1.0 SCOPE OF WORK

During the November 2021 maintenance outage at Spurlock Station, an Eddy Current inspection was performed on 100% of all in-service tubes in LPFWH 2A and 2B. The tube specifications are as follows:

Material	OD Dimension	Wall Thickness	BWG	Length
304 SS	0.750"	0.035"	20	34'

This inspection of LPFWH 2A and 2B was performed as part of an ongoing maintenance program at the Spurlock Station. The current results will be compared to future inspections to assure performance and trend the progression of previously recorded damage.

Eddy Current Testing is used to inspect a wide range of non-ferrous material for defects and degradation without damaging the test specimen. A digital multi-frequency tester with two-channel mixing was used. The tester is set with high sensitivity to small defects meanwhile still able to size large volume wear.

530 Jones Street Verona, PA 15147 U.S.A. Tel: 1-800-345-3476 Fax: 412-826-8255

2.0 INSPECTION SUMMARY

	Manufacturer	Type	Serial Number
Test System	CoreStar	Omni 200	0017-0806
Analysis Software	CoreStar	EddyVision 8.1	N/A
Calibration Standard	Ecutec	ASME	CSC-434
Calibration Standard	Ecutec	ASME	CSC-432
Probe	CoreStar	630 ESH/HF	N/A
Probe	CoreStar	610 ESH/HF	N/A

LPFWH 2A and 2B

The results of this inspection are summarized in the Results Summary Table and on the Results Map.

A 100% Eddy Current inspection was performed on the LP Feedwater Heater 2a and 2B.

FWH 2A: A total of 762 tubes were inspected (100%). No tubes were obstructed or restricted after downsizing probe. Two tubes recorded moderate wear of 29 and 41% wall loss. Several tubes recorded possible erosion of the drain cooler end plate in row 1 of the inlet and 2 tubes in row 1 of the outlet.

FWH 2B: A total of 762 tubes were inspected (100%). There were no obstructed or restricted tubes after probe downsizing. Ten tubes showed wear indications of 22 to 33% wall loss. Four tubes recorded small volume ID/OD indications

There was no plugging criteria, supplied by site, at the time of this examination.

Keeping these tubes as clean as possible will help enhance the performance of this heat exchanger. Re-inspect this heat exchanger 1 to 2 operating cycles to assure performance, monitor for any future damage, and trend the progression of previously recorded damage.

