data, business and nonfarm business sectors, 1969–2017	551

Government Finance, Interest Rates, and Money Stock

B-17. Federal receipts, outlays, surplus or deficit, and debt, fiscal years 1952–2019	552
B-18. Federal receipts, outlays, surplus or deficit, and debt, as percent of gross domestic product, fiscal years 1947–2019.	553
B-19. Federal receipts and outlays, by major category, and surplus or deficit, fiscal years 1952–2019	554
B-20. Federal receipts, outlays, surplus or deficit, and debt, fiscal years 2014–2019	555
B-21. Federal and State and local government current receipts and expenditures, national income and product accounts (NIPA) basis, 1967–2017	556
B-22. State and local government revenues and expenditures, fiscal years 1955–2015	557
B-23. U.S. Treasury securities outstanding by kind of obligation, 1980–2017	558
B-24. Estimated ownership of U.S. Treasury securities, 2004–2017.	559
B-25. Bond yields and interest rates, 1947–2017	560
B-26. Money stock and debt measures, 1977–2017	562

General Notes

Detail in these tables may not add to totals due to rounding.

Because of the formula used for calculating real gross domestic product (GDP), the chained (2009) dollar estimates for the detailed components do not add to the chained-dollar value of GDP or to any intermediate aggregate. The Department of Commerce (Bureau of Economic Analysis) no longer publishes chained-dollar estimates prior to 1999, except for selected series.

Because of the method used for seasonal adjustment, the sum or average of seasonally adjusted monthly values generally will not equal annual totals based on unadjusted values.

Unless otherwise noted, all dollar figures are in current dollars.

Symbols used:

^p Preliminary.

... Not available (also, not applicable).

Data in these tables reflect revisions made by source agencies through February 2, 2018.

Excel versions of these tables are available at www.gpo.gov/erp.

¹ Gross domestic product (GDP) less exports of goods and services plus imports of goods and services.

² Personal consumption expenditures plus gross private fixed investment.

³ Gross domestic income is deflated by the implicit price deflator for GDP.

Note: Percent changes based on unrounded GDP quantity indexes.

Source: Department of Commerce (Bureau of Economic Analysis).

¹ All figures are forecasts as published by the International Monetary Fund. For the United States, advance estimates by the Department of Commerce show that real GDP rose 2.3 percent in 2017.

² For 2018, includes data for: Austria, Belgium, Cyprus, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Portugal, Slovak Republic, Slovenia, and Spain.

³ Includes Georgia, Turkmenistan, and Ukraine, which are not members of the Commonwealth of Independent States but are included for reasons of geography and similarity in economic structure.

⁴ Data and forecasts are presented on a fiscal year basis and output growth is based on GDP at market prices.

⁵ Consists of Indonesia, Malaysia, Philippines, Thailand, and Vietnam.

Note: For details on data shown in this table, see *World Economic Outlook*, October 2017, and *World Economic Outlook Update*, January 2018, published by the International Monetary Fund.

¹ The GDP chain-type price index is used to convert the current-dollar statistics to 2017=100 equivalents.
² Crop receipts include proceeds received from commodities placed under Commodity Credit Corporation loans.
³ The value of production equates to the sum of cash receipts, home consumption, and the value of the change in inventories.
⁴ Includes income from forest products sold, the gross imputed rental value of farm dwellings, machine hire and custom work, and other sources of farm income such as commodity insurance indemnities.

Note: Data for 2017 are forecasts.

¹ Authorized by issuance of local building permits in permit-issuing places: 20,100 places beginning with 2014; 19,300 for 2004–2013; 19,000 for 1994–2003; 17,000 for 1984–93; 16,000 for 1978–83; and 14,000 for 1974–77.

² Monthly data do not meet publication standards because tests for identifiable and stable seasonality do not meet reliability standards.

Note: One-unit estimates prior to 1999, for new housing units started and completed and for new houses sold, include an upward adjustment of 3.3 percent to account for structures in permit-issuing areas that did not have permit authorization.

¹ Includes other items not shown separately.

² Data beginning with 1983 incorporate a rental equivalence measure for homeowners' costs.

³ Commodities and services.

⁴ Household energy—electricity, utility (piped) gas service, fuel oil, etc.—and motor fuel.

⁵ Chained consumer price index (C-CPI-U) introduced in 2002. Reflects the effect of substitution that consumers make across item categories in response to changes in relative prices. Data for 2017 are subject to revision.

Note: Changes from December to December are based on unadjusted indexes.

Note (cont'd): employed when they are not at work because of industrial disputes, bad weather, etc., even if they are not paid for the time off; which are based on a sample of the working-age population; and which count persons only once—as employed, unemployed, or not in the labor force. In the data shown here, persons who work at more than one job are counted each time they appear on a payroll.
 Establishment data for employment, hours, and earnings are classified based on the 2017 North American Industry Classification System (NAICS).
 For further description and details see *Employment and Earnings*.

¹ Output refers to real gross domestic product in the sector.

² Hours at work of all persons engaged in sector, including hours of employees, proprietors, and unpaid family workers. Estimates based primarily on establishment data.

³ Wages and salaries of employees plus employers' contributions for social insurance and private benefit plans. Also includes an estimate of wages, salaries, and supplemental payments for the self-employed.

⁴ Hourly compensation divided by consumer price series. The trend for 1978-2016 is based on the consumer price index research series (CPI-U-RS). The change for prior years and recent quarters is based on the consumer price index for all urban consumers (CPI-U).

⁵ Current dollar output divided by the output index.

TABLE B–20. Federal receipts, outlays, surplus or deficit, and debt, fiscal years 2014–2019

[Millions of dollars; fiscal years]

Description	Actual				Estimates	
	2014	2015	2016	2017	2018	2019
RECEIPTS, OUTLAYS, AND SURPLUS OR DEFICIT						
Total:						
Receipts	3,021,491	3,249,887	3,267,961	3,316,182	3,340,360	3,422,301
Outlays	3,506,091	3,688,383	3,852,612	3,981,554	4,172,992	4,406,696
Surplus or deficit (–)	–484,600	–438,496	–584,651	–665,372	–832,632	–984,395
On-budget:						
Receipts	2,285,926	2,479,515	2,457,781	2,465,564	2,488,081	2,517,119
Outlays	2,800,038	2,945,306	3,077,939	3,180,353	3,315,775	3,494,104
Surplus or deficit (–)	–514,112	–465,791	–620,158	–714,789	–827,694	–976,985
Off-budget:						
Receipts	735,565	770,372	810,180	850,618	852,279	905,182
Outlays	706,053	743,077	774,673	801,201	857,217	912,592
Surplus or deficit (–)	29,512	27,295	35,507	49,417	–4,938	–7,410
OUTSTANDING DEBT, END OF PERIOD						
Gross Federal debt	17,794,483	18,120,106	19,539,450	20,205,705	21,478,237	22,702,807
Held by Federal Government accounts	5,014,584	5,003,414	5,371,826	5,540,254	5,688,505	5,831,122
Held by the public	12,779,899	13,116,692	14,167,624	14,665,450	15,789,731	16,871,686
Federal Reserve System	2,451,743	2,461,947	2,463,456	2,465,418
Other	10,328,156	10,654,745	11,704,168	12,200,032
RECEIPTS BY SOURCE						
Total: On-budget and off-budget	3,021,491	3,249,887	3,267,961	3,316,182	3,340,360	3,422,301
Individual income taxes	1,394,568	1,540,802	1,546,075	1,587,120	1,660,063	1,687,746

¹ Fiscal years not the same for all governments. See Note.
² Excludes revenues or expenditures of publicly owned utilities and liquor stores and of insurance-trust activities. Intergovernmental receipts and payments between State and local governments are also excluded.
³ Includes motor vehicle license taxes, other taxes, and charges and miscellaneous revenues.
⁴ Includes intergovernmental payments to the Federal Government.
⁵ Includes expenditures for libraries, hospitals, health, employment security administration, veterans' services, air transportation, sea and inland port facilities, parking facilities, police protection, fire protection, correction, protective inspection and regulation, sewerage, natural resources, parks and recreation, housing and community development, solid waste management, financial administration, judicial and legal, general public buildings, other government administration, interest on general debt, and other general expenditures, not elsewhere classified.

Note: Except for States listed, data for fiscal years listed from 1963-64 to 2014-15 are the aggregation of data for government fiscal years that ended in the 12-month period from July 1 to June 30 of those years; Texas used August and Alabama and Michigan used September as end dates. Data for 1963 and earlier years include data for government fiscal years ending during that particular calendar year.

¹ Money market mutual fund (MMMF). Savings deposits include money market deposit accounts.

² Consists of outstanding debt securities and loans of the U.S. Government, State and local governments, and private nonfinancial sectors. Quarterly data shown in last month of quarter. End-of-year data are for fourth quarter.

³ Annual changes are from December to December; monthly changes are from six months earlier at an annual rate.

⁴ Debt growth of domestic nonfinancial sectors is the seasonally adjusted borrowing flow divided by the seasonally adjusted level of debt outstanding in the previous period. Annual changes are from fourth quarter to fourth quarter; quarterly changes are from previous quarter at an annual rate.

Note: For further information on the composition of M1 and M2, see the H.6 release.

For further information on the debt of domestic nonfinancial sectors and the derivation of debt growth, see the Z.1 release.

The economic agenda outlined here is designed to make it possible for the American people to dream of, and to achieve, the bright future they deserve.

– President Donald J. Trump

A BUDGET FOR A
Better
America

PROMISES KEPT. TAXPAYERS FIRST.

FISCAL YEAR 2020
BUDGET OF THE U.S. GOVERNMENT

THE BUDGET DOCUMENTS

Budget of the United States Government, Fiscal Year 2020 contains the Budget Message of the President, information on the President's priorities, and summary tables.

Analytical Perspectives, Budget of the United States Government, Fiscal Year 2020 contains analyses that are designed to highlight specified subject areas or provide other significant presentations of budget data that place the budget in perspective. This volume includes economic and accounting analyses; information on Federal receipts and collections; analyses of Federal spending; information on Federal borrowing and debt; baseline or current services estimates; and other technical presentations.

Supplemental tables and other materials that are part of the *Analytical Perspectives* volume are available at <https://www.whitehouse.gov/omb/analytical-perspectives/>.

Appendix, Budget of the United States Government, Fiscal Year 2020 contains detailed information on the various appropriations and funds that constitute the budget and is designed primarily for the use of the Appropriations Committees. The *Appendix* contains more detailed financial information on individual programs and appropriation accounts than any of the other budget documents. It includes for each agency: the proposed text of appropriations language; budget schedules for each account; legislative proposals; narrative explanations of each budget account; and proposed general provisions applicable to the appropriations of entire agencies or group of agencies. Information is also

provided on certain activities whose transactions are not part of the budget totals.

Major Savings and Reforms, Fiscal Year 2020, which accompanies the President's Budget, contains detailed information on major savings and reform proposals. The volume describes both major discretionary program eliminations and reductions and mandatory savings proposals.

BUDGET INFORMATION AVAILABLE ONLINE

The President's Budget and supporting materials are available online at <https://www.whitehouse.gov/omb/budget/>. This link includes electronic versions of all the budget volumes, supplemental materials that are part of the *Analytical Perspectives* volume, spreadsheets of many of the budget tables, and a public use budget database. This link also includes *Historical Tables* that provide data on budget receipts, outlays, surpluses or deficits, Federal debt, and Federal employment over an extended time period, generally from 1940 or earlier to 2020 or 2024. Also available are links to documents and materials from budgets of prior years.

The budget documents and other supplemental materials included at this link were previously included on the Budget CD-ROM, which is no longer made available.

For more information on access to electronic versions of the budget documents, call (202) 512-1530 in the D.C. area or toll-free (888) 293-6498. To purchase the printed documents call (202) 512-1800.

GENERAL NOTES

1. All years referenced for budget data are fiscal years unless otherwise noted. All years referenced for economic data are calendar years unless otherwise noted.
2. At the time the Budget was prepared, five of the annual appropriations bills for 2019 had been enacted (the Energy and Water Development and Related Agencies Appropriations Act, 2019; the Legislative Branch Appropriations Act, 2019; the Military Construction, Veterans Affairs, and Related Agencies Appropriations Act, 2019; the Department of Defense Appropriations Act, 2019; and the Departments of Labor, Health and Human Services, and Education, and Related Agencies Appropriations Act, 2019). The programs and activities provided for in the seven remaining 2019 annual appropriations bills were operating under a continuing resolution (Public Law 115-245, as amended). For these programs, references to 2019 spending in the text and tables reflect the levels provided by the continuing resolution (except for the *Major Savings and Reforms* (MSV) volume which was written following enactment of all appropriations and reflects 2019 enacted for all programs).
3. Detail in this document may not add to the totals due to rounding.

THE BUDGET MESSAGE OF THE PRESIDENT

TO THE CONGRESS OF THE UNITED STATES:

In just over 2 years, together with the American people, we have launched an unprecedented economic boom. Since I was elected, we have created more than 5 million new jobs, including half a million manufacturing jobs. Nearly 5 million Americans have been lifted off food stamps. Unemployment is the lowest in nearly half a century. African American unemployment, Hispanic American unemployment, and Asian American unemployment rates have all reached historic lows. Our Nation is experiencing an economic miracle—and it is improving the lives of all our citizens.

We have achieved these extraordinary gains thanks to historic tax cuts and an unprecedented regulatory reduction campaign, through unleashing American energy production, systematically fixing bad trade deals, and remaining absolutely committed to putting the needs of the American worker first.

My Administration worked with the Congress to pass unprecedented legislation to confront the opioid crisis, a sweeping new farm bill, groundbreaking criminal justice reform, major investments to rebuild the military, and historic Department of Veterans Affairs reforms to ensure that our great veterans have access to high quality healthcare.

We are also making our communities safer. To target violent crime, my Administration has increased support for Federal, State, and local law enforcement. We have added nearly 200 new violent crime prosecutors across the United States. And last year, the Department of Justice prosecuted more violent crimes than ever before. As a result, violent crime is falling.

My Administration is confronting the national security and humanitarian crisis on our southern border, and we are accepting the moral duty to create an immigration system that protects the lives and jobs of our citizens. This includes our obligation to the millions of immigrants living in the United States today who followed the rules and respected our laws.

In the 20th century, America saved freedom, transformed science, and defined the middle class standard of living. Now we must write the next chapter of the great American adventure, turbocharging the industries of the future and establishing a new standard of living for the 21st century. An amazing quality of life for all of our citizens is within reach. We can make our communities safer, our families stronger, our culture richer, our faith deeper, and our middle class bigger and more prosperous than ever before.

We are now addressing our challenges from a position of strength. My 2020 Budget builds on the tremendous progress we have made and provides a clear roadmap for the Congress to bring Federal spending and debt under control. We must protect future generations from Washington's habitual deficit spending.

This year, I asked most executive departments and agencies to cut their budgets by at least 5 percent. In addition to reflecting those reductions, my Budget invests in the following priorities:

Securing our Borders and Protecting our Sovereignty. As President, my highest duty is the defense of our Nation—which is why finishing the border wall is an urgent national priority. All who are privileged to hold elected office must work together to create an immigration system that promotes wage growth and economic opportunity, while preventing drugs, terrorism, and crime from entering the United States. Immigration policy, like all policy, must serve the interests of Americans living here today—including the millions of new Americans who came here legally to join our national family. The American people are entitled to a strong border that stops illegal immigration, and a responsible visa policy that protects our security and our workforce. My Budget continues to reflect these priorities, and I look forward to working with the Congress to finish the border wall and build a safe, just, and lawful immigration system that will benefit generations of Americans to come.

Preserving Peace through Strength. A strong military, fully integrated with our allies and all our instruments of power, enables our Nation to deter war, preserve peace, and, if necessary, defeat aggression against United States interests. To that end, my Budget requests \$750 billion for national defense, an increase of \$34 billion, or 5 percent, from the 2019 enacted level. The Budget funds the National Security Strategy and National Defense Strategy, building on the major gains we have already made throughout the world.

Protecting our Veterans. Our Nation's brave warriors and defenders deserve the best care America has to offer—both during and after their active service. Last year, I signed into law the historic VA MISSION Act of 2018 to reform and transform the Department of Veterans Affairs health-care system into an integrated system for the 21st century. My Budget fully funds all requirements for veterans' healthcare services and provides additional funding to implement the VA MISSION Act of 2018.

Investing in America's Students and Workers. To help protect taxpayer dollars, my Budget continues my request to create an educational finance system that requires postsecondary institutions that accept taxpayer funds to have skin in the game through a student loan risk-sharing program. My Administration will also continue to seek expanded Pell Grant eligibility for high-quality, short-term programs in high-demand fields, so that students and workers can quickly gain valuable skills at a more affordable cost and obtain family-sustaining jobs. We must create and invest in better opportunities for our Nation's students and job seekers, while ensuring that we do so in a more efficient and effective manner.

Research for Childhood Cancers. Many childhood cancers have not seen new therapies in decades. My Budget initiates a new effort that invests \$500 million over the next 10 years to support this critical life-saving research.

Defeating HIV/AIDS in America. The HIV epidemic still plagues our Nation, with more than 38,000 Americans infected every year. In response, my Budget provides \$291 million to the Department of Health and Human Services to defeat the HIV/AIDS epidemic. The goal is to eliminate most new infections within 5 years (75 percent) and nearly all within 10 years (90 percent). This initiative will focus efforts on diagnosis, prevention, and treatment efforts in the locations where intense transmissions of the virus are driving the epidemic.

Confronting the Opioid Epidemic. My Budget continues historic levels of funding for our law enforcement, prevention, and treatment efforts to combat the opioid and drug addiction epidemic.

Supporting Working Families. America must also lead in supporting the families of our workforce so that they can balance the competing demands of work and family. My Budget includes a one-time, mandatory investment of \$1 billion for a competitive fund aimed at supporting underserved populations and stimulating employer investments in child care for working families. My Administration has also pledged to provide paid parental leave to help working parents, and we are committed to partnering with the Congress to enact this important policy.

We must always strive to uphold our oaths to promote and protect the personal and economic freedoms the Constitution guarantees to us all.

We must work together to renew the bonds of love and loyalty that link us to one another—as friends, as citizens, as neighbors, as patriots, and as Americans.

My Budget reflects my Administration’s commitment to these worthy goals as it seeks to make the United States of America wealthier, stronger, safer, and greater for every American family and neighborhood.

DONALD J. TRUMP

THE WHITE HOUSE,
MARCH 11, 2019

A BUDGET FOR A BETTER AMERICA

Over the past two years, the President has restored faith in the American dream and extended a more prosperous future—an American future—that is secure, sovereign, and affordable.

The President's pro-growth economic agenda, MAGAnomics, has unleashed the American economy. Working alongside Republicans in the Congress, the President signed historic tax reform into law, marking the first time in more than 30 years that the Nation's tax laws were overhauled to provide much-needed relief to American Families, all while allowing U.S. small businesses to flourish. Unemployment is the lowest in 50 years, millions of jobs have been created, and GDP grew by 3.1 percent over the four quarters of 2018. For the first time in history, there are more vacant jobs than job seekers to fill them. The economic health of the Nation is as strong as it has ever been.

The Administration's ongoing efforts to cut red tape are also key to continued economic growth. Over the past year, Federal agencies have eliminated 12 unnecessary or duplicative regulations for every one new regulation implemented, which has saved the economy more than \$23 billion in Washington-imposed costs. The President's deregulatory efforts are providing relief for all Americans through real wage growth and more jobs, ushering in a new era of optimism. The weight of Washington's presence is now a more distant memory, and Americans feel confident to invest in their families, businesses, and future.

However, for economic growth to endure, Washington must fix its longtime spending problem, which has driven the Nation's debt to more than \$22 trillion this year. Even with high levels of economic growth, excessive deficits continue

to threaten the Nation's progress, and any unforeseen shocks to the economy could make deficits unsustainable. Without action to restore the proper size and role of the Government, deficits will remain over a trillion dollars per year for the foreseeable future. Debt, already run up by the excesses of previous administrations' economic policies, will soon surpass a percent of GDP not seen since 1947.

If financial obligations continue to grow at the current pace, the Nation's creditors may demand higher interest rates to compensate, potentially leading to lower private investment and a smaller capital stock, harming both American businesses and workers. If nothing is done, interest payments alone on the Federal Government's debt will double by 2023 and exceed spending on the U.S. military by 2024.

Even with a booming economy, excluding Social Security and Medicare spending and revenues, the Federal Government is still running a net deficit of \$608 billion. During the Great Recession, this figure increased from \$664 billion in 2008 to \$1,354 billion in 2010, illustrating what can happen during changes in the business cycle when there is a complete lack of fiscal restraint. Since the end of the recession, little has been done to rein in excessive spending as net deficits averaged \$759 billion from 2010–2016.

The President is committed to protecting and respecting American taxpayers. Recognizing the importance of controlling excessive spending, the President directed Federal agencies to reduce their programmatic spending to five percent below the non-Defense discretionary budget cap. Only in Washington would that be considered impossible. Ordinary, hard-working American families

make necessary sacrifices daily to provide for their families. Washington should be no different.

Yet, facing up to fiscal reality does not mean ignoring the other needs facing the Nation. The Budget demonstrates how, even within this constrained discretionary topline, the President proposes to fund critical national priorities by re-prioritizing other spending. The Budget protects or increases funding for border security, national defense, opioids, law enforcement, childcare, veterans' healthcare, emerging technologies that support the industries of the future, and workforce development. The Budget also illustrates the Administration's commitment to rebuilding

the Nation's infrastructure and addressing high drug prices.

The 2020 Budget builds off the foundation of the President's previous budgets and provides an avenue toward spending restraint. The Budget meets the President's directive on spending reductions by agency, proposing over \$2.7 trillion in spending reductions—more proposed spending reductions than any previous administration in history—and closing out the 10-year budget window with spending below the post-war average of 20 percent of GDP. Once again, with the Budget, the President provides his vision to get the Nation's fiscal house back in order to provide a better America for you.

2020 Budget Outlays Below Historical Average

MODERNIZING GOVERNMENT

The 2020 Budget supports the Administration's work to modernize Government for the 21st Century. The American people deserve a modern Government that will refocus efforts on core mission areas, provide excellent customer service, and ensure accountable stewardship.

The President's Management Agenda (PMA) lays the foundation for a portfolio of work to address critical challenges where Government has failed to keep up with technical advances and business process improvements.

PRESIDENT'S MANAGEMENT AGENDA

The PMA outlines a long-term vision for an effective Government that better achieves its missions and enhances key services on which the American people depend. It advances three drivers of change—technology, data, and the workforce—through multiple paths, recognizing that real transformation requires cross-functional change across disciplines. The PMA sets 14 Cross-Agency Priority (CAP) Goals where Executive Branch agencies can collaborate to drive modernization, including critical areas such as cybersecurity, customer experience, payment accuracy, information technology (IT), human resources, and procurement.

IT Modernization

The 2020 Budget supports agency investments to modernize IT systems and improve the value they provide to the American people.

Modernizing Government Technology (MGT) Provisions¹ and the Technology Modernization Fund (TMF). MGT provisions

¹ Pub. L. No. 115-91, National Defense Authorization Act for Fiscal Year 2018, Title X, Subtitle G (§§ 1076 through 1078).

provide financial resources and technical expertise to improve Federal technology. A key component of the MGT provisions is the TMF, which enables agencies to reimagine and transform how technology is used to deliver mission and services. Agencies propose projects to a TMF Board and, if selected and funded, repay funds within five years.

- From among nearly 50 proposals totaling over \$500 million in the first 10 months, the Board has so far funded seven projects totaling almost \$90 million. Projects are listed at <https://tmf.cio.gov>.
- The Administration requests \$150 million for the TMF in 2020 to provide seed funding for additional projects and to allow the TMF to tackle more complex, Government-wide efforts.

In addition, MGT provisions authorized agencies to establish IT Working Capital Funds (WCFs) as a dedicated resource for IT modernization. The Budget requests necessary transfer authority to better enable agencies to operationalize these IT WCFs and fully implement flexibilities of the MGT provisions. The Budget reflects instances where agencies are establishing IT WCFs.

Modernizing IT to Increase Productivity and Security (CAP Goal 1). Through this goal, the Administration is building and maintaining more modern, secure, and resilient IT to enhance mission delivery and productivity.

- Federal Agencies have delivered on the action items provided in the *Report to the President on Federal IT Modernization*,

completing all of the 52 tasks outlined and informing further priorities and next steps included in this goal.

- The Administration released Office of Management and Budget (OMB) Memorandum M-19-03, Strengthening the Cybersecurity of Federal Agencies by enhancing the High Value Asset Program, creating a formal program to support all agencies in High Value Asset identification, assessment, remediation, and response to incidents.
- The Administration released the draft *2018 Federal Cloud Computing Strategy* on September 24, 2018, for public comment, soliciting feedback from industry, agencies, and the American people.
- The Administration released a draft memorandum, Strengthening the Cybersecurity of Federal Agencies through Improved Identity, Credential, and Access Management, on April 6, 2018, for public comment, to better control information access and protect information.
- The Department of Homeland Security (DHS) and OMB piloted enhancements to the cybersecurity controls required by the Trusted Internet Connection program.
- Agencies continue to implement the Continuous Diagnostics and Monitoring program, with all Chief Financial Officers Act agencies now sharing data with the Federal Dashboard.

Data, Accountability, and Transparency

Leveraging Data as a Strategic Asset (CAP Goal 2). The Administration is creating the first comprehensive Federal Data Strategy for managing and using Federal data.

- In 2018, the Administration launched the Federal Data Strategy outlining Principles, Practices, and a Year 1 Action Plan on <https://strategy.data.gov>. The Data Incubator Project creates practical case

studies for future complementary Federal data management and use.

- The Budget supports the Federal Data Strategy by establishing a U.S. Federal Data Service within the Department of Commerce's Office of the Undersecretary for Economic Affairs.
- The Administration will begin implementing the Foundations for Evidence-Based Policymaking Act of 2018, including designating agency Statistical Officials and Chief Data Officers, requiring machine-readable data, improving secure access to data, and strengthening privacy protections.
- The Budget supports the Federal Geographic Data Committee's work to improve management of geospatial data and implement the provisions of the Geospatial Data Act of 2018.

Workforce for the 21st Century

Developing a Workforce for the 21st Century (CAP Goal 3). The Federal workforce represents a critical part of realizing change. Failure to address fundamental workforce needs will render other modernization work ineffective. This goal reflects a transformational shift in strategic human capital management based on three pillars:

1. Actively Managing the Workforce: Improving employee performance management and employee engagement;
2. Developing Agile Operations: Reskilling and redeploying human capital resources; and
3. Acquiring Top Talent: Enabling simple and strategic hiring practices.

The goal is co-led by OMB, the Office of Personnel Management (OPM), and the Department of Defense. DHS, the Departments of Veterans Affairs, Health and Human Services (HHS), and the Interior lead three subgoals. Almost all agencies participate in some capacity.

The first year of implementation focused on defining a baseline for how agencies address poor performers, distribute financial awards, and hire staff. The Administration is using existing authority to remove barriers and fix processes. Examples include issuing direct hire authority for science, technology, engineering, and mathematics positions; modernizing Senior Executive Service processes; strengthening performance management; and acting to increase employee engagement. Going forward, this goal will focus on continuous improvement within agencies.

Additional Focus Areas to Strengthen Mission, Service, and Stewardship

Improving Customer Experience (CAP Goal 4). Customer satisfaction with Federal services lags by as much as nine points behind the private sector. To close this gap, the Administration has identified Federal programs that provide the highest impact customer-facing services. These programs are implementing Government-wide customer feedback measures aligned with private-sector best practices and creating action plans for improvement. Performance data and action plans will be posted online for the public.

Agency Initiatives to Transform Customer Experience

The General Services Administration (GSA) and the U.S. Digital Service launched <https://www.login.gov>, a single, common identity platform that lets users access Government services more securely, easily, and quickly. This site has grown to more than 12 million users and continues to grow.

The Departments of Labor, Education, Defense, and Veterans Affairs; the Small Business Administration; GSA; and OPM have created an interagency journey map of how servicemembers interact with programs across Government during their transition to civilian employment. With this perspective, the team is now identifying improvements that matter most to the customer.

Sharing Quality Services (CAP Goal 5). This goal created a new shared service model to improve performance, customer experience, and operational costs. The new model establishes Government-wide centralized capabilities offered through Quality Service Management Offices that each oversee one functional area, such as financial management, procurement, payroll, etc. In an early effort to apply this model in 2018, GSA awarded blanket purchase agreements for the NewPay initiative for software as a service solutions for payroll and time and attendance services across Government. The Budget provides funds to begin migrating the Departments of Agriculture and the Interior and GSA to NewPay.

Shifting from Low-Value to High-Value Work (CAP Goal 6). The Administration has lifted nearly 60 redundant, obsolete, or unnecessary requirements from all Federal agencies and proposed to eliminate or modify more than 400 congressionally required plans and reports that are outdated or duplicative. In addition, OMB is coordinating with OPM and GSA to reform burdensome data collection and reporting requirements.

Category Management (CAP Goal 7). Increasing the use of proven, enterprise solutions for more than \$300 billion in common goods and services allows the Government to leverage its buying power and reduce unnecessary, expensive duplication. As a result, the Government has avoided \$17 billion in costs, applied category management principles to nearly 45 percent of common spend, exceeded metrics for use of top-tier Government-wide solutions by \$11 billion, and exceeded small businesses goals.

Results-Oriented Accountability for Grants (CAP Goal 8). This goal helps maximize the value of grant funding by applying a risk-based, data-driven framework to balance compliance requirements with demonstrating successful results for the American taxpayer. The *Analytical Perspectives* chapter 17 “Aid to State and Local Governments” provides more information about this Goal.

