                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Concentrations - Daily Maximum<br>Loadings -         #### **Rainfall Runoff Calculations**

#### Data

Area Coefficient for Rainfall Runoff 10 Year 24 Hour Rainfall Annual Average Rainfall

# Acres Cr 45

March 8, 2021

inch/24 hours 43 56 inch/year

Runoff Equations:

#### 1-Day Flow

(#Acres)(43560 ft2)/Acre)(Cr)(4.1 in/day)(1 ft/12 inch)(7.48 gal/ft3)(1MG/1000000 gal) MGD = (# Acres) x (Cr) x 0.1221858

30-Day Flow:

(#Acres)(43560 ft2)/Acre)(Cr)(43.56 in/yr)(1 ft/12 inch)(7.48 gal/ft3)(1MG/1000000 gal) MGD = (# Acres) x (Cr) x 0.003240434

Definition of Runoff Coefficients:

Vegetated Areas (without slope considerations) Gypsum & Loose Gravel (substations, rail beds, dam face, rock-faced slopes, etc.) Packed Surfaces (Coal, Bare Soil, Packed Gravel [Roads, Parking Areas, etc.]) Impervious Surface (Pavement, Roofs, Cooling Tower Direct Precip) Basin Surfaces

# LG&E-Mill Creek Station – KPDES Permit Renewal Information Construction Projects Work Required for ELG Federal Rule Compliance

Rev December 15, 2022

### SUMMARY

To update the renewal of the Louisville Gas & Electric Company (LG&E) Mill Creek Generating Station (Plant) KPDES permit, this description of construction activities provides technical and scheduling information to support retaining applicability dates for KPDES permit conditions to meet Federal Effluent Limitations Guidelines (ELG) regulations. EPA recently issued communications that it will reconsider the 2020 ELG rule with potential changes to limits for FGD wastewater, bottom ash transport water, legacy wastewater, and landfill leachate. However, until such proposed rulemaking is published and finalized, steam-electric utilities must comply with the 2020 ELG rule and its compliance dates. Therefore, LGE is proceeding with ELG rule construction activities under the applicability dates granted in the Mill Creek Generation Station KPDES permit KY0003221 modification with an effective date of November 1, 2021. Mill Creek utilizes a dry pneumatic bottom ash conveying system and has no discharge of Bottom Ash Transport Water (BATW).

Therefore, to comply with the ELG Rule, LG&E is continuing activities to:

• construct a biological wastewater treatment system and ancillary Ultrafiltration (UF) for Flue Gas Desulfurization (FGD) process waters.

Specifically at the Mill Creek Plant, construction of new biological wastewater treatment facilities for FGD (Flue Gas Desulfurization) systems wastewaters and other plant process waters require:

- Construction of a biological treatment system building to house tanks, chemical storage, equipment, electrical components, controls, etc.;
- procurement and installation of a sophisticated, modular biological treatment system which includes multiple biological fluidized bed reactors and ancillary pumps, piping, valving, electrical, and controls as well as a large Ultrafiltration system;
- A complex design to retrofit new equipment with the existing physical-chemical wastewater treatment facility;
- Complex construction scheduling sequencing to construct while units operate and install tie-ins when outages are scheduled;

With the intent to reduce the discharge of wastewater contaminants as expeditiously and economically as possible, the description and schedule provided here are accelerated and represent a current best-estimate, but it must be recognized that construction activities are still in the early stages and all-weather construction activities may have a profound effect upon the final completion date. Accordingly, LG&E-Mill Creek will contact KDOW-KPDES staff to provide updated information if the actual schedule significantly deviates from that provided here including if adjustment in ELG applicability dates are required.

## LG&E-Mill Creek Station – KPDES Permit Renewal Information Construction Projects Work Required for ELG Federal Rule Compliance

Rev December 15, 2022

### CONSTRUCTION ACTIVITIES DESCRIPTION

Construction activities for the following projects are currently underway.

### Flue Gas Desulfurization Wastewater (FGDWW) Project

For the FGDWW project, discreet steps of the engineering-procurement-installation contract include multiple overlapping phases which are not specifically sequential but highly interdependent so that delays of any step likely lead to delays of completing the entire project.

For the FGDWW specific-activities, these phases and general expected durations include:

- Detailed engineering: beginning May 2021
- Procurement: beginning Q3 2021
- Construction -multi-discipline and multi-trades: beginning Q4 2021
- Mechanical startup, troubleshooting and testing: beginning Q2 2023
- Commercial completion and performance test: beginning Q1 2024
- Plant testing and optimization: Q2 Q4 2024
- Applicability Date: January 1, 2025

### **Construction – FGDWW**

Engineering and procurement activities, associated with changes or impacts of the finalized ELG Rule, are already underway for the Flue Gas Desulfurization Wastewater (FGDWW) treatment system.

### **FGDWW System Design**

Specifically, the Mill Creek Station existing FGDWW treatment system will be modified by constructing a new selenium/biological treatment system (ELG System) to post-treat the existing physical-chemical equipment flows. Included in the ELG System are outdoor bioreactors, sump and a new building housing additional process equipment, electrical switchgear, control panels, laboratory and chemical storage tanks. The solids from the ELG System will be integrated into the existing FGDWW solids flows for management in existing onsite CCR storage facility.

Treated effluent flows will continue to be discharged through internal Outfall 024 and combined with other plant process flows to the Process Pond to internal Outfall 002 to the high-rate multiport diffuser at external outfall 025 to the Ohio River.

# **EXECUTIVE SUMMARY**

This document is submitted in compliance with U.S. Environmental Protection Agency (EPA) final § 316(b) regulations (Rule) for existing facilities that became effective on October 14, 2014. The Mill Creek Generating Station (Mill Creek) is owned by Louisville Gas and Electric Company (LG&E). Mill Creek is covered by the Rule that requires all facilities using >2 MGD to use best technology available (BTA) for entrainment and impingement. All facilities are required to submit the § 122.21(r)(2) and (3) information and applicable provisions of the (r)(4) through (8) information for impingement that includes:

- (r)(2) Source Water Physical Data
- (r)(3) Cooling Water Intake Structure Data
- (r)(4) Source Water Baseline Biological Characterization Data
- (r)(5) Cooling Water System Data
- (r)(6) Chosen Method of Compliance with the Impingement Mortality Standard
- (r)(7) Entrainment Performance Studies
- (r)(8) Operational Status

The BTA determination for entrainment is based on information provided to the National Pollutant Discharge Elimination System (NPDES) permitting authority, the Kentucky Department of Environmental Protection (KDEP) for Mill Creek. The BTA determination for entrainment is made on a site-specific basis. At a minimum, all facilities using >125 MGD actual intake flow (AIF) are required to submit entrainment information that includes the § 122.21(r)(9)-(12) information as follows:

(r)(9) – Entrainment Characterization Study

(r)(10) – Comprehensive Technical Feasibility and Cost Evaluation Study

(r)(11) – Benefits Valuation Study

(r)(12) – Non-water Quality Environmental and Other Impacts Study

The § 122.21(r)(10) - (12) information must be peer reviewed as required at § 122.21(r)(13) of the Rule.

While Mill Creek's AIF currently exceeds 125 MGD, the Rule has a provision at

§122.21(r)(1)(ii)(G) that states: "If the owner or operator of an existing facility plans to retire the facility after the current permit expires but within one permit cycle, then the Director may waive the requirements of paragraphs (r)(7), (9), (10), (11), (12), and (13) of this section pending a signed certification statement from the owner or operator of the facility specifying the last operating date of the facility. LG&E is planning to retire Unit 1 (the only once-through unit at Mill Creek) no later than the end of 2024. LG&E has already informed the public service commission that it plans to retire the Mill Creek once-through condenser cooled unit (Unit 1 during the next permit cycle and therefore qualifies for the exemption from having to submit the entrainment BTA determination. Unit 2 (a closed-cycle unit) will also be retired by the end of 2028. LG&E is still required to submit the § 122.21(r)(2) through (8) information and that information is provided in this document. **Flow Reductions -** The planned retirement of Unit 1 by 2024 will reduce the station's current DIF from 285.7 MGD to 59.0 MGD. This will result in a 79% reduction from the current DIF. The three remaining units at Mill Creek, Units 2, 3 and 4, use closed-cycle recirculating systems (CCRS) that meets the definition of CCRS at § 125.92 of the Rule. CCRS for these units reduces flow by approximately 93% when compared to similar units if they were designed for once-through cooling. Actual flow reductions are expected to be greater because the annual peak monthly average make-up water flow for Units 2 through 4 is less than the design make-up water flow.

Additional reductions in the DIF will occur after 2028 with the retirement of Unit 2.

**Federally Protected Species** – Potential risks to federally protected species are discussed in Section 4.6 of this document. No federally protected species have been collected in any of the entrainment or impingement samples during the course of Mill Creek's entrainment characterization studies. Currently, there is a low risk of entrainment, impingement or designated critical habitat impacts as a result of current operations. As noted above any risk will be reduced by the 79% reduction in cooling water flow with the retirement of Unit 1. This includes elimination of any impacts as a result of the Unit 1 thermal discharge downstream of the facility.

### Conclusion

As a result of retiring Unit 1, the only once-through cooled unit, the Mill Creek DIF will be reduced by 79% by the end of 2024. The remaining three units, Units 2, 3 and 4 already have closed-cycle recirculating systems as defined at § 125.92. These units will meet the impingement mortality and entrainment standards of the Rule and continued operation does not pose a significant risk to federally protected species.

# **1 INTRODUCTION**

## 1.1 General § 316(b) Rule Overview

The U.S. Environmental Protection Agency (EPA) issued final § 316(b) regulations (Rule) for existing facilities that became effective on October 14, 2014. These regulations require all facilities using >2 MGD to use best technology available (BTA) for entrainment and impingement. All facilities are required to submit the § 122.21(r)(2) and (3) information and applicable provisions of the (r)(4) through (8) information for impingement that includes:

- (r)(2) Source Water Physical Data
- (r)(3) Cooling Water Intake Structure Data
- (r)(4) Source Water Baseline Biological Characterization Data
- (r)(5) Cooling Water System Data
- (r)(6) Chosen Method of Compliance with the Impingement Mortality Standard
- (r)(7) Entrainment Performance Studies
- (r)(8) Operational Status

The BTA determination for entrainment is based on information provided to the National Pollutant Discharge Elimination System (NPDES) permitting authority, Kentucky Division of Environmental Protection (KDEP) for Mill Creek. The BTA determination for entrainment is made on a site-specific basis. At a minimum, all facilities using >125 MGD actual intake flow (AIF) are required to submit entrainment information that includes the § 122.21(r)(9)-(12) information as follows:

(r)(9) – Entrainment Characterization Study

(r)(10) – Comprehensive Technical Feasibility and Cost Evaluation Study

(r)(11) – Benefits Valuation Study

(r)(12) – Non-water Quality Environmental and Other Impacts Study

The § 122.21(r)(10) - (12) information must be peer reviewed as required at § 122.21(r)(13) of the Rule.

The Rule includes a number of potential exemptions that include:

- a *de minimis* exemption for low levels of impingement,
- a provision for less stringent standards for low capacity utilization,
- an exemption for some or all of the §122.21(r) information for facilities that withdraw cooling water from manmade lakes and reservoirs and have stocked or managed fisheries,
- an exemption from use of technologies at nuclear facilities that conflict with federal nuclear safety requirements, and
- an exemption from submitting entrainment information for facilities retiring in the current or next NPDES permit cycle.

#### Introduction

The Rule provides broad discretionary authority to KDEP to deny exemptions or even impose additional requirements, especially if federally protected threatened or endangered species or their designated critical habitat are at risk.

### 1.2 Compliance Approach for Mill Creek

While Mill Creek's AIF currently exceeds 125 MGD, the Rule has a provision at §122.21(r)(1)(ii)(G) that states: "If the owner or operator of an existing facility plans to retire the facility after the current permit expires but within one permit cycle, then the Director may waive the requirements of paragraphs (r)(7), (9), (10), (11), (12), and (13) of this section pending a signed certification statement from the owner or operator of the facility specifying the last operating date of the facility. LG&E is planning to retire Unit 1 (the once through cooled unit) at Mill Creek no later than the end of 2024 and it will also retire Unit 2, a closed-cycle unit by the end of 2028. Thus, the facility is exempted from having to provide the entrainment information. In this document LG&E is providing the \$ 122.21(r)(2) through (8) information for Mill Creek's once-through cooled Unit (Units 1) as well as the closed-cycle cooled units (Units 2, 3 and 4). In Chapter 6, LG&E plans to use BTA for Impingement through retiring Unit 1 and 2 and the continued use of closed-cycle recirculating systems (CCRS) as BTA for Units 3 and 4. This compliance approach is allowed under the provision at 122.21(r)(1)(ii)(G) of the Rule. LG&E recognizes that KDEP is still required to make an entrainment BTA determination based on factors that must and may be considered as required at §125.98(f) of the Rule. However, LG&E provides information in Chapter 9 and the executive summary to assist KDEP in making the determination relative to those factors.

### 1.3 Report Organization

The report is organized such that the \$ 122.21(r)(2) through (8) information is presented in Chapters 2 through 8 of this report respectively. Chapter 9 provides information to KDEP to inform the entrainment BTA determination that is based on factors that must and may be considered in making that determination. Chapter 10 provides a list of references used in this document. A high quality flow line diagram is provided as Appendix A.

The entrainment characterization study (r)(9), reports on use of CCRS and fine-mesh screens (r)(10), information and information on the non-water quality and (r)(12), other environmental impact were also completed for Mill Creek. These reports were drafted prior to the LG&E decision to retire Units 1 and 2 and no longer required for Mill Creek. They are therefore not included in this submittal.

# 2 § 122.21(R)(2) SOURCE WATERBODY PHYSICAL DATA

The Rule at § 122.21(r)(2) requires LG&E to provide the following source waterbody physical data for Mill Creek:

(i) A narrative description and scaled drawings showing the physical configuration of all source water bodies used by your facility, including areal dimensions, depths, salinity and temperature regimes, and other documentation that supports your determination of the water body type where each cooling water intake structure is located:

(ii) Identification and characterization of the source waterbody's hydrological and geomorphological features, as well as the methods you used to conduct any physical studies to determine your intake's area of influence within the waterbody and the results of such studies; and

### (iii) Locational maps.

The following physical data are being provided to characterize the source waterbody in the vicinity of Mill Creek. This information is used, in part, to evaluate the various measures that LG&E are required to consider to meet the BTA requirements of the Rule. The following sections describe the Ohio River's dimensions, key physical and chemical characteristics, and provides the figures and maps required under 40 CFR 122.21(r)(2).

## 2.1 Narrative Description of Source Waterbody

The Ohio River is nearly 1,000 miles long, flowing from the confluence of the Allegheny and the Monongahela Rivers in Pittsburgh, Pennsylvania to where it joins the Mississippi River in Cairo, Illinois. The drainage area of the Ohio River and approximate location of Mill Creek is shown on Figure 2-1. The Ohio River is divided into a series of pools by 20 locks and dams. These locks and dams were installed to improve navigation and control flooding on the river and are managed by the U.S. Army Corps of Engineers (USACE).

Mill Creek is located on the eastern shore of the Ohio River in Louisville, Kentucky at River Mile (RM) 625.8 within the Cannelton Pool. This pool is 113.9 miles long, extending from the McAlpine Locks and Dam (RM 606.8) downstream to the Cannelton Locks and Dam (RM 720.7), as shown on Figure 2-2. The pool has a gradient drop of 0.3 feet per mile (ft/mi.) and averages 1,674 feet wide and 32 feet deep (ORSANCO 2020a).

Major inflows into the Cannelton Pool include the Salt River, Big Indian Creek, Sinking Creek and Blue River (ORSANCO 2020a). The Salt River, the closest tributary to Mill Creek, discharges into the Ohio River at RM 629.8, 4.0 miles downstream of the station.

### 2.2 Aerial Dimensions

Mill Creek is located on the eastern shore of the Ohio River at RM 625.8. The river near the CWIS is approximately 1,800 ft wide and flows in a southerly direction, as shown in Figure 2-3.

Case No. 2022-00402 Attachment 3 to Response to JI-1 Question No. 1.101(f-h) Page 211 of 307 Imber

## 2.3 Depths

Limited information is available on the water levels and river bathymetry in the Cannelton Pool near Mill Creek. The normal pool level in the Cannelton Pool is El. 383.0 ft. Water level information within the pool was obtained from USGS Gage #03294600 for the Ohio River at Kosmosdale, KY, which is located at approximately RM 627, 1.2 river miles downstream of Mill Creek (USGS 2022a). For the period of record from January 1, 2002 through December 31, 2021, water levels at this site ranged from a low of El. 380.34 ft which occurred on July 27, 2011, to a high on February 26, 2018 of El. 435.48 ft with an average surface elevation of 391.95 ft. The 50% exceedance water level during this period was El. 388.51 ft. Assuming a pool gradient of 0.3 ft/mile during low water, the low water level at Mill Creek would be El. 380.7 ft. All elevations are given in NGVD29. The stage duration curve for this period is provided in Figure 2-4. The average monthly water level for this period is provided in Table 2-1.

Historic design information from Mill Creek indicates both a normal and low water elevation of 383.0 ft. This water level is consistent with the project pool elevation but is not expected to be a good representation of low water levels at the site. A water level of El. 375.0 ft., approximately 5.7 ft below the estimated lowest water level recorded during the period of record, was assumed for the design low water level at Mill Creek. This low water level is consistent with the design low water level at Cane Run, located 9.2 river miles upstream of Mill Creek, and provides a conservatively low estimate of low water at the site. A river level of El. 375.0 ft is therefore used for velocity calculations and technology designs throughout the 122.21(r) studies. This water level may not however be indicative of the lowest water level that the station can operate.

Bathymetric data is not available for the Ohio River near Mill Creek. The only information on water depths is provided in the navigation chart for the Ohio River near Mill Creek (Figure 2-5). The white sections of river in the navigation chart indicate a water depth of 9 ft or more at the project pool (El. 383.0 ft), and the blue sections represent water depths less than 9 ft at the project pool.

Month	Average Surface Elevation (ft) (2002-2021)
January	397.76
February	396.15
March	399.93
April	398.94
May	395.86

## 2.4 Flows

River flows in the Ohio River near Mill Creek are based on river flows recorded from USGS Gage #03294500 for the Ohio River at Louisville, KY (USGS 2022b). River flows at this site have been recorded since January 1, 1928, however only information from the last 20 calendar years on record (2002-2021) were used for this report. EPRI limited the data to the last 20 years, because this period is expected to be a good representation of existing land use, water use and climactic conditions on the Ohio River. For the period of record daily mean flows ranged from a high of 720,000 cubic feet per second (cfs) measured February 26, 2018 to the low of 877 cfs measured in September 21, 2010. The average mean river flow was approximately 141,638 cfs and the median flow (50% exceedance) was 104,000 cfs. The average annual flows for the period of record are provided in Table 2-2. The flows in this stretch of the river follow seasonal trends with higher flows occurring in the late winter and lower flows in the late summer as shown in Table 2-3 and Figure 2-6.

Year	Mean Annual Flow (cfs)
2002	120,600
2003	177,000
2004	178,700

#### 2.5 Salinity

The Ohio River is characterized as freshwater and therefore has very low salinity (i.e., <1 ppt).