EAST KENTUCKY POWER CO-OP SPURLOCK STATION UNIT 2 LPFWH-2A

VIEW FROM: INLET/OUTLET

Model LPFWH-2A (762 tubes) 762 open tubes

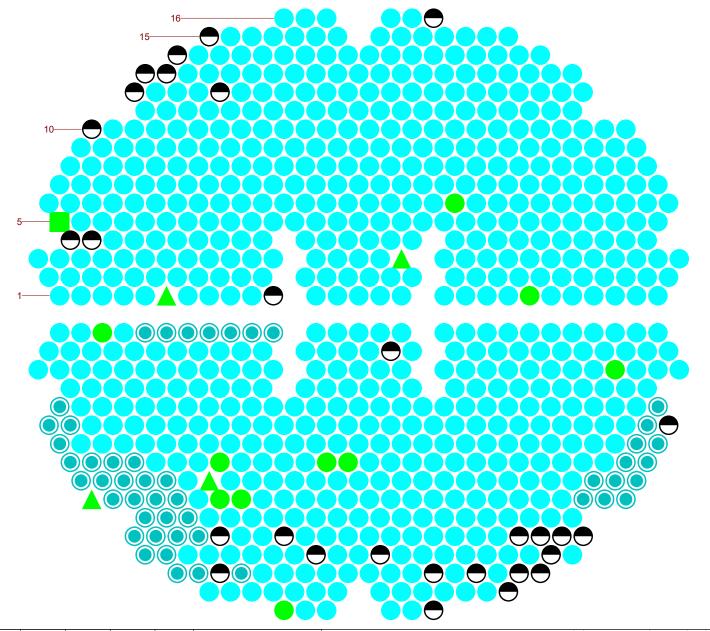

Results Summary East Kentucky Power Co-Op Spurlock Station Unit 2 LPFWH-2B

	11-2021 Inspection
Total Tubes in Component (U-Tubes)	381
Total Tubes Inspected (Straight Lengths)	762
Tubes Recording Damage:	Totals
Approx. Wall Loss 90% & Greater	0
Approx. Wall Loss 80% to 89%	0
Approx. Wall Loss 70% to 79%	0
Approx. Wall Loss 60% to 69%	0
Approx. Wall Loss 50% to 59%	0
Approx. Wall Loss 40% to 49%	0
Approx. Wall Loss 30% to 39%	4
Approx. Wall Loss 20% to 29%	10
Tubes Recording Dents	29
Possible Support Erosion (PSE)	48
Restricted Tubes (Complete Inspection Not Possible)	0
Obstructed Tubes	0
(No Test Possible)	U
Previously Plugged Tubes	0
Tubes Recommended for Plugging	0
Total of Previously Plugged Tubes & Tubes Recommended for Plugging	0

3.0 INSPECTION PROCEDURE

Technicians

Conco EC technicians are certified to CSC-QAP-9.1 (SNT-TC-1A guidelines, CP-189) and also trained in confined space, first aid, and CPR. All Conco Analysts have passed an industry recognized Data-Analysis level IIA or level IIIA class.

Process

All inspections are performed in accordance with CSC-NDE-11.0 Rev 4 Data Acquisition and Analysis. Conco will use CoreStar equipment recording data with 4 frequencies and on 8 channels (4-differential channels and 4-absolute channels). The data will be recorded on medium consistent with the tester used (Magnetic Optical disk, compact flash disk, or USB flash drive). The data will be interpreted by qualified data analyst using the CoreStar analysis software. The results will be stored in the CoreStar DBMS software. This will enable future trending and inspection planning of the unit. While on site, Conco will visually inspect the tube sheet and they will generate a list of plugged tubes to be included on the tube sheet maps. All test equipment will be visually inspected prior to use to ensure the equipment is suitable for the inspection. All test equipment will also be within calibration as per manufacture specifications.

Eddy Current probes are purchased to conform to specific metallurgical characteristics, inside diameter and wall thickness of the tubes in this proposal. The probe diameter is calculated to achieve a fill-factor of approximately 85% between the probe head diameter and the tube ID.

We propose to use our services on a "best effort" basis. The detection of particular defect or variable in the material tested cannot be guaranteed.

- 1. Probes should be pulled @ 40 inches/second or less.
- 2. Review each data channel and ensure that adequate/expected signal responses are achieved before recording the calibration. Do not record data until the proper spans and rotations have been set.
- 3. Monitor the data by setting the left strip chart to channel 1 vertical, right strip chart to channel 6 vertical and the lissajous display set to channel 1 as a minimum. The operator will determine the specific strip chart settings and lissajous display to verify the system is functioning properly and that data quality is acceptable.
- 4. Follow the Conco NDE procedure CSC-NDE-11.0 Rev 4.
- 5. Encode the tube ID's as per map for respective sections.
- 6. The initial exam attempt shall be performed with the 630 ESH/HF probe.
- 7. Tubes that will not allow the probe to enter, report as "Obstructed".
- 8. Tubes unable to be examine the desired extent, report as "Restricted".
- 9. Write a message for all tubes that are unable to be examined full length explaining the reason.
- 10. Encode the ASME Std. as "999", Thinning Std as "999" with a message.
- 11. Perform "System Null" only if "Display Null" is ineffective in balancing the signal.

1. Purpose/Scope

This procedure establishes the techniques for performing multi-frequency eddy current (ET) examination of non-ferromagnetic heat exchanger tubing. This includes magnetic saturation techniques for mildly ferritic thin walled tubing. All personnel utilizing the procedure shall follow each manufacturer's instructions and operations of the applicable instrumentation used.

