**REBUTTAL TESTIMONY OF**  
**JOHN J. SPANOS**  
**ON BEHALF OF**  
**KENTUCKY POWER COMPANY**

---

December 19, 2025

## **TABLE OF CONTENTS**

<b><u>SECTION</u></b>	<b><u>PAGE</u></b>
<b>I. INTRODUCTION .....</b>	<b>1</b>
<b>II. TERMINAL NET SALVAGE FOR PRODUCTION .....</b>	<b>2</b>
<b>III. INTERIM RETIREMENTS AND INTERIM NET SALVAGE.....</b>	<b>8</b>
<b>IV. CONCLUSION .....</b>	<b>12</b>

## **I. INTRODUCTION**

1   **Q.   PLEASE STATE YOUR NAME AND ADDRESS.**

2   A.   My name is John J. Spanos. My business address is 300 Sterling Parkway,  
3       Mechanicsburg, Pennsylvania, 17050 (formerly 207 Senate Avenue, Camp Hill,  
4       Pennsylvania, 17011).

5   **Q.   HAVE YOU PREVIOUSLY SUBMITTED TESTIMONY IN THIS**  
6       **PROCEEDING?**

7   A.   Yes. I previously submitted direct testimony on behalf of Kentucky Power  
8       Company (“Kentucky Power” or the “Company”).

9   **Q.   WHAT IS THE PURPOSE OF YOUR REBUTTAL TESTIMONY?**

10  A.   The purpose of my rebuttal testimony is to respond to the direct testimony of the  
11       Office of the Attorney General of the Commonwealth of Kentucky and Kentucky  
12       Industrial Utility Customers witness Lane Kollen as it relates to the Company’s  
13       depreciation rates proposed in this proceeding.

14  **Q.   WHAT ARE THE SUBJECTS OF YOUR REBUTTAL TESTIMONY?**

15  A.   My rebuttal testimony relates to depreciation issues, specifically the appropriate  
16       recovery methodology for generating facilities which includes the standard practice  
17       of recording decommissioning costs as a component of the depreciation rate and  
18       the most reasonable interim survivor curves and interim net salvage for generating  
19       facilities.

## **II. TERMINAL NET SALVAGE FOR PRODUCTION**

1   **Q.   WHAT ARE MR. KOLLEN’S OBJECTIONS TO THE TERMINAL NET**  
2       **SALVAGE ESTIMATES FOR THE GENERATING FACILITIES?**

3   A.   Mr. Kollen has two objections to the development of the proper recovery of the full  
4       service value of generating facilities in this case. First, he claims decommissioning,  
5       or terminal net salvage, should be excluded from the depreciation rate for the steam  
6       (thermal) generating units. Second, Mr. Kollen excludes interim retirements and  
7       interim net salvage from proper recovery. I will address the terminal net salvage  
8       component in this section.

9   **Q.   WILL MR. KOLLEN’S PROPOSAL TO ELIMINATE TERMINAL NET**  
10       **SALVAGE PROPERLY ALLOCATE THE COMPANY’S COSTS OVER**  
11       **THE SERVICE LIVES OF THEIR GENERATING FACILITIES?**

12   A.   No. Not only should there be decommissioning costs included as part of the net  
13       salvage component in the depreciation rates but the net salvage costs need to be  
14       escalated so that the correct amounts are allocated over the lives of the plants. Mr.  
15       Kollen’s proposal to remove terminal net salvage to the date of retirement would  
16       result in insufficient recovery of the Company’s actual costs. As is the case for all  
17       assets, full recovery is determined based on the original cost at the time of  
18       installation plus the end of life cost (cost of removal minus gross salvage) to retire  
19       the asset. If the full cost at the time of retirement, which is in the future, is not  
20       determined then full recovery of the service value of the asset is not achieved.

1   **Q.    ARE MR. KOLLEN’S NET SALVAGE PROPOSALS BASED ON**  
2       **ACCEPTED DEPRECIATION PRACTICES IN THE INDUSTRY?**

3    A.    No. It is widely accepted that depreciation should include future net salvage costs,  
4        which are recovered on a straight-line basis and that those costs should be based on  
5        the expected cost to retire the Company’s assets at the time of retirement or  
6        removal. This applies not only to decommissioning costs but to the costs of all  
7        plant assets.

8   **Q.    SHOULD NET SALVAGE BE BASED ON THE FUTURE COSTS**  
9       **EXPECTED TO BE INCURRED, NOT ON TODAY’S COSTS?**

10   A.    Yes. Because net salvage must be based on future costs, decommissioning costs  
11       for net salvage must also be estimates of the future cost at the time of  
12       decommissioning. For this reason, if decommissioning estimates are developed  
13       using the cost to decommission a plant today, then these costs must be escalated to  
14       the time period in which they are expected to be incurred to achieve adequate  
15       recovery.

