CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 **I. INTRODUCTIONS & QUALIFICATIONS**

2 **Q. Please state for the record your name and business address.**

3 A. My name is Andrew McDonald. My business address is 316 Wapping St., Suite 204,
4 Frankfort, KY 40601.

5 **Q. By whom are you employed and in what position?**

6 A. I am employed by Apogee – Climate & Energy Transitions, a program of Earth Tools
7 Inc.

8 **Q. On whose behalf are you testifying in this proceeding?**

9 A. I am testifying on behalf of Mountain Association (“MA”), Appalachian Citizens’ Law
10 Center (“ACLC”), Kentuckians for the Commonwealth (“KFTC”), and Kentucky Solar
11 Energy Society (“KYSES”) (collectively, “Joint Intervenors”).

12 **Q. Are you a member of any of the organizations you are testifying on behalf of here?**

13 A. Yes, I am a member of KYSES, and I currently serve on KYSES’s Board of Directors. I
14 am also a member of KFTC.

15 **Q. Please describe your professional background.**

16 A. I have been working to address climate change and sustainability for thirty years. My
17 experience spans solar energy system design and installation; green building and energy
18 efficiency; state and local energy policy; and community outreach and education. I have
19 written technical and public-education documents on energy issues, including co-
20 authoring the Kentucky Solar Energy Guide in 2004 with Joshua Bills. For twenty years I
21 have been actively involved in efforts to establish, expand, and defend net metering in
22 Kentucky. I have participated in multiple utility rate cases and Integrated Resource

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 Planning processes as a concerned citizen, intervenor, and expert witness.

2 I was the Director of the Kentucky Solar Partnership for Appalachia-Science in the
3 Public Interest from 2004 to 2012. In 2013, I joined Earth Tools, where I established our
4 Sustainable Systems Program, and in 2020, founded Apogee-Climate & Energy
5 Transitions.

6 I am a Certified Energy Manager and I hold an M.Sc. in Sustainable Systems from
7 Slippery Rock University of Pennsylvania and a B.A. in Philosophy from the University
8 of Buffalo. I am attaching my resume as Exhibit AM-1.

9 **Q. Have you previously filed expert testimony in other proceedings before this**
10 **Commission or before other regulatory commissions?**

11 A. Yes. I have provided expert testimony before the Kentucky Public Service Commission
12 in Case Nos. 2022-0402 and 2020-00174. In Case No. 2013-00287, I submitted testimony
13 that the Commission construed as a public comment.

14 **Q. What is the purpose of your testimony?**

15 A. The purpose of my testimony is as follows:

- 16 1. To make recommendations concerning Kentucky Power Company's
17 (Kentucky Power" or "Company") Solar Gardens proposal. These
18 recommendations are as follows:
- 19 a. Include evaluation of the use of Power Purchase Agreements ("PPAs")
20 as an alternative to Company ownership of the Solar Garden facilities.
- 21 b. Include battery storage in at least one of the Solar Garden locations to
22 provide enhanced resiliency, grid services, and additional experience

1 with solar plus storage systems.

2 c. Consider the locational benefits for the distribution grid, including
3 community resilience, when selecting locations for the Solar Garden
4 facilities.

5 d. Expand the 25 MW limit for the program if the projects are found to
6 be economical.

7 2. To discuss the ways distributed energy resources (“DERs”), especially
8 customer-sited solar energy and battery storage systems, are a valuable
9 resource that Kentucky Power should leverage as an asset for reducing
10 costs, improving reliability and resilience, and mitigating the impacts of
11 the proposed rate increases on the Company’s customers.

12 **II. SOLAR GARDENS PROGRAM**

13 **Q. Can you briefly summarize the Company’s Distributed Solar Proposal (“Solar**
14 **Gardens Program”)?**

15 A. Kentucky Power proposes to build one or more distributed solar photovoltaic (“PV”)
16 systems on their distribution grid to serve their general customer load.¹ The individual
17 facilities, which they call Solar Gardens, would be no more than 10 MW in capacity and
18 the aggregate capacity of all solar sites would not exceed 25 MW. These facilities would
19 reduce the Company’s load with PJM and reduce the Company’s costs for energy,

¹ Direct Testimony of Alex E. Vaughan, *Electronic Application of Kentucky Power Company For (1) A General Adjustment of Its Rates for Electric Service; (2) Approval of Tariffs and Riders; (3) Approval of Accounting Practices to Establish Regulatory Assets and Liabilities; (4) A Securitization Financing Order; and (5) All Other Required Approvals and Relief*, Case No. 2023-00159, at 27 (June 29, 2023) (“Vaughan Direct”).

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 ancillary services, and transmission and generation capacity.² By being located on the
2 distribution system and not supplying power into PJM’s transmission system, the projects
3 would bypass the PJM interconnection queue, which has been plagued by delays and a
4 backlog of generation projects awaiting approval. By keeping projects under 10 MW and
5 not selling power onto the wholesale market, the Company may also avoid the need for
6 permitting by the Kentucky Electric Generation and Transmission Siting Board, another
7 step that should reduce project cost, development time, and execution risk.³

8 An additional feature of the Solar Gardens Program is a Low-Income Benefit
9 option in which the Company proposes to provide 50 percent of the energy benefits from
10 the Solar Garden facilities to low-income customers who participate in the Federal Low
11 Income Home Energy Assistance Program. The Company estimates this would amount to
12 approximately \$66 per customer annually, for a group of about 11,500 customers.

13 **Q. What is your overall assessment of the proposed Solar Gardens Program?**

14 A. Kentucky Power’s Solar Gardens proposal represents an important step towards
15 integrating more DERs into the Company’s system, and on the whole I believe it offers
16 significant benefits for the Company’s customers. The Program provides a specific
17 example of some of the benefits that DERs can provide. In the following section I offer
18 several recommendations for improving the proposal and increasing the value it offers for
19 customers.

² *Id.* at 29–32.

³ Kentucky State Board on Electric Generation and Transmission Siting, *Kentucky’s Electric Generation and Transmission Siting Process For Merchant Facilities; A Guide to Public Participation*, at 2, https://psc.ky.gov/agencies/psc/siting_board/guide.pdf (last visited Oct. 1, 2023).

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 As mentioned above and as stated by the Company, these “solar facilities will
2 reduce the Company’s wholesale load that it purchases from PJM each hour that the solar
3 facilities are producing solar power and injecting it into the Company’s distribution
4 system. Because of this, the Company will realize energy, ancillary service, and capacity
5 benefits related to both its generation and transmission obligations in PJM.”⁴ I encourage
6 the Companies to continue along this path and take advantage of the many benefits that
7 distributed resources offer, including customer-owned and -sited resources. The benefits
8 offered by the proposed Company-owned Solar Garden are also available from customer-
9 owned resources, but the latter are available at no cost to the Company because the
10 customer provides for the capital, financing, operations, and maintenance costs.

11 **Q. What recommendations do you have for improving the Solar Gardens Proposal?**

12 **A. 1. Include evaluation of Power Purchase Agreements as an alternative to**
13 **Company ownership of the Solar Garden facilities.** A solar PPA may offer a
14 substantially lower cost for the Company and ratepayers. In the example project provided
15 by the Companies in response to a Commission staff data request, the total Cost of
16 Service used in the model⁵ was very high relative to current solar PPA prices. The
17 Levelized Cost of Energy (“LCOE”) over 25 years for the Company-owned project was
18 \$0.109/kWh,⁶ while solar PPAs in the PJM region were around \$0.065/kWh as of Q2-
19 2023, according to the Level Ten Energy PPA Price Index.⁷ The Level Ten report

⁴ Vaughan Direct at 31:3–7.