#### 2.6 Temperature

Monthly average water temperatures for the Ohio River are available from ORSANCO (ORSANCO 2020c). River temperatures measured at Newburgh Lock and Dam are available for the months of May through October through 2017. Daily average water temperatures for the Ohio River from the McAlpine Lock and Dam to Cairo, IL are available from 1995 to 2003. The daily data set, while older is presented in this analysis because it includes all twelve months. During this time the daily river water temperature ranged from 38.8°F to 83.0°F with an average daily temperature of 61.2°F (Table 2-4). The seasonal change in water temperature is shown on Figure 2-7.

#### 2.7 Area of Influence

The area of influence (AOI) of a CWIS represents the portion of the source waterbody that is affected by the CWIS cooling water withdrawal (i.e., area in the source waterbody where organisms are potentially subject to entrainment or impingement by the CWIS). This information is needed to indicate the potential area of adverse environmental impact on the source waterbody and to appropriateness of any design or technologies proposed by the applicant. The AOI differs depending on whether it is considered for impingement or entrainment. From an impingement standpoint, the AOI can be defined as the area where a healthy fish may not be able to swim against and escape the intake flow. The AOI from an entrainment standpoint is the chance of a particle within the source waterbody becoming entrained. This area can vary depending on the number of cooling water pumps in operation.

Accurately defining the AOI at the CWIS requires a detailed understanding of the intake and the surrounding waterbody environment. Simple desktop models using available information can however provide sufficient AOI estimates for the purpose of designing entrainment and/or source waterbody studies and evaluating fish protection technologies and/or operational measures.

#### 2.7.1 Impingement AOI

A desktop model was used to estimate the impingement area of influence (AOI) for Mill Creek's CWIS. The first step in determining the impingement AOI is to define the approximate area within the 0.5 foot per second (ft/sec) velocity contour. EPA considers this velocity to be a *de minimis* value for impingement. That is, a fish can swim freely in a flow at this velocity and avoid impingement. Several basic and common assumptions were made for Mill Creek to define the approximate AOI using simplified calculations. These assumptions are:

- The maximum AOI occurs at the minimum design water level;
- The maximum AOI occurs when the station is operating at its maximum design intake flow (DIF) (442.0 cfs), which includes the once-through cooling water flow;
- Due to the absence of detailed bottom bathymetry of the river in front of the CWIS, the inverts were assumed to be horizontal and level with the invert of the CWIS (El. 364.0 ft);
- All of the currents in the area are a direct result of the Mill Creek withdrawal; and
- The flow field extends the full depth of the water column;
- The flow per unit area increase towards the center of the CWIS resulting in an elliptical AOI.

The geometry of the intake, the adjacent shoreline, the bottom bathymetry, and design intake flow were based on information presented in  $\frac{122.21(r)(2)}{(3)}$ .

All four units at Mill Creek share the same CWIS, therefore, the simplified estimate of the AOI uses a DIF of 442.0 cfs, which includes both once-though cooling water and make-up water flow for the closed-cycle units. This DIF was divided by 0.5 fps to calculate the effective flow area necessary to achieve a 0.5 fps velocity (884 ft<sup>2</sup>). With a minimum water depth of 11 ft, the 0.5 fps velocity contour will be approximately 80.4 ft long. This length along with the length of the

intake was used to solve the Ramanujan equation for the radius of an ellipse along the minor axis. The Ramanujan equation is provided below.

$$p \approx \pi \left[ 3(a+b) - \sqrt{(3a+b)(a+3b)} \right]$$

p= perimeter of ellipse (twice the effective flow length)

a= radius of ellipse along the long axis (half of the intake or intake bay width)

b= radius of ellipse along the short axis (maximum distance of the velocity contour)

The results of this analysis indicate that the 0.5 fps contour extends out a maximum of 16.9 ft from the face of CWIS at the design low water level (El. 375.0 ft) as shown on Figure 2-8. At the lowest recorded river level (El. 380.7), the impingement AOI is expected to extend out a maximum of 9.5 ft from the face of the CWIS when operating at the DIF.

Unit 1, the once-though unit at Mill Creek, is slated to be retired by the end of 2024. Once Unit 1 is retired, the four long-shaft pumps that provide make-up water for the three closed-cycle units will be the only pumps withdrawing water from the Ohio River. This will reduce the Mill Creek DIF to 91.4 cfs, a 79% flow reduction. Under this operating scenario, the 0.5 ft/sec contour would extend 2.3 ft into the river assuming flow is limited to only one trash rack opening and a low water level of El. 375.0 ft as shown on Figure 2-8. At the lowest recorded river level of El. 380.7 ft, the impingement AOI occurs within the CWIS. After 2028, the DIF may be lower than what is estimated here, because one or more of the long-shaft pumps may be retired as part of the Unit 2 retirement.

#### 2.7.2 Entrainment AOI

The AOI from an entrainment standpoint is the area in the river within which a suspended particle is likely to become drawn into the Mill Creek CWIS along with the cooling water. In the Rule preamble (see Footnote 48) EPA states that

"Entrainment is generally considered to be proportional to flow and therefore a reduction in flow results in a proportional reduction in entrainment, as EPA assumes for purposes of national rulemaking that entrainable organisms are uniformly distributed throughout the source water".

A simple desktop model was used to determine the AOI for entrainment at the Mill Creek CWIS. Accurately defining the AOI for entrainment at CWIS(s) requires an understanding of both intake and river flows. The following basic and common assumptions were made for Mill Creek to define the approximate entrainment AOI using simplified calculations.

- The design intake flow of the Mill Creek CWIS is 442.0 cfs.
- The maximum AOI occurs at the lowest daily mean river flow as recorded in Louisville, KY (877 cfs occurring on September 21, 2010).
- The river near the CWIS has a width of 1,800 feet with a uniform bottom
- The flow in the Ohio River is uniform throughout the river cross section.

Localized flows and currents were not considered in this simplified model but could potentially effect entrainment.

During the lowest recorded flow conditions, the Mill Creek CWIS could withdraw up to 50% of the Ohio River flow. Based on the river geometry assumptions, the AOI for entrainment would extend approximately 907 ft out from the face of the CWIS during the extreme low river flow conditions. During average daily mean river flow conditions from 2002 to 2021 (141,638 cfs), the Mill Creek CWIS could withdraw up to approximately 0.31% of the Ohio River flow resulting in an entrainment AOI extending approximately 6 ft from the face of the CWIS.

The percent of the river flow withdrawn based on the average monthly river flows from 2002-2021, and the estimated distance the entrainment AOI extends out into the river under the existing DIF are provided in Table 2-5. The main spawning and larval recruitment period for the Ohio River at Mill Creek extends from mid-April through mid-August. From April through August, Mill Creek could withdraw up to 0.35% of the average monthly river flow (127,589 cfs) resulting in an affected entrainment AOI extending approximately 6 ft from the face of the CWIS.

With the retirement of Unit 1 during the next permit cycle, the Mill Creek DIF will drop from 442.0 cfs to 91.4 cfs. During extreme low flow conditions and Mill Creek operating at the new DIF, the station could withdraw up to 10% of the river flow, with an entrainment AOI extending up to 188 ft from the CWIS. If operating at its DIF, Mill Creek would withdraw less than 0.1% of both the average annual river flow and the average monthly river flow during the entrainment season. The entrainment AOI under these conditions extend approximately 1 ft out from the CWIS. The entrainment AOI would be reduced further if one or more long-shaft pumps are retired in conjunction with the Unit 2 retirement. The percent of the river flow withdrawn and the estimated distance the entrainment AOI extends out into the river, for the average monthly river flow from 2002-2021 and assuming Mill Creek is operating at its future DIF are provided in Table 2-6.

Case No. 2022-00402 Attachment 3 to Response to JI-1 Question No. 1.101(f-h) Page 224 of 307 Imber

## 3 § 122.21(R)(3) COOLING WATER INTAKE STRUCTURE DATA

The Rule at § 122.21(r)(3) requires LG&E to provide the following cooling water intake information for Mill Creek:

(*i*) A narrative description of the configuration of each of your cooling water intake structures and where it is located in the water body and in the water column;

(*ii*) Latitude and longitude in degrees, minutes and seconds for each of your cooling water structures;

(iii) A narrative description of the operation of each of your cooling water intake structures, including design intake flows, daily hours of operation number of days of the year in operation and seasonal changes, if applicable;

(*iv*) A flow distribution and water balance diagram that includes all sources of water to the facility, recirculating flows, and discharges; and

(v) Engineering drawings of the cooling water intake structure.

The following CWIS data are being provided to characterize the Mill Creek CWIS and evaluate the potential for impingement and entrainment of aquatic organisms.

#### 3.1 CWIS Configuration

Mill Creek is a steam electric generating station with four coal-fired units located on the eastern shore of the Ohio River at River Mile (RM) 625.8, in Louisville, Jefferson County, Kentucky (KY). This is approximately 15 miles southwest of downtown Louisville, KY and 9.2 miles downstream from the Cane Run Generating Station. The Mill Creek CWIS is located at latitude 38°03'11.2" and longitude 85°54'44.0". The Mill Creek CWIS provides circulating water to the Unit 1 once-through cooling water system, and make-up water to three units' (Units 2, 3, and 4) with CCRS.

The shoreline CWIS includes a skimmer wall, trash racks, a baffle wall and four traveling water screens that are used to keep fish and debris out of the circulating and make-up water systems. The CWIS has a total width of approximately 70 ft, a top deck elevation of 462.0 ft and is divided into four intake bays, two for Unit 1 and two for Units 2, 3, and 4. The overall arrangement of the Mill Creek site and CWIS is shown in Figure 3-1. Plan and section views of the CWIS are provided in Figure 3-3 and Figure 3-4 respectively.

The skimmer wall is located at the face of the CWIS. This skimmer wall extends 2 ft below the normal water level to El. 381.0 ft. There are two openings in the skimmer wall, each 17 ft high by 14 ft wide. Trash racks span the total width and height of both openings. The trash racks have 3 inch by 0.375 inch bars spaced 4 inches on center.

The CWIS, downstream of the skimmer wall, is divided into four screen bays; each 11.3 ft wide. A baffle wall, located at the face of each screen bay extends down to El. 373.2 ft. The floor under the baffle wall is at El. 365.2 ft providing an 8 ft high by 11.3 ft wide opening.

Traveling water screens are located downstream of the baffle wall openings. The centerline of the traveling water screens is located 5.75 ft downstream of the baffle walls. These screens are 10 ft wide and equipped with 0.375 (3/8) inch square stainless-steel mesh. The screens extend from the invert of the CWIS (El. 364.0 ft) to above the top deck (El. 462.0 ft). The screens rotate at either 2.5 ft/min or 10/ft min, depending on river and debris conditions. Typically, one screen is rotated at a time for one hour. Once all four screens are rotated, there is a two-hour period before the sequence starts again. All the screens may be operated simultaneously during periods of heavy debris loading. The screens are inspected every week and any damaged baskets are corrected at that time. Debris loading on the screens typically consists of sticks and leaves and is heaviest during the spring and fall. The debris is washed off the screens using a high-pressure front spray wash. An open debris trough conveys screen wash water back to the river at the south (downstream) side of the screen house. Large debris is collected and removed from the screens for disposal. The traveling water screens are on a four-year overhaul cycle with one screen being completed each year.

The Unit 1 circulating water pumps are located downstream of traveling water screens in the two southernmost (downstream) bays. Typically, both circulating water pumps are operated when the unit is operating, however one pump can be taken out of service during cold weather. Operating with only one circulating water pump puts station reliability at risk and is only conducted to facilitate maintenance. Operating only one pump results in a flow of 206.2 cfs (92,600 gpm, 133.3 MGD). The combined flow rate with both pumps operating is 350.7 cfs, (157,400 gpm, 226.7 MGD). The difference between the flow rate through each pump with one and two pumps operating is a result of increased backpressure on the circulating water pumps associated with the increased flow. The two circulating water pumps will be retired by the end of 2024 in conjunction with the Unit 1 retirement. The Unit 1 circulating water is discharged back to the Ohio River approximately 577 ft downstream of the CWIS.

Four, long-shaft service water pumps are located in the other two bays. These pumps are used to provide service water and auxiliary make-up water to the three closed-cycle units. Two pumps are located in the northernmost bay and have a combined flow of 44.6 cfs (20,000 gpm, 28.8 MGD); the two other pumps are located in the other screen bay and have a combined flow of 46.8 cfs, (21,000 gpm, 30.2 MGD). These pumps will remain in service beyond the retirement of Unit 1, however there is potential that one or more of these pumps can be retired in conjunction with the retirement of Unit 2, by the end of 2028. Cooling tower blow down for Units 2, 3, and 4 is discharged back to the Ohio River through the same discharge structure as Unit 1.

The maximum combined DIF through the CWIS is 442.0 cfs (198,400 gpm, 285.7 MGD) with Unit 1 operating. After Unit 1 is retired the new Mill Creek DIF will be 91.4 cfs (41,000 gpm, 59.0 MGD), when all four long-shaft pumps are operating. This represents a 79% reduction in the design flow.

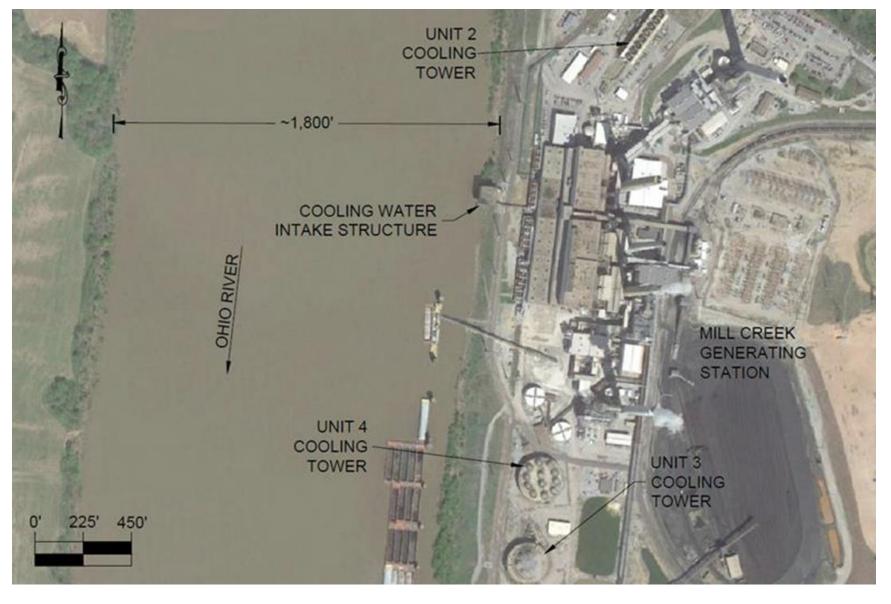

Figure 3-1 Mill Creek Site Configuration

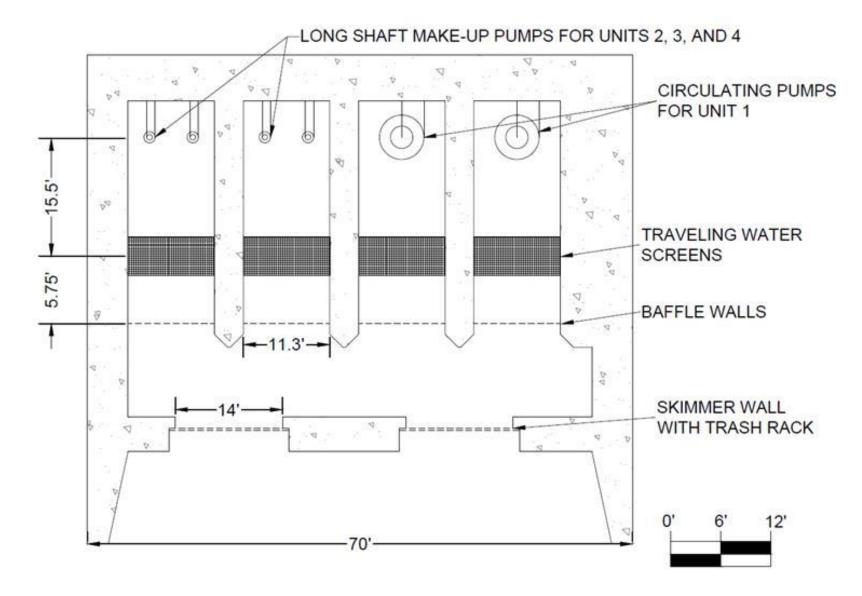

Figure 3-3 Mill Creek CWIS - Plan View

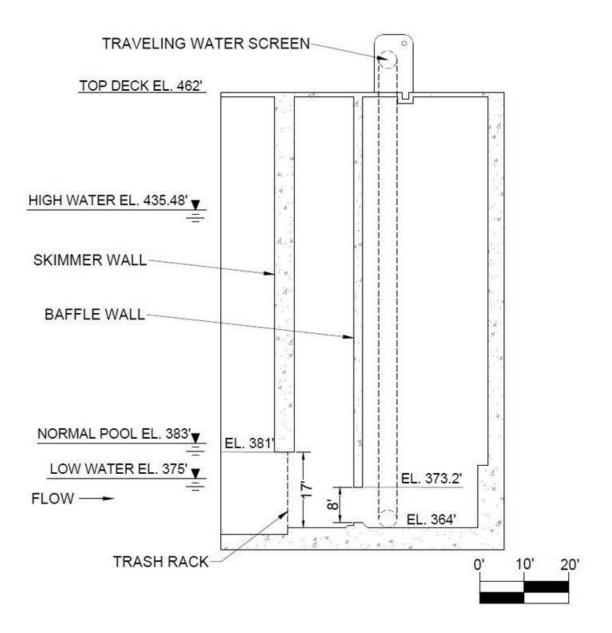

Figure 3-4 Mill Creek CWIS - Section View

#### 3.2 CWIS Operation and Intake Flows

There are two circulating water pumps for Unit 1, and a total of four long-shaft service water pumps located downstream of the traveling water screens. The circulating water pump flow for Unit 1 is 206.2 cfs (92,600 gpm, 133.3 MGD), when one pump is operating. Two pump operation, which is how the unit is normally operated, results in the total circulating water flow rate for Unit 1 of 350.7 cfs (157,400 gpm, 226.7 MGD). The difference between the flow rate through each pump with one and two pumps operating is a result of increased backpressure on the circulating pumps associated with the increased flow. These two circulating water pumps will no longer operate after Unit 1 is retired.

The two long-shaft service water pumps that are located in the northernmost bay have a combined flow of 44.6 cfs (20,000 gpm, 28.8 MGD); the two other long-shaft pumps are located in the adjacent screen bay and have a combined flow of 46.8 cfs (21,000 gpm, 30.2MGD). The combined design intake flow (DIF) of the four long-shaft pumps is 91.4 cfs (41,000 gpm, 59.0 MGD). The total DIF with all six pumps operating is 442.0 cfs (198,400 gpm, 285.7 MGD).

Pump capacities and the design intake flow for the Mill Creek station are listed in Table 3-1. Typically, both circulating water pumps are operated when the unit is operating, however one pump can be taken out of service during cold weather. Operating with only one circulating water pump puts station reliability at risk and is only conducted to facilitate maintenance. Two or three long-shaft service water pumps are usually operated depending on the service and make-up water needs for the Units 2, 3, and 4 cooling towers. Starting in 2020, Mill Creek was able to reduce the total average daily river intake flow of the station by 1.9%. The majority of the flow reduction is a result of the conversion of the Units 1, 2, 3, and 4 fly and bottom ash sluicing system to dry handling, and gypsum wash water reductions. A small portion of this reduction was also a result of reduced flows to the Units 2, 3, and 4 cooling system remain constant and were not reduced by these improvements. The flow through the Unit 1 pumps will be reduced to zero by the end of 2024, when Unit 1 is retired.