16   **Q.    SHOULD NET SALVAGE BE RECOVERED IN TODAY’S COST (THAT IS,**  
17       **THE COST IN TODAY’S DOLLARS)?**

18   A.    No. In order to recover the service value of the Company’s assets, net salvage must  
19       be determined at the cost that will be incurred in the future when the plant is retired.  
20       When using the straight-line method of depreciation, these costs are recovered  
21       ratably, or in equal amounts each year, over the life of the Company’s plant.

1     **Q.     IS RECOVERING THE FUTURE COST OF NET SALVAGE CONSISTENT**  
2           **WITH THE FEDERAL ENERGY REGULATORY COMMISSION’S**  
3           **UNIFORM SYSTEM OF ACCOUNTS (FERC USOA)?**

4     A.     Yes. The FERC USOA specifically defines net salvage as follows:

5                 19. Net salvage value means the salvage value of property retired  
6                 less the cost of removal.

7                 Cost of removal is defined as:

8                     10. Cost of removal means the cost of demolishing, dismantling,  
9                     tearing down or otherwise removing electric plant, including the  
10                    cost of transportation and handling incidental thereto. It does not  
11                    include the cost of removal activities associated with asset  
12                    retirement obligations that are capitalized as part of the tangible  
13                    long-lived assets that give rise to the obligation. (See General  
14                    Instruction 25).

15                Finally, cost is defined as (emphasis added):

16                    9. Cost means the amount of money actually paid for property or  
17                    services. When the consideration given is other than cash in a  
18                    purchase and sale transaction, as distinguished from a transaction  
19                    involving the issuance of common stock in a merger or a pooling of  
20                    interest, the value of such consideration shall be determined on a  
21                    cash basis.

22                Read together, it should be clear from these definitions that the USOA specifies  
23                cost of removal, as part of net salvage, must be recovered through depreciation  
24                expense and is the actual amount paid at the time the retirement occurs. Because  
25                net salvage will occur in the future, it is an estimate of the future cost that must be  
26                included in depreciation rates.

1   **Q.   DO GENERALLY ACCEPTED DEPRECIATION CONCEPTS SUPPORT**  
2           **THAT THE NET SALVAGE IN DEPRECIATION SHOULD BE INCLUDED**  
3           **AT THE COST THAT WILL BE INCURRED?**

4   A.   Yes. Including the future cost of net salvage for plant accounts is consistent with  
5           established depreciation concepts. Depreciation is a cost allocation concept, in  
6           which the full cost of an asset (original cost less net salvage) is allocated on a  
7           straight-line basis over the period of time an asset will be in service.

8   **Q.   DO ANY AUTHORITATIVE DEPRECIATION TEXTS SUPPORT THAT**  
9           **THE NET SALVAGE AMOUNT SHOULD REPRESENT THE FUTURE**  
10          **COST?**

11   A.   Yes. Two preeminent depreciation texts are the National Association of Regulatory  
12          Utility Commissioners' Public Utility Depreciation Practices (typically referred to  
13          as "NARUC<sup>1</sup>") and *Depreciation Systems* by Wolf and Fitch (Wolf and Fitch<sup>2</sup>).  
14          Both texts are clear that net salvage should be included in depreciation as a future  
15          cost. NARUC states the following:

16                   [U]nder presently accepted concepts, the amount of depreciation to  
17                   be accrued over the life of an asset is its original cost less net  
18                   salvage. Net salvage is difference between the gross salvage that will  
19                   be realized when the asset is disposed of and the cost of retiring it.<sup>3</sup>  
20                   (Emphasis added)

21                   NARUC also explains that:

22                   The goal of accounting for net salvage is to allocate the net cost of  
23                   an asset to accounting periods, making due allowance for the net  
24                   salvage, positive or negative, that will be obtained when the asset is  
25                   retired. This concept carries with it the premise that property  
26                   ownership includes the responsibility for the property's ultimate

---

1 National Association of Regulatory Utility Commissioners, *Public Utility Depreciation Practices* (1996).

2 Frank K. Wolf and W. Chester Fitch, *Depreciation Systems* (1994).

<sup>3</sup> NARUC Manual at 18.

