Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

PUBLIC KSES-DR-01-002
(As to Attachment 2 only)

REQUEST:

For each East Bend and Woodsdale generating unit, provide the following historical annual data by unit, or, if Duke does not maintain unit-level data, by plant, from 2018 to present:

- a. Fixed O&M cost
- b. Non-fuel variable O&M cost
- c. Fuel costs
- d. Capital costs
- e. Heat rate
- f. Generation
- g. Capacity rating
- h. Capacity factor
- i. Forced outage rate
- j. Planned outage rate
- k. Energy revenues
- l. Capacity revenues
- m. Ancillary services revenues.
- n. Unforced capacity (“UCAP”)

RESPONSE:

CONFIDENTIAL PROPRIETARY TRADE SECRET (As to Attachment 2 only)

Objection. Duke Energy Kentucky objects to this request as overly broad and unduly burdensome, particularly the portion of the request seeking data from 2018-2024. Duke Energy Kentucky also objects to this request to the extent it seeks a calculation or compilation that has not already been performed and that Duke Energy Kentucky objects to performing. Duke Energy Kentucky objects to this request to the extent it seeks information not maintained by the Company in the ordinary course of business.

- a. Please see KSES-DR-01-002 Attachment 1.
- b. See objection. Duke Energy Kentucky does not maintain this information.
- c. Please see KSES-DR-01-002 Confidential Attachment 2. Fuel costs are provided at a plant level.
- d. Please see KSES-DR-01-002 Attachment 1.
- e. Please see KSES-DR-01-002 Confidential Attachment 2.
- f. Please see KSES-DR-01-002 Confidential Attachment 2.
- g. Please see KSES-DR-01-002 Confidential Attachment 2.
- h. Please see KSES-DR-01-002 Confidential Attachment 2.
- i. Please see KSES-DR-01-002 Confidential Attachment 2.
- j. See objection. Duke Energy Kentucky does not maintain this information. Answering further, please see KSES-DR-01-002 Confidential Attachment 2 for Equivalent Planned Outage Rate (EPOR).
- k. Please see KSES-DR-01-002 Confidential Attachment 2.
- l. Total net capacity revenues are provided in the table below. Note that excess capacity revenues are sold and are only realized after the Company has utilized its generation resources to satisfy its FRR Plan. Excess capacity sales may not occur in every year.

2018	\$ 2,026,798
2019	\$ 0
2020	\$ 0
2021	\$ 0
2022	\$ 1,537,235
2023	\$ 1,300,148
2024 YTD Thru July	\$ 153,040

m. Ancillary services revenues, as defined by Duke Energy Kentucky, are provided in the table below. For the purposes of this response, Duke Energy Kentucky defines the following PJM Billing Line Items (BLI) as ancillary services; BLI 2330, BLI 2340, BLI 2360, BLI 2361, BLI 2362, BLI 2365, BLI 2366, BLI 2367, BLI 2368, and BLI 2380.

2018	\$ 3,732,763
2019	\$ 2,622,320
2020	\$ 2,627,149
2021	\$ 3,105,090
2022	\$ 6,225,308
2023	\$ 3,605,644
2024 YTD Thru July	\$ 2,606,862

n. PJM Unforced capacity (“UCAP”) period runs from June – May annually.

	2018/2019	2019/2020	2020/2021	2021/2022	2022/2023	2023/2024	2024/2025

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-003

REQUEST:

For each East Bend and Woodsdale generating unit, provide the following historical annual data by unit, or, if Duke does not maintain unit-level data, by plant, for the years 2023 through 2037:

- a. Fixed O&M cost
- b. Non-fuel variable O&M cost
- c. Fuel costs
- d. Capital costs
- e. Heat rate
- f. Generation
- g. Capacity rating
- h. Capacity factor
- i. Forced outage rate
- j. Planned outage rate
- k. Energy revenues
- l. Capacity revenues
- m. Ancillary services revenues

RESPONSE:

Actuals for 2023 not available. Projections for 2024-2037 are attached when available for preferred portfolio.

- a. Please see KSES-DR-01-003 Attachment.
- b. Please see KSES-DR-01-003 Attachment.
- c. Please see KSES-DR-01-003 Attachment.
- d. N/A
- e. Please see KSES-DR-01-003 Attachment.
- f. Please see KSES-DR-01-003 Attachment.
- g. Please see KSES-DR-01-003 Attachment.
- h. Please see KSES-DR-01-003 Attachment.
- i. Can be found in SIERRA-DR-01-003 response.
- j. Planned Outage Rate can be found using the following formula: $1 - (\text{Availability} - \text{Forced Outage Rate}) = \text{Planned Outage Rate}$. Forced Outage Rate and Availability by unit can be found in SIERRA-DR-01-003.
- k. N/A
- l. N/A
- m. N/A

REQUEST:

Regarding East Bend Unit 2, please answer the following:

- a. Please describe the gas supply capacity currently available to East Bend 2.
- b. Please explain whether existing gas supply infrastructure available to East Bend 2 would be adequate to meet the unit's full requirements if operated as a dual fuel unit.
 - i. If additional gas supply infrastructure would be necessary to operate East Bend 2 as a dual fuel unit, please describe the necessary infrastructure, provide cost estimates, and explain in full how the estimated costs were included in the IRP modeling.
- c. Please explain whether existing gas supply infrastructure available to East Bend 2 would be adequate to meet the unit's full requirements if fully converted to gas-fired operation.
 - i. If additional gas supply infrastructure would be necessary to operate East Bend 2 fully on gas, please describe the necessary infrastructure, provide cost estimates, and explain in full how the estimated costs were included in the IRP modeling.

RESPONSE:

- a. There is currently no gas supply to East Bend 2.
- b. See response to part (a).

- i. In order to supply gas to East Bend 2 as a dual-fueled unit, a new lateral would need to be constructed to connect the unit to an interstate pipeline. The costs included in the IRP modeling were based on a high-level budgetary estimate of the lateral and firm transportation costs provided by the interstate pipeline company.
- c. See response to part (a).
 - i. In order to supply gas to East Bend 2 as a fully converted unit, a new lateral would need to be constructed to connect the unit to an interstate pipeline. KSES-DR-01-005

REQUEST:

According to Form EIA-861 “Advanced Meters” (2022), over 99% of Duke Energy Kentucky customers have advanced metering infrastructure. Please answer the following requests:

- a. Is the information in Form EIA-861 accurate? If more accurate or recent details on advanced meters is available, please provide that information.
- b. Has the Company implemented conservation voltage reduction? If so, please explain the efforts undertaken.
- c. Please explain how the Company’s investment in advanced meter improves the efficiency or quality of service to customers.

RESPONSE:

Objection. This request is overly broad, unduly burdensome, and seeks information that is irrelevant to this proceeding. Without waiving said objection and to the extent discoverable,

- a. Confirmed as accurate.
- b. Objection. This request seeks information that includes undefined terms such as “conservation voltage reduction” and thus cannot be answered without engaging in unreasonable speculation and guess work.
- c. Objection. This request seeks information that is irrelevant to this proceeding. Without waiving said objection, and to the extent discoverable, please see the

Company's Application and testimony in Case No. 2016-152, where the Commission approved the AMI deployment. A non-exhaustive list of efficiency and quality of service improvements that AMI provides or enabled includes, but is not limited to the following:

- Read meters remotely.
- Connect and disconnect meters remotely.
- Capture and provide energy usage data.
- Allow a customer to pick their own due date.
- Provide usage alerts.
- Support remote power quality analysis.
- Support real time power verification (Ping It)
- Provide tamper detection events.

PERSON RESPONSIBLE: Legal-as to objection.
Jacob Colley

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-006

REQUEST:

Please refer to the Kentucky 2024 Duke Energy Integrated Resource Plan (“2024 IRP”) at p. 2, and the statement that “Duke Energy Kentucky, Inc. (Duke Energy Kentucky or the Company) is a wholly-owned subsidiary of Duke Energy Ohio, Inc. (Duke Energy Ohio),” and the statement at p. 10 that “Electric energy and peak demand forecasts are prepared each year as part of the planning process by a staff that is shared among Duke Energy Corp. (Duke Energy) affiliated utilities.” Please explain the relationship between Duke Energy Kentucky, Duke Energy Ohio, Duke Energy Ohio/Kentucky (DEOK) and Duke Energy.

RESPONSE:

Duke Energy Kentucky is a utility providing electric and natural gas service in Northern Kentucky. Duke Energy Kentucky is a wholly-owned subsidiary of Duke Energy Ohio, Inc., meaning Duke Energy Ohio is Duke Energy Kentucky’s immediate parent company. Both Duke Energy Ohio and Duke Energy Kentucky are utility operating companies under the Duke Energy Corp., (Duke Energy) holding company.

DEOK is the local delivery area zone for the northern Kentucky/ southwestern Ohio regions in PJM. For the PJM delivery zone map, see:

https://www.monitoringanalytics.com/reports/PJM_State_of_the_Market/2017/2017-som-pjm-volume2-appendix.pdf

PERSON RESPONSIBLE: Matthew Kalemba

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-007

REQUEST:

Please refer to the 2024 IRP at p. 3, particularly that, as compared to the 2021 IRP, “the 2024 IRP includes updated policies at both the state and federal level including: . . . Removal of a CO2 tax on plant emissions as a likely future policy primarily due to the inclusion of the IRA and EPA CAA Section 111 provisions.”

- a. Please list additional justifications for removing a CO2 tax on plant emissions in the 2024 IRP, if any.
- b. Please explain why a CO2 tax on plant emissions was not included in scenarios that assumed EPA’s CAA Section 111 provisions would be stayed or eventually repealed.
- c. Please explain how scenarios that assumed EPA’s CAA Section 111 provisions would be stayed or repealed accounts for regulatory risk of carbon emitting generating sources.

RESPONSE:

- a. An additional justification for not including a CO2 tax is that there is no current legislation being considered requiring a CO2 tax on plant emissions and there is currently no proposed legislation being considered contemplating a CO2 tax.
- b. A CO2 tax was not included in scenarios that assumed EPA’s CAA Section 111 provisions would be stayed or eventually repealed because 1) there is no current

legislation being considered requiring a CO2 tax and 2) this scenario is helpful in testing the sensitivity of the portfolios in the absence of any carbon regulation.

- c. As stated above, this scenario is helpful in testing the sensitivity of the portfolios in the absence of any carbon regulation. The “With EPAC CAA Section 111 Update” and “Without EPA CAA Section 111 update” scenarios, in tandem, are helpful for evaluating the risk of carbon regulation as one can view the cost deltas of different pathways with and without carbon regulations.

PERSON RESPONSIBLE: Matthew Kalemba

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-008

REQUEST:

Please refer to the 2024 IRP at pp. 8-9, and the statement that “Future regulation cannot be forecasted in a quantitative manner; therefore, the current regulatory environment is assumed to persist throughout the planning period. The one major exception to that assumption is regarding a stay of, future changes to, or repeal of the EPA CAA Section 111 Update, which, given its potential impact, is addressed in several sensitivities under a ‘without EPA CAA Section 111 Update’ scenario,” and answer the following requests:

- a. What makes the EPA CAA Section 111 Update different from other regulations in regard to quantification?
- b. Refer also to p. 11, “Environmental Regulations Included in the IRP.” Did the Company consider the impacts of any other environmental regulations than those listed here?
- c. Did the Company consider the impact of the Reconsideration of the National Ambient Air Quality Standards (“NAAQS”) for Particulate Matter (“PM”) (“2024 PM2.5 NAAQS”)?
 - i. If so, how? If not, why not?
 - ii. Please refer to the statement at p. 130 that “[a]s to Duke Energy Kentucky, a likely impact of the more stringent PM NAAQS would be increased permitting requirements for projects that are located in a nonattainment area. Under the Clean Air Act, a new major source of air pollutants or a major modification to

an existing source must obtain preconstruction permits, that demonstrate through air quality modeling that the source will not cause or contribute to a NAAQS violation.” Did the Company assess the additional cost for any of its portfolios of additional preconstruction permitting? If so, provide the results of any such assessment. If not, why not?

- d. Did the Company consider the impact of the Federal “Good Neighbor Plan” (“GNP”) for the 2015 Ozone National Ambient Air Quality Standards (“2015 Ozone GNP”)? If so, how? If not, why not?
- e. Did the Company consider the impact of the Hazardous and Solid Waste Management System: Disposal of Coal Combustion Residuals From Electric Utilities; Legacy CCR Surface Impoundments rule (“Legacy CCR Rule”)? If so, how? If not, why not?

RESPONSE:

- a. The EPA CAA Section 111 Update is different from other regulations in regard to quantification because the requirements to comply with EPA CAA Section 111 Update are known, measurable, and able to be modeled. Future regulations that are not yet in place call for speculation that could lead to results that are not meaningful or actionable.
- b. No
- c. (i) The Company did consider the impact of the “2024 PM2.5 NAAQS” and determined that future air permitting would be subject to non-attainment requirements (LAER instead of BACT) for only those pollutants that contribute to PM2.5. East Bend is already equipped with a precipitator, SCR, and wet-FGD, therefore no changes or additions to the existing control technology are anticipated.

(ii) Under the Clean Air Act, all new major sources of air pollutants or a major modification to an existing source must obtain preconstruction permits, regardless of whether or not the facility is located in an area that is identified as being in non-attainment with one or more of the NAAQS. The company has not specifically estimated the cost difference for obtaining a permit authorizing DFO operation between attainment areas and non-attainment. However, the incremental cost between the two is anticipated to be very minor and certainly a small fraction of the overall project price.

- d. Effective November 3, 2023, EPA approved the Commonwealth of Kentucky's request to redesignate the Northern KY portion of the Cincinnati, OH-KY 2015 8-Hour Ozone Nonattainment Area to Attainment. The Ohio portion of this non-attainment area had previously been redesignated by EPA to attainment. Currently the Good Neighbor rule is being litigated and in 2023 its effect in Kentucky was stayed. The Company did however consider the requirements of the Federal "Good Neighbor Plan" (GNP) for the 2015 Ozone National Ambient Air Quality Standards (2015 Ozone GNP) as part of its planning process. At this time, it is not anticipated that East Bend plant would require an SCR performance upgrade in order to meet the requirements of this rule. Rather the SCR will continue to require routine maintenance and periodic catalyst replacement.
- e. No, those costs were not considered. Since much of the focus of the new CCR rule is on legacy facilities, those costs would be the same under any scenario and thus would not be helpful in identifying differences between proposed portfolios.

Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-009

REQUEST:

Please refer to the 2024 IRP at p. 9, particularly that “[t]he Company included supply and demand-side resource for consideration if they are technically feasible and commercially available in its service territory during the planning window,” and answer the following requests:

- a. Confirm that the Company considers CCS “technically feasible and commercially available in its service territory.” If anything but confirmed, please explain.
- b. Confirm that the Company considers CCS of emissions from a combined 10 cycle gas plant “technically feasible and commercially available in its service territory.” If anything but confirmed, please explain.
- c. Confirm that the Company considers SMRs “technically feasible and commercially available in its service territory.” If anything but confirmed, please explain.
- d. Please refer also to the statement at p. 12 that “[t]he first step in the screening process for supply-side resources is a technical screening to eliminate from consideration those technologies that are not technically or commercially available during the planning window. Technologies excluded from consideration on these grounds include solar steam augmentation, fuel cells, supercritical CO2 Brayton cycle, and liquid air energy storage.” Produce any analysis, study, or other references relied upon in determining that the technologies listed are not technically or commercially available during the planning window.