The annual pump hours of operation and estimated withdrawal rate for each long shaft service water pump over the last 5 years (2017-2021) are provided in Table 3-2. The operation of the Unit 1 circulating water pumps is not included in Table 3-2 or subsequent tables in this section to provide a better representation of the withdrawal rate once Unit 1 is retired. The annual average daily long shaft service water flow, annual hours of operation, and the percent of future maximum design intake flow for the Mill Creek facility based on the last 5 years of operating data (2017-2021) are provided in Table 3-3. As shown in Table 3-3 Mill Creek would have withdrawn an average of 58.5% of its future DIF during the last 5 years. The average monthly daily intake flow, number of days per month and total monthly and annual withdrawal for the Mill Creek long shaft service water pumps over the past 5 years (2017-2021) is provided in Table 3-4.

Pump Description	DIF (gpm)	DIF (MGD)	DIF (cfs)
Unit 1 Circulating Water Pump A	78,700 <sup>1</sup>	113.3 <sup>1</sup>	175.3 <sup>1</sup>
Unit 1 Circulating Water Pump B	78,700 <sup>1</sup>	113.3 <sup>1</sup>	175.3 <sup>1</sup>
Long-Shaft Service Water Pump 1	10,000	14.4	22.3

#### Table 3-4 (Continued)

#### 3.3 Flow Distribution and Water Balance Diagrams

The water balance diagram for the Mill Creek circulating water system is shown below in Figure 3-5. This diagram is based on the current flow conditions with Unit 1 operating. After Unit 1 is retired by the end of 2024, the new Mill Creek DIF will be 91.4 cfs (41,000 gpm, 59.0 MGD), with all four long-shaft pumps operating. This will represent a 79% reduction in the design flow. A higher quality version of the water balance diagram is provided as a separate PDF that is attached to this submittal (Appendix A).

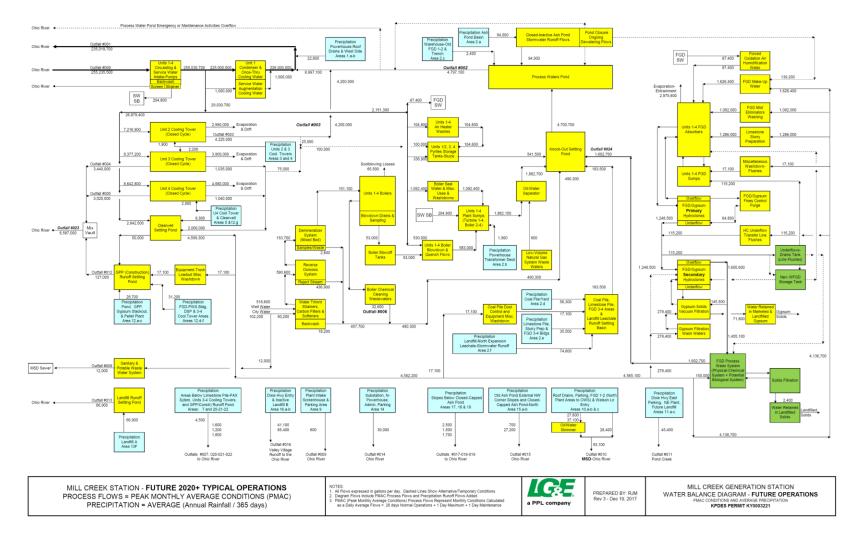

Figure 3-5 Water Balance Diagram for the Mill Creek Circulating Water System

### 4 § 122.21(R)(4) SOURCE WATER BASELINE BIOLOGICAL CHARACTERIZATION DATA

This section includes the source water baseline biological characterization data for Mill Creek Generating Station (Mill Creek Station), required at 122.21(r)(4) of the Rule. Since there are twelve subsections for this information, the requirement for each subsection will be stated followed by information responsive to the required information.

Source water baseline biological characterization data. This information is required to characterize the biological community in the vicinity of the cooling water intake structure and to characterize the operation of the cooling water intake structures. The Director may also use this information in subsequent permit renewal proceedings to determine if your Design and Construction Technology Plan as required in § 125.86(b)(4) or § 125.136(b)(3) of this chapter should be revised. This supporting information must include existing data (if they are available). However, you may supplement the data using newly conducted field studies if you choose to do so. The information you submit must include:

#### 4.1 Missing Data

(i) A list of the data in paragraphs (r)(4)(ii) through (vi) of this section that are not available and efforts made to identify sources of the data.

Except for information describing the source water crayfish community near Mill Creek Station, data required in paragraphs (r)(4)(ii) through (r)(4)(vi) were available. However, other information and the site-specific impingement study at a nearby facility was used to determine that crayfish are not susceptible to entrainment and have limited susceptibility to impingement.

#### 4.2 List of Relevant Taxa in the Vicinity of the CWIS

(ii) A list of species (or relevant taxa) for all life stages and their relative abundance in the vicinity of the cooling water intake structure.

#### 4.2.1 Shellfish

A mussel survey was conducted immediately upstream and downstream of Mill Creek Station in 2012 by Ecological Specialists, Inc. (ESI 2012). In addition, EPRI (2012) identified five freshwater mussel surveys conducted from 1994 to 2007 upstream of Mill Creek Station (Ohio River Miles [ORM] 613.5 to 623.5), and EPRI (2018) contained one survey that was conducted along the Indiana shoreline from 0.5 miles upstream of the facility to 1.8 miles downstream of the facility in 2017 (LEC 2017). These data are summarized in Table 4-1.

#### Table 4-1 Summary of historical live mussel collections near the Mill Creek Station (EPRI 2012, 2018; ESI 2012; LEC 2017)

(a) ORM 613.5 to 617.4; (b) ORM 615.5 to 617.7; (c) near ORM 616.8; (d) ORM 610.3 to 616.7 and ORM 617.5 to 623.5; (e) ORM 625.2 to 626.4; and (f) ORM 625.3-627.6 (Rosebud Mussel Bed). (g) Represents data from only the five surveys that had count information. (h) Naming convention follows Williams et al. (2017). Note: P=✓ denotes present, No.=number collected, % = relative abundance, "--" indicates none collected, and 0.0 denotes values less than 0.05. Among those seven surveys, 21 mussel species were reported (Table 4-1). Threeridge (*Amblema plicata*), Washboard (*Megalonaias nervosa*), and Threehorn Wartyback (*Obliquaria reflexa*) were observed during each survey, while Mucket (*Actinonaias ligamentina*), Purple Wartyback (*Cyclonaias tuberculata*), Pocketbook (*Lampsilis ovata*), and Fawnsfoot (*Truncilla donaciformis*) were collected during only one survey. Ebonyshell (*Reginaia ebenus*, 34.0%) and Pimpleback (*Cyclonaias pustulosa*, 20.1%) were the most abundant species observed during the five years for which count data were available.

Information describing the source water crayfish community near Mill Creek Station was not identified. However, crayfish were a target organism during an impingement study at a nearby facility on Cannelton Pool (see Section 4.3.1), but were not identified to species (i.e., they were recorded only as "crayfish").

#### 4.2.2 Fish

Adult and juvenile fish studies in the immediate vicinity of Mill Creek Station have not been conducted in recent years. However, to obtain more recent data, surveys conducted by the Ohio River Ecological Research Program (ORERP), which was administered by the Electric Power Research Institute (e.g., EPRI 2019) were used These surveys consist of annual adult fish electrofishing and seining investigations in Cannelton Pool near LGE-KU's Cane Run Plant at ORM 616.8, approximately nine miles upstream of Mill Creek Station. Seasonal electrofishing and seining surveys conducted at the Cane Run Plant from 2014 through 2018 provided the basis of the compiled list of fish species. The ORERP results were supplemented with electrofishing data collected by the Ohio River Valley Water Sanitation Commission (ORSANCO) from ORM 616.6 to ORM 630.1 in July 2016 (http://www.orsanco.org/data/fish-population/).

The list of adult and juvenile fish compiled from the ORERP and ORSANCO data comprises of 59 species and three hybrids, representing 15 fish families (Table 4-2). Families with the most species were the carps and minnows (18 species), sunfishes (12), and suckers (10). Twenty-eight species and hybrid striper were encountered each year. Six of those common species accounted for 93.4% of the six-year total: Emerald Shiner (53.7%), Channel Shiner (26.4%), Gizzard Shad (5.8%), River Shiner (4.0%), Sauger (1.8%), and Freshwater Drum (1.7%).

#### Table 4-2 (Continued)

(a) ORERP ELECTROFISHING AND SEINING DATA COLLECTED NEAR CANE RUN PLANT IN JUNE/JULY, AUGUST, AND OCTOBER. (b) INCLUDES SIX ORSANCO ELECTROFISHING EVENTS FROM JULY (<u>http://www.orsanco.org/data/fish-population/</u>). NOTE: 0.0 DENOTES VALUES LESS THAN 0.05. A two-year entrainment study was conducted at Mill Creek Station in 2015 and 2016 to fulfill 40 CFR 122.21(r)(9) of the U.S. Environmental Protection Agency's (EPA) final Clean Water Act § 316(b) Existing Facilities Rule (see Section 9 and EPRI 2020c). Sampling was conducted in the Area of Influence (AOI) in front of the CWIS at multiple depths and during two diel periods to characterize annual, seasonal, and diel variations in entrainment. In 2015, sampling was conducted every two weeks from March through September. Sampling in 2016 was also conducted every two weeks from April through early May and July through August, but every week from early May through June to gather more data during times of highest ichthyoplankton density. This study provides the most recent data describing the ichthyofauna at Mill Creek Station.

In 2015, 35,743 fish including all life stages (adults, juveniles, larvae, and eggs) were collected, consisting of 25 distinct identifications<sup>1</sup> (Table 4-3). The 2016 collections yielded 52,971 fish (juveniles, larvae, and eggs) representing 27 distinct identifications. For the two years combined, 88,714 specimens were collected that represented 33 distinct identifications across 11 fish families.

#### Table 4-3 (Continued)

<sup>(a)</sup> Asian carp taxa and groupings were combined into Asian carp (+type) because relatively few Asian carp (Grass Carp [+type], Silver Carp type, or *Hypophthalmichthys* sp.) were identified beyond the Asian carp or Asian carp type categories (EPRI 2020c).

Note: # = number collected; % = relative abundance; "--" indicates none collected.

The most abundant taxa collected in 2015 were, in decreasing order of abundance, Gizzard Shad, Freshwater Drum, Clupeidae sp. (Gizzard Shad, Threadfin Shad, and/or Skipjack Herring), and Ictiobinae sp. (carpsucker/buffalo species). These taxa composed 88.6% of the specimens collected at Mill Creek Station in 2015 (EPRI 2020c). In fact, Gizzard Shad post yolk-sac larvae alone composed 50.5% of the entire catch. The dominant taxa for 2016, in decreasing order of abundance, were Freshwater Drum, Asian carp (+type)<sup>2</sup>, Ictiobinae sp., and Gizzard Shad. These taxa composed 89.6% of the specimens collected in 2016. The two most abundant taxa in 2016, Freshwater Drum and Asian carp (+type), were dominated by the viable egg life stage (EPRI 2020c).

#### 4.3 Species and Life Stages Most Susceptible to Impingement and Entrainment

(iii) Identification of the species and life stages that would be most susceptible to impingement and entrainment. Species evaluated should include the forage base as well as those most important in terms of significance to commercial and recreational fisheries.

Impingeable sized organisms are defined in § 125.92(n) of the Rule and are individuals sufficiently large enough to not pass through 3/8-inch square or 1/2 x 1/4-inch rectangular mesh screens. They are trapped against the screen by the force of intake water flowing through the screen. Organisms that pass through the mesh are entrained (see Rule definition at § 125.92(h)). Entrained specimens will pass through the condenser cooling water systems and do not impact facility operation. Generally, a fish species vulnerability to impingement and/or entrainment is a function of life history such as habitat preference, water column distribution, reproductive behavior, early life history characteristics, swimming ability, natural mortality, or physical influences such as water body hydraulics and ambient water temperature. Vulnerability to impingement and/or entrainment for most fish species is not dictated by their abundance in the source water body.

#### 4.3.1 Shellfish

Adult and juvenile Unionida mussels reside in the sediment and have very limited mobility; therefore, it can reasonably be concluded that they are not susceptible to entrainment nor are they readily susceptible to impingement. Larval Unionida mussels, glochidia, require temporary attachment to a "host" (almost exclusively fish) to survive beyond the larval stage. Some Unionida species use active methods to ensnare or attract a host: 1) they release "webs" or "trot lines" of mucus containing glochidia that ensnare passing fishes; 2) they bind glochidia into matrices called conglutinates that can resemble fish larvae, worms, insect larvae, or other food items that attract fish, which are subsequently infested with glochidia when they attempt to feed on the conglutinates; or 3) they have modified their mantle into lures resembling fishes, insects, and other food items such that when it is struck by a predatory fish, females snap their shells closed on the protruded marsupia, causing the marsupia to rupture and release clouds of glochidia (Watters et al. 2003). It is reasonable to assume that glochidia of such species would only be indirectly susceptible to entrainment if their host is entrained.

<sup>&</sup>lt;sup>2</sup> Asian carp taxa and groupings were combined into Asian carp (+type) because relatively few Asian carp (Grass Carp [+type], Silver Carp type, or *Hypophthalmichthys* sp.) were identified beyond the Asian carp or Asian carp type categories (EPRI 2020c).

§ 122.21(r)(4) Source Water Baseline Biological Characterization Data

Other Unionida species are broadcast spawners that expel the glochidia along with water and waste products. Hosts either take in suspended glochidia and pass them over their gills, where they attach, or the hosts contact glochidia on the substrate, where they attach to the fins or skin (Watters et al. 2009).

Although unattached glochidia may be susceptible to direct entrainment, it would be challenging or impossible to: 1) effectively and efficiently collect them; 2) identify them to species; and 3) determine whether they are viable or moribund. For example, glochidia range in size from 50 to 450  $\mu$  (Williams et al. 2008) and therefore would require a net with a minimum mesh size of 50  $\mu$ , which would become clogged quickly upon deployment (water will not passively flow through 50  $\mu$ ). Most importantly, once shed by the female, glochidia must acquire a suitable host or die, usually within 24-48 hours (Watters et al. 2009). As such, glochidia collected during entrainment sampling are likely moribund because they would have drifted past hundreds or thousands of potential host fish before being entrained.

Little is known about host use in nature for most mussel species because using morphological characteristics to identify encysted glochidia is difficult. Morphological characteristics have been used with some success when only one or a few mussel species are present in a location; however, in species rich communities, only a fraction of glochidia are identifiable based on morphology and some are not identifiable below the genus or subfamily levels. Molecular identification keys, using restriction fragment length polymorphisms (RFLPs) for species identification of encysted glochidia, have been created in response to the difficulty of identifying glochidia; however, these keys have not been used frequently in nature (Kneeland and Rhymer 2008). Given the above information, all life stages of Unionida mussels would **not** be considered among "*the species and life stages that would be most susceptible to impingement and <i>entrainment*". For example, Unionida mussels were a target organism during the 2005-2007 impingement study at the nearby Cane Run Plant and none were collected during that two-year study (EPRI 2009). Additionally, the KDEP did not request that mussels be a target organism for the 2015-2016 entrainment study at Mill Creek Station.

Crayfish do not appear in entrainment samples due to their reproductive behavior. Females retain and protect eggs attached to their swimmerets. After hatching, the young may stay with the mother until after the second or third molt<sup>3</sup>. Therefore, crayfish are not susceptible to entrainment and have limited susceptibility to impingement. For example, they composed only 0.8% of the 2005-2007 impingement catch at the nearby Cane Run Plant (Table 4-4).

Note: Nomenclature follows Page et al. (2013); % = relative abundance; "--" indicates none collected.

#### 4.3.2 Fish Impingement

Although recent impingement data are not available for the Mill Creek Station, a two-year study was conducted at the nearby Cane Run Plant during 2005-2007 (EPRI 2009; King et al. 2010). That study consisted of 40, 24-hour sampling events during which 22 fish species were impinged (Table 4-4). Over 99% of the impinged organisms were fish; the remainder consisted of unidentified crayfish that accounted for 0.8% of the two-year total. All fish species collected during impingement sampling, except Shovelnose Sturgeon, Blue Sucker, and Blue Catfish were also collected during the in-river surveys near Cane Run (Table 4-2 and Table 4-4), whereas 41 of the 59 species collected during the in-river surveys were not encountered during impingement

#### § 122.21(r)(4) Source Water Baseline Biological Characterization Data

sampling. Impingement collections were dominated by Freshwater Drum and Gizzard Shad that collectively accounted for 91.0% of the fish impinged during the study. The Kentucky Administrative Regulations<sup>4</sup> classifies Freshwater Drum and Gizzard Shad as rough fish. Freshwater Drum was the sixth most abundant species during the in-river surveys near Mill Creek Station, whereas Gizzard Shad was the third most abundant. The relative abundance of Freshwater Drum and Gizzard Shad were much lower in the in-river surveys (1.7% and 5.8%, respectively) than in the impingement fish collections (69.7% and 21.3%, respectively), indicating they are disproportionately susceptible to impingement. Impingement of both Gizzard Shad and Freshwater Drum can be attributed to their overall abundance in the river and pelagic schooling behavior of their young-of-the-year (YOY). Markedly lower numbers of all other impinged species or taxa during the two-year study suggests low susceptibility to impingement. For example, Emerald Shiner, Channel Shiner, and River Shiner were among the four most abundant species in the in-river catch for 2014 through 2018 combined (Table 4-2), but no Channel Shiner or River Shiner and only 10 Emerald Shiner specimens were impinged during the two-year study (Table 4-4). The in-river collections show that cyprinids were much more abundant than indicated by the impingement collections, suggesting that they are not susceptible to impingement. Similarly, Longnose Gar, River Carpsucker, Quillback, Smallmouth Bass, and Sauger had higher relative abundances in the in-river surveys compared to impingement collections. Sport fish<sup>4</sup> taxa contributed only 2.1% to the impingement catch. White Bass and Morone sp. were the most commonly impinged sport fish taxa, composing 72.9% of the sport fish catch.

Commercial harvest data from 1999 through 2007 for the portion of the Ohio River bordering Indiana and Kentucky was dominated by Paddlefish (51.6%) followed by catfish (Channel Catfish, Blue Catfish, and Flathead Catfish) and buffalo that accounted for 24.2% and 23.2% of the total harvest, respectively (Stefanavage 2009). These dominant commercial (rough fish<sup>4</sup>) species accounted for only 2.3% of the fish impinged during the two-year study.