1                   abandonment or removal. Hence, if users benefit from its use, they  
2                   should pay their pro rata share of the costs involved in the  
3                   abandonment or removal of the property and also receive their pro  
4                   rata share of the benefits of the proceeds received.<sup>4</sup> (Emphasis  
5                   added)

6                   Wolf and Fitch explain that:

7                   The matching principle specifies that all cost incurred to produce a  
8                   service should be matched against the revenue produced. Estimated  
9                   future costs of retiring an asset currently in service must be accrued  
10                  and allocated as part of the current expenses.<sup>5</sup>

11       **Q.     MR. KOLLEN ADDRESSES THE CONCEPT OF INTERGENERATIONAL**  
12       **EQUITY ON PAGE 34 OF HIS TESTIMONY. IS HIS ASSESSMENT**  
13       **ACCURATE?**

14       A.     No. First, the decommissioning cost is a component of the full service value of an  
15              asset. Per the definition of depreciation, the full service value of an asset which  
16              includes its removal at the end of life, needs to be recovered over the life of the  
17              asset systematically and rationally. Therefore, delaying recovery does not promote  
18              intergenerational equity as Mr. Kollen states in his testimony. It does the exact  
19              opposite. It requires generations of customers that did not benefit from the asset  
20              while in service to pay for the decommissioning of the asset. It also means that  
21              generations of customers who do get benefit from the generating facility are not  
22              paying their fair share of the service value of that facility. He then goes on in his  
23              testimony to say not only will future customers need to pay for the  
24              decommissioning of the retired generating plant but also the new facilities that  
25              replace it.

---

<sup>4</sup> NARUC Manual at 18.

<sup>5</sup> Wolf and Fitch, p. 7.

1           Second, the development of depreciation rates are based on many estimates.  
2           Suggesting that the decommissioning costs are different than the estimation of  
3           future costs of other asset classes such as poles is completely inappropriate and  
4           contradicts the entire concept of depreciation and the matching principle.  
5           Depreciation is an estimation process, so when Mr. Kollen claims that terminal net  
6           salvage costs should be disallowed simply because they represent costs to be  
7           incurred many years in the future and need to be estimated,<sup>6</sup> that is an erroneous  
8           statement.

9   **Q.   IS THERE ANY REASON THAT DECOMMISSIONING COSTS SHOULD**  
10   **BE RECOVERED ANY DIFFERENTLY THAN MASS PROPERTY NET**  
11   **SALVAGE?**

12   A.   No. Decommissioning costs as well as the mass property net salvage (cost of  
13           removal and gross salvage) are all end of life costs. Each, by definition, are part of  
14           the recovery of the full service value of the asset over the entire life of the assets.  
15           Additionally, the percentages that are established are based on informed judgment  
16           that includes statistical information and estimates of the future. Therefore, the  
17           decommissioning (terminal net salvage) component should be included in the  
18           depreciation rate just like all other net salvage percentages for each of the other  
19           asset classes.

---

6 Kollen Direct Testimony, p. 34, 8-21

### **III. INTERIM RETIREMENTS AND INTERIM NET SALVAGE**

1   **Q.   HAS MR. KOLLEN PROPERLY REFLECTED HOW DEPRECIATION**  
2       **RATES ARE DETERMINED IN DEPRECIATION STUDIES FOR RATE**  
3       **CASES?**

4   A.   No. Depreciation studies are the development of depreciation rates to be applied  
5       into the future. Two of the primary parameters in determining each account's  
6       depreciation rate is the survivor curve and the net salvage percentage. For every  
7       account, an estimate of the life characteristics includes a survivor curve which  
8       represents life estimation for the future and a net salvage percentage. As described  
9       by all authoritative texts, this includes a combination of statistical analysis and  
10      informed judgment. Two of the key authoritative texts in which this concept is  
11      described are the Public Utility Depreciation Practices by the National Association  
12      of Regulatory Utility Commissioners (NARUC) and Depreciation Systems by Wolf  
13      and Fitch. The process that I have conducted in the Depreciation Study follows the  
14      requirements as presented in those texts.

15   **Q.   IS MR. KOLLEN'S DISCUSSION ON INTERIM RETIREMENTS**  
16       **ACCURATE?**

17   A.   No. Mr. Kollen mischaracterizes the process of projecting interim retirements and  
18       interim net salvage in his testimony.<sup>7</sup> He says, "Witness Spanos used the estimated  
19       interim retirements to effectively shorten the average remaining lives for the  
20       production plant accounts, which increased the depreciation rates and depreciation  
21       expense."<sup>8</sup> This is an incorrect and very misleading statement by Mr. Kollen. The

---

7 Kollen Direct Testimony, p. 37, 3-16

8 Kollen Direct Testimony, p. 37, 10-13

1 interim retirements were projected using the interim survivor curves for the  
2 production plant accounts<sup>9</sup>, which Mr. Kollen has not disputed as part of his  
3 testimony. Put a different way, Mr. Kollen is arguing against retirements that were  
4 projected based on survivor curves that he doesn't disagree with. The interim  
5 survivor curves are based on historical analysis and informed judgment. He also  
6 does not explain how projecting interim retirements using an approved survivor  
7 curve would lead to an increase in depreciation. It is unclear what two depreciation  
8 amounts he is comparing that is creating this "increase" in his opinion.

