RECEIVED

APR 2 5 2013 PUBLIC SERVICE COMMISSION

Mr. Jeff Derouen Executive Director Public Service Commission of Kentucky P.O. Box 615 211 Sower Boulevard Frankfort, KY 40602-0615

In The Matter Of: Application of Big Rivers Electric Corporation For A General Adjustment In Rates - Case No. 2012-00535

Dear Mr. Derouen:

Enclosed for filing are an original and ten (10) copies of (i) Big Rivers Electric Corporation's response to Ben Taylor and Sierra Club's initial request for information; (ii) a petition for confidential treatment; and (iii) a motion for deviation.

I certify that on this date copies of this letter, the response, the petition, and the motion have been served on those parties listed on the attached service list by either Federal Express or hand delivery.

Sincerely,

Top

Tyson Kamuf

In the Matter of:

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES

Case No. 2012-00535

Response to the Sierra Club's Initial Request for Information dated February 14, 2013

FILED: April 25, 2013

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 1)	State whether	Big Rivers	has evaluated	how the	termination of
---	---------	---------------	-------------------	---------------	---------	----------------

2 Alcan's retail electric service agreement with Kenergy will impact Big

- 3 Rivers' financial situation.
- a. If so, describe the results of such evaluation and produce any
 documents or reports regarding that evaluation.
- 6 **b.** If not, explain why not.
- 7

Response) Big Rivers is in the process of evaluating the impact of the Alcan
termination notice. Please see the response to PSC 2-1.

10

11 Witness) Billie J. Richert

Case No. 2012-00535 Response to SC 1-1 Witness: Billie J. Richert Page 1 of 1

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 2)	Identify the magnitude of the impact of the termination of
2	Alcan's r	etail electric service agreement with Kenergy on Big Rivers':
3	a.	Peak load in MWs
4	<i>b</i> .	Annual energy demand in MWh
5	с.	Projected revenue deficiency in the forecasted test period,
6		2014, and 2015.
7	d.	The size of the rate increase that Big Rivers would need to
8		eliminate the revenue deficiency in the forecasted test period,
9		2014, and 2015.
10	е.	Credit rating
11	f.	Ability to maintain two investment-grade credit ratings
12	g.	Ability to meet its financial obligations to its creditors
13	h.	Ability to attract necessary capital
14		
15	Response	e) Please see the response to PSC 2-1.
16	a.	The impact of the Alcan contract termination on Big Rivers'
17		forecasted peak load is the amount of Alcan's contract demand,
18		which is 368 MW.
19	b.	The impact on annual energy is the amount of Alcan's contract
20		demand at a 98% load factor, or 3,159,206 MWh.

Case No. 2012-00535 Response to SC 1-2 Witnesses: Lindsay N. Barron, John Wolfram, Billie J. Richert Page 1 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	с.	Big Rivers is in the process of evaluating the impact of the Alcan
2		termination notice on its projected revenue deficiency. Please see
3		the response to PSC 2-1.
4	d.	Big Rivers is in the process of evaluating the impact of the Alcan
5		termination notice on any future rate increases. Please see the
6		response to PSC 2-1.
7	e.	Refer to Response AG 1-54(c) in Case No. 2012-00492 for copies of
8		credit reports for Big Rivers issued by the three rating agencies
9		during February 2013 which illustrate the magnitude of the impact
10		of Alcan's termination notice on Big Rivers' credit rating.
11	f.	Big Rivers is implementing steps identified in its Load
12		Concentration Analysis and Mitigation Plan, and, in consultation
13		with the RUS, developed a written plan (the "Corrective Plan to
14		Achieve Two Credit Ratings of Investment Grade") setting forth the
15		actions to be taken that are reasonably expected to achieve two
16		investment grade credit ratings. Please see the response to PSC 3-9
17		for a copy of the Corrective Plan to Achieve Two Credit Ratings of
18		Investment Grade, dated March 7, 2013.
19	g.	Big Rivers does not believe the Alcan termination notice will prevent
20		it from meeting its financial obligations to its creditors.