Shifting to High-Value Work: Leveraging Technology

The Administration is using Robotics Process Automation and other emerging technologies to reduce error, improve compliance, and focus the Federal workforce on higher-value work.

GSA's Office of the Chief Financial Officer shifted staff to higher-value work after automating tasks that consumed approximately 12,000 labor hours per year at an estimated half the cost.

The National Aeronautics and Space Administration's Shared Services Center has four bots running nine different processes, including distributing funds, procurement, documenting images, scanning files, and creating folders to establish grants packages.

HHS is using artificial intelligence to help identify opportunities to consolidate contract vehicles, which will offer significant cost savings.

Getting Payments Right (CAP Goal 9). Preventing improper payments that result in a monetary loss is a high priority for the Administration. For additional details, please refer to the *Analytical Perspectives* volume chapter 9, "Payment Integrity," which includes Budget proposals aimed at preventing these improper payments.

Improving Outcomes through IT Cost Transparency (CAP Goal 10). This goal aims to leverage budget, acquisition, and financial data from authoritative sources using automation. Federal employees will be able to shift efforts to analysis and strategy recommendations rather than duplicating data entry, often not from authoritative sources.

Improving the Management of Major Acquisitions (CAP Goal 11). Federal agencies will ensure contracts supporting transformative and other priority projects will meet or beat delivery schedules, provide exceptional customer service, and achieve savings or cost avoidance for the taxpayer. The implementation strategy includes strengthening talent management and agency

governance as well as tracking investments using portfolio management principles.

Modernizing Infrastructure Permitting (CAP Goal 12). The Administration is working to reduce the overall time to make decisions for major infrastructure projects with the goal of reducing time to an average of two years. These efforts have already resulted in \$1 billion in cost savings through avoided permitting delays. The public can now track agency performance online at <https://www.permits.performance.gov>.

Security Clearance, Suitability, and Credentialing Reform (CAP Goal 13). This goal promotes a Federal workforce that reliably protects Federal Government people, property, systems, and information through an enhanced risk management framework.

Improving the Transfer of Federally Funded Technologies from Lab-to-Market (CAP Goal 14). This goal will strengthen the ability of federally funded innovations to transition from discovery in the laboratory to impact in the marketplace, including by reducing regulatory burden, strengthening partnerships, and enhancing how to measure return on Federal investment. See *Analytical Perspectives* chapter 21, "Research and Development," for more information.

OTHER PRIORITIES TO MODERNIZE GOVERNMENT

Government Reform and Reorganization. Another tool to modernize the Federal Government for today's mission needs is reorganization. In June 2018, the *Delivering Government Solutions in the 21st Century* plan laid out specific examples of organizational misalignment. The *Analytical Perspectives* volume chapter 8 provides more information about the Administration's reform priorities and phased implementation approach.

Acquisition Modernization. The Federal Government spends a half trillion dollars through contracts each year to help deliver the mission in hundreds of agencies. While user-driven and innovative acquisitions continue to achieve results, most agencies remain encumbered by an antiquated and complex system. The Administration

will unveil an Acquisition Modernization Plan to guide incremental transformation through continuous process improvement testing, feedback, re-testing, and scaling. The Administration will work with the Congress on appropriate pilot authorities to allow tailored flexibility, if necessary, to test ideas to improve value and efficiency, consistent with principles of impartiality, transparency, and a robust supplier base.

Enterprise Risk Management (ERM). ERM is a tool to support strategic planning, improve performance, and foster a more risk-aware culture. In June 2018, OMB updated OMB Circular No. A-123, Appendix A, Management of Reporting and Data Integrity Risk, to integrate prior guidance for internal controls with current ERM policy. Agencies will now use a risk-based approach to assess, document, test, and report on internal controls over reporting and data integrity. Increasing maturity among agency ERM programs will support decision making across the PMA.

Performance Management. The Administration continues to leverage best practices from across sectors to drive improvement via the Federal Performance Management Framework.

In 2018, agencies continued quarterly, data-driven performance reviews of over 80 Agency Priority Goals. OMB held strategic review meetings with the major agencies to discuss management successes, challenges, and risks for over 265 strategic objectives and identify course corrections where needed. The Administration also issued a five-year strategic plan with key strategies and guidance to implement the Program Management Improvement Accountability Act.

Strengthen Use of Evidence. To further implement the Foundations for Evidence-Based Policymaking Act of 2018, the Administration will direct agencies to establish multiyear learning agendas to strategically plan their evidence-building activities in order to improve policy and programs. Agencies will also designate an Evaluation Officer to help lead evidence-building activities.

Real Property. The Administration has prioritized optimizing the Federal real property portfolio to achieve the mission and minimize cost. The *Analytical Perspectives* volume chapter 10 describes recent accomplishments and the vision to achieve this reform.

CUTTING THE RED TAPE: UNLEASHING ECONOMIC FREEDOM

Since taking office, the President has reinvigorated the economy through an historic regulatory reform agenda. The American people can feel the effects of economic freedom as the Administration eliminates unduly burdensome regulations and pulls back the long reach of Federal mandates.

In 2018, the Administration removed 12 old regulations for every one new significant regulation and saved the American people \$23 billion in overall regulatory costs. In just his first 21 months in office, the President achieved a total of \$33 billion in net regulatory cost savings for the American people, a stark contrast to the \$245 billion in net regulatory costs imposed by the Obama Administration during the same amount of time. The President's regulatory reform agenda represents a fundamental change of direction for the Federal Government. The strategy is simple: by eliminating or amending regulations that are duplicative, unnecessary, ineffective, or unduly burdensome, the Administration is unleashing the ingenuity, determination, and know-how of the private sector, which has always been the principal driver of American prosperity.

Comprehensive regulatory reform has provided relief to millions of Americans. The Department of Labor eased the burden on small business owners, affording them new opportunities to provide healthcare to their employees through association health plans. The Department of Veterans Affairs has expanded veterans' ability to use telecommunications to

access healthcare providers, expanding options for those who live in rural and underserved areas. The Administration rolled back regulations on America's fishermen, providing a net economic benefit of over \$654 million to that industry. The Department of Health and Human Services reduced healthcare paperwork burdens, saving \$8.2 billion in regulatory costs and providing much-needed relief to Medicare providers. In a major report, the Council of Economic Advisers estimates that key Administration healthcare deregulatory actions that expanded choice of insurance coverage will produce massive economic benefit—on the magnitude of nearly \$250 billion over a decade.

The Administration plans even bolder efforts during the remainder of 2019. Agencies plan deregulatory actions on Corporate Average Fuel Economy standards, Waters of the United States, and automated vehicles, resulting in even more benefits for the American people. While continuing to protect health and safety, the President's regulatory reform allows individuals and small businesses to produce and innovate. These bold actions will create jobs, spur innovation, and yield billions of dollars in benefits for American businesses and families.

Getting Washington out of the way promotes the American dream. The Administration's commonsense regulatory policy has renewed confidence in the economy so the American people can once again confidently invest in their families, businesses, and future.

DEPARTMENT OF AGRICULTURE

Funding Highlights:

- The U.S. Department of Agriculture (USDA) provides leadership and direction on issues related to food, agriculture, and natural resources based on sound public policy, the best available science, and effective management.
- The Budget focuses on core Departmental activities such as agricultural research, rural lending, and protecting the Nation's forested lands and private agricultural lands, while also supporting the Secretary's efforts to improve services and expand broadband. The Budget also proposes that USDA responsibly and efficiently use taxpayer resources by making targeted reforms to duplicative programs and overly generous subsidy programs.
- The 2020 Budget requests \$20.8 billion for USDA, a \$3.6 billion or 15-percent decrease from the 2019 estimate (including changes in mandatory programs and receipts).

The President's 2020 Budget:

USDA works to promote American agricultural products and exports, support rural economic development, maintain access to a safe and nutritious food supply, and strengthen the productive and sustainable use of National Forest System Lands and stewardship of private lands.

USDA's broad mission encompasses everything from domestic feeding programs and assistance in rural America, to farm loans and the National Forest System. Throughout rural America, USDA's programs provide financing to help grow job prospects and raise income levels as well as improve utilities and infrastructure. The Department works to promote agricultural production while also protecting the long-term availability of safe and affordable food. USDA programs safeguard and protect America's food supply by reducing the incidence of food-borne hazards through the inspection of meat, poultry, and egg products.

The Department's programs also improve nutrition and health through food assistance and nutrition education. USDA works to increase foreign market access for U.S. agricultural products and provides data and analysis of foreign market conditions. This helps U.S. agricultural producers make informed decisions on international trade opportunities, and supports the U.S. economy through increased exports. In addition, USDA manages and protects America's public and private lands by working cooperatively across Federal, State, and local governments and the private sector and the private sector to preserve and conserve the Nation's natural resources through restored forests,

improved watersheds, and healthy private working lands. The Budget supports critical investments across core mission areas within USDA to best deliver results and support rural America.

Protects Health Outcomes for Pregnant Women, Infants, and Young Children. The Budget requests \$5.8 billion to serve all projected participants in the Special Supplemental Nutrition Program for Women, Infants, and Children. This program provides nutritious supplemental food packages, nutrition education, and health and immunization referrals to low-income and nutritionally at-risk pregnant and postpartum women, infants, and children.

"[W]e will continue to provide the best possible service to our customers – the farmers, ranchers, foresters, and producers of American agriculture and 'do right and feed everyone'."

USDA Strategic Goals
May 2018

Promotes Work and Reforms the Food Safety Net. The Budget includes bold proposals to help able-bodied adults participating in the Supplemental Nutrition Assistance Program (SNAP) enter the job market and work toward self-sufficiency. The Budget continues the America's Harvest Box proposal, allowing innovative partnerships with the private sector to combine the traditional SNAP Electronic Benefits Transfer benefits with 100 percent American grown foods provided directly to households. The proposal ensures that Americans in need have access to a nutritious diet while significantly reducing the cost to taxpayers. States maintain the ability to provide choice to their partici-

pants, including innovative approaches for the inclusion of fresh products. The Budget also includes proposals to reserve benefits for those most in need, promote efficiency in State operations, and strengthen program integrity.

Invests in Rural America. In today's information-driven global economy, e-connectivity has become an essential component to attract and grow rural businesses. To that end, the Budget supports continued implementation of the Secretary's e-Connectivity Pilot Program to foster thriving agricultural economies. The Department also helps to maintain and modernize rural utilities by providing critical support for infrastructure, such as \$528 million in funding for water and wastewater grants and loans that support \$1.2 billion in water and wastewater direct loans, \$5.5 billion in electric loans, and \$690 million in telecommunications loans. Through USDA's \$24 billion portfolio of guaranteed housing loans, the Department assists lenders in providing low- to moderate-income rural Americans with access to affordable housing. In addition, the Budget supports a \$3 billion loan level for community facility direct and guaranteed loans, which assist communities in developing or improving essential public services and facilities across rural America, such as health clinics or fire and rescue stations.

Combats the Opioid Challenge Facing Rural America. According to the Centers for Disease Control and Prevention, the rates of drug overdose deaths are rising in rural communities, surpassing the rate in urban areas. Through the Secretary's leadership of the Task Force on Agriculture and Rural Prosperity, the Department has identified specific actions to combat the opioid crisis and improve the quality of life in rural communities. USDA is approaching the opioid crisis with a dedicated urgency by partnering with local communities to provide program resources for prevention, treatment, and recovery. For example, USDA has launched an interactive data tool to help rural communities as they plan and build a local response to this monumental challenge. The Budget proposes \$44 million in distance learning and telemedicine grants, of which \$20 million would be dedicated to projects that combat the opioid crisis. In addition, the Budget proposes \$60 million in community facilities grants, which can be used to support treatment centers and other community needs.

Prioritizes Agricultural Research. USDA funded research helps to protect, secure, and improve the Nation's food, agricultural, and natural resource systems. Because the challenges facing the agriculture industry are immense, the Budget prioritizes competitive research through the Department's flagship grant program, the Agriculture and Food Research Initiative (AFRI). The Budget requests \$500 million for AFRI, an increase of \$100 million above the 2018 enacted level, and maintains formula-based research and extension grants at the level requested in the 2019 Budget. In 2020, the Budget also invests in the Nation's aging research infrastructure by proposing \$50 million for a new competitive grant program to modernize agriculture research facilities at land grant universities. The Budget proposes \$1.2 billion for the Agricultural Research Service, which conducts in-house basic and applied research. This includes additional funding for the National Bio- and Agro-Defense Facility, currently under construction in Manhattan, Kansas. USDA is assuming the responsibility for operational planning and future operations of the facility, which will provide the United States the ability to conduct comprehensive research, develop vaccines, and provide enhanced diagnostic capabilities to protect against emerging foreign animal and zoonotic diseases that threaten the Nation's food supply, agricultural economy, and public health. The Budget also proposes \$50 million for modernizing Agricultural Research Service facilities.

Implements Firefighting Funding Fix and Supports Forest Management Priorities. In 2018, Forest Service wildfire suppression spending was \$2.6 billion, a record level for the second consecutive year. Extreme fire behavior fueled by dry forest ecosystems and aggressive suppression operations in the wildland-urban interface to protect life and property were primary factors contributing to this unprecedented outlay of resources. The Administration's work with the Congress to enact a wildfire funding fix culminated last March with the wildfire cap adjustment in the Consolidated Appropriations Act, 2018. In 2020, the wildfire cap adjustment would provide the Forest Service and the Department of the Interior with additional funding of up to \$2.25 billion if the agencies fully expend their base funding levels for wildfire suppression. This funding aims to eliminate the need for disruptive "fire borrowing" from other uses to fund shortfalls during times of emergency.

In addition, the Administration has been direct and unequivocal about the need to accelerate active forest management. The Budget reflects this critical priority by requesting \$450 million for hazardous fuel mitigation work and \$375 million for the forest products program, higher amounts than in any prior Budget or enacted appropriation for both programs. Hazardous fuel removal is pivotal in ensuring Federal forests and watersheds are sustainable, healthy, and productive, which helps to make them safer and more resilient to the destructive impacts of wildfire. These programs also generate jobs in rural forest communities.

Improves Customer Service. The Budget supports new and continuing investments in information technology modernization by USDA to improve customer service and streamline and modernize rural and farm program and service delivery. Through the <https://www.Farmers.gov> service portal, the Department is working toward greater online service delivery and fewer in-person and paper-based transactions. In addition, the Budget continues support for the Secretary's realigned Farm Production and Conservation mission area by streamlining service delivery between the Farm Service Agency, Natural Resources Conservation Service, and Risk Management Agency to improve efficiency, effectiveness, and accountability.

Supports Comprehensive Farm Safety Net Reforms and Reduces Waste. The Budget proposes to optimize and improve crop insurance and commodity programs in a way that maintains a strong safety net. The Budget does this while also achieving savings, eliminating subsidies to higher income farmers, and reducing overly generous crop insurance premium subsidies to farmers and payments made to private sector insurance companies. The Budget includes a bold set of proposals, including those that would reduce the average premium subsidy for crop insurance from 62 percent

to 48 percent and limit commodity, conservation, and crop insurance subsidies to those producers that have an Adjusted Gross Income of \$500,000 or less. In addition, the Budget proposes reductions to overly generous subsidies provided to participating insurance companies by capping underwriting gains at 12 percent, which would ensure that the companies receive a reasonable rate of return given the risks associated with their participation in the crop insurance program. The Budget proposes to tighten commodity payment limits, including eliminating an unnecessary and separate payment limit for peanut producers and limiting eligibility for commodity subsidies to one manager per farm.

Ensures Commodity Purchases and Donations and Improves Program Transparency. During times of market disruption, low prices, or oversupply, USDA has the ability to purchase commodities from the marketplace and donate them to domestic feeding programs and soup kitchens. The Budget includes a suite of proposals to ensure stable historical levels of funding for all the nutrition programs that benefit from these activities while also increasing transparency and improving operational efficiency.

DEPARTMENT OF COMMERCE

Funding Highlights:

- The Department of Commerce (DOC) ensures fair and secure trade; provides data that empowers and informs American businesses and citizens; prevents U.S. technologies from being exploited, misused, or stolen through export controls and an effective system of patents and trademarks; and conducts foundational research and development.
- The Budget request for DOC prioritizes and protects investments in core Government functions such as preparing for the 2020 Decennial Census, providing the observational infrastructure and personnel to produce timely and accurate weather forecasts, and enforcing laws that promote fair and secure trade.
- The Budget requests \$12.2 billion for DOC, a \$1.0 billion or a 9.3-percent increase from the 2019 estimate.

The President's 2020 Budget:

The Budget continues to invest in critical priorities such as the 2020 Decennial Census, trade enforcement, intellectual property, weather and Earth observations, and spectrum management. In order to fund these priorities in a fiscally disciplined manner, the Budget reduces grant funding and consolidates or eliminates duplicative or unnecessary programs.

Supports a Fair, Modern, and Accurate 2020 Decennial Census. April 1, 2020, is Census Day and marks the culmination of nearly a decade of design, research, and testing to meet the Administration's goal of conducting a complete, accurate, and fair Decennial Census. Required every 10 years by the Constitution, the Decennial Census is responsible for the allocation of congressional representation and more than \$675 billion of Federal funds to local communities. The 2020 Census will be the most modern census in the Nation's history, as households will have the choice to participate via the internet, telephone, or by paper. An accurate Decennial Census is imperative because of the role its data play in shaping and informing policymaking for the next decade. The Budget recognizes

Did you know?

The census is the Nation's largest peacetime mobilization of its workforce, an exercise that requires collaboration across Federal agencies, non-Federal organizations, State and local governments, and the public. These efforts help to ensure an accurate and complete count of U.S. residents as required by the Constitution every 10 years. To make this a success, the Census Bureau will recruit more than three million applicants between now and 2020.

the importance of the Census Bureau's mandate by supporting \$7.2 billion in total budget authority in 2020.

"The era of economic surrender is over. From now on, we expect trading relationships to be fair and to be reciprocal."

President Donald J. Trump
September 28, 2018

Promotes Free and Fair Trade. The Budget includes \$16 million to support the President's robust trade agenda in order to protect critical elements of U.S economic security and level the playing field for American workers, farmers, and manufacturers. The Budget supports the implementation of the John S. McCain National Defense Authorization Act of 2019, which expanded the jurisdiction of the Committee on Foreign Investment in the United States and provided DOC with new responsibilities to identify emerging and foundational technologies that are essential to national

security. The Budget also establishes a new initiative within the International Trade Administration to counter the circumvention or evasion of U.S. trade actions aimed at those who engage in unfair and illegal trade practices.

Supports America's Prominence in Critical Technologies. The Budget provides \$688 million for the National Institute of Standards and Technology to conduct cutting-edge research, including quantum computing, artificial intelligence, and microelectronics. Together, these investments would drive innovation for national security and economic competitiveness. The Budget also provides \$10 million to support functions assigned in the Administration's Space Policy Directives, including new capacity to manage commercial space traffic and provide real-time data to serve the civilian space sector. In addition, the Budget supports the application of innovative spectrum access techniques, spectrum sharing technologies, and spectrum leasing options to enable smarter and more efficient ways to leverage the Nation's valuable and finite spectrum resources. As part of the Administration's commitment to the Heartland, the Budget funds broadband mapping work to support ongoing efforts to increase the availability of affordable, reliable, and modern high-speed internet access in rural and underserved communities.

Protects Lives and Property with Weather Data. America's satellites are vital to keeping America safe and secure, providing space-based observations that improve the accuracy and timeliness of weather predictions. The Budget provides \$1.2 billion in funding to support the development of these critical satellite systems, including polar weather satellites, space weather instruments, and satellite data collection systems. The Budget also includes funding to study how commercial technologies could be leveraged to help support future satellite architectures, assure data continuity, and reduce lifecycle costs. Funding these priorities reduces the risk of a weather satellite coverage gap, which would have devastating consequences for public safety and the national economy.

Improves the Delivery of America's Economic Statistics. The President and the Administration are changing a once-stagnant economy with pro-growth policies, and the Nation's economic data tells the story of this success. The Budget recognizes the importance of economic statistics for businesses and everyday citizens to make informed decisions and confidently invest in America's future. The Administration urges the Congress to consider the *Delivering Government Solutions in the 21st Century* plan's recommendation to consolidate critical economic statistics programs at Census, the Bureau of Economic Analysis, and the Bureau of Labor Statistics, making agency operations more efficient, improving products, and reducing respondent burden.

As part of the Administration's commitment to deploy effectively Government resources to the neediest communities, the Budget also provides funding to improve poverty measurement in America.

Supports Infrastructure Permitting. The Budget supports the ongoing, multi-agency work to streamline Federal permitting processes by increasing the National Oceanic and Atmospheric Administration's (NOAA) capacity to complete environmental reviews for permitting applications under the Endangered Species and Marine Mammal Protection Acts. Allocating additional funding to this initiative would allow NOAA to reduce the burden on the regulated community by providing more timely, consistent, and clear consultations and authorizations, resulting in faster reviews and a reduced backlog for permits, including those supporting energy, oil and gas, and transportation projects. This investment in America's future would contribute to prosperity and economic growth.

Eliminates Redundant, Ineffective, and Inefficient Programs. Americans deserve a Government that makes investments that are transparent, accountable, and provide the greatest return for their hard-earned tax dollars. The Budget eliminates the Economic Development Administration, which provides small grants with limited measurable impacts and duplicates other Federal programs. The Budget also proposes to eliminate funding for several lower priority NOAA grant and education programs, including Sea Grant, Coastal Zone Management Grants, and the Pacific Coastal Salmon Recovery Fund. These eliminations would allow NOAA to better target remaining resources to core missions and services. In addition, the Budget eliminates Federal funding for the Manufacturing Extension Partnership program, assuming its transition to solely non-Federal revenue sources, as originally intended when the program was established. The Budget also proposes the modernization of the Minority Business Development Agency, reforming its operations to expand its reach and better help meet its programmatic objective of helping minority businesses.

DEPARTMENT OF DEFENSE

Funding Highlights:

- The Department of Defense (DOD) provides the combat credible military capabilities needed to compete, deter, and if necessary, fight and win wars to protect the security of the United States.
- The Budget funds the National Defense Strategy to support DOD's three lines of effort: rebuilding readiness and lethality; strengthening alliances and partnerships; and improving performance and affordability through reform.
- The Budget requests \$718 billion for DOD, a \$33 billion or 5-percent increase from the 2019 enacted level.

The President's 2020 Budget:

The Budget provides the necessary resources for DOD to defend the homeland, remain the pre-eminent military power in the world, ensure balances of power in key regions remain in America's favor, and advance an international order that is most conducive to U.S. security and prosperity. The Budget enhances the military's readiness and lethality, prioritizing strategic competition with China and Russia. The Budget also sustains efforts to deter and counter rogue regimes such as North Korea and Iran, defeat terrorist threats, and consolidate gains in Iraq and Afghanistan through a resource-sustainable approach. DOD will increase the impact of its investments, as it rebuilds more lethal force, strengthens the network of allies and partners, and implements reform.

The Budget builds on steady gains that have restored military readiness, enhanced lethality, increased force size, and driven the Islamic State of Iraq and Syria (ISIS) out of territory it once held. On this foundation of strength, the Budget reflects the full integration of the National Defense Strategy across DOD, and supports dominance across all domains. The Budget provides the Army, Navy, Air Force, and Marine Corps the capabilities to bolster advantage in the air, on land, and at sea, leveraging advances in key technologies, including long-range precision fires, hypersonic missiles, and missile defense systems. For space, the Budget supports the creation of a new branch of the Armed Forces, the United States Space Force, and a new combatant command, U.S. Space Command, while the Space Development Agency, which is being established in 2019, fosters innovation. For cyber, the Budget continues to integrate efforts and operationalize U.S. cyber strategy, while scaling artificial intelligence throughout the Department. The Budget funds these advanced capabilities for the force needed to achieve the objectives in the National Defense Strategy. In 2020, the Budget funds an end strength of 2,140,300 active and reserve military personnel, buys 12 battle

force ships and two large experimental unmanned surface ships, procures 110 fighter aircraft, and modernizes nearly two armored brigade combat teams.

Ensures the Readiness of U.S. Armed Forces. The Budget provides the resources necessary to continue rebuilding military readiness, which had been degraded by budget reductions imposed by the Budget Control Act and more than 17 years of warfighting. The Budget includes increased funding for the U.S. Army to modernize existing forces, provides additional training for soldiers to meet readiness goals by 2022, and increases readiness of security assistance brigades to train, advise, and enable foreign security forces to build partner capacity. The Budget funds continuing efforts to improve Navy and Marine Corps aviation readiness, with robust funding for maintenance, spare parts, and flying hours, while prioritizing close combat investments in lethality and enablers to provide every advantage to America's tactical warfighters. The Budget also funds ship depot maintenance and ship operations accounts to the maximum executable levels. In addition, the Budget funds Air Force flying hours to the maximum executable levels and continues to fund maintenance at a high level to achieve desired readiness gains, in addition to an aggressive program to recruit and retain additional pilots. The Budget also expands multiyear investments in training for high-end combat to ensure the United States remains able to defeat any adversary.

"My Administration's National Security Strategy lays out a strategic vision for protecting the American people and preserving our way of life, promoting our prosperity, preserving peace through strength, and advancing American influence in the world."

President Donald J. Trump
December 18, 2017

Modernizes the Nuclear Deterrent. The return of great power competition demonstrates the need for flexible, adaptable, and resilient nuclear capabilities to keep America safe and secure. The Budget continues the Administration's implementation of the Nuclear Posture Review through investments in nuclear ballistic missile submarines, strategic bombers, nuclear air-launched cruise missiles, intercontinental ballistic missiles, and the associated nuclear command, control, and communications systems.

Pursues Technological Innovation for Decisive Military Advantage. The rapid advancement and proliferation of new technologies is changing the character of war. To prevent the erosion of the U.S. competitive military advantage, DOD is investing in new technologies to compete, deter, and if necessary, fight and win the wars of the future. The Budget's key areas of focus include autonomous systems, hypersonics, and artificial intelligence, including \$208 million to scale DOD's Joint Artificial Intelligence Center. In addition, in 2020 the Army's newly formed Army Futures Command would be at full operating capability, designed to increase the efficiency of Army modernization, by leveraging technology across the enterprise and reducing development time. The Budget requests more than \$59 billion in research, engineering, and prototyping activities to maintain the military's technological superiority and conventional overmatch against priority challenges.

Establishes the United States Space Force (USSF). The Budget supports the creation of USSF as the sixth branch of the Armed Forces. For the first time in 70 years, DOD will establish a new service to organize, train, and equip DOD's forces in order to protect and defend America's national interests in the fourth domain of warfare. The USSF will initially realign existing space forces and materiel from the military services and will scale up responsibly and deliberately over the next several years in order to address increasing threats and maintain strategic stability. The Budget provides funding to establish the USSF as a new service within the Department of the Air Force while continuing to accelerate the development and procurement of vital capabilities to the Joint Force, allies, and partners. Central to achieving this new acquisition paradigm is the Space Development

Agency, which is being established in 2019 under existing authorities to foster innovation by leveraging the thriving domestic commercial space sector. The Budget also supports U.S. Space Command as the newest Combatant Command, which will employ the forces and capabilities presented by the USSF.

Advances Airpower for the 21st Century. The Budget request supports the continued modernization of DOD's aircraft fleets to enable them to meet the challenges they will face in the contested environment of the future. The Air Force's tactical fighter investment program is focused on procuring the advanced F-35A stealth fighter while improving its fleet of current fighters such as the F-15 and F-16. The Navy and Marine Corps would also continue to procure their own variants of the F-35, as well as modernize their current F/A-18E/F fighters. In addition, the Budget continues to fund the development of the next generation stealth bomber and procurement of KC-46 aerial refueling tankers. These investment programs would ensure that DOD will be able to successfully counter the wide variety of threats that could be encountered in future combat situations.

Builds a More Lethal and Ready Navy. The Budget enhances lethality to meet the Nation's security challenges today while preparing for tomorrow. The Budget balances between modernization and readiness as well as capability and capacity. Notably, the Budget accelerates acquisition for several key systems, including Unmanned Undersea Vehicles, and invests in advanced tactical munitions, such as Tactical Tomahawks and the Standard Missile 6 Block 1B. The Budget also buys two large experimental unmanned surface ships and 12 battle force ships, including three guided missile destroyers, three fast attack submarines, and the first of a new class of guided missile frigates. The Budget also supports the Navy's recent innovative procurement of nuclear aircraft carriers, which should enable the shipbuilder to achieve unprecedented efficiencies from the construction of two ships.

Improves Ground Combat Lethality. The Budget invests in enhancements to close combat lethality of small infantry units, and the modernization of armored brigades. Most combat deaths suffered by infantry squads happen while engaging with the enemy at close range. The Budget makes investments in improved equipment and training to enhance the overmatch of Army, Marine Corps, and Special Operations small combat units. By investing in new weapons and body armor, warfighter recruitment and training, tactical communications and sensors, the Budget makes these front line units more lethal, resilient, and capable in a close combat environment. The Budget also accelerates the modernization of the Army's armored brigades to nearly seven over the five-year window while investing in the development of a next generation ground combat vehicle.

Strengthens Missile Defense. The Budget supports the President's commitment to expand and improve state-of-the-art missile defense systems as articulated in the recently released Missile Defense Review (MDR). The Budget sustains deployed missile defense assets, improves system reliability against today's threats, increases engagement capability and capacity, and makes strides to rapidly address the advanced threat. The Budget continues work to build a new missile field at Fort Greely, Alaska, with 20 silos and 20 additional Ground-Based Interceptors (GBIs) in support of the Administration's plans to increase the number of deployed GBIs to 64, to protect the homeland against North Korean and other intermediate- and long-range ballistic missile threats. In addition to enhancing current capabilities, the Budget embraces the MDR principles of exploring promising new technologies, including in space, and enhancing offensive capabilities to neutralize missile threats prior to launch during a conflict.