9 There are also several issues with his statement, "Witness Spanos added the  
10 estimated future interim net salvage to the actual net book value of the plant  
11 accounts to increase the costs recovered through the depreciation rates, thus further  
12 increasing the depreciation rates and expense."<sup>10</sup> The estimated interim net salvage  
13 percentage is not applied to the actual net book value, it is applied to the original  
14 cost of the assets. This is because the original cost is the amount that will be retired  
15 in the future, thus it is the amount that will experience interim net salvage in the  
16 future. As stated previously in my testimony, the service value of an asset is the  
17 original cost less net salvage and the full service value should be collected through  
18 depreciation.

---

9 Based on historical Company data and shown on pages VII-2 through VII-16 of the Depreciation Study  
10 Kollen Direct Testimony, p. 37

1   **Q.    HAVE THERE BEEN INTERIM RETIREMENTS TO DATE THAT ARE**  
2           **SUPPORT FOR INTERIM SURVIVOR CURVES FOR GENERATING**  
3           **ACCOUNTS?**

4    A.    Yes. Part III of the Depreciation Study discusses the process for determining  
5           survivor curves and in the case of generating accounts, the interim survivor curve.  
6           Part VII sets forth the statistical support for the interim survivor curves. These  
7           interim survivor curves support the historical indications and the need to include  
8           interim survivor curves for generating assets and the expectation that these curves  
9           are reasonable expectations to occur into the foreseeable future for determining  
10          depreciation rates. For example, Account 312.00, Boiler Plant Equipment, has a  
11          recommended interim survivor curve of 60-R0.5. See page VII-5 of the  
12          Depreciation Study. The 60-R0.5 survivor curve is supported by statistical data  
13          from the transactional period, 1999-2024 related to 1963-2024 vintages. This  
14          shows that approximately 55 percent of the assets over that period have been  
15          retired/replaced. Mr. Kollen has proposed the historical indications going forward  
16          will completely stop and all existing assets will stay in service until the date of  
17          retirement. That would be an unprecedented change for life characteristics for  
18          boiler plant equipment.

19   **Q.    HAS THERE BEEN NET SALVAGE TO DATE THAT ARE SUPPORT FOR**  
20           **INTERIM NET SALVAGE PERCENTAGES FOR GENERATING**  
21           **ACCOUNTS?**

22   A.    Yes. Part IV of the Depreciation Study discusses the process for determining net  
23          salvage percentages and, in the case of generating accounts, the interim net salvage.

1 Part VIII sets forth the statistical support for the interim net salvage. These net  
2 salvage data provide historical indications of what the Company has experienced  
3 related to net salvage in the past. The data also supports the need to include interim  
4 net salvage for generating assets and the expectation that the interim net salvage  
5 component is a reasonable expectation to occur into the foreseeable future for  
6 determining depreciation rates of each account. For example, Account 312.00,  
7 Boiler Plant Equipment, has a recommended interim net salvage component of  
8 negative 30 percent. See page VIII-2 of the Depreciation Study. The negative 30  
9 percent is supported by statistical data from the transactional period, 2001-2024.  
10 The statistical support shows \$122.2 million of retirements over the 24 year period  
11 and this includes \$43.4 million of cost of removal and \$4.3 million of gross salvage.  
12 The data supports interim net salvage for Account 312.00 of negative 30 percent.  
13 Mr. Kollen has proposed not only that the annual retirements will stop, but the  
14 associated cost of removal of those retirements will also not be incurred. Again,  
15 quite a change from what has been experienced in the last 24 years. That would be  
16 an unprecedented change for the standard operation of a generating facility.

17 **Q. DOES MR. KOLLEN'S DISCUSSION RELATED TO ESTIMATED**  
18 **INTERIM RETIREMENT AND INTERIM NET SALVAGE APPLY TO**  
19 **HOW DEPRECIATION RATES SHOULD BE DEVELOPED?**

1 A. No. The process of determining depreciation rates for regulatory ratemaking  
2 purposes presented in the Depreciation Study are consistent with standard utility  
3 practice. Mr. Kollen appears to try to correlate the interim retirements and interim  
4 net salvage calculations as future components. This is very misleading. The  
5 process for determining interim retirements and interim net salvage for generating  
6 facilities is the same as all mass property accounts. There are no future entries  
7 calculated into rates. There are just estimations of what retirements should be  
8 anticipated into the future based on historical indications.

#### IV. CONCLUSION

9 **Q. DOES THIS CONCLUDE YOUR REBUTTAL TESTIMONY?**

10 A. Yes.

## VERIFICATION

The undersigned, John J. Spanos, being duly sworn, deposes and says he is the President of Gannett Fleming Valuation and Rate Consultants, LLC, that he has personal knowledge of the matters set forth in the foregoing testimony and the information contained therein is true and correct to the best of his information, knowledge, and belief after reasonable inquiry.