⁵ Response of Kentucky Power Company to Commission Staff’s Supplemental Request for Information, Case No. 2023-00159, Question 1 (Aug. 28, 2023) (“KPCo Response Staff Q2.1”), Attach. 20.

⁶ Exhibit AM-2.

⁷ Level Ten Energy, *Q2 2023 PPA Price Index Executive Summary, North America*, at 10 (2023), <https://go.leveltenenergy.com/l/816793/2023-07->

1 indicates solar PPA prices may be trending downward again, after peaking in Q1-2023.⁸

2 While the Solar Garden proposal indicated a significant net benefit even with the higher
3 cost of service, much greater savings may be possible for customers if a solar PPA option
4 is considered.

5 **2. Include battery storage in at least one of the Solar Garden locations to**
6 **provide enhanced resiliency, grid services, and additional experience with solar plus**
7 **storage systems.**

8 **3. When selecting locations for the Solar Garden facilities, consider the**
9 **locational benefits for the distribution grid.** Identify locations with needs that could be
10 addressed by solar (or solar plus storage). For example, identify communities that suffer
11 frequent power outages to provide a community micro-grid; or choose a location that
12 provides critical community services, such as a hospital, water treatment plant, or
13 emergency shelter.

14 **4. Expand the 25 MW limit of the program if the projects are found to be**
15 **economical.** Based on the analysis of the sample Solar Garden project provided by the
16 Company, these projects are expected to provide substantial economic benefits.⁹ The
17 Company should leverage these projects to provide as many benefits for its customers
18 and communities as possible.

19 I recommend that the Commission support Kentucky Power's Solar Garden
20 proposal with the modifications that I have described above.

[17/37bhhy/816793/1689639546mVH9ljkc/2023Q2_NA_ExecutiveSummary_PPAPriceIndex.pdf](https://www.kycourts.gov/courts/17/37bhhy/816793/1689639546mVH9ljkc/2023Q2_NA_ExecutiveSummary_PPAPriceIndex.pdf); *Id.* at 2

⁹ KPCo Response to Staff Supplemental Q2.1, Attach. 20.

1 **III. LEVERAGING DISTRIBUTED ENERGY REOURCES TO REDUCE COSTS**
2 **AND IMPROVE SERVICES FOR CUSTOMERS**

3 **Q. Do distributed energy resources represent a valuable asset that Kentucky Power can**
4 **leverage to improve the affordability, reliability, and resilience of electrical service**
5 **for their customers?**

6 A. Yes. DERs are a valuable resource that can and should play an increasingly significant
7 role in meeting the Company’s customers’ needs for more affordable, reliable, and
8 resilient electrical service. The Company’s Solar Garden proposal acknowledges this
9 value, and yet the opportunities offered by DERs extend beyond the 25 MW of solar that
10 the Company has proposed. As my testimony will show, leveraging the value of DERs
11 will help to ensure the Company’s rates are fair, just, and reasonable, and directly
12 supports the Company’s four objectives as identified in its 2022 Integrated Resource
13 Plan:¹⁰

- 14 1. Customer affordability
- 15 2. Rate stability
- 16 3. Maintaining reliability
- 17 4. Local impact & sustainability

18 **Q. Can you discuss more specifically what other benefits distributed energy resources**
19 **offer to Kentucky Power and its customers?**

20 A. DERs can help to serve crucial Company needs:

¹⁰ Case No. 2023-00092, *Kentucky Power 2022 Integrated Resource Plan, Volume A – Public Version*, at 22 (Ky. PSC Mar. 20, 2023) (“KPCo 2022 IRP-Vol. A”).

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 (a) **Supplying capacity requirements.** Customer-owned solar can serve as a
2 capacity resource just as the proposed Company-owned Solar Garden would.
3 Other examples of DERs that offer capacity value are battery energy storage
4 and demand response resources such as controllable thermostats, water
5 heaters, and electric vehicle chargers.

6 (b) **Reducing fuel price volatility.** DERs reduce the Company’s reliance on
7 fossil fuel generation, thereby reducing customer exposure to fuel price
8 volatility.

9 (c) **Improving reliability of the distribution grid.** DERs can support the
10 distribution grid and improve its resilience and reliability, at lower costs to
11 ratepayers. For example, by reducing loads on transformers, DERs can extend
12 the life of existing transformers and defer maintenance and replacement
13 costs.¹¹ Batteries can provide voltage and frequency support, improving the
14 reliability of distribution circuits.¹²

15 (d) **Increasing Resilience.** DERs can provide critical support to customer and
16 community resilience. The need for greater resilience is especially important
17 for Kentucky Power’s customers, due to the region’s specific geography, its
18 vulnerability to natural disasters, and the economic hardship facing the region.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 Kentucky Power has an extensive network of distribution wires through
2 mountainous and forested terrain, and as described in the Company’s
3 testimony, falling trees are the greatest source of power outages on their
4 system.¹³ Customer-sited solar plus storage systems can enable customers to
5 ride through grid-outages without losing power. These DERs can be deployed
6 to provide individual customer resilience; at community centers that provide
7 resilience for the community; and in microgrids that enable multiple
8 customers to share power when the grid is down.

9 **(e) Overcoming barriers to deployment of new resources.** DERs are deployed
10 in small increments, but those small units can be deployed relatively quickly,
11 often circumventing barriers that face larger centralized generation projects.
12 PJM’s interconnection queue, for example, has become a bottleneck,
13 preventing gigawatts of wind and solar from coming online while projects
14 wait for a backlog of applications to be processed and approved by PJM.¹⁴
15 The Company’s Solar Garden proposal would effectively skirt this problem by
16 building the solar facilities on the Company’s own distribution system, to
17 serve local loads, avoiding the use of the PJM transmission system. While
18 many utility-scale projects in PJM have been waiting years for approval,

¹³ Direct Testimony of Everett G. Phillips, *Electronic Application of Kentucky Power Company For (1) A General Adjustment of Its Rates for Electric Service; (2) Approval of Tariffs and Riders; (3) Approval of Accounting Practices to Establish Regulatory Assets and Liabilities; (4) A Securitization Financing Order; and (5) All Other Required Approvals and Relief*, Case No. 2023-00159, at 14–18 (June 29, 2023) (“Phillips Direct”).

¹⁴ See Ethan Howland, *FERC approves PJM’s ‘first-ready, first-served’ interconnection reform plan, steps to clear backlog*, Utility Dive (Dec. 1, 2022), <https://www.utilitydive.com/news/ferc-pjm-interconnection-reform-plan-queue/637717/>.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 smaller distribution-level projects can have a much easier and faster path for
2 development. Although DERs are developed in relatively small units, their
3 combined impact can add up to a major resource for the grid.

4 **Q. What are specific examples of how DERs can support reliability and resilience?**

5 **A.** Customer resilience can be improved, for example, by Demand-Side Management
6 (“DSM”) programs that provide home weatherization and insulation upgrades. The loss
7 of power in the winter is less critical in a well-insulated home, as the indoor temperature
8 will drop more slowly. Likewise in the summer, outages during heatwaves are less
9 dangerous for residents of well-insulated homes that can better withstand high outdoor
10 temperatures.