2. Attachments

2.1. Sample Examination Technique Specification Sheet (ETSS)

3. References

- 3.1. ASME Boiler and Pressure Vessel Code, Section XI (2007 edition, through 2009 addenda).
- ASME Boiler and Pressure Vessel Code, Section V, Article 8 (2007 edition, through 2009 addenda).
- 3.3. CSC-QAP-9.1 "Certification of NDE Personnel"
- 3.4. CSC-QAP-12.1 "Control of M&TE"
- 3.5. CSC-NDE-3.4 "Optimum Test Frequency Manual"

4. Definitions

- 4.1. ASME American society of Mechanical Engineers.
- 4.2. Absolute Test (external-reference) An eddy current test utilizing one inspection coil in the test material, which references against another single coil in a reference material.
- 4.3. Differential Test (self-comparison) An eddy current test arrangement utilizing, two or more inspection coils electrically connected in series opposition, which compares a section of the test specimen against another section of the same test specimen.
- 4.4. ASME Calibration Standard A specimen of the same material, size, wall thickness, and heat treatment, as the material being inspected. This standard may contain artificial discontinuities used for system set-up.
- 4.5. Reference Standard A material of the same size, wall thickness, and heat treatment, as the material being inspected. This standard shall be free from defects and used for comparison purposes.

4.6. Examination Technique Specification Sheet (ETSS) – Documentation completed by the Lead Analyst (or designee), that outlines the eddy current parameters for a particular inspection. The ETSS contains specific information regarding the test subject, frequency selection, setup parameters, proper probes and test equipment required to complete the inspection. The ETSS also outlines the analysis parameters such as voltage settings, reporting channels, curves (phase or magnitude), reporting thresholds and applicable codes for defects and other conditions encountered.

5. Responsibilities

- 5.1. Level IT personnel may operate equipment under the direct supervision of a Level II or Level III. Level IT personnel shall not evaluate or accept the results of a nondestructive examination.
- 5.2. Level I personnel shall use written procedures when performing specific setups, calibrations, and examinations and when recording data. The activities shall be conducted under the direct guidance of Level II or Level III personnel. Level I NDE personnel shall not evaluate or accept the results of a nondestructive examination.
- 5.3. Level II personnel shall be familiar with the operation of the equipment, applicable examination techniques, and recording or the examination data. Level II personnel shall be familiar with the codes, standards, and specifications of any inspection being performed.
- 5.4. Level IIA personnel shall be responsible for data interpretation or evaluation and give guidance to Level II personnel as needed. The Data Analyst has the right to request a retest on any tube with an unusual condition. The Lead Analyst may alter the original inspection technique or plans to address any special condition encountered. The Lead Analyst is responsible for the correct inspection probes, calibration standards, and any other information on the ETSS sheet.
- 5.5. Level III personnel shall hold the same responsibilities as Level IIA. The Level III, with approval of the customer, may alter the original inspection technique or plans to address any special condition encountered. The Level III is responsible for the correct inspection probes, calibration standards, and any other information on the ETSS sheet.

6. Procedure

- 6.1. Code and Procedure Requirements All Eddy Current technicians shall be familiar with this procedure and examination program prior to the start of the examination.
- 6.2. Personnel Criteria Personnel performing Eddy Current examinations shall be certified in accordance with the Quality Assurance Procedure CSC-QAP-9.1, "Certification of NDE Personnel" or their employers, written practice that has been approved by Conco Services Corporation.
- 6.3. Heat Exchangers under inspection must be shut down or isolated and the system drained. Manways shall be opened and sufficient time should be allowed for cool down prior to the start of the job.
- 6.4. All personnel engaging in eddy current at operating nuclear facilities shall receive instructions and understand radiation rules and guidelines in effect at the plant site.
- 6.5. Equipment