Invests in Cyber Activities. The Budget continues to place a high priority on cybersecurity and cyber operations by requesting more than \$9.6 billion in 2020 to advance DOD's three primary cyber missions: safeguarding DOD's networks, information, and systems; supporting military commander

objectives; and defending the Nation. This investment provides the resources necessary to grow the capacity of U.S. military cyber forces (including the recently elevated United States Cyber Command), invest in the cyber workforce, and continue to maintain the highest cybersecurity standards at DOD.

Continues to Promote Stability and Security in South Asia. The Budget furthers the U.S. goal of a stable and secure South Asia by supporting the Afghan government and security forces in their fight against jihadist terrorist organizations. The Budget requests funding for continued U.S. training and assistance for the Afghan National Defense and Security Forces and enables U.S. forces to conduct counterterrorism operations.

Secures the Enduring Defeat of ISIS, al Qaeda, and other Jihadist Terrorists. The Budget requests the funding necessary to ensure the lasting defeat of ISIS. Building on ISIS's territorial defeat in Iraq and the liberation of ISIS-controlled territory in Syria, DOD will continue to work with partner forces to destroy remnants of ISIS, strengthen border security, retain territorial control, and disrupt ISIS's capability to attack the U.S. homeland and America's allies. The Budget also requests funding for DOD to address the threat from ISIS branches outside Iraq and Syria, and to protect the United States against other terrorist threats.

Increases Compensation for Servicemembers and Supports Military Families. Military compensation must be competitive to recruit and retain the most qualified men and women to serve in an All-Volunteer Force. The Budget proposes a 2020 military pay raise of 3.1 percent—the largest increase in a decade. The Budget also requests funding for a full range of compensation programs, from monthly incentive pays to recently modernized retirement benefits. In addition, the Budget requests funding to continue important programs that improve the quality of life for military families, and ensure they receive the support they need throughout every stage of their family members' service.

Strengthens the Defense Industrial Base. In September 2018, DOD released a whole-of-Government report titled *Assessing and Strengthening the Manufacturing and Defense Industrial Base and Supply Chain Resiliency in the United States*, pursuant to Executive Order 13806. Following through on the report's recommendations, the Budget invests \$286 million in DOD efforts to ensure a robust, resilient, secure, and ready manufacturing and defense industrial base. DOD's investments to implement this comprehensive, Government-wide effort demonstrate that manufacturing and the defense industrial base are vital not only to the Nation's economic security, but also to national security.

Reforms Business Practices for Greater Performance and Accountability. DOD continues to pursue management reforms to increase affordability and redirect savings to higher priorities. For example, DOD will continue achieving savings by reducing management overhead and the size of headquarters staff in 2020. DOD is also modernizing business processes and systems and eliminating duplication, which will yield significant savings and transparency, and improve decision support. In addition, the Department is looking holistically at contract management for services and commodities, to identify better approaches to demand management, requirements definition, and contracting strategies. DOD has also reviewed spending priorities in light of the new National Defense Strategy, and realigned funds from outdated legacy capability to better support the Department's lethality against near peer threats. In total, DOD achieved \$4.7 billion in reform savings in 2017 and 2018 and is targeting \$6 billion in savings in 2019. The objective is not simply savings over time, but a sustainable change in process and culture that will continue to ensure the most effective use of resources and increased lethality.

Audits the Department and Invests in Fixing Audit Findings. Better management begins with effective financial stewardship of taxpayer dollars. With more than \$2.6 trillion in assets spread across 24 stand-alone reporting entities, the Department's recent full financial statement audit was DOD's first comprehensive audit and the largest ever undertaken by an agency of the U.S.

BUDGET OF THE U. S. GOVERNMENT FOR FISCAL YEAR 2020

27

Government. Under the President's leadership, DOD continues to place a high priority on performing annual financial statement audits to bolster accountability and public confidence in the Department's fiscal discipline and to modernize its business practices and systems. The Department will address findings by holding the military departments and defense agencies accountable for the development and implementation of corrective actions, with a goal of meaningful, persistent progress toward a clean audit opinion. Armed with audit findings and remediation plans, DOD will leverage better data to inform decision-making, while enhancing internal controls and business procedures to improve efficiency and effectiveness.

DEPARTMENT OF EDUCATION

Funding Highlights:

- The Department of Education focuses its mission on supporting States and school districts in their efforts to provide high-quality education to the Nation's most vulnerable students, on streamlining and simplifying funding for college, and on expanding access to new postsecondary options.
- The Budget demonstrates fiscal discipline while maintaining funding for key K-12 education formula grants and making targeted investments in school safety, workforce development, teacher quality, and school choice.
- The Budget devotes an unprecedented level of resources to promoting school choice by proposing a Federal tax credit of up to \$50 billion over 10 years for donations to scholarship programs for families of elementary and secondary students who are seeking State-defined public or private education options.
- The Budget ensures students can successfully pursue various pathways of postsecondary education and training by investing in career and technical education, streamlining and improving student loan repayment, increasing institutional accountability, and offering the opportunity to use Pell Grants for high-quality, short-term training.
- The Budget requests \$62.0 billion for the Department of Education, an \$8.5 billion or 12.0-percent decrease compared to the 2019 enacted level (including cancellations of Pell Grant unobligated balances). Excluding cancellations, the Budget requests a program level of \$64.0 billion for the Department of Education, a \$7.1 billion or 10.0-percent decrease compared to the 2019 enacted level.

The President's 2020 Budget:

The President's Budget achieves two equally important goals: fiscal discipline in discretionary spending and support for priorities that would improve the Nation's schools and make the United States stronger by preparing the workforce for the jobs of the 21st Century. The Budget reduces the Federal role in education, and prioritizes targeted investments in school safety, teacher quality, school choice, and workforce development. By modernizing U.S. education and training programs, the Budget would increase competition and transparency, reduce student debt, and ensure that what students are learning matches the needs of emerging industries. By increasing accountability for institutions of higher education and helping students complete postsecondary education more quickly, the Budget would help make higher education more affordable and protects both students

and taxpayers. In addition, the Budget includes a Federal school choice tax credit to provide scholarships for both private schools and qualifying public education expenses. These policies would initiate tremendous strides toward the Administration's goal of providing all students with the opportunity to receive a high-quality education and achieve future success.

K-12 Education

The Budget request for elementary and secondary education reflects this Administration's continued commitment to providing States and school districts with the resources and flexibility to ensure that all children receive an excellent education. In addition, the Budget builds on the Administration's efforts to give families more choices for their children's education and to ensure that all students learn in safe and secure schools.

"Parents have the greatest stake in the outcome of their child's education. Accordingly, they should also have the power to make sure their child is getting the right education."

Betsy DeVos
Secretary
March 13, 2018

Ensures Families Have the Resources and Choices to Provide the Best Education for Their Children. Families should be empowered to decide which schools and academic supports are best for their children. That is why the Budget makes a first-of-its-kind proposal to equip families with the financial resources necessary to choose the education that best serves their children. The Budget proposes to make available annually \$5 billion worth of tax credits for individual and corporate donations to State-authorized nonprofit education scholarship-granting organizations (SGOs). SGOs would use donated funds to provide families with scholarships or additional educational resources

that can be used on a range of educational activities such as career and technical dual-enrollment programs, afterschool tutoring programs, tuition for private schools, courses not available in their assigned schools, special education services, and additional qualifying public education expenses. States would determine family eligibility requirements and allowable uses of scholarship funds. In addition to this historic Federal tax-credit scholarship proposal, the Budget provides over \$650 million to support public school choice. The Budget requests \$500 million to fund the opening and expansion of high-quality public charter schools and the financing of charter school facilities. The Budget also requests \$107 million to expand magnet schools, which offer specialized curricula and instructional programming. In addition, the Budget invests \$50 million in funding for districts participating in the Title I student-centered funding pilot. The pilot program would help districts transition to more transparent funding systems that enable Federal, State, and local funding to follow the student to the public school of his or her choice.

Supports High-Need Students through Essential Formula Grant Programs. The Budget invests \$15.9 billion in Title I grants, maintaining a historic level of funding for a program that provides critically-important support to students in high-poverty schools. Title I serves approximately 25 million students in nearly 60 percent of all public schools, and is the foundation for the State-developed accountability systems under the Elementary and Secondary Education Act (ESEA). The Budget also proposes \$1.4 billion for Impact Aid programs that support school districts that educate federally-connected children, such as those living on military bases and Indian lands. The Budget continues to maintain the Federal investment in the Individuals with Disabilities Education Act (IDEA) formula and discretionary grant programs. The Budget invests \$13.2 billion for IDEA formula grants to States to support special education and early intervention services for more than seven million children with disabilities, and requests \$226 million for discretionary grants to support research, demonstrations, technical assistance and dissemination, and personnel preparation and development.

Protects Students and Secures Schools. The Administration is committed to ensuring that students are able to learn in a safe and secure educational environment. After the tragedy in Parkland, Florida, the President established the Federal Commission on School Safety to assess and develop Federal, State, and local policy recommendations to help prevent violence in schools. The recommendations were published in December 2018. The Budget provides approximately \$700 million, an increase of \$354 million compared to the 2019 Budget, in Departments of Education, Justice, and Health and Human Services grants to give States and school districts resources to implement the Commission’s recommendations, such as expanding access to mental healthcare, developing threat assessments, and improving school climate. At the Department of Education, the Budget requests \$200 million for School Safety National Activities, which provide grants to States and school districts to develop school emergency operation plans, offer counseling and emotional support in schools with pervasive violence, and implement evidence-based practices for improving behavioral outcomes.

Invests in Innovation to Elevate the Teaching Profession. The Administration is committed to ensuring teachers have access to high-quality professional development opportunities that meet their individual needs. The Budget proposes \$200 million for the Teacher and School Leader Incentive grant program to improve teacher induction and recognize and reward teaching excellence. The program would support performance-based compensation systems and human capital management systems that include either high-quality mentoring of novice teachers or increased compensation for effective teachers, particularly in high-need subjects such as science, technology, engineering, and mathematics (STEM) and coding. The Budget also includes \$300 million for Education Innovation and Research to support a rigorously evaluated demonstration of empowering teachers to choose the individualized continuing education and training that contributes to their own professional growth and improved student outcomes. Within the program, the Budget proposes to pilot vouchers for teachers, enabling them to select training opportunities that are tailored to their unique needs.

Higher Education

The Budget continues support for Federal programs that: help prepare low-income and minority students for postsecondary education; target student financial aid to help students and families pay rising college costs; promote multiple pathways to obtaining family-sustaining careers; and strengthen postsecondary institutions serving large proportions of minority students. The Budget also includes proposals that would address student debt by simplifying student loan repayment and redirecting inefficiencies in the student loan program to prioritize debt relief for undergraduate borrowers. These proposals would support congressional efforts to modernize and reauthorize the Higher Education Act to be responsive to the needs of both students and employers. The Budget also addresses student debt and higher education costs while reducing the complexity of student financial aid.

Increases Institutional Accountability. Investing in higher education generally provides strong value for students and taxpayers. However, some postsecondary programs fail to deliver a quality education that enables students to repay Federal student loans—leaving borrowers and taxpayers holding the bill. A better system would require postsecondary institutions accepting taxpayer funds to share a portion of the financial responsibility associated with student loans. The Administration plans to work with the Congress to address these issues.

“If the Federal Government is going to subsidize student loans, it has a right to expect that colleges work hard to control costs and invest their resources in their students. If colleges refuse to take this responsibility seriously, they will be held accountable ... And we must hold all schools equally accountable for their performance.”

President Donald J. Trump
as Presidential Candidate
October 13, 2016

Reforms Student Loan Programs. In recent years, income-driven repayment (IDR) plans, which offer student borrowers the option of making affordable monthly payments based on factors such as income and family size, have grown in popularity. However, the numerous IDR plans currently offered to borrowers overly complicate choosing and enrolling in the right repayment plan. The Budget proposes to streamline student loan repayment by consolidating multiple IDR plans into a single plan. The Single IDR plan would cap a borrower's monthly payment at 12.5 percent of discretionary income. For undergraduate borrowers, any balance remaining after 180 months of repayment would be forgiven. For borrowers with any graduate debt, any balance remaining after 30 years of repayment would be forgiven.

To support this generous pathway to debt relief for all undergraduate borrowers, the Budget eliminates the Public Service Loan Forgiveness program, establishes reforms to guarantee that all borrowers in IDR pay an equitable share of their income, and eliminates subsidized loans. To further improve and simplify loan repayment, the Budget proposes auto-enrolling severely delinquent borrowers and instituting a process for borrowers to consent to share income data for multiple years. To facilitate these program improvements and to reduce improper payments, the Budget proposes to streamline the Department of Education's ability to verify applicants' income data held by the Internal Revenue Service. These reforms would reduce inefficiencies and waste in the student loan program, and focus assistance on needy undergraduate student borrowers. All student loan proposals would apply to loans originating on or after July 1, 2020, except those provided to borrowers to finish their current course of study.

Continues Investment in the NextGen Servicing and Processing Environment. The Budget invests \$1.8 billion in Student Aid Administration at Federal Student Aid (FSA), which has 42 million customers and manages one of the largest consumer loan portfolios in the United States. Nearly 6,000 institutions of higher education participate in the Federal student aid programs. FSA's customers deserve a world-class experience, but they do not consistently receive one today. Currently, when customers apply for, receive, and repay Federal student aid, they interface with multiple brands and vendors. FSA is investing in best-in-class financial services technologies to deploy a mobile-first, mobile-complete digital customer experience. This transformation will provide better outcomes for customers, streamline processes and procedures for FSA employees, and improve value for American taxpayers.

Expands Pell Grant Eligibility for Short-Term Programs. There are many paths to a successful career in addition to a four-year degree. The Budget expands Pell Grant eligibility to include high-quality short-term programs. This would help more Americans access education and training programs that can equip them with skills to secure well-paying jobs in high-demand fields more quickly than traditional two-year or four-year degree programs.

Advances Grantmaking and Supports for Minority-Serving Institutions (MSIs) and Historically Black Colleges and Universities (HBCUs). The Budget supports important investments in the academic quality, institutional management and capacity, infrastructure, and student support services for MSIs and HBCUs. In particular, the Budget proposes to improve grantmaking by consolidating six MSI programs into a \$148 million formula grant, providing funds more institutions can count on and yielding program management efficiencies. The Budget also continues to recognize the extraordinary contributions of HBCUs and requests more than \$404 million to maintain funding for HBCU formula and competitive grant programs that strengthen their capacity to provide the highest quality education.

Empowers States to Deliver Evidence-Based Postsecondary Preparation Programs. The Budget proposes to restructure and streamline the TRIO and GEAR UP programs by consolidating

them into a \$950 million State formula grant. These grants would support evidence-based postsecondary preparation programs designed to help low-income students progress through the pipeline from middle school to postsecondary opportunities. Given the statutory prohibition limiting the Department's ability to evaluate overall TRIO program effectiveness using the most rigorous methodologies, as well as budget constraints, the Budget supports a restructuring of the programs that leverages evidence-based activities and allows States more flexibility in meeting the unique needs of their students.

Workforce

In today's rapidly changing economy, it is more important than ever to prepare workers to fill both existing and future jobs. The Administration has placed a priority on science, technology, and computer science skills, devoting a minimum of \$200 million annually to prepare students, especially girls and minorities who are underrepresented in these industries, for the growing role technology is playing in driving the American economy. These skills open the door to jobs and drive solutions to complex problems across industries. The U.S. education system must provide access to affordable and quality education and training that includes in-demand career and vocational tracks as well as opportunities for work-based and experiential learning. The Budget supports programs that help students obtain the skills necessary to secure high-paying jobs in today's workforce and contribute to the Nation's economy.

Invests in Career and Technical Education (CTE). As part of the Administration's commitment to ensuring the Nation's students have the knowledge and skills to succeed in today's competitive economy, the Budget includes \$1.3 billion for CTE State grants. The recently reauthorized program helps ensure students have access to technical education, including work-based learning during high school and a wide array of post-secondary options including certificate programs, community colleges, and apprenticeships. The Budget also includes \$20 million for CTE National Programs to support quality STEM and coding-focused CTE programs. In addition, the Budget proposes to double the American Competitiveness and Workforce Improvement Act fee for the H-1B visa program and direct 15 percent of the revenues to the CTE State grants.

Refocuses Federal Work Study to Emphasize Workforce Development. The Budget proposes to reform the Federal Work Study program to support workforce and career-oriented training opportunities for low-income undergraduate students, not just subsidized employment as a means of financial aid, in order to create more available pathways to high-paying jobs. The program would allocate funds to schools based in part on enrollment of Pell recipients. Schools could fund individual students through subsidized employment, paid internships, or other designs, as long as the placements were career or academically relevant. Schools could also serve groups of students through programs and initiatives that expose students to or build their preparedness for careers.

Reduces Waste: Eliminates Ineffective or Redundant Programs. The Budget eliminates funding for 29 discretionary programs that do not address national needs, duplicate other programs, are ineffective, are poorly targeted, or are more appropriately supported by State, local, or private funds. These eliminations would decrease taxpayer costs by \$6.7 billion and include the Supporting Effective Instruction State Grants, 21st Century Community Learning Centers, and Federal Supplemental Educational Opportunity Grants.

DEPARTMENT OF ENERGY

Funding Highlights:

- The mission of the Department of Energy (DOE) is to advance U.S. national security and economic growth through transformative science and technology innovations that promotes affordable and reliable energy through market solutions, and meets America's nuclear security and environmental clean-up challenges.
- The 2020 Budget makes strategic investments to maintain global leadership in scientific and technological innovation and aggressively modernize the nuclear security enterprise that underpins the safety and security of Americans both at home and abroad.
- The 2020 Budget requests \$31.7 billion for DOE, an 11-percent decrease from the 2019 enacted level.

The President's 2020 Budget:

The Budget for DOE enables advancement of American leadership in science and technology, a cornerstone to enhancing national security, economic growth, and job creation. American ingenuity combined with free-market capitalism can drive tremendous technological breakthroughs. The Budget reasserts that the proper role of the Federal Government is to focus resources on early-stage research and development (R&D) of energy technologies. Refocusing on the appropriate role of the Federal Government ensures that taxpayer dollars are being effectively used while implementing fiscal discipline.

The Budget addresses the challenges that face the Nation and reflects the critical role DOE has in protecting the safety and security of the American people, including by ensuring that nuclear and radiological materials worldwide remain secured against theft by those who might use them against the U.S. homeland or U.S. interests abroad. The Budget also funds the modernization of nuclear weapons and ensures that the U.S. nuclear force remains superior in the world. In addition, the Budget ensures continued progress on cleaning up sites contaminated from nuclear weapons production and nuclear energy R&D. The Budget also demonstrates the Administration's commitment to nuclear waste management by supporting the implementation of a robust interim storage program and restarting the Nuclear Regulatory Commission licensing proceeding for the Yucca Mountain geologic repository.

The Budget further protects taxpayers by eliminating costly, wasteful or duplicative programs. The private sector is better positioned to provide financing for the deployment of commercially viable projects. As a result, programs proposed for elimination include: the Title XVII Innovative Technology Loan Guarantee Program; the Advanced Technology Vehicle Manufacturing Loan

Program; and the Tribal Energy Loan Guarantee Program. To further achieve fiscal discipline and reduce taxpayer risk, the Budget proposes to repeal the Western Area Power Administration's borrowing authority that finances the construction of electricity transmission projects. Investments in transmission assets are best carried out by the private sector where there are appropriate market and regulatory incentives. To promote effective and efficient use of taxpayer funds, the Advanced Research Projects Agency-Energy (ARPA-E) is also proposed for elimination. This elimination facilitates opportunities to integrate the positive aspects of ARPA-E into DOE's applied energy research programs. In addition, the elimination enables the Department to efficiently direct scarce resources as part of an integrated national energy strategy.

Modernizes the Nuclear Deterrent. The Budget supports the Administration's Nuclear Posture Review by maintaining a tailored and flexible nuclear deterrent that protects the homeland, assures allies, and, above all, deters adversaries. While the investments in America's nuclear weapons are large, given their importance in keeping America safe, the investments should be regarded as both necessary and affordable. The Budget increases investments in the nuclear stockpile to guarantee it is modern, robust, safe, and effective. Specifically, the Budget completes development and production of the W76-2 warhead, begins production of the B61-12 and the W88 Alteration 370, and continues development of the W80-4 and the W87-1. The Budget also continues support of the underlying Stockpile Stewardship Program, which facilitates stockpile modernization while advancing scientific understanding that can be applied to other national security missions.

Rebuilds Nuclear Weapons Infrastructure. The National Nuclear Security Administration's (NNSA) nuclear security enterprise of national laboratories, production plants, and the Nevada National Security Site is a critical component of the U.S. nuclear deterrent. However, the physical infrastructure is in acute need of updating to better support the stockpile, as more than half the facilities are over 40 years old. To maintain a modern, resilient infrastructure, the Nation must invest in facilities needed to produce strategic materials and components for U.S. nuclear weapons. The Budget makes these significant investments, such as construction of the Uranium Processing Facility in Tennessee. The Budget also increases funding to repurpose the Mixed-Oxide (MOX) Fuel Fabrication Facility in South Carolina for production of nuclear weapons plutonium pits to meet Department of Defense requirements. NNSA must have a modern enterprise with the capacity to respond to unforeseen developments.

Reduces Global Nuclear Threats. Nuclear terrorism and proliferation remain serious threats to the security of the United States and its allies. The Nation must maintain vigilance in its nuclear nonproliferation, counter-proliferation, and counterterrorism efforts to provide for the safety and security of the American people. The Budget makes the necessary, fiscally disciplined investments in these capabilities. Specifically, the Budget supports enhanced capabilities within the United States to respond more quickly to a nuclear terrorism threat. The Budget continues efforts to prevent terrorists from acquiring nuclear materials by removing these materials from around the world and helping countries protect remaining materials.

Disposes of Surplus Plutonium. With the termination of the MOX project, the Budget aggressively moves forward with the Dilute and Dispose approach to disposing of surplus plutonium. Consistent with the Administration's commitments to South Carolina, the Budget expedites removal of plutonium from the State. The Budget also makes investments in key facilities at the Savannah River Site and the Los Alamos National Laboratory to further accelerate plutonium disposition.

Provides Safe Naval Nuclear Propulsion. The Budget continues DOE's support of a strong U.S. Navy through NNSA's Naval Reactors (NR) program. NR works to provide the U.S. Navy with safe, environmentally conscious operation of nuclear propulsion plants for submarines and aircraft

carriers. The Budget continues development of the reactor systems for the *Columbia*-class ballistic missile submarine, maintaining alignment with the Navy for lead ship delivery. The Budget also supports recapitalization of the Navy's spent fuel handling infrastructure while making other needed investments at the four Naval Nuclear Laboratory sites.

Supports Cutting-Edge Basic Research and Leading Scientific User Facilities. The Budget provides \$5.5 billion for the Office of Science to continue its mission to focus on early-stage research, operate the national laboratories, and continue high priority construction projects. Within this amount, \$500 million is budgeted for Exascale computing to help secure a global leadership role in supercomputing, \$169 million for Quantum Information Science, \$71 million for artificial intelligence and machine learning, and \$25 million to enhance materials and chemistry foundational research to support U.S.-based leadership in microelectronics.

Invests in Laboratory Infrastructure and Testbeds to Enable Future Breakthroughs in Energy. DOE supports 17 national laboratories that offer world class scientific user facilities and the critical laboratory infrastructure necessary to operate them. Within the Office of Science, Science Laboratory Infrastructure focuses on strengthening the backbone of the labs with \$118 million to modernize aging critical infrastructure and laboratory space. The Budget continues to ensure access to the scientific user facilities of the future, including \$104 million for the Long Baseline Neutrino Facility/Deep Underground Neutrino Experiment and \$40 million to complete the Facility for Rare Isotope Beams. The Budget prioritizes select infrastructure and testbeds to maintain the world-class nature of national laboratory facilities and better enable private sector demonstration and deployment of energy technologies. For example, the Budget includes \$100 million to put DOE on a path to construct the Versatile Advanced (Fast) Test Reactor, a facility that would enable development and testing of advanced fuels and materials for the next generation of commercial nuclear reactors. The Budget also includes \$5 million for a new Grid Storage Launchpad initiative, which would support a new lab-based grid-scale battery testing center to help push technologies forward, and \$15 million to accelerate the conversion of the National Wind Testing Facility site into an experimental microgrid capable of testing grid integration at the megawatt scale.

Enhances Support for Cyber and Energy Security Initiatives. Ranging from cybersecurity of the bulk electrical system to prioritization of early-stage R&D focused on hardening energy infrastructure, the Budget prioritizes energy security for all Americans through continued investments that address the many cyber threats across the Nation's energy sector. To ensure robust cybersecurity programs across the energy sector, the Budget provides funding in multiple programs, including over \$156 million for the recently established Office of Cybersecurity, Energy Security, and Emergency Response. This funding would support early-stage R&D activities that improve cybersecurity and resilience to enable the private sector to harden and evolve critical infrastructure, including protecting critical infrastructure from both natural and man-made events.

Launches an Era of Energy Dominance through Strategic Support for Energy Technology Innovation. The United States has among the most abundant and diverse energy resources in the world, including oil, gas, coal, nuclear, and renewables. The ability of entrepreneurs and businesses to commercialize technologies that take full advantage of those resources is paramount to promoting U.S. economic growth, security, and competitiveness. That is why the Budget provides a programmatic funding level of \$2.3 billion across the applied energy programs at DOE to support early-stage R&D that will enable the private sector to

"America's future has never been brighter, and American energy is leading the way in providing jobs, opportunity, and security for our Nation."

President Donald J. Trump
September 28, 2018

deploy the next generation of technologies and energy services that usher in a more secure, resilient, and integrated energy system.

The Budget emphasizes two new intra-departmental initiatives within the Applied Energy Office portfolio that coordinate and build upon existing capabilities and expertise and seek to replicate successful program models to achieve results more effectively. Specifically, the Budget requests \$158 million for the Advanced Energy Storage Initiative, a coordinated effort jointly led by the Office of Electricity and the Office of Energy Efficiency and Renewable Energy (EERE) to advance energy storage R&D as a key to increasing energy security, reliability, and resilience. The initiative takes a broad, holistic view of energy storage as a set of capabilities that enable the conversion of energy resources to useful energy services. Assuring grid security and resilience will require greater grid flexibility and the deployment of grid assets, such as energy storage, that can efficiently buffer increased variable supply and demand. The Budget also requests \$59 million for the Harsh Environment Materials Initiative, a coordinated effort led by the Office of Nuclear Energy and the Office of Fossil Energy, in coordination with the Advanced Manufacturing Office within EERE, to exploit synergies in materials and component manufacturing R&D for advanced thermoelectric power plants. This initiative leverages activities related to advanced reactor technologies and high efficiency low emissions modular coal plants to align the R&D of novel materials, integrated sensors, and manufacturing processes relevant for advanced thermoelectric power plants.

Continues Reforms in the Environmental Management Program to Address the Challenge of Waste and Contamination from Nuclear Weapons Production. The Budget includes \$6.5 billion for 16 sites remaining to be cleaned up to meet environmental regulatory requirements. The Budget provides within this total \$128 million to advance the initiative to accelerate deactivation and decommissioning of selected high-risk excess facilities to protect human health and the environment, and to support the modernization of the Nuclear Security Enterprise.

Proposes to Divest Federally Owned and Operated Transmission Assets and Authorize the Power Marketing Administrations (PMAs) to Charge Market Based Rates for Power. The Budget proposes to sell the transmission assets owned and operated by the PMAs, including those of Southwestern Power Administration, Western Area Power Administration, and Bonneville Power Administration. The Budget also proposes to authorize the PMAs to charge rates comparable to those charged by for-profit, investor-owned utilities, rather than being limited to cost-based rates, for electricity. The vast majority of the Nation's electricity needs are met through investor-owned utilities. Reducing or eliminating the Federal Government's role in electricity transmission infrastructure ownership, thereby increasing the private sector's role, and introducing more market-based incentives, including rates, for power sales from Federal dams would encourage a more efficient allocation of economic resources and mitigate risk to taxpayers.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Funding Highlights:

- The mission of the Department of Health and Human Services (HHS) is to protect and strengthen the health and well-being of Americans through effective health and human services for the American people and by fostering sound, sustained advances in the sciences underlying medicine, public health, and social services.
- The Budget addresses the Nation's critical public health needs through investments that combat the opioid epidemic and support mental health services, increase efforts to eliminate infectious diseases, support high priority biomedical research, speed access to new innovative technology, and enhance emergency preparedness and health security. The Budget also offers strategies to reduce drug-related costs, improve the health of older Americans, and strengthen work requirements to promote self-sufficiency.
- The Budget also invests in child care to support America's working families, and promotes work among able-bodied adults receiving assistance.
- The 2020 Budget requests \$87.1 billion for HHS, a 12-percent decrease from the 2019 estimated level. The Budget proposes \$1,248.8 billion in net mandatory health savings, reducing longer-term deficits.

The President's 2020 Budget:

The Budget supports the mission of HHS while creating a streamlined Federal Government that promotes the most efficient and effective use of taxpayer dollars. The Budget invests in the highest priority public health needs of the Nation—combatting the opioid epidemic, supporting services for serious mental illness, and preparing for public health threats. The Budget launches an initiative to end HIV/AIDS in America, an ambitious, yet necessary effort to eliminate a disease that has plagued the Nation for more than three decades. In addition, the Budget takes bold steps to increase access and reduce drug costs for Americans, empowers consumers and States to regain control over health-care and increase affordability and consumer choice, and strengthens and protects the Medicare program for America's seniors.