11 By giving attention to the locational value of DERs, whether owned by the
12 Company or Customer, Kentucky Power can achieve needed improvements at specific
13 locations on the distribution grid. For example, the utility San Diego Gas & Electric
14 (“SDG&E”) has deployed a mix of DERs to form a Virtual Power Plant (“VPP”) in
15 Shelter Valley, California, a remote rural community 90 minutes from San Diego. With a
16 combination of battery storage, rooftop solar, smart thermostats, and controllable water
17 heaters, SDG&E uses the VPP to support the grid during times of peak demand.¹⁵

18 The utility Green Mountain Power (“GMP”) in Vermont is developing Resiliency
19 Zones to provide secure power using battery storage, and in some cases renewable power,
20 when the wider grid is down.¹⁶ In Rutland, Vermont, GMP uses a 2.5 MW solar array

¹⁵ *SDG&E Pioneers Virtual Power Plant to Help Ease Strain on the Power Grid During Extreme Heat*, SDG&E News Release (Aug. 28, 2023), <https://www.sdgenews.com/article/sdge-pioneers-virtual-power-plant-help-ease-strain-power-grid-during-extreme-heat>.

¹⁶ See Green Mountain Power, *GMP Resiliency Zones* (Sept. 29, 2022) (“GMP Resiliency Zones”),

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 and 4 MW/3.4 MWh battery to serve as a microgrid and emergency shelter at the local
2 high school. The project has reduced the utility's operating costs while providing
3 emergency back-up power to the community.¹⁷ GMP presently plans to add about three
4 new Resiliency Zones each year.¹⁸

5 As these examples illustrate, battery storage systems can provide back-up power
6 to homes and critical community facilities, like nursing homes and schools. Adding solar
7 to a battery storage system provides an even greater level of resilience, as the solar power
8 can be used directly and for re-charging the battery, extending the availability of back up
9 power.¹⁹

10 The deployment of customer-sited solar plus storage systems could play a critical
11 role in improving the resilience of the communities and customers that Kentucky Power
12 serves, while reducing costs. This exemplifies the opportunity Kentucky Power has to
13 leverage the financial benefits offered by DERs to fundamentally improve the services
14 provided to the Company's customers.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 **Q. What is the potential growth of distributed solar generation in Kentucky Power**
2 **Company's territory?**

3 A. Distributed solar generation currently represents a very small portion of Kentucky
4 Power's power supply. As of December 2022, Kentucky Power had 184 net metering
5 customers totaling 2.5 MW (megawatts) of installed capacity.²⁰ This represents only
6 0.18% of the Company's annual peak demand (1359 MW, which occurred in December
7 2022).²¹ The Company's 2022 IRP presented a forecast of future net metering customer
8 growth that projected net metering capacity would reach 3.7 MW by 2030, following an
9 annual growth rate of 5%.

10 A review of Kentucky Power's historic net metering customer data dating back to
11 2018, however, shows that actual growth rates averaged 90% per year from 2018 to 2022,
12 and 60% per year from 2020 to 2022. Kentucky Power offers no explanation in their IRP
13 as to why they expect customer adoption of solar to dramatically slow over the next 15
14 years. If net metering's recent growth trend were to continue for the rest of the decade,
15 we would see net metering capacity increasing dramatically to 107 MW by 2030,
16 representing 7.8% of Kentucky Power's maximum peak demand.²² Figure 1 illustrates
17 these two scenarios of future distributed solar growth on Kentucky Power's system.

18 "Scenario A" is based on Kentucky Power's 2022 IRP and "Scenario B – DER Continued

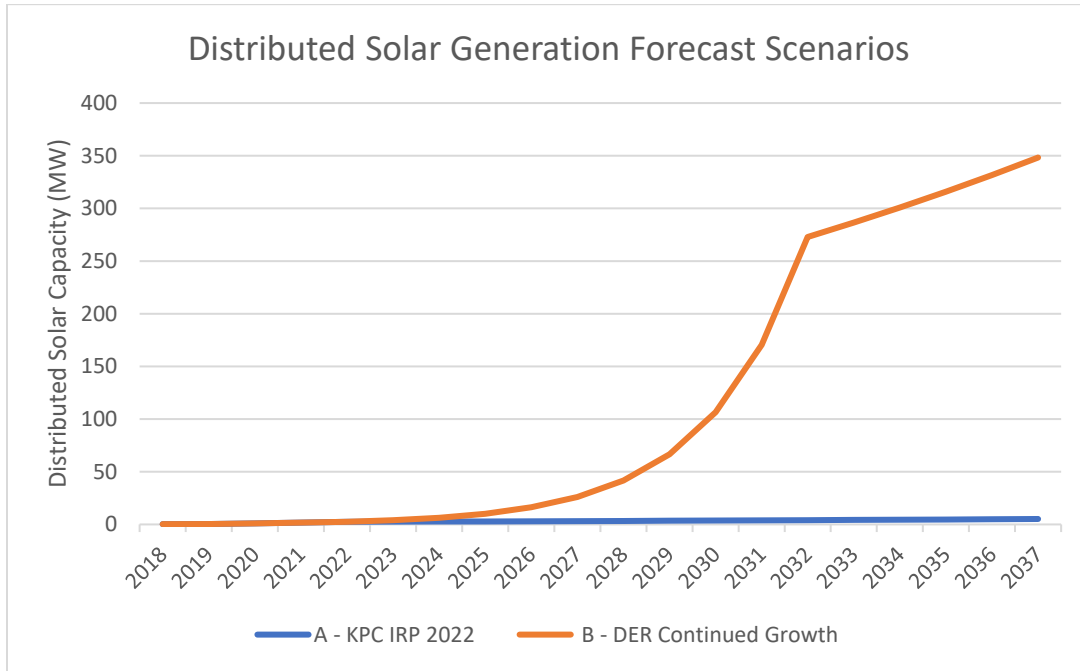

²⁰ U.S. Energy Information Administration, *Electricity: Annual Electric Power Industry Report, Form EIA-861 detailed data files* (data last rel. Aug. 3, 2023), <https://www.eia.gov/electricity/data/eia861/> (found under the 2022 early release files for net metering); See Response of Kentucky Power Company to Joint Intervenors' First Request for Information, Case No. 2023-00159, Question 27 (Aug. 28, 2023) Joint Intervenors requested an up-to-date set of equivalent data from the Company in this case, but the Company refused to provide it.

²¹ KPCo 2022 IRP-Vol. A. at 23.

²² Exhibit AM-3.

1 Growth,” projects the historic annual growth rate of 60% continuing until 2033, when the
2 rate reduces to 5% per year.

3 **Figure 1 – Distributed Solar Generation Forecast Scenarios**

4

5 **Q. Why does the Company assume such limited growth of distributed solar?**

6 A. Kentucky Power’s 2022 IRP offers no explanation for its assumption that distributed
7 solar capacity growth would slow to a mere 5% per year. While seemingly arbitrary, this
8 growth rate would have the effect of keeping total net metering capacity below 1% of the
9 Company’s annual peak demand. Kentucky statute allows (but does *not* require) utilities
10 to stop offering new net metering service once total net metering capacity reaches 1% of
11 their annual peak load,²³ so it may be that in this forecast the Company was assuming
12 they would impose this limit.

²³ KRS 278.466(1).

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 **Q. Is Kentucky Power Company required by law to stop offering net metering after net**
2 **metering installed capacity reaches 1% of their previous year's peak load?**

3 A. No. Kentucky's net metering statute, as amended in 2019, allows utilities to stop offering
4 net metering after reaching 1% of their annual peak load, but does *not* require them to
5 stop. KRS 278.466(1) states:

6 Each retail electric supplier shall make net metering available to any eligible
7 customer-generator that the supplier currently serves or solicits for service. If the
8 cumulative generating capacity of net metering systems reaches one percent (1%)
9 of a supplier's single hour peak load during a calendar year, the supplier shall have
10 no further obligation to offer net metering to any new customer-generator at any
11 subsequent time.²⁴

12 While utilities are not obligated to offer net metering to new customers beyond
13 1%, they are not prohibited from doing so. If allowing distributed solar to grow beyond
14 1% is found to be in their customers' and the Company's best interest, the utility has the
15 opportunity to do so. Indeed, allowing and supporting distributed solar to continue to
16 grow is precisely what Kentucky Power should do, to bring hundreds of MW of low-cost
17 solar power onto their system, at minimal cost to the utility.