6.5.1. Eddy current test instrument

- 6.5.1.1. The eddy current test instrument shall be capable of multi-frequency inspection in multiplexed mode, simultaneous injection mode and operation in the differential and/or absolute mode.
- 6.5.1.2. The eddy current test instrument shall be capable of recording and playing back data, real time, in a format suitable for evaluation and archival storage.
- 6.5.1.3. The test instrument outputs shall provide phase and amplitude information.
- 6.5.1.4. The eddy current inspection system shall be capable of detecting and recording dimensional changes, metallurgical changes, deposits and determine if discontinuities are ID or OD initiated.
- 6.5.1.5. Testing equipment shall hold current calibration in accordance with CSC-QAP-12.1 and the interval shall not exceed one year or whenever the equipment has been overhauled or repaired as a result of malfunction or damage.
- 6.5.2. The acceptable eddy current probes for an inspection shall be listed on the ETSS and may include bobbin coil, cross-wound and pancake coil designs from various manufacturers. The sensitivity for the differential bobbin probes technique shall be sufficient to produce a response from the 20% flat bottom holes with a minimum peak to peak response of 30% screen height of the Lissajous. A minimum fill factor of 80% should be used. For special interest regions (i.e. obstructions and restrictions), a lower fill factor may be used. If the minimum sensitivity requirements can not be met, the test will be considered a best effort examination. Customer approval shall be obtained prior to examination. Customer requirements for higher fill factor values will be followed and documented on the ETSS.

6.5.3. ASME Calibration Standards

- 6.5.3.1. The ASME calibration standard shall be manufactured in accordance with the specifications of the ASME Boiler and Pressure Vessel Code, Section V, Article 8. The standard shall contain the following artificial discontinuities at a minimum: 100% through wall hole, 60% through wall flat bottom hole, and four 20% through wall flat bottom holes spaced 90 degrees apart in a single plane around the tube circumference.
- 6.5.3.2. A simulated support ring should be used to simulate a support plate in the unit being inspected. If an "artificial" ring cannot be obtained, a support plate in the unit can be used for mixing/process channels.
- 6.5.3.3. Each standard shall be identified by a unique serial number and have an associated drawing or data sheet showing the actual flaw depths. The eddy current system response shall become part of the permanent record of the standard.
- 6.5.3.4. Other calibration standards may be used in addition to the ASME standard for unique applications.

6.5.4. Digital Data Analysis System

6.5.4.1. The eddy current data analysis system shall be capable of displaying and evaluating the recorded data from all frequency channels.

530 JONES STREET·VERONA, PA 15147 (412) 828-1166 · FAX: (412) 826-8255

Procedure No	CSC-NDE-11.0	
Title	Data Acquisition & Analysis	
Revision:	4	
Date:	January 7, 2021	
Page 4 of 12		

- 6.5.4.2. The system shall have multi-parameter mixing capability.
- 6.5.4.3. The system shall have a minimum resolution of 12 bits per data point.
- 6.5.4.4. The Lissajous display shall have a minimum resolution of 7 bits full scale.
- 6.5.4.5. The strip chart display shall have a minimum resolution of 6 bits full scale.
- 6.5.4.6. The strip chart display shall be selectable to display either the X or Y component of the raw or processed (mixed) data.
- 6.5.4.7. In addition, the system shall meet the "General System Requirements", stated in ASME Boiler and Pressure Vessel Code, Section V, Article 8, II-830.5.1.

6.6. System Set-up

6.6.1. Preparation

- 6.6.1.1. Review all safety and radiological procedures with plant personnel as applicable (i.e. air sample, radiation surveys, confined space requirements, etc.)
- 6.6.1.2. Review all Foreign Material Exclusion (FME) procedures with plant personnel as necessary.
- 6.6.1.3. Examine work area for any potential hazards or interference and resolve any problems.
- 6.6.1.4. Establish location of the test station and placement of the test instrument.
- 6.6.1.5. Locate 110 VAC power source. (Clean power source)
- 6.6.1.6. Establish location of cable routing.
- 6.6.1.7. Acquire copies of the ETSS and all applicable procedures from the Lead Analyst (or designee). Verify the probes and standards listed on the ETSS are appropriate for the component or material to be examined.
- 6.6.1.8. Acquire copies of the inspection plan and tubesheet maps if available. Verify that the tubesheet map is correct for the component and the view or test end is correct.