- e. Please refer also to the statement at p. 12 that “[a]lso excluded from further consideration are technologies that are not feasible or available in the Duke Energy Kentucky service territory. These include geothermal, offshore wind, pumped storage hydropower, and compressed air energy storage.” Please produce any analysis, study, or other reference relied upon in determining that the technologies listed are not feasible or available in the Duke Energy Kentucky service territory.
- f. Confirm whether all resources outside the Duke Energy Kentucky service territory were excluded from consideration.

RESPONSE:

- a. At the time the IRP was developed, the Company believed that CCS may be feasible and commercially available as early as the 2035 timeframe. However, given that the technology is still nascent, the Company did not assume this technology was available in its preferred portfolio. See page 38 of the Duke Energy Kentucky IRP for more information.
- b. At the time the IRP was developed, the Company believed that CCS may be feasible and commercially available as early as the 2035 timeframe. However, given that the technology is still nascent, the Company did not assume this technology was available in its preferred portfolio. See page 38 of the Duke Energy Kentucky IRP for more information.
- c. At the time the IRP was developed, the Company believed that SMRs may be feasible and commercially available as early as the 2038 timeframe. However, given that the technology is still nascent, the Company did not assume this technology was available in its preferred portfolio.

- d & e: • Solar steam augmentation: This is a regional specific technology that requires high daily sunshine and low to no cloud/rain cover to maintain the paired storage system at an elevated temperature, which is typically only seen in desert climates. The climate in Kentucky is not conducive to this technology.
- Fuel cells: Fuel cells are typically a distributed resource that are not competitive with large scale turbines. Distribution-level technologies are typically not included with capacity expansion planning.
- Supercritical CO2 Brayton Cycle: This is a new technology that's in the demonstration phase. It has not yet reached technical maturity to be included in the modeling, and it also has many unknown parameters that need to be determined during testing. This is a technology that the company continues to track.
- Liquid air energy storage: This is among the many varieties of long duration energy storage, and it is still being demonstrated. Long duration energy storage as a whole is under evaluation for inclusion in the models.
- Geothermal: Traditional geothermal requires very specific geology to build, and the Kentucky territory does not have favorable geology for this technology.
- Offshore wind: Offshore wind has been considered for coastal areas with ocean access. The Kentucky territory does not have access to the large water areas required for offshore wind.
- Pumped storage hydropower: Pumped storage requires geology with an upper and lower water basin to allow for pumping and discharge, which is

typically not found in many areas of the country. There are also substantial environmental impacts associated with new pumped storage plants, so it is unlikely that a new pumped hydro facility would be able to be licensed.

- Compressed air energy storage: Traditional compressed air energy storage requires specific underground geology to hold the compressed air energy. That specific geology is uncommon and does not exist in the Kentucky territory to Duke Energy's best knowledge.
- f. Wind PPAs outside the Duke Energy Kentucky service territory were included in the IRP. Please see page 39 of the Duke Energy Kentucky IRP for more information regarding resources located outside of the DEOK zone.

KSES-DR-01-010

REQUEST:

Please refer to the 2024 IRP at p. 9, particularly that “[t]he primary criteria for evaluating each portfolio is affordability using PVRR as the metric, CO2 reduction and level of market purchases.”

- a. Please explain why CO2 reduction was selected as a primary criteria for evaluating portfolios.
- b. Please explain why “level of market purchases” was selected as a primary criteria for evaluating portfolios. Confirm that the Company considers CCS “technically feasible and commercially available in its service territory.” If anything but confirmed, please explain.

RESPONSE:

- a. Duke Energy has publicly stated carbon reduction goals (subject to regulatory approval) and as such it is a variable that is tracked in any portfolio, in any jurisdiction that Duke Energy operates in. However, this is just one criterion that must be weighed against other criteria that are required to be considered in the jurisdictions Duke Energy operates in.
- b. Level of market purchases is a primary criterion for evaluating portfolios because it reflects the potential dependence Duke Energy Kentucky has on the market to supply its energy. Higher dependence on market purchases signifies that Duke Energy Kentucky customers have a greater exposure to power price fluctuations.

- c. The Company converts the third-party’s 9–10-year short-term cost projections from nominal \$ to real \$. For proceeding years, the Company uses the AEO forecasted annual cost growth factors and applies them to the last year of the third-party's projected capital cost.
- d. At this time, the Company has not analyzed the historical accuracy of AEO forecast factors.
- e. At this time, the Company is unaware of any analysis evaluating the AEO forecast factors’ historical accuracy.

KSES-DR-01-014

REQUEST:

Please refer to the statement at p. 14 of the 2024 IRP that “Annual US coal consumption has fallen over 30% in the last decade in response to coal plant retirements and relatively low natural gas prices.” Does the Company anticipate that coal supply will decline, remain steady, or increase over the forecast period?

RESPONSE:

According to U.S. Energy Information Administration (EIA) data, 2024 coal production is expected to decline 14% from 2023 production levels and is forecasted to drop an additional 5% in 2025. Although coal exports in the EIA forecast remain robust, ongoing declines in coal production are the result of less coal being used to generate electric power domestically due to relatively low natural gas prices and 12 GW of coal-fired electricity generating capacity going into retirement. As domestic coal generating capacity is expected to continue to retire over the next several years, the Company anticipates coal supply will continue to follow a similar downward trend in response to lower domestic demand.

KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-015

REQUEST:

Please refer to the 2024 IRP at p. 16-25, Section 3.B. Power Prices, and answer the following requests:

- a. Please provide the hourly energy price outputs for each of the six generation expansion plan scenarios (listed in Table 3.1) in excel format, if possible.
- b. At p. 16, the IRP states, “generic unit characteristics and reserve margin requirements are consistent across expansion plans for each of the operating regions.” Please explain the meaning of “operating regions” as used in this statement.
- c. At p. 16, the IRP states, “[e]xisting generating units were allowed to economically retire in each scenario.” For each expansion plan scenario, please identify the generating units retired by the model and the year selected for economic retirement.
- d. Were the hourly energy prices modeled in the generation expansion plan scenarios used in the resource modeling described in Section 6 of the IRP? If so, please identify which energy price forecast was used in each modeling exercise summarized in Section 6.
- e. Were the base, high, and low fuel forecasts used in the generation expansion plan scenarios also used in the resource modeling described in Section 6 of the IRP? If so, please explain in full.

- f. Compare figure 3.6 at p. 19 with figures 3.4, 3.8, 3.10, 3.12, and 3.14 and explain the difference in 2025-2050 projections. Compare also with figure 3.5 and confirm whether the graph appears to show growth in capacity, not generation.

RESPONSE:

- a. Please see KSES-DR-01-015(a) Attachment.
- b. Operating regions refer to the various Balancing Authorities in the Eastern Interconnection within the National Database.
- c. Please see KSES-DR-01-015(c) Attachment.
- d. Energy prices used in local modeling described in Section 6 came from the subsequent production cost run that used the expansion plan developed in the capacity expansion run. All runs labeled “Without EPA CAA Section 111 Update” used the 24S Ref PC power prices found in the excel document from part a. of this question, and all scenarios labeled “With EPA CAA Section 111 Update” used the 24S EPA 111 PC power price found in the excel document from part a. of this question. The high and low fuel sensitivities on the preferred portfolio used the 24S EPA 111 High Fuel and 24S EPA 111 Low Fuel power prices found in the excel document from part a. of this question.
- e. The base, high, and low fuel forecasts were used in the generation expansion plans scenarios in Section 6. The base fuel forecasts were used in all optimized and alternate portfolios listed in Tables 6.1-6.17. The high and low fuels forecast was used in sensitivity analysis listed in Tables 6.19-6.20. The purpose of the high and low fuels forecast portfolios was to analyze how the portfolio from the base fuel forecast may be affected due to a change to the fuel price.

f. Figure 3.6 is showing the incorrect data, the data shown in the IRP report is Capacity (MW). The corrected figure 3.6 is shown below:

Figure 3.6: With EPA CAA Section 111 Update, High Fuels, Generation (GWh)

Figure 3.5 shows the capacity under the EPA CAA Section 111 Update with high fuels, and the above corrected Figure 3.6 shows the generation under the same scenario.

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-016

REQUEST:

Please refer to Section 3.D., Inflation Reduction Act Assumptions.

- a. What IRA benefits aside from the Production Tax Credits (PTC) and Investment Tax Credits (ITC) did the Company evaluate?
- b. What IRA benefits has the Company applied for?
- c. Has the Company evaluated the Grid Resilience and Innovation Partnerships (GRIP) Program?
- d. Has the Company evaluated the Energy Infrastructure Reinvestment (EIR) Program?
- e. Has the Company evaluated the Transmission Facilitation Program (TFP)?
- f. Please provide any evaluation, documentation, communication, letter of interest, or application related to the Company's engagement with any IRA programs.
- g. If the Company has not evaluated any other IRA programs explain why not.

RESPONSE:

- a. For the IRP modeling, the company only evaluated/modeled the relevant IRA benefits including production tax credits and investment tax credits. However, outside the IRP process, the Company is also evaluating other IRA benefits, such as the Home Energy Rebates Program and Solar for All which will be funded through and managed by the KY Energy and Environment Cabinet.

- b. The Company has not applied for IRA benefits at this time as IRA tax credits are not applied for prior to project development.
- c. Yes. The Company has evaluated, decided to pursue, and has been actively engaged in submitting Concept Papers & Applications for the GRIP Program since the first FOA for 1st Round funding in late 2022. The Company was unsuccessful in securing an award during the Department of Energy’s (DOE) 1st Round solicitation and is awaiting a final decision from DOE for its 2nd Round solicitation.
- d. The Company has not evaluated the EIR program for any specific projects within Duke Energy Kentucky.
- e. Yes, the Company evaluated but did not pursue the Transmission Facilitation Program.
- f. Objection. This request is overly broad as to scope in seeking “any evaluation, documentation, communication, letter of interest, or application related to the Company’s engagement with any IRA programs” and thus is unduly burdensome, vague, and ambiguous. Further, this request seeks information that is neither relevant nor likely to lead to the discovery of any relevant information and contains undefined terms with respect to engagement and thus would require speculation and guesswork to respond.
- g. The Company has modeled all IRA programs that are directly applicable in its IRP modeling, including production tax credits and investment tax credits.

PERSON RESPONSIBLE:

As to objection, Legal
As to responses, Jennifer Poppler
Paige Swofford
Matt Kalemba

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-017

REQUEST:

Please refer to the 2024 IRP at p. 28, and the statement that “Energy community bonuses are based on siting projects on retired coal generation sites or closed mined sites, brownfield sites or statistical area categories with historical employment in fossil areas and high unemployment. It was assumed that 25% of standalone solar, 25% of solar plus storage and 25% of batteries would be located in energy communities and that 100% of SMRs would be located in energy communities.” Answer the following requests:

- a. What portion of the Duke Energy Kentucky service territory qualifies as an energy community?
- b. What is the basis for the assumption that 25% of standalone solar would be located in energy communities?
- c. What is the basis for the assumption that 25% of solar plus storage would be located in energy communities?
- d. What is the basis for the assumption that 25% of batteries would be located in energy communities?
- e. What is the basis for the assumption that 100% of SMRs would be located in energy communities?

RESPONSE:

- a. Based on the US Department of Energy (DOE) Inflation Reduction Act (IRA) Energy Community Tax Credit Bonus map, it is anticipated approximately 25% of

the Company's service territory may qualify as an energy community. Energy communities are updated annually, and subject to change.

- b. Locating in an Energy Community is one parameter when considering siting a renewable facility. Limited available land within an energy community, ability to contract for the land, supportive topography, transmission, environmental conditions, permitting, and stakeholder impacts are considerations that are evaluated in development.
- c. See response 01-017(b)
- d. To the extent feasible, batteries would be sited in Energy Communities. However, similar constraints exist in development, including available transmission, permitting and stakeholder impact.
- e. SMRs were only included in modeling if they acted as a replacement for East Bend. For modeling purposes, it was assumed that these resources would be placed at or near the retiring coal generation site such that they were eligible for the energy community bonus.

PERSON RESPONSIBLE: Matthew Ruscio

REQUEST:

Please refer to the 2024 IRP at p. 28, and the statement that “From review of studies from Rhodium, REPEAT, Resources for the Future, Energy Innovation and other recent IRPs, Duke Energy has determined that the 75% reduction from 2022 levels will not be reached until the mid-2040s at the earliest.” Please provide the referenced studies and other recent IRPs, or publicly-accessible links to each.

RESPONSE:

Please see the links to the reports below. Also, an additional NREL report.

PERSON RESPONSIBLE: Jennifer Poppler

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-019

REQUEST:

Please refer to the IRP at p. 28, including the statement that Duke “assumed that 25% of standalone solar, 25% of solar plus storage, and 25% of batteries would be located in energy communities and that 100% of SMRs would be located in energy communities.”

- a. Please explain how this 25% assumption was applied in the modeling (e.g., are their particular solar resource options with cost assumptions that include the energy community adder and other solar resource options without the energy community adder).
- b. Has Duke mapped or otherwise analyzed the sites in the DEOK PJM load zone that would likely qualify as energy communities? If so, please provide any such maps or analyses.
- c. Please explain why a battery storage would be more or less likely to be sited in an energy community than a SMR.
- d. Please explain why a solar resource would be more or less likely to be sited in an energy community than a SMR.

RESPONSE:

- a. For the Inflation Reduction Act ITC credits, if the baseline wage and apprenticeship guidelines are met, then the project qualifies for 30% ITC. If the Energy Community requirements are met, then the project will qualify for 40% ITC. From internal discussion, it was decided that about 25% of SPS and Standalone storage

would be able to be sited at Energy Communities. The 25% assumptions were modeled by assuming the that 25% of all storage behind solar and standalone storage would receive a 40% ITC and that 75% of all storage would receive a 30% ITC. These components were weighted and resulted in a 32.5% ITC for all storage. Since the sites are generic at this point, we assume the 25% of the storage additions will all be located in Energy Communities and use one ITC for all.

SMRs receive a 40% ITC to reflect Energy Community.

The standalone solar and the SPS solar receives portions of two PTC curves. The first PTC curve is one based on meeting wage and apprenticeship guidelines and the second PTC curve is based on additionally meeting energy community guidelines. These two curves are weighted at 25% energy community and 75% wage and apprenticeship PTCs.

- b. Duke has used publicly available data, such as the US Department of Energy (DOE) Inflation Reduction Act (IRA) Energy Community Tax Credit Bonus map. IRA Energy Communities are updated annually by the IRS, and subject to change.
- c. Battery storage footprints will be smaller than SMRs, so from a size perspective, storage may be more likely to be sited in an energy community than an SMR. However, there will be many more storage sites than SMRs sites, so there will be less sites available for all the storage projects. In addition, some storage may be sited for transmission issues and therefore not be able to be sited in an Energy Community.
- d. Solar footprints can be large and there will be many more solar sites than SMR sites, so solar is less likely to be sited in an energy community than an SMR.