#### 4.3.3 Fish Entrainment

The two-year entrainment study conducted in 2015 and 2016 provided recent data that addressed the taxa and life stages susceptible to entrainment at Mill Creek Station (EPRI 2020c). The sampling periods each year encompassed the vast majority of the time when ichthyoplankton were present in the Ohio River. Thirty-three unique taxa were collected during the Mill Creek Station study with Gizzard Shad, Freshwater Drum, Clupeidae sp. (Gizzard Shad, Threadfin Shad, and/or Skipjack Herring), and Ictiobinae sp. (carpsucker/buffalo species) accounting for 88.6% of the catch in 2015, and Freshwater Drum, Asian carp (+type)<sup>2</sup>, Ictiobinae sp., and Gizzard Shad composing 89.6% of the catch in 2016 (Table 4-3 and Table 4-5). Collectively, these five taxa composed 90.6% to 91.6% of the catch each year. These taxa are considered rough fish by the Kentucky Administrative Regulations<sup>4</sup>. In addition, Asian carp (+type) are

<sup>&</sup>lt;sup>4</sup> At 301 KAR 1:060 (<u>http://www.lrc.state.ky.us/kar/301/001/060.pdf</u>), the Kentucky Administrative Regulations define "sport fish" and "rough fish": **Section 1.** The following fishes are designated sport fishes and may be taken only by angling: Largemouth Bass; rock fish (Striped Bass); Smallmouth Bass; White Bass; Kentucky [Spotted] Bass; Yellow Bass; Coosa Bass; Musky; Rock Bass; Northern Pike; White Crappie; Black Crappie; Chain Pickerel; trout; Walleye; Sauger; Redear Sunfish; and hybrids of any of the above. **Section 2.** All species of fishes, except those listed in Section 1 of this administrative regulation, are hereby designated as rough fish and may be harvested by the methods prescribed by any section of KRS Chapter 150 or 301 KAR Chapter 1.

considered aquatic nuisance species by the Kentucky Department of Fish and Wildlife Resources<sup>5</sup>.

## Table 4-5Number, density, and relative abundance of common and abundant taxacollected in entrainment samples at Mill Creek Station in 2015 and 2016 (EPRI 2020c)

<sup>(a)</sup> Asian carp taxa and groupings were combined into Asian carp (+type) because relatively few Asian carp (Grass Carp [+type], Silver Carp type, or *Hypophthalmichthys* sp.) were identified beyond the Asian carp or Asian carp type categories.

Note: % = relative abundance and Density =  $\#/10m^3$ .

In 2015, specimen density for all taxa combined was 39.1 specimens per ten cubic meters (#/10m<sup>3</sup>) (Table 4-5). Gizzard Shad dominated (50.6%) the 2015 catch with a density of 19.8/10m<sup>3</sup>, followed by Freshwater Drum (14.3%; 5.6/10m<sup>3</sup>), Clupeidae sp. (12.3%; 4.8/10m<sup>3</sup>), and Ictiobinae sp. (11.4%; 4.5/10m<sup>3</sup>). *Dorosoma* sp. (Gizzard Shad and/or Threadfin Shad), Asian carp (+type), *Pimephales* type<sup>6</sup>, and *Morone* sp. (not Striped Bass)<sup>7</sup> were the only other taxa that contributed greater than 1.0% to the 2015 catch (Table 4-3; EPRI 2020c). Collectively, *Dorosoma* sp., *Pimephales* type, and *Morone* sp. (not Striped Bass) composed 64.7% of the "Other Identified Taxa" in 2015 (Table 4-3 and Table 4-5).

Specimen density for all taxa combined in 2016 was  $53.4/10m^3$  (Table 4-5). Freshwater Drum dominated (42.3%) the 2016 catch with a density of 22.6/10m<sup>3</sup>, followed by Asian carp (+type) (20.1%; 10.7/10m<sup>3</sup>), Ictiobinae sp. (16.6%; 8.9/10m<sup>3</sup>), and Gizzard Shad (10.7%; 5.7/10m<sup>3</sup>).

<sup>&</sup>lt;sup>5</sup> <u>https://fw.ky.gov/Fish/Pages/Asian-Carp-Information.aspx#ACI04</u>

<sup>&</sup>lt;sup>6</sup> Larvae in this grouping were characterized by flattened, elliptical eyes, sometimes flattened heads, and scattered ventral chromatophores. Myomere counts for this group varied but most often had 22-24 preanal myomeres. In the Ohio River, this grouping contains members of *Pimephales*, the old *Hybopsis* complex (*Macrhybopsis* sp., *Erimystax* sp., and *Hybopsis* sp.), Suckermouth Minnow, and some shiner species (possibly River Shiner and Spotfin Shiner) (EPRI 2020c).

<sup>&</sup>lt;sup>7</sup> This category distinguished the small larvae of White Perch or White Bass from Striped Bass, the latter being much larger in the egg and yolk-sac larval stages. Typically, *Morone* larvae from about 4 to 6 mm in total length, without visible yolk or oil, were placed in this grouping (EPRI 2020c).

§ 122.21(r)(4) Source Water Baseline Biological Characterization Data

*Pimephales* type, Emerald Shiner type<sup>8</sup>, and Clupeidae sp. were the only other taxa that contributed greater than 1.0% to the 2016 catch (Table 4-3; EPRI 2020c). Collectively, *Pimephales* type and Emerald Shiner type composed 66.6% of the "Other Identified Taxa" in 2016 (Table 4-3 and Table 4-5).

The dominant life stage in 2015 was post yolk-sac larvae (72.2%), followed by yolk-sac larvae (14.6%) and viable eggs (6.8%) (Table 4-6). Gizzard Shad post yolk-sac larvae alone composed 50.5% of the 2015 catch, and Clupeidae sp. post yolk-sac larvae contributed an additional 7.8% (Table 4-7). Freshwater Drum ichthyoplankton were co-dominated by viable eggs and post yolk-sac larvae, which collectively composed 12.0% of the 2015 catch. The most abundant life stage for Ictiobinae sp. was yolk-sac larvae, and they accounted for 9.9% of the 2015 catch. Combined, these five taxa-life stages composed 80.3% of the entrainment catch at Mill Creek Station in 2015.

In contrast to 2015, the dominant life stage in 2016 was viable eggs (50.4%). Freshwater Drum and Asian carp (+type) accounted for 68.5% and 31.0% of the 2016 viable egg catch, respectively (Table 4-6 and Table 4-7). Yolk-sac larvae was the second most abundant life stage in 2016, composing 26.8% of the catch and 57.1% of them were Ictiobinae sp. Slightly less than 20% of the 2016 catch was made up of post yolk-sac larvae compared to slightly over 50% in 2015 (Table 4-6). As in 2015, post yolk-sac larvae was again the dominant life stage for Gizzard Shad in 2016; however, their relative abundance was much lower in 2016 (10.4%) than in 2015 (50.5%) (Table 4-7). Collectively, these four taxa-life stages composed 75.8% of the entrainment catch at Mill Creek Station in 2016.

<sup>&</sup>lt;sup>8</sup> Most of the cyprinid larvae in this grouping had high preanal myomere counts (usually > 25), and streamlined, slender bodies. Pigmentation consisted of a mid-ventral row of melanophores on the yolk sac or gut, occipital and mid-lateral pigment that increased with total length, and a developing double row of dorsal pigment. Most of the representatives had round eyes, but a few specimens with all the above characters had slightly flattened eyes. Based on the taxonomic literature, these characteristics are typical of Emerald Shiner. However, since descriptive or developmental taxonomic information are lacking for most Cyprinidae species, this grouping probably represents more than one species and may include Channel Shiner, Mimic Shiner, Ghost Shiner, and Silver Shiner. For many of these "type" eggs, the chorions were collapsed. These eggs appeared to be 3 to 4 mm in diameter, with a clear perivitelline space and small embryos, which are characteristic of Emerald Shiner (EPRI 2020c).

### Table 4-7 (Continued)

<sup>(a)</sup> Yolk-sac and/or post yolk-sac larvae that could not be differentiated due to damage or were in a transitional phase between yolk-sac and post yolk-sac (T1) (EPRI 2020c).

Note: # = number collected; % = relative abundance; Density = #/10m<sup>3</sup>.

Based on information summarized above, the native taxa most susceptible to entrainment and/or impingement at or near Mill Creek Station are Gizzard Shad, Freshwater Drum, and Ictiobinae sp. (assumed Quillback, River Carpsucker, and Smallmouth Buffalo). Freshwater Drum and Gizzard Shad were the two most abundant species collected in a recent impingement study at the nearby Cane Run Plant (Table 4-4), and they also ranked first and second, respectively, during the two-year entrainment study at Mill Creek Station (Table 4-3 and Table 4-5). Although Ictiobinae species collectively composed only 1.2% of the fish impinged (Table 4-4), Ictiobinae sp. was the third most abundant taxon during the Mill Creek Station entrainment study and accounted for 14.5% of the two-year entrainment catch (Table 4-3). Ictiobinae species identified during both the in-river and impingement studies were River Carpsucker, Quillback, Smallmouth Buffalo, and Bigmouth Buffalo; however, Bigmouth Buffalo was uncommon during both the inriver and impingement studies (Table 4-2 and Table 4-4). Therefore, due to their higher relative abundance in the in-river catch, Quillback, River Carpsucker, and Smallmouth Buffalo will be discussed for Ictiobinae sp. It should be noted that Stefanavage (2009) listed buffalo species as an important commercial fish group in the Kentucky/Indiana portion of the Ohio River. Freshwater Drum, Gizzard Shad, Quillback, River Carpsucker, and Smallmouth Buffalo are rough fish as defined by the Kentucky Administrative Regulations<sup>4</sup>.

Sport fish species<sup>4</sup> were uncommon in the entrainment and impingement collections with *Morone* taxa being the most abundant sport fish taxa group collected during both studies (Table 4-3 and Table 4-4). *Morone* taxa (White Bass and *Morone* sp.) composed only 1.5% of the fish impinged during the two-year study at the nearby Cane Run Plant, and all *Morone* taxa collectively accounted for only 1.0% of the two-year entrainment catch at Mill Creek Station. Since White Bass was the most abundant or only identifiable *Morone* species during the in-river, impingement, and entrainment studies (Table 4-2, Table 4-3, and Table 4-4), it represents the White Bass (+*Morone* sp.) sport fish group. White Bass is classified as a sport fish species by the Kentucky Administrative Regulations<sup>4</sup> and therefore are subject to statewide and regional

§ 122.21(r)(4) Source Water Baseline Biological Characterization Data

recreational fishing regulations of the Kentucky Department of Fish and Wildlife Resources (KDFWR 2020).

### 4.4 Primary Period of Reproduction, Larval Recruitment, and Period of Peak Abundance for Relevant Taxa

*(iv) Identification and evaluation of the primary period of reproduction, larval recruitment, and period of peak abundance for relevant taxa.* 

In the Ohio River, there is a marked seasonality to ichthyoplankton in the water column (ESE 1992). Most species have a limited spawning season, outside of which individuals are not susceptible to entrainment due to growth beyond the size that can pass through traveling screens. Some taxa have a defined single spawning season that is temporally compressed and measured in days or weeks, while others may spawn over a longer season, measured in months. Ichthyoplankton are effectively absent in the winter months. Ichthyoplankton densities begin to increase mid-spring, peak in late spring or early summer, and then decline in July and August. This pattern occurred in 2015 and 2016 during the Mill Creek Station entrainment study (Figure 4-1).

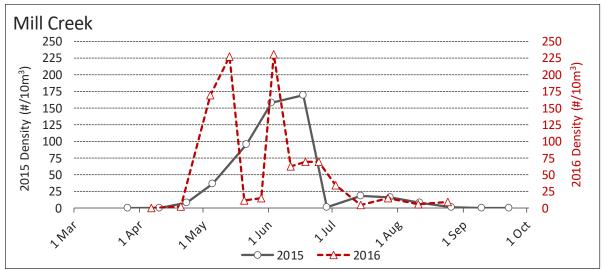

Figure 4-1 Ichthyoplankton density by sampling event at Mill Creek Station, 2015 and 2016

The temporal pattern in 2015 consisted of increasing densities from latter April through mid-June, a sharp decrease in densities during late June, followed by low and variable densities through August; only a few ichthyoplankton were collected in September (Figure 4-1). The maximum densities in 2015 were observed in early June (157.8/10m<sup>3</sup>) and mid-June (169.3/10m<sup>3</sup>), when Gizzard Shad composed 62.8% and 70.0% of the catches, respectively (EPRI 2020c). Clupeidae sp., most likely Gizzard Shad, accounted for an additional 21.4% and 9.7% of those peak densities, respectively. The two peak-density periods yielded 64.4% of the 2015 ichthyoplankton catch.

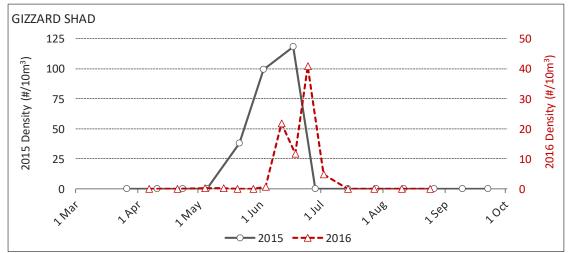

In 2016, initial density peaks  $(168.7/10m^3 \text{ to } 227.0/10m^3)$  were observed during the first half of May with markedly lower densities in the latter half of May. Following that low-density period, another peak  $(231.0/10m^3)$  was observed in early June. Elevated densities  $(61.8/10m^3 \text{ to } 227.0/10m^3)$ 

69.2/10m<sup>3</sup>) were also observed through late June, after which densities decreased and remained low through August (Figure 4-1). The three peak-density periods produced 61.1% of the ichthyoplankton collected in 2016. Ictiobinae sp. (primarily yolk-sac larvae) composed 78.0% of the early May peak, whereas Asian carp (+type) eggs accounted for 93.8% of the mid-May peak. The early June peak was dominated (92.1%) by Freshwater Drum (primarily eggs). Freshwater Drum and Gizzard Shad collectively composed between 69% and 87% of the elevated densities through the remainder of June (EPRI 2020c).

The primary period of reproduction near Mill Creek Station begins latter April and extends through July, whereas the period of peak abundance occurs in May and June (Figure 4-1). Temporal characteristics of four taxa most susceptible to entrainment in upper Cannelton Pool, Gizzard Shad, Clupeidae sp., Ictiobinae sp., and Freshwater Drum (Table 4-5) are presented below. Asian carp (+type) are not discussed because this grouping represents aquatic nuisance species<sup>5</sup>; taxa that are not "relevant". Although *Morone* taxa were uncommon during the two-year entrainment catch (Table 4-3 and Table 4-7), the White Bass (+*Morone* sp.) taxa group is discussed below because it was the most abundant sport fish taxa group entrained (1.0% of the two-year entrainment catch) and likely represents primarily White Bass.

### 4.4.1 Gizzard Shad

In 2015, Gizzard Shad was collected from latter May through late June and in mid-August (Figure 4-2), though only three post yolk-sac larvae and 10 juveniles were collected after mid-June (EPRI 2020c). No Gizzard Shad or other Clupeidae specimens were collected during July 2015, possibly the result of historic high river flow conditions during much of July that may have interrupted clupeid spawning (Figure 4-2; USACE 2015; EPRI 2020c). 2015 peak Gizzard Shad densities occurred from latter May (38.1/10m3) through mid-June (118.5/10m3), whereas densities were low during the other two sampling events in which they were collected in 2015 (Figure 4-2). In fact, 99.9% of the 2015 Gizzard Shad catch occurred in those three peak-density sampling events, and 60.4% of the ichthyoplankton catch during that period was made up of Gizzard Shad (EPRI 2020c).

Note: The scale of the y-axis is different for each year.

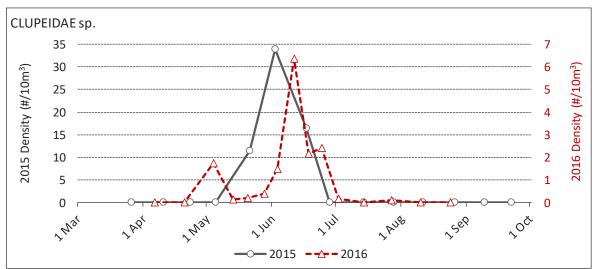

### Figure 4-2 Gizzard Shad density by sampling event at Mill Creek Station, 2015 and 2016

§ 122.21(r)(4) Source Water Baseline Biological Characterization Data

In 2016, Gizzard Shad larvae were collected from early May through the first half of August (Figure 4-2). Peak densities (11.7/10m<sup>3</sup> to 40.9/10m<sup>3</sup>) occurred during the latter three June sampling events, particularly late June (Figure 4-2; EPRI 2020c). Those three peak-density periods produced 92.5% of the 2016 Gizzard Shad catch (EPRI 2020c). Gizzard Shad were collected more frequently in 2016 (12 sampling events) than in 2015 (five sampling events). Based on the 2015 and 2016 data, the primary period of reproduction for Gizzard Shad near Mill Creek Station is from mid-May through early July, whereas the period of peak abundance occurs in June (Figure 4-2).

### 4.4.2 Clupeidae sp.

Specimens identified as Clupeidae sp. were often in a physical condition that did not allow identification to lower taxonomic levels nor differentiation between post yolk-sac and yolk-sac larval life stages, many were therefore categorized as "larvae<sup>9</sup>" (EPRI 2020c). It is likely that many Clupeidae sp. specimens were Gizzard Shad because this taxa group shared a similar temporal distribution to Gizzard Shad (Figure 4-3 and Figure 4-2).

Note: The scale of the y-axis is different for each year.

### Figure 4-3 Clupeidae sp. density by sampling event at Mill Creek Station, 2015 and 2016

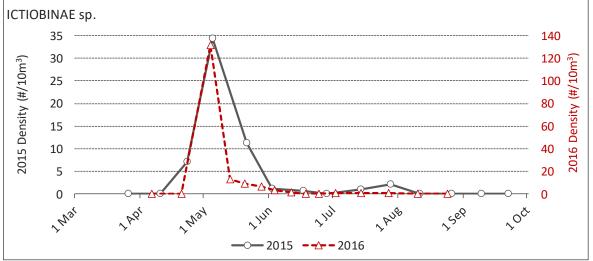

As per Gizzard Shad, 99.9% of the 2015 Clupeidae sp. catch occurred from latter May through mid-June, with densities ranging from 11.4/10m<sup>3</sup> (latter May) to 33.9/10m<sup>3</sup> (early June) (Figure 4-3). Only three post yolk-sac larvae were collected outside of that 2015 period, in mid-August (EPRI 2020c). Similarly, 99.9% of the 2016 Clupeidae sp. catch occurred in June. However, the maximum density in 2016 (6.4/10m<sup>3</sup>) was noticeably lower than that observed in 2015 (33.9/10m<sup>3</sup>) (Figure 4-3; EPRI 2020c). As observed for Gizzard Shad, Clupeidae sp. were collected more frequently in 2016 (10 sampling events) than in 2015 (four sampling events). Based on these data, the primary period of reproduction for Clupeidae sp. near Mill Creek

<sup>&</sup>lt;sup>9</sup> Yolk-sac and/or post yolk-sac larvae that could not be differentiated due to damage or were in a transitional phase between yolk-sac and post yolk-sac (T1).

Station is from early May through June, whereas the period of peak abundance occurs from latter May through June (Figure 4-3).

### 4.4.3 Ictiobinae sp.

Ictiobinae sp., primarily yolk-sac larvae, were collected from latter April through the first half of August in 2015, but they were most abundant (7.1/10m<sup>3</sup> to 34.4/10m<sup>3</sup>) from latter April through May when 92.1% of all Ictiobinae sp. were caught (Figure 4-4; EPRI 2020c). In addition, this taxon composed 89.0% to 96.3% of the ichthyoplankton catches in latter April and early May of 2015. Ictiobinae sp. densities in 2016 exhibited a temporal pattern similar to 2015 (Figure 4-4). Specimens, primarily yolk-sac larvae, were again collected over a broad season (latter April through late July) during 2016, and the peak density (131.6/10m<sup>3</sup>) occurred in early May. That peak-density sampling event produced 79.0% of the 2016 Ictiobinae sp. catch, and this taxon composed 78.0% the ichthyoplankton catch in early May (EPRI 2020c). The 2015-2016 temporal density patterns indicate that the primary period of reproduction for Ictiobinae sp. near Mill Creek Station occurs from latter April through early June with the period of peak abundance is abbreviated and occurs in early May (Figure 4-4; EPRI 2020c).