Combats the Opioid Epidemic. In addition to progress already being made by the Administration, the Budget makes significant investments to combat the drug abuse and opioid epidemic, which claimed more than 70,000 lives in 2017. In the last year, the President released a new Initiative to Stop Opioid Abuse and Reduce Drug Supply and Demand, secured \$6 billion in new resources in the 2018 and 2019 to combat the epidemic, and signed the SUPPORT for Patients and Communities

Act, which enhances the Federal response to the opioid epidemic. The number of opioid prescriptions dispensed monthly has fallen by more than 20 percent since the beginning of 2017 and preliminary data from the Centers for Disease Control and Prevention (CDC) suggests that the number of drug overdose deaths are finally starting to level off or even decline.

The Budget sustains critical investments in surveillance, prevention, treatment, access to overdose reversal drugs, recovery support services, and research. For example, the Budget includes \$1.5 billion for State Opioid Response grants, which fund prevention, treatment, and recovery support services in all States and Territories. The Budget maintains more than \$1 billion in the National Institutes of Health (NIH) for opioid and pain research, including the continuation of the Helping to End Addiction Long-term Initiative that began in 2018.

The Budget includes \$221 million to expand the behavioral health workforce, including an additional \$4 million for a new effort authorized in the SUPPORT for Patients and Communities Act to increase the number of providers that are able to prescribe medication-assisted treatment. In addition, the Budget maintains \$120 million to support treatment and prevention of substance use disorder, including opioid abuse, in rural communities at the highest risk. The Budget also enables States to more easily provide one year of post-partum Medicaid coverage for women with a substance use disorder, to improve health outcomes for mothers and their infants.

The Budget provides \$476 million for CDC to continue current activities in support of all 50 States and Territories, as well as local jurisdictions, to track and prevent overdose deaths. CDC would prioritize expanding support to States and Territories to collect and report real-time overdose and robust overdose mortality data. The Budget also provides \$58 million for CDC to address the infectious disease consequences of the opioid epidemic. Approximately 95 percent of new Hepatitis C infections and one of every seven new HIV infections is due to injection drug use. CDC would focus on areas most at risk for outbreaks of HIV and hepatitis due to injection drug use.

Addresses Mental Health Needs. Mental illness, especially serious mental illness, takes a toll on individuals, families, and communities all across the United States. In 2017, only 7.5 million of the 11.2 million adults suffering from serious mental illness received mental health services in the past year. The Budget invests in activities that increase access to mental health services. The Budget includes \$723 million for the Community Mental Health Services Block Grant, which provides funding to every State to provide services to seriously mentally ill adults and children with serious emotional disturbances, and \$150 million for Certified Community Behavioral Health Centers, which provide comprehensive healthcare services, including 24-hour crisis response services to individuals with serious mental illness. The Budget also makes new targeted investments to help divert seriously mentally ill individuals away from the criminal justice system and into treatment, and to increase the access to evidence-based comprehensive services. In addition, the Budget contains important investments for children and young adults, including \$125 million for Children's Mental Health Services and \$133 million for school violence prevention. The Budget funds important suicide prevention activities, such as the suicide lifeline and activities to address the high suicide rates in middle-age and older adults.

Reforms Drug Pricing and Payment. The Administration's comprehensive drug pricing strategy addresses the problem of high drug prices, provides greater access to lifesaving medical products, and ensures that the United States remains the leader in biomedical innovation. Consistent with the Administration's *American Patients First Blueprint*, the Budget proposes strategies targeted at increasing competition, encouraging better negotiation, incentivizing lower list prices, and lowering out-of-pocket costs for beneficiaries.

- **Modernizes the Medicare Part D Prescription Drug Benefit**—In the past year, the Administration made great strides to better equip plans with the tools necessary to manage drug spending in the Part D program. The Budget builds on this progress by addressing the misaligned incentives of the Part D benefit structure. The proposed changes are designed to: encourage utilization of higher value drugs by eliminating cost-sharing for generic drugs for beneficiaries who receive the low-income subsidy; remove the competitive disadvantage placed on generic drugs that increases spending for both beneficiaries and the Government; and provide beneficiaries with more predictable annual drug expenses through the creation of a new out-of-pocket spending cap.

“One of my greatest priorities is to reduce the price of prescription drugs. In many other countries, these drugs cost far less than what we pay in the United States. That is why I have directed my Administration to make fixing the injustice of high drug prices one of our top priorities. Prices will come down.”

President Donald J. Trump
January 30, 2018

- **Reduces Costs for Part B Drugs**—The Budget addresses unnecessary barriers to free-market competition in Part B and proposes reforms to payment for Part B drugs, which heavily influences physician-prescribing behavior. Longstanding challenges in Part B include the lack of competition among drugs with similar health effects and limited tools to encourage lower drug prices. To address these challenges, the Budget includes proposals targeted at: removing the three-year payment protection of average sales price (ASP) plus six percent for certain new drugs provided in outpatient hospitals; deterring anti-competitive behavior from drug manufacturers that exploit aspects of the patent system to keep out competition; and moving coverage of some Part B drugs to Part D to reduce spending while protecting beneficiaries from increased out of pocket costs.

In addition, the Budget limits growth in Part B drug payment to an inflation benchmark and mandates manufacturers report ASP data for all Part B drugs to improve payment accuracy. The Budget also modifies hospitals’ payment for drugs acquired through the 340B drug discount program by rewarding hospitals that provide charity care and reducing payments to hospitals that provide little to no charity care.

- **Increases Access to More Affordable Generics Through Greater Competition**—The Budget would include a number of proposals to speed development of generics and eliminate loopholes that have allowed drug companies to use the regulatory framework to hinder competition. The Budget would:
 - Reform the current 180-day exclusivity forfeiture provision for first generics so that first generics do not block subsequent generics from U.S. Food and Drug Administration (FDA) approval.
 - Clarify FDA’s approach in determining whether a new drug is a new chemical entity to ensure that only truly innovative new drugs receive an additional five years of exclusivity.
 - Enhance FDA authority to address abuse of petition process so FDA has greater flexibility to summarily deny petitions when circumstances indicate that the primary purpose of the petition is to delay FDA approval.

- Enable FDA to tentatively approve a subsequent generic application, which would start the 180-day exclusivity clock, when a first to file generic application cannot be approved due to deficiencies.
- Improves Program Integrity—The Budget proposes to improve the integrity of the 340B program and ensure that benefits are used to help low-income and uninsured patients. This proposal includes broad regulatory authority for the 340B Drug Pricing Program to set enforceable standards of program participation and requires all covered entities to report on use of program savings.
- Lowers Costs and Increases Flexibility for Medicaid Prescription Drugs—The Budget proposes removing the cap on Medicaid manufacturer drug rebates, to ensure rebates reflect all price increases for a drug. In addition, the Budget includes new demonstration authority allowing States to test innovative approaches for Medicaid prescription drug coverage. Under the demonstration, participating States would test a closed formulary and negotiate prices directly with manufacturers. The Budget also prevents manufacturers from using authorized generics to lower their rebate obligations, and includes payment changes so State Medicaid programs do not overpay for generic drugs, saving money for States and taxpayers.

"[U]nder this Administration, we are putting American patients first...I've instructed Secretary Azar to begin moving forward on reforms that will bring soaring drug prices back down to earth."

President Donald J. Trump
May 11, 2018

Empowers States and Consumers to Reform Healthcare.

Under the Patient Protection and Affordable Care Act (PPACA) healthcare spending has increased significantly, particularly premiums for families without employer-sponsored coverage who don't qualify for Obamacare subsidies. To help expand families' health coverage options, the President signed into law the Tax Cut and Jobs Act, which eliminated Obamacare's individual mandate penalty, and took swift administrative actions that empower individuals to purchase health coverage that best suits their needs. Some new flexibilities already implemented include ex-

panding access to Association Health Plans for employers and many self-employed individuals, extending the duration and renewability of Short-Term Limited Duration Insurance, and proposing to allow employers to offer health reimbursement arrangements to employees for purchasing individual market coverage.

The Budget supports several initiatives to empower States and consumers to regain control over healthcare and increase affordability and consumer choice. The proposals in the Budget strive to put States back into the healthcare driver's seat as States are best situated to make decisions to improve the health and healthcare delivery of their citizens.

First, the Budget continues to support a two-part approach, starting with enactment of legislation modeled after the Graham-Cassidy-Heller-Johnson bill proposed in September 2017, followed by enactment of additional reforms to help set Government healthcare spending on a sustainable fiscal path that leads to higher value spending. Beginning in 2021, the Market-Based Health Care Grant Program, the Medicaid block grant, and the per capita cap program are set to grow at the Consumer Price Index. These programs would support States as they transition to more sustainable healthcare programs and encourage States to pursue innovative ideas that aim to curb costs moving forward. The Budget acknowledges the importance of ensuring protections for individuals with pre-existing conditions and States would be required to include such plans in their applications for these grants. Specifically, States would be required to allocate at least 10 percent of their grant funding to

be used to ensure protections for high-cost individuals, including those with pre-existing conditions. States would have the flexibility to design an approach that best allows States to meet this goal. The two-part approach would also provide relief for States and consumers from many of the PPACA's insurance rules and pricing restrictions that have resulted in a lack of affordable coverage options. This new flexibility would build on the Administration's regulatory actions and would empower more people to buy insurance plans that work for them, a substantial benefit to middle class families who do not receive coverage through the workplace or do not qualify for subsidies.

The Budget also proposes to give States additional flexibility over their Medicaid programs by transferring control of Medicaid transformation efforts locally where it belongs. The Administration recognizes that the only way to reform Medicaid and set it on a sound fiscal path is by putting States on equal footing with the Federal Government to implement comprehensive Medicaid financing reform through a per capita cap or block grant. A new Federal-State partnership is necessary to eliminate inefficient Medicaid spending, including repeal of the Medicaid expansion, and reducing financing gimmicks such as provider taxes. The Budget would empower States to design State-based solutions that prioritize Medicaid dollars for the most vulnerable and support innovation.

The Budget emboldens individuals to take charge of their healthcare needs and own their healthcare spending, while protecting them from large unexpected costs. Currently, too many Americans are gouged by unfair and often surprise bills for hospital care and for pharmaceutical drugs. The President is committed to addressing this issue and proposes that the Congress partner in these efforts to increase healthcare price transparency of providers, suppliers, and insurers, including curtailing surprise medical bills. This would not only help protect consumers from unexpected healthcare costs, but would also empower them to make more informed healthcare decisions. Such price transparency may lead to more robust competition between actors in the healthcare supply chain, ultimately lowering costs for patients and plan sponsors such as employers, associations, and unions. To further encourage increased consumer engagement, the Budget immediately requires all subsidized individuals that purchase health coverage on the Federal Exchange to contribute something to their healthcare coverage.

Health savings accounts (HSAs) are a tool to increase consumer engagement and lower healthcare spending without negatively affecting quality. The Budget includes a series of reforms to expand access to HSAs. Under tax provisions originally enacted in 2003, persons enrolled in certain high deductible health plans—which are generally referred to here as HSA-qualified plans—may contribute to savings accounts to pay for healthcare expenses on a tax-preferred basis. The Budget proposes that all plans with an actuarial value of up to 70 percent may be integrated with HSAs. This would enable consumers to utilize the benefits of HSAs with a larger number of innovative plan designs.

Together, these reforms and consumer protections aim to encourage innovation from States, help consumers with the costs of their healthcare, and focus Medicaid resources on the most vulnerable individuals, while continuing to protect those with high healthcare needs.

Modernizes Medicaid to Enhance State Flexibility. The Budget would empower States with additional tools to strengthen their Medicaid programs and empower States to further modernize Medicaid benefits and eligibility. The Budget would give States additional flexibility around benefits and cost-sharing, such as increasing copayments for non-emergency use of the emergency department to encourage appropriate use of healthcare resources, as well as allowing States to consider savings and other assets when determining Medicaid eligibility. In addition, the Budget would allow States to streamline appeals processes and delegate authority to another entity, to help eliminate duplicative appeals and reduce beneficiary confusion. The Budget would also bolster the safety net available to

States experiencing Children's Health Insurance Program (CHIP) funding shortfalls, while eliminating funding streams that do not support children's health.

Reduces Wasteful Medicaid Spending. The Budget takes numerous steps to reduce wasteful Medicaid spending. The Budget proposes eliminating loopholes that some States use to shift and increase costs to Federal taxpayers, and for the Centers for Medicare and Medicaid Services (CMS) to issue guidance ensuring that State Medicaid supplemental payments to hospitals and other providers are supported by robust and timely data. The Budget also proposes realigning the Federal matching payments for State Medicaid eligibility workers with other administrative costs, providing a fair balance between Federal and State resources for these activities. In addition, the Budget extends current law reductions in Medicaid disproportionate share hospital payments, and proposes to limit reimbursement to Government providers to no more than the cost of providing services to Medicaid beneficiaries.

Improves Program Integrity for Medicare, Medicaid, and CHIP. The Budget includes several legislative proposals and administrative actions to reduce monetary loss from improper payments and strengthen the integrity and sustainability of Medicare, Medicaid, and CHIP. Combined with additional funding investments in the Health Care Fraud and Abuse Control program, these policies provide CMS with additional resources and tools to combat waste, fraud, and abuse and to promote high-quality and efficient healthcare.

The Budget proposes to expand the Medicare program's authority to conduct prior authorization on items or services at high risk of fraud and abuse. The proposal helps ensure that the right payment goes to the right provider for appropriate services and saves taxpayer dollars from paying for Medicare services that are not medically necessary. The Budget also addresses healthcare overutilization and waste by expanding CMS's work in notifying providers that prescribe drugs or perform procedures in excess of their peers. In addition, the Budget proposes to strengthen Medicare Advantage program integrity by ensuring initial risk-adjustment payments are paid correctly and expanding risk-adjustment data validation audits.

Addressing vulnerabilities to Medicaid program integrity is a key priority for the Administration, and the Budget includes a number of proposals to ensure sound stewardship and oversight of Medicaid resources. For example, the Budget proposes to strengthen CMS's ability to partner with States to address improper payments and ensure Federal recovery of incorrect eligibility determinations, an area of concern identified by the HHS Office of Inspector General. In addition, the Budget allows States flexibility to more frequently assess beneficiary eligibility, ensuring resources are available for the millions of Americans who depend on Medicaid's safety net.

Strengthens and Protects the Medicare Program. The Budget proposes to reduce wasteful spending and incentivize efficiency and quality of healthcare in Medicare, extending the solvency of the program for America's seniors consistent with the President's promise to protect Medicare. The Budget brings transparency to several Medicare payments to hospitals, by financing payments not directly related to Medicare's health insurance role outside the Medicare Trust Fund and tying future growth to inflation growth; the Budget also reduces Medicare's spending on beneficiaries' unpaid cost sharing obligations, consistent with private sector business practices. In addition, the Budget proposes realigning incentives through site neutral payment reform to ensure accurate payments across different healthcare provider types are based on patient characteristics rather than site of care. By ensuring payments are accurately aligned with the costs of care and strengthening providers accountability to improve quality and health outcomes, the Budget protects seniors from excessive out-of-pocket costs and improves the standard of care they receive. The Budget also supports the Administration's commitment to reduce provider burden so providers can focus on patient care by

eliminating reporting burden and low-value metrics in performance-based payment for physicians, improving incentives for physicians to participate in advanced payment models that reward high-value healthcare delivery, and providing CMS with greater flexibility in beneficiary education and quality assurance.

The Budget demonstrates the Administration's commitment to ensuring Medicare beneficiaries have access to timely and appropriate care, by reprioritizing primary care through a budget neutral increase to payments for primary care providers. The Budget proposes to expand seniors' personal control and introduce more consumer power into the healthcare market by allowing Medicare beneficiaries to make tax-deductible contributions to HSAs associated with high deductible health plans offered by their employers or Medicare Advantage plan. The Budget would extend Medicare's solvency by roughly eight years.

Supports Access to Innovative New Medical Technology. Consistent with the Administration's commitment to addressing barriers to healthcare innovation, the Budget includes several administrative actions and a legislative proposal aimed at ensuring Medicare beneficiaries have access to critical and life-saving new cures and other technologies that improve beneficiary health outcomes. In particular, the policies would instill greater transparency and consistency in how Medicare covers and pays for innovative technology. The Budget also proposes to test new ways of covering and paying for certain devices. For Medicare beneficiaries with diabetes, to improve health outcomes and cost savings for both beneficiaries and the Government, the Budget proposes expanding coverage of disposable devices that substitute for a durable device for use in the management and treatment of diabetes.

Launches an Initiative to End the HIV Epidemic in America. For more than three decades, the Nation and the world have confronted the challenges posed by HIV and AIDS. More than 700,000 Americans have lost their lives to HIV since 1987. Each year, there are approximately 40,000 new HIV infections in the United States, the majority clustered in a limited number of counties. For the first time in modern history, America has the ability to end the epidemic, with the availability of biomedical interventions such as antiretroviral therapy and pre-exposure prophylaxis (PrEP). This initiative is the first step toward this goal.

The Administration is proposing a new multiyear initiative focused on accelerating progress to eliminate new HIV infections in America, with the goal of reducing new infections by 75 percent within five years, and by 90 percent within 10 years. The 2020 Budget provides a total of \$291 million to HHS for the Ending HIV Epidemic Initiative. Of this amount, the Budget provides \$140 million for CDC to reduce new HIV infections by working closely with State and local health departments on intensive testing and referral to care efforts in areas of the Nation that constitute the majority of new infections. The Budget also includes \$120 million for the Health Resources and Services Administration to deliver additional care and treatment for people living with HIV through the Ryan White HIV/AIDS Program and to supply testing, evaluation, prescription of PrEP, and associated medical costs for people who are at risk for HIV infections through the Health Centers program. In addition, the Budget prioritizes the reauthorization of the Ryan White program to ensure Federal funds are allocated to address the changing landscape of HIV across the United States. Reauthorization of the Ryan White Program should include data-driven programmatic changes as well as simplifying and standardizing certain requirements and definitions. These changes would ensure Federal funds may be allocated to populations experiencing high or increasing levels of HIV infections/diagnoses while continuing to support Americans already living with HIV across the Nation. The Indian Health Service would also receive funding to enhance HIV testing and linkages to care. In addition, the Initiative would leverage NIH current regional Centers for AIDS Research to refine implementation strategies to assure effectiveness of prevention and treatment.

Game-changing Progress on HIV Drugs

With advances in research and development, biomedical tools are now available to end the HIV epidemic in America. HIV antiretroviral therapy has progressed substantially from the drugs available in the 1990s. What were formerly multi-pill, high-toxicity regimens have progressed to more potent, one pill per day regimens with few side effects. In addition, there is now a groundbreaking single pill, pre-exposure prophylaxis (PrEP), which is proven to prevent HIV transmission. There are more than 1.2 million Americans at high risk for HIV for whom PrEP is indicated, yet only about 10 percent are currently on preventive therapy.

Reforms and Improves the U.S. Public Health Service Commissioned Corps (Corps). The Budget proposes to transform the Corps into a leaner and more efficient organization that would be better prepared to respond to public health emergencies and provide vital health services. The Budget significantly reduces the number of Corps officers working in non-mission critical positions and increases the number of officers working in mission critical positions. The Budget creates a Ready Reserve Corps similar to those used by other uniformed services to provide additional surge capacity during public health emergencies. The Budget also makes changes to the funding structure of the Corps' retirement pay and survivor's benefits to align with how the Government pays for almost all civilian and military retirement costs.

Prioritizes Critical Health Research. The Budget provides \$33 billion to improve public health by advancing knowledge of living systems to tackle major health challenges and improve diagnosis, prevention, and treatment of diseases and disorders. With this investment, NIH would continue to address the opioid

epidemic, make progress on developing a universal flu vaccine, and support the next generation of researchers. NIH has provided upfront funding for certain projects in recent years and would continue this approach in 2019 and 2020 to facilitate efficient management of NIH resources across multiple years. The Budget also supports cutting-edge intramural research by addressing the backlog of repair and improvement across NIH facilities. In addition, the Budget includes a new, dedicated effort to support research and develop new treatments for childhood cancer. Cancer is the leading cause of death from disease among children and adolescents in the United States. The basic biology of childhood cancers is not fully understood and differs from that of adult cancers. The Budget includes increased funding and an innovative initiative to enable the Nation's best researchers and doctors to learn from every child with cancer, providing the opportunity to comprehend finally the unique causes and the best cures for childhood cancer.

Strengthens Health Services for American Indians and Alaska Natives. The Budget expands access to direct health services for American Indians and Alaska Natives by funding the staffing and operations of new facilities and extending services to newly recognized Tribes. In addition, the Budget boosts recruitment and retention efforts for qualified health professionals by funding competitive employment packages for positions with high vacancies and building new staff quarters at remote sites. The Budget also begins a multiyear effort to modernize the Indian Health Service's electronic health record (EHR) system to promote interoperability between Federal health systems, as the Department of Veterans Affairs transitions to a new EHR system.

Enhances Emergency Preparedness and Health Security. Infectious disease outbreaks whether naturally occurring, such as an influenza pandemic, deliberate, or accidental, remain a serious threat to the U.S. homeland. HHS undertakes a variety of activities to prevent, mitigate, and respond to outbreaks and other public health threats. The Budget continues support for a variety of preparedness and response programs across HHS.

The Budget includes an increase of \$10 million for the Strategic National Stockpile, compared to 2019 enacted, to enhance medical preparedness for chemical, biological, radiological, and nuclear threats. The Budget supports priority HHS biodefense and emergency preparedness such as the Biomedical Advanced Research and Development Authority, BioShield, and pandemic influenza. This funding would enable HHS to continue to build on investments to protect the civilian population in the event of public health emergencies related to infectious disease outbreaks, and other man-made crises.

As newly evolved strains of drug-resistant influenza viruses emerge that pose a significant threat to public health, as seen with the 2017 H7N9 avian influenza outbreak in China, the Budget continues to build on previous investments in pandemic preparedness and response capacity. Through the Assistant Secretary for Preparedness and Response and the Office of Global Affairs, the Budget provides \$260 million to support investments in critical domestic influenza vaccine manufacturing facility infrastructure, continue the advanced research and development of improved vaccines, therapeutics, and rapid in-home diagnostics, and support international pandemic preparedness. The Budget also includes an increase of \$10 million for CDC's influenza activities compared to 2019 enacted to support vaccine effectiveness studies, help expand the production capacity of cell-grown vaccine candidates, and undertake other high priority flu activities in support of the Administration's efforts to modernize influenza vaccines. The Budget also includes \$50 million within CDC to build up the Infectious Diseases Rapid Response Reserve Fund. These funds provide needed flexibility for HHS agencies to quickly respond to emerging health threats as they arise.

The Budget includes \$100 million to support CDC's global health security activities, an increase of \$50 million compared to 2019 enacted. The Global Health Security Agenda is a multiyear global initiative to reduce infectious disease threats by strengthening the capacity of other countries to contain outbreaks at their source. Containing the spread of deadly infectious diseases through efficient biodefense capabilities is vital to protect the homeland and preserve U.S. national and economic security. CDC will implement a regional hub office model, allowing staff to more efficiently work in multiple countries in a region, as needed, to support health security priorities. CDC will primarily focus its activities on areas where it has seen the most success: lab and diagnostic capacity; surveillance systems; training of disease detectives; and establishing strong emergency operation centers.

Advances Medical Product Safety. The Budget provides \$6.1 billion in total resources for FDA, \$643 million more than the 2019 estimated level. The Budget includes \$55 million to strengthen FDA's activities in response to the Nation's opioid crisis, \$55 million to advance digital technology, \$13.5 million for ensure that compounded drugs are safe and effective, and \$20 million for a pilot program to develop and test technology that could detect pathogens in the blood supply.

Tackles the Epidemic of Youth E-Cigarette Use. The Budget includes a new user fee on e-cigarettes and other electronic nicotine delivery system products and proposes new FDA authority to collect user fees in support of its regulatory oversight of new tobacco and nicotine related products in the future as appropriate. The proposal would amend current law to add e-cigarette manufacturers and importers to a list of product categories subject to the user fee. The FDA's annual user fee cap of \$712 million would be increased by \$100 million and future collections of all tobacco related products would be indexed to inflation. This proposal would ensure that FDA has the resources to address today's alarming rise in youth e-cigarette use as well as new public health threats of tomorrow. New tobacco or nicotine products that are regulated by FDA should also pay a user fee, just as other tobacco related products that are subject to FDA's user fee.

Serves Older Americans. The Budget prioritizes funding for programs that address the needs of older Americans, many of whom require some level of assistance to continue living independently

or semi-independently within their communities. This funding provides critical help and support to seniors, providing direct services such as respite care, transportation assistance, and personal care services. These services also include \$907 million for senior nutrition programs. This funding is estimated to provide 221 million meals to more than 2.3 million older Americans nationwide.

Strengthens Work Requirements to Promote Self-Sufficiency. The Budget improves consistency between work requirements in federally funded public assistance programs, including Medicaid and Temporary Assistance for Needy Families (TANF), by requiring that able-bodied, working-age individuals find employment, train for work, or volunteer (community service) in order to receive welfare benefits. This would enhance service coordination for program participants, improve the financial well-being of those receiving assistance, and ensure federally funded public assistance programs are reserved for the most vulnerable populations.

Supports Children and Families in Achieving Their Potential. The Budget continues to invest in programs that help American families and children thrive. The Budget's investments in child care and early learning would help families access and afford the care they need while they work, go to school, or enroll in job training. The Budget maintains funding for Head Start and the Child Care and Development Block Grant at HHS. The Budget also proposes a \$1 billion one-time mandatory investment for States to build the supply of care and stimulate employer investment in child care.

The Budget also supports States in providing key services to children and youth by increasing State flexibilities and reducing administrative burdens in foster care. These child welfare reforms focus on preventing the need for foster care unless absolutely necessary to ensure families can remain intact. In addition, the Budget promotes evidence-building and innovation to strengthen America's safety net, proposes improvements to the TANF program, and supports efforts to get noncustodial parents to work. Together, these proposals reflect the Administration's commitment to helping low-income families end dependency on Government benefits and promote the principle that gainful employment is the best pathway to financial self-sufficiency and family well-being.

Expands Statutory Access to the National Directory of New Hires (NDNH) for Program Integrity and Evidence Building. The Budget includes a package of proposals to provide valuable employment and earnings data—NDNH—for program integrity and evidence building activities, while ensuring privacy and security safeguards. Program integrity proposals to strengthen eligibility verification and/or reduce improper payments include those at HHS's CMS, the Railroad Retirement Board, and the Department of the Treasury's Do Not Pay Business Center on behalf of agencies with statutory access to NDNH. Evidence-building proposals include providing access for statistical agencies and evaluation offices, as well as access for State agencies to administer child support, workforce, and vocational rehabilitation programs. The package is detailed in *Analytical Perspectives*, Chapter 6, "Building and Using Evidence to Improve Government."

DEPARTMENT OF HOMELAND SECURITY

Funding Highlights:

- The Department of Homeland Security (DHS) protects Americans by safeguarding the homeland. The Department accomplishes its mission by: preventing terrorism; securing and managing the Nation's borders; administering and enforcing U.S. immigration laws; defending and securing Federal cyberspace; and ensuring disaster resilience, response, and recovery.
- The 2020 Budget prioritizes funding to secure the Nation's borders, strengthen and enforce U.S. immigration laws, and respond to and recover from major disasters and large-scale emergencies.
- High priority 2020 Budget investments include \$5 billion for construction of the border wall, and \$506 million to hire over 2,800 additional law enforcement officers and critical support personnel at U.S. Customs and Border Protection (CBP) and U.S. Immigration and Customs Enforcement (ICE). An additional \$19.4 billion is available to help communities across the United States recover from the devastating impact of major disasters.
- The 2020 Budget requests \$51.7 billion in discretionary appropriations for DHS, a \$3.7 billion or 7.8-percent increase from the 2019 estimate (excluding 2019 amounts for Overseas Contingency Operations).

The President's 2020 Budget:

DHS protects Americans from threats by land, sea, air, and cyberspace, 24 hours a day, 365 days a year. The Department prioritizes smart, innovative, and effective programs to prevent terrorism, promote cybersecurity, manage America's borders, and enforce U.S. immigration laws, and it leads the Federal Government's coordinated and comprehensive Federal response to major disasters and other large-scale emergencies. The men and women of the Department work tirelessly to ensure the safety, preparedness, and resilience of the Nation. The Budget includes increased funding for border security, immigration enforcement, cybersecurity, and law enforcement capabilities. The Budget would allow the Department to adapt to new and evolving threats and challenges in order to protect the American people, the homeland, and U.S. values.

In addition to aggressively pursuing the resources necessary to support border security and immigration control, the Administration is calling upon the Congress to enact immigration reforms, including ending chain migration, canceling the visa lottery program, and moving from low-skilled migration to a merit-based immigration system, thereby raising wages, shrinking the deficit, and raising living standards for both U.S.-born and immigrant workers.

“Our policy at DHS in the face of growing dangers will not be ‘strategic patience.’ Instead, we are reasserting U.S. leadership. And we are building the toughest homeland security enterprise America has ever seen.”

Kirstjen M. Nielsen
 Secretary
 September 5, 2018

Secures the Borders of the United States. Each day, DHS works to protect the American people and economy by preventing the illegal movement of people and contraband across U.S. borders while facilitating legitimate trade and travel to advance American prosperity. As depicted in the chart below, the number of people determined to be inadmissible at a port of entry or apprehended for illegally crossing the border grew by over 25 percent from 2017 to 2018, with illegitimate border crossers travelling as a family increasing by 53 percent.