PERSON RESPONSIBLE: Matthew Kalemba

Date Received: August 14, 2024

KSES-DR-01-020

REQUEST:

Please refer to the 2024 IRP at p. 30, and the statement that “Executing on these compliance pathways will require updates to Kentucky statutes.” Answer the following requests:

- a. Please explain what updates to Kentucky statutes the Company is referring to.
- b. Explain what updates to Kentucky statutes the Company believes will be required.
- c. Explain how the Company intends to comply if statutes are not amended.

RESPONSE:

- a. Objection. Calls for legal opinion and seeks information that is protected under the doctrine of attorney client privilege. Without waiving said objection and to the extend discoverable, the Company is referring to K.R.S. § 224.20-142, specifically paragraph (3).
- b. Objection. Calls for legal opinion and seeks information that is protected under the doctrine of attorney client privilege.
- c. Objection. Calls for legal opinion and seeks information that is protected under the doctrine of attorney client privilege. R.S. § 224.20-142 speaks to actions the cabinet, not the Company, may or may not take. Nothing in the statute precludes the Company from incorporating the dual fire option, which is how the Company intends to comply.

REQUEST:

Please refer to Table 3.3 at IRP p. 31. Please explain the costs included in Table 3.3 (e.g., capital costs of resource conversion and additions in the preferred portfolio, fuel supply costs, energy market revenues (or losses)).

RESPONSE:

Table 3.3 provides the annual revenue requirements. These include the following costs and revenues:

- Fuel Costs
- Fixed Operating and Maintenance Cost (FOM)
- Variable Operating and Maintenance Cost (VOM)
- Cost for NOx emissions
- Cost for SO2 emissions
- Start-up costs
- Production tax credits generated under the Inflation Reduction Act. These tax credits can be earned through renewable generation, nuclear generation, and carbon capture and sequestration projects.
- Fixed fuel Costs
- Energy market purchase costs
- Energy market sales revenues
- Ancillary Purchases

- Ancillary Sales
- Existing Resources FOM
- Existing Resources Capital Expense
- Economic carrying charges

PERSON RESPONSIBLE: Matthew Kalemba

REQUEST:

Please refer to the IRP at p. 37, including the following statement:

For the 2025/2026 Delivery Year, PJM determined that the members of the Gas Combined Cycle Dual Fuel Class are so distinct from one another that a single ELCC Class Rating would fail to capture their physical characteristics. This is due to the Gas Combined Cycle Dual Fuel Class having very few members (less than 10 units) following the dual fuel attestation process for the 2025/26 BRA and there being a large disparity in the observed historical performance during hours of risk across the members of this class. Therefore, no ELCC Class Rating will be determined for the Gas Combined Cycle Dual Fuel Class for the 2025/2026 Delivery Year.

- a. To the Company’s knowledge, what is the resource-specific ELCC value for each of the referenced 10 units.
- b. As understood by the Company, please explain the meaning and significance of “performance during hours of risk” in PJM.

RESPONSE:

- a. Although the Company followed the development of ELCC values in the PJM stakeholder process, it does not believe that PJM published any of the individual unit Gas Combined Cycle Dual Fuel Class resource-specific individual unit information.

- b. The meaning and significance of “performance during hours of risk” is defined on page 25 of the following PJM filing,

<https://www.pjm.com/directory/etariff/FercDockets/7657/20231013-er24-99-000.pdf>

which states:

The capacity capability determined through the ELCC approach, i.e., a resource’s “Accredited UCAP,” is not solely a function of the resource’s installed capacity and performance during historical time periods without consideration of resource adequacy risk patterns during such time periods (e.g., $MW * [1 - EFORd]$, which has long been used for traditional thermal resources). Rather, in general, Accredited UCAP is the product of (1) the maximum physical output capability of the resource, (2) the output of the ELCC analysis (by way of the class rating), and, as applicable, (3) the resource’s performance relative to other members of the ELCC Resource’s class. In short, a resource’s Accredited UCAP reflects the resource’s *expected* performance during hours of resource adequacy risk.

KSES-DR-01-024

REQUEST:

Please refer to the 2024 IRP at p. 39 and explain what is meant by “zonal pricing risk.” Is the zonal pricing risk quantifiable? How or why not?

RESPONSE:

In a PJM Base Residual Auction (BRA) or subsequent Incremental Auction (IA), it is possible for one or more individual zones to separate, or clear at a different, higher price than that of the rest of the PJM footprint. This is referred to as “zonal pricing risk,” or specifically is any cost implication that results from a higher clearing price for a zone.

Prior to each auction, PJM publishes a document that defines the upcoming auction planning parameters. This document displays items that may help a user understand the risk of separation (zonal pricing risk) for each impacted zone in PJM. Please refer to KSES-DR-01-024 Attachment for the parameters for the upcoming 2025/2026 BRA.

After the auction is completed, zonal separation risk is more readily calculated by taking the difference in capacity prices between zones.

DEOK	Mean Thermal	Conastone - Peach Bottom 500 kV pre-contingency
DOM	Discrete Voltage	Low voltage on Bismark 500 kV for the loss of Bedington - Black Oak 500 kV
JCPL	Discrete Thermal	Smithburg - East Windsor 230 kV for the loss of Deans - Smithburg 500 kV

REQUEST:

Please refer to the IRP at p. 39, including that statement that “[w]ithin the modeling execution assumption, opportunities to mitigate the above risks were identified, such as capping the generating size of an asset or considering shorter term power purchase agreements.”

- a. Please explain the phrase “modeling execution assumption.”
- b. Please explain how capping the generating size of an asset would mitigate zonal pricing risk exposure.
- c. Please confirm that the amount of zonal pricing risk exposure would be influenced by a given resource’s ELCC, e.g., one 250 MW resource with an ELCC of 70% will have more zonal pricing risk exposure than a 250 MW resource with an ELCC of 15%.
- d. Where purchase power agreement available to EnCompass as a selectable resource addition? If please, please describe how in material detail.

RESPONSE:

- a. For any generation resource that can be selected by the Encompass model, certain assumptions are made to reflect the potential availability of that resource. Those assumptions can include the first year a resource is available and is able to be selected by the model, the number of MWs available in a given year, and/or the

total number of MWs available over the planning horizon. Each of those would be considered “modeling execution assumptions.”

- b. Duke Energy Kentucky must locate a certain, PJM-determined, percentage of its unit-specific generation that is included in its FRR plans within the DEOK zone. Capping a generators size limits zonal pricing risk simply due to the smaller size of a generator. For example, if Duke Energy Kentucky were to rely on a generator outside of the DEOK zone to satisfy part of its FRR plan, this asset would be able to be used in the DEK FRR plan only to the extent that the Company has not exceeded its minimal internal requirement. By limited the size of assets outside of the DEOK, the zonal price risk price exposure is reduced.
- c. Confirmed
- d. PPAs were not available as a selectable resource.

PERSON RESPONSIBLE: Matthew Kalemba – a.
John Swez – b., c.
Matthew Kalemba – d.

KSES-DR-01-027

REQUEST:

Please refer to the 2024 IRP at p. 39 and the statement that “Based on the timelines to site and develop a wind resource, it was determined that a wind resource located in Duke Energy Kentucky’s service territory was not feasible in the near term.” Explain the timeline to site and develop a wind resource and define “near term” as used in this context.

RESPONSE:

One of the critical first steps in the development of onshore wind is identifying and establishing site control for suitable wind farms. Siting and developing onshore wind facilities is higher complexity and require a significant amount of land control. Securing land rights can take 12 to 18 months for a project and is required to support an interconnection application. Interconnection applications are prepared and submitted into PJM. To understand the wind speed on site, a series of met towers will need to be erected on each secured project site to collect meteorological data over several years. Environmental studies, including but not limited to wetland delineation, Phase I Environmental Site Assessment, cultural and archeological, would need to be performed to refine facility design and support permitting. Species surveys will typically require multiple seasons of study. Stakeholder engagement and impacts are critical, as are key permit approvals. Permits which are critical path for any new wind facility include the FAA, county zoning and discretionary permitting, state permitting (as applicable) and Commissions approval (i.e., Certificate of and Public Convenience and Necessity). The

development process from origination to in-service may be between 6-10 years depending on interconnection study timelines and results.

KSES-DR-01-028

REQUEST:

Please refer to the IRP at p. 43, including the statement that “Portfolios were optimized in EnCompass for each East Bend strategy . . .”, and listing of three optimized portfolios intended to comply with the EPA CAA Section 111 Update.

- a. In the “East Bend DFO Conversion by 2030” portfolio, was the selection of DFO by 2030 a fixed input by the Company or was DFO by 2030 selected by the resource optimization model? Please explain.
- b. In the “East Bend Natural Gas Conversion by 2030” portfolio, was the selection of natural gas conversion by 2030 a fixed input by the Company or was natural gas conversion by 2030 selected by the resource optimization model? Please explain.
- c. In the “East Bend Retirement by 2032” portfolio, was the selection of retirement by 2032 a fixed input by the Company or was retirement by 2032 selected by the resource optimization model? Please explain.

RESPONSE:

- a. The selection of East Bend DFO Conversion by 2030 was a fixed input by the Company. Based on EPA CAA Section 111 Update, there are four pathways for existing coal units; (i) convert to DFO by 2030 and retire at the end of 2038, (ii) convert to 100% natural gas by 2030, (iii) continue operating on coal and retire the unit by 2032, or (iv) retrofit the coal unit with CCS by 2032, which the Company feels is not achievable within that timeframe. The Company modeled three potential

pathways (i-iii) for East Bend and let the model optimize around those predetermined pathways.

- b. The selection of East Bend Natural Gas Conversion by 2030 was a fixed input by the Company. Same explanation as Bullet (a.) above.
- c. The selection of East Bend retirement by 2032 was a fixed input by the Company. Same explanation as Bullet (a.) above

KSES-DR-01-029

REQUEST:

Please refer to the IRP at p. 54, including the statement that “market purchases also vary between portfolios prior to operational changes at East Bend due to random outages that are modeled in EnCompass.” How does EnCompass model random outages for East Bend prior to operational changes as compared to after operational changes? Please explain.

RESPONSE:

In EnCompass planned outages that are not specifically set dates are allowed to be shifted by the model to optimize reliability. The model may try many different strategies for moving this outage to optimize the schedule outage. There are also forced outages to represent unplanned outages which are determined by a multitude of factors including a random outage seed. From EnCompass Help: *"Note that when using either the "New forced outage dates" or the "New outages with convergence" option without entering a random seed value, EnCompass will redraw the forced outages for the scenario. This means that identical scenarios will likely have a different forced outage pattern and results may be different in these scenarios due to the changes in the forced outages pattern."*

REQUEST:

Please refer to the 2024 IRP at pp. 43-60, Section 6 Model Results & Sensitivity Analysis, and answer the following requests. a. Please identify, for each scenario, the first year in which the East Bend 2 unit was allowed to economically retire in the model. b. Please identify, in each optimized portfolio and each alternate portfolio, the first year in which each Woodsdale CT unit was allowed to economically retire in the model.

RESPONSE:

- a. In each scenario, the date for either conversion or retirement for East Bend 2 was prescribed and the economics of those retirement dates were evaluated through the subsequent PVRR analysis.
- b. For all scenarios, Woodsdale CT was not allowed to economically retire in the planning horizon.

KSES-DR-01-033

REQUEST:

Please refer to the 2024 IRP at p. 56, and explain how “the CC ... would reduce customer exposure to fluctuating market prices compared to the natural gas conversion case....”

RESPONSE: By firing natural gas on a significantly more efficient generator, the CC is more likely to operate below the market marginal power prices than the less efficient converted East Bend station. Thus, customers would be more protected from higher market prices in the case of a new, efficient CC generator.

KSES-DR-01-034

REQUEST:

Please refer to the 2024 IRP at p. 62, “Inflation Impacts on New Generation” and explain how the results of the recent PJM 2025/2026 Base Residual Auction impact the analysis in the 2024 IRP.

RESPONSE:

The results of the recent PJM 2025/2026 Base Residual Auction have little bearing on the results of the 2024 IRP. However, the results highlight the importance of reliably operating the existing assets on the Duke Energy Kentucky system and replacing those resources with equivalent UCAP megawatts in order to meet Duke Energy Kentucky’s prescribed reserve margin requirements.

KSES-DR-01-035

REQUEST:

Please refer to the 2024 IRP at p. 63 and the statement that “[t]he requirements of SB4 and SB349 do not apply to the Company’s plan to convert East Bend to DFO,” and answer the following requests:

- a. Explain the Company’s rationale that the requirements of SB4 and SB349 do not apply to the conversion of East Bend to DFO.
- b. Is it the Company’s understanding that the requirements of SB4 and SB349 would or would not apply to the conversion of East Bend to run exclusively on natural gas? Please explain.
- c. Is it the Company’s understanding that the requirements of SB4 and SB349 would or would not apply to the replacement of the current East Bend Unit 2 with a combined cycle unit. Please explain.

RESPONSE:

- a. Objection. Calls for a legal opinion and seeks information that is privileged and protected. Without waiving said objection and to the extent discoverable, KRS 278.264 applies to retirement of fossil generation units. Duke Energy Kentucky would not be retiring East Bend by converting it to DFO. It would continue to operate as both a coal and natural gas unit.

- b. Objection. Calls for a legal opinion and seeks information that is privileged and protected. Without waiving said objection and to the extent discoverable, KRS 278.264 applies to retirement of fossil generation units.
- c. Objection. Calls for a legal opinion and seeks information that is privileged and protected. Without waiving said objection and to the extent discoverable, KRS 278.264 applies to retirement of fossil generation units.

PERSON RESPONSIBLE: As to objection, Legal

KSES-DR-01-036

REQUEST:

Please refer to the 2024 IRP at p. 64, and specifically the statement that “There currently are no transmission system projects planned or in-progress affecting any Duke Energy Kentucky transmission facilities that are intended to provide or are associated with the provision of additional resources.” Please answer the following requests:

- a. Please confirm no transmission upgrades are planned or needed to accommodate the additional solar added in the preferred portfolio in 2029, 2031, 2033, 2035, 2037, and 2039. Why or why not?
- b. Please confirm no transmission upgrades are planned or needed for the additional capacity of the East Bend CC (1x1) planned for 2039 in the preferred portfolio. Why or why not?
- c. Explain the transmission upgrades that would be needed under each of the optimized and alternative portfolios in Section 6.

RESPONSE:

- a. The Company has not performed this analysis. Until a site is identified for the generation, the Company cannot know whether transmission is needed. Thus the statement in the IRP.
- b. The resource identified in 2039 is assumed would replace the existing unit at the existing East Bend site. Thus no additional transmission would be needed.

- c. See responses above. The Company has not done a specific analysis for each of the scenarios.

REQUEST:

Please refer to the IRP at p. 67, including the statement: “Internal forecasts are utilized for electricity prices, weather conditions, and customer adoption of rooftop solar and electric vehicles.”

- a. Please provide the Company’s forecast for customer adoption of rooftop solar.
- b. Please provide the Company’s forecast for customer adoption of electric vehicles.
- c. Please provide the Company’s forecast for customer adoption of behind-the meter battery storage.

RESPONSE:

a-b.