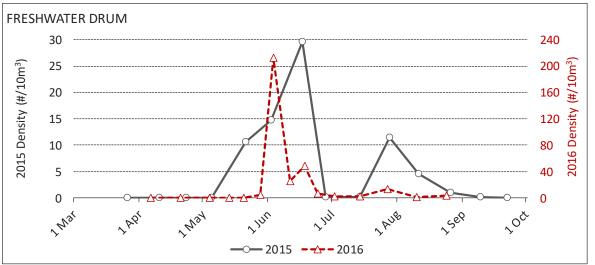

Note: The scale of the y-axis is different for each year.

### 4.4.4 Freshwater Drum

Freshwater Drum was collected from May through September in 2015, but it was most abundant (10.6/10m<sup>3</sup> to 29.7/10m<sup>3</sup>) during two periods: latter May through mid-June and late July through mid-August (Figure 4-5; EPRI 2020c). The latter May through mid-June period produced 76.0% of its 2015 catch, but Freshwater Drum composed only 9.4% to 17.5% of those ichthyoplankton catches. Conversely, the second period contributed only 22.2% to the 2015 Freshwater Drum catch, but it composed 57.5% to 71.5% of the ichthyoplankton catches during that period (EPRI 2020c). Few specimens were collected from late June to mid-July (Figure 4-5), which was likely the result of Freshwater Drum spawning being interrupted by the historic high river flow conditions that occurred from late June through mid-July (USACE 2015; EPRI 2020c).

Note: The scale of the y-axis is different for each year.

#### Figure 4-5 Freshwater Drum density by sampling event at Mill Creek Station, 2015 and 2016

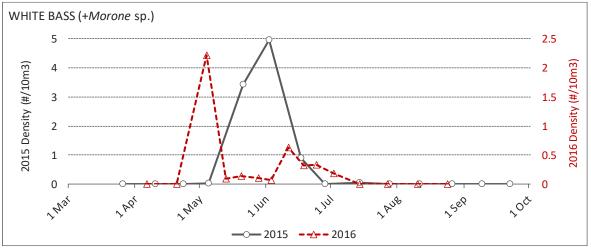

As in 2015, Freshwater drum was collected from May through the end of the sampling season in 2016 (Figure 4-5). The primary peak density in 2016 (212.8/10m<sup>3</sup>) was about seven times higher than the 2015 peak (29.7/10m<sup>3</sup>), and it occurred about two weeks earlier than the 2015 peak. The 2016 peak produced 66.4% of the 2016 Freshwater Drum catch, and this species composed 92.1% of the ichthyoplankton catch during that peak (Figure 4-5; EPRI 2020c). The 2015-2016 temporal density patterns indicate that the primary period of reproduction for Freshwater Drum near Mill Creek Station occurs from latter May through July, with less intensive reproduction through August. The period of peak abundance for Freshwater Drum occurs in June (Figure 4-5; EPRI 2020c).

#### 4.4.5 White Bass (+Morone sp.)

White Bass (+*Morone* sp.<sup>10</sup>), primarily post yolk-sac larvae, were collected almost exclusively from early May through mid-June in 2015, with only two larvae collected outside that period in mid-July (Figure 4-6; EPRI 2020c). Their peak 2015 densities occurred in latter May (3.4/10m<sup>3</sup>) and early June (5.0/10m<sup>3</sup>), whereas densities were low ( $\leq 0.9/10m^3$ ) during the other three sampling events in which they were collected that year. Those two peak events produced 90.1% of all White Bass (+*Morone* sp.) specimens collected in 2015 (EPRI 2020c). In 2016, White Bass (+*Morone* sp.) were collected over a period that was similar to 2015, early May through early July (Figure 4-6; EPRI 2020c). The yolk-sac larval stage was the most abundant life stage collected in 2016 (Table 4-7). Two density peaks were also observed in 2016. However, the primary peak (2.2/10m<sup>3</sup>) occurred in early May, three to four weeks earlier than the 2015 peaks, and the second (minor) peak in 2016 (0.6/10m<sup>3</sup>) occurred near mid-June, which was about a week later than the primary peak in 2015 (Figure 4-6; EPRI 2020c). The two peak events in 2016 produced 66.3% of all White Bass (+*Morone* sp.) specimens collected that year. White Bass (+*Morone* sp.) densities were low ( $\leq 0.3/10m^3$ ) during the other seven sampling events in which they were collected in 2016 (EPRI 2020c). The primary period of reproduction for White Bass (+*Morone* sp.) specimens collected that year. White Bass (+*Morone* sp.) densities were low ( $\leq 0.3/10m^3$ ) during the other seven sampling events in which they were collected in 2016 (EPRI 2020c). The primary period of reproduction for White Bass

<sup>&</sup>lt;sup>10</sup> Excludes Striped Bass type (Table 4-3 and Table 4-7).

(+*Morone* sp.) near Mill Creek Station begins in early May and extends through June, whereas the period of peak abundance extends from early May to mid-June (Figure 4-6).

Note: The scale of the y-axis is different for each year.

# Figure 4-6 White Bass (+*Morone* sp.) density by sampling event at Mill Creek Station, 2015 and 2016

### 4.5 Seasonal and Daily Activities of Relevant Taxa

(v) Data representative of the seasonal and daily activities (e.g., feeding and water column migration) of biological organisms in the vicinity of the cooling water intake structure.

The studies conducted in upper Cannelton Pool during 2005-2006 and 2015-2016 determined that Gizzard Shad, Freshwater Drum, and Ictiobinae sp. (assumed Quillback, River Carpsucker, and Smallmouth Buffalo) were the native taxa most susceptible to impingement and/or entrainment. Sport fish species<sup>4</sup> were uncommon in the entrainment and impingement collections with *Morone* taxa being the most abundant sport fish taxa group collected during both studies.

## 4.5.1 Gizzard Shad

Gizzard Shad is classified as a rough fish by the Kentucky Administrative Regulations<sup>4</sup>. It is a pelagic species, usually living in schools at or the near surface, and inhabits large rivers, lakes, reservoirs, swamps, bays, sloughs, and similar quieter open waters (Becker 1983). Although Gizzard Shad is not considered a migratory species, spring and fall runs as well as winter migrations have been noted (Wallus et al. 1990). Spawning occurs from April through June in the Midwest (Smith 2002), which is consistent with the primary collection periods of its early life stages in upper Cannelton Pool (Figure 4-2 and Figure 4-3). They usually spawn at night in shallow shoreline areas over a variety of substrates (Wallus et al. 1990). Gizzard Shad egg production is highest in age-2 females, averaging about 380,000 per individual. Fertilized eggs are demersal and adhesive, and therefore adhere to submerged vegetation and various benthic substrate (Becker 1983), which makes them less susceptible to entrainment. Conversely, their pelagic larval stages are highly susceptible to entrainment (Table 4-3 and Table 4-7; EPRI 2011). Yolk-sac larvae can move vertically in the water column soon after hatching and after three or four days, they begin active horizontal movements. However, larvae are weak swimmers for at

least several weeks after hatching (Becker 1983). Yolk-sac and post yolk-sac larvae appear to feed primarily on protozoans, but transition to zooplankton as juveniles and greater percentages of phytoplankton as they grow older (Becker 1983). Within its range, Gizzard Shad is usually among the most abundant species entrained and tends to dominate impingement collections (EPRI 2011; Table 4-3 and Table 4-4). Its prevalence in impingement studies is largely associated with winter-die offs (EPRI 2008a and 2008b) and the fact that they are considered a fragile species, as classified by The Rule at 40 CFR 125.92(m).

### 4.5.2 Freshwater Drum

Freshwater Drum is classified as a rough fish by the Kentucky Administrative Regulations<sup>4</sup>. It is a bottom dweller and often found over mixed substrates such as sand, silt, and mud, and prefers moderately deep water. Freshwater Drum is considered a mobile species and tends to travel long distances downstream and much shorter distances upstream. In large rivers, it may travel distances up to approximately 100 miles (Wallus and Simon 2006). Spawning occurs from May through mid-summer (Mettee et al. 1996; Figure 4-5). Freshwater Drum spawns pelagically in main channel areas of large rivers and reservoirs, usually far from shore, in schools of a few to several hundred individuals (Wallus and Simon 2006; Becker 1983). Fecundity of females varies greatly from about 27,000 to 850,000 eggs per individual, but most females tend to produce between 200,000 and 400,000 eggs (Wallus and Simon 2006). Fertilized, water-hardened eggs are buoyant or semibuoyant; therefore, eggs and newly hatched yolk-sac larvae float at or near the surface and are scattered by currents and wind (Wallus and Simon 2006; Becker 1983), which makes these early life stages of Freshwater Drum highly susceptible to river drift and entrainment (Table 4-3 and Table 4-7; EPRI 2011). At approximately 25 mm in length, Freshwater Drum juveniles are found on or near the bottom where they remain for most of their lives. Feeding often begins before the yolk-sac is completely absorbed; the early diet consists primarily of copepods and cladocerans, though early piscivory on clupeids and cyprinids has been observed (Wallus and Simon 2006; Becker 1983). Larger Freshwater Drum feed primarily on aquatic insects, along with snails, crayfish, and fish (Mettee et al. 1996; Becker 1983). Freshwater Drum is also susceptible to impingement. For example, EPRI (2011) summarized the results of 2004 Phase II EPA Rule § 316(b) impingement data for large rivers such as the Ohio River, and Freshwater Drum was the third most frequently impinged species. During the Cane Run Plant impingement study, it was the most abundant species (Table 4-4).

### 4.5.3 Ictiobinae sp.

Ictiobinae sp. were the third most abundant taxon collected during the 2015-2016 entrainment study at Mill Creek Station (Table 4-3 and Table 4-5). Ictiobinae species identified during both the in-river and impingement studies were River Carpsucker, Quillback, Smallmouth Buffalo, and Bigmouth Buffalo; however, Bigmouth Buffalo was uncommon during both the in-river and impingement studies (Table 4-2 and Table 4-4). Therefore, due to their higher relative abundance in the in-river catch, Quillback, River Carpsucker, and Smallmouth Buffalo will be discussed for Ictiobinae sp. All three species are classified as a rough fish by the Kentucky Administrative Regulations<sup>4</sup>, and buffalo were noted as an important commercial fish on the Kentucky/Indiana portion of the Ohio River (Stefanavage 2009). Quillback, River Carpsucker, and Smallmouth Buffalo are bottom-dwelling species found in pools, oxbow lakes, and deeper water of large rivers (Smith 2002; Becker 1983). All three species can tolerate turbid and silty waters (Smith

2002; Kay et al. 1994). Peak spawning occurs in the spring, typically starting in April or May, but may continue into September in its southern range (Smith 2002; Kay et al. 1994; Becker 1983; Figure 4-4). These species are broadcast spawners with adhesive eggs that attach to the substrate, woody debris, and vegetation (Smith 2002; Kay et al. 1994). Fecundity has been estimated to be 18,200 eggs per age-2 female to over 500,000 per age-15 female for Smallmouth Buffalo, 15,000 to 64,000 per female for Quillback, and 18,000 to 196,000 per female for River Carpsucker (Kay et al. 1994; Becker 1983). No parental care is provided to the early life stages. Immediately after hatching, planktonic yolk-sac larvae repeatedly swim to the surface and drift back to the bottom of the water column (Kay et al. 1994). As such, these species are susceptible to entrainment during the yolk-sac larval life stage. For example, over 90% of collected Ictiobinae sp. specimens were volk-sac larvae during the two-year entrainment study at Mill Creek Station (Table 4-7). Young Smallmouth Buffalo feed on small planktonic invertebrates such as copepods and cladocerans, but algae and duckweed may also be consumed. Smallmouth Buffalo become more opportunistic as they grow, feeding on algae and associated invertebrates (Becker 1983). Quillback and River Carpsucker are bottom feeders that typically consume algae, insects, and small invertebrates from bottom substrate (Becker 1983). Ictiobinae taxa composed only 1.3% of the fish collected during electrofishing/seining surveys near Mill Creek Station from 2014 through 2018 (Table 4-2). Based on this community composition, Ictiobinae species appear to be moderately susceptible to impingement, composing 1.3% of all fish impinged during the 2005-2007 study (Table 4-4), and slightly more susceptible to entrainment as they composed 14.5% of all specimens entrained during the 2015-2016 study (Table 4-3 and Table 4-5).

### 4.5.4 White Bass (+*Morone* sp.)

White Bass (+*Morone* sp.<sup>11</sup>) composed only 1.5% of the impinged fish and only 1.0% of the entrained ichthyoplankton; however, they were the most abundant sport fish taxa group collected during these two studies (Table 4-3 and Table 4-4). Since White Bass was the most abundant or only identifiable Morone species during the in-river, impingement, and entrainment studies (Table 4-2, Table 4-3, and Table 4-4), it represents the White Bass (+Morone sp.) sport fish group. White Bass is classified as a sport fish species by the Kentucky Administrative Regulations<sup>4</sup> and therefore are subject to statewide and regional recreational fishing regulations of the Kentucky Department of Fish and Wildlife Resources (KDFWR 2020). White Bass is a schooling pelagic species that prefers open water of lakes, reservoirs, and large rivers. This species is capable of large movements (up to 1 mile per day) and in one study of post-spawning adults, the average distance traveled prior to recapture was 21 miles (Becker 1983). Spawning primarily occurs from April through June (e.g., Figure 4-6) and is temperature dependent with peak spawning occurring at 16.9-22.6°C. Spawning takes place mid-water with spawning groups rising to the surface where eggs are scattered. Eggs are adhesive and attach to vegetation, gravel, and rocks. The average female produces 565,000 eggs per season, but larger individuals may produce over 900,000 (Becker 1983; Wallus and Simon 2006). Young White Bass feed on planktonic crustaceans and insect larvae such as cladocerans, chironomid larvae, and copepods. As they grow, White Bass incorporate fish as a food item, though small invertebrates still

<sup>&</sup>lt;sup>11</sup> Excludes Striped Bass type collected during the entrainment study (Table 4-3 and Table 4-7). However, the entrained and impinged *Morone* sp. may include Striped Bass and/or hybrid striper in addition to White Bass (Table 4-2).

compose an important portion of their diet (Becker 1983). *Morone* taxa composed 0.5% of the fish collected during in-river surveys near Mill Creek Station (Table 4-2), but slightly higher percentages (1.0% to 1.5%) of all fish specimens impinged and entrained (Table 4-3 and Table 4-4). Based on those relative abundance data, White Bass (+*Morone* sp.) appear to be moderately susceptible to impingement and entrainment in upper Cannelton Pool.

### 4.6 Threatened, Endangered, and Other Protected Species that Might be Susceptible to Impingement and Entrainment

(vi) Identification of all threatened, endangered, and other protected species that might be susceptible to impingement and entrainment at your cooling water intake structures.

Federally-listed and state-listed threatened and endangered (T&E) species were identified that are known to or believed to occur in Jefferson County, Kentucky, where Mill Creek Station is located and Harrison County, Indiana, which is across the river from the facility. The following addresses these federally-listed T&E species, whereas discussion of state-listed T&E is limited to aquatic species that potentially have a nexus with the operation of the Mill Creek Station CWIS.

Although the Kentucky State Nature Preserves Commission (KSNPC 2019)<sup>12</sup> lists taxa as T&E, the definition of endangered species in the Kentucky Administrative Regulations (Title 301, Chapter 3, Part 061, Section 2)<sup>13</sup> states:

Any species or subspecies designated as endangered by the Secretary of the Interior on a current United States List of Endangered and Threatened Wildlife as recorded in 50 Code of Federal Regulations, Part 17, is considered an endangered species in Kentucky under the provisions of KRS 150.183. Those species described as "threatened" on the above federal list are not included under KRS 150.183 or this administrative regulation.

This definition does not include a state list of T&E species; nonetheless, the KSNPC T&E designations are presented here with the federal- and Indiana state-level listings.

### 4.6.1 Federally-listed Species

Federally-listed species for Jefferson County, Kentucky, and Harrison County, Indiana, were gathered from the USFWS Environmental Conservation Online System (ECOS)<sup>14</sup> and Information for Planning and Consultation (IPaC)<sup>15</sup> websites (USFWS 2020a and 2020b). The IPaC Project area encompasses 350 acres and includes the Ohio River near Mill Creek Station and surrounding terrestrial habitat on both sides of the river (Figure 4-7):

<sup>&</sup>lt;sup>12</sup> <u>http://app.fw.ky.gov/speciesinfo/speciesinfo.asp</u>

<sup>&</sup>lt;sup>13</sup> https://apps.legislature.ky.gov/law/kar/301/003/061.pdf

<sup>&</sup>lt;sup>14</sup> <u>https://ecos.fws.gov/ecp/</u>

<sup>&</sup>lt;sup>15</sup> https://ecos.fws.gov/ipac/

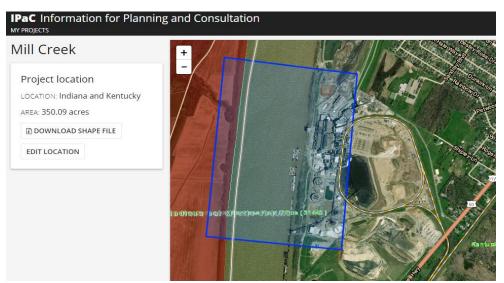

Figure 4-7 Project area designated for investigation in the IPaC website (https://ecos.fws.gov/ipac/; USFWS 2020b).

The USFWS lists 18 species as endangered and three as threatened under the Endangered Species Act (Table 4-8; USFWS 2020a and 2020b). Eleven freshwater mussel species are listed as endangered and one as threatened in Jefferson County, Kentucky, and/or Harrison County, Indiana, and two additional endangered mussels were identified through the IPaC website search. None of these 14 federally-listed mussel species were collected during recent mussel surveys conducted upstream and downstream of the facility (ESI 2012; LEC 2017), nor during historical surveys conducted upstream of the facility from ORM 610.3 to ORM 623.5 (Table 4-1). The other federally-listed species consist of the endangered Running Buffalo Clover (*Trifolium stoloniferum*), Short's Goldenrod (*Solidago shortii*), Least Tern (*Sterna antillarum*), Indiana Bat (*Myotis sodalis*), Gray Bat (*Myotis grisescens*), and the threatened Kentucky Glade Cress (*Leavenworthia exigua laciniate*) and Northern Long-eared Bat (*Myotis septentrionalis*) (Table 4-8). There is no nexus between these seven species and operation of the Mill Creek Station CWIS. Federally-listed fish species are not known to occur in the action area based on the county listings (USFWS 2020a) and the IPaC website search (USFWS 2020b).

There is designated critical habitat for only the Indiana Bat, which is located across the river from the Mill Creek Station CWIS (USFWS 2020b). The Indiana Bat critical habitat is limited to terrestrial environments and is not affected by the operation of the Mill Creek Station CWIS.