Border security remains a top Administration priority, and the Budget continues to implement the President’s direction to secure the U.S. Southwest border. The Budget requests \$5 billion to construct approximately 200 miles of border wall along the U.S. Southwest border; provides \$192 million to hire 750 Border Patrol agents, 171 CBP Officers, and support staff; and invests \$367 million in CBP aircraft, vessels, surveillance technology, and equipment. In addition, the Budget includes \$1.2 billion to continue to modernize U.S. Coast Guard vessels and aircraft that patrol and provide life-saving rescue missions across the Nation’s coastal borders. The men and women of CBP work to keep the Nation safe from those seeking to smuggle people and

contraband across America’s borders. The Administration is pursuing innovative and effective solutions to hire and retain these valuable Government employees.

Increased Illegitimate Cross-Border Activity On the Southwest Border

Source: Department of Homeland Security, 2018.

Enforces the Nation’s Immigration Laws and Strengthens Border Security. The Budget provides discretionary and mandatory funding to promote the Administration’s immigration and border security priorities and ensure the safety and security of American communities. While the Budget provides discretionary funding and investments to support a robust level of immigration and border security activities, these resources are insufficient to close existing loopholes in U.S. immigration laws and provide the full range of programs, activities, and staff-

ing necessary. To bridge this gap, the Budget proposes the creation of a new Border Security and Immigration Enforcement Fund to be financed from mandatory receipts.

Provides Discretionary Funding to Support Enhanced Immigration and Border Security. The Budget provides \$314 million to hire an additional 1,000 ICE law enforcement officers, 128 immigration court prosecuting attorneys, and 538 additional critical support staff to carry out this vital national security mission. Funding of \$2.7 billion is provided for 54,000 detention beds to ensure ICE has the ability to detain criminal aliens and those apprehended at the border—including aliens with meritless asylum claims—so they can be safely removed. The Budget also makes additional investments in the Alternatives to Detention program for active monitoring of a total alien population of approximately 120,000. Moreover, the Budget increases funding for the Transportation and Removal

programs to manage the growing numbers of family units and unaccompanied alien children apprehended at the border.

Provides Additional Mandatory Border and Immigration Enforcement Funding. The Administration proposes the creation of a Border Security and Immigration Enforcement Fund to provide the additional mandatory funding resources necessary to meet the President’s border security and immigration enforcement goals. These goals include the expansion of immigration detention capacity to 60,000—including 10,000 family detention beds—and the hiring of 15,000 DHS law enforcement officers, 600 new ICE immigration court prosecuting attorneys, 100 new immigration judge teams and associated support at the Department of Justice’s (DOJ) Executive Office for Immigration Review, and 50 new Federal prosecutors at DOJ’s Offices of the United States Attorneys. The Administration plans to work with the Congress to identify offsets for these activities.

Reduces Illegal Immigration Work Incentives. The employment of illegal aliens by companies is a violation of the law, harms U.S. workers, and contributes to human smuggling, document fraud, identity theft, money laundering, and labor violations. The Budget proposes mandatory, nationwide use of the E-Verify system, an online tool that allows businesses to determine the eligibility of their employees to work in the United States. E-Verify is available at no cost to employers and has an accuracy rate of over 99.8 percent.¹ The Administration continues to require the use of E-Verify by Federal contractors to ensure the proper utilization of Federal dollars.

Secures U.S. Transportation Systems. The Transportation Security Administration (TSA) secures not just aviation, but also mass transit systems, passenger and freight railways, pipelines, highways, and ports. The Budget aggressively supports the deployment of new technologies, including 320 Computed Tomography units to the Nation’s highest risk airports, and other new technologies to increase the effectiveness and efficiency of security operations for all modes of transportation. Approximately \$7.8 billion is included in the Budget to support the TSA employees and technology that ensure the free movement of people and commerce.

Ensures Resilience to Disasters. The Budget provides significant investments for the Disaster Relief Fund to help affected communities that are continuing to recover from disasters in 2017 and 2018. The Budget proposes a \$430 million all-hazards competitive grant program that would be rigorously evaluated to demonstrate how the Federal Emergency Management Agency is supporting communities to make the Nation safer and more resilient.

Flood insurance is the first line of defense for survivors to recover after flooding events. The Budget continues to hold the Administration’s position that flood insurance rates should reflect the risk homeowners face by living in flood zones, while protecting low-income policyholders from rate increases they may otherwise face. The Administration is committed to the principle that homeowners share in the financial burden of protecting their property against the threat of flooding.

Supports the Cybersecurity of Government Networks and Critical Infrastructure. The President’s National Cyber Strategy highlighted DHS’s role in securing and building cybersecurity resilience for the Nation’s most critical infrastructure, including Government networks. DHS works with key partners and stakeholders to identify and manage national cybersecurity risks. The Budget includes more than \$1 billion for DHS’s cybersecurity efforts. These resources would increase the number of DHS-led network risk assessments from 473 to 684—including assessments of State and local electoral systems—as well as for additional tools and services, such as the EINSTEIN and the Continuous Diagnostics and Mitigation programs, to reduce the cybersecurity risk to Federal information technology networks.

¹ <https://www.uscis.gov/e-verify/about-program/performance>

Addresses the Federal Cybersecurity Workforce Shortage. The *Delivering Government Solutions in the 21st Century* plan, released in June of 2018, included an initiative to solve the Federal cybersecurity workforce shortage by establishing a unified cyber workforce capability across the civilian enterprise. The Budget includes funding to support DHS's Cyber Talent Management System, which reflects the exemption of DHS's cyber workforce from many of the hiring and compensation requirements and restrictions in existing law under Title 5. Under this new initiative, DHS would hire at least 150 new cybersecurity employees using this system by the end of 2020. In this way, DHS would be better positioned to compete with the private sector for cyber talent.

Protects the Nation's Leaders by Strengthening the U.S. Secret Service. The Budget provides \$2.3 billion for the U.S. Secret Service, fully supporting the Agency's dual missions of protecting the Nation's leaders while securing America's financial systems. The Budget proposes hiring an additional 177 special agents, officers, and professional staff at the U.S. Secret Service to continue to rightsize the Agency to perform its important missions. The Budget also provides funding for the 2020 presidential campaign and proposes investments in protective equipment and technology, consistent with recommendations of independent reviews of U.S. Secret Service operations.

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

Funding Highlights:

- The Department of Housing and Urban Development (HUD) supports safe and affordable housing for Americans and provides access to homeownership opportunities.
- The Budget reflects the President's commitment to fiscal discipline by reforming programs to promote work and self-sufficiency, and focusing support on critical cost-effective programs that assist vulnerable households. The Budget also recognizes a greater role for State and local governments and the private sector.
- The Budget requests \$44.1 billion in gross discretionary funding for HUD, an \$8.7 billion or 16.4-percent decrease from the 2019 estimate.

The President's 2020 Budget:

HUD supports affordable housing for low-income families and provides access to homeownership for traditionally underserved first-time, low- and moderate-income, and minority homebuyers. The Budget provides \$44.1 billion to support HUD's core functions. For HUD's rental assistance programs, the Budget provides \$37.9 billion to maintain services to all currently assisted low-income families and proposes reforms that build on the Administration's Making Affordable Housing Work Act (MAHWA). This legislative proposal would not only reduce program costs, but also promote tenant work and self-sufficiency. In addition, the Budget continues to support efforts to remove lead and other hazards from housing, reduce homelessness, and make targeted investments in designated Opportunity Zones. For first-time and low- to moderate-income homebuyers, HUD's Federal Housing Administration (FHA) remains a critical source of mortgage financing. The Budget also provides critical resources for HUD's Financial Transformation Plan to address audit findings, ensure strong stewardship of taxpayer dollars, and increase transparency.

The Budget also redefines the proper role of the Federal Government by proposing to eliminate programs that have failed to demonstrate effectiveness, such as the Community Development Block Grant (CDBG) program, recognizing that State and local governments are better equipped to address local community and economic development needs.

Reforms Rental Assistance and Incorporates Uniform Work Requirements. The funding level for HUD's rental assistance programs provides sufficient resources to continue assistance to all 4.7 million currently served low-income families. To reduce the significant costs of these programs, the Budget re-proposes MAHWA and rent reforms that would require work-able individuals to

shoulder more of their housing costs while providing an incentive to increase their earnings. Proposed rent reforms, however, would mitigate the impact on currently assisted elderly individuals and people with disabilities by phasing in a reduced rent increase over six years. The Administration's legislative proposal would also reduce administrative and regulatory burdens and allow communities further flexibility to develop rent requirements for tenants that are consistent with local needs and objectives.

"The RAD program is a win-win. It preserves affordable housing for the people who need it most and transforms aging public housing into safer places to live..."

Brian Montgomery
FHA Commissioner
September 19, 2018

In addition, the Budget incorporates the principles of the Administration's policy on uniform work requirements for non-elderly and non-disabled persons to work a minimum of 20 hours per week, or participate in training or educational activities. As a part of its implementation, HUD would explore ways to leverage existing compliance and enforcement mechanisms with the goal of avoiding additional burden on Public Housing Authorities and private multifamily property owners.

Leverages Capital for Housing Improvements.

The Budget provides investments and statutory authorities to facilitate a shift from the Public Housing funding platform to Housing Vouchers and Project-Based Rental

Assistance (PBRA). The Housing Voucher and PBRA programs benefit from leveraging both public and private financing to invest in long-term affordable housing stock. To advance this objective, the Budget requests \$100 million for the Rental Assistance Demonstration (RAD) program, which supports the redevelopment of Public Housing units through conversion to Housing Voucher and PBRA units. Additional authorities in the Public Housing program, such as repositioning certain troubled public housing assets, would also assist in this effort. Recognizing this shift and that State and local governments should bear greater responsibility in providing affordable housing, the Budget does not request funding for the Public Housing Capital Fund.

Reduces Lead Exposure for Low-Income Children. Lead-based paint in housing presents one of the largest threats to the health, safety, and dreams of America's next generation, with more than 23 million homes having significant lead-based paint hazards. The Budget requests \$290 million to promote healthy and lead-safe homes, \$60 million above the 2019 estimated level. Research has shown that lead-based paint hazard control is an efficient and effective approach to reducing and preventing lead exposure, generating high returns on investments due to increased lifetime earnings and reduced medical costs. This funding level also includes resources for enforcement, education, and research activities to further support this goal.

Continues Supporting Communities' Efforts to Reduce Homelessness. The Budget provides \$2.6 billion for the Homeless Assistance Grant (HAG) programs. HAG primarily funds the Continuum of Care (CoC) program, which is a coordinated community-based network of programs to prevent and address local homelessness. HUD awards CoC grants through a competitive funding process that promotes cost-effective and evidence-based strategies. As a part of the total, the Budget requests \$270 million for Emergency Solutions Grants, which would enable municipalities to support emergency shelter, rapid re-housing, and homelessness prevention.

Promotes Economic Mobility and Improves Quality of Life. The Budget requests \$75 million for the Family Self-Sufficiency program and \$15 million for the Jobs-Plus Initiative. These programs connect HUD-assisted households to social services and employment resources, helping tenants maximize their earning potential and improve their financial situations and quality of life. A rigorous evaluation has shown that the Jobs-Plus Initiative produces lasting increases in tenant

wages. The Secretary's EnVision Center research demonstration will also support this goal by providing communities centralized hubs that offer holistic approaches to self-sufficiency. In addition, the Budget requests funding for research and demonstrations to continue to build the evidence base for the most effective policies that promote economic self-sufficiency.

Targets Investments in Opportunity Zones. The Budget provides targeted resources aligned with the Administration's focus on encouraging investment in Opportunity Zones. The \$100 million request for RAD, referenced above, would prioritize the redevelopment of Public Housing properties that are located in Opportunity Zones. The Budget also funds Technical Assistance to local municipalities that are seeking to attract public and private investments to their communities.

"...I've seen the negative impact lead exposure can have on a child's developing brain. HUD's Office of Lead Hazard Control and Healthy Homes has been a significant contributor to the ongoing development of a [F]ederal strategy to eliminate childhood lead poisoning, ensuring kids have a foundation and a home environment that contribute to their ability to thrive."

Ben Carson
Secretary
October 22, 2018

Supports Sustainable Homeownership Opportunities. The Budget preserves access to sustainable homeownership opportunities for creditworthy borrowers through FHA and Ginnie Mae credit guarantees. FHA provides a crucial source of mortgage financing for first-time homebuyers, who accounted for more than 80 percent of FHA-insured home purchase loans in 2018. The Budget requests \$20 million above the 2019 estimated level to modernize FHA's outdated and burdensome information technology systems. This additional funding is fully offset by a modest new fee on FHA lenders, better aligning the responsibilities for the costs and benefits of this program. In addition, the Budget includes legislative proposals that would align FHA authorities with the needs of its lender enforcement program and limit FHA's exposure to down-payment assistance practices that not only increase the risk of taxpayer losses, but oftentimes are not in the best interest of borrowers.

Strengthens HUD's Financial Management. The Budget includes \$20 million for HUD's Financial Transformation Plan, a multiyear effort to strengthen the agency's financial reporting, accounting operations and internal controls. This effort is critical to addressing recurring audit issues, ensuring strong stewardship of taxpayer dollars, and increasing transparency.

Eliminates Major Block Grants. The Administration continues to redefine the proper role of the Federal Government and proposes eliminating funding for programs that lack measurable outcomes or are ineffective. The Budget would eliminate several of HUD's community and economic development programs as well as affordable housing production programs. The Budget would eliminate CDBG, a program that has expended more than \$150 billion since its inception in 1974, but has not demonstrated sufficient impact. Studies have shown that CDBG's allocation formula, which has not been updated since 1978, is ineffective at targeting funds to the areas of greatest need, and many aspects of the program have become outdated. The Budget would also eliminate the HOME Investment Partnerships Program, which has not been authorized since 1994. The Budget devolves responsibility to State and local governments, which are better positioned to assess local community needs and address unique market challenges.

DEPARTMENT OF THE INTERIOR

Funding Highlights:

- The Department of the Interior (DOI) conserves and manages natural resources and cultural heritage for the benefit and enjoyment of the American people, provides scientific and evidence-based information about America's natural resources and hazards, supports safe and responsible development of Federal energy resources, fosters rural prosperity, and honors the Nation's trust responsibilities and special commitments to American Indians, Alaska Natives, and U.S.-affiliated island communities to help them prosper.
- The 2020 Budget request for DOI prioritizes wildland fire risk mitigation, energy development programs, infrastructure improvements on public lands, and DOI-wide reorganization efforts. The Budget eliminates funding for unnecessary or duplicative programs while reducing funds for lower priority activities, including land acquisition and various grant programs.
- The Budget requests \$12.5 billion for DOI, a \$2 billion or 14-percent decrease from the 2019 estimate (including 2019 changes in mandatory programs).

The President's 2020 Budget:

DOI protects and manages the Nation's natural resources and cultural heritage, manages development of energy and mineral resources on Federal lands and waters, provides scientific and other information about the Nation's natural resources, manages water infrastructure, honors trust responsibilities to American Indians and Alaska Natives, and fulfills commitments to Insular areas. The 2020 Budget reflects the Administration's strong commitment to promoting economic security and energy dominance by developing domestic energy resources. These efforts invest in America's future and prioritize the safety and security of American taxpayers by reducing U.S. dependency on foreign nations.

Strengthens America's Energy Security. The Budget increases funding for DOI programs that support the safe and responsible development of energy on public lands and offshore waters. DOI has proposed an aggressive strategy for leasing offshore oil and gas under its Draft Proposed Program for 2019-2024. Onshore, the Administration is working aggressively to carry out congressional direction to implement oil and gas leasing in the coastal plain of the Arctic National Wildlife Refuge. The Department will also continue to make new areas available for renewable energy development—both onshore and offshore—and will prioritize renewable project permitting consistent with industry demand. The Budget also maintains funding for scientific research and data collection by the U.S. Geological Survey (USGS) to inform responsible energy and mineral development

and minimize the environmental impacts of these activities. Combined with administrative reforms to streamline permitting processes, these efforts would provide industry with access to the energy resources America needs, while ensuring that taxpayers receive a fair return from the development of these public resources.

"Together, we are going to start a new energy revolution—one that celebrates American production on American soil."

President Donald J. Trump
March 28, 2017

Supports Reorganization of DOI. The Budget provides \$28 million to continue implementing DOI's vision for a reorganized Department, focusing resources on its new unified regions, moving headquarters staff west, and expanding the use of shared services. Through its 12 new unified regions, DOI hopes to improve collaboration and coordination across its bureaus on key DOI missions—such as recreation, conservation, and permitting—and to focus regions on the same resources and constituents. By relocating staff, the Department brings employees closer to the public that they serve and the resources they manage. Efforts to expand shared ser-

vices will reduce duplicative capacity within DOI and increase the Department's ability to deliver on DOI's missions and responsibilities.

Supports Federal Efforts to Reduce Wildfire Risk. In light of historically catastrophic wildfire seasons in recent years, the Budget significantly increases funding for wildland fire management programs to reduce hazardous fuel loads and support wildfire preparedness efforts. The Budget responsibly funds base suppression costs pursuant to the Consolidated Appropriations Act, 2018, which would be bolstered by \$300 million in additional suppression resources under the recently enacted wildfire cap adjustment. In addition, the Administration is unequivocal about the need to accelerate active forest management. The Budget reflects this critical priority by requesting \$194 million for DOI's hazardous fuel mitigation work and \$172 million for DOI timber programs; together, these programs help ensure that Federal lands and watersheds are sustainable, healthy, and productive. These programs also generate jobs in rural communities and help make them safer and more resilient to the destructive impacts of wildfire.

Invests in Public Lands Infrastructure Fund. DOI and the U.S. Department of Agriculture's Forest Service manage an infrastructure asset portfolio with a replacement value exceeding \$300 billion. The buildings, trails, roads, water systems, and Bureau of Indian Education (BIE) schools managed by the Departments are deteriorating, as evidenced by a deferred maintenance backlog that exceeds \$18 billion. To address this backlog, the Budget proposes a \$6.5 billion Public Lands Infrastructure Fund (Fund) to improve and repair facilities at national parks and forests, wildlife refuges, BIE schools, and on other public lands. The Fund would be supported by the deposit of 50 percent of the proceeds received from Federal offshore and onshore energy leases over the 2020-2024 period, subject to an annual limit of \$1.3 billion. These investments would improve some of America's most visited parks and public lands that support a multi-billion dollar outdoor recreation economy.

Preserves National Park Service (NPS) Assets for Future Generations. NPS has a long history of preserving and protecting the natural and cultural sites that tell America's story. To continue this tradition and ensure preservation of national parks for generations to come, the Budget provides \$293 million to help address NPS's \$12 billion deferred maintenance backlog. Along with the mandatory funding provided by the Public Lands Infrastructure Fund, this funding would help NPS maintain and preserve America's highest priority assets.

Prioritizes Land Management Operations at NPS, United States Fish and Wildlife Service, and Bureau of Land Management. To protect and conserve America's public lands, the Budget provides \$5 billion for land management operations. These resources would ensure access to recreational activities such as hunting, fishing, and camping, and provide safe experiences for visitors. The Budget also advances efforts to streamline operations and reduce unnecessary spending.

Invests in Essential Science Programs. The Budget invests in USGS science related to natural hazards; water, energy, minerals, and other natural resources; and the health of America's ecosystems and environment. The Budget supports development of the Landsat 9 ground system, as well as research and data collection to inform sustainable energy and mineral development, responsible resource management, and natural hazard risk reduction.

Supports Tribal Sovereignty and Self-Determination across Indian Country. The Budget supports Federal trust responsibilities and tribal needs related to education, social services, law enforcement, infrastructure maintenance, and stewardship of land, water, and other natural resources. Funding priorities include core operational activities and services that support tribal sovereignty, sustain tribal governments, including assisting tribal law enforcement initiatives and training, and foster effective stewardship of trust resources, such as fully funding contract support costs. The Budget also supports BIE's efforts to foster the success of the approximately 47,000 students it serves.

Streamlines Reviews and Permitting. DOI is responsible for administering foundational environmental and historic preservation laws nationwide and for managing more than 20 percent of the Nation's lands, which affects the American public and many private stakeholders. The Budget supports DOI in fulfilling these important permitting and review responsibilities in a timely and thorough manner. As an example, the Budget maintains core funding for the United States Fish and Wildlife Service to conduct Endangered Species Act (ESA) consultations, which help facilitate development of infrastructure projects while ensuring threatened and endangered species receive the protections intended by the ESA. The Budget also strengthens the Bureau of Land Management's ability to efficiently facilitate and administer development of energy transmission projects.

Eliminates Unnecessary, Lower Priority, or Duplicative Programs. The Budget includes elimination of discretionary Abandoned Mine Land economic development grants that overlap with existing mandatory reclamation grants, National Heritage Areas that are more appropriately funded locally, Indian Guaranteed Loan Program funding that largely duplicates other existing loan programs serving Indian Country, and National Wildlife Refuge Fund payments to local governments that are duplicative of other payment programs.

Reduces Funding for Land Acquisition. The Budget continues to focus on using resources to manage existing lands and assets managed by DOI. For example, the Budget reduces funding for land acquisition to \$8 million, including balance cancellations. Less funding for land acquisition would allow DOI to focus resources on supporting activities and asset repair in existing national parks, refuges, and public lands which encompass more than 500 million acres.

Supports Law Enforcement Capacity on Public and Trust Lands. DOI serves as the steward of more than 500 million acres of public lands and more than 55 million acres of tribal trust lands. The Budget keeps visitors and natural resources safe on the Nation's public lands and supports safe tribal communities on trust lands through law enforcement efforts. The Budget supports a strong and secure border, with DOI law enforcement efforts focused on the 12 million acres of DOI lands along the United States-Mexico border. The Budget also invests in the United States Park Police, who safeguard lives and protect America's national treasures. In addition, the Budget invests in

efforts to combat illegal wildlife trafficking using United States Fish and Wildlife Service law enforcement capacity, in support of the President's Executive Order on combatting transnational criminal organizations.

Expands Recreational Access and Supports the Outdoor Recreation Economy. Each year, hundreds of millions of Americans visit U.S. national parks, wildlife refuges, and other public lands to hike, hunt, fish, view wildlife, and participate in other recreation opportunities. Visitors to public lands spend money in local gateway regions, and these expenditures generate and support economic prosperity within these local communities. In addition, through the purchases of hunting and fishing licenses and equipment—and associated excise taxes—sportsmen and women have generated billions of dollars to fuel wildlife and habitat conservation efforts. To serve these visitors, the Budget supports expanded public access to lands and waters administered by DOI. The Budget also invests in increased access to encourage sportsmen and women conservationists, veterans, minorities, and underserved communities that traditionally have low participation in outdoor recreation activities.

Invests in Water Resources and Infrastructure. The Budget invests in the safe, reliable, and efficient management of water resources throughout the United States. The Budget requests \$1.1 billion for the Bureau of Reclamation, with an emphasis on operating, maintaining, and rehabilitating existing water resources infrastructure throughout the western United States. Through the Bureau of Reclamation and Bureau of Indian Affairs, the Budget requests \$179 million for the implementation of enacted Indian water rights settlements in support of Federal trust responsibilities to Tribes. The Budget also invests \$194 million in water-related science at USGS and the Bureau of Reclamation to sustain and enhance ground and surface water quality and quantity research and monitoring, and to develop new technologies to respond to the water resource challenges facing the Nation.

DEPARTMENT OF JUSTICE

Funding Highlights:

- The Department of Justice defends the interests of the United States and protects all Americans as the chief enforcer of Federal laws.
- The Budget prioritizes and protects investments in core Government functions such as national security, cybersecurity, violent crime reduction, immigration law, drug enforcement, and also addresses the opioid epidemic.
- The Budget requests \$29.2 billion for the Department of Justice, a \$698 million or 2-percent decrease from the 2019 estimate. The Budget targets funding increases to support public safety and national security while reducing or eliminating lower priority spending.

The President's 2020 Budget:

The Department of Justice enforces the laws and defends the interests of the United States; ensures public safety against foreign and domestic threats; provides Federal leadership in preventing and controlling crime; seeks just punishment for those guilty of crimes; and ensures the fair and impartial administration of justice for all Americans. After two consecutive years of increases in the violent crime rate, the estimated number of violent crimes in the Nation decreased 0.2 percent in 2017 when compared with 2016. The Department is committed to building on this success by expanding efforts to dismantle criminal networks, disrupt and prosecute human trafficking rings, halt the flow of illegal drugs, and restore law and order to communities. The Budget requests a total of \$29.2 billion to expand the capacity of key law enforcement agencies and strengthen the Department's ability to address the most pressing public safety needs.

Enforces Immigration Laws. The Administration is committed to strengthening the Nation's security through robust enforcement of the Nation's immigration laws. Because of this increased enforcement, the Executive Office for Immigration Review (EOIR) received more than 230,000 new cases last year, bringing the pending caseload to over 750,000. To support this adjudicative need, the Budget provides a total of \$673 million for EOIR, which includes funding to hire an additional 100 immigration judge teams and expand both physical and virtual courtroom space to conduct administrative immigration hearings.

Provides Additional Mandatory Border and Immigration Enforcement Funding. The Administration proposes the creation of a Border Security and Immigration Enforcement Fund to provide the additional mandatory funding resources necessary to meet the Administration's

border security and immigration enforcement goals. These goals include the expansion of immigration detention capacity to 60,000—including 10,000 family detention beds—and the hiring of 15,000 Department of Homeland Security law enforcement officers, 600 new Immigration and Customs Enforcement immigration court prosecuting attorneys, 100 new immigration judge teams and associated support at EOIR, and 50 new Federal prosecutors at DOJ's Offices of the United States Attorneys. The Administration plans to work with the Congress to identify offsets for these activities.

Strengthens National Security. The Federal Bureau of Investigation (FBI) has responsibility for protecting U.S. citizens from harm both at home and abroad. In support of this vital work, the

Calling for Bipartisan Action

“Our whole Nation benefits if former inmates are able to reenter society as productive, law-abiding citizens.”

President Donald J. Trump
November 14, 2018

Budget provides \$9.3 billion in Salaries and Expenses for the FBI. These resources would maintain and expand efforts across a wide array of important mission areas, including cybersecurity, transnational organized crime, and background checks for firearms purchases. In addition, the National Security Division is provided with \$110 million, including resources to support additional work associated with the Foreign Investment Risk Review Modernization Act.

Supports Criminal Justice Reform. In addition to prosecuting crime and enforcing the Nation's laws, the Administration proposes to promote public safety by helping prevent individuals who have reentered society

from returning to prison. Approximately 95 percent of incarcerated persons will eventually leave prison. However, individuals released from State prisons have a five-year recidivism rate of 77 percent, and those released from Federal prisons have a five-year recidivism rate of 42 percent. The Administration is committed to breaking this cycle of recidivism by better preparing individuals to reenter communities and to mitigating the collateral consequences of incarceration. In addition to backing criminal justice reform through the FIRST STEP Act, the Administration supports efforts to bolster evidence-based programming in Federal correctional institutions. The Budget provides approximately \$754 million for reentry programming in the Bureau of Prisons, including funding for education, career and technical training, substance abuse, and residential reentry centers. Of this amount, the Budget provides \$14 million for the development of new and innovative pilot programs designed to address the needs of individuals incarcerated in Federal prisons. In addition, through State and local assistance programs, the Budget provides \$85 million for the Second Chance Act grant program to reduce recidivism and help returning citizens lead productive lives.

Combats Violent Crime. The Department of Justice is committed to restoring law and order by providing Federal resources where they are most needed and most effective. The Budget provides \$14.9 billion for Federal law enforcement, including FBI, the Drug Enforcement Administration (DEA), the United States Marshals Service, the Bureau of Alcohol, Tobacco, Firearms, and Explosives (ATF), and the Organized Crime and Drug Enforcement Task Forces. These resources support the Department's ability to respond to national security crises; investigate violent and drug-related crime; and apprehend, detain, and prosecute offenders.

The Budget would transfer the entirety of the ATF alcohol and tobacco regulatory and enforcement responsibilities to the Alcohol and Tobacco Tax and Trade Bureau (TTB) in the Department of the Treasury. This transfer would enable ATF to hone its focus on activities that protect U.S. communities from violent criminals and criminal organizations, while consolidating duplicative alcohol and tobacco enforcement mechanisms within TTB. In addition, the operating capability of DEA's Special

Investigative Unit program would retain its critical role in enhancing the Federal Government's ability to pursue threat networks to their source, as prioritized in the National Security Strategy.

Tackles the Opioid Epidemic. Today, the United States faces the deadliest drug overdose crisis in American history. More than 70,000 Americans lost their lives to drug overdoses in 2017. Evidence shows that fentanyl, heroin, or prescription opioids were responsible for nearly 48,000 of these tragic deaths. The Department of Justice recognizes its critical role in combating prescription opioid misuse and illicit heroin and fentanyl use. The Budget provides \$2.3 billion in discretionary resources for DEA, including an additional \$35 million to enhance heroin enforcement efforts, end anonymous online drug trafficking, and pursue transnational criminal organizations profiting from these deadly substances. The Budget also provides \$443 million in fee-funded resources for DEA's Diversion Control Fee Account to combat the diversion of licit drugs and precursor chemicals. These efforts are bolstered by an additional \$4 million to deploy 23 United States Attorney opioid prosecutors to districts hardest hit by this crisis. In addition, the Budget includes \$330 million for opioid-related State and local assistance including: \$145 million for the Comprehensive Opioid Abuse Program to support treatment and recovery, diversion, and alternatives to incarceration programs; \$125 million for Drug Courts, Mental Health Courts, and Veterans Treatment Courts; \$30 million for Residential Substance Abuse Treatment; and \$30 million for Prescription Drug Monitoring Programs.