18 **Q. Is a 1% limit on net metering needed to protect the utility grid?**

19 A. No. The 1% threshold was established when Kentucky's net metering law was
20 established in 2003. In the original version of the statute, utilities were given the right to
21 request permission from the PSC to cease offering net metering service after reaching 1%
22 of their annual peak demand. At that time, net metering was still fairly new and the solar
23 PV industry as a whole was in its infancy. The 1% threshold was included as a safety
24 measure while utilities and the electricity industry learned how to incorporate distributed

²⁴ *Id.*

1 resources into the grid. Twenty years later, the solar PV industry is established as the
2 fastest growing new energy resource in the world. Extensive real-world experience has
3 demonstrated that grid penetrations of solar much higher than 1% can be handled safely
4 and effectively. Figure 2 shows solar generation as a percentage of total generation in the
5 twelve leading states plus the United States as a whole. Solar generation ranges from
6 6%–28% among these states and the United States as a whole is at 5%.²⁵ While this data
7 includes utility-scale and distributed solar, it demonstrates that our utility grids can
8 manage large percentages of variable solar generation.

9 **Figure 2 – Solar Generation as a Percentage of Total Generation, 2014 – 2022**

10

11

²⁵ David Feldman et al., *Spring 2023 Solar Industry Update*, National Renewable Energy Laboratory, at 34, 37 (Apr. 27, 2023), <https://www.nrel.gov/docs/fy23osti/86215.pdf>.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 **Q. Is a 1% limit on net metering needed to prevent cost-shifting and cross-**
2 **subsidization of customer-generators?**

3 A. No. One rationale that has been used to justify limits on net metering, such as a 1%
4 system-wide cap on installations, is the alleged need to prevent cross-subsidization
5 between non-customer-generators and net metering customers. Despite the many
6 weaknesses to these claims, this has been a common argument that utilities have made for
7 imposing various limits on net metering.²⁶ However, the question of cross-subsidization
8 for the Companies has been resolved through the ratemaking process that established the
9 Companies' NMS-II rates.²⁷

10 Following changes to Kentucky's net metering statute in 2019, utilities now have
11 a mechanism for recovering their costs to serve net metering customers through the
12 ratemaking process.²⁸ The Company now has a net metering structure which provides for
13 the recovery of their costs and ensures no cross-subsidization by non-participating
14 ratepayers. Therefore, allowing net metering to continue to higher capacities beyond 1%

²⁷ Order, *Electronic Application of Kentucky Power Company for (1) A General Adjustment of Its Rates for Electric Service; (2) Approval of Tariffs and Riders; (3) Approval of Accounting Practices to Establish Regulatory Assets and Liabilities; (4) Approval of a Certificate of Public Convenience and Necessity; and (5) All Other Required Approvals and Relief*, at 25, Case No. 2020-00174 (May 14, 2021), https://psc.ky.gov/pscscf/2020%20Cases/2020-00174//20210514_PSC_ORDER.pdf.

²⁸ See KRS 278.466(5) (“Using the ratemaking process provided by this chapter, each retail electric supplier shall be entitled to implement rates to recover from its eligible customer-generators all costs necessary to serve its eligible customer-generators, including but not limited to fixed and demand-based costs, without regard for the rate structure for customers who are not eligible customer-generators.”).

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 should have no cost-shifting implications. In the future as PV installations increase, if the
2 Company believes that is leading to changing cost impacts, they can apply to the
3 Commission to adjust their net metering rates, using the ratemaking process that
4 produced the Company's current NMS-II rates, consistent with the legacy protections for
5 NMS-II customers with respect to rate structure.

6 **Q. Is distributed solar generation a low-cost resource for the Company?**

7 A. Yes. Like energy efficiency measures that customers install at their own expense, net
8 metered solar energy systems are installed by customers using their own financial
9 resources. Customer-generators are responsible for all capital, operating, and
10 maintenance expenses for these systems throughout their operational life, and bear the
11 risk for these investments, not the utility, nor other ratepayers. This contrasts with supply-
12 side resources that the Company might develop, for which the Company (and ultimately
13 its customers) would be financially responsible, either through ownership (incurring the
14 costs of capital and long-term operations and maintenance) or through long-term power
15 purchase agreements with third-party developers. As the Company's Solar Garden
16 proposal demonstrates, solar resources on the distribution system provide multiple direct
17 financial benefits to the utility, through reduced costs for energy, ancillary services, and
18 transmission and generation capacity from PJM.²⁹ However, when the customer owns
19 these generation assets, the utility gains the benefit without the costs of ownership,
20 making customer-owned DERs even more valuable than Company-owned resources.

21 **Q. Are there policies the Commission and Kentucky Power could use to support and**
22 **drive the growth of distributed solar resources?**

²⁹ Vaughan Direct at 31.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 A. Yes, if Kentucky Power chooses to approach distributed solar as a valuable resource that
2 should be leveraged for the many benefits it offers, there are several policies they could
3 implement to support its ongoing growth, in addition to (and as improvements upon) the
4 Company's Solar Garden proposal.

5 **Q. What policies would you recommend to support and drive the growth of distributed**
6 **solar resources?**

7 A. I would recommend that Kentucky Power implement the following policies:

8 **1. Eliminate the 1% limit on net metering as an official Company policy.**

9 This would signal to the solar industry and investors that Kentucky Power is supportive
10 of distributed solar's long-term growth in the region and that the utility will not impose
11 arbitrary, unnecessary market barriers.

12 **2. Raise the cap on net metering customer system size from 45 kW up to**
13 **at least 500 kW.³⁰**

14 **3. Allow and encourage third-party ownership of distributed solar**
15 **systems (e.g., solar leases and power purchase agreements) to expand access for**
16 **residential, commercial, and industrial customers.**

17 **4. Allow and encourage Virtual Net Metering to expand access to solar,**
18 **especially for residents of multi-family housing.**

19 **5. Focus on equity and access for low- and moderate-income ("LMI")**
20 **customers with policies to reduce up-front costs and finance expenses, including on-**

³⁰ KRS 278.465–466 (requiring retail electric suppliers to offer net metering to customers with eligible generators, including solar photovoltaics, up to 45 KW. The statute does not prohibit utilities from offering net metering to customers with generators larger than 45 KW, however.).

1 **bill financing.**

2 **6. Collaborate with community partners on education, consumer**
3 **protection, and workforce development programs.**

4 **Q. With respect to your second policy in the list above, why should Kentucky Power**
5 **make net metering available for PV systems up to 500 kW capacity?**

6 A. Increasing the availability of net metering to systems up to 500 kW would significantly
7 expand the market for distributed solar in Kentucky Power’s territory, especially for
8 commercial customers such as public schools, hospitals, grocery stores, and many other
9 businesses. The current 45 kW cap limits net metering to residential and small
10 commercial customers, despite the fact that many commercial customers have loads that
11 could require hundreds of kW of solar. This creates an arbitrary and unnecessary market
12 barrier for a large group of Kentucky Power’s non-residential customers. This creates an
13 arbitrary and unnecessary market barrier for a large group of Kentucky Power’s non-
14 residential customers.

15 If larger PV systems up to 500 kW were allowed to participate in net metering,
16 the growth of distributed solar up to 100+ MW by 2030 would be more readily achieved.
17 This would expand the solar market to include many more commercial and institutional
18 roofs, in addition to ground mount structures in locations such as parking lots.