As discussed in Section 4.3.1, mussels are not among organisms that are most susceptible to impingement and entrainment. However, impingement of host fish likely represents the highest risk among all potential CWIS impact pathways for mussels (EPRI 2017b). Most common host species for listed mussels are bottom-dwelling species, as they provide the greatest opportunity for interaction with mussels and provide the greatest success rates for glochidia attachment (EPRI 2017b). Known host fish species for the 14 federally-listed mussel species are given in Table 4-9; this is an incomplete list because all mussel species have not been tested with all fish species presented, and hosts are not known for three of the mussel species.

# Table 4-8 Endangered and Threatened Species listed by the USFWS known to or believedto occur in Jefferson County, KY, and Harrison County, IN, and species listed in JeffersonCounty by the KDFWR and in Harrison County by the IDNR

<sup>(a)</sup> The Jefferson County, KY, list of T&E species is compiled by KDFWR (2019) from the state-wide list of T&E species generated by the KSNPC (2019).

<sup>(b)</sup> NL denotes that the federally-listed species was not present on that USFWS list.

<sup>(c)</sup> Only the federally-listed bird and plant species are presented.

Source: USFWS (2020a); USFWS (2020b); KDFWR (2019); IDNR (2019, 2020); mussel scientific nomenclature follows Williams et al. (2017).

# Table 4-9 Known host fish species of Federally-listed mussel species known to or believed<br/>to occur in Jefferson County, Kentucky, and Harrison County, Indiana

Mussel Species	Host Species (from EPRI [2017b] and INHS [2014] unless otherwise noted)
Fanshell (Cyprogenia stegaria)	Greenside Darter ( <i>Etheostoma blennioides</i> ), Mottled Sculpin ( <i>Cottus bairdii</i> ), Snubnose Darter ( <i>Etheostoma simoterum</i> ), Banded Darter ( <i>Etheostoma zonale</i> ), Tangerine Darter ( <i>Percina aurantiaca</i> ), Blotchside Logperch ( <i>Percina burtoni</i> ), Logperch ( <i>Percina caprodes</i> ), and Roanoke Logperch ( <i>Percina rex</i> )
Catspaw (Epioblasma obliquata)	<b>Rock Bass</b> ( <i>Ambloplites rupestris</i> ), Mottled Sculpin, Stonecat ( <i>Noturus flavus</i> ), Blackside Darter ( <i>Percina maculata</i> ), and <b>Logperch</b> (USFWS 2015)
Northern Riffleshell (Epioblasma rangiana)	Mottled Sculpin, Rainbow Darter ( <i>Etheostoma caeruleum</i> ), Bluebreast Darter ( <i>Etheostoma camurum</i> ), Iowa Darter ( <i>Etheostoma exile</i> ), Johnny Darter ( <i>Etheostoma nigrum</i> ), Banded Darter ( <i>Etheostoma zonale</i> ), <b>Logperch</b> , Blackside Darter, and Brown Trout ( <i>Salmo trutta</i> )
Snuffbox (Epioblasma triquetra)	Mottled Sculpin, Banded Sculpin ( <i>Cottus carolinae</i> ), Blackspotted Topminnow ( <i>Fundulus olivaceus</i> ), Round Goby ( <i>Neogobius melanostomus</i> ), <b>Logperch</b> , and Blackside Darter
Pink Mucket (Lampsilis abrupta)	Walleye (Sander vitreus), <u>Sauger (Sander canadensis)</u> , <u>Freshwater Drum</u> (Aplodinotus grunniens), <u>Smallmouth Bass (Micropterus dolomieu)</u> , Spotted Bass (Micropterus punctulatus), <u>Largemouth Bass (Micropterus salmoides</u> ), and White Crappie (Pomoxis annularis)
Spectaclecase (Margaritifera monodonta)	Shorthead Redhorse ( <i>Moxostoma macrolepidotum</i> ) and Bigeye Chub ( <i>Hybopsis amblops</i> )
Ring Pink (Obovaria retusa)	None Identified
Orangefoot Pimpleback (Plethobasus cooperianus)	None Identified
Sheepnose (Plethobasus cyphyus)	Primary hosts: <u>Sauger</u> , Central Stoneroller ( <i>Campostoma anomalum</i> ), and Mimic Shiner ( <i>Notropis volucellus</i> ) Potential hosts: Blackspotted Topminnow, Blacktail Shiner ( <i>Cyprinella venusta</i> ), Bleeding Shiner ( <i>Luxilus zonatus</i> ), <b>Bluntnose Minnow</b> ( <i>Pimephales notatus</i> ), Brassy Minnow ( <i>Hybognathus hankinsoni</i> ), <b>Bullhead Minnow</b> ( <i>Pimephales vigilax</i> ), Common Shiner ( <i>Luxilus cornutus</i> ), Eastern Blacknose Dace ( <i>Rhinichthys atratulus</i> ), Fathead Minnow ( <i>Pimephales promelas</i> ), Longnose Dace ( <i>Rhinichthys cataractae</i> ), Ozark Minnow ( <i>Notropis nubilus</i> ), Pearl Dace ( <i>Margariscus margarita</i> ), Red Shiner ( <i>Cyprinella lutrensis</i> ), <b>River Shiner</b> ( <i>Notropis blennius</i> ), <b>Silver Chub</b> ( <i>Macrhybopsis storeriana</i> ), Southern Redbelly Dace ( <i>Chrosomus erythrogaster</i> ), <b>Spotfin Shiner</b> ( <i>Luxilus chrysocephalus</i> ), Suckermouth Minnow ( <i>Phenacobius mirabilis</i> ), <b>Western</b> Mosquitofish ( <i>Gambusia affinis</i> ), and Whitetail Shiner ( <i>Cyprinella galactura</i> )
Clubshell (Pleurobema clava)	Blackside Darter, <b>Central Stoneroller</b> , <b>Logperch</b> , and <b>Striped Shiner</b> (O'Dee and Watters 2000)
Rough Pigtoe ( <i>Pleurobema plenum</i> )	None Confirmed
Fat Pocketbook (Potamilus capax)	Freshwater Drum
Rabbitsfoot (Theliderma cylindrica)	Whitetail Shiner, <b>Spotfin Shiner</b> , Bigeye Chub, and Rainbow Darter (NatureServe 2019)
Rayed Bean (Villosa fabalis)	Tippecanoe Darter ( <i>Etheostoma tippecanoe</i> ), Rainbow Darter, <b>Greenside Darter</b> , Mottled Sculpin, and <u>Largemouth Bass</u> (Woolnough 2002; White et al. 1996)

Note: Bolded taxa were collected during in-river surveys in Cannelton Pool from 2014 to 2018 (Table 4-2). Underlined taxa were impinged at the nearby Cane Run Plant during 2005-2007 (Table 4-4).

With the exception of Spectaclecase (Margaritifera monodonta) and three mussel species for which hosts have not been identified, host fish for each mussel species have been collected during Cannelton Pool in-river surveys (Table 4-9 and Table 4-2). In addition, at least one fish host species for four of the 10 remaining mussel species was collected during the 2005-2007 impingement study at the nearby Cane Run Plant (Table 4-9 and Table 4-4). The Fanshell (Cyprogenia stegaria), which prefers coarse sand or gravel that is stable and silt free, typically uses darter species as hosts. The Catspaw (Epioblasma obliquata) uses Rock Bass, Mottled Sculpin, Stonecat, and darter species as hosts. It prefers shallow water and requires swift current; it is found in substrates from sand to boulders and is intolerant of siltation. Preferred habitat for Northern Riffleshell (Epioblasma rangiana) is medium to large rivers with riffles and coarse substrate; hosts for this species are primarily darter species. The Snuffbox (Epioblasma triquetra) is typically found in large or medium rivers with coarse substrate and riffles; it utilizes small demersal species such as darters and sculpin as hosts. The Pink Mucket (Lampsilis abrupta) utilizes Walleye, Sauger, Freshwater Drum, black bass species, and White Crappie as hosts and prefers silt-free substrates in areas with swift currents and riffles. Only two species (Shorthead Redhorse and Bigeve Chub) have been identified as hosts for Spectaclecase, which occurs primarily under slab rocks and bedrock shelves or among boulders. However, it is likely that Smallmouth Redhorse (Moxostoma breviceps), a former Shorthead Redhorse subspecies, is a host species for Spectaclecase. Host species are not known for Ring Pink (Obovaria retusa) or Orangefoot Pimpleback (*Plethobasus cooperianus*); both of these species prefer sand and gravel substrates. Sheepnose (*Plethobasus cyphyus*), which may occur in gravel and cobble riffles or areas with mixtures of sand, gravel, and mud, is known to use Sauger, Central Stoneroller, and Mimic Shiner as hosts, but may be able to utilize a wide array of small cyprinid species based on laboratory studies. The Clubshell is generally found in medium to small rivers and streams within clean, coarse sand and gravel of runs, often just downstream of a riffle and uses Blackside Darter, Central Stoneroller, Logperch, and Striped Shiner as hosts. Hosts are not known for Rough Pigtoe (*Pleurobema plenum*), which requires stable substrates composed of a mixture of firm and clean gravel and sand. Preferred habitat for Fat Pocketbook (Potamilus capax) includes medium or large rivers with finer sediment such as gravel, sand, and muck. Freshwater Drum is the only species known to act as a host for the Fat Pocketbook. The Rabbitsfoot mussel is typically found in small to medium streams but may be found in larger rivers in areas with sand and gravel. Whitetail Shiner, Spotfin Shiner, Bigeye Chub, and Rainbow Darter have been confirmed hosts of Rabbitsfoot glochidia. Though the Rayed Bean (Villosa fabalis) is often found in smaller headwater creeks, it can also inhabit large rivers in areas of gravel and sand. The Rayed Bean's hosts include Largemouth Bass, Rainbow Darter, Greenside Darter, and Mottled Sculpin.

### 4.6.2 State-listed Species

As stated above, the Kentucky Administrative Regulations' definition of endangered species of fish and wildlife<sup>13</sup> does not include a state list of T&E species. However, the KSNPC's list of T&E species is considered here for completeness. KDFWR compiles wildlife T&E species by county from the KSNPC's state-encompassing list (KDFWR 2019; KSNPC 2019)<sup>12</sup>. One amphibian, 28 birds (only one presented in Table 4-8), three mammals, 14 mussels, two crustaceans, and three fish are listed as T&E by the KSNPC in Jefferson County, Kentucky

§ 122.21(r)(4) Source Water Baseline Biological Characterization Data

(Table 4-8). The list of T&E species in Harrison County, Indiana, was obtained from the IDNR<sup>16</sup> (IDNR 2020). One amphibian species, one reptilian species, three bird species (not presented in Table 4-8), eight dragonfly/damselfly species, four stonefly species, one caddisfly species, five mussel species, and two fish species are Indiana state-listed T&E species in Harrison County (Table 4-8). The plant, bird (e.g., Barn Owl), and bat (e.g., Indiana Bat) species are not considered here because they are not susceptible to entrainment nor impingement. The remaining state-listed T&E animal species include one amphibian, one reptile, eight dragonfly/damselfly, four stonefly, one caddisfly, 15 mussel, two crustacean, and five fish species (Table 4-8).

The Eastern Hellbender (*Cryptobranchus a. alleganiensis*) is listed as endangered in Indiana and as endangered by the KSNPC for Kentucky (Table 4-8). Its native habitat consists of large slab rocks in clear and well-aerated streams and rivers (Burgmeier et al. 2011), habitat that is lacking in the impounded Ohio River in the vicinity of the Mill Creek Station.

Western Cottonmouth (*Agkistrodon piscivorus leucostoma*) is listed as endangered for Harrison County, Indiana (Table 4-8). This species utilizes aquatic habitat and feeds primarily on small fish and amphibians; therefore, if this species occurs near Mill Creek Station, an indirect effect of CWIS operation could occur if entrainment or impingement losses are substantial, which is highly unlikely.

Eight Dragonfly/damselfly species are listed as endangered or threatened in Harrison County, Indiana. Known habitats for these insect species are given in Table 4-10. The majority would not occur in the Ohio River due to habitat requirements. However, three species (Smoky Shadowdragon [*Neurocordulia molesta*], Stygian Shadowfly [*Neurocordulia yamaskanensis*], and Elusive Clubtail [*Stylurus notatus*]) have been noted to use larger rivers. It is unknown if these three species occur in the vicinity of Mill Creek Station.

Common Name	Habitat Details
Handsome Clubtail (Gomphus crassus)	Small to medium rivers with rapid current and gravel bottom (NatureServe 2019).
Green-faced Clubtail (Gomphus viridifrons)	Small to large moderate-gradient rivers; free flowing with high water quality; larvae burrow in silt (NatureServe 2019).
Smoky Shadowdragon (Neurocordulia molesta)	Rivers, including the large rivers, sometimes large streams, all with rocks or logs to which the larvae cling (NatureServe 2019).
Stygian Shadowfly (Neurocordulia yamaskanensis)	It prefers clean lakes and large rivers with water in constant motion and not too acidic. It is occasionally found in larger rivers (NatureServe 2019).
Spatterdock Darner (Rhionaeschna mutata)	Sinkhole ponds, bog ponds, small lakes, and artificial ponds; usually fishless; <i>Nuphar</i> sp. (spatterdock) frequently present at breeding sites (NatureServe 2019).
Least Clubtail (Stylogomphus sigmastylus)	Small, clear rivers with moderate current and sand to rock substrates, usually in woodlands. Larvae burrow in bottom substrates (Paulson 2017).
Riverine Clubtail (Stylurus amnicola)	Clear rivers with moderate current and gravel/sandy substrates (NatureServe 2019).
Elusive Clubtail (Stylurus notatus)	Large, clear rivers with moderate current and gravel or sandy substrates; can also occur in large lakes with bottom substrates of silt or gravel rather than just sand (NatureServe 2019).

# Table 4-10 Dragonfly and Damselfly species listed as endangered or threatened in<br/>Harrison County, Indiana.

<sup>&</sup>lt;sup>16</sup> <u>http://www.in.gov/dnr/naturepreserve/files/np\_harrison.pdf</u>

Four stonefly species are listed as endangered in Harrison County, Indiana (Table 4-8); however, species-specific habitat data are not available (NatureServe 2020). Stoneflies (Order Plecoptera) have an immature larval stage that is entirely aquatic in North America. Nymphs of most genera occur in cold lotic habitats with several occurring in warm lotic systems, but comparatively few occur in cold lentic habitats, and none in warm lentic habitats (NatureServe 2020). Dispersal is primarily accomplished stochastically by nymphs and actively by winged adults. Most stoneflies require some form of moving water for development of nymphs but drift tendency is low for stoneflies (NatureServe 2020). As such, they would have low susceptibility to entrainment. It is unlikely that these four species occur in the vicinity of Mill Creek Station.

Of the 15 mussel species listed for Indiana or by the KSNPC for Kentucky, ten have been discussed above as they are also federally-listed. Of the remaining taxa, Pocketbook (*Lampsilis ovata*) and Pyramid Pigtoe (*Pleurobema rubrum*) are endangered in Jefferson County, Kentucky; Round Hickorynut (*Obovaria subrotunda*) is listed as endangered in Harrison County, Indiana; and Elktoe (*Alasmidonta marginata*) and Salamander Mussel (*Simpsonaias ambigua*) are listed as threatened in Jefferson County, Kentucky (Table 4-8). Pocketbook is the only state-listed mussel species that has been collected near Mill Creek Station (Table 4-1). However, it was only reported along the Indiana shoreline (LEC 2017) and not in the immediate vicinity of the CWIS during the ESI (2012) study.

Information for the host fish of the Pocketbook could not be identified. It adapts well to variable waterbody characteristics including strong currents or standing water. Pocketbook may be found in big rivers or reservoirs at depths of 5 to 6 m and in small streams in less than 0.6 m water. It prefers mixed substrate of gravel, coarse sand, and silt or mud (Woolnough and Seddon 2017). The Pyramid Pigtoe is typically found in medium to large rivers with sand or gravel substrates. A single species has been identified as a host for this species: the Spotfin Shiner (INHS 2014). The Round Hickorynut can be found in medium rivers with flow and substrates of sand and gravel; host fish include Banded Sculpin, Greenside Darter, Iowa Darter, Fantail Darter (*Etheostoma flabellare*), and Blackside Darter. The Elktoe is associated with medium to large streams with swift flow. They utilize a wide variety of sucker species, cyprinid species, and topminnow species as hosts (24 species listed in INHS 2014). The Salamander Mussel only utilizes the Common Mudpuppy (*Necturus maculosus*) as a host and is therefore typically found in habitat that suits its host, medium to large streams with coarse substrate and slab rocks (INHS 2014).

Two crustaceans, Bousfield's Amphipod (*Gammarus bousfieldi*) and Louisville Crayfish (*Faxonius jeffersoni*) are listed as endangered by the KSNPC for Jefferson County, Kentucky (Table 4-8). Neither of these species are known to occur in the vicinity of the Mill Creek Station CWIS and would not be at risk to entrainment. For example, Bousfield's Amphipod is found in mud substrates of small streams<sup>17,18</sup> and habitat of the Louisville Crayfish consists of small tributaries to the Ohio River, but not in the river proper<sup>19</sup>.

Although federally-listed fish species are not known to occur in the action area (USFWS 2020a and 2020b), five fish species are state-listed for the action area (Table 4-8). Three are listed as

<sup>&</sup>lt;sup>17</sup> https://explorer.natureserve.org/Taxon/ELEMENT\_GLOBAL.2.115181/Gammarus\_bousfieldi

<sup>&</sup>lt;sup>18</sup> <u>https://nepis.epa.gov/Exe/ZyNET.exe/...</u>

<sup>&</sup>lt;sup>19</sup> https://explorer.natureserve.org/Taxon/ELEMENT\_GLOBAL.2.116858/Faxonius\_jeffersoni

§ 122.21(r)(4) Source Water Baseline Biological Characterization Data

endangered in Jefferson County (KDFWR 2019): Lake Sturgeon (*Acipenser fulvescens*), Alabama Shad (*Alosa alabamae*), and Alligator Gar (*Atractosteus spatula*), but they have not been reported in Kentucky since 2000<sup>20</sup>, 1995<sup>21</sup>, and 1977<sup>22</sup>, respectively (waterbodies unknown but Ohio River is likely). Indiana lists two fish species as endangered in Harrison County (IDNR 2020): Hoosier Cavefish (*Amblyopsis hoosieri*) and Variegate Darter (*Etheostoma variatum*). The cavefish obviously does not occur in the Ohio River, and Variegate Darter has only been collected in the upper portion of the Ohio River (ORMs 45.6-126.8) based on ORSANCO fisheries data from 1957 through 2018<sup>23</sup> and ORERP fisheries data from 1973 through 2018 (EPRI 2016, 2017a, 2019, 2020a,b). Therefore, it is reasonable to conclude that these five species do not occur in the vicinity of the Mill Creek Station CWIS. Furthermore, no state-listed species were collected during the recent in-river (Table 4-2), entrainment (Table 4-3), nor impingement (Table 4-4) studies at or near Mill Creek Station.

### 4.7 Public Participation

(vii) Documentation of any public participation or consultation with Federal or State agencies undertaken in development of the plan.

This pubic participate documentation refers to the Design and Construction Technology Plan for new facilities and for offshore oil and gas facilities that was previously required in the 2011 proposed EPA Rule, but does not apply to existing facilities under the new Rule. There is no required plan submittal associated with the § 122.21(r) studies, nor are there requirements for public participation or consultation with Federal or State agencies in completion of the required studies in this section.