Supports State and Local Law Enforcement. The Budget also supports key State and local assistance programs, including \$405 million for the Byrne Justice Assistance Grants Program, which provides State and local governments with crucial Federal funding to prevent and control crime. In addition, the Budget provides \$100 million for the Violent Gang and Gun Crime Reduction/Project Safe Neighborhoods (PSN) program. PSN creates safer communities through sustained reductions in gang violence and gun crime by leveraging Federal, State, and local partnerships. The Budget further reflects the Administration's commitment to keeping children safe by providing \$100 million in STOP School Violence Act funding. This critical program supports a variety of school safety programs including training for school personnel, preventative tip lines and threat assessments, and coordination between schools and law enforcement. In addition, the Budget supports critical victim assistance programs, including \$492 million in Violence Against Women Act funding and \$77 million to support victims of human trafficking.

Protecting America's Children

"Through the STOP School Violence grants, we are giving local schools and police departments the resources they need to hire more officers, and train more teachers, and better detect and address early warning signs of mental illness before it's too late."

President Donald J. Trump
October 8, 2018

DEPARTMENT OF LABOR

Funding Highlights:

- The Department of Labor (DOL) supports the Nation's wage earners, job seekers, and retirees.
- The Budget focuses DOL on its highest priority functions and restores fiscal discipline by eliminating programs that are duplicative, unnecessary, unproven, or ineffective. The Budget also takes steps to reorganize and modernize the Agency's operations so taxpayer dollars are spent efficiently.
- The Budget requests \$10.9 billion for DOL, a \$1.2 billion or 9.7-percent decrease from the 2019 enacted level.

The President's 2020 Budget:

DOL supports American workers, job seekers, and retirees by providing resources and opportunities to improve their skills, find work, and enter or return to the workforce. The Department also safeguards their working conditions, health and retirement benefits, and wages. Workers are the backbone of the American economy, and the Nation needs a skilled and productive workforce to keep the economy growing. The Budget improves the quality of life for all workers by making targeted, evidence-based investments to help workers remain competitive in the workforce and by eliminating duplicative, wasteful, and non-essential activities.

Builds a Highly Skilled and Competitive Workforce

Expands Access to Apprenticeship. The Budget invests \$160 million in apprenticeship, a proven earn-while-you-learn strategy that equips workers with the skills they need to fill open, high-paying jobs. The Budget also proposes to increase H-1B fee revenues in order to fund additional apprenticeship activities. Apprenticeship is a great solution for employers looking for a skilled workforce and workers looking for an affordable path to a secure future. As part of implementing the President's Executive Order "Expanding Apprenticeships in America," the Department is establishing a new industry-recognized apprenticeship system to modernize and expand the U.S. approach to apprenticeships. In 2018, there were 238,549 new apprentices, a 20-year high. DOL is working to further expand apprenticeships by empowering third party "accreditors" to recognize new, industry-driven apprenticeship programs, focusing on those in high-growth sectors where apprenticeships are underutilized, such as healthcare, information technology, and advanced manufacturing.

Closes the Skills Gap by Training American Workers. The Budget proposes to double the American Competitiveness and Workforce Improvement Act of 1998, as amended, fee for the H-1B

visa program to prepare American workers for jobs that are currently being filled by foreign workers, especially in science, technology, engineering, and mathematics fields. The increased revenue would support DOL's grants to expand apprenticeship and provide additional support for technical skills instruction at the K-12 and community college levels through the Department of Education's Career and Technical Education formula grants.

Moves toward Reorganizing and Consolidating the Nation's Workforce Development

"[W]e recognize the importance of apprenticeships in helping our country's hardworking people develop the competencies that enable success in today's dynamic, 21st [C]entury economy."

President Donald J. Trump
November 9, 2018

Programs. Currently, the Federal Government has more than 40 workforce development programs spread across 15 agencies with a total annual cost of approximately \$18 billion. In its *Delivering Government Solutions in the 21st Century* plan, the Administration proposed Government-wide workforce development program consolidation, streamlining separate programs in order to increase efficiencies and better serve American workers. The Administration looks forward to working with the Congress to achieve this necessary restructuring, and the Budget takes steps in this direction by eliminating programs that are ineffective, unproven, or

duplicative.

Supports America's Veterans. The Budget invests in the Nation's veterans, transitioning servicemembers, and their spouses by better assisting their transitions from active duty to civilian life. The Budget increases funding for the Transition Assistance Program to assist servicemembers in their transition to civilian employment. The Budget also provides funding to support military spouses, who are often required to find new opportunities after their spouse has been relocated. In addition, the Budget provides funding for the Veterans Employment and Training Services' core programs, which help improve skills and provide employment opportunities for veterans across the United States.

Reforms Job Corps. Job Corps educates and provides skills instruction to approximately 50,000 disadvantaged youth at 123 primarily residential centers across the United States. The Budget takes aggressive steps to improve Job Corps for the youth it serves by: improving center safety; empowering new, more effective entities to operate centers; focusing the program on the older youth for whom the program is more effective; and closing centers that inadequately prepare students for jobs. As part of this reform effort, the Budget ends the Department of Agriculture's (USDA) role in the program, unifying responsibility in DOL. Workforce development is not a core USDA role, and the 25 centers it operates are overrepresented in the lowest performing cohort of centers. The Budget also proposes new legislative flexibilities that would enable the Department to more expediently close low-performing centers, target the program to groups more likely to benefit, and make the necessary capital investments to ensure successful pilot programs. These reforms would save money and improve results by eliminating ineffective centers and finding better ways to educate and provide skills instruction to youth.

Improves the Delivery of America's Economic Statistics. The Budget recognizes the importance of economic statistics for businesses and everyday citizens to make informed decisions and confidently invest in America's future. The Administration urges the Congress to favorably consider the *Delivering Government Solutions in the 21st Century* plan's recommendation to consolidate within the Department of Commerce critical economic statistics programs at the Census Bureau, the Bureau of Economic Analysis, and the Bureau of Labor Statistics, making agency operations more efficient, improving products, and reducing the burden on respondents, while preserving the Agencies' brand recognition and independence.

Modernizes the Unemployment Safety Net to Emphasize Work

Combats Waste, Fraud, and Abuse in the Unemployment Insurance Program. The Federal-State Unemployment Insurance (UI) program has continually had one of the highest rates of improper payments in the Federal Government. More than 13 percent of the program's payments, representing \$3.7 billion, are paid to individuals that do not meet all of the program's eligibility requirements. The Budget takes aggressive steps to address this problem by providing grants to States to combat the top two root causes of improper payments in their programs. The Budget also reduces waste, fraud, and abuse in the UI program with a package of program integrity proposals. These proposals to combat improper payments are based on tools that States already have at their disposal but would require that States use those tools to spend certain UI program funds on activities that reduce waste, fraud, and abuse in the system. The Budget also supports the UI Integrity Center of Excellence, which is developing a data hub to allow States to access a fraud analytics database to identify fraud as effectively as possible.

Focuses Trade Adjustment Assistance on Apprenticeship and Other Work-Based Training. The Trade Adjustment Assistance (TAA) program, which provides cash benefits and training to workers who have been displaced as a result of international trade, is in need of reform. A rigorous 2012 evaluation of the program demonstrated that workers who participated in the program had lower earnings than the comparison group at the end of a four-year follow-up period,¹ in part because they were more likely to participate in long-term job training programs rather than immediately reentering the workforce. However, this training was not targeted to in-demand industries and occupations—only 37 percent of participants became employed in the occupations for which they trained. The Budget proposes to refocus the TAA program on apprenticeship and on-the-job training, earn-as-you-learn strategies that ensure that participants are training for relevant occupations in today's competitive workforce. States would also be encouraged to place a greater emphasis on intensive reemployment services for workers who are not participating in work-based training, getting those workers back into the workforce more quickly.

Protects American Workers

Makes Health Insurance More Affordable for Small Businesses. The President's Executive Order "Promoting Healthcare Choice and Competition Across the United States" directed the Secretary of Labor to consider expanding access to health coverage by allowing more employers to form Association Health Plans (AHPs), arrangements under which small businesses may band together to offer competitive and affordable health insurance to their employees. The Budget supports this initiative by increasing funding for the Employee Benefits Security Administration to develop policy, regulations, and enforcement capacity to enable more employers to adopt the AHP model and expand health insurance access for American workers.

Secures Safe and Healthy Workplaces. The Budget maintains targeted investments in the Occupational Safety and Health Administration (OSHA) and Mine Safety and Health Administration (MSHA) aimed at preventing worker fatalities, injuries, and illnesses through enforcement, outreach, and compliance assistance. The Budget includes funding for additional OSHA inspectors to conduct more inspections in high-hazard industries and for protecting whistleblowers' rights. The Budget proposes a new budget activity within MSHA, consolidating the Coal Mine Safety and Health and the Metal and Nonmetal Mine Safety and Health budget activities. The new enforcement structure would provide the flexibility to address industry changes and maximize the efficient use of MSHA's resources.

¹ <https://www.mathematica-mpr.com/our-publications-and-findings/publications/the-evaluation-of-the-trade-adjustment-assistance-program-a-synthesis-of-major-findings>

Rebuilds DOL's Role in Overseeing Union Integrity. To help safeguard labor union democracy and financial integrity, the Budget takes steps to restore the Office of Labor-Management Standards' investigative workforce, which has fallen by more than 40 percent during the past 10 years. The Budget would strengthen protections for union members by supporting more audits and investigations to uncover flawed officer elections, fraud, and embezzlement.

Protects Americans' Pensions. The Pension Benefit Guaranty Corporation's (PBGC) multi-employer program, which insures the pension benefits of 10 million workers, is at risk of insolvency by 2025. As an important step to protect the pensions of these hardworking Americans, the Budget proposes to add new premiums to the multiemployer program, raising approximately \$18 billion in premiums over the 10-year window. At this level of premium receipts, the program is projected to remain solvent over the next 20 years, helping to ensure that there is a safety net available to workers and retirees whose multiemployer plans fail. The Budget proposes to rebalance premiums in the single-employer program, which insures pension plans that are maintained by individual employers. The Budget proposes to freeze for one year premium rates for well-funded plans, which have faced numerous premium increases since 2012, and shift the premium burden to underfunded plans that pose a greater solvency risk to PBGC.

Reforms the Federal Employees' Compensation Act. The Budget proposes to reform the Federal Employees' Compensation Act program, which provides workers' compensation benefits to Federal employees injured or killed on the job and their survivors. The proposed reforms would save taxpayer dollars by modernizing program administration, simplifying benefit rates, and introducing controls to prevent waste, fraud, and abuse.

Puts American Workers First. DOL administers the labor certification component of foreign temporary work visa programs, which ensure that American workers are not unfairly displaced or disadvantaged by foreign workers. The certification programs lack a reliable workload-based source of funding, which has created recurring seasonal backlogs for employers. The Budget proposes to establish fees to create a workload-based funding source and place responsibility for funding this work on the program's users rather than taxpayers.

Supports Working Families

Provides for Paid Family Leave for New Parents. The Budget invests in a better future for Americans with a proposal to provide paid family leave to new mothers and fathers, including adoptive parents, so all families can afford to take time to recover from childbirth and bond with a new child. The proposal would allow States to establish paid parental leave programs in a way that is most appropriate for their workforce and economy. The Administration looks forward to working with the Congress to advance policies that would make paid parental leave a reality for families across the Nation.

Makes Government More Efficient

Tackles Duplication and Inefficiency at DOL. DOL is acting to implement in-house reforms consistent with the President's directive to reorganize and improve the Federal Government. Many of DOL's administrative activities, including information technology, procurement, human resources, financial management, and physical security, are separated across its subcomponents. This creates duplication, limits economies

"Paid family leave enables parents to balance the competing demands of work and family, pursue their careers, and build strong and thriving families. It is an investment in the future of our workers, our families, and our country."

Ivanka Trump
Advisor to the President
July 11, 2018

BUDGET OF THE U. S. GOVERNMENT FOR FISCAL YEAR 2020

69

of scale, and prevents resources from being spent on core mission-related work. DOL is working to centralize these activities to improve oversight, eliminate duplication, save money, and achieve economies of scale. In addition, the Budget includes funding and more flexibilities for DOL's Chief Information Officer to modernize the Department's legacy case management systems by reallocating base resources.

DEPARTMENT OF STATE AND OTHER INTERNATIONAL PROGRAMS

Funding Highlights:

- The Department of State, the U.S. Agency for International Development (USAID), and other international programs promote the national security and economic prosperity of the United States by advancing diplomacy, security, and fair economic competition.
- The Budget for the United States' international programs advances the Nation's strategic objectives, including those outlined in the National Security Strategy of the United States. The Budget supports new tools to allow the United States to respond flexibly to international challenges, as well as organizational reforms to increase agency effectiveness. These reforms prioritize the efficient use of taxpayer dollars and increased burden-sharing to rebalance U.S. contributions to international organizations.
- The Budget requests \$40.0 billion for the Department of State and USAID, a \$12.3 billion or 23-percent decrease from the 2019 estimate. The Budget also requests \$1.6 billion for Department of the Treasury international programs, approximately equal to the 2019 estimate.

The President's 2020 Budget:

The President's Budget supports the Department of State, USAID, and other international programs to protect U.S. citizens, increase American prosperity, and advance the development of democratic societies. The Budget provides the necessary resources for the United States to expand its influence and safeguard its economic interests, even as competition from rising powers increases. To achieve this, the Budget invests in new capabilities to defend American interests and values across the security, trade, and information domains. The Budget supports America's reliable allies, but reflects a new approach toward countries that have taken unfair advantage of the United States' generosity. The Budget restores fiscal discipline by eliminating ineffective programs and initiating wide-reaching agency reforms. The Budget also recalibrates American contributions to international organizations to a more sustainable level, maintaining American leadership while asking other nations to increase participation. Through the strategic, efficient use of resources, the Budget would reduce spending while adapting U.S. international agencies to the current era and providing better results for the American people.

Supports More Effective American Diplomacy

Supports the U.S. Diplomatic Presence to Advance America's Interests and Protect National Security. The Budget requests \$4.7 billion for diplomatic programs supporting

Department of State professionals working every day to achieve U.S. foreign policy objectives and advance American interests through a network of 277 embassies, consulates, and diplomatic missions around the world. This funding level sustains and invests in the State Department's workforce, allowing the Department to recruit and develop its personnel to meet high priority needs while promoting efficient operations. The Budget would enable the Department to continue modernizing its information technology platform to allow its workforce to do their jobs efficiently, effectively, and securely. In addition, the Budget includes \$3.8 billion for consular and border security programs, financed through fee collections, to carry out passport and visa functions. This critical component of U.S. border security protects the American people while facilitating legitimate travel. The Budget also requests \$1.3 billion for USAID operating expenses to support USAID personnel in 87 missions.

Prioritizes Embassy Security to Protect Diplomats and Staff. The Budget requests \$4.7 billion to protect overseas personnel and facilities, including the Department's share of the \$2.2 billion requested Government-wide for new, secure embassy construction, as recommended by the Benghazi Accountability Review Board. This security funding supports the protection of every U.S. diplomatic mission and the thousands of employees who serve U.S. interests overseas in dangerous and challenging security environments. With the proposed level of funding, the Department of State would continue to protect American personnel representing more than 30 agencies, as well as provide services to Americans overseas, in a safe and secure environment.

Supports Strategic Partners and Diplomatic Progress. The Budget fully supports the U.S.-Israel Memorandum of Understanding and includes \$3.3 billion in Foreign Military Financing grant assistance to bolster Israel's capacity to defend itself against threats in the region and maintain its qualitative military edge. The Budget also fully supports the U.S.-Jordan Memorandum of Understanding and the U.S. diplomatic and security partnership with Egypt. The Budget includes a Diplomatic Progress Fund, which would allow the United States to incentivize and take advantage of diplomatic openings and opportunities to advance the Nation's foreign policy priorities as they arise. This Fund provides flexibility to respond to improved engagement from governments for which the Budget has not proposed specific bilateral funding, such as non-security assistance for the West Bank and Gaza, should diplomatic progress be achieved in support of U.S. objectives and regional peace. The Administration continues to assess how best to advance regional peace and stability, counter destabilizing activities and influence, and ensure resources are appropriately aligned with U.S. national security and economic interests. The Budget also continues robust assistance to support religious and ethnic minorities across the Middle East and elsewhere.

Supports a Peaceful Resolution to the Afghan Conflict. The Budget provides \$533 million for assistance to Afghanistan. The Budget prioritizes economic growth and reconciliation, investments to help Afghanistan to work toward peace. The Budget supports programs that target private-sector led economic growth, including by increasing the country's export capability and attracting international investment. The Budget also supports education, health, governance, and other sectors that are necessary for a stable and thriving Afghanistan.

Emphasizes Great Power Competition

Advances a Free and Open Indo-Pacific. The Nation's future security, prosperity, and leadership depends on maintaining a free and open Indo-Pacific region. The Budget provides over \$1 billion for the Indo-Pacific, reflecting the Administration's commitment to the region. This funding supports democracy and good economic governance, private sector mobilization and competitiveness, critical infrastructure standards and financing, and security cooperation. The new Development Finance Corporation's (DFC) work in the region will also advance U.S. strategy by leveraging private sector capital in much needed, high-quality regional infrastructure. Together, these programs ensure that

the United States remains the preferred security and economic partner in the region.

Counters Russian Malign Influence. The Budget provides over \$500 million for assistance to Europe, Eurasia, and Central Asia to: advance shared security; safeguard the territorial integrity of U.S. allies; support partner countries' efforts to transition away from Russian military equipment, particularly through Foreign Military Finance lending; and address weaknesses in the macro-economic environment that the Government of Russia seeks to exploit, such as dependence on energy and trade.

"We believe that when nations respect the rights of their neighbors, and defend the interests of their people, they can better work together to secure the blessings of safety, prosperity, and peace."

President Donald J. Trump
September 25, 2018

Advances Fair and Reciprocal Trade. The Budget increases funding for the Office of the U.S. Trade Representative (USTR) in support of the President's trade agenda. The Administration has renegotiated outdated agreements with Canada, Mexico, and South Korea, and is pursuing new agreements with the European Union, Japan, and the United Kingdom. These efforts will help ensure that fair trade grows the economy and supports jobs at home. The Administration further protects American workers and businesses by identifying trade violations and pursuing enforcement options to end abuses. Robust support for USTR would also help support implementation of the Foreign Investment Risk Review Modernization Act, which helps protect U.S. businesses and technology from intellectual property theft.

Supports Fair Competition for American Exporters. The Budget supports a fully functioning Export-Import Bank (ExIm) to implement reforms and help American exporters compete in an increasingly unfair global marketplace. The Budget ensures ExIm would be able to help correct market failures, especially by supporting small businesses, sectors with national security importance, and American companies with foreign-government supported competitors.

Makes Programs More Effective While Increasing Burden Sharing

Maintains U.S. Global Humanitarian Leadership while Expecting Others to Do More. The Budget requests significant humanitarian assistance resources that would enable the United States to remain the largest single humanitarian donor in the world. These resources would address major humanitarian crises, including those driven by conflict, such as in Syria, Yemen, and Iraq. The Budget continues the new approach to relief announced in the 2019 Budget to influence other donors to give a greater funding share and to demand improved performance by United Nations (UN) and other implementers in order to maximize benefits for recipients. The new approach strives for greater accountability by international partners along with donor burden sharing that is more balanced, while reducing suffering and meeting the needs of refugees and displaced persons close to their homes until they can return safely. As conflict-based crises increase and force multiple displacements of populations within and outside their national borders, the Budget proposes to adapt and significantly improve America's ability to respond flexibly by consolidating all overseas humanitarian assistance in a single account so that funds can adjust as needed to reach affected persons. U.S. refugee admissions will continue to be funded through the Migration and Refugee Assistance account, a separate State Department account.

Pushes Multilateral Organizations Toward Fairer Burden Sharing and Advancing U.S. Interests. The Budget supports the aims of the National Security Strategy that the United States will "compete and lead in multilateral organizations so that American interests and principles are

protected” and therefore “will prioritize [our] efforts in those organizations that serve American interests...” but “where existing institutions and rules need modernizing, the United States will lead to update them.” In line with these objectives, the Budget prioritizes U. S. contributions to organizations that most closely align with American interests. The Administration continues to seek greater transparency and reform across the multilateral sphere, including by strategically assessing United Nations peacekeeping missions and demanding increased efficiency and effectiveness from all international organizations, while also seeking a more equitable distribution of financial responsibility.

Maintains U.S. Leadership at Multilateral Development Banks (MDBs). The Budget requests \$1.6 billion in funding for MDBs, including a new commitment for the World Bank’s International Bank for Reconstruction and Development where the United States remains the largest shareholder. As a leading donor, the United States demands financial discipline, high performance and accountability, fair burden sharing, and strategic investments that serve U.S. development, foreign policy, and national security goals.

Continues U.S. Leadership Against HIV/AIDS, and Mobilizes Others to Contribute More. For the next replenishment of the Global Fund to Fight AIDS, Tuberculosis and Malaria, the Budget offers to match \$1 for every \$3 pledged by other donors, providing a \$1.1 billion contribution in 2020 and up to \$3.3 billion over the three-year replenishment period, using unmatched funds appropriated by the Congress for 2019 from the last replenishment. This new match will support a global target of \$13.2 billion, an increase from the previous replenishment, and challenges other donors to make significant new commitments to fighting the three diseases. The Budget also provides \$3.4 billion for the U.S. President’s Emergency Plan for AIDS Relief (PEPFAR), fully funding the final year of the Administration’s *Strategy for Accelerating HIV/AIDS Epidemic Control (2017-2020)*, when coupled with additional resources appropriated by the Congress in 2019. With these resources, PEPFAR would provide lifesaving support in more than 50 countries, maintain all current patients on treatment, and continue the United States’ position as the world’s top HIV/AIDS donor.

Protects the United States and the World From Infectious Disease Through the Global Health Security Agenda (GHSA). To prevent, detect, and respond to infectious disease threats before they reach U.S. borders, the Budget continues significant support through a renewed commitment for the next five-year phase of GHSA. This commitment would bolster an international partnership to reduce the likelihood of outbreaks abroad and strengthen the capacity of countries to respond. The Budget also requests more than \$2 billion for lifesaving programs to address maternal and child health, family planning, nutrition, malaria, neglected tropical diseases, and for the U.S. contribution to Gavi, the Vaccine Alliance. The Budget prioritizes resources to combat tuberculosis, the most lethal infectious disease in the world, with an emphasis on drug-resistant tuberculosis through a new business model that promotes sustainable partnerships with local organizations.

Reorganization and Reform: Supports New Tools and Needed Reforms

Strengthens U.S. Allies and Bilateral Security Relationships by Helping Partner Countries Buy More U.S. Defense Articles and Services. The Budget proposes to expand the U.S. Government’s toolkit for financing U.S. defense sales by requesting expanded authority to provide Foreign Military Financing (FMF) loans. New for 2020, the Budget requests interest rate flexibility for the FMF direct loan program to make U.S. defense equipment a more competitive and more affordable option for partner countries. The Budget also requests authority to provide partial U.S. Government-backed loan guarantees to incentivize the private sector to fill the defense financing gap, reducing the risk to U.S. taxpayers. This reformed FMF loan program would serve to complement the Budget’s request for \$5.4 billion in FMF grant assistance so that America can still be the defense supplier of choice for partner countries for which loans are not the best option. This expanded set of

FMF tools would help support increased U.S. defense sales and increase opportunities for allies and partners to build their militaries around U.S. innovation and quality.

Implements New Development Finance Legislation to Increase U.S. Influence. On October 5, 2018, the President signed into law the Better Utilization of Investments Leading to Development Act. The legislation consolidates, modernizes, and reforms the U.S. Government’s “development finance” capabilities—primarily, the Overseas Private Investment Corporation and USAID’s Development Credit Authority—into the U.S. International DFC, consistent with the Administration’s *Delivering Government Solutions in the 21st Century* reform plan. For its first year in operation, the Budget provides \$300 million to the DFC for its operations and to extend loans, guarantees, and political risk insurance. This amount also supports a new equity investment program and other support to facilitate private-sector investment in emerging markets that would have positive developmental impact. These are transactions that the private sector will not undertake on its own. These tools would allow the U.S. Government to better partner with allies and deliver financially-sound alternatives to state-led initiatives from countries like China.

Optimizes Fragmented and Outdated Humanitarian Assistance Structure. In its *Delivering Government Solutions in the 21st Century* reform plan, the Administration committed to make fundamental changes to optimize the effectiveness of the Nation’s fragmented and outdated humanitarian assistance structure. In addition to the previously-announced merger of USAID’s humanitarian offices, the Budget consolidates the overseas humanitarian assistance programming currently conducted by the Department of State into the new bureau at USAID. In addition, all humanitarian assistance would be funded through a single, flexible appropriations account. This reorganization builds on each organization’s comparative advantages by leveraging USAID’s program implementation and partner oversight expertise with the State Department’s expertise on humanitarian policy, diplomacy, and refugee issues. The Budget pairs this restructuring with a high-level, dual-hat humanitarian leadership structure at the Department of State and USAID under the authority of the Secretary of State. The Department of State would continue management and implementation of the U.S. Refugee Admissions Program through the Migration and Refugee Assistance account. This restructuring and consolidation would facilitate dynamic funding allocations and program coordination across refugees abroad, those displaced within their own country, and other victims as conflict-driven crises evolve. This restructuring is critical to establishing a strong, unified U.S. voice that can extract optimal UN reforms and deliver long-overdue optimal outcomes for beneficiaries and taxpayer dollars.

Transforms USAID and Promotes Self-Reliance. The Budget reflects the Administration’s goal of reducing the long-term need for foreign assistance by helping partner countries become self-reliant. The Budget prioritizes investments in private-sector led growth, domestic resource mobilization, and economic and governance reforms, informed by objective metrics and roadmaps that track progress and identify areas for emphasis. These programs aim to catalyze sustainable economic growth in recipient countries, and to allow countries to solve their own development challenges. The recently launched Women’s Global Development and Prosperity Initiative represents the type of responsible spending the Administration seeks to achieve, through establishing a cohesive whole-of-government approach to women’s economic empowerment, tracking rigorous metrics, and leveraging partners’ resources to achieve shared goals. In addition, the Budget supports implementation of the comprehensive set of reforms outlined in the Administration’s *Delivering Government Solutions in the 21st Century* reform plan, including a major structural reorganization of USAID to strengthen core capabilities, increase efficiency, and reduce costs. This also includes the creation of a small grants office that would consolidate the African Development Foundation and the Inter-American Foundation into USAID, thus elevating the small-grants function as a tool of development and diplomacy and sharing best practices with USAID.

DEPARTMENT OF TRANSPORTATION

Funding Highlights:

- The mission of the Department of Transportation (DOT) is to ensure that the Nation has the safest, most efficient and modern transportation system in the world; the system improves the quality of life for all American people and communities, from rural to urban; and the system increases the productivity and competitiveness of American workers and businesses.
- The Budget request for DOT focuses on its critical transportation safety mission and provides targeted investments in competitive programs that effectively leverage Federal resources to spur larger, partnership-driven investment in infrastructure in key areas.
- The Budget requests \$21.4 billion in discretionary budget authority for 2020, a \$5.9 billion or 22-percent decrease from the 2019 discretionary estimate. The Budget also provides \$62.2 billion in mandatory funds and obligation limitations.

The President's 2020 Budget:

DOT is responsible for supporting and enabling a high functioning transportation system—to move both people and goods safely and efficiently in order to support jobs and economic growth. The Budget supports necessary investments that ensure the Nation's air, surface, and maritime transportation systems are safe.

The Budget also funds initiatives to improve the condition and performance of the Nation's transportation infrastructure. In 2018 and 2019, DOT received large discretionary increases for surface transportation and airport infrastructure investments, meeting the Administration's call for increased infrastructure investments. The 2020 Budget continues certain important transportation infrastructure investments, but in a way that also recognizes that the Federal Government is not—and should not be—the primary funder of the Nation's transportation systems. The Budget also proposes robust competitive funding for programs that fund projects of national- or regional-significance, or that would result in improved safety outcomes. In addition, DOT will be bolstering its capabilities necessary to improve the efficiency and effectiveness of policy, economic analysis, and regulatory reform.

Invests in America's Surface Transportation Infrastructure. The 2020 Budget fully funds Highway Trust Fund-supported programs at levels consistent with the fifth and final year of the FAST Act. The Administration looks forward to working with the Congress to enact a long-term surface transportation reauthorization to follow the FAST Act. A long-term bill is necessary to

Invests in Emerging Transportation Technologies

DOT must keep pace with emerging entrants and technologies such as Unmanned Aircraft Systems (UAS), commercial space transportation, and autonomous vehicles, to ensure that the transformative benefits of these emerging technologies are realized. The Budget supports key investments in the Federal Aviation Administration (FAA) to expand the integration of UAS into the National Airspace and develop tools to automate the launch and reentry of commercial space operations and improve the efficiency of the launch license process. For autonomous vehicles, which could revolutionize the Nation's surface transportation system, DOT has had a number of important accomplishments, including the release of the Department's multimodal *Preparing for the Future of Transportation: Automated Vehicles 3.0* guidance document, which will help the private sector, States, and localities continue research and deployment activities safely. The Department will continue efforts in 2020 to enable the safe testing and integration of autonomous vehicles within the Nation's transportation systems by reducing regulatory barriers and conducting research.

provide certainty to America's State, local, and private partners, so they can plan and invest in projects with confidence. In addition, the 2020 Budget includes \$200 billion for additional infrastructure investments. The Administration will work with the Congress on allocating this funding, to advance projects that provide the most benefit to Americans.

Prioritizes the Safety of the Nation's Transportation System. The Budget funds important investments to ensure the safety of the Nation's aviation, surface transportation, and maritime transportation networks. The Nation has made good progress in reducing overall transportation-related fatalities and injuries during the past two decades. Through its oversight of safety standards, outreach, and investments, DOT is committed to continuing this trend. The majority of transportation-related fatalities occur on the Nation's highways: 37,133 in 2017. To help address this issue, the Budget provides the Federal Highway Administration's Highway Safety Improvement Program with \$2.7 billion. The Budget also provides FAST Act authorized funding of \$929 million to the National Highway Traffic Safety Administration and \$676 million to the Federal Motor Carrier Safety Administration to reduce fatalities and improve the safety of the Nation's infrastructure.