19 Expanding access to distributed solar will also more effectively leverage federal
20 incentives from the Inflation Reduction Act (“IRA”), which offers bonus tax credits to
21 commercial taxpayers and now makes the solar tax credit available to tax-exempt, non-

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 profit organizations via a “direct pay” mechanism.³¹ The economic development value of
2 distributed solar expansion on this scale, coupled with the associated influx of federal
3 resources to the region, would be substantial. Kentucky Power is in a unique position to
4 help its customers tap into these resources, which could help mitigate the effects of the
5 rate increase requested by Kentucky Power in this case and help ensure that the resulting
6 rates are fair, just, and reasonable.

7 If the Company is open to raising the cap on individual net metering system size, I
8 only recommend doing so if the Company also lifts the 1% cap on total net metering
9 capacity. If the individual cap is raised to 500 kW but the 1% cap remains in effect, the
10 result could limit the availability of net metering to residential and small business
11 customers, if many large commercial and industrial customers choose to invest in net
12 metering and use up much of the available capacity below the 1% cap.

13 **Q. How would third-party ownership support the growth of distributed solar**
14 **generation and help mitigate the effects of the proposed rate increase?**

15 A. One of the primary barriers to solar adoption is the high up-front cost for installing PV
16 systems. Solar leases and PPAs address this barrier by eliminating the up-front cost to the
17 customer and, instead, enable the customer to gradually pay for the installation over time.
18 “Under a solar lease arrangement, a homeowner enters into a service contract to pay
19 scheduled, pre-determined payments to a solar leasing company, which installs and owns
20 the solar system on the homeowner’s property.”³²

³¹ The Inflation Reduction Act, (Direct Pay) (“IRA”), H.R. Con. Res. 5376, 117th Cong. (2022) (enacted), <https://www.whitehouse.gov/cleanenergy/directpay/> (last accessed Oct. 2, 2023).

³² Nate Hausman, *A Homeowner’s Guide to Solar Financing: Leases, Loans, and PPAs*, at 4, Clean Energy States Alliance, (updated Nov. 2018), <https://www.cesa.org/wp-content/uploads/Homeowners-Guide-to-Solar-Financing.pdf>.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 With a solar PPA, the customer contracts with a developer that installs, owns, and
2 operates the solar system on the customer's property. The customer purchases all the
3 energy produced by the solar array at a specified rate per kWh, potentially lower than the
4 local utilities' kWh rate. Solar leases and PPAs can be structured so that the customer
5 achieves immediate and ongoing savings on their utility bills, with no up-front cost.³³

6 Enabling third-party ownership would increase access to distributed solar for
7 commercial, industrial, and institutional customers, such as public schools, universities,
8 churches, government facilities, and other non-profit organizations. In states where solar
9 PPAs are allowed, "[r]etail solar PPAs are often the model of choice for local
10 government solar projects."³⁴ This would provide the added community benefit of
11 enabling essential community institutions, such as public schools, to reduce their utility
12 costs and stabilize their energy bills for the long-term.

13 As of 2018, forty percent of residential solar systems in the United States were
14 installed using third-party ownership.³⁵ However, these financing mechanisms are not
15 generally available in Kentucky due to ambiguities in state regulations and statute. A PSC
16 Staff Opinion (2012-010) was issued in 2012 that addressed issues related to solar leases
17 and power purchase agreements. The Staff Opinion was prepared in response to a request
18 from then-Secretary of the Kentucky Energy and Environment Cabinet, Leonard Peters.
19 The Opinion reviewed several scenarios related to leases and power purchase agreements,
20 identifying circumstances in which leases or PPA's may be permissible under Kentucky

³³ See generally *Id.* at 5.

³⁴ IREC, *Solar Power Purchase Agreements: A Toolkit for Local Governments*, at 3-1 (Mar. 2015),
https://irecusa.org/wp-content/uploads/2021/07/Solar-Power-PPA-Toolkit_FINAL_041015.pdf.

³⁵ *Id.*

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 statute. However, the conclusion of the letter states, “This letter represents Commission
2 Staff’s interpretation of the law as applied to the facts presented. This Opinion is advisory
3 in nature and not binding upon the Commission should the issues presented herein be
4 formally presented for Commission.”³⁶

5 The Staff Opinion 2012-010 suggests that further guidance from the Commission
6 is needed to resolve uncertainties and clearly establish under what circumstances third-
7 party ownership is permissible in Kentucky. Without such guidance, in the form of a
8 declaratory order or in the context of this case, it would be imprudent for a third-party to
9 expend resources developing such a business model. If this could be done, a major barrier
10 to the distributed solar market would be removed. This would not only expand the solar
11 market but would make solar much more accessible to low- and moderate-income
12 customers. At a time when Kentucky Power is proposing dramatic rate increases, on top
13 of rates that are already a major burden on their customers, providing rates that are fair,
14 just, and reasonable must include enabling customers to take actions to control their own
15 utility costs. Allowing third-party ownership of solar energy systems is a key measure the
16 Company could implement to empower customers to control and lower their energy
17 costs.

18 **Q. What is virtual net metering?**

19 A. Virtual net metering is a utility rate structure that allows the credits from a single solar
20 array to be allocated to multiple customers’ accounts. For example, in a multi-family
21 apartment building, virtual net metering would allow the solar energy from a rooftop

³⁶ Kentucky Public Service Commission, Staff Opinion 2012-010, Letter to Hon. Leonard K. Peters, at 9 (May 18, 2012).

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 array to be credited to individual tenant's accounts, in proportion to their contractual
2 share of the solar array. Each participating tenant would receive credits on their utility
3 bill just as they would in a traditional net metering arrangement. There are variations to
4 how virtual net metering programs can be structured. For example, a program may
5 require participants to live in the building where the solar array is located. Alternately,
6 the utility may allow a solar array to be shared among any mix of its customers regardless
7 of their location, so long as the array is on the utilities' distribution system and all
8 participants are their customers. Virtual net metering can be a powerful means for
9 expanding access to solar to renters and the many people who live in multi-family
10 housing.

11 **Q. How would these policies work together to mitigate the impacts of the proposed rate**
12 **increase on Kentucky Power's low- and moderate-income populations, while**
13 **increasing equity and access to solar?**

14 A. Low-income customers face numerous barriers when it comes to accessing the benefits of
15 solar energy. This includes the high up-front cost of installation, lack of access to capital
16 and low-cost financing, low credit ratings, the fact that many low-income customers are
17 renters, and many live in multi-family housing. In a report for the Public Service
18 Commission of Wisconsin, the consulting firm Cadmus identified key policies for
19 expanding the rooftop solar market and increasing access for low-income customers.³⁷
20 Those policies included:

21 **Third-party ownership** – removes the up-front cost barrier and provides

³⁷ Jeremy Eckstein et al., *Focus on Energy 2021 Rooftop Solar Potential Study Report*, Cadmus, at 8 (Oct. 4, 2021), <https://apps.psc.wi.gov/ERF/ERFview/viewdoc.aspx?docid=421984>.

1 immediate utility bill savings.

2 **Virtual net metering** – makes net metering available to tenants in multi-family
3 housing and can be combined with third-party ownership.

4 **Provide incentives for low-income customers to cover up-front costs, as well**
5 **as home-readiness improvements.** Cadmus recommends the use of financial incentives,
6 such as rebates, to assist low-income customers with the up-front cost of solar.³⁸

7 Additionally, many low-income homes require energy efficiency investments and
8 structural improvements (e.g., roof repair or replacement) prior to installing solar.