6.6.2. Equipment Set-up

- 6.6.2.1. Connect and power-up eddy current system per owners manual
- 6.6.2.2. Attach probe extensions, of equal length, and probes to the test instrument
- 6.6.2.3. Establish communication for personnel engaging in the examination
- 6.6.2.4. Set configurations for channels and gain setting on test instrument.
- 6.6.2.5. Verify recording path
- 6.6.2.6. Set and verify pull speed (if a probe pusher is being used).

6.6.3. Acquisition Set-Up (Configuration)

6.6.3.1. Test Parameters

- 6.6.3.1.1. Set the frequencies, drives, and gains in the configuration of the test instrument, per the ETSS. The primary frequency shall be set to obtain a response of the 4X20% FBH's to fall within 90° to 120° from the 100% thruwall hole set at 40°.
- 6.6.3.1.2. Set the proper sample rate, in the test instrument, per the ETSS. The sample rate should meet the minimum of 30 samples per inch of tubing per ASME Section V, Article 8.
- 6.6.3.1.3. With the proper settings, a signal-to-noise ratio of 3:1 or higher shall be obtained.
- 6.6.3.1.4. Assure the reference probe has been placed in the reference tubing or the component. Test systems with internal reference capabilities can be used in lieu of a reference probe.
- 6.6.3.1.5. Place the test probe in the end of the ASME Calibration standard assuring that none of the coils are influenced by the flaws in the standard and perform a hardware null.
- 6.6.3.1.6. Open a calibration group, with the proper recording path, to allow the calibration standard data to be recorded.
- 6.6.3.1.7. Turn on the acquire function of the tester and assure data is in the strip charts, on the left of the acquisition screen.
- 6.6.3.1.8. Assure both the reference, and test probes are in good metal and center the data in the Lissajous.
- 6.6.3.1.9. Push the test probe out of the end of the ASME Calibration standard.
- 6.6.3.1.10. Start recording the data and pull the probe back through the calibration. (If a probe pusher is being used for the inspection, it should be used to pull the calibration standards also. If this is the case, care should be taken to minimize snap of the probe as it is retracted through the calibration standard.)
- 6.6.3.1.11. Stop recording data and review the calibration standard to ensure compliance with the ETSS.
- 6.6.3.1.12. Set spans and rotations on all absolute and differential channels for the ASME standard, identified on the approved ETSS.
- 6.6.3.1.13. Store the set-up with the new values for the spans and rotations of the calibration standard.
- 6.6.3.1.14. Repeat steps from above, (6.6.3.1-(6.6.3.1.6) through (6.6.3.1.9)) for all calibration standards being used for the inspection.

530 JONES STREET·VERONA, PA 15147 (412) 828-1166 · FAX: (412) 826-8255

Page 6 of 12		

Note: If Wear Scar and/or Thinning Standards are being used, check all channels to assure that none of the signals are saturated. If any signals are saturated, adjust the gains in the configuration screen, notify the Level IIA/III of changes needed to ETSS, and repeat the entire calibration process with the updated ETSS settings.

6.7. Examination

6.7.1. Summary Form

6.7.1.1. Select the "Summary Form" and complete all designated input areas. The summary form shall be written to the storage media and contain the following information as a minimum:

Owner

Plant site and unit number

Heat Exchanger identification and test end

Recording media identification (i.e. calibration group)

Date of examination

Serial number of the calibration standard(s)