### 4.8 Methods and Quality Assurance Procedures for Supporting Field Studies

(viii) If you supplement the information requested in paragraph (r)(4)(i) of this section with data collected using field studies, supporting documentation for the Source Water Baseline Biological Characterization must include a description of all methods and quality assurance procedures for sampling, and data analysis including a description of the study area; taxonomic identification of sampled and evaluated biological assemblages (including all life stages of fish and shellfish); and sampling and data analysis methods. The sampling and/or data analysis methods use must be appropriate for a quantitative survey and based on consideration of methods used in other biological studies performed within the same source water body. The study area should include, at a minimum, the area of influence of the cooling water intake structure.

No new field studies were conducted because information for upper Cannelton Pool was available to address § 122.21(r)(4). Methods for the collection of juvenile and adult fish from the Ohio River near the Mill Creek Station are described in EPRI (2019) and ORSANCO (2020d),

<sup>&</sup>lt;sup>20</sup> <u>http://app.fw.ky.gov/speciesinfo/speciesListCounty.asp?strScientificName=Acipenser+fulvescens&strGroup=1</u>

<sup>&</sup>lt;sup>21</sup> http://app.fw.ky.gov/speciesinfo/speciesListCounty.asp?strScientificName=Alosa+alabamae&strGroup=1

<sup>&</sup>lt;sup>22</sup> http://fw.ky.gov/Fish/Pages/Alligator-Gar.aspx

<sup>&</sup>lt;sup>23</sup> <u>http://www.orsanco.org/data/fish-population/</u>

entrainment sampling methods are described in EPRI (2020c), and the Cane Run Plant impingement study methods can be found in EPRI (2009).

### 4.9 Source Water Baseline Biological Characterization Data Affirmation

(ix) In the case of the owner or operator of an existing facility or new unit at an existing facility, the Source Water Baseline Biological Characterization Data is the information in paragraphs (r)(4)(i) through (xii) of this section.

This provision simply contains a statement of clarification and does not call for specific information. This report provides the information required under 122.21(r)(4)(i-xii).

### 4.10 Protective Measures and Stabilization Activities near the CWIS

(x) For the owner or operator of an existing facility, identification of protective measures and stabilization activities that have been implemented, and a description of how these measures and activities affected the baseline water condition in the vicinity of the intake.

Protective measures at Mill Creek Station consist of the cooling towers on Units 2, 3, and 4, which have reduced the design intake flow rate by 82.7 percent and the retirement of Unit 1. There have been no stabilization activities or other protective measures performed by LGE-KU near the intake that would affect fish populations or baseline water conditions.

## 4.11 Fragile Species

(xi) For the owner or operator of an existing facility, a list of fragile species, as defined at 40 CFR 125.92(m), at the facility. The applicant need only identify those species not already identified as fragile at 40 CFR 125.92(m). New units at an existing facility are not required to resubmit this information if the cooling water withdrawals for the operation of the new unit are from an existing intake.

Gizzard Shad is the only species known to occur in Cannelton Pool (Table 4-2) that is listed as a fragile species in 40 CFR 125.92(m). EPA defines a fragile species of fish or shellfish as those that have an impingement survival rate of less than 30%, which ensures that a facility's performance in reducing impingement mortality would only reflect effects of its improvements to the CWIS technology and not be biased by effects of data collection that are not caused by impingement.

## 4.12 USFWS Incidental Take Exemption or Authorization

(xii) For the owner or operator of an existing facility that has obtained incidental take exemption or authorization for its cooling water intake structure(s) from the U.S. Fish and Wildlife Service or the National Marine Fisheries Service, any information submitted in order to obtain that exemption or authorization may be used to satisfy the permit application information requirement of paragraph 40 CFR 125.95(f) if included in the application.

This is not applicable to Mill Creek Station because it does not hold an incidental take exemption or authorization from the USFWS.

Case No. 2022-00402 Attachment 3 to Response to JI-1 Question No. 1.101(f-h) Page 276 of 307 Imber

# 5 § 122.21(R)(5) COOLING WATER SYSTEM DATA

The Rule at § 122.21(r)(5) requires that LG&E provide the following cooling water system data for Mill Creek:

(i) A narrative description of the operation of the cooling water system and its relationship to cooling water intake structures; the proportion of the design intake flow that is used in the system; the number of days of the year the cooling water system is in operation and seasonal changes in the operation of the system, if applicable; the proportion of design intake flow for contact cooling, non-contact cooling, and process uses; a distribution of water reuse to include cooling water reused as process water, process water reused for cooling, and the use of gray water for cooling; a description of reductions in total water withdrawals including cooling water intake flow reductions already achieved through minimized process water withdrawals; a description of any cooling water that is used in a manufacturing process either before or after it is used for cooling, including other recycled process water flows; the proportion of the source waterbody withdrawn (on a monthly basis);

(ii) Design and engineering calculations prepared by a qualified professional and supporting data to support the description required by paragraph (r)(5)(i) of this section; and

(iii) Description of existing impingement and entrainment technologies or operational measures and a summary of their performance, including but not limited to reductions in impingement mortality and entrainment due to intake location and reductions in total water withdrawals and usage.

The data presented in this section is used to evaluate the existing cooling water system and potential designs of entrainment BTAs that would apply to Mill Creek.

## 5.1 Cooling Water System Design and Operation

Four generating units are currently operated at Mill Creek. Unit 1 is designed with once-through cooling, while Units 2, 3, and 4 have closed-cycle recirculating systems. All four units use the Ohio River as the cooling water source. There are two circulating water pumps for Unit 1. Both pumps are typically operated resulting in a maximum circulating water flow rate is 350.7 cfs (157,400 gpm, 226.7 MGD). When only one pump is operated, such as when one pump is offline for maintenance, the flow to Unit 1 is 206.3 cfs (92,600 gpm, 133.3 MGD). The difference between the flow rate through each pump with one and two pumps operating is a result of increased discharge pressure on the circulating water pumps associated with the increased flow. The two Unit 1 circulating water pumps will cease operations by the end of 2024 when Unit 1 is retired.

The two circulating water pumps for Unit 1 discharge into two 60 inch diameter inlet pipes, which run from the CWIS to the unit's condenser. Only one pipe is used while the unit is in one pump operation, while both pipes are utilized when both circulating pumps are operating. The

condenser is divided into two independent condenser halves with cross-over valves. This arrangement allows each half to be taken out of service for maintenance while the other remains in operation.

There are also four long-shaft service water pumps that provide service water and auxiliary make-up water to Units 2, 3, and 4 CCRS. Two service water pumps are located in the northernmost intake bay and have a combined flow of 44.6 cfs (20,000 gpm, 28.8 MGD); the two other pumps are located in the adjacent screen bay and have a combined flow of 46.8 cfs (21,000 gpm, 30.2 MGD). Two or three long-shaft service water pumps are operated depending on service water needs. The amount of service water needed is expected to be reduced with the retirement of Unit 2, which will occur no later than the end of 2028.

A single 20-inch diameter pipe carries water from the long-shaft service water pumps at the screen house, to the Unit 2 condenser and cooling tower. The Unit 2 condenser is designed for a flow rate of 289.6 cfs (130,000 gpm, 187.2 MGD). The Unit 2 cooling tower is an 8-cell induced draft cooling tower that is approximately 290 ft long, and 75 ft wide. Each of the 8 cells contains a 28-ft diameter fan with a 200 hp motor. The cooling tower is designed for an internal circulating water flow of 334.2 cfs (150,000 gpm, 216 MGD). According to the water balance diagram, (Figure 3-5), the Unit 2 cooling tower has an annual peak monthly average make-up water flow rate of approximately 11.1 cfs (5,000 gpm, 7.2 MGD). The tower is located approximately 890 ft northeast of the CWIS. Unit 2 is scheduled to be retired by the end of 2028. Once this unit is retired, additional long-shaft pumps may also be retired.

Units 3 and 4 condensers and cooling towers are also provided cooling water by two long-shaft service water pumps in the CWIS. The Unit 3 condenser is designed for a flow rate of 287.7 cfs (174,000 gpm, 250.6 MGD), while the Unit 4 condenser is designed for a flow rate of 449.5 cfs (201,770 gpm, 290.5 MGD).

The Unit 3 cooling tower is a round, 8-cell mechanical draft cross-flow designed cooling tower that is approximately 211 ft in diameter, and 60 ft tall. Each of the 8 cells contains a 28 ft diameter fan with a 200 hp motor. The cooling tower is designed for an internal circulating water flow of 456.7 cfs (205,000 gpm, 295.2 MGD) measured at the cooling tower discharge. The Unit 3 cooling tower is designed for an inlet temperature of 116°F and an outlet temperature of 95°F at a wet bulb temperature of 78°F. According to the water balance diagram, (Figure 3-5), the Unit 3 cooling tower has an annual peak monthly average make-up water flow rate of approximately 13.0 cfs (5,833 gpm, 8.4 MGD). Approximately 8.4 cfs (3,778 gpm, 5.4 MGD) is lost to evaporation from heat rejection by the towers and another 0.02 cfs (10.25 gpm, 0.014 MGD) is lost to drift. The tower is located approximately 1,700 ft southwest of the CWIS.

The Unit 4 cooling tower is a round, 12-cell counter-flow design that is approximately 215 ft in diameter, and approximately 61 ft tall. Each of the 12 cells contains an 8 bladed, 30 ft diameter fan with a 200 hp motor. The cooling tower is designed for an internal circulating water flow of 496.0 cfs (222,600 gpm, 320.5 MGD), with an inlet temperature of 116°F and an outlet temperature of 94°F at a wet bulb temperature of 78°F. According to the water balance diagram, (Figure 3-5), the Unit 4 cooling tower has an annual peak monthly average make-up water flow rate of approximately 13.3 cfs (5,972 gpm, 8.6 MGD). Approximately 9.2 cfs (4,117 gpm, 5.9

MGD) is lost to evaporation from heat rejection by the towers and another 0.02 cfs (11.13 gpm, 0.016 MGD) is lost to drift. The tower is located immediately north of the Unit 3 cooling tower.

After passing through the condenser, the flows from Unit 1 combine into a 6.5 ft wide by 7 ft high discharge tunnel. The cooling tower blowdown from Units 2, 3 and 4 also flows into this common discharge tunnel. The tunnel directs the water where it is discharged back to the Ohio River approximately 577 ft downstream of the CWIS.

The current design intake flow (DIF) for Mill Creek with all six pumps operating is 442.0 cfs (198,400 gpm, 285.7 MGD). Except for emergency fire suppression water, no other pumps withdraw water directly from the Ohio River. After the retirement of Unit 1 and its two circulating water pumps by the end of 2024, the Mill Creek DIF will be reduced to 91.4 cfs (41,000 gpm, 59.0 MGD). This is a 79% reduction in flow. Additional flow reductions will be realized after the retirement of Unit 2 in 2028.

The annual pump hours of operation for the four long-shaft service water pumps for the last 5 years (2017-2021) are provided in Table 3-2.

### 5.2 Proportion of Design Intake Flow for Contact Cooling, Non-contact Cooling, and Process Uses

The current Mill Creek DIF is 442.0 cfs (198,400 gpm, 285.7 MGD). The proportion of the design intake flow used for contact cooling, non-contact cooling, and process uses were estimated using the flow splits identified in the water balance diagram Figure 3-5. All but approximately 2.4% of the water withdrawn is used for contact or non-contact cooling. This small percentage (2.4%) is comprised of flue gas desulfurization (FGD )service water, spraywash water, clear well settling, The remaining water is used for the Unit 1 once-through cooling and make-up water to Units 2, 3, and 4 CCRS. Mill Creek is an electrical generating facility and does not use any water for manufacturing processes.

With the retirement of Unit 1 before the end of 2024, the Mill Creek DIF will be reduced from 442.0 cfs (198,400 gpm, 285.7 MGD) down to 91.4 cfs (41,000 gpm, 59.0 MGD).

## 5.3 Proportion of Source Waterbody Withdrawn

The current Mill Creek DIF is 442.04 cfs (198,400 gpm, 285.7 MGD). The actual intake flow (AIF) varies throughout the year, based on the intake water temperature and number of units operating. The average monthly AIF for the long shaft service water pumps from 2017 through 2021, as presented in Table 3-4 were used when calculating the percent of the Ohio River flow withdrawn by Mill Creek. The circulating water flow withdrawn by Unit 1 was excluded from these calculations to provide a better estimate of the amount of river flow that will be withdrawn once Unit 1 is retired. This is consistent with how Mill Creek will be operated after Unit 1 is retired in 2024.

Average monthly Ohio River flows were estimated using daily flow data from January 1, 2002 through December 31, 2021 the period of record, for flows measured at USGS 03294500 at

Louisville, KY. The average monthly river flow was compared to the future DIF (post retirement of Unit 1), and the average monthly AIF of just the long shaft service water pumps from 2017 to 2021 to estimate the percent of river flow withdrawn. The following equation was used to determine the proportion of the Ohio River flow withdrawn by Mill Creek;

 $Proportion of Source Waterbody = \frac{Mill Creek Intake flow (cfs)}{Ohio River Flow (cfs)} \times 100$ 

After the retirement of Unit 1 by the end of 2024, the Mill Creek DIF will be reduced to 91.4 cfs (41,000 gpm, 59.0 MGD). The average monthly proportion of the Ohio River withdrawn by Mill Creek for both the future DIF and monthly AIF is provided in Table 5-1. As can be seen from this table, if operated at its future DIF, Mill Creek would withdraw a maximum of 0.19% of the Ohio River occurring in the month of August. Based on historic operations, Mill Creek's long-shaft service water pumps withdrew up to 0.12% of the Ohio River flow, also occurring in the Month of August. The future DIF does not account for the possible retirement of one or more of the long-shaft pumps as part of the Unit 2 retirement, which will occur by the end of 2028.

# Table 5-1 Average Monthly Ohio River Flow (January 2000 through December 2019) and Percent of Ohio River Flow Withdrawn by the Mill Creek Long Shaft Service Water Pumps based on Historic Operations from 2017 through 2021

Month	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Mean of Monthly Ohio River Discharge (cfs)	200,013	214,400	252,915	216,858	184,246	111,550	77,036	48,256	60,015	59,450	111,247	173,128

### 5.4 Intake Velocities

Velocities at the Mill Creek CWIS were calculated approaching the trash racks, approaching the traveling water screens, and through the traveling water screen mesh. The velocities under the skimmer and baffle wall were also calculated. The velocities were calculated for two different inflow conditions, the current DIF (442.0 cfs, 198,400 gpm, 285.7 MGD) with all four long-shaft service water pumps operating and both the Unit 1circulating water pumps operating and the future DIF (91.4 cfs, 41,000 gpm, 59.0 MGD). The velocities were also calculated at two different water levels, the assumed design low water level El. 375.0 ft and the lowest recorded river level from January 1, 2002 through December 31, 2021 adjusted to Mill Creek of El. 380.7 ft.

Velocities in the intake opening, through the trash racks and traveling water screens were calculated at 100% clean condition. The traveling water screens have a 0.375 inch square mesh with 14 gauge wires. This mesh has an estimated percent open area of 67.9%. In lieu of a measured percent open area for the Mill Creek traveling water screen frames, percent open area values provided by screen vendors for similar screens were used for determining the through-screen velocities. The traveling water screens are standard through-flow traveling water screens with an assumed framing open area of 86%. Taking into account the screen mesh and framing, the traveling water screens are estimated to have a 58.0% combined open area.

The results of the intake velocity calculations at the assumed design low water level are summarized in Table 5-2. The calculated velocities at the lowest recorded water levels are provided in Table 5-3. Once Unit 1 is retired, the velocities within the CWIS, including the through-screen velocity, are expected to remain at 0.5 ft/sec or below down to the minimum recorded water level as shown in Table 5-3. The velocity calculations are provided in Figure 5-1.

I	Existing DIF		Velocity (ft/sec)					
Pumps	Flow (gpm)	Low Water (ft)	Approach to Trash Rack/ Under Skimmer Wall	Under Baffle Wall	Approach to Screens	Through- screen (clean)		
Unit 1	157,400	EL 275 0 6	1.4	1.9/2.31	$1.6/2.7^{1}$	$3.2/3.8^{1}$		
Long-shaft	41,000	El. 375.0 ft	1.4	0.5	0.4	0.7		
	Future DIF		Velocity (ft/sec)					
Pumps	Flow (gpm)	Low Water (ft)	Approach to Trash Rack/ Under Skimmer Wall	Under Baffle Wall	Approach to Screens	Through- screen (clean)		
Long-shaft	41,000	El. 375.0 ft	0.6 <sup>2</sup>	0.5	0.4	0.7		

# Table 5-2 Estimated Intake Velocities (ft/sec) During Assumed Design Low WaterLevels (El. 375.0 ft)

1 Velocities within the Unit 1 screen bay were calculated with both one pump (92,600 gpm) and two pumps (157,400 gpm) operating.

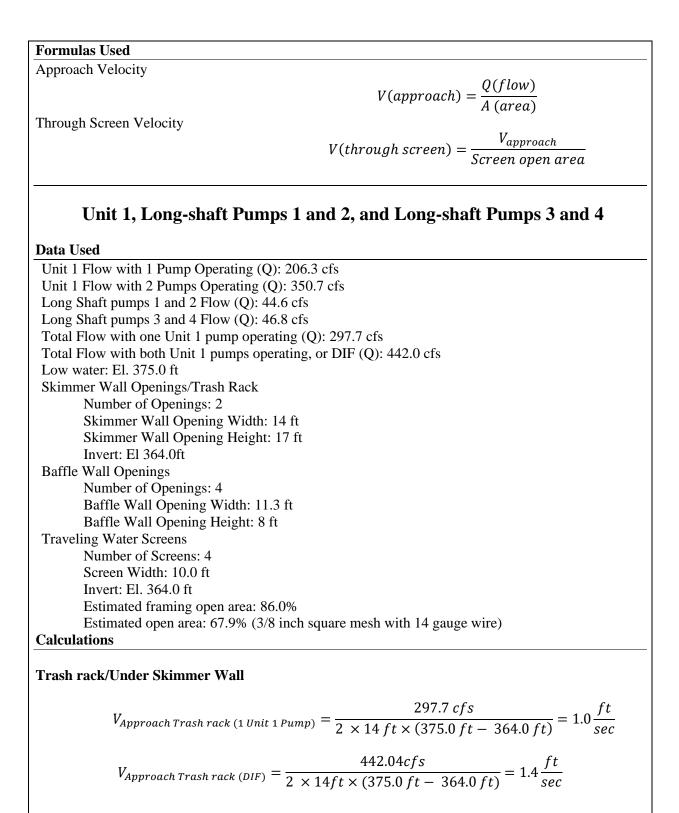

2 Assumed all the flow is concentrated through one trash rack opening

I	Existing DIF			Velocity	(ft/sec)		
Pumps	Flow (gpm)	Low Water (ft)	Approach to Trash Rack/ Under Skimmer Wall	Under Baffle Wall	Approach to Screens	Through- screen (clean)	
Unit 1	157,400	El. 380.7 ft	0.0	$1.9/2.3^{1}$	$1.0/1.2^{1}$	$1.8/2.1^{1}$	
Long-shaft	41,000	El. 380.7 Il	0.9	0.5	0.3	0.5	
	Future DIF		Velocity (ft/sec)				
Pumps	Flow (gpm)	Low Water (ft)	Approach to Trash Rack/ Under Skimmer Wall	Under Baffle Wall	Approach to Screens	Through- screen (clean)	
Long-shaft	41,000	El. 380.7 ft	0.4 <sup>2</sup>	0.5	0.3	0.5	

# Table 5-3 Estimated Intake Velocities (ft/sec) During Observed Lowest Low WaterLevels ((El. 380.7 ft) (January 1, 2002 through December 31, 2022)

1 Velocities within the Unit 1 screen bay were calculated with both one pump (92,600 gpm) and two pumps (157,400 gpm) operating.