9 Cadmus recommends that solar programs aimed at serving low-income customers should
10 offer incentives for home-readiness improvements, in addition to incentives for solar
11 installation costs.³⁹

12 **Q. What role could on-bill financing play in expanding access to and deployment of**
13 **solar energy systems, while reducing the burden of the proposed rate increases?**

14 A. On-bill financing (i.e., “Pay As You Save” or “Inclusive Utility Investments”) programs
15 offer another avenue for making solar more accessible for customers. Through on-bill
16 financing, the up-front cost of the installation is covered by the utility and paid back over
17 time via a charge on the utility bill. Payments can be structured to provide immediate and
18 ongoing utility bill savings for the customer. The charge for the solar investment remains
19 with the meter until it is paid off, rather than with the customer, which makes the
20 program available to renters. If a customer moves away and closes their account, the next
21 resident becomes responsible for paying the solar charge on the bill (and receives the

³⁸ *Id.* at 52.

³⁹ *Id.* at 48.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 benefit of the solar savings, too).

2 On-bill financing has been used for energy efficiency improvements by electric
3 utilities in multiple states, including Kentucky, and could readily be expanded to include
4 solar PV. On-bill financing should be of particular interest to Kentucky Power because it
5 provides an opportunity to earn a return on investments from power supplies located on
6 their customers' properties:

7 Tariffed on-bill programs treat improvements to the energy performance of homes
8 and buildings as an investment in system reliability and as a development of lower
9 cost distributed energy resources, such as energy efficiency. The utility employs its
10 established authority to make investments and seek cost recovery through tariffs
11 using existing mechanisms for issuing bills and collecting revenue. The investment
12 in energy savings is tied not to an individual customer but to the location until the
13 value of the utility's investment is recovered. A tariffed investment does not add to
14 the debt profile of the location owner the way a bank loan would. A notable benefit
15 of this model is that it can be utilized by renters and LMI customers, especially
16 those with limited credit or low credit scores, because the utility's investment is
17 based on the cost effectiveness of the upgrades and not the socio-economic status
18 of the billpayer at that location. . . . Customers, vendors, and capital providers using
19 the PAYS system have produced an unprecedented rate of resource efficiency
20 investment while also improving options for low cost, local, clean energy resources.
21 PAYS is the most widely used form of tariffed on-bill programs for energy
22 efficiency.⁴⁰

23 The Company should consider offering an on-bill financing program to increase access to
24 distributed solar and energy efficiency and to offset the impacts of the proposed rate
25 increase on its customers.

26

⁴⁰ Southeast Energy Efficiency Alliance, *Utility Guide to Tariffed On-Bill Programs*, at 3 (Wesley Holmes et al., eds., Feb. 2020), https://www.seealliance.org/wp-content/uploads/SEEA_TOBGuide_FINAL_UPDATED_2020_04_13.pdf.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 **Q. How can the Companies collaborate with community partners to support the solar**
2 **market?**

3 A. Based on the experience of the Joint Intervenors, who work in the communities served by
4 Kentucky Power, there is strong interest in distributed solar generation in the region.
5 KPC should leverage this community support and collaborate with partners in the non-
6 profit, private, and public sectors to drive sustained growth in the solar market. Specific
7 areas that the Company and community partners can work on would include public
8 education, consumer protection, permitting and codes, and workforce development.

9 **Q. What benefits could be gained through a robust Distributed Energy Resource**
10 **strategy supporting customer-sited solar and battery storage systems?**

11 A. Combined solar and storage systems offer enhanced values to the utility and customers.
12 For the customer, a solar plus storage system provides greater resilience and increases the
13 availability of the battery-solar system. During a grid outage, a solar-only system will
14 cease producing power for safety reasons to prevent power from back-feeding the grid,
15 thereby leaving the customer without power (a frustrating reality for many net metering
16 customers). In battery-only systems, the customer will have back-up power but be limited
17 by the storage capacity of the battery. If the outage drags on long enough, eventually a
18 battery can become discharged.

19 Combining solar plus storage creates a more resilient system—the solar array can
20 recharge the batteries even when the grid is down, providing the customer with a limited
21 but indefinite supply of electricity until the grid is repaired, which can be used to serve
22 critical loads. (That is to say, the solar array and battery will have maximum limits as to
23 how much energy they can supply in a day, but if consumption is kept within those limits,

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 the battery can continue to be recharged by sunlight each day, indefinitely). Furthermore,
2 the presence of the battery allows solar generation to be used on-site when the grid is
3 down, making the solar array more valuable to the customer. Using solar energy directly
4 also preserves stored energy in the battery.

5 Solar plus storage systems can play a vital role in improving community resilience:

6
7 In communities across the United States, public buildings, such as hospitals, police
8 departments, fire stations, and other facilities, provide critical services that require
9 continued operations during natural disasters or malicious attacks that disable the
10 electric grid. In many areas, schools or other large public buildings serve as
11 emergency shelters for prolonged recovery periods. While onsite diesel generators
12 have historically powered a majority these sites, other DER options can support a
13 microgrid system to provide the dual benefits of both backup power during an
14 emergency and efficient, onsite energy that reduces utility bills year-round.⁴¹
15

16 This resilience potential is an important feature of DERs and battery storage that
17 can provide direct benefits to Kentucky Power’s customers in their communities. The
18 ability to provide power at local critical facilities when the larger grid is down can be a
19 life-saving function of these distributed energy systems, such as during natural disasters.

20 **Q. Why is Kentucky a favorable location for Behind the Meter Storage?**

21 A study by the National Renewable Energy Laboratory (“NREL”) examined
22 where the best potential markets for behind-the-meter (“BTM”) storage might be, based
23 on utility demand charges. According to the study, “high demand charges are often cited
24 as a critical factor in battery project economics,”⁴² because the batteries can be used to

⁴¹ U.S. Dep’t. of Energy, *How Distributed Energy Resources Can Improve Resilience in Public Buildings: Three Case Studies and a Step by-Step Guide*, at 2 (Sept 2019), https://betterbuildingssolutioncenter.energy.gov/sites/default/files/attachments/How%20DERs%20Can%20Improve%20Resilience%20in%20Public%20Buildings_Three%20Case%20Studies%20and%20a%20Step-By-Step%20Guide_APRIL%20EDIT%20v3.pdf (citations omitted).

⁴² Joyce McLaren et al., *Identifying Potential Markets for Behind-the-Meter Battery Energy Storage: A Survey of U.S. Demand Charges*, NREL, at 1 (Aug. 2017), <https://www.nrel.gov/docs/fy17osti/68963.pdf>.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 shave peak loads, reducing customer demand charges. NREL identified demand charges
2 in excess of \$15 per kilowatt (kW) as creating especially favorable economics for BTM
3 storage. Their study analyzed demand charges from utilities throughout the United States
4 and noted Kentucky as one of the most favorable locations. Kentucky had the sixth-
5 greatest number of commercial customers (41,000) eligible for rates with demand charges
6 greater than \$20/kW.⁴³ Kentucky Power's Tariff IGS (Industrial General Service) fits
7 within this category, with demand charges ranging from \$17.52/kW to \$27.32/kW,
8 depending on the type of service.⁴⁴ Kentucky Power had 71 customers using Tariff IGS
9 as of March 2023.⁴⁵

10 While Kentucky Power's Industrial General Service customers would find the
11 greatest peak demand savings from on-site batteries, other commercial customers could
12 find batteries attractive for their resilience value, in addition to their financial value. This
13 includes facilities such as hospitals, nursing homes, public schools, fire departments,
14 police stations, jails, water and wastewater treatment plants, grocery stores, and other
15 food service facilities, where secure power systems that can endure grid outages could
16 provide vital services for their local communities. Unlike conventional diesel or propane
17 generators, which sit idle most of the time, a battery or solar-plus-battery back-up system
18 can be used on a daily basis to reduce demand and energy charges, while also being
19 available to provide back-up power during grid outages.