Emphasizes Competitive Programs that Generate Large Returns on Investment. The Budget makes targeted investments emphasizing innovation, leveraging, and partnerships to improve the Nation's surface transportation infrastructure. The Budget provides \$1 billion to the Better Utilizing Investments to Leverage Development competitive grant program, which supports innovative projects that enhance quality of life and economic competitiveness in communities across the Nation, particularly in rural

areas. The Budget allocates \$2 billion to the Infrastructure for Rebuilding America (INFRA) competitive grant program, which is a \$1 billion increase above the FAST Act-authorized level. The INFRA program has been successful in providing the seed money necessary to spur non-Federal investment in large projects that relieve congestion on the Nation's strategic multimodal freight network. The Budget includes \$300 million in competitive highway bridge grants, which would reward States that use innovative and efficient procurement practices to repair or replace rural bridges that are in poor condition.

Modernizes FAA Infrastructure. The Budget invests \$3.3 billion in FAA infrastructure. Modernizing the Nation's air traffic control infrastructure would improve the safety of the Nation's airspace, while reducing flight delays. Specifically, FAA would invest \$136 million to further expand its Data Communication program, which would improve the communication between controllers and pilots across all phases of flight. The Budget would also invest \$127 million to support the

safe integration of unmanned aerial systems into the Nation's airspace, ensuring that the United States remains the world's aviation leader for decades to come.

Significantly Improves Amtrak and Rural Transportation Services. Amtrak's network has not been significantly modified since Amtrak's inception over 40 years ago, and long distance routes continually underperform, suffering from low ridership and large operating losses of roughly half a billion dollars annually. Simply put, Amtrak trains inadequately serve many rural markets while not serving many growing metropolitan areas at all. The Administration believes that restructuring the Amtrak system can result in better service (at a lower cost) by focusing trains on shorter distance (less than 750 miles) routes, while providing robust intercity bus service to currently underserved rural areas via a partnership between Amtrak and bus operators. To accomplish this transformation, the Budget provides \$550 million in transitional grants as States and Amtrak begin the process to restructure the network and States prepare to incrementally take financial responsibility for the newly created State-supported routes. The Budget also provides \$936 million in direct grants to Amtrak, to support investment on the Northeast Corridor and existing State-supported lines, and to assist Amtrak in this transition.

Leveraging Federal Investment for Critical Projects

The INFRA program, which makes awards to large projects that relieve congestion and reduce freight bottlenecks, is an example of how DOT effectively "leverages" Federal dollars to maximize overall investment in top priority infrastructure projects. For example, in 2018, DOT awarded a \$184 million grant (paired with \$70 million from other Federal sources) to an express lanes highway project in Georgia that has an estimated total cost of \$1.6 billion. In the second round of INFRA awards, each Federal dollar invested in an INFRA project was matched by \$1.65 in investment by State, local, and private partners.

Focuses the Capital Investment Grants (CIG) Program on the Most Impactful Projects. The CIG program supports the construction of new, or extensions of, fixed guideway transit, commuter rail, light rail, and bus rapid transit projects. The Administration believes that the program needs to be refocused on projects that have high non-Federal funding commitments and provide the greatest impact to improving mobility and access for riders who depend on public transit. The Budget includes \$1.5 billion for the CIG program, which includes \$500 million in funding for new projects.

Reforms the Essential Air Service (EAS) Program. EAS provides subsidized commercial air service to rural airports. Originally designed as a temporary program 40 years ago, today many EAS flights are left unfilled and obtain high per passenger subsidy costs. In addition, several EAS eligible communities are relatively close to major airports. The Budget proposes to reduce the discretionary funding for EAS and reform the program to target Federal funds for communities most in need of their services. The Budget would continue the mandatory resources for EAS at approximately \$145 million.

Invests in Information Technology (IT) Transformation. The Budget builds on the work started in 2018 to consolidate and transform the Department's IT efforts to better support the Department's mission, strengthen cyber security, and achieve greater efficiencies in IT across DOT's Operating Administrations. The Budget proposes \$502 million for DOT's Working Capital Fund, which would allow the Department to continue to consolidate IT investments into the Office of the Secretary of Transportation.

DEPARTMENT OF THE TREASURY

Funding Highlights:

- The Department of the Treasury (Treasury) manages the U.S. Government's finances, promotes conditions that enable stable economic growth, protects the integrity of the financial system, and combats financial crimes and terrorist financing.
- The Budget proposes reforms to bring greater accountability and efficiency to Treasury's operations and requests targeted new investments to protect the Nation from malign economic and cyber intrusions, secure and modernize the taxpayer experience, and lower the deficit.
- The Budget requests \$12.7 billion in base discretionary resources for Treasury's domestic programs, a \$0.2 billion or 1-percent decrease from the 2019 estimate.
- The Budget also proposes a program integrity initiative to narrow the gap between taxes owed and taxes paid that is estimated to reduce the deficit by \$33 billion over 10 years.

The President's 2020 Budget:

The President's Budget would improve stewardship of taxpayer dollars by focusing on the Department's core economic and financial responsibilities. The Budget prioritizes resources to combat terrorist financing, proliferation financing, and other forms of illicit finance. The Budget also supports Treasury's role as chair of the Committee on Foreign Investment in the United States (CFIUS) to address current and future national security risks. In addition, the Budget invests in the Department's functions as the Federal Government's revenue collector, financial manager, and economic policymaker. The Budget would ensure that taxpayers, investors, and job-creators operate in an economy that is secure, fair, and free from unnecessary bureaucratic impediments.

Strengthens Review of Foreign Investments. CFIUS, a multi-agency body chaired by the Secretary of the Treasury, determines potential national security risks arising from certain foreign investments. The Foreign Investment Risk Review Modernization Act (FIRRMA), enacted in 2018, expands CFIUS's jurisdiction and strengthens its authorities to protect critical U.S. technologies and infrastructure from new and evolving threats, while preserving an open investment environment. The Budget requests \$35 million for Treasury, as CFIUS chair, to ensure swift, robust, and effective implementation of FIRRMA.

Prioritizes Safeguarding Markets and Protecting Financial Data. Treasury's Office of Terrorism and Financial Intelligence (TFI) possesses a unique set of authorities and tools

to combat terrorists, rogue regimes, proliferators of weapons of mass destruction, and other illicit actors by denying their access to the financial system, disrupting their revenue streams, and degrading their capabilities to inflict harm. The Financial Crimes Enforcement Network (FinCEN) links law enforcement and the intelligence communities with financial institutions and regulators facilitating the discovery and prosecution of illegal activities and money-laundering schemes.

The Budget requests \$167 million for TFI to continue its work safeguarding the financial system from abuse and combatting other national security threats using economic sanctions. These funds would support TFI's growing workforce through critical investments in information technology and mission-support capabilities. The Budget requests \$125 million for FinCEN to administer the Bank Secrecy Act and focus on the prevention of terrorist financing, money laundering, and other financial crimes. These resources would expand FinCEN's special measures enforcement activities and enhance its efforts to combat cybercrime and cryptocurrency threats.

The Budget also requests \$18 million to protect Treasury information technology (IT) systems that carry out these activities, as well as those that account for and process trillions of dollars in revenue and payments against cybersecurity threats. These funds are requested in addition to bureau-level investments, and would be centrally managed to strengthen the security of Treasury's highest-value IT assets and improve Treasury's response and recovery capabilities.

The U.S. financial services sector faces a range of cybersecurity vulnerabilities and physical hazards. The Nation's adversaries have grown in technical capability, and their attacks have increased in sophistication. The Budget requests \$13 million for the Office of Critical Infrastructure Protection and Compliance Policy to enhance the Department's capacity to identify and remediate new vulnerabilities before they can be exploited.

Invests in a 21st Century Internal Revenue Service (IRS). The IRS collects approximately \$3.5 trillion in tax revenue annually and processes more than 253 million tax returns and forms resulting in more than \$464 billion in tax refunds. The Budget proposes \$11.5 billion in base funding for IRS to ensure that IRS can fulfill its core tax filing season responsibilities, continue critical IT modernization efforts, and provide acceptable levels of taxpayer service.

The Budget provides \$290 million for the IRS's multi-year IT modernization efforts, including upgrading its antiquated infrastructure and integrating its multiple case management and tax processing systems. Approximately 90 percent of individual taxpayers file their taxes electronically and can check on the status of their funds electronically. However, for most other taxpayer interactions, taxpayers and the IRS must interact through the mail, which slows the resolution of issues. These funds would also be used to increase taxpayers' ability to interact with IRS securely and electronically, improving the time it takes for IRS to resolve concerns.

The Budget also proposes legislation enabling additional funding for new and continuing investments to expand and strengthen tax enforcement. These additional proposed investments are estimated to generate approximately \$47 billion in additional revenue at a cost of \$15 billion, yielding a net savings of \$33 billion over 10 years. The Budget also includes several proposals to ensure that taxpayers comply with their obligations and that tax refunds are only paid to those who are eligible, including: improving oversight of paid tax preparers; giving IRS the authority to correct more errors on tax returns before refunds are issued; requiring a valid Social Security Number for work in order to claim certain tax credits; and increasing wage and information reporting.

Manages the Nation's Finances More Effectively. The Bureau of the Fiscal Service (Fiscal Service) conducts all Treasury debt financing operations, provides central payment services for Federal agencies, runs Government-wide accounting and reporting services, and manages the collection of delinquent debt. In 2018, the Fiscal Service issued approximately \$10 trillion in marketable Treasury securities, processed the collection of more than \$4 trillion in Federal receipts, and distributed more than \$3.5 trillion in payments, including Social Security payments, IRS tax refunds, and veterans' benefits. The Budget supports increased efforts to monitor and protect the vital IT systems that implement these critical functions.

The Fiscal Service performs the vast majority of payment and collection transactions electronically, but in 2018, it still issued almost 56 million paper checks and collected more than \$592 billion in payments by mail or in person. The Budget supports Treasury's efforts to move more payments to electronic methods to increase options for citizens and customers to conduct transactions with the Federal Government in a secure and more convenient electronic environment. It also includes proposals to help the Fiscal Service improve payment integrity.

Increases Treasury's Efficiency and Effectiveness by Streamlining Operations. The Budget eliminates funding for Community Development Financial Institutions (CDFI) Fund discretionary grant and direct loan programs. More than two decades ago, the CDFI Fund was created to jumpstart an industry at a time when CDFIs had limited access to private capital. The industry has now matured and has ready access to the capital needed to extend credit and provide financial services to underserved communities.

Brings Accountability and Transparency to Treasury's Regulatory Oversight Functions. The Budget proposes that the Congress establish funding levels for the Office of Financial Research (OFR) and the Financial Stability Oversight Council (FSOC) through annual appropriations bills. OFR and FSOC, established by the Dodd-Frank Act, are currently able to set their own budgets, which circumvents congressional approval and oversight. Bringing OFR and FSOC into the congressional appropriations process is consistent with recommendations made in Treasury's June 2017 report to the President on banks and credit unions. OFR has taken administrative steps to further the goals laid out in the Treasury report, including initiating an organizational realignment that has resulted in significant reductions to its staffing and operating expenses. In addition, Treasury is continuing efforts to make FSOC decision-making procedures more transparent and to implement more rigorous cost-benefit analysis standards.

The Federal Insurance Office within Treasury is coordinating with State insurance regulators and insurance industry groups to improve oversight and administration of the Terrorism Risk Insurance Program (TRIP), consistent with Treasury's October 2017 report to the President on asset management and insurance. Treasury is also evaluating reforms, to be included in any legislation extending TRIP beyond its current sunset date of December 31, 2020, to further decrease taxpayer exposure.

Streamlines Oversight of Alcohol and Tobacco Industries. The Budget proposes to transfer all alcohol and tobacco responsibilities from the Department of Justice's Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF) to Treasury's Alcohol and Tobacco Tax and Trade Bureau (TTB). This transfer would leverage TTB's resources and expertise relating to the alcohol and tobacco industries and allow ATF to continue to focus on its firearms and explosives mandates, enabling both agencies to more efficiently and effectively carry out their core mission of protecting the public.

Consolidates and Streamlines Federal Financial Literacy and Education Efforts. The Budget proposes that Federal efforts to promote financial literacy focus on the high-impact

areas of: basic financial capability; housing; higher education; military and veteran programs; and investment and retirement planning. More than 20 Federal agencies have some form of financial education or literacy programs. Collectively, Federal agencies spent an estimated \$250 million on financial literacy and education activities in 2017. Streamlining and consolidating programs and activities would be a multi-year effort.

DEPARTMENT OF VETERANS AFFAIRS

Funding Highlights:

- The Department of Veterans Affairs (VA) is committed to providing military veterans and their survivors with the benefits, care, and support they have earned through sacrifice and service to the Nation.
- The 2020 Budget fulfills the President's promise by making critical investments in high priority initiatives that ensure veterans receive top quality care, benefits, and services—wherever they work or live. The Budget provides dedicated resources to implement the historic VA MISSION Act of 2018 and gives veterans greater choice and access to the medical care they deserve. The Budget also provides resources to improve the veteran experience across all programs and services, as well as promote efficiency, transparency, and accountability within the Department.
- The Budget requests \$93.1 billion for VA, a \$6.5 billion or 7.5-percent increase from the 2019 enacted level. In addition, the Budget requests \$87.6 billion in advance appropriations for VA medical care programs in 2021 to ensure the Department has sufficient resources to continue providing the premier services that veterans have earned. The request also includes new legislative authorities and \$123.1 billion in mandatory budget authority, including \$129.5 billion in 2021 advance appropriations for other critical veteran and survivor benefits.

The President's 2020 Budget:

VA's mission is to deliver world-class benefits, care, and support to America's military veterans, their families, and survivors. The Budget provides the necessary resources to meet the Nation's commitment to veterans to help them recover from illnesses, injuries, or wounds sustained in service and to enable their successful reintegration into civilian life.

The Budget fully funds VA to operate one of the largest integrated healthcare systems in the United States with over 9.3 million enrolled veterans, provide disability compensation benefits to nearly 5.5 million veterans and their survivors, and administer pension benefits for approximately 440,000 veterans and their survivors.

In addition, the Budget makes investments across a broad range of veteran services and programs including: educational assistance for nearly one million students; rehabilitation and employment benefits for approximately 149,000 veterans; servicemember and veteran group life insurance plans for approximately six million enrollees; home mortgages, including more than three million active loans; and memorial and burial benefits in more than 137 national cemeteries and thousands of other cemeteries across the Nation.

Expands Veterans' Choice and Access to Medical Care

Invests in World-Class Healthcare. The Budget proposes \$80.2 billion to fully fund VA medical care requirements in 2020, a \$7.0 billion or 9.6-percent increase from the 2019 enacted level. The Budget also proposes \$87.6 billion in advance appropriations for VA medical care programs in 2021.

"Our Nation's veterans fulfilled their duty to this country with brave and loyal service; it is our moral and solemn obligation to demonstrate to them our continuing gratitude, unwavering support, and meaningful encouragement."

President Donald J. Trump
October 31, 2018

Implements the VA MISSION Act of 2018. The Budget fully supports implementation of the VA MISSION Act of 2018 and provides veterans greater choice on where they receive their healthcare—whether at VA or through a private healthcare provider. The Budget consolidates all veterans' community care programs into a single program, reducing bureaucracy and making it easier for veterans to navigate their healthcare needs.

Increases Veterans' Access to Urgent Care and Expands the Caregivers Program. As part of the VA MISSION Act of 2018, the Budget supports VA's brand

new urgent care benefit. Veterans would be able to use more convenient, urgent care facilities in the community, often times closer to home. The Budget also supports the VA MISSION Act of 2018's expansion of the Caregivers program to include eligible veterans who incurred or aggravated a serious injury in the line of duty before September 11, 2001. Expansion of the Caregivers program would coincide with new information technology (IT) updates necessary to effectively manage the program.

Prioritizes Funding for Suicide Prevention. Reducing deaths by suicide among the Nation's veterans continues to be VA's top clinical priority. The Budget provides essential resources for VA's suicide prevention programs and supports the expansion of key initiatives aimed at advancing VA's National Strategy for Preventing Veteran Suicide.

Improves the Veteran Experience

Provides Critical Funding for IT. The Budget provides \$4.3 billion for essential investments in IT to improve the online interface between the veteran and the Department. This includes an increase of more than \$200 million to recapitalize aging network infrastructure, to expedite VA's transition to the cloud, and to support emerging VA MISSION Act of 2018 IT requirements.

In addition, the Budget includes \$1.6 billion as part of a multiyear effort to continue implementation of a new Electronic Health Record (EHR) system. The EHR is a high-priority initiative that would ensure a seamlessly integrated healthcare record between the Department of Defense and VA, by bringing all patient data into one common system.

Addresses Infrastructure Deficiencies. The Budget provides \$1.6 billion for VA's construction program to complete high priority major and minor construction projects. More than \$1.2 billion is provided to begin construction of a new hospital in Louisville, KY, complete construction of other ongoing major medical facilities, make critical seismic corrections, and expand

"More importantly, the interoperability of the new electronic health records system will connect VA to the DOD, private doctors and private pharmacies to create a continuum of care and organize the healthcare around our veteran's needs."

Robert L. Wilkie
Secretary
June 27, 2018

VA's national cemeteries. An additional \$399 million would be used to renovate existing office and patient care space across the Department. The Budget also provides \$1.2 billion for non-recurring maintenance projects to maintain and modernize medical facilities. These critical investments enhance the safety and security of VA facilities, help implement new patient-centered designs, and ensure VA programs and services keep pace with modern technologies.

Modernizes the Veteran Appeals Process. The Budget provides sufficient resources for the Board of Veterans Appeals and the Veterans Benefits Administration to implement the Veterans Appeals Improvement and Modernization Act of 2017, a new streamlined framework that will provide quicker decisions on new veteran compensation appeals and resolve the remaining legacy appeals inventory. The new framework will provide veterans with increased options to resolve their appeals and improve the timeliness of appeals decisions.

Increases Access to Burial and Memorial Benefits. The Budget includes \$329 million, a 4.2-percent increase from the 2019 enacted level, to expand veteran access to memorial benefits, deliver premier services to veterans' families, and provide perpetual care for more than 3.9 million gravesites. This funding would sustain 144 cemeteries and sites, including the initial activation of five new cemeteries to support VA's goal of providing veterans with a burial option within 75 miles of their home. The Budget also funds the transfer of 11 cemeteries from the Department of Defense as part of the President's *Delivering Government Solutions in the 21st Century* plan. In addition, the Budget increases funding by \$13 million to improve customer service, responsiveness, and efforts to better memorialize veterans and tell their stories.

Promotes Efficiency, Transparency, and Accountability

Targets Investments to Create Efficiencies. The Budget prioritizes investments in areas that would create cost savings over time, as well as improve the efficiency and effectiveness of VA programs. Targeted investments to IT systems, to include more than \$200 million for cloud migration and replacing aging infrastructure to support the new EHR system, would result in cost savings as VA consolidates data centers and reallocates resources to higher priority needs. VA is also committed to modernizing the disability compensation program and identifying innovative pilot programs aimed at providing meaningful empowerment opportunities for disabled veterans seeking employment.

Streamlines Government. The Budget promotes fiscal discipline by implementing Federal reorganization proposals that would more effectively and efficiently utilize taxpayer funds. The Budget better aligns small business certification programs across Government by ensuring proper management of Service Disabled Veteran Owned Small Business certification programs under the Small Business Administration.

Reduces Waste, Fraud, and Abuse. The Budget provides \$229 million for VA programs designed to improve oversight, accountability, and performance within the Department. This includes \$22 million, a 25-percent increase from the 2019 enacted level, in direct funding for the Office of Accountability and Whistleblower Protection. Since the President's signing of the Department of Veterans Affairs Accountability and Whistleblower Protection Act of 2017, which has allowed the Department to more efficiently discipline poor-performing VA employees, more than 4,300 employees have been removed, demoted, or suspended. The Budget also provides \$207 million, a 7.8-percent increase above the 2019 enacted level, for the Office of the Inspector General to strengthen accountability, promote transparency, and reduce waste, fraud, and abuse.

CORPS OF ENGINEERS—CIVIL WORKS

Funding Highlights:

- The Army Corps of Engineers civil works program (Corps) develops, manages, restores, and protects water resources primarily through the construction, operation and maintenance, and study of water-related infrastructure projects. The Corps is also responsible for regulating development on navigable waters of the United States and works with other Federal agencies to help communities respond to and recover from floods and other natural disasters.
- The Budget focuses Federal investment where it is most warranted within the three primary mission areas of the Corps to address the most significant risks to public safety or to provide a high economic or environmental return to the Nation. The Budget also proposes reforms to how the Nation invests in water resources projects, reducing the reliance on Federal funding and control and providing State and local governments, as well as the private sector, more flexibility to make investments they deem a priority.
- The Budget requests \$4.8 billion for the Corps, a \$2.2 billion or 31-percent decrease from the 2019 enacted level.

The President's 2020 Budget:

The Corps has three main missions: flood and storm damage reduction; commercial navigation; and aquatic ecosystem restoration. The Corps also regulates development in navigable waters and wetlands. While the Agency has had a significant impact on water resources development throughout its history, current approaches to funding, constructing, and maintaining projects often do not deliver benefits in either a timely or cost-effective manner. The current paradigm for investing in water resources development is not optimal; it can deter rather than enable local communities, States, and the private sector from making important investments on their own, even when they are the primary beneficiaries. The Budget lays the foundation for accelerating the construction of infrastructure and increasing competition in the delivery of projects, thereby resulting in faster completion of projects and cost savings. The Budget focuses Federal resources where they are most warranted, encourages more non-Federal leadership, and removes barriers that can impede the ability of non-Federal parties to move forward on their own with investments in water resources infrastructure they deem priorities.

Invests in America's Future

Emphasizes Investments in Ongoing Construction of Projects that Address a Significant Risk to Public Safety or Provide a High Economic or Environmental Return. The Budget keeps the Federal Government's promise to complete ongoing construction projects that provide a high return to the Nation or address a significant risk to public safety more quickly and at a more effective cost. By proposing not to start any new construction projects, the Budget enables the Corps to focus on completing these ongoing priority projects faster and at a reduced cost, allowing the affected communities to see their benefits sooner. The Budget also recognizes the need to change the way future construction investments are funded with less reliance on Federal appropriations. For example, the Budget provides \$150 million for innovative partnerships between the Federal Government and non-Federal sponsors to accelerate completion of projects.

Prioritizes Operating and Maintaining Existing Infrastructure. The Budget gives priority to operating and maintaining existing water resources infrastructure and improving its reliability. Maintenance of the key features of this infrastructure is funded; this includes navigation channels that serve the Nation's largest coastal ports and the inland waterways with the most commercial use, such as the Mississippi and Ohio Rivers and the Illinois Waterway.

Transforming How Water Resources Infrastructure is Delivered for the Nation

"For the first time, the work plan provides funds for two projects where the local sponsor could use [s]ection 1043 of the Water Resources Reform and Development Act of 2014 to complete project construction. This section authorizes [Corps] to provide its share of a project's construction costs directly to a non-[F]ederal sponsor who is able to assume responsibility for construction of a [Corps] project."—*Army Corps of Engineers FY 2018 Work Plan* press release, June 11, 2018. The Budget builds on this progress, providing \$150 million in funding for non-Federal sponsors that propose to construct projects on their own under section 1043 of the Water Resources Reform and Development Act of 2014, as amended.

Promotes More Local Control in Constructing Water Resources Projects. The Budget expands the Corps's current use of section 1043 of the Water Resources Reform and Development Act of 2014, as amended, by including \$150 million for an innovative program under which the Corps would transfer appropriated funds to non-Federal sponsors that decide to construct a project on their own. Non-Federal implementation of projects, where appropriate, would accelerate the construction of more infrastructure projects and create efficiencies in their delivery. Under this program, the Corps would issue a solicitation for proposals from non-Federal sponsors to construct their own projects using a combination of Federal and non-Federal funding. Other projects specifically funded in the Budget may also qualify for implementation under section 1043. The Budget also proposes to extend section 1043 which, under current law, expires in 2019.

Respects and Protects American Taxpayers

Reforms Inland Waterways Funding. The Budget proposes to reform the laws governing the Inland Waterways Trust Fund, including an annual per-vessel fee for commercial users, to help finance future capital

investments on these waterways and a portion of the cost of operating and maintaining them. The current diesel fuel tax is insufficient to support the users' share of these costs.

Divests the Washington Aqueduct. The Budget proposes to sell the Washington Aqueduct, the wholesale supply system for Washington D.C.; Arlington County, Virginia; the City of Falls Church, Virginia; and parts of Fairfax County, Virginia. The Corps owns and operates the Aqueduct, which is the only local water supply system in the Nation owned and operated by the Corps. Ownership of

local water supply is best carried out by a State or local government, or by the private sector where there are appropriate market and regulatory incentives. Selling the Aqueduct to a public or private utility would contribute to American prosperity through a more efficient allocation of economic resources.

Increases Accountability. The Budget establishes clear priorities based on objective criteria for investment decisions. This approach ensures the best overall use of available funds and allows the American taxpayer to understand how Federal resources are allocated. For example, the Budget funds dam safety studies and dredged material management plans within the Investigations account, instead of the Operation and Maintenance account, where they appropriately belong.

The Budget also classifies the Poplar Island project, which serves as the primary dredged-material disposal site for the Port of Baltimore, as a navigation project.

Increases Fiscal Discipline and Transparency. The Budget proposes revisions to the appropriations language for the Construction, Operation and Maintenance, and Mississippi River and Tributaries accounts, and new appropriations language for the Harbor Maintenance and Inland Waterways Trust Funds, to provide greater transparency in how these funds are spent. Establishing separate appropriations accounts for the navigation trust funds would improve accountability, ensure appropriations are used for the purpose for which the Congress intended, and increase transparency for the public, including the users that pay fees to finance some of these costs.

Working with States and Local Communities to Improve Infrastructure

The Budget funds transfer of ownership of the Kentucky River Locks and Dams 1, 2, 3, and 4, to the Kentucky River Association. Transferring infrastructure such as these locks and dams, which no longer serve a Federal role, to the primary beneficiaries enables greater local control and management of infrastructure that is important to the local communities.

ENVIRONMENTAL PROTECTION AGENCY

Funding Highlights:

- The Environmental Protection Agency (EPA) is responsible for implementing and enforcing statutes designed to protect human health and the environment.
- The 2020 Budget continues EPA's work to ensure clean air, water, and land, and safer chemicals, while reducing regulatory burden and eliminating lower-priority activities. Focusing on the core mission makes EPA a better steward of taxpayer dollars and promotes operational efficiencies that enhance the Agency's performance.
- The Budget requests \$6.1 billion for EPA, a \$2.8 billion or 31-percent decrease from the 2019 estimate.

The President's 2020 Budget:

Environmental protection and public health are key to U.S. prosperity and essential to America's quality of life. Through cooperative federalism, EPA works with States and Tribes, as well as local governments, businesses, and the public to protect human health and the environment.

The Budget proposes to eliminate many voluntary and lower-priority activities and refocus the Agency on strategic and regulatory reforms such as implementation of:

- Cooperative federalism activities under various environmental statutes;
- Requirements under Executive Order 13807, "One Federal Decision;"
- Activities to support attainment of the national ambient air quality standards and implementation of air toxics standards;
- Waters of the United States (WOTUS) definitional changes;
- The 2016 Amendments to the Toxic Substances Control Act (TSCA); and
- The Affordable Clean Energy rule, a replacement to the Obama-era Clean Power Plan.

Continues Focus on Core Agency Activities. The Budget maintains EPA's focus on its core mission—providing Americans with clean air, land, and water, and ensuring chemical safety. EPA will continue streamlining programs and processes, eliminating many voluntary and lower-priority activities, and empowering States and Tribes as the primary implementers of environmental

programs. This prioritization supports an efficient, effective approach that will provide tangible environmental results for the American people within the scope of EPA's core statutory obligations.

Promotes Regulatory and Permitting Reforms, and Enhances Cooperative Federalism. The Budget provides resources to ensure EPA is able to meet pressing demands in priority areas including reviewing and revising regulations, improving the permitting process, and enhancing collaboration with State, tribal, and Federal partners. For example, several significant rulemakings are expected to be completed before 2020, including replacement rules for WOTUS and the 2015 Clean Power Plan. EPA will work to provide technical assistance and implementation guidance to States, Tribes, and regulated entities as they adapt to these changes. Efforts to identify and address potential hold-ups in the permitting process will also continue, to ensure that unnecessary delays do not get in the way of environmental protection or economic growth. In addition, EPA will promote joint governance in order to enhance shared accountability between EPA, States, and Tribes, including facilitating and promoting the delegation of environmental programs.

Supports Healthier Schools. Approximately 50 million American children spend their time in K-12 school facilities every day. Many of these buildings are old and contain environmental hazards that could pose a risk to children's health. To address this issue, the Budget establishes a \$50 million multi-media grant program to identify and help resolve these hazards. Activities supported by this grant program would result in safer and healthier school environments for American children.

User Fee Proposals

By administering select EPA programs through the collection of user fees, entities benefiting from those programs would directly pay for the services and benefits that the programs provide. The 2020 Budget outlines legislative proposals to authorize EPA to administer a handful of mature programs through the collection and expenditure of user fees. For instance, the Budget includes a proposal to fee-fund the ENERGY STAR program, a voluntary certification program that aims to help businesses and individuals save money and protect the environment through improved energy efficiency. Other proposals would authorize EPA to collect and spend fees to provide compliance assistance services related to risk management and spill prevention and response planning at industrial facilities. The Budget also includes a proposal to expand the range of activities that EPA can fund with existing pesticide registration service fees and maintenance fees.