Operator's identification and certification level

Examination frequencies

Lengths of probe and probe extension cables

Size and type of probes

Probe manufacturer's name and manufacturer's part number or probe description

Serial number of the eddy current test instrument

Calibration "Due Date", from the test instrument being used

6.7.2. Record Calibration Standards

- 6.7.2.1. Identify the ASME standard run as Row 999 Tube 999 or as stated on the ETSS. If other standards are utilized refer to the ETSS for identification.
- 6.7.2.2. Place the test probe in a defect-free portion of the standard and balance the tester.
- 6.7.2.3. Record a minimum of three standard runs in the direction and at the speed that the inspection will be performed.
- 6.7.2.4. Retrieve a standard run from the storage media to verify proper system operation.
- 6.7.2.5. Calibration standard runs shall be recorded for the following conditions:
 - 6.7.2.5.1. At the beginning and end of a directory/cal group or when changing storage
 - 6.7.2.5.2. At the beginning and end of a work shift
 - 6.7.2.5.3. When changing equipment, including probes and cables
 - 6.7.2.5.4. When four hours time has elapsed since the last calibration verification
 - 6.7.2.5.5. When a power failure or system lockup has occurred
 - 6.7.2.5.6. At anytime the operator deems it necessary to check the system integrity
- 6.7.2.6. A written message to the data disk should precede or follow a calibration run stating

530 JONES STREET·VERONA, PA 15147 (412) 828-1166 · FAX: (412) 826-8255

Procedure No	CSC-NDE-11.0	
Title	Data Acquisition & Analysis	
Revision:	4	
Date:	January 7, 2021	
Page 7 of 12		

the reason the calibration run is being performed.

- 6.7.2.7. If a system is found out of tolerance, recalibration is required. This should be noted by recording an updated summary and message to the recording media. In addition to this, if any part of the test system is changed, due to damage or any other issue, recalibration is required.
- 6.7.2.8. The analyst will determine if any or all tubes need to be retested.
- 6.7.2.9. The "End of Calibration" standard run shall be performed at the same pull speed used during the examination.
- 6.7.2.10. If a calibration run cannot be performed at the four-hour interval, a detailed message shall be recorded on the recording media stating the reason for the "missed" standard run and the site lead shall be notified. A calibration standard run shall then be performed at the first opportunity and prior to the continuation of the inspection.

6.7.3. Typical examination process

- 6.7.3.1. Identify and encode the tube identification using the appropriate identification/numbering scheme.
- 6.7.3.2. Insert the probe into the tube to be examined, check balance of the data and rebalance if required.
- 6.7.3.3. Insert the Probe to the intended examination extent.
- 6.7.3.4. Initiate data recording.
- 6.7.3.5. Withdraw the probe at the speed noted on the ETSS.
- 6.7.3.6. Monitor the data quality during the recording process. Ensure that acceptable data is being acquired in all channels.
- 6.7.3.7. Stop recording data when the examination is complete.
- 6.7.4. If the probe cannot traverse the entire length of the scheduled examination and the tube is considered restricted, record a message identifying the tube number or group of tubes. Include an explanation as to why the tubes(s) cannot be examined over the entire length (if known).
- 6.7.5. When an error in tube identification occurs, the operator shall clearly identify which tube entries are incorrect with a recorded message.

6.8. Data Analysis and Reporting

- 6.8.1. Evaluate the recorded digital data from the acquisition process.
- 6.8.2. Evaluate any indications. Indication types that must be reported shall be characterized using the frequencies or frequency mixes and analysis curves (Phase or Magnitude) appropriate for the damage mechanism as identified in the Examination Technique Specification Sheet (ETSS).

Procedure No	CSC-NDE-11.0	
Title	Data Acquisition & Analysis	
Revision:	4	
Date:	January 7, 2021	
Page 8 of 12		

- 6.8.3. Provide a preliminary report following the examination. Include in the report a record indicating the tube(s) examined, any scanning limitations, the location and depth (or descriptive code) of each reported flaw, and any specific reporting requirements identified by the customer.
- 6.8.4. Unless otherwise requested by the customer, only the deepest flaw in each tube will be identified.
- 6.8.5. Graphic printouts of typical and questionable defect types shall be added at the customer's request.
- 6.8.6. Report all obstructions restrictions, or conditions known to limit the desired extent of test for all tubes on the examination plan (e.g. dents, tube cleanliness, foreign material).
- 6.8.7. Report any addition conditions deemed necessary.