DEK Electric Vehicle and Rooftop Solar forecast, Meter level (in MWhs)

Year	Electric Vehicle	Rooftop Solar
2024	953	(940)
2025	4,164	(3,123)
2026	8,404	(5,140)
2027	13,813	(6,929)
2028	20,493	(8,801)
2029	28,845	(10,729)
2030	39,570	(12,746)
2031	54,678	(14,820)
2032	72,980	(17,004)
2033	94,010	(19,105)
2034	117,156	(21,136)
2035	141,921	(22,885)
2036	167,681	(24,430)
2037	194,041	(25,949)
2038	220,670	(27,557)
2039	247,418	(29,227)

2040	274,076	(31,016)
2041	292,492	(32,725)
2042	312,968	(34,575)
2043	334,877	(36,464)
2044	359,103	(38,489)
2045	383,287	(40,388)

- c. The Company does not prepare forecast for customer adoption of behind-the meter battery storage.

REQUEST:

Please refer to the 2024 IRP at pp. 90-92 and provide the units for Tables B.15- B.27.

RESPONSE:

Unless noted otherwise, the energy/sales is presented in MWh, and peak values are in MW.

In most cases, the title or column name indicates the units. The table below further clarifies the units used in the tables mentioned above.

Table	Units
B.15	MW
B.16	Volume in MWhs and Peak in MW
B.17	MW
B.18	MW
B.19	Energy in GWh and Peak in MW
B.20	Energy in MWh, and Peak in MW
B.21	Energy in MWh, and Peak in MW
B.22	MWh
B.23	MWh

PUBLIC KSES-DR-01-039
(As to Attachments only)

REQUEST:

Please refer to the 2024 IRP at p. 102, particularly the statement that “[t]he Company may vary the incentive by type of equipment and differences in efficiency to induce customers to purchase greater levels of efficiency at the minimum necessary incentive amount.”

- a. As part of this IRP, did the Company evaluate the potential impact of higher incentives in its Residential Smart Saver® program on participation, estimated savings, or cost-effectiveness?
 - i. If so, please provide that evaluation, including supporting documentation and workpapers in native file format with formulas intact.
 - ii. If not, please explain why not.

RESPONSE:

CONFIDENTIAL PROPRIETARY TRADE SECRET (As to Attachments only)

- a. In preparation for the January 1, 2023, Department of Energy federal baseline changes, the company contracted with Tierra Resource Consultants to evaluate the potential impact of higher incentives in its Residential Smart Saver® program. This evaluation included modeling of both Replacement on Failure and Early Replacement of operating HVAC measures. In addition, the analysis included 3 tiers of each HVAC measure that was cost effective to allow more customer choices for higher efficiency rebate levels. The final evaluation provided the following

UCT and TRC scores and enabled us to offer higher incentives for early replacement measures:

Kentucky HVAC Measures	UCT	TRC	End of Life (ROF) Rebate	Early Replacement Rebate
KY_ ASHP to 16 SEER ASHP with Duct Sealing - As-Found + Inc	1.42	1.61		\$ 600.00
KY_ ASHP to 16 SEER ASHP with Duct Sealing - EOL	1.55	1.08	\$ 300.00	
KY_ ASHP to 17 SEER ASHP with Duct Sealing - As-Found + Inc	1.46	1.56		\$ 700.00
KY_ ASHP to 17 SEER ASHP with Duct Sealing - EOL	1.41	1.07	\$ 400.00	
KY_ ASHP to 18 SEER ASHP with Duct Sealing - As-Found + Inc	1.52	1.59		\$ 800.00
KY_ ASHP to 18 SEER ASHP with Duct Sealing - EOL	1.66	1.22	\$ 500.00	
KY_ CAC to 16 SEER CAC with Duct Sealing - As-Found	0.95	1.01		\$ 300.00
KY_ Electric Resistance to ASHP 16 SEER - EOL	8.34	3.45	\$ 800.00	

i. Please see KSES-DR-01-039 Confidential Attachments 1 and 2.

KSES-DR-01-042

REQUEST:

Please refer to the 2024 IRP at p. 127, regarding the updates to the National Emission Standards for Hazardous Air Pollutants: Coal- and Oil-Fired Electric Utility Steam Generating Units (aka “Mercury and Air Toxics Standards” or “MATS” Rule), and the 2024 Update (“MATS Update”). Answer the following requests:

- a. Refer to the statement that “East Bend demonstrates compliance using the filterable particulate surrogate.” Provide hourly filterable PM emissions from East Bend for the past three years in native machine-readable electronic format (e.g., CSV or Microsoft Excel), with all formulas and cell references intact.
- b. Refer to the statement that “[t]o ensure that it can reliably meet the lower filterable particulate standard prior to July 8, 2027, Duke Energy Kentucky is evaluating capital projects that will be required on the electrostatic precipitators (ESP) and flue gas desulfurization (FGD) units. Initial cost estimates for these projects have been included in the IRP modeling efforts to ensure that compliance with the MATS regulation is factored into long-term planning decisions.” Provide the cost estimates, separated out for each option being considered.

RESPONSE:

- a. See Attachment KSES-DR-01-042
- b. The detailed work scope for the ESP and FGD systems has not yet been completed but are expected to be general improvements to ensure additional margin to comply

with the new filterable PM limits in the updated MATS rule. The total initial cost estimate is approximately \$3 million.

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-043

REQUEST:

Please refer to the 2024 IRP at pp. 127-128, regarding “Interstate Transport – Ozone “Good Neighbor” Plans,” and provide the following information:

- a. Ozone season emissions of nitrogen oxides (NOX) from each of the Woodsdale and East Bend units, at the unit level.
- b. Allowances used, purchased, sold, and traded for each of the Woodsdale and East Bend units over the past five years under the 2015 Ozone GNP or its predecessor programs.

RESPONSE:

- a. Ozone Season Emissions (tons per season)

		2023	2022	2021	2020	2019
East Bend	2	559.3	716.9	728.3	672.5	1,012.4
Woodsdale	1	11.8	10.2	6.0	6.5	17.8
Woodsdale	2	18.0	10.8	9.9	7.7	22.2
Woodsdale	3	4.3	0	7.7	6.4	24.7
Woodsdale	4	18.2	11.4	10.2	7.2	19.8
Woodsdale	5	17.5	9.2	5.8	7.2	18.0
Woodsdale	6	<u>14.5</u>	<u>9.2</u>	<u>5.5</u>	<u>6.6</u>	<u>13.3</u>
		643.6	767.7	773.4	714.1	1,128.2

- b. One allowance is consumed for compliance for each ton of NOx emitted (see above) In addition, below is a summary of Ozone Season NOx allowances purchased or sold during the period:

Trade Date	Buy/Sell	Vintage	Qty
4/11/2024	Sell	2023	250
8/9/2022	Sell	2022	50
5/13/2022	Sell	2021	100
1/27/2022	Sell	2021	100

KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-044

REQUEST:

Please refer to the 2024 IRP, Appendix F, at p. 144, noting that “[a]ll portfolios were developed with the inclusion of EE and DR forecasts,” and answer the following requests:

- a. Were all portfolios developed with the same EE and DR forecasts? Please explain.
- b. Please explain in full the modeling performed as part of this IRP to evaluate the impact of higher levels of energy savings from Duke’s EE and DR programs.
- c. Were savings from energy efficiency programs offered to the resource expansion model as a selectable resource option? If so, please explain in full the approach used to make program savings available as a selectable resource option. If not, please explain why not.

RESPONSE:

- a. Yes, all portfolios were developed with the base assumptions for EE and DR. EE was reflected as a reduction to the load forecast and DR was treated as resource in the Encompass model.
- b. Additional modeling to evaluate the impact of higher levels of energy savings from EE and DR programs was not included.
- c. It is not appropriate to allow energy efficiency programs to be a selectable resource when those resources depend on choices made by the end user. Customers have a variety of reasons for choosing or not choosing to participate in energy efficiency programs, and the final cost and incentives of those programs must be approved by

the Commission. The projected adoption of future programs is best left to development outside of the IRP modeling software where assumptions around those factors can be better assessed.

Date Received: August 14, 2024**

**PUBLIC KSES-DR-01-045
(As to Attachment only)**

REQUEST:

Please refer to Duke’s June 21, 2024 Motion for Confidential Treatment,¹ para. 3, including the statement that the “Capital cost data contained in Figure 4.1 was derived from data obtained from Guidehouse and Burns & McDonnell, as well as, confidential pricing for resources that were bid into a recent RFP that was issued in another Duke Energy Corporation (Duke Energy Corp) utility subsidiary’s jurisdiction.”

- a. Please provide the referenced “recent RFP.”
- b. Please provide the pricing for resources that were bid into the referenced RFP.
- c. Please explain in full Duke Energy Kentucky’s reasons for assuming the pricing for resources that were bid into the referenced RFP would be representative of pricing for resources in Duke Energy Kentucky’s service territory.
- d. Please provide the referenced data obtained from Guidehouse.
- e. Please provide the referenced data obtained from Burns & McDonnell.

RESPONSE:

CONFIDENTIAL PROPRIETARY TRADE SECRET (As to Attachment only)

- a. The recent RFP was for Duke Energy Indiana which can be publicly accessed at www.deirfp.com.

¹ https://psc.ky.gov/pscecf/2024-00197/debbie.gates%40duke-energy.com/06212024125232/Motion_for_Confidential_Treatment_.pdf

- b. Summary level pricing for the Duke Energy Indiana 2023/2024 RFP can be found on slide 23 for the Duke Energy Indiana IRP Stakeholder Meeting 4 presentation which can be publicly accessed at <https://www.duke-energy.com/-/media/pdfs/for-your-home/dei-irp/20240813-dei-irp-public-meeting-4-slides.pdf>.
- c. Pricing for new resources was based on generic estimates from Guidehouse and Burns & McDonnell, RFP data was not used for the pricing of generics in Duke Energy Kentucky.
- d. Please see KSES-DR-01-045 Confidential Attachment.

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-046

REQUEST:

Please refer to the 2024 IRP at p. 143, particularly:

Response: Duke Energy Kentucky offers several time of use (TOU) based rates to non-residential customers to assist them with managing their bills including Rate RTP, Rate DT, Rate TT, and Rider LM. In addition, the Company currently has a pending TOU residential rate option in Case No. 2022-00372; Rate RS-TOU-CPP. However, these TOU rates are not offered through the Company's DSM portfolio of programs. They are either mandatory or optional rates customers can consider to help manage their bill.

- a. Please confirm that the Company did not evaluate alternative TOU based rates or adjustments to existing TOU based rates as part of this IRP. If anything but confirmed, please explain.
- b. Please confirm that the Company did not evaluate new or expanded demand side management program options as part of this IRP. If anything but confirmed, please explain.

RESPONSE:

- a. Confirmed.
- b. Confirmed.

PERSON RESPONSIBLE: Matthew Kalemba

REQUEST:

Please refer to the IRP at p. 144, particularly:

Duke Energy Kentucky should evaluate low-income DSM programs in other jurisdictions and analyze whether such programs would be effective in Duke Energy Kentucky's service territory. Response: The Company monitors programs in other jurisdictions and requests changes to the Kentucky programs as deemed necessary.

- a. Please list the programs that the Company is monitoring.
- b. Please explain in full the evaluation of low-income DSM programs undertaken by the Company since its last IRP, including producing studies or reports documenting such evaluation(s), if any.

RESPONSE:

- a. Duke Energy Kentucky is monitoring the following programs or other efforts to address the DSM needs of low-income customers,
 - High Energy Usage Assistance Pilot which is currently operating in Duke Energy Carolinas in North Carolina and will be expanding to Duke Energy Progress in South Carolina in September 2024.
 - Income-qualified Multifamily Working Group in North Carolina

Although not programs, these efforts are being monitored that also affect income-qualified customers.

- Inflation Reduction Act
 - Solar for all
- b. Please see KSES-DR-01-047(b) Attachment. The Duke Energy Kentucky Neighborhood Energy Saver Program 2018 – 2019 evaluation report was filed in Case No. 2023-00269. The next evaluation is scheduled to begin second quarter 2026.

1. Evaluation Summary

1.1 Program Summary

The Duke Energy Kentucky (DEK) Neighborhood Energy Saver (NES) Program provides one-on-one energy education, on-site energy assessments, and energy conservation measures to customers in selected low-income neighborhoods. These services are offered free of charge to all active DEK account holders who are individually metered homeowners or tenants living in predetermined income-qualified communities. Qualifying neighborhoods have at least 50% of households with incomes equal to or less than 200% of the federal poverty level.

The program employs a neighborhood canvas approach to drive participation while working with existing organizations in each community to maximize the number of customers benefitting from the program. Each year the program team has a goal of serving 600 households and achieving an overall neighborhood penetration rate of 65%.¹

The program period under evaluation is June 1, 2018, through June 30, 2019.²

1.2 Evaluation Objectives

The scope of this evaluation included estimation of gross impacts and a process evaluation. The evaluation objectives were to:

- Review and update, as necessary, deemed savings estimates through a review of measure assumptions and calculations.
- Verify measure installation and persistence.
- Estimate program energy (kWh) and summer and winter demand (kW) savings, and realization rates.
- Identify ways the Duke Energy program team may be able to improve the NES Program in the future based on the evaluation of program impacts.
- Assess participant satisfaction with the program, identify any barriers to participation in the program, and recommend strategies for addressing those barriers.

To achieve these objectives, Opinion Dynamics completed several data collection and analytic activities, including an interview with the program manager, a participant telephone survey, an analysis of survey results, an analysis of program tracking data, a consumption analysis, a deemed savings review, an engineering analysis, and a process analysis.

1.3 High Level Findings

Overall, NES Program teams implemented the program effectively and exceeded the program's annual goal to serve 600 households. Participation was strong with a total of 612 DEK customers from six different neighborhoods participating in the NES Program between June 1, 2018 and June 30, 2019. Of the 612

¹ Based on communications by NES Program staff (April 13, 2021) and Duke Energy EM&V staff (September 26, 2022).

² The evaluation period was selected to ensure that sufficient post-installation usage data was available for participants before the COVID-19 pandemic.

participants, 551 were single-family households and 61 were multifamily.³ The program penetration rate was 53%, slightly below the goal of 65%.⁴

1.3.1 Impact Findings

Based on results of the consumption analysis, the average annual net energy savings per household are 892 kWh. At the program level, estimated net energy savings are 546 MWh for the evaluation period. The estimates include savings from equipment installed by program representatives, as well as savings from any additional behavioral changes and participant spillover attributable to the program. Table 1 presents net impact results, including demand savings, which are calculated by applying the ratios of engineering analysis kW to kWh savings (see Table 5 below) to the consumption analysis-derived energy savings.

Table 1. Net Impact Results

Per Household			Program Level		
Energy Savings (kWh)	Summer Coincident Demand (kW)	Winter Coincident Demand (kW)	Energy Savings (kWh)	Summer Coincident Demand (kW)	Winter Coincident Demand (kW)
892	0.07266	0.10785	545,607	44.47	66.01

As part of the impact evaluation, we also conducted an engineering analysis to (1) provide insight into how each measure contributes to overall program savings and (2) develop kW to kWh savings ratios to determine ex post demand savings for the program. The engineering analysis included development of in-service rates (ISRs) and a review of deemed savings values.

Overall ISRs are high for all measures (see Table 2). Verification rates equaled 100% for all measures, which means customers confirmed that they received the quantities tracked in the program data. Installation rates for LEDs and domestic hot water measures ranged from 90% to 96%, which means virtually all received measures were installed. The persistence rates for LEDs and faucet aerators were just under 100% due to removal of some of these measures.