Case No. 2012-00535 Response to SC 1-2 Witnesses: Lindsay N. Barron, John Wolfram, Billie J. Richert Page 2 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	h.	Big Rivers is in the process of evaluating the impact of the Alcan
2		termination notice on its ability to attract capital. Please see the
3		response to PSC 2-1.
4		
5		
6	Witnesses)	Lindsay N. Barron (parts a, b)
7		John Wolfram (parts d, e)
8		Billie J. Richert (parts f, g, h)

Case No. 2012-00535 Response to SC 1-2 Witnesses: Lindsay N. Barron, John Wolfram, Billie J. Richert Page 3 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 3) Refer to p. 11 line 19 through p. 12 line 2 of the testimony of
2	Billie J. Richert. Given Alcan's notice of termination of its retail electric
3	service agreement with Kenergy, state whether the \$74.5 million rate
4	increase sought in this proceeding would be:
5	a. Adequate to "keep Big Rivers whole"
6	i. If so, explain how.
7	ii. If not, explain why not and identify what level of rate
8	increase would be needed to do so.
9	b. Adequate to "avoid exacerbating the other urgent credit issues
10	facing Big Rivers"
11	i. If so, explain how.
12	ii. If not, explain why not and identify what level of rate
13	increase would be needed to do so.
14	
15	Response) Century's retail contract terminates on August 20, 2013, and
16	Alcan's retail contract terminates January 31, 2014. While Big Rivers is
17	currently in the process of evaluating the impact of the Alcan termination notice,
18	Big Rivers still needs the \$74.5 million revenue requirement beginning August
19	20, 2013, to keep Big Rivers whole at the time of the Century contract
20	termination, to avoid exacerbating the other urgent credit issues facing Big
21	Rivers at this juncture, and for the reasons I stated in my testimony.
22	

Case No. 2012-00535 Response to SC 1-3 Witness: Billie J. Richert Page 1 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1 Witness) Billie J. Richert

Case No. 2012-00535 Response to SC 1-3 Witness: Billie J. Richert Page 2 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 4) Refer to p. 22 lines 13-19 of the testimony of Billie J. Richert.
2	State whether the rates proposed by Big Rivers in this proceeding will
3	still enable Big Rivers to comply with the minimum MFIR covenant in
4	the indenture given the announced termination of Alcan's retail electric
5	service agreement with Kenergy.
6	a. If so, explain how.
7	<i>b. If not:</i>
8	i. Explain why not.
9	ii. Identify the level of rate increase needed to enable Big Rivers
10	to comply with the minimum MFIR covenant.
11	
12	Response) Century's retail contract terminates on August 20, 2013, and
13	Alcan's retail contract terminates January 31, 2014. While Big Rivers is
14	currently in the process of evaluating the impact of the Alcan termination notice,
15	Big Rivers still needs the rate increase proposed in this proceeding beginning
16	August 20, 2013, for the reasons I stated in my testimony, and Big Rivers still
17	expects the proposed rates to produce at least a 1.10 MFIR for fiscal year 2013.
18	
19	Witness) Billie J. Richert

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 5) Refer to p. 26 lines 12-13 of the testimony of Billie J. Richert.
2	With regards to the \$60 million in pollution control equipment
3	expenditures in 2013 and 2014, identify:
4	a. Each pollution control included in that \$60 million
5	i. The cost of each such pollution control
6	ii. The unit on which each such control is to be installed
7	iii. The schedule of installation for each such control
8	iv. The amount that Big Rivers has spent to date for each
9	such control
10	
11	Response)
12	a.i – a.iii See attached table.
13	a.iv. Through March 31, 2013, Big Rivers has spent \$617,071 on
14	MATS Testing.

5	b. MW and MWh reductions achieved per year
6	c. Life expectancy of individual program measures
7	d. Total Resource Cost test score for each program
8	e. Monetary savings from each program
9	
10	Response) Two additional programs are being developed by Big Rivers to
11	address outdoor lighting and commercial HVAC. Each program is described
12	below:
13	
14	Commercial High Efficiency Heating, Ventilation and Air Conditioning
15	("HVAC") Program Purpose:
16	
17	This program promotes an increased use of high-efficiency HVAC systems
18	among Rural Customers by paying a Member an incentive for the benefit
19	of an eligible Rural Customer who purchases and installs an HVAC
20	system beyond minimum efficiency standards to HVAC systems meeting
21	ENERGY STAR® standards ("Qualified System").
22