7. Records

- 7.1. Records and documentation are handled in accordance to CSC-QAP-17.1.
- 7.2. A copy of this procedure, personnel certifications and equipment certifications shall be submitted to the customer upon request.
- 7.3. The examination results and technical information regarding test parameters and inspection requirements shall be included in the final report.

Special Instructions for Analysis

- Calibration curves shall be constructed using the "As-Built" dimensions from the calibration standard drawings.
- 2. Normalize to 4 volts on the 4 X 20% flat bottom holes using channel #1 differential and store to all channels.
- All Quantifiable indications of tube wall degradation ≥ 20% TW and 1 Volt shall be reported (however, not to exceed 6 reportable ID defects).
- 4. Locate all defect indications in inches measured from the test end.
- Previously reported indications shall be addressed by the primary analyst. Report previously reported Inds. In same channel as history. Report previous indications that are not found as "INF" and indications not recordable as "INR".
- If test data appears to be un-interpretable shall be report as "RBD".

4.0 CERTIFICATIONS

The following personnel were involved with this inspection:

Robert Prentice	ECT IIA	Conco Services
Darwin Shaner	ECT II	Conco Services
Jason Shomo	ECT I	Conco Services

The following testers were used on this inspection:

Corestar OMNI 200 S/N 0017-0806

The following calibration standards were used on this inspection:

ASME CSC-434
Wall Thinning CSC-432

Note: see following pages for a copy of all certifications and standard drawings

CORESTAR INTERNATIONAL CORPORATION AS FOUND EQUIPMENT CALIBRATION CERTIFICATE

INSTRUMENT LAB TEMP: 75.2 °F

Certificate Number: CB-210151 Instrument S/N: 0017-0806

Instrument: OMNI-200TM AM201R1-10 Date: 24-Jun-2021

Customer: Conco

Instruction Number: CIC-HI002, Rev. 5

VOLTAGE SPECIFICATION

Instrument:	Agilent Model 34401A	Instrument S/N:	US36141491
	Digital Multimeter	Calibration Date:	05-Feb-2021
Calibration Interval:	1 year	Calibration Due:	05-Feb-2022
Voltage (Vdc)	Measured Value (Vdc)	Tolerance (Vdc)	As Found (Vdc)
+3.3	+3.330	+/- 0.100	+3.330
+15.0	+14.978	+/- 0.200	+14.977
-15.0	-15.019	+/- 0.200	-15.019

FREQUENCY SPECIFICATION

Instrument:	Agilent Model 53131A	Instrument S/N:	MY40003653
	Universal Counter	Calibration Date:	05-Feb-2021
Calibration Interval:	1 year	Calibration Due:	05-Feb-2022
Frequency (Hz)	Measured Value (Hz)	Tolerance (Hz)	As Found (Hz)
100	100	+/- 5	100
2,000	2,000	+/- 100	2,000
30,000	30,000	+/- 1,500	30,000
400,000	400,000	+/- 20,000	400,000
2,000,000	1,999,998	+/- 100,000	1,999,998

COIL GAIN CALIBRATION SPECIFICATION

Calibration Frequencies: 5 kHz to 1 MHz

Calibration Module SN: 0269-0307

Test Parameters: See instructions

NOTE: The complete table of measured values for each frequency, gain setting, and coil number is permanently stored in the instrument hardware. To view and print the report, go to the Calibration menu in the Tester Config screen.

Gain Step (decibels)	Average Value (Volt/Volt)	Tolerance	As Found (Volt/Volt)
-22 db	0.087	.087 ±.002 V/V	0.087
-16 db	0.173	$.173 \pm .005 \text{ V/V}$	0.173
-10 db	0.337	$.337 \pm .010 \text{ V/V}$	0.337
-4 db	0.666	$.664 \pm .019 \text{ V/V}$	0.666