Table 2. Measure In-Service Rates

Measure	Verification Rate	Installation Rate	Persistence Rate	ISR
LEDs	100%	95%	95%	91%
Faucet Aerators	100%	96%	96%	93%
Low Flow Showerheads	100%	90%	100%	90%
HVAC Filters ^A	100%	100%	N/A	100%
Infiltration Measures ^B	100%	Not asked	Not asked	100%
Pipe Insulation Wrap ^B	Not asked	Not asked	Not asked	100%
Tank Insulation Wrap ^B	Not asked	Not asked	Not asked	100%

^A Since HVAC filters are designed to be removed and replaced regularly, the persistence rate is not applicable for this measure.

^B Customers often do not have visibility into the installation of infiltration and insulation measures, and these measures are unlikely to be removed. We therefore only verified the receipt of infiltration measures and assumed 100% for all other rates.

³ A majority of the single-family homes (457) are manufactured homes. We classify these as single-family for the purposes of this report.

⁴ Calculated as participating households based on unique account numbers (612) divided by the total number of eligible households in the targeted neighborhoods (1,161).

Table 3 presents the per unit ex post deemed savings values for all program measures, developed as part of our engineering analysis.

Table 3. Ex Post Per Unit Deemed Energy Savings and Demand Reduction Values

Measure	Energy Savings (kWh)	Summer Peak Demand (kW)	Winter Peak Demand (kW)
Lighting			
LEDs (75W equivalent)	39.11	0.0031	0.0053
LEDs (60W equivalent)	32.43	0.0025	0.0044
LEDs (40W equivalent)	22.42	0.0018	0.0031
LEDs 5W or similar - Globes	19.56	0.0015	0.0027
LEDs 5W or similar - Candelabra Bulbs	20.03	0.0016	0.0027
Domestic Hot Water			
Low Flow Showerhead	415.87	0.0144	0.0288
Water Heater Insulation Wrap	121.54	0.0139	0.0139
Pipe Insulation (5-ft. sections)	192.79	0.0220	0.0220
Kitchen Faucet Aerator	98.01	0.0049	0.0099
Bathroom Faucet Aerator	15.02	0.0016	0.0031
Air Sealing			
Infiltration Reduction	81.22	0.0202	0.0273
HVAC			
HVAC Filters	17.08	0.0085	0.0035

Note: The values above are the ex post deemed savings values weighted by (1) fuel type and (2) the share of the measure installed in single-family and multifamily homes, respectively. The values do not reflect ISRs. The ex post deemed savings values are presented in the *DEK NES Program Deemed Savings Review Revised Final Memorandum* from Opinion Dynamics to Duke Energy's EM&V Team. August 29, 2022, which can be found in Appendix B.

We calculated engineering-based gross impacts for the various measures installed through the program by applying ISRs and deemed savings values to quantities in the program tracking database (see Table 4). Low flow showerheads are responsible for the largest proportion of savings (41%) followed by lighting (29%).

Table 4. Total Measure-Level Gross Energy Savings

Measure Type	Energy (kWh)	Percent of Total kWh ^A
Low Flow Showerheads	193,876	43%
Lighting	137,955	31%
Faucet Aerators	47,492	11%
Infiltration Reduction	33,059	7%
Pipe Insulation	20,436	5%
HVAC Filters	9,479	2%
Water Heater Insulation Wrap	7,778	2%
Total	450,075	100%

^A Column may not sum to 100% exactly due to rounding.

Table 5 shows the program-level energy and demand savings, based on the engineering analysis, and the resulting kW to kWh savings ratios. As noted above, we multiply these ratios by the consumption analysis-derived energy savings to arrive at summer and winter coincident demand reduction.

Table 5. Gross Annual Program Impact Results from Engineering Analysis

Energy Savings (kWh)	Summer Coincident Demand (kW)	Winter Coincident Demand (kW)	Summer Demand Ratio (kW/kWh)	Winter Demand Ratio (kW/kWh)
450,075	36.7	54.5	0.000081503	0.00012098

1.3.2 Process Evaluation Findings

The research team focused the process evaluation on several questions related to energy education, NES participant satisfaction, potential barriers to participation, and the overall effectiveness of the program. Key process findings include:

- **The program exceeded its participation goals in terms of the number of enrolled households, but fell slightly short of its neighborhood penetration goal.** During the evaluation period, the program served 612 households, exceeding its goal of 600 households. The penetration rate was 53%, slightly short of the goal of 65%.
- **The program is successful in providing most participating households with a comprehensive package of energy savings measures.** Ninety percent or more of participating households received LEDs, HVAC filters, and educational and other measures, while two-thirds or more received infiltration reduction measures, kitchen aerators, and bathroom aerators.
- **Cross-participation among program participants is high.** More than two of every five program participants (41%) also participated in another Duke Energy program after participating in the NES Program, most of them in the Smart \$aver Residential Program. This suggests successful promotion of additional energy savings opportunities and Duke’s other programs by NES program representatives.
- **The program’s outreach methods are successful.** Almost half of all participants (48%) first heard about the program through Duke Energy’s direct outreach (mail, post card, or door hanger) and another 26% learned about the program when a representative came to their door, suggesting that the initial contact made by the program team is an effective form of outreach.
- **The educational component of the program is successful.** Eighty-three percent of respondents recalled receiving in-person education and almost all of those (96%) thought that the information was either very useful or useful. Additionally, 90% of respondents reported that they were more knowledgeable about ways to save energy in their homes after their NES Program participation than they were beforehand.
- **Participants are highly satisfied with their program experience.** Ninety-three percent of DEK respondents reported they were mostly or completely satisfied with the program and with the energy-saving products they received. In addition, all surveyed participants were mostly or completely satisfied with the NES Program representatives who visited their homes and their communication with Duke Energy.
- **Participants encounter no barriers to participation.** When all 29 survey respondents were asked whether they encountered any barriers to participation, none said that they did.

1.3.3 Recommendations

Based on our evaluation, the DEK NES Program is operating successfully. We therefore recommend Duke Energy continue offering the program as it has been.

2. Program Description

2.1 Program Design

Duke Energy's NES Program provides one-on-one energy education, on-site energy assessments, and appropriate packages of no-cost energy conservation measures to customers in income-qualified neighborhoods. The program is available to active DEK account holders who are individually metered homeowners or tenants living in pre-determined neighborhoods. Neighborhoods targeted for this program are eligible to participate if at least 50% of the households within the community have incomes less than or equal to 200% of the federal poverty guidelines. Participants are limited to a one-time receipt of energy efficiency measures through the NES Program. The overall goal of the NES Program is to offer persistent energy and demand savings to Duke Energy customers through the direct installation of energy savings measures and by providing education on other ways to reduce household energy use.

In targeted neighborhoods, the NES implementation team recruits customers via door-to-door canvassing and community events. Program staff work with community leaders and organizations to maximize the number of customers benefiting from the program. Each engaged neighborhood consists of approximately 500 to 1,500 households, and program staff aim to serve at least 600 households in the DEK jurisdiction per year.

2.2 Program Implementation

Honeywell Building Solutions implements the DEK NES Program in partnership with Duke Energy program staff. The implementer performs all assessments and installations. DEK program staff are heavily involved in selecting specific neighborhoods based on program eligibility criteria.

Prior to participating in the program, residents in the selected neighborhoods receive targeted mailings that provide introductory information about how to participate, the benefits of participation, and a notice that additional information from program staff will be circulated throughout their community, (including additional mailings and a community launch event). The implementation team organizes at least one community launch event in each targeted neighborhood, to both make residents aware of the program and provide demonstrations of the measures the NES Program offers. The Duke Energy NES program manager noted that reaching out to neighborhoods allows the program to reach a large number of customers in a cost-effective manner.

The implementation team recorded measure installation information at each premise, which is tracked in the Duke Energy program tracking database. Program representatives also recorded the location(s) in which they installed lighting measures and faucet aerators (i.e., kitchen or bathroom), along with household characteristics, such as primary heating fuel type and the type of heating and cooling equipment present in each participating household. Finally, implementation teams left behind educational materials that explain the measures they install in each home, additional recommendations for how participants could save energy through behavioral changes, and information about other Duke Energy programs that may be of interest.

2.3 Program Performance

The program period under evaluation is June 1, 2018, through June 30, 2019. Over this period, the program teams served 612 DEK households in six different neighborhoods, which surpassed the DEK goal to serve at least 600 households annually. The neighborhood penetration rate of 53%, calculated as a ratio of households served (612) to the number of eligible households (1,161), fell just short of the goal of 65%.

Table 6 shows a comprehensive breakdown of DEK participants' home types by location based on information present in the program tracking data. A majority of the participants (90%) were from single-family households. Most single-family and multifamily households were located in Florence, KY. We did note that a single household from Crittenden and another two from Union participated, which is unexpected since the NES Program typically targets homes in selected neighborhoods.

Table 6. Breakdown of Participant Home Types by Location

Location	Single-Family	Multi-Family	Total Treated
Florence, KY 41042	351	59	410
Covington, KY 41015	6	0	6
Walton, KY 41094	173	2	175
Crittenden, KY 41030	1	0	1
Union, KY 41091	2	0	2
Elsmere, KY 41018	18	0	18
Total	551	61	612

Note: The counts above for single-family are inclusive of manufactured homes. There were a total of 457 manufactured homes.

Based on the results from the consumption analysis, participants save an average of 892 kWh per household per year. Energy and demand savings are displayed in Table 7.

Table 7. Annual Energy Savings and Summer and Winter Peak Demand Reduction per Household

Energy Savings (kWh)	Summer Peak Demand (kW)	Winter Peak Demand (kW)
892	0.07266	0.10785

Note: Demand savings are calculated by applying the kW-to-kWh savings ratio from the engineering analysis to net energy savings from the consumption analysis.

3. Overview of Evaluation Activities

To answer the research objectives outlined in Section 1.2, Opinion Dynamics performed a range of data collection and analytic activities, including:

- An interview with the DEK program manager
- A review of program materials and program tracking data
- A participant telephone survey
- A consumption analysis
- An engineering analysis of deemed savings
- A process evaluation

The subsections below provide a summary of these activities. Section 4 presents additional results of the consumption and engineering analyses. Section 5 provides results from the process evaluation.

3.1 Program Staff Interviews

Opinion Dynamics conducted an in-depth interview with NES program staff responsible for program administration during the evaluation period. The in-depth interview allowed the evaluation team to discuss implementation of the DEK NES Program, including implementation differences between the DEK program and NES programs in other Duke Energy jurisdictions. We also used this interview to identify program successes, to discuss any difficulties in administering the program, and to determine any barriers for the program achieving its goals.

3.2 Program Material and Data Review

DEK Program administration staff provided Opinion Dynamics with information on the program, including marketing materials and program tracking databases. Review of these materials informed development of the participant survey instrument and the engineering analysis.

- **Marketing Materials.** Opinion Dynamics reviewed the leave-behind brochure, the customer survey booklet, the pre-participation program informational brochure, the leave-behind door hanger, the energy efficiency brochure about other Duke Energy programs, the introduction letter to the NES Program, and postcards sent to participants with information about how to participate.
- **Program Database.** The program staff provided Opinion Dynamics with tracking data covering the evaluation period of June 1, 2018, to June 30, 2019. The database provided us with information on the quantities, location, and types of measures installed in each treated household.

3.3 Participant Survey

The purpose of the participant survey was to collect information to support the development of ISRs and the process evaluation. Opinion Dynamics implemented the survey as a computer-assisted telephone interviewing (CATI) survey between October and November 2021. We fielded the participant survey with customers who participated in the program between July 1, 2019, and March 31, 2020 (i.e., “future participants”) as their recollection of their participation details was likely to be stronger than those who participated in the program during the evaluation period. Though we fielded the survey with customers who participated more recently, we expect their responses about the verification, installation, and persistence of program measures would be similar to the customers who participated during the evaluation period.

3.3.1 Sample Design

We attempted a census for the participant survey and tried to reach all 332 DEK participants from the “future participant” group. The evaluation team completed 29 interviews and achieved a response rate of 28.7%; the average interview length was nine minutes.

3.4 Consumption Analysis

Opinion Dynamics conducted a consumption analysis to determine the energy savings attributable to the NES Program during the evaluation period. We specified linear fixed effects regression (LFER) models to estimate the overall net ex post program savings for the DEK jurisdiction. The fixed effect in our models is the customer, allowing us to control for all household factors that do not vary over time. Treatment customers included those who participated in the program during the evaluation period. We attempted to construct a comparison group consisting of future participants, but due to some differences in treatment and comparison group composition (e.g., differences in seasonal energy consumption and the shares of customers relying on electric vs. gas heating fuel), savings results are based on a pre-post LFER model including treatment customers only. Section O provides a summary of the consumption analysis approach; Appendix A contains the detailed methodology description.

3.5 Engineering Analysis

The engineering analysis was used (1) to provide a ratio of kW demand to kWh energy savings, which we applied to the consumption analysis energy savings to estimate demand savings, and (2) to better understand the relative contribution of each measure to overall energy savings.

The engineering analysis consisted of two components:

- **Measure verification and development of measure-specific ISRs:** We verified measures and developed measure-specific ISRs based on responses to the participant survey.⁵
- **A deemed savings review of all program measures:** We reviewed measure-level savings algorithms and parameters and revised input assumptions, as needed. To develop ex post deemed energy and demand savings for each measure, we leveraged, in order of preference, program tracking data, survey results,⁶ and Technical Reference Manuals (TRMs). The deemed savings review memorandum developed for Duke Energy provides more detail on the sources and inputs used in the deemed savings review.⁷ This document is available as part of Appendix B.

We calculated program-level savings by applying ISRs and ex post deemed savings values to the measure quantities tracked in the program tracking database.

⁵ While equivalency checks for the consumption analysis found differences between participants during the evaluation period and future participants (who were included in the survey), we do not expect this to impact the validity of survey-based ISRs. ISRs reflect whether customers received the quantity of measures recorded in the program tracking data, had the measures installed by program staff, and left them in place, which we do not expect to be affected by the observed differences between the two groups.

⁶ Detailed survey questions about participant demographics were not included on the survey fielded for this evaluation to keep the survey length short. We relied on participant demographic data from the survey implemented to evaluate the Duke Energy Indiana NES Program in an earlier program period (April 1, 2017, to March 31, 2018).

⁷ DEK NES Program Deemed Savings Review Revised Final Memorandum from Opinion Dynamics to Duke Energy’s EM&V Team. August 29, 2022.

4. Impact Evaluation

4.1 Methodology

The impact analysis included a consumption analysis as well as an engineering analysis. The consumption analysis determined the net evaluated energy (kWh) impacts for the program. The engineering analysis supplemented the consumption analysis by providing (1) a kW-to-kWh savings ratio, which we applied to the consumption analysis energy savings to estimate demand savings, and (2) insights into the relative contribution of each measure to overall savings.

4.1.1 Consumption Analysis

Opinion Dynamics conducted a consumption analysis to determine evaluated energy savings for the DEK jurisdiction. Consumption analysis is a statistical analysis of energy consumption recorded in utility billing records. Because billing records reflect whole-building energy use, the method is well suited for studying the combined impact of the NES Program's mix of energy efficiency measures (and any behavioral changes) per home. Per-household energy savings are estimated by examining variation among participants' monthly electricity consumption in the pre- and post-program periods, ideally relative to the variation in a comparison group's electricity consumption during those times. For this consumption analysis, we were not able to leverage a comparison group due to nonequivalence between the treatment group and the available comparison group customers.