1	Availability:
2	This DSM program's rates, terms and conditions are available to a
3	Member for its Rural Customers, subject to the limitations and eligibility
4	requirements of this program, and to the rules and regulations of this
5	tariff and the Member's corresponding tariff.
6	
7	Eligibility:
8	An eligible Rural Customer is a Member's Rural Customer who upgrades
9	an HVAC system located in the Member's service area and installs a
10	Qualified System.
11	
12	<u>Member Incentives:</u>
13	Big Rivers will reimburse a Member an incentive payment of \$75 per ton
14	(12,000 BTU per hour nominal capacity) when a non-residential Rural
15	Customer installs a Qualified System HVAC upgrade located in the
16	Member's service area.
17	Big Rivers will also reimburse a Member's reasonable costs of promoting
18	this program, if the promotional program and its costs are pre-approved
19	by Big Rivers.
20	
21	Terms & Conditions:
22	To qualify for the incentive under this program, a Member must submit to

Item 11. Produce the DSM potential study developed by GDS Associates
 referenced on p. 14 of the testimony submitted by Albert Yockey,
 including any workpapers and modeling input and output files in
 machine readable format with formulas intact.

5

Response) Please see the attached DSM potential study that was referenced on 6 p. 14 of Mr. Yockey's testimony. In order to develop the Big Rivers DSM 7 Potential Study report, voluminous modeling was required to develop the 8 measure assumptions and related energy efficiency potential inputs and outputs. 9 For select energy efficiency measures, proprietary/licensed building energy 10 simulation software was utilized to determine measure-specific savings. Due to 11 software updates over time and closed-source algorithms, exact replicate files 12 are not able to be produced in all instances. In addition to the models provided 13 in response to request 10a, the major inputs and outputs associated with the 14 residential and commercial/industrial sector DSM potential analyses have also 15 been provided. The residential files (BR Full Potential Spreadsheet v2, GDS 16 Model – Achiev. SF – TRC, and GDS Model – Achiev. MH - TRC) detail the 17 major assumptions and calculations utilized to develop inputs for cost-18 effectiveness testing and valuation of energy and demand benefits. 19 The C&I files (BREC Commercial & Industrial Assumptions v4, GDS Model - BREC 20 Achievable Potential 9-28-10 P1, and GDS Model – BREC Achievable Potential 21 9-28-10 P2) represent similar data and function. To ease any review process and 22

APPENDIX 2

RESIDENTIAL SECTOR DATA (ENERGY EFFICIENCY)

APPENDIX 2-1

RESIDENTIAL MEASURE DESCRIPTIONS, ASSUMPTIONS, AND SOURCES

DESCRIPTIONS OF RESIDENTIAL ENERGY EFFICIENCY MEASURES

This technical appendix describes a broad range of residential sector energy efficiency measures and programs where GDS has assessed the technical and achievable potential for electric energy savings for Big Rivers. The purpose of this technical appendix is to briefly describe these efficiency measures and to provide data on their costs, energy savings and useful lives.

1. ELECTRIC APPLIANCES

The following section describes the energy efficiency measures that were included in this analysis for various household appliances in Big Rivers' homes. Five residential appliance energy efficiency measures/programs are covered in this section: Energy Star® Compliant Refrigerators, Energy Star® Compliant Freezers, Energy Star® Dehumidifiers, Second Refrigerator Turn-In, and Second Freezer Turn-In.¹ Complete assumptions and sources for the measures can be found at the end of the Appendix B.

(1) Energy Star® Compliant Refrigerators²: In April 2008, the Energy Star® criteria for refrigerators changed to require all qualifying, full-size models to be at least 20% above the minimum federal standard. High efficiency refrigerators use a number of technologies to achieve energy savings (more efficient compressors, insulation, door seals, etc.). There are a few variations of high efficiency refrigerator models: top freezer models, side by side models, and bottom freezer models.

(2) Energy Star® Compliant Freezers³: On January 1, 2003, the Energy Star® criteria for freezers was established, mandating all freezers 7.75 cubic feet or greater in volume must be at least 10% above the minimum federal standard to qualify for Energy Star®. Meanwhile, all freezers less than 7.75 cubic feet in volume and 36 inches or less in height must be at least 20% above the minimum federal standard to qualify for Energy Star®. Freezers come in two main styles: Chest and Upright. Chest style models have a door on top that opens upward while Upright models have the door on the front opening outward.