Sets and Implements Appropriate Air Pollution Standards. The Budget funds EPA's activities to control air pollution and radiation exposure at \$425 million. Prioritizing funding would help reduce the number of areas of nonattainment across the Nation, ensuring that the United States continues to lead the world in having both clean air and a strong economy. EPA will continue its implementation of national air quality standards and, in close collaboration with States and Tribes, will seek to improve the efficiency and effectiveness of State Implementation Plan review processes. In addition, funding for EPA's vehicle programs would support the review of approximately 5,000 vehicle and engine emissions certification requests.

Strengthens Protections from Toxic Chemicals. In 2016, the Congress passed the Frank R. Lautenberg Chemical Safety for the 21st Century Act to modernize TSCA. TSCA, as amended, requires EPA to evaluate whether existing chemicals may pose unreasonable risks and, if so, take immediate steps to protect human health and the environment. EPA must also affirm that new chemicals entering the market are safe and that appropriate measures are taken to address risks. In 2020, this work would accelerate as the Agency reaches statutory deadlines to complete the first set of risk evaluations for existing chemicals and begins the next phase of work. The Budget provides support to these efforts, which would supplement fees paid by chemical manufacturers and processors.

Invests in Water Infrastructure Construction, Repair, and Replacement. The Budget funds water infrastructure through the State Revolving Funds, the Water Infrastructure Finance and Innovation Act (WIFIA) credit program, and the recently authorized America’s Water Infrastructure Act (AWIA). The 2020 capitalization of the State Revolving Funds would supplement approximately \$80 billion currently revolving at the State level. Credit subsidy funding for WIFIA would continue the program’s momentum by supporting more than \$2 billion in direct loans which, when combined with other funding sources, would spur more than \$4 billion in total water infrastructure investment. In addition, the Budget proposes funds for AWIA grant programs that would assist in lead testing and drinking water fountain replacement in schools, sewer overflow control, and water infrastructure workforce investment. These resources would complement State and local drinking water and wastewater infrastructure investments as well as funding provided through other Federal channels.

Optimizes the Approach to Clean-Up Efforts at the Nation’s Most Complex Hazardous Waste Sites. The Budget provides \$1 billion for the Hazardous Substance Superfund Account to address the release of hazardous substances and clean up hazardous waste sites. With EPA on track to complete all of the recommendations made in EPA’s Superfund Task Force Report by the end of 2019, the Budget supports the full implementation of the optimized approach to cleaning up Superfund sites. EPA has made significant progress identifying impediments to expeditious clean up at sites with significant exposure risks and developing action plans to overcome those impediments. EPA is also working with prospective purchasers, developers, and responsible parties to bring more private funding for redevelopment, saving taxpayer dollars for the sites that truly need Federal funding. Reducing exposure to hazardous substances and revitalizing contaminated land for use by the community is a priority for the Administration and a fundamental part of EPA’s core mission.

Making Decisions and Saving Taxpayer Dollars

In meeting its commitment to the community of Bridgeton, Missouri, EPA signed a final Record of Decision (ROD) setting forth a \$205 million clean-up plan for the West Lake Landfill Superfund site. The ROD amends a controversial version from 2008 that caused a near stalemate in remedial activity at the site. EPA leadership identified this site as a priority and worked through the challenges to settle on a final remedy that will take less time to complete and cost \$30 million less, while still maintaining the desired public health protections.

Reinforces Emergency Preparedness and Response Capabilities. Recognizing weather impacts on U.S. communities and intentional threats made against the homeland, the Administration continues to support capabilities across the Federal Government to prepare for and respond to these hazards. EPA plays a critical role in this capacity, providing technical assistance to drinking water and wastewater utilities, responding to the release of hazardous substances, and advising on disease vector control and waste disposal. Within the Hazardous Substance Superfund Account, the Budget supports EPA’s efforts by providing \$176 million to the Superfund Emergency Preparedness and Emergency Response and Removal programs, as well as \$81 million for EPA’s Homeland Security programs. This funding supports the development of hazard mitigation and resilience guidance, specialized regional emergency response planning documents, sampling methods, and decontamination technical support tools. Protecting the safety and security of the American people is a Federal priority that ensures a prosperous Nation.

Enhances Monitoring of America’s Significant Watersheds. The Budget funds programs to measure and assess the health of the Great Lakes and Chesapeake Bay. These watersheds require coordination and collaboration among numerous States, Tribes, and local governments. In the case of the Great Lakes, international coordination is also necessary. The availability of accurate and

continuous water quality data underpins ecosystem restoration efforts. The Budget provides support for basin-wide monitoring in these watersheds, including efforts to track and address harmful algal blooms and invasive species. These programs support cooperative federalism by building State and local capacity to conduct monitoring.

Supports Leading-Edge Research and Development for American Safety, Prosperity, and a Better Future. The Budget funds EPA's research and development activities in support of core mission areas, focusing on air quality, water resources, sustainable communities, chemical safety, and human health risk assessment. These interdisciplinary research programs provide the scientific foundation for EPA to execute its mandate to protect human health and the environment. EPA research programs also support cooperative federalism by developing new approaches and methodologies that States and Tribes leverage to address current and future environmental hazards. The Agency will continue aligning research resources to fulfill its statutory obligations and support EPA programs, regions, States, and Tribes in addressing their most pressing environmental and related public health challenges.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

Funding Highlights:

- The National Aeronautics and Space Administration (NASA) is responsible for leading an innovative and sustainable program of exploration with commercial and international partners to enable human expansion across the solar system and bring new knowledge and opportunities back to Earth.
- The Budget takes steps to achieve lunar exploration goals sooner, improve sustainability of NASA's exploration campaign, and increase the use of commercial partnerships and other procurement models to enhance the efficiency and effectiveness of NASA programs.
- The Budget includes \$363 million to support commercial development of a large lunar lander that can initially carry cargo and later astronauts to the surface of the Moon.
- The Budget focuses funding for the Space Launch System (SLS) rocket, a heavy-lift expendable launch vehicle, to ensure the rocket is operational in the early 2020s when it will be needed to carry astronauts to the vicinity of the Moon.
- The Budget requests \$21 billion for NASA, a \$283 million or 1.4-percent increase from the 2019 estimate.

The President's 2020 Budget:

NASA supports growth of the Nation's economy in space, increases understanding of the universe and America's place in it, works with industry to improve America's aerospace technologies, and advances American leadership. The Budget supports an innovative and sustainable program of space exploration by using novel approaches to partner closely with American industry, funding transformative technologies that will lower the cost and increase the capabilities of the Nation's space activities, while focusing on key capabilities to meet long-term exploration outcomes.

Continues Building the Key Components that Would Send Astronauts to the Moon and Beyond. The Budget proposes funding for key components of NASA's exploration campaign, including: the SLS and Orion crew capsule to support a first uncrewed test launch in the early 2020s and a steady crewed launch cadence thereafter; the Lunar Gateway, a small way station around the Moon in the mid-2020s; commercial launch capabilities to enable regular, low-cost access to the lunar vicinity and surface; and lunar landers to enable cargo delivery and human access to the lunar surface. The Budget proposes reforms to the SLS program to prevent the program's significant cost and schedule challenges from further diverting resources from other exploration activities. Most

“My Administration is reclaiming America’s heritage as the world’s greatest space-faring [N]ation. The essence of the American character is to explore new horizons and to tame new frontiers.”

President Donald J. Trump
June 18, 2018

notably, the Budget defers funding of upgrades (known as “Block 1B”) for the SLS, and instead focuses the program on the completion of the initial version of the SLS and supporting a reliable SLS and Orion annual flight cadence. Lunar Gateway elements would be launched on competitively procured vehicles, complementing crew transport flights on the SLS and Orion. This approach would accelerate commercial lunar delivery capabilities critical to U.S. exploration objectives and speed up the timeline for lunar surface exploration.

Increases Funding for New Technologies, Partnerships, and Approaches to Accelerate Exploration while Making It More Affordable.

The Budget supports robust funding for exploration technology research and development, with an increase in funding to support lunar surface activities. These efforts prioritize developing the capacity to understand and potentially utilize lunar resources to reduce transportation costs both to and from the Moon as well as to enhance lunar exploration capabilities. The Budget also supports use of commercial capabilities to deliver science and technology payloads to the Moon in preparation for future exploration. In addition, the Budget supports a major new initiative to support competitive commercial development of a large lander that would first carry cargo, and then crew, to the lunar surface.

Drives toward a Vibrant, U.S.-Led Economy in Earth Orbit. The Budget provides funding for the International Space Station as well as for new commercial space capabilities that will facilitate a transition to a more robust and cost-effective approach to human space activities near the Earth. By 2025, the Budget envisions commercial capabilities on the International Space Station as well as new commercial facilities and platforms to continue the American presence in Earth orbit. The Budget also increases funding for innovative activities conducted in orbit, including microgravity research and in-space robotic manufacturing and assembly. NASA would also expand its reliance on existing commercial space activity by creating a new Communications Services Program that would begin to purchase commercial communications services to return data generated by science missions back to Earth.

“President Trump and our entire Administration believe that America’s prosperity, security, and even our national character, depend on American leadership in space. And over the past year, the world has seen the vital role that private enterprise plays to advance American leadership in outer space.”

Michael R. Pence
Vice President
February 21, 2018

Supports an Ambitious Program of Solar System Exploration. The Budget provides \$2.6 billion for Planetary Science, including approximately \$600 million for a mission to Jupiter’s moon Europa that would launch in 2023. By launching that mission on a commercial launch vehicle, NASA would save over \$700 million, allowing multiple new activities to be funded across the Agency. The Budget would also initiate a mission to return samples from Mars, a top priority of the science community that also supports future human exploration. The Budget fully funds the James Webb Space Telescope, which is planned to be NASA’s premier observatory of the next decade.

Replenishes Resources for Crosscutting Mission Support Activities. Each NASA mission rests on a sound foundation of institutional capabilities that keep the Agency functioning. The Budget

increases investments in mission support areas such as facility maintenance, information technology and mission safety to ensure that critical services and assets are ready and reliable when needed. The Budget also funds numerous construction programs, including \$126 million to consolidate research and production facilities at two NASA Centers.

Supports Transformative Aeronautics Technology Research. The Budget funds cutting-edge aeronautics research to boost U.S. technological and economic leadership and support high-quality American jobs. The Budget funds continued development of the X-59 Quiet Supersonic Technology demonstrator to usher in a new era of U.S.-led supersonic transportation. The Budget also supports development of capabilities that could be used to make commercial air travel more efficient, enables expanded operation of commercial unmanned vehicles in U.S. airspace, and begins a new partnership with industry to enable a potential new urban air mobility market.

Redirects Funds from Lower Priority Science and Education Programs to Higher Priorities. Consistent with prior budgets, the Budget provides no funding for the WFIRST space telescope, two Earth science missions, and the Office of Science, Technology, Engineering, and Mathematics (STEM) Engagement. Lower-cost STEM-related activities such as internships and robotics competitions funded outside of the Office of STEM Engagement continue to be supported.

SMALL BUSINESS ADMINISTRATION

Funding Highlights:

- The Small Business Administration (SBA) serves American entrepreneurs in their pursuit to start, grow, recover, and expand their businesses. As the Nation's leading advocate for small businesses, SBA ensures that business owners have access to affordable capital, mentoring and counseling opportunities, and immediate support in the wake of disaster.
- The Budget recognizes the vital role small businesses fulfill in contributing to the Nation's economic strength, building America's future, and helping the United States compete in today's marketplace. The Budget emphasizes the importance of investing in growing and recovering American communities while upholding SBA's commitment that its services are efficient, effective, and accountable.
- The Budget requests \$820 million in new budget authority for 2020, a \$119 million or 17-percent increase from the 2019 estimate. This request is offset by fiscally responsible proposals to provide SBA the flexibility to adjust existing fee structures across its business loan guarantee programs, resulting in a net request of \$665 million, a \$36 million or 5-percent decrease from the 2019 estimate.

The President's 2020 Budget:

Small businesses are the engines of the American economy. They are the job creators and innovators that fuel American neighborhoods and preserve U.S. prosperity. The SBA was established in 1953 to aid, counsel, assist, and protect the interests of small business concerns; preserve free competitive enterprise; and maintain and strengthen the overall economy of the Nation. Today, SBA continues to support the Nation's 30 million small businesses through an array of tailored programs and services. SBA's lending programs complement credit markets by meeting demand when economic shocks reduce commercial lending to small businesses, and when the private market is unwilling to offer capital to credit-worthy borrowers. Its nationwide network of private-sector and non-profit partners educate, advise, and inspire a new generation of entrepreneurs. In 2020, SBA will be uniquely positioned to leverage the Administration's pro-growth policies to equip small business owners with the right resources to be competitive in today's market and promote economic security for their businesses and families. The agency will fulfill this mission while promoting fiscal discipline by proposing policies that level the playing field with private sector support for small businesses.

Expands Opportunity for Small Business Owners. The Budget supports \$43 billion in business lending to assist U.S. small business owners in accessing affordable capital to start, build, and

grow their businesses. These products serve a variety of business needs, from funding general business operations like working capital and capital expenses, to fixed-asset financing for machinery and equipment, construction, and commercial real estate. They also provide the opportunity for small businesses to refinance existing loans. To ensure that SBA can provide these services without taxpayers subsidizing their costs, the Budget proposes that SBA have the flexibility to adjust fees across its business loan programs. This would allow the agency to finance both its anticipated lending and operational costs while ensuring it does not supplant services better provided solely by the private sector in periods of economic growth.

Strengthens Support to Entrepreneurs in Emerging Markets. The Budget would support

“For many years, Washington tried to hold you back and tear you down, crushing the American small business with crippling taxes and oppressive regulation. But all that has changed starting in November 2016. The Trump [A]dministration is with you, and we are with you 100 percent. And always will be.”

President Donald J. Trump
June 19, 2018

greater outreach and lending to socially and economically disadvantaged urban communities and rural areas. In 2020, the SBA would build on its ongoing rural outreach efforts by adapting and developing new platforms to reach entrepreneurs in emerging markets. SBA would also work with other Federal agencies, such as the U.S. Departments of Agriculture and the Interior to improve program effectiveness and increase access to capital through enhanced collaboration and coordination.

Promotes Investment in the Nation’s Newest Enterprises. Through its 7(m) Direct Microloan program, the SBA supports low-interest financing for non-profit intermediaries that in turn provide loans of up to \$50,000 to the smallest of small businesses and start-

ups. In addition to the \$25 million in technical assistance grant funds requested for the Microloan program, the Budget requests \$4 million in subsidy resources to support \$40 million in direct lending.

Modernizes the Government’s Role in Venture Capital. Created in 1958, the Small Business Investment Company (SBIC) program guarantees funds for privately owned and operated venture capital firms to make investments in small businesses. While the Budget supports \$4 billion in new lending to continue this program, it also recognizes that the SBIC program has not kept pace with the evolution of the venture capital market, presenting an opportunity for sensible program reform. The Budget supports SBA’s efforts to comprehensively evaluate the program to ensure SBICs provide innovative and modern financial products to American small businesses, regardless of their geographic location or industry focus.

Supports Recovery Efforts in the Wake of Disaster. SBA continues to be a vital resource for American households and businesses that need to recover quickly in the wake of disaster. In 2018, SBA approved more than 140,000 disaster loans totaling nearly \$7 billion in financial support to American communities. The Budget continues to support more than \$1 billion in direct, low-interest lending to business owners, homeowners, renters, and property owners.

Fosters Entrepreneurial Development and Education. SBA leverages its nationwide field personnel and diverse network of private sector and non-profit partners across each U.S. State and Territory to provide counseling, mentoring, and training assistance to nearly one million small business owners each year. The Budget requests \$101 million for the Small Business Development Center program and proposes the creation of a competitive set-aside within this total to reward partners who most efficiently serve small businesses. The Budget continues to invest in counseling and mentoring

programs such as Women’s Business Centers, Veterans Outreach, and SCORE that provide essential coaching opportunities to developing small businesses and entrepreneurs.

Creates Fair Competition in Federal Contracting and Research. The ability to enter into contracts with the Federal Government is one of the most direct forms of financial support the Federal Government grants to U.S. small businesses. The Budget increases investment in SBA’s 8(a) program to establish a full certification program for SBA’s women-owned business certification programs. SBA continues to lead Federal efforts to deliver 23 percent of contracts to U.S. small businesses, which includes set-asides of five percent for women-owned and small, disadvantaged 8(a) businesses, and three percent for historically underutilized business zones and service-disabled veteran-owned businesses. The Budget also continues to support small business research and innovation by supporting competitive funding agreements through its Small Business Innovation Research program.

“The tax cuts spearheaded by President Trump mean more workers have gotten new jobs, raises, and bonuses – giving them more money to spend. Plus, as small businesses succeed, they create more revenue and more jobs for their communities – benefits that propel our economy and our [N]ation toward even greater prosperity.”

Linda McMahon
Administrator
November 23, 2018

Advocates for the American Entrepreneur. The Budget supports \$9.1 million for SBA’s Office of Advocacy. As the independent voice for small business interests within the Federal Government, the Office of Advocacy promotes policies that minimize economic burdens faced by small business owners and analyzes the effects of proposed regulations and deregulatory efforts.

Proposals in the 2020 Budget:														
Invest in critical national priorities:														
Provide defense funding to rebuild and restore the military and protect the Nation			55	76	83	79	74	51	37	25	17	13	367	510
Implement the VA MISSION Act of 2018			8	10	10	10	10	10	10	10	10	10	49	99
Support major investment in infrastructure			5	26	40	50	40	19	10	5	5	0	160	199
Establish Education Freedom Scholarships			1	5	5	5	5	5	5	5	5	5	21	45
Provide paid parental leave			1	1	1	2	2	2	3	3	3	3	7	20
Debt service			1	4	9	14	18	22	25	28	30	32	46	183
Total			71	122	148	159	149	110	89	76	70	63	650	1,058
Restrain spending to protect and respect American taxpayers:														
Right-size Government and apply two-penny plan to non-defense discretionary spending			23	-8	-46	-72	-99	-127	-154	-181	-207	-233	-202	-1,105
Empowering States and consumers to reform healthcare			4	14	-27	-40	-57	-75	-86	-107	-130	-154	-106	-659
Address wasteful spending, fraud, and abuse in healthcare			-10	-24	-32	-39	-45	-52	-64	-70	-77	-83	-151	-496
Improve drug pricing and payment policies			-0	-3	-4	-6	-7	-9	-9	-10	-11	-11	-20	-69
Improve the welfare system			-22	-30	-32	-33	-34	-34	-35	-35	-35	-36	-151	-327
Reform Federal student loans			-6	-11	-16	-20	-22	-24	-25	-27	-28	-28	-75	-207
Reform disability programs and test new approaches			-1	-2	-2	-3	-4	-7	-10	-14	-19	-23	-11	-84
Modify retirement and health benefits for Federal employees			-5	-3	-6	-7	-9	-11	-13	-14	-16	-17	-31	-102
Implement agricultural reforms			-2	-5	-6	-7	-7	-7	-7	-7	-7	-7	-26	-61
Reform the Postal Service			-4	-8	-8	-9	-10	-10	-11	-12	-13	-13	-39	-98
Other spending reductions and program reforms		-6	-12	-18	-14	-19	-21	-23	-30	-18	-57	-72	-84	-285
Debt service and other interest effects		-*	-1	-3	-8	-16	-25	-37	-51	-68	-87	-110	-53	-406

²The single income-driven repayment plan proposal has sizable interactive effects with the proposals to eliminate subsidized loans and Public Service Loan Forgiveness. These effects, \$19.7 billion over 10 years, are included in the single income-driven repayment plan subtotal.

³Estimates were not available at the time of Budget publication.

⁴Fully fund CSR payments for qualified health plans that did not increase premiums to account for non-payment of CSRs.

⁵While this proposal increases outlays to provide means-tested assistance to low-income policyholders, the National Flood Insurance Program is also accelerating premium increases on other policyholders that currently do not pay full-risk premiums.

⁶Net of income offsets.

⁷The paid parental leave proposal consists of \$28,233 million in benefit and program administration costs, offset by \$7,770 million in savings associated with increased State revenues.

⁸The President's Budget proposes to transfer functions of the Office of Personnel Management to the GSA. For additional information on this reorganization proposal, please consult the Reorganization Chapter of the *Analytical Perspectives* volume.

⁹The proposal would allow the D.C. Courts to retain a portion of the bar examination and application fees it currently deposits into the D.C. Crime Victim's Compensation Fund. Retained fees are estimated at \$360,000 annually beginning in 2019.

¹⁰The Federal Capital Revolving Fund is capitalized with \$10 billion in mandatory funds in 2020. Agency repayments to the fund are reflected as offsetting collections, which reduce the total outlays estimated from the fund over the 10-year window. However, the initial \$10 billion in capitalization funding is fully expended by 2024.

21st Century Cures Appropriations ⁷	1	*	*	1	1	*	*	*	4
Non-BBEDCA Emergency Funding ⁸	-5	-5

* \$500 million or less.

¹ The current law funding levels presented here are equal to the caps estimated for 2019 through 2021 in the Balanced Budget and Emergency Deficit Control Act of 1985 (BBEDCA) with separate categories of funding for “defense” (or Function 050) and “non-defense” (NDD) programs and include Office of Management and Budget (OMB) estimates of Joint Committee enforcement (also known as “sequestration”). For 2022 through 2029, programs are assumed to grow at current services growth rates.

² The 2020 Budget proposes funding levels at the existing 2020 BBEDCA caps for defense and NDD programs. In 2021, the Administration proposes no change to the existing defense and NDD caps but would fund defense programs at the existing cap while beginning an annual two percent (or “2-penny”) decrease to NDD programs. After 2021, the 2020 Budget proposes defense caps through 2029 that resource national defense requirements while NDD caps are proposed that would continue the 2-penny decrease for each year.

Table S-7. Proposed Discretionary Funding Levels in 2020 Budget—Continued

(Net budget authority in billions of dollars)

-
- ³ The 2020 Budget proposes to hold the national defense base budget to the current law BBEDCA cap levels for national defense programs in 2020 and 2021. In order to fully re-source national defense requirements, funding above the current law caps will also be necessary. The Budget therefore increases OCO amounts in 2020 and 2021 to nearly \$165 billion and \$156 billion, respectively. These amounts fund direct war costs, enduring in-theater support, and certain base budget requirements. In addition, more than \$9 billion is requested in 2020 as an emergency requirement to address border security and hurricane recovery. After 2021, which is the final year of the discretionary caps in current law, outyear OCO amounts for 2022 and 2023 would be \$20 billion in each year and \$10 billion in 2024, consistent with the outyear OCO amounts included in OMB's 2019 Mid-Session Review. 2025 through 2029 amounts reflect a notional \$10 billion placeholder for OCO consistent with a potential transition of certain OCO costs into the base budget while continuing to fund contingency operations. The placeholder amounts for 2025 through 2029 do not reflect specific decisions or assumptions about OCO funding in any particular year.
- ⁴ This adjustment reflects savings from a reform proposed in the 2020 Budget that would reduce Federal agency costs through changes to current civilian employee retirement plans. After 2021, the Administration supports reductions to its proposed NDD caps for this reform.
- ⁵ The 2020 Budget continues the Administration's policy to shift NDD OCO amounts into base discretionary funding. No NDD OCO amounts are proposed in 2020 or the outyears.
- ⁶ "Disaster Relief" appropriations are amounts designated as such by the Congress provided they are for activities carried out pursuant to a Presidential disaster declaration under the Robert T. Stafford Disaster Relief and Emergency Assistance Act. These amounts are held to a funding ceiling that is determined annually according to a statutory formula. Based on its 2020 Budget assumptions, OMB estimates the 2020 ceiling to be more than \$21 billion and the Administration is requesting more than \$19 billion for Disaster Relief in 2020 to address significant and unprecedented recovery needs of recent hurricanes and wildfires. The Budget does not explicitly request disaster-designated appropriations in any year after 2020 and a placeholder set at the 10-year average level is included in each of the outyears. The Administration's disaster relief request is discussed in greater detail in the Budget Process chapter of the *Analytical Perspectives* volume of the Budget.
- ⁷ The 21st Century Cures Act permitted funds to be appropriated each year and not counted towards the discretionary caps so long as the appropriations were specifically provided for the authorized purposes. These amounts are displayed outside of the discretionary totals for this reason and the levels included through the budget window reflect authorized levels.
- ⁸ The 2020 Budget includes permanent cancellations of balances of emergency funding in the Departments of Energy and Housing and Urban Development that were not designated pursuant to BBEDCA. These cancellations are not being re-designated as emergency, therefore no savings are being achieved under the caps nor will the caps be adjusted for these cancellations.

* \$50 million or less.

¹ At the time the 2020 Budget was prepared, 2019 appropriations remained incomplete. The 2019 column reflects at the account level enacted full-year appropriations provided for agencies funded in Public Law 115-244 and in divisions A and B of Public Law 115-245. For all other agencies, the 2019 column reflects annualized continuing appropriations provided under the Continuing Appropriations Act, 2019 (division C of Public Law 115-245, as amended). Any changes in mandatory programs (CHIMPs) enacted in full-year bills have been rebased as mandatory while any CHIMPs continuing under the 2019 continuing resolution are included in the 2019 column. The 2019 levels are further adjusted to illustratively reflect an alternative level in 2019 for the 2020 Decennial Census. An allowance is also included to reflect the current law caps for 2019 for defense and NDD.

² Funding for Food for Peace Title II Grants is included in the State and Other International Programs total. Although the funds are appropriated to the Department of Agriculture, the funds are administered by the U.S. Agency for International Development (USAID).

³ The Department of Defense funding level in this presentation includes \$9.2 billion requested as an emergency requirement to address border security and hurricane recovery.

⁴ Funding from the Hospital Insurance and Supplementary Medical Insurance trust funds for administrative expenses incurred by the SSA that support the Medicare program are included in the HHS total and not in the SSA total.

⁵ The total for HHS includes amounts authorized under the 21st Century Cures Act, which permitted funds to be appropriated each year for certain activities and not counted toward the discretionary caps so long as the appropriations were specifically provided for the authorized purposes.

⁶ The State and International Programs total includes funding for the Department of State, USAID, Treasury International, and 12 international agencies.

⁷ The total for the Department of the Treasury includes \$0.4 billion for a new cap adjustment related to program integrity in the Internal Revenue Service. See the Budget Process chapter of the *Analytical Perspectives* volume of the Budget for more information on this adjustment.

⁸ "Disaster Relief" appropriations are amounts designated as such by the Congress provided they are for activities carried out pursuant to a Presidential disaster declaration under the Robert T. Stafford Disaster Relief and Emergency Assistance Act. These amounts are held to a funding ceiling that is determined annually according to a statutory formula. Based on its 2020 Budget assumptions, OMB estimates the 2020 ceiling to be more than \$21 billion and the Administration is requesting more than \$19 billion for Disaster Relief in 2020 to address significant and unprecedented recovery needs of recent hurricanes and wildfires. The Budget does not explicitly request disaster-designated appropriations in any year after 2020 and a placeholder set at the 10-year average level is included in each of the outyears. The Administration's disaster relief request is discussed in greater detail in the Budget Process chapter of the *Analytical Perspectives* volume of the Budget.

⁹ The 2020 Budget proposes to eliminate the Title 17 Innovative Technology Loan Guarantee Program and the Advanced Technology Vehicles Manufacturing Loan Program in the Department of Energy. This proposal includes a permanent cancellation of most of the remaining balances of emergency funding that were not designated pursuant to BBEDCA. This total also includes some smaller emergency cancellations in HUD. These cancellations are not being re-designated as emergency, therefore no savings are being achieved under the caps nor will the caps be adjusted for these cancellations.

Debt held by the public net of financial assets	13,910	15,001	16,101	17,169	18,218	19,126	19,826	20,457	21,033	21,546	22,054	22,256
As a percent of GDP	68.7%	70.5%	71.8%	72.9%	73.6%	73.5%	72.6%	71.3%	69.8%	68.2%	66.6%	64.1%

* \$500 million or less.

- ¹ A decrease in the Treasury operating cash balance (which is an asset) is a means of financing a deficit and therefore has a negative sign. An increase in checks outstanding (which is a liability) is also a means of financing a deficit and therefore also has a negative sign.
- ² Includes checks outstanding, accrued interest payable on Treasury debt, uninvested deposit fund balances, allocations of special drawing rights, and other liability accounts; and, as an offset, cash and monetary assets (other than the Treasury operating cash balance), other asset accounts, and profit on sale of gold.
- ³ Consists mainly of debt issued by the Federal Financing Bank (which is not subject to limit), the unamortized discount (less premium) on public issues of Treasury notes and bonds (other than zero-coupon bonds), and the unrealized discount on Government account series securities.
- ⁴ Legislation enacted February 9, 2018 (Public Law 115-123), temporarily suspended the debt limit through March 1, 2019.
- ⁵ Treasury securities held by the public and zero-coupon bonds held by Government accounts are almost all measured at sales price plus amortized discount or less amortized premium. Agency debt securities are almost all measured at face value. Treasury securities in the Government account series are otherwise measured at face value less unrealized discount (if any).
- ⁶ At the end of 2018, the Federal Reserve Banks held \$2,313.2 billion of Federal securities and the rest of the public held \$13,436.4 billion. Debt held by the Federal Reserve Banks is not estimated for future years.

OMB CONTRIBUTORS TO THE 2020 BUDGET

The following personnel contributed to the preparation of this publication. Hundreds, perhaps thousands, of others throughout the Government also deserve credit for their valuable contributions.