Data Cleaning and Preparation

Prior to specifying the models, we performed a thorough cleaning of the consumption and participation data. We checked data for gaps and inconsistencies as well as for sufficiency. Among other checks, we ensured the participants retained in the analysis had sufficient pre- and post-participation consumption data, participation dates were accurate, and the consumption data was free of outliers, such as bill periods with unreasonably small or unreasonably large consumption.

Comparison Group Selection

Incorporation of a comparison group into the consumption analysis allows evaluators to control for changes in economic conditions and other non-program factors that might affect energy use during the study period. Like many other energy efficiency programs, the NES Program was not designed as an experiment. As such, our preferred approach is to leverage a quasi-experimental approach to the evaluation by developing a comparison group of participants.

There are multiple approaches to selecting a comparison group, including the use of future participants, past participants, or similar non-participants. When possible, it is preferable to use future program participants as a comparison group. The use of future participants—who are similar to the evaluated participants—as the comparison group allows us to effectively control for self-selection biases. The use of a comparison group, however, is predicated on reasonable equivalency in pre-period energy consumption between the treatment group and future participants.

For this evaluation, we were unable to construct a viable comparison group from future participants due to pronounced differences in energy consumption and observable housing characteristics. Due to these differences, we chose to proceed with a treatment participant only modeling approach that evaluates the impacts without a comparison group. This is an acceptable option when a suitable comparison group cannot

be constructed and when the nonequivalence of the available comparison group may impact the accuracy or rigor of savings estimates.⁸

Controlling for Participation in Other Programs

Some customers participated in other Duke Energy programs after participating in the NES Program. Including those customers in the consumption analysis would result in double counting of savings from other programs and artificially inflating the estimate of savings from the NES Program. In order to obtain the most accurate estimate of the effects of the NES Program, we removed customers who cross-participated in the following programs from the analysis: Residential Energy Efficient Products & Services, Smart \$aver Residential, Residential Energy Assessments, and Low Income Services.

After performing data cleaning and removing cross-participating customers, 357 of the 612 treatment group participants (or 58%) were available for developing the consumption analysis models.⁹

Modeling

We used a Linear Fixed Effects Regression (LFER) model for this analysis. Fixed effects models capture the effect of time invariant household-specific characteristics and are the best practice approach to modeling program savings in the industry. We specified a variety of models ranging from simple pre-post models to more complex models incorporating a variety of terms to control for known sources of variation. We specified distinct models with consideration of unique characteristics of participant populations and integration of additional terms in the models to control for variation. Consumption analyses typically include a series of additional variables to explain non-program variation in monthly energy use pre- and post-participation. Our final model specifications included weather (heating degree days and cooling degree days) in the model as well as monthly dummy variables to further control for seasonal differences in energy consumption. The final models also contained a control for electricity usage, which was interacted with the weather term so as not to be absorbed by the fixed effect. The final models produced savings associated with installed measures and any behavioral changes from energy efficiency knowledge gained during their participation process.

Appendix A contains a detailed discussion of the consumption analysis methodology, including data cleaning steps, comparison group selection and assessment of equivalency, modeling process, and the final model specification and outputs.

4.1.2 Engineering Analysis

The engineering analysis consisted of two distinct steps: (1) verification of measure installation and continued operation and (2) review of per-unit deemed savings values for program measures.

Measure Verification Methodology

The participant survey included questions designed to verify that participants received and installed program measures and that those measures remained in place and operational. The ISR for each measure represents

⁸ While the comparison group of future participants differed from the treatment group in seasonal energy usage patterns and mix of fuel type for space heating, the evaluation team does not expect that the differences would result in largely different ISRs. Note that ISRs are only used in the engineering analysis, which focuses on the relative contribution of different measure types to program savings. ISRs do not affect the consumption analysis derived ex post net savings for the program.

⁹ Note that participants who were excluded from the consumption analysis models are still included in the overall program savings estimate; they receive the average per household savings of modeled participants.

the share of measures in the program tracking data that were in service at the time of the survey, based on responses from surveyed participants who completed the ISR survey battery.

Figure 1 outlines the method for deriving the ISR for each measure. During the survey, we asked participants to confirm that they received the quantity of measures recorded in Duke Energy’s program tracking data and, when necessary, to provide the correct quantity. We also asked participants to report the quantity of measures installed as well as the quantity that remained in service at the time of the survey.

Based on the survey responses, we calculated the verification, installation, and persistence rates, as well as the resulting ISR—using the equations shown in Equation 1—for each participant and each measure they received. We then developed an average of all four rates for each measure group.

Equation 1. In-Service Rate Equations

$$\textit{Verification Rate} = \frac{(B)\textit{Received Quantity}}{(A)\textit{Reported Quantity}}$$

$$\textit{Installation Rate} = \frac{(C)\textit{Installed Quantity}}{(B)\textit{Received Quantity}}$$

$$\textit{Persistence Rate} = \frac{(D)\textit{In Service Quantity}}{(C)\textit{Installed Quantity}}$$

$$\textit{In – Service Rate} = \frac{(D)\textit{In Service Quantity}}{(A)\textit{Reported Quantity}}$$

In previous evaluations of the NES Program, Opinion Dynamics found that participants were unable to verify certain measures (e.g., water heater tank wraps and pipe wraps). For these measures, we assumed 100% for all four rates. Additionally, for some air infiltration measures, such as caulking or glass patch tape, participants were unable to verify installation and persistence of individual measures. As such, we asked participants to verify installation of the entire package of air infiltration measures and assumed that 100% of those

treatments remain installed. As tank and pipe wraps and air infiltration measures are installed directly by program staff and in the case of infiltration measures, are difficult to remove, we consider these assumptions reasonable for this type of program.

Deemed Savings Review

To develop ex post per-unit savings for each program measure, we reviewed measure-level savings algorithms and parameters and revised input assumptions, as needed. We leveraged the following sources in our review:

- **Program tracking data:** Where available, we used program tracking data to update household characteristics such as the percentage of homes with electric heat, central cooling, and electric water heating. Since program tracking data is available for the population, it is the most reliable and evaluation-specific source of information.
- **Participant survey data:** Where not available from program tracking data, we used survey data to update household characteristics such as the number of people per household.¹⁰ Since survey data is specific to the program’s participants, it is preferable over deemed assumptions from TRMs.
- **Technical Reference Manual (TRM) assumptions:** We used algorithms and parameters from various TRMs. The preferred TRMs were the Indiana TRM v2.2 and the Illinois TRM V10.0. We also leveraged other TRMs, including the Mid-Atlantic TRM V10.0, if a parameter was not available from the Indiana or Illinois TRMs or if other TRMs were deemed to have more recent or more rigorous parameters.

For more information on the algorithms and inputs used to develop deemed savings estimates for each measure, see Appendix B.

Total Program Gross Savings

We developed total program gross savings by applying the measure-specific ISRs and the ex post deemed values to the measure quantities provided in the program tracking database, using the formula shown in Equation 2:

Equation 2

$$Sav = \sum_{i=1}^n Q_{dbi} \times ISR_i \times EST_i$$

Where:

- i* = Program measures 1...n, where n = maximum number of DEK NES Program measures
- Sav* = Total program savings
- Q_{dbi}* = Database quantity of measure *i*
- ISR_i* = In-service rate for measure *i*
- EST_i* = Per unit deemed savings estimate for measure *i* (KW or kWh)

Where measure savings vary based on the presence of electric heating equipment, electric water heating equipment, or central cooling equipment, our engineering team developed fuel-specific deemed values and applied them based on the space and water heating equipment specified within the program tracking database. For example, domestic hot water measures are available to all NES participants, regardless of the

¹⁰ See Footnote 6.

fuel they use to heat water in their homes. Participants with electric water heaters are assigned ex post deemed savings values reflective of electric water heating while those with other water heating fuels are assigned zero savings. We then calculated per-household savings by dividing total program savings by the number of participating households.

4.2 Results

4.2.1 Consumption Analysis

This section provides average per-participant consumption analysis results. Appendix A contains the complete results of the final model used to estimate the per-household energy savings. Table 8 summarizes modeling results and presents key model fit metrics. The model showed positive statistically significant participation coefficients, indicating that it established a statistically significant relationship between participation in the program and energy consumption.

Table 8. Summary of Modeling Results

Model Output Component	
Modeled Customers (treatment only)	357
Modeled Baseline (kWh/day)	43.28
Modeled Savings (kWh/day)	2.44
Standard Error	0.24
Statistically Significant Participation Coefficient	Yes
Akaike Information Criterion	125,440
Bayesian Information Criterion	128,295
Adjusted R Squared	0.66

Table 9 contains annual savings with associated confidence bounds. The average annual per-household energy savings for DEK participants was 892 kWh, or 5.6% of the baseline consumption.

Table 9. Results of Consumption Analysis Models

Modeled Treatment Participants	Average Annual Baseline Energy Consumption per Participant (kWh)	Average Per Participant Ex Post Net Annual Savings (kWh)	Average Per Participant Savings Percentage	90% Confidence Interval	
				Lower	Upper
357	15,797	892	5.6%	749	1,034

Based on these results and the kW to kWh ratio from the engineering analysis, we developed average per participant demand savings. We then multiplied the per-participant savings by the total number of participants to develop program-level energy and demand savings (Table 10).

Table 10. Net Impact Results from Consumption Analysis

Energy Savings (kWh)	Per Household		Energy Savings (kWh)	Program Level	
	Summer Coincident Demand (kW)	Winter Coincident Demand (kW)		Summer Coincident Demand (kW)	Winter Coincident Demand (kW)
892	0.07266	0.10785	545,607	44.5	66.0

4.2.2 Engineering Analysis

Measure Verification Results

The results of the measure verification analysis showed high ISRs for all measures, as shown in Table 11. Verification rates equaled 100% for all measures, which means customers confirmed that they received the quantities tracked in the program data. Installation rates for LEDs and domestic hot water measures ranged from 90% to 96%, which means virtually all received measures were installed. A few participants (n=3) mentioned the LEDs they received were spares that were not needed at the time of their home audit, resulting in an installation rate of 95% for LEDs. The persistence rates for LEDs and faucet aerators are just under 100% due to removal of these measures. Two participants mentioned they uninstalled the faucet aerators because they did not work with their sinks.

Table 11. Measure In-Service Rates

Measure	Verification Rate	Installation Rate	Persistence Rate	ISR
LEDs	100%	95%	95%	91%
Faucet Aerators	100%	96%	96%	93%
Low Flow Showerheads	100%	90%	100%	90%
HVAC Filters ^A	100%	100%	N/A	100%
Infiltration Measures ^B	100%	Not asked	Not asked	100%
Pipe Insulation Wrap ^B	Not asked	Not asked	Not asked	100%
Tank Insulation Wrap ^B	Not asked	Not asked	Not asked	100%

^A Since HVAC filters are designed to be removed and replaced regularly, the persistence rate is not applicable for this measure.

^B Customers often do not have visibility into the installation of infiltration and insulation measures, and these measures are unlikely to be removed. We therefore only verified the receipt of infiltration measures and assumed 100% for all other rates.

Ex Post Deemed Savings Estimates

Table 12 provides the estimated gross per-unit energy and demand savings for all measures installed through the program during the evaluation period. The values below are the average of single-family and multifamily fuel-weighted deemed values. As described in Section 3.5, we based the measure-level savings on program tracking data, survey results, and TRMs, in that order of source preference.

Table 12. Ex Post Per Unit Deemed Energy Savings and Demand Reduction Values

Measure	Energy Savings (kWh)	Summer Peak Demand (kW)	Winter Peak Demand (kW)
Lighting			
LEDs (75W equivalent)	39.11	0.0031	0.0053
LEDs (60W equivalent)	32.43	0.0025	0.0044
LEDs (40W equivalent)	22.42	0.0018	0.0031
LEDs 5W or similar – Globes	19.56	0.0015	0.0027
LEDs 5W or similar – Candelabra Bulbs	20.03	0.0016	0.0027
Domestic Hot Water			
Low Flow Showerhead	415.87	0.0144	0.0288
Water Heater Insulation Wrap	121.54	0.0139	0.0139
Pipe Insulation (5-ft. sections)	192.79	0.0220	0.0220
Kitchen Faucet Aerator	98.01	0.0049	0.0099

Measure	Energy Savings (kWh)	Summer Peak Demand (kW)	Winter Peak Demand (kW)
Bathroom Faucet Aerator	15.02	0.0016	0.0031
Air Sealing			
Infiltration Reduction	81.22	0.0202	0.0273
HVAC			
HVAC Filters	17.08	0.0085	0.0035

Note: The values above are the ex post deemed savings values weighted by (1) fuel type and (2) the share of the measure installed in single-family and multifamily homes, respectively. The values do not reflect ISRs. The ex post deemed savings values are presented in the *DEK NES Program Deemed Savings Review Revised Final Memorandum* from Opinion Dynamics to Duke Energy's EM&V Team. August 29, 2022, which can be found in Appendix B.

Total Program Savings

The evaluation team calculated total program savings by applying the deemed savings values and ISRs summarized above to measure quantities tracked in the program database.¹¹ Table 13 presents total gross program energy and demand savings by measure for the evaluation period. As this table shows, the individual measures that contributed the most to program savings are low flow showerheads (43%) followed by 60-watt equivalent LEDs (26%). On average, household annual savings were equal to 735 kWh, or slightly lower than the consumption analysis-based annual per household savings of 892 kWh.

Table 13. Total Gross Program Energy and Demand Savings

Measure	Quantity in Database	Quantity Units	kWh	% of kWh	Summer kW	Winter kW
Lighting						
LEDs (75W equivalent)	23	Per bulb	815	<1%	0.06	0.11
LEDs (60W equivalent)	4,028	Per bulb	118,375	26%	9.29	16.13
LEDs (40W equivalent)	127	Per bulb	2,580	1%	0.20	0.35
LEDs 5W or similar–Globes	309	Per bulb	5,475	1%	0.43	0.75
LEDs 5W or similar–Candelabra Bulbs	590	Per bulb	10,709	2%	0.84	1.46
Domestic Hot Water						
Low Flow Showerhead	518	Per showerhead	193,876	43%	6.72	13.43
Water Heater Insulation Wrap	64	Per water heater	7,778	2%	0.89	0.89
Pipe Insulation (5-ft. sections)	106	Per 5-ft. of pipe	20,436	5%	2.33	2.33
Kitchen Faucet Aerator	404	Per aerator	36,661	8%	1.85	3.70
Bathroom Faucet Aerator	779	Per aerator	10,831	2%	1.12	2.24
Air Sealing						
Infiltration Reduction	407	Per home	33,059	7%	8.24	11.12
HVAC						
HVAC Filters	555	Per home	9,479	2%	4.72	1.94
Total	7,910		450,075	100%	36.68	54.45

¹¹ The ex post analysis applies fuel-type and housing-type specific deemed savings values, rather than the single-family weighted average values presented in Table 12.