(3) Energy Star® Dehumidifiers⁴: Often used in the damp areas of a home, such as basements, dehumidifiers remove moisture from the air to maintain comfort and to limit the growth of mold and mildew. Energy Star® qualified models provide the same features as conventional models but they are more energy efficient. Energy Star® qualified models have more efficient refrigeration coils, compressors, and fans than conventional models. Energy Star® dehumidifiers operate at least 10 percent more efficiently than conventional models. This analysis compared replacing a standard 40 pint dehumidifier with a 40 pint Energy Star® dehumidifier that is used 1,620 hours/year.

(4) Second Refrigerator Turn-In: The goal of a refrigerator turn-in program is to get underutilized but operational second refrigerators out of service and properly dismantled. While appliance recycling programs are praised for handling the disposal of major appliances in an

¹ Dishwashers & Clothes Washers can be found under the section for Electric Hot Water Heaters due to the electric savings associated with reduced hot water use.

² Refrigerators & Freezers: Key Product Criteria. (www.energystar.gov)

³ Refrigerators & Freezers: Key Product Criteria. (www.energystar.gov)

⁴ Dehumidifiers. (www.energystar.gov)

environmentally sound manner, the programs must also provide energy savings on a costeffective basis, which means that only operating units qualify for recycling.

(5) Second Freezer Turn-In: The freezer turn-in program is the same as the refrigerator turn-in program described above.

2. CONSUMER ELECTRONICS

Five residential energy efficiency measures are covered in this section: Standby Power, Energy Star® Televisions, Energy Star® Desktop Computers, Monitors, and Laptop Computers. Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1) Home Electronics⁵: Many consumer electronics continue to consume electricity when switched off or not performing their main function (stand-by mode). The most common sources of standby power consumption include products with remote controls, low-voltage power supplies, rechargeable devices, and continuous displays. A typical North American home may contain fifteen to twenty devices constantly drawing standby power. For this analysis, homes were assumed to replace fifteen devices consuming standby power to an energy saving model.

(2) Energy Star® Televisions⁶: In addition to the Home Electronics category defined above, this analysis looks at the most common electronics found in homes today: televisions and computers. Energy Star® televisions must consume 1 watt or less in standby mode. On mode power requirements vary according to screen area and whether the unit is non-high, high, or full-high definition. External power supplies (EPS) packaged with TV products must meet all Energy Star® requirements for EPS devices.

(3) Energy Star® Desktop Computers⁷: Today's Energy Star® criteria for personal computers include power supply efficiency standards, operational mode energy efficiency requirements, and power management requirements. Power management features place monitors and computers (CPU, hard drive, etc.) into a low-power "sleep mode" after a period of inactivity.

4) Energy Star® Computer Monitors: Similar to computers, Energy Star® Monitors also are equipped with power management features that enable monitors to switch into a low-power mode after a period of inactivity.

5) Energy Star® Laptop Computers: See Energy Star® Desktop Computers.

3. LIGHTING

Two residential energy efficiency measures are covered in this section: Compact Fluorescent Lighting and LED Lighting. Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1)Compact Fluorescent Lighting⁸: Residential fluorescent bulbs and fixtures present a significant opportunity for energy and maintenance savings. On a per lamp basis, compact fluorescent

⁵ Emerging Energy Saving Technologies & Practices for the Buildings Sector as of 2004. ACEEE Report# AO42. October 2004. Pg. 41.

⁶ Televisions (www.energystat.gov)

⁷ Computers. (www.energystar.gov)

⁸ Compact Fluorescent Bulbs. (www.energystar.gov)

lamps are generally 75 percent more efficient than incandescent bulbs and last up to ten times longer. In addition, CFL bulbs produce about 75 percent less heat, so they're safer to operate and can cut energy costs associated with home cooling. CFL bulbs vary in size and shape. Their appearance can be a spiral-shaped fluorescent tube or they can appear as a standard shape, such as the R-30 floodlight used in recessed cans. Dimmable CFL bulbs and 3-way CFL bulbs are also available.

The lighting sockets eligible for CFL replacement were designated as either high use (>5 hrs/day), medium use (1-5 hrs/day), and low use (1 hrs or less/day). In single family homes, more than half (57%) were considered low use bulbs. In manufactured homes, the percent of low use sockets was even greater (80%). Only 10.5% of sockets in single family homes were assumed to be high use bulbs, and less than 4% of bulbs in manufactured homes were estimated to be on 5 hours per day or greater.