⁴³ *Id.* at 6, Table 3.

⁴⁴ Application of Kentucky Power, Section II: Filing Requirements and Exhibits A through R, Vol. 1, Exhibit E, at 61 of 194 (June 29, 2023). The demand charges indicated are as-proposed by the Company.

⁴⁵ Response of Kentucky Power Company to Commission Staff's First Request for Information, Case No. 2023-00159, Question 15 (May 31, 2023), Attach. 3.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 It is notable that Kentucky Power offers numerous Time-of-Day (“TOD”) rates
2 that incentivize customers to shift their loads into off-peak periods. Our review of
3 Company data indicates very little customer participation in these optional TOD rates.⁴⁶
4 Programs that incentivize batteries and other load-shifting technologies offer the
5 Company an opportunity to encourage more customers to use these TOD rates and reduce
6 the Company’s peak load expenses.

7 **Table 1 – Customer Participation in TOD Tariffs⁴⁷**

Tariff	Number of Customers as of March 2023
RS TOD	6
SGS TOD	500 (meeting participation cap)
MGS TOD	142
LGS TOD	7

8

9 **Q. Do DERs offer any advantages in terms of rate of deployment and execution risk?**

10 A. A significant feature of DERs, including solar and batteries, but also many other
11 technologies, is their ability to be installed in small, modular units, but in large quantities
12 and at a relatively rapid pace compared to large, centralized, utility-scale facilities.
13 Utility-scale solar and batteries will be very important elements of our electricity grid as
14 it develops in the coming years, but as the backlog on the PJM Interconnection queue
15 demonstrates, there are execution risks for these large projects. Permitting,
16 interconnection, and transmission all present potential barriers to large projects. Investing
17 in and supporting DERs provides the utilities with valuable diversity and a hedge against

⁴⁶ *Id.*

⁴⁷ *Id.*

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 execution risk for their utility-scale projects.

2 **Q. Can you point to any solar plus storage incentive programs being offered by a utility**
3 **in the Southeast?**

4 A. Yes. Duke Energy Progress in North Carolina is implementing a solar plus storage pilot
5 program called PowerPair. Duke was ordered by the North Carolina Utilities Commission
6 (“NCUC”) to develop a pilot program that would “evaluate the operational impacts to the
7 electric system of behind the meter residential solar plus energy storage.”⁴⁸ The program
8 aims to support the installation of up to 30,000 kW of solar and 40,500 kWh of battery
9 storage, in the homes of 3,000 residential customers. Duke will provide participating
10 customers with up-front payments to offset the installation costs of the solar and battery
11 equipment. In addition, some customers will receive annual performance payments for
12 allowing the utility to discharge their batteries as needed for peak demand shaving. The
13 PowerPair program was approved by the North Carolina Utilities Commission NCUC in
14 August 2023.⁴⁹

15 **Q. Have customer-sited battery storage programs been found to be cost-effective?**

16 A. Yes. An assessment for the Massachusetts *ConnectedSolutions* program concluded that
17 “(a)mong the supply-side and demand-side measures reviewed in this report, customer-

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

1 sited battery storage is by far the lowest priced new winter peaking resource now
2 available to utilities.”⁵⁰ In an accompanying report, the Applied Economics Clinic
3 (“AEC”) reported that the Commercial & Industrial program’s planned benefits exceeded
4 costs by a ratio of 4:1.⁵¹ The residential battery program’s planned benefits exceeded
5 costs by a 2:1 ratio.⁵² As was noted above, GMP in Vermont reports ratepayer savings
6 around \$3 million per year from their battery programs.

7 **IV. KENTUCKY POWER COMPANY’S RFP**

8 **Q. Do you have any comments concerning the RFP issued by Kentucky Power on**
9 **September 22, 2023?**

10 A. Yes. I am concerned that a provision in the Solar and Wind RFP will significantly limit
11 the number of applications the Companies will receive for distributed solar and wind
12 resources and thereby undermine the Companies’ ability to assess the true availability
13 and cost of distributed solar and wind resources. On p.6 of the RFP it states:

14 3.10.2. Projects must be interconnected to KPCO’s distribution electrical
15 system and must have a completed Distribution Impact Study from the
16 KPCO Distribution Planning Group prior to the Proposal Due Date. In
17 addition, the application for the Distribution Impact Study shall have a
18 utility date and time-stamp no later than September 22, 2023.⁵³

⁵¹ Bryndis Woods et al., *ConnectedSolutions: A Program Assessment for Massachusetts*, Applied Economics Clinic, at 18 (Sept. 2021), <https://www.cleangroup.org/wp-content/uploads/ConnectedSolutions-An-Assessment-for-Massachusetts.pdf>.

⁵² *Id.* at 20.

⁵³ American Electric Power Service Corporation as agent for Kentucky Power Company, Request for Proposals Power Purchase Agreements (PPAs) from Qualified Bidders for Solar Energy Resources, and / or Wind Energy Resources, at 6 (Sept. 22, 2023) (emphasis omitted), https://www.kentuckypower.com/lib/docs/business/b2b/rfp/ky/KPCO_2023_Wind_Solar_PPA_RFP.pdf.

1 Requiring bidders to have submitted applications for a Distribution Impact Study by
2 the same date the RFP was issued will greatly restrict the potential pool of proposals.
3 Considering that the RFP seeks projects to come online in January 2027 or January 2028,
4 there should be ample time for distribution-level projects to be developed, even if their
5 application for the Distribution Impact Study had not been received by the date the RFP was
6 issued. This requirement risks biasing the RFP process against distribution-connected
7 projects. In future RFPs I would recommend the Company provide respondents more time to
8 submit this application, to enable a larger number of projects to respond to the RFP.

9 **V. RECOMMENDATIONS**

10 **Q. Do you recommend that the Commission approve the proposed Distributed Solar**
11 **Garden programs proposed by Kentucky Power?**

12 A. With the modifications I explain in the following question, I do recommend the
13 Commission approve the Distributed Solar Garden program as proposed by Kentucky
14 Power.

15 **Q. What recommendations do you have for the Commission regarding the Kentucky**
16 **Power's DER programs?**

17 A. I recommend the following:

18 **1. Include evaluation of Power Purchase Agreements as an alternative to**
19 **Company ownership of the Solar Garden facilities.**

20 **2. Include battery storage in at least one of the Solar Garden locations to**
21 **provide enhanced resiliency, grid services, and additional experience with solar plus**
22 **storage systems.**

1 **3. When selecting locations for the Solar Garden facilities, consider the**
2 **locational benefits for the distribution grid. Identify locations with needs that could**
3 **be addressed by solar (or solar plus storage).**

4 **4. Allow the Solar Garden program to expand beyond 25 MW if the projects**
5 **are found to be economical.**

6 **5. Develop policies and programs to support customer-owned and -sited**
7 **DERs. Leverage customer investments in DERs to provide greater benefits and**
8 **reduced costs for all customers. In particular:**

9 a. Allow and encourage net metering to continue beyond the 1% threshold as an
10 official Company policy.

11 b. Raise the cap on individual net metering systems from 45 kW to 500 kW.

12 c. Allow third-party ownership of customer-sited solar energy systems.

13 d. Allow virtual net metering.

14 e. Develop programs to encourage customer adoption of battery storage systems
15 for reducing peak demand and customer resilience.

16 **Q. Does this conclude your testimony?**

17 A. Yes.

CASE NO. 2023-00159
DIRECT TESTIMONY OF ANDREW MCDONALD

VERIFICATION

The undersigned, Andrew McDonald, being first duly sworn, deposes and says that he has personal knowledge of the matters set forth in the foregoing testimony and that the information contained therein is true and correct to the best of his information, knowledge, and belief, after reasonable inquiry.