We further examined the energy savings by disaggregating them by single-family and multifamily housing types. As Figure 2 shows, low flow showerheads contributed the most to single-family program savings (45%), followed by lighting (29%). The opposite is true for multifamily households where lighting measures were responsible for the largest share (44%), followed by low flow showerheads (22%). These different contributions are driven by (1) single-family households, on average, receiving more low flow showerheads (0.8 per household) than multifamily households (0.4 per household) and having a higher incidence of electric hot water heating (92% versus 72%); and (2) multifamily households, on average, receiving more LEDs (11.3 per household) than single-family households (8.0 per household).

Figure 2. Measure Contribution to Total Energy (kWh) Savings for Single-Family and Multifamily Households

5. Process Evaluation

5.1 Researchable Questions

Based on experience evaluating similar programs in previous years and discussions with DEK Program staff, Opinion Dynamics developed the following process-related research questions:

- How satisfied are participants with the program and the measures they received?
- How effective are the one-on-one education and program leave behind materials?
- What are barriers, if any, to implementing or participating in the program?

5.2 Methodology

The process evaluation relied on the following tasks:

- An in-depth interview with the DEK NES Program manager
- A review of secondary materials (i.e., NES marketing materials, data associated with neighborhood populations)
- A telephone survey of program participants
- An analysis of program tracking data

5.3 Key Findings

5.3.1 Program Participation

The NES Program began operation in the DEK territory in 2018. Between June 1, 2018, and June 30, 2019, the program team reached six neighborhoods and served 612 DEK customers. The program surpassed its goal to reach 600 customers but fell slightly short of its goal to reach at least 65% of the customers in the neighborhoods served. Overall, staff reached 53% of customers across all neighborhoods served during the evaluation period.

Measures Provided to NES Participants

To evaluate the success of the program in providing energy-saving measures to participants, and to determine if there were missed savings opportunities, Opinion Dynamics examined the number of measures provided to each home. Table 14 shows the share of homes that received at least one of each measure and the average quantity provided per home (not including homes that did not receive the measure). The table shows that 90% of participating households received at least one LED, with the average number exceeding eight bulbs. Aerators and infiltration reduction measures were provided to at least two-thirds of treated households, while 60% received low-flow showerheads. Almost all households also received education and other measures, as well as HVAC filters. The breadth and depth of the measures provided to participating households shows the success of the program's reach.

Table 14. Measure Installation Rates from Program Tracking Data

Measure Category	Measure	Number of Households with Measure	Percent of Households with Measure	Average Qty Per HH
Lighting	Any LEDs	549	90%	8.3
	LEDs (75W equivalent)	9	1%	2.6
	LEDs (60W equivalent)	510	83%	7.9
	LEDs (40W equivalent)	22	4%	5.8
	LEDs 5W or Similar-- Globes	59	10%	5.2
	LEDs 5W or Similar-- Candelabra Bulbs	128	21%	4.6
Hot Water	Kitchen Faucet Aerator	404	66%	1.0
	Bathroom Faucet Aerator	454	74%	1.7
	Low Flow Showerhead	368	60%	1.4
	Pipe Insulation (5-ft. sections)	60	10%	1.8
	Water Heater Insulation Wrap	64	10%	1.0
Infiltration Reduction	Any Infiltration Reduction	407	67%	n/a
	Door Sweep	165	27%	1.3
	Caulking	162	26%	1.0
	Weatherstripping per Door	168	27%	1.2
	Foam Insulation	314	51%	1.0
	Cover for A/C Installed	95	16%	1.7
	Poly Tape	1	<1%	1.0
HVAC	HVAC Filters	555	91%	12.0
Education/Other	Refrigerator Thermometer	556	91%	2.1
	Water Heater Temperature Check	571	93%	1.0
	Switch Plate Wall Thermometer	527	86%	1.0

Cross Participation

There were high levels of cross participation in other Duke Energy programs among DEK NES participants who participated between June 1, 2018, and June 30, 2019. As shown in Table 15 below, 251 DEK participants (41%) also participated in another Duke Energy program after participating in the NES Program, most of them in the Smart \$aver Residential Program. In general, the share of cross-participation is relatively high in comparison to the NES Programs offered in Duke Energy's other jurisdictions. While it is unclear if these participants were directly influenced by the NES Program to participate in another Duke Energy program, the program's focus on energy education (see also Section 5.3.4 below) suggests that their experience with the NES Program and the information they received encouraged them to seek out another Duke Energy program for additional equipment and services.

Table 15. Count of NES Cross Participants by Program

Program	DEK
Smart \$aver Residential	221
Residential Energy Efficiency Products & Services	27
Low Income Services	2
Residential Energy Assessment	1
Total Unique Cross Participants	251

5.3.2 Marketing and Outreach

For each neighborhood, Duke Energy program staff and implementation teams conducted both broad and targeted outreach aimed at encouraging program participation and educating communities about energy efficiency. Program teams first sent customized introductory letters to neighborhood residents that provided information on the measures the program offers, the monetary savings participants can achieve by enrolling, and information about how to participate. The introductory letter also noted any local community organizations that program teams have partnered with and provided information about the neighborhood’s community launch event.

In coordination with the implementation teams, program staff conducted a community launch event for each neighborhood, introducing the NES Program and the implementation teams, and showing residents the types of energy efficiency measures offered through the NES Program. Program teams also sent follow-up postcards reminding residents about the NES Program and, for those not home when an implementation team knocked on their door, crews left behind door hangers that provided an option to schedule an appointment to have measures installed.

Figure 3 shows participant responses about how they first heard about the NES Program. The most common way participants heard about the program was through a direct mailer, postcard, or door hanger (48%). The second most common method respondents cited was a home visit from a program representative (26% of participants). These responses indicate the initial contact made by the program team is an effective form of outreach that introduces a majority of NES participants to the program.

Figure 3. How Participants First Heard About the NES Program

5.3.3 Program Satisfaction

Participants were generally satisfied with all components of the program. As shown in Figure 4, on a five-point scale where 5 is “completely satisfied” and 1 is “not at all satisfied,” 93% of DEK NES respondents reported that they were either “completely satisfied (5)” or “mostly satisfied (4)” with the program overall, as well as

with program products they received. In fact, no participants expressed any dissatisfaction with any of the program components, (i.e., a rating of 1). All participants were also completely or mostly satisfied with program representatives who installed energy-efficient equipment and their communication with Duke Energy staff. Additionally, 85% of respondents were completely or mostly satisfied with their ability to sign up with the program. Based on the responses provided to the satisfaction questions, an overwhelming majority of customers were completely or mostly satisfied with the program overall as well as all aspects of the program about which they were asked.

Figure 4. Satisfaction with NES Program Overall and Program Components

5.3.4 Energy Education

An important customer benefit of the NES Program is the energy education customers receive, which occurs at several points during the participation process:

- Prior to the in-home visits by program representatives, customers receive information about ways to save energy through mailings and flyers either left at their homes or provided at community launch events.
- During the launch events, program staff discuss the energy-saving measures offered through the NES Program and how each measure saves energy in participants' homes.
- During the in-home visits, the implementation team provides more detail on energy-saving measures, discusses other ways participants might change their behavior to save more energy, and answers participant questions. The implementation team then leaves behind information to reinforce the energy education, provides other tips for saving energy in their homes, and shares information about other Duke Energy programs for which participants may have been eligible.

Overall, our evaluation found the energy education provided through the program to be very effective, especially the information provided in conversations with the program representative. As shown in top left pie

chart in Figure 5, 83% of respondents reported discussing energy-saving tips with the implementation team, and close to 80% of these found this information to be very useful (e.g., a 5 on a scale of 1 to 5 where 1 is “not at all useful” and 5 is “very useful”) in helping them save energy (top right pie chart).

In addition, as shown in the pie chart on the bottom left, 76% of respondents said that they received educational materials during their home visit. Of those, almost 70% ranked the usefulness of the brochure at a 4 or 5 where 1 is “not at all useful” and 5 is “very useful” (bottom right pie chart).

Figure 5. Energy Information from Program Representatives Received and Its Usefulness

Note: The energy information participants received included a brochure or booklet that was provided by the NES representative during their home visits.

Interviewed participants also reported that their knowledge increased after their enrollment in the NES Program. Prior to participation, 38% of participants rated their knowledge about ways to reduce energy usage in their homes either a 4 or a 5.¹² After participation, 90% of respondents gave a rating of 4 or 5 when asked the same question, indicating the effectiveness of the NES Program in increasing participants' perceived energy usage knowledge (see Figure 6).

Figure 6. Participant Knowledge of Ways to Save Energy

5.3.5 Barriers to Participation and Participants' Recommendations to Improve the Program

Respondents were asked whether they faced any barriers to participating in the program; notably, all said that they experienced none. Accordingly, most respondents did not offer any recommendations to improve the program when asked, though a few did make comments and provide suggestions. One respondent noted that he was not aware that the program was being offered until an NES representative knocked on his door, which is not unusual given the design of the program's outreach and the fact that 26% of participants first found out about the program when the representative came to their door. This respondent would have preferred to hear about the program ahead of time. When asked what additional measures they would like to see the program offer, two customers said they would like to see the program offer windows — a measure that is not consistent with direct install nature of the program.

¹² On a scale from 1 to 5, where 1 means "not at all knowledgeable" and 5 means "very knowledgeable."

6. Conclusions and Recommendations

Overall, the NES Program team implemented the program effectively and achieved its goal of serving 600 households through the program annually. Participation was strong with a total of 612 DEK customers from six different neighborhoods participating in the NES Program between June 1, 2018 through June 30, 2019. Though the number of households served surpassed the annual program goal, the program penetration rate was 53%, which falls below the goal to reach 65% of homes in neighborhoods served.

Using consumption analysis, the evaluation team found annual ex post net program savings of 892 kWh. The estimates include savings from equipment installed by program representatives, as well as savings from any additional behavioral changes and participant spillover attributable to the program.

The engineering analysis included development of in-service rates (ISRs) and a review of deemed savings values. ISRs were 90% or higher for all measures provided through the program. The engineering analysis also showed that low flow showerheads contributed the largest share of program savings (41%), followed by lighting (29%).

The process evaluation showed that outreach and educational efforts by the program were successful and that the program provided most participating households with a comprehensive package of energy savings measures. In addition, participation in other programs following participation in the NES Program was high (41%). Participants did not experience any barriers to participation, and customer satisfaction was high as well, with the program and all program components receiving average satisfaction ratings of 4.6 or higher (on a scale of 1 to 5).

Based on our evaluation, the DEK NES Program is operating successfully. We therefore recommend Duke Energy continue offering the program as it has been.

7. EM&V Summary Form

PROGRAM DESCRIPTION

The DEK Neighborhood Energy Saver (NES) Program provides one-on-one energy education, on-site energy assessments, and energy conservation measures to customers in selected low-income neighborhoods. These services are offered free of charge to all active DEK account holders who are individually metered homeowners and tenants living in predetermined income-qualified communities.

Date:	December 20, 2022
Region(s):	Duke Energy Kentucky
Evaluation Period:	June 1, 2018 – June 30, 2019
Annual kWh Savings (ex post net):	545,607 kWh
Coincident kW Impact (ex post net):	44.47 kW (Summer), 66.01 kW (Winter)
Measure Life:	Not Evaluated
Net-to-Gross Ratio:	N/A
Process Evaluation:	Yes
Previous Evaluation(s):	Not evaluated previously

EVALUATION METHODOLOGY

The evaluation team conducted a **consumption analysis**, using a Linear Fixed Effect Regression (LFER) model, to determine the overall ex post net program energy savings.

In addition, we conducted an **engineering analysis**, consisting of a deemed savings review and a survey-based ISR analysis. Based on the results of these two analyses, we calculated ex post gross energy and demand savings for measures provided through the DEK NES Program. The goal of the engineering analysis was to (1) develop a kW-to-kWh savings ratio, which we applied to the consumption analysis energy savings to estimate demand savings, and (2) provide insights into the relative contribution of each measure to overall savings.

We also conducted a **process evaluation** focused on participant satisfaction, marketing and outreach, cross participation in other Duke Energy programs, energy education received through the program, and barriers to participation. We based the process evaluation on an interview with the DEK Program manager, responses to a participant survey, and a review of program tracking data.

DSMore Table

8. **DSMore Table**

An Excel spreadsheet containing measure-level inputs for Duke Energy Analytics is provided as a separate attachment to this report. Per-measure savings values in the spreadsheet are based on the net impact analyses reported above. The evaluation scope did not include updates to measure life assumptions.

Appendix A. Detailed Consumption Analysis Methodology

The evaluation team conducted a consumption analysis using a Linear Fixed Effect Regression (LFER) model, with the goal of determining the overall ex post net program savings. The model allows all household factors that do not vary over time to be absorbed by (and therefore controlled for) the individual constant terms in the equation. In other words, this method uses account-specific intercepts.

As part of the consumption analysis of Neighborhood Energy Saver (NES) program participants, the evaluation team followed a standard series of steps for data collection, data cleaning, model specification, and analysis.

Participant Data Preparation

The participant dataset contained a range of data fields with participation attributes including participant identifiers, participation dates, measure detail, and participant housing characteristics. The participant data set included customers who participated in the program between June 1, 2018, and March 31, 2020 (including both the treatment group and the comparison group of future participants). As part of our review of the participation data, we worked with Duke Energy to ensure that participation files were complete based on our explorations of participation trends over time and comparison of accounts in the participation and consumption data received.

Comparison Group Selection

A key challenge for estimating energy savings via consumption analysis is the identification of an appropriate comparison group to represent a baseline for how much energy the customers would have consumed in the absence of the program. We consider two main factors in the design of a comparison group. A comparison group must: (1) have similar energy usage patterns (compared to participants) before participation (i.e., pre-participation period) and (2) effectively address self-selection bias (the correlation between the propensity to participate in a program and energy use). In an ideal experimental design, we would use a randomized control group that would be equivalent to the treatment group in all aspects, save for the treatment being evaluated (in this case, participation in the NES Program). When a randomized control trial is not feasible, we use a matched comparison group based on usage and other characteristics. A perfect match is impossible when studying the effects of energy efficiency programs, since we cannot know if any group of non-participants is equivalent to the participant group, especially on the dimension of what the participants would have done absent the program. We generally cannot even know whether a “matched” customer might be in the market for relevant equipment. Achieving similarity on usage supports our aim that the estimates from our quasi-experiment are representative on usage patterns at least. Usage patterns reflect not only a household’s level of electricity use but also its energy-related responses to changes in the weather, economic, and political environment. It is more difficult to assure that the comparison group represents what the participants would have done absent the program. Another way to put it is that it is difficult to know whether we have captured factors involved in customers’ self-selection into the program, some of whom would have installed program-qualified measures without the program.

If we could establish a reasonable level of equivalency, we would rely on future participants as a comparison group for this analysis. The use of future participants allows us to better control for self-selection, because those customers choose to participate in the same program, just later. With the NES Program, wherein distinct neighborhoods with differing geographic and housing characteristics are targeted over time, leveraging future participants as a comparison group may not always be possible due to differences that targeting different neighborhoods over time may create in participant composition and their energy consumption.

To support the evaluation of this program, we attempted to construct a comparison group comprised of future participants who participated between July 1, 2019, and March 31, 2020.¹³ Upon constructing this group, we encountered differences between the treatment and comparison group, leading to a conclusion of non-equivalence. This exploration is discussed further in the equivalency section. Although we attempted to control for the differences between the treatment and comparison group in modeling, we ultimately concluded that these differences were too substantial, and the use of a comparison group would not lead to the most rigorous or accurate savings estimates possible in this case.