2 Assumed all of the flow is concentrated through one trash rack opening

**Under Baffle Wall** 

$$V_{Unit 1(1 pump operating)} = \frac{206.3 cfs}{1 \times 8 ft \times 11.3} = 2.3 \frac{ft}{sec}$$

$$V_{Long Shafts 1 and 2} = \frac{44.6 cfs}{1 \times 8 ft \times 11.3} = 0.5 \frac{ft}{sec}$$

$$V_{Long Shafts 3 and 4} = \frac{46.8 cfs}{1 \times 8 ft \times 11.3} = 0.5 \frac{ft}{sec}$$

$$V_{Unit 1(both pumps operating)} = \frac{350.7 cfs}{2 \times 8 ft \times 11.3} = 1.9 \frac{ft}{sec}$$
Traveling screen
$$Screen open area = 86.0\% \times 67.9\% = 58.0\%$$

$$V_{Approach Unit 1 with 1 pump operating} = \frac{206.3 cfs}{1 \times 10 ft \times (375.0 ft - 364.0 ft)} = 1.9 \frac{ft}{sec}$$

$$V_{Approach Long Shaft pumps 1 and 2} = \frac{44.6 cfs}{1 \times 10 ft \times (375.0 ft - 364.0 ft)} = 0.4 \frac{ft}{sec}$$

$$V_{Approach Long Shaft pumps 3 and 4} = \frac{46.8 cfs}{1 \times 10 ft \times (375.0 ft - 364.0 ft)} = 0.4 \frac{ft}{sec}$$

$$V_{Approach Unit 1 with 2 pumps operating} = \frac{350.7 cfs}{0.58} = 3.2 \frac{ft}{sec}$$

$$V_{Approach Unit 1 with 2 pumps operating} = \frac{0.41 \frac{ft}{sec}}{0.58} = 0.7 \frac{ft}{sec}$$

$$V_{Through screen Long Shaft Pumps 3 and 4} = \frac{0.43 \frac{ft}{sec}}{0.58} = 2.8 \frac{ft}{sec}$$

### Figure 5-1 Mill Creek Velocity Calculations

### 5.5 Existing I&E Reduction Measures

Mill Creek's CWIS is equipped with trash racks and standard through-flow traveling water screens. These features alone do not constitute I&E reduction measures. The CWIS shared between four units, one once-through cooled unit (Unit 1) and three with CCRS (Units 2, 3, and 4). The existing design and operation of Mill Creek Units 2, 3, and 4 are expected to provide a significant reduction in impingement and entrainment at the CWIS. The use of CCRS greatly reduces the amount of cooling water withdrawn from the Ohio River and is considered BTA for both impingement and entrainment under 316(b).

The estimated level of flow reduction provided by the Units 2 through 4 cooling towers was calculated by determining the ratio of make-up water flow to the internal circulating water flow in the cooling towers.

% Flow Reduction =  $1 - \frac{Makeup Water}{Internal Circulating Water Flow}$ 

The combined internal circulating water flow for Units 2 through 4 cooling towers is 831.7 MGD. As a result of CCRS, the combined annual peak monthly average flow of cooling tower make-up water for Units 2 through 4 is only 37.4 cfs (16,800 gpm, 24.2 MGD). This results in a 97% flow reduction compared to what the units would have withdrawn if they were designed with once-through cooling.

The planned retirement of Unit 1 by the end of 2024 will reduce the station's DIF to 91.4 cfs (41,000 gpm, 59.0 MGD). This will result in a 79% flow reduction from the existing DIF. Additional reductions in the DIF are expected to occur after 2028 with the retirement of Unit 2.

Case No. 2022-00402 Attachment 3 to Response to JI-1 Question No. 1.101(f-h) Page 288 of 307 Imber

## 6 § 122.21(R)(6) CHOSEN METHOD OF COMPLIANCE WITH IMPINGEMENT MORTALITY IMPINGEMENT STANDARD

The Rule at § 122.21(r)(6) requires LG&E to discuss the chosen method of compliance with the impingement mortality standard for Mill Creek. Facilities must select one of the seven alternatives at § 125.95(c)(1) through (7) unless the facility qualifies for an exemption or less stringent standard. The owner/operator must identify the chosen compliance method for the entire facility; alternatively, the applicant must identify the chosen compliance method for each cooling water intake structure.

LG&E selects use of § 125.94(c)(1), operating a closed-cycle recirculating system as defined at § 125.92. LG&E is planning on retiring Unit 1, the only unit that uses once-through cooling, by the end of 2024, leaving Units 2, 3 and 4 in operation. These three units currently use CCRS. Unit 2, which uses CCRS will be retired by the end of 2028.

Case No. 2022-00402 Attachment 3 to Response to JI-1 Question No. 1.101(f-h) Page 290 of 307 Imber

## 7 § 122.21(R)(7) ENTRAINMENT PERFORMANCE STUDIES

### 7.1 Entrainment Performance Studies at §122.21(r)(7)

The Rule at § 122.21(r)(7) requires LG&E to discuss entrainment performance studies for Mill Creek. Specifically, the Rule requires "*The owner or operator of an existing facility must submit any previously conducted studies or studies obtained from other facilities addressing technology efficacy, through-facility entrainment survival, and other entrainment studies. Any such submittals must include a description of each study, together with underlying data, and a summary of any conclusions or results. Any studies conducted at other locations must include an explanation as to why the data from other locations are relevant and representative of conditions at your facility. In the case of studies more than 10 years old, the applicant must explain why the data are still relevant and representative of conditions at the facility and explain how the data should be interpreted using the definition of entrainment at 40 CFR 125.92(h)."* 

LG&E has never conducted entrainment performance studies at Mill Creek. LG&E did participate in an EPRI § 316(b) supplemental project that included conducting a literature survey of all impingement and entrainment performance studies that could be located. The final report for the literature survey is titled "Narrative Descriptions of Impingement and Entrainment Survival Studies" (EPRI 2014). This study identified 16 entrainment survival studies, some of which were through plant survival studies and some of which were survival after collection on fine-mesh traveling water screens. However, 13 of the studies were conducted at facilities located on oceans and estuaries where species are not representative of Mill Creek's source waterbody and two of the studies were conducted on the Great Lakes and are also not considered representative for Mill Creek's species. A single study that is potentially relevant for Mill Creek was conducted at Fort Calhoun, located on the mainstem Missouri River from 1974 - 1977. This was a through plant entrainment survival study that compared intake larval fish survival with discharge larvae survival. Freshwater Drum was also a commonly entrained species for Mill Creek (Freshwater Drum made up 16.4% of total entrainment in 2015 and 41.5% of total entrainment study in 2016, see Chapter 4, section 4.9.5 of Appendix A). Following is a summary of the Missouri River entrainment survival study taken from the report.

"Freshwater drum (*Aplodinotus grunniens*) was the most abundant species collected ranging from 43.7% (1974) to 88.2% (1977) of the total yearly larval collection (Table 3-45). Catostomids; consisting of carpsucker (*Carpiodes* spp.), white sucker (*Catostomus commersoni*), buffalo (*Ictiobus* sp.), and redhorse (*Moxostoma* spp.) were the only other taxa collected in sufficient number for survival analysis. Discharge mortalities of all species averaged 86.4% over the four-year study, with a range of 57 to 95% in June and July during peak seasonal larval abundance. Freshwater drum which accounted for nearly 75% of the entrained larvae, experience 96% entrainment mortality, while Catostomids experience nearly 49% mortality at the discharge. Collection in 1977 samples indicated that nearly 62% of the larvae collected at the intake were dead. The author attributed the high intake mortality to net- and naturally-induced mortality.

§ 122.21(r)(7) Entrainment performance studies

Additionally, the data obtained from separation of opaque and transparent dead larvae indicated that natural mortality was less than 60% at the intake."

# 8 § 122.21(R)(8) OPERATIONAL STATUS

The Rule at § 122.21(r)(8) requires LG&E to discuss the operational status of Mill Creek. Specifically, *"the owner or operator of an existing facility must submit a description of the operational status of each generating, production, or process unit that uses cooling water, including but not limited to:* 

(i) For power production or steam generation, descriptions of individual unit operating status including age of each unit, capacity utilization rate (or equivalent) for the previous 5 years, including any extended or unusual outages that significantly affect current data for flow, impingement, entrainment, or other factors, including identification of any operating unit with a capacity utilization rate of less than 8 percent averaged over a 24-month block contiguous period, and any major upgrades completed within the last 15 years, including but not limited to boiler replacement, condenser replacement, turbine replacement, or changes to fuel type; (ii) Descriptions of completed, approved, or scheduled uprates and Nuclear Regulatory Commission relicensing status of each unit at nuclear facilities;

(iii) For process units at your facility that use cooling water other than for power production or steam generation, if you intend to use reductions in flow or changes in operations to meet the requirements of 40 CFR 125.94(c), descriptions of individual production processes and product lines, operating status including age of each line, seasonal operation, including any extended or unusual outages that significantly affect current data for flow, impingement, entrainment, or other factors, any major upgrades completed within the last 15 years, and plans or schedules for decommissioning or replacement of process units or production processes and product lines; (iv) For all manufacturing facilities, descriptions of current and future production schedules; and

(v) Descriptions of plans or schedules for any new units planned within the next 5 years."

The section provides information on the operation of the Mill Creek as required by  $\frac{122.21(r)(8)}{122.21(r)(8)}$ .

### 8.1 Operating Status

Mill Creek is owned and operated by LG&E and has four coal-fired units. Unit 1 has a gross generating capacity of 303 MW, Unit 2 has a gross generating capacity of 299 MW, Unit 3 has a gross generating capacity of 397 MW, while Unit 4 has a gross generating capacity of 492 MW for a combined generating capability of 1,491 MW. Unit 1 utilizes a once-through cooling system and was put into service in 1972 (50 years). Units 2, 3, and 4 all utilize a CCRS system with mechanical draft cooling towers. Unit 2 was put into service in 1974 (48 years), Unit 3 was put into service in 1978 (44 years), while Unit 4 was put into service in 1982 (40 years). The net annual capacity factor for the entire Mill Creek facility from 2017 through 2021 was 59.7%. The annual capacity factor for each of the four Mill Creek units from 2017 through 2021 is summarized in Table 8-1.

Year	Unit 1	Unit 2	Unit 3	Unit 4
2017	63.6%	64.9% 75.3%		68.9%
2018	74.4%	59.5%	71.6%	63.3%
2019	57.1%	70.1%	53.7%	73.3%
2020	64.2%	35.4%	50.2%	54.5%
2021	50.6%	43.0%	62.1%	67.4%
Average	62.0%	54.6%	62.6%	65.5%

 Table 8-1
 Average Annual Net Capacity Factor for Mill Creek (2017-2021)

#### 8.2 Major Upgrades in Last 15 Years

There have been no major structural changes to the Mill Creek CWIS in the last fifteen years. However, there were some operational changes made. Starting in 2020, Mill Creek was able to reduce the total average daily river intake flow of the station by 1.9%. The majority of the flow reduction is a result of the conversion of the Units 1, 2, 3, and 4 fly and bottom ash sluicing system to dry handling, and gypsum wash water reductions.

### 8.3 Other Cooling Water Uses

The Mill Creek generating station is a coal-fired steam electric generating facility and does not use water for manufacturing purposes.

#### 8.4 Plans or Schedules for New Units within Five Years

There are no plans for any new units at Mill Creek in the next five years. Unit 1 and 2 are however scheduled to be retired during the next permit cycle.

## 9 § 125.98(F) FACTORS THAT MUST AND MAY BE CONSIDERED FOR THE ENTRAINMENT BTA DETERMINATION

KDEP is required to make an entrainment BTA determination for Mill Creek as discussed in §125.98(f) of the Rule which states:

"(f) Site-specific entrainment requirements. The Director must establish site-specific requirements for entrainment after reviewing the information submitted under 40 CFR 122.21(r) and § 125.95. These entrainment requirements must reflect the Director's determination of the maximum reduction in entrainment warranted after consideration of factors relevant for determining the best technology available for minimizing adverse environmental impact at each facility. These entrainment requirements may also reflect any control measures to reduce entrainment of Federally-listed threatened and <u>f</u>endangered species and designated critical habitat (e.g. prey base). The Director may reject an otherwise available technology as a basis for entrainment requirements if the Director determines there are unacceptable adverse impacts including impingement, entrainment, or other adverse effects to Federally-listed threatened or endangered species or designated critical habitat. Prior to any permit reissuance after July 14, 2018, the Director must review the performance of the facility's installed entrainment technology to determine whether it continues to meet the requirements of § 125.94(d).

(1) The Director must provide a written explanation of the proposed entrainment determination in the fact sheet or statement of basis for the proposed permit under 40 CFR 124.7 or 124.8. The written explanation must describe why the Director has rejected any entrainment control technologies or measures that perform better than the selected technologies or measures, and must reflect consideration of all reasonable attempts to mitigate any adverse impacts of otherwise available better performing entrainment technologies.

(2) The proposed determination in the fact sheet or statement of basis must be based on consideration of any additional information required by the Director at § 125.98(i) and the following factors listed below. The weight given to each factor is within the Director's discretion based upon the circumstances of each facility.

(i) Numbers and types of organisms entrained, including, specifically, the numbers and species (or lowest taxonomic classification possible) of Federallylisted, threatened and endangered species, and designated critical habitat (e.g., prey base);

(ii) Impact of changes in particulate emissions or other pollutants associated with entrainment technologies;

(iii) Land availability inasmuch as it relates to the feasibility of entrainment technology;

(iv) Remaining useful plant life; and

§ 125.98(f) factors that must and may be considered for the entrainment bta determination

(v) Quantified and qualitative social benefits and costs of available entrainment technologies when such information on both benefits and costs is of sufficient rigor to make a decision.

(3) The proposed determination in the fact sheet or statement of basis may be based on consideration of the following factors to the extent the applicant submitted information under 40 CFR 122.21(r) on these factors:

(i) Entrainment impacts on the waterbody;

(*ii*) Thermal discharge impacts;

(iii) Credit for reductions in flow associated with the retirement of units occurring within the ten years preceding October 14, 2014;

*(iv) Impacts on the reliability of energy delivery within the immediate area;* 

(v) Impacts on water consumption; and

(vi) Availability of process water, gray water, waste water, reclaimed water, or other waters of appropriate quantity and quality for reuse as cooling water.

(4) If all technologies considered have social costs not justified by the social benefits, or have unacceptable adverse impacts that cannot be mitigated, the Director may determine that no additional control requirements are necessary beyond what the facility is already doing. The Director may reject an otherwise available technology as a BTA standard for entrainment if the social costs are not justified by the social benefits."

#### 9.1 Factors That Must Be Considered:

#### Numbers and Types of Organisms Entrained 0

The Rule states for this factor "(i) Numbers and types of organisms entrained, including, specifically, the numbers and species (or lowest taxonomic classification possible) of Federallylisted, threatened and endangered species, and designated critical habitat (e.g., prey base);"

The purpose of the factor is to identify the reduction in entrainment as a result of the alternative fish protection technologies evaluated. For Mill Creek, retirement of Unit 1 will completely eliminate any entrainment associated with once-through cooling. This will reduce the DIF of the facility by 79% and is expected to result in a commensurate reduction in entrainment. Organisms will still be susceptible to entrainment into the Units 2, 3 and 4 make-up water systems. The CCRS used by these units represents BTA for both impingement and entrainment.

#### Impact of Particulate Emissions or Other Pollutants 0

The Rule states for this factor "(ii) Impact of changes in particulate emissions or other pollutants associated with entrainment technologies;"

Since Unit 1 will be retired, there will be an overall reduction in particulate emissions and other pollutants that are currently generated by Unit 1. Particulate emission rates for the remaining three units are expected to be the same as current operations.

#### Land Availability 0

The Rule states for this factor "(iii) Land availability inasmuch as it relates to the feasibility of entrainment technology;"

Since Unit 1 is being retired, no entrainment technology is considered and as a result land availability is not an issue for Mill Creek.

#### • Remaining Useful Plant Life

The Rule states for this factor "(iv) Remaining useful plant life;"

As discussed, Unit 1 will be retired by the end of 2024 and thus there are less than three years of operation left for Mill Creek.

### • Quantified Benefits and Costs

The Rule states for this factor "(v) Quantified and qualitative social benefits and costs of available entrainment technologies when such information on both benefits and costs is of sufficient rigor to make a decision."

There is insufficient time for the design, permitting and construction of any alternative entrainment fish protection technology for Unit 1 prior to its retirement. Thus, there would be a very significant cost for no biological benefit.

### 9.2 Factors that May be Considered

#### • Entrainment Waterbody Impacts

The Rule states for this factor "(*i*) *Entrainment impacts on the waterbody*;". The purpose of this factor is to quantify the benefit of alternative fish protection technologies evaluated.

For Mill Creek, the decision to retire Unit 1 will eliminate all entrainment associated with oncethrough cooling. It is therefore unnecessary to evaluate other technologies for Unit 1. Units 2, 3 and 4 already use CCRS, which minimize their cooling water withdrawals and are considered BTA for entrainment. Therefore, it is unnecessary to evaluate other entrainment reducing technologies for Units 2, 3 and 4.

#### • Thermal Discharge Impacts

The Rule states for this factor "*Thermal discharge impacts;*". The purpose of this factor is to consider the change in the thermal plume resulting from a fish protection technology such as a CCRS that would significantly reduce the size of the thermal plume.

For Mill Creek, the retirement of Unit 1 will completely eliminate the thermal discharge associated with once-through cooling. Cooling tower blowdown will still be discharged. The amount of water discharged will however be significantly reduced along with any thermal discharge related impacts,

### • Credit for Retired Unit Flow Reductions

The Rule states for this factor "(*iii*) Credit for reductions in flow associated with the retirement of units occurring within the ten years preceding October 14, 2014;"

No units were retired at Mill Creek prior to October 14, 2014.

### Impacts on Energy Delivery

The Rule states for this factor "(*iv*) *Impacts on the reliability of energy delivery within the immediate area;*". The purpose of this factor is to consider the impact of electrical output to the

§ 125.98(f) factors that must and may be considered for the entrainment bta determination

grid as a result of energy loss due to the energy requirement of an alternative fish protection technology such as a CCRS.

While the retirement of Unit 1 will reduce the electrical output to the grid provided by this unit, the retirement decision was based on economic considerations not related to § 316(b).

#### Impacts on Water Consumption 0

The Rule states for this factor "(v) Impacts on water consumption;". The purpose of this factor is to consider loss of freshwater due to increased evaporation from use of a CCRS.

In the case of Mill Creek, this will not be an issue and there will be a decrease in water consumption from evaporative water loss within the thermal plume.

#### Availability of Other Cooling Water Sources 0

The Rule states for this factor "Availability of process water, gray water, waste water, reclaimed water, or other waters of appropriate quantity and quality for reuse as cooling water." The purpose of this factor is to evaluate the use of alternative sources of cooling to reduce withdrawals from the source waterbody.

Since Retirement of Unit 1 will completely eliminate the need for once-through cooling water, consideration of this factor is not relevant for Mill Creek.