Andrew S. Martin

Subscribed and sworn to before me by 29 this SEP. day of 2023, 2023.

My commission expires: Aug. 24 2027

Exhibit AM-1

ANDREW SCOTT McDONALD, CEM, M.Sc.

316 Wapping St., Rm. 204 (502)699-2553
Frankfort, KY 40601 andyboeke@yahoo.com

EDUCATION & CERTIFICATIONS

- ◆ **Certified Energy Manager, Association of Energy Engineers, 2020, #26142.**
- ◆ **Slippery Rock University of Pennsylvania, 2003, M.S. in Sustainable Systems.**
- ◆ **State University of New York at Buffalo, 1992. B.A. Philosophy.**

WORK EXPERIENCE

- ◆ September 2013 – present. **Director, Apogee-Climate & Energy Transitions, Earth Tools, Inc.**
Providing design, consulting, project development, and installation services for solar energy, energy conservation, green building, and other sustainability-related projects. Performing research, advocacy, and education on sustainable energy issues, especially concerning Kentucky electric utilities.
- ◆ January 2013 – September 2013. **Independent consultant.**
Provided consulting services for green building and solar energy projects.
- ◆ January 2004 – January 2013. **Director, Kentucky Solar Partnership, Appalachia – Science in the Public Interest.**
Implemented programs to advance the use of solar, other renewable energy resources, and energy efficiency in Kentucky. Responsibilities included public education, organizing contractor training, policy research and advocacy, technical consulting, and development of demonstration projects.
- ◆ January 2003 – January 2004. **Independent Contractor.**
Provided research, design, and construction services for green building projects.
- ◆ August 2001 - December 2002: **Graduate Assistant, Robert A. Macoskey Center for Sustainable Systems Education and Research at Slippery Rock University of PA.**
Responsible for monitoring resource use at Center and developing strategies for increased resource conservation; special focus on energy systems.
- ◆ January 2001 - May 2001: **Graduate Assistant, Pennsylvania Center for Environmental Education, Slippery Rock University.**
Performed data analysis and edited a published report concerning environmental education.
- ◆ January 2000 - July 2000: **Conservation Assistant, Frontera Audubon Society, Harlingen, Texas.**
Provided research, networking and logistical support for a federal lawsuit.
- ◆ April 2000 - June 2000: **Crew Leader, U.S. Census Bureau, Harlingen, Texas.**
- ◆ October 1995 - May 1999: **Staff and Resident, Proyecto Fe y Esperanza/Casa Juliana, Alamo, Texas.**
Proyecto Fe y Esperanza (PFE) operated a demonstration center for sustainable living and environmentally appropriate technology. Located in a low-income, Mexican-American immigrant farm-worker community, PFE worked in various ways to improve the quality of life in this community.
 - January 1998 - May 1999: **Project Director**
Coordinated the reorganization of PFE during transitional period. Managed merger of PFE with a program offering experiential education tours of the US/Mexico border.
 - May 1997 - May 1999: **Appropriate Technology Program Coordinator**
Maintained and developed PFE's Appropriate Technology (AT) Demonstration Center; consulted with regional groups and individuals regarding AT and sustainable living; contracted to build various AT systems (i.e. solar water heaters, solar cookers, cisterns, compost toilets); collaborated with local organizations, e.g. Habitat for Humanity, on community development projects; designed and co-authored technical manuals and other educational materials.

- ◆ October 1997 - December 1997: **Member, Solar Cooker Team, Cuzco and Arequipa, Peru.**
Introduced solar cookers in three communities, trained local people in their construction and use, and did follow-up work in two communities we had worked with in 1994 (see below).
- ◆ July 1996 - October 1996: **Educator for Composting Program, City of Alamo, Texas.**
- ◆ January 1995 - September 1995: **Volunteer, United Farm Workers Organic Farm Cooperative, Alamo, Texas.**
Assisted in all aspects of farm operations, management, and organizational development.
- ◆ January 1994 - June 1994: **Member, Solar Cooker Team, Arequipa, Peru.**
At invitation of Medical Mission Sisters, we worked to design an economical, efficient solar cooker using locally available materials. We trained local people in construction and use of solar cookers; helped design Spanish-language pamphlet explaining use and construction of cooker.
- ◆ September 1992 - October 1993: **Waste Watch Coordinator, Appalachia - Science in the Public Interest, Livingston, Kentucky.**
Performed research, authored publications, and organized workshops.

Other Relevant Work Experiences

- ◆ Performed complete renovation of farm house using green building strategies to achieve an energy efficient, net-zero-electricity passive solar home for my family (2010 – present).
- ◆ Installed 2.1 KW solar photovoltaic system at my home, achieving net-zero electricity usage for our home and farm (2011, expanded in 2017). Expanded solar photovoltaic system to 7.3 KW in 2020.
- ◆ Assisted my wife in operation of a certified organic vegetable farm (2005 – 2022).
- ◆ Designed and installed battery-based PV system, solar water heater, and water pumping system from rainwater cistern for off-grid straw-bale house, Frankfort, Kentucky, 2013.
- ◆ Designed and developed 30 grid-tied or off-grid solar PV systems, including first solar lease in Kentucky, 2014 – present.
- ◆ Provided consulting services for Stonebridge Hospitality, Inc., owner of four hotels in Frankfort, Kentucky, regarding energy efficiency and sustainability improvements to their hotels (2010 – 2011).
- ◆ Designed 12 KW solar photovoltaic system for Earth Tools, Inc. and provided technical support in drafting a successful USDA REAP Grant application. Installation completed September 2011. Have prepared four successful USDA REAP Grant applications in total.
- ◆ Designed and managed installation of 17 solar water heating systems, serving 68 apartments, for the Housing Authority of Owensboro, Kentucky, 2010.
- ◆ Consulted with the Frankfort YMCA on renovation of solar thermal pool heating system, 2007 – 2010.
- ◆ Managed installation of solar water heaters on homes of seven families in Eastern Kentucky, 2008 – 2009.
- ◆ Developed and managed statewide rebate program for solar water heaters, 2006 – 2007.
- ◆ Provided educational presentations to the public about solar electric and solar water heating systems.
- ◆ Co-chaired the Frankfort Mayor’s Task Force on Energy Efficiency and Climate Change, 2007.
- ◆ Participated in Al Gore’s Climate Reality Project training (2008) and have made numerous public presentations about climate change and the energy transition.
- ◆ Consulted on green design features for the CHIPS Group Home in Pulaski, Pennsylvania, for RCI Company Architects, 2002 - 2003.
- ◆ Have implemented and managed multiple Federal and state grant projects, including from US Departments of Energy, Agriculture, EPA, and Kentucky Office of Energy Policy.

- ◆ Co-authored "Greening the New Science and Technology Center" for the Dean of the College of Health, Environment and Science at Slippery Rock University, April 2002.
- ◆ Designed and installed a solar electric system at the Robert A. Macoskey Center for Sustainable Systems Education and Research, April 2002, Slippery Rock, Pennsylvania.
- ◆ Led reconstruction of a root cellar, summer 2001, Frankfort, Kentucky.
- ◆ Assisted construction of a passive solar, timber frame house, including installation of a solar electric system and composting toilet in Frankfort, Kentucky, 2000.
- ◆ Led Composting Toilet Design workshop at Cedar Ring Congress, Frankfort, Kentucky, April 1997.
- ◆ Co-hosted weekend solar oven construction workshops, Frankfort, Kentucky, October 1994 and 1995.