Consumption Data Preparation

Upon merging participant and consumption data, we performed the following consumption data cleaning steps:

- **Duplicate records.** We explored duplicate records and made adjustments to arrive at a single bill per period.
- **Inadequate days.** We identified and dropped bill periods with zero or negative days.
- **Extremely low Average Daily Consumption.** We checked for and dropped bills with very low (less than 0 kWh) or missing average daily consumption.
- **Extremely high Average Daily Consumption.** We checked for customers with entire pre- or post-installation periods having very high (exceeding three times the standard deviation) average usage.
- **Inadequate billing history before or after program participation.** Many energy savings measures in these programs are expected to generate energy savings throughout the year. To assess changes in consumption due to program measures before and after installation, we need to ensure that participants have a billing history covering, at a minimum, nine months (or the 270-day equivalent) in the pre- and post-installation periods.
- **Insufficient billing history in the heating season before and after program participation.** We also required participants to have a billing history that included a minimum of 75% of the heating season (November through March) in the pre-participation and post-participation periods.
- **Insufficient billing history in the cooling season before and after program participation.** Similar to the heating season, we required participants to have a billing history that included a minimum of 75% of the cooling season (June through August) in the pre-participation and post-participation periods.
- **Removing consumption records for cross-participants.** We identified and removed NES Program treatment participants as well as future comparison group participants who cross-participated in one or more of seven programs administered by DEK following NES program participation. Customers were only removed if they cross-participated during the evaluation period. However, the average per-participant savings estimate was multiplied by the total number of evaluated participants, including those who participated in other programs, to determine total program savings.

¹³ Often, we use future participants that participated a year after the end of the evaluation period as the comparison group. For this analysis, we shortened this time period to avoid confounding effects of the COVID-19 pandemic.

Data Cleaning Summary

Table 16 contains a summary of the accounts dropped as part of each cleaning step for treatment and comparison groups comprised of future participants. As these tables show, the largest drops are associated with insufficient pre-period and post-period consumption data as well as with cross-participation. Upon completing data cleaning, we retained over half of treatment group participants (58%) in our analysis and 72% of future comparison group participants.

Table 16. Summary of Data Cleaning Results

Drop Reason	Treatment Accounts Remaining		Comparison Accounts Remaining	
	N	%	N	%
Total	612	100%	367	100%
Duplicate Records	612	100%	367	100%
Inadequate Days	612	100%	367	100%
NA or Negative Usage	612	100%	367	100%
Outliers	612	100%	366	100%
Long Bills	612	100%	366	100%
Pre-Period Sufficiency	509	83%	321	87%
Post-Period Sufficiency	445	73%	321	87%
75% Heating Days in Pre	421	69%	305	83%
75% Heating Days in Post	390	64%	305	83%
75% Cooling Days in Pre	390	64%	304	83%
75% Cooling Days in Post	387	63%	304	83%
Gaps and Overlaps	387	63%	304	83%
Cross Participation	357	58%	265	72%

Weather Data Preparation

To include weather patterns in our model, we used daily weather data from numerous weather stations across the DEK territory, utilizing the site closest to each account’s geographic location. By using multiple sites, we increased the accuracy of the weather data associated with each account. We obtained these data from the National Climatic Data Center (NCDC).

The daily data are based on hourly average temperature readings from each day. We calculated cooling degree day (CDD) and heating degree day (HDD) for each day (in the analysis based on average daily temperatures, using the same formula used in weather forecasting).¹⁴ We merged daily weather data into the consumption dataset so that each billing period captures the HDD and CDD for each day within that billing period (including

¹⁴ A “degree-day” is a unit of measure for recording how hot or how cold it has been over a 24-hour period. The number of degree-days applied to any particular day of the week is determined by calculating the mean temperature for the day and then comparing the mean temperature to a base value of 65 (HDD) and 75 (CDD) degrees Fahrenheit. (The “mean” temperature is calculated by adding together the high for the day and the low for the day, and then dividing the result by 2.) If the mean temperature for the day is 5 degrees higher than 75, then there have been 5 cooling degree-days. On the other hand, if the weather has been cool, and the mean temperature is 55 degrees, then there have been 10 heating degree-days (65 minus 55). “Degree Days,” National Weather Service, <https://www.weather.gov/ffc/degdays>.

start and end dates).¹⁵ For analysis purposes, we then calculated average daily HDD and average daily CDD, based on the number of days within each billing period.

Comparison Group Equivalency Assessment

Future Comparison Group Assessment

The appropriate use of the future participant comparison group design depends on its equivalency with the treatment group on as many dimensions as possible, including consumption during the pre-participation period, weather, program implementation, and available sociodemographic data for participants. Substantial differences between the treatment and comparison groups could lead to a misrepresentation of the baseline or point of comparison. As such, as part of our assessment of the comparison group equivalency, we explored the following dimensions:

- Pre-period consumption
- Weather
- Housing characteristics

Pre-period Consumption

Participants enter the NES Program on a rolling basis, which means that each participant's pre- and post-period is defined by that customer's participation date and is specific to that participant's timing of program entry. Therefore, when assessing equivalency of the comparison and treatment groups' energy consumption, it is important to use a pre-period shared by both groups.

Figure 7 summarizes consumption trends (average daily consumption [ADC]) between treatment and comparison groups for DEK. As the figure shows, pre-participation energy usage of the comparison group followed a significant divergent pattern throughout the full pre-period, signifying underlying differences between these groups.

¹⁵ Daily weather data are merged based on the given dates of the billing period. Assigning weather this way provides a more accurate representation of the weather experienced during the billing period than does using weather for the calendar month of the bill.

Figure 7. Participant and Comparison Group Usage During their Pre-Participation Period

Weather

Figure 8 and Figure 9 compare HDD and CDD between treatment and comparison groups for DEK. These figures show that weather patterns were very similar between treatment and comparison participants.

Figure 8. Average Heating Degree Days Experienced by Treatment and Comparison Groups

Figure 9. Average Cooling Degree Days Experienced by Treatment and Comparison Groups

Household Characteristics of Participants

Table 17 shows core available heating and housing characteristics of treatment and comparison group participants. As shown, DEK treatment and comparison group participants differ in terms of heat source and home type. While these time invariable differences should be captured and absorbed by the fixed effect in our model, our concern was that these differences in heating and housing characteristics could be associated with pre- to post- differences in consumption, (i.e., the housing characteristic can affect the impact “slope” in the model).

Table 17. Household Characteristics of Treatment and Comparison Groups

Characteristic	Treatment	Comparison
Heat Source ^a		
Electric	49%	20%
Gas	49%	78%
Home Type		
Manufactured Housing	78%	1%
Multi-Family	6%	24%
Single-family	17%	75%

^a Values do not sum to 100% due to missing data for a small number of participants

Given both the housing and pre-period consumption differences observed between the treatment and future participant comparison group, we chose to exclude the comparison group from the model.

Model Specifications

To estimate savings for the NES Program, Opinion Dynamics specified a LFER model in a pre-post design that incorporated weather and interaction terms, showing the effect of weather in the post-installation period. The fixed effect for the model is set at the account level, which allows us to control for all household factors that do not vary over time. In the process of determining the appropriate model for the analysis, we specified a range of models from simple pre-post to more complex models incorporating a variety of terms and controls.

We judged our final models on several criteria. Primarily, we aimed to use a model that explained as much about changes in the dependent variable as possible. The most direct measure of this is the adjusted R-squared, which provides an estimate of the extent to which the model explains any difference between post-period usage and the baseline. We also compared Akaike Information Criterion (AIC) values of each model specification within the same sample. The AIC provides a measure of relative quality between models; a lower value indicates a relatively more efficient model. This method inherently incorporates explained variation as well as how many variables we use to achieve that level of explanation.

Equation 3 contains final model specifications for the DEK NES Program. Of all the models we tested, we found these to have the best overall fit and the most reasonable set of terms.

Equation 3. Final Model Specification – DEK

$$ADC_{it} = B_h + B_1 TreatPost_{it} + B_2 HDD_{it} + B_3 CDD_{it} + B_4 HDD_{it} \times Electric_i + B_{5-15} MonthDummies_t + \varepsilon_{it}$$

Where:

ADC_{it} = Average daily consumption (in kWh) for the billing period

$TreatPost$ = Indicator for DEK treatment group in post-installation period (coded “0” in the pre-participation period, coded “1” in post-installation period)

HDD = Average daily heating degree days from NCDC

CDD = Average daily cooling degree days from NCDC

Electric = Indicator for Electric Heat Usage (0,1) that does not vary over time; interacted with HDD

B_h = Average household-specific constant

B_1 = Main program effect (change in ADC associated with being a participant in the post-installation program period)

B_2 = Increment in ADC associated with one-unit increase in HDD

B_3 = Increment in ADC associated with one-unit increase in CDD

B_4 = Increment in ADC associated with one-unit increase in HDD for customers who have electric usage

B_{5-15} = Increments in ADC associated with each calendar month, omitting April

ε_{it} = Error term

Table 18 provides the coefficients estimated using the above model specification. Virtually all coefficients were statistically significant at the 95% confidence level (i.e., p-value < 0.05).

Table 18. Final Model Coefficients

Variable	Estimate	Significant (p-value < 0.05)
TreatPost	-2.44251	Yes
HDD	0.009187	No
CDD	4.303664	Yes
February	0.927054	No
March	-3.40376	Yes
April	-7.01856	Yes
May	0.397063	No
June	-3.96094	Yes
July	-3.01196	Yes
August	-2.14896	Yes
September	-3.76764	Yes
October	-8.45564	Yes
November	-4.75298	Yes
December	-1.58358	Yes
HDD × Electric	1.468351	Yes

Savings Estimation

The regression model results presented in the section above show a statistically significant reduction in electric consumption in the DEK jurisdiction. Table 19 shows an estimate of the average daily savings, which reflect actual savings under actual weather conditions.

Table 19. Modeled Savings Estimates

Modeled Treatment Participants	Average Daily Savings Estimate (kWh)	Standard Error	Significant	90% Confidence Interval	
				Lower	Upper
357	2.44	0.24	Yes	2.05	2.83

To better facilitate comparisons of program performance, we also show savings here as a percentage of energy saved with respect to the modeled baseline. The baseline usage is calculated using the coefficients from the model and fixed effects. This calculation shows the energy that customers would have used, on average, if the program equipment had not been installed. To estimate the percent of savings from baseline energy consumption, we divided the change in daily electricity use for the program by the mean baseline ADC to arrive at the savings percentage. We annualized first-year savings by multiplying the daily savings estimate by 365 days. The annualized value represents average annual first-year savings. Table 20 shows estimated annualized savings, baseline consumption, and savings percentages. We used these values to determine the overall program level savings reported in the body of the report.

Table 20. Estimated Annual Savings from Consumption Analysis

Average Annual Baseline Energy Consumption per Participant (kWh)	Average Per Participant Ex Post Net Annual Savings (kWh)	Average Per Participant Savings Percentage	90% Confidence Interval	
			Lower	Upper
15,797	892	5.6%	749	1034

PERSON RESPONSIBLE: Mitch Carmosino

Duke Energy Kentucky
Case No. 2024-00197
KSES First Set Data Requests
Date Received: August 14, 2024

KSES-DR-01-051

REQUEST:

Regarding the option to convert East Bend to dual fuel operation, please answer the following requests:

- a. Please identify and produce any analysis in the Company's possession of the costs to convert East Bend 2 to dual fuel operation.
- b. Please identify and produce any analysis in the Company's possession of the expected operating characteristics (or range thereof) of East Bend post conversion.

RESPONSE:

- a. Objection. Duke Energy Kentucky objects to this request to the extent it seeks information that was prepared under privilege and at the direction of counsel. Without waiving said objection and to the extent discoverable, Coal to gas conversion / dual-fuel costs were based on the company's significant actual project experiences in Carolinas (8 units), scaled as appropriate and then escalated and inflated to reflect today's market conditions. They are intended to be ballpark estimates for initial modeling screening. At a high level, the 50% DFO was estimated at \$260/kw of the 50% gas converted capacity (i.e., 1/2 of full capacity). Engineering studies would need to be conducted to determine the necessary project scope and gain more accuracy on the projected costs prior to seeking any Commission authorization.

- b. Based on the same company experienced referenced in the response to part (a), DFO converted units are expected to have slightly poorer heat rate, lower minimum load, increased ramp rates and lower variable operations and maintenance costs namely due to decreased environmental reagent use.

PERSON RESPONSIBLE: As to objection, Legal
As to response, Dan Simpson

KSES-DR-01-052

REQUEST:

Regarding the option to convert East Bend to operate entirely on gas, please answer the following requests:

- a. Please identify and produce any analysis in the Company's possession of the costs to convert East Bend 2 to gas-only operation.
- b. Please identify and produce any analysis in the Company's possession of the expected operating characteristics (or range thereof) of East Bend as a gas only unit.

RESPONSE:

- a. Objection. Duke Energy Kentucky objects to this response to the extent it seeks information that was prepared at the request of counsel and is otherwise protected by privilege. Without waiving said objection, and to the extent discoverable, coal to gas conversion costs were based on the company's significant actual project experiences in Carolinas (8 units), scaled as appropriate and then escalated and inflated to reflect today's market conditions. They are intended to be ballpark estimates for initial modeling screening. At a high level, 100% conversion (not including demo) was estimated at \$216/kw. Engineering studies would need to be conducted to determine the necessary project scope and gain more accuracy on the projected costs.
- b. Based on the same company experienced referenced in the response to part (a), gas converted units are expected to have slightly poorer heat rate, lower minimum load,

increased ramp rates and lower variable operations and maintenance costs namely due to decreased environmental reagent use.

KSES-DR-01-053

REQUEST:

Is Duke Energy Kentucky aware of any new large load customers considering locating in the Company's service territory? If so, please describe the potential customers including their energy service needs.

RESPONSE:

The Company base forecast shows 0.6% load growth (Figure 3.17, page 26). We are not aware of any large customers such as data centers making any determinative decisions regarding locating in the Company's territory.

REQUEST:

With respect to cryptocurrency facilities in the Company's territory, if any, please answer the following requests:

- a. Identify all currently operating cryptocurrency facilities by name, location, capacity need (in MW), percentage of capacity need that is firm capacity, anticipated load factor, and which consumer class they belong to.
- b. Identify all proposed cryptocurrency facilities that you anticipate will begin operating in the next three years by name, location, capacity need (in MW), percentage of capacity need that is firm capacity, anticipated load factor, and to which consumer class they would belong.
- c. For each currently operating or proposed cryptocurrency facility identified in response to paragraphs (a) and (b), please explain in detail whether or how you have incorporated the facility into the load forecast for this IRP.
- d. Identify the projected cryptocurrency capacity need (in MW) for the Company's territory for each of the years 2025 through 2040.

RESPONSE:

- a. Currently there are no known cryptocurrency facilities operating in the Company's footprint.
- b. N/A
- c. N/A

d. N/A. See response to a. The Company has not performed this analysis.

REQUEST:

In the Company's estimation, how many residential customers rely on electric heating?

Please provide any available analyses or workpapers to support your answer.

RESPONSE:

The Company's billing system denotes an electric heating indicator for 39,112 residential customer meters as of July 2024.