(2)LED Lighting⁹: Light emitting diode (LED) lights are more efficient than both CFL and incandescent lighting. LED lighting uses at least 75% less energy, lasts 25 times longer than incandescent lighting, and provides optimal light color. LED lights are more rugged and damage-resistant than compact fluorescents and incandescent bulbs. LED lights don't flicker. In addition, LEDs do not produce heat like incandescent bulbs. However, current LEDs have primarily directional output in single direction and are better at placing light in a single direction than incandescent or fluorescent bulbs and may be limited to certain applications, such as under counter or recessed lighting. This analysis compared the savings potential of replacing both incandescent and CFL lighting with the more efficient LED lights.

4. ELECTRIC WATER HEATING

Nine residential water heating energy efficiency measures are covered in this section: Low Flow Showerhead, Low Flow Faucet Aerators, Water Heater Blanket, Pipe Wrap, Electric Water Heaters (stand-alone), Heat Pump Water Heaters(SF), Solar Water Heater with Electric Water Heating Back Up(SF), Energy Star® Dishwashers, and Energy Star® Clothes Washers.¹⁰ Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1) Low Flow Showerheads/Faucets¹¹,¹²: An existing showerhead is replaced with a new unit that has a low-flow rate (<2.5 gallons/minute). Significant savings in hot water use can be achieved by installing low-flow showerheads and faucets. The single best action is to replace old showerheads as showers use 37% of the hot water in typical U.S. homes.

(2) Low Flow Fourier Aerators¹³: An existing faucet is replaced with a new unit that has a low-flow rate (<1.0 gallon/minute).

(3) Water Heater Blanket¹⁴: Water heater jackets are designed to wrap around an existing water heater tank to improve insulation, prevent heat loss, and save energy. Installing an insulating blanket can reduce water heating energy use by 3-9%.

⁹ LED Lighting. Toolbase Services. (www.toolbase.org/Technology-Inventory/Electrical-Electronics/white-LED-lighting)

 ¹⁰ SF: designates measures that were applied only to single-family homes due to measure applicability. For example, solar water heating possesses additional market barriers for manufactured home units.
 ¹¹ Global Green USA website (www.globalgreen.org/pha-energytoolbox/tech_dhw.htm)

 ¹² Residential Deemed Savings, Installation, and Efficiency Standards. Frontier Associates. January 2008. Pg. 35

 ¹³ Residential Deemed Savings, Installation, and Efficiency Standards. Frontier Associates. January 2008. Pg. 36

(4) Pipe $Wrap^{15}$: Insulating hot water pipes will reduce losses as the hot water is flowing to the faucet and, more importantly, it will reduce standby losses when the tap is turned off and then back on within an hour or so. Pipe wrap will conserve energy and water that would normally be lost waiting for the hot water to reach the tap. Energy loss still occurs after pipe wrap has been installed, though to a smaller degree than the losses observed in non-insulated pipes.

(5) Efficient Electric Water Heater (stand-alone)^{16,17}: In this measure, baseline replacement stand alone electric water heaters are replaced with high efficiency stand alone storage tank water heaters. Storage water heaters work by heating up water in an insulated tank. However, because heat is lost through the walls of the storage tank, energy is consumed even when no hot water is being used. New high-efficiency storage water heaters contain higher levels of insulation around the tank, reducing standby losses. In this analysis a baseline replacement model (EF=.90) is replaced with a high efficiency model (EF=.95). This measure applies to homes operating primarily electric heating systems and electric water heaters.

(6) Heat Pump Water Heater $(SF)^{18,19}$: Heat pump water heaters are more efficient than electric storage water heaters because the electricity is used for moving heat from one place to another in lieu of generating the heat directly. For heat pump water heaters, the heat source is typically the outside air or air in the basement where units are typically located. A heat pump water heater uses anywhere from 33%-50% of the electricity required by a conventional storage tank water heater and are available with built-in water tanks or as add-ons to existing water tanks. In this analysis a baseline electric storage tank model (EF=.90) is replaced with a heat pump water heater model (EF=2.0). This measure applies to homes operating primarily electric heating systems and electric water heaters.

(7) Solar WH w/ Electric Back-up (SF)²⁰: Solar water heaters are designed to serve as pre-heaters for conventional storage or demand water heaters. As the solar system preheats the water, the extra temperature boost required by the storage or demand water heater is relatively low, and high flow rate can be achieved. Solar water heaters can be particularly effective if they are designed for three-season use, with a home's heating system providing hot water during the winter months. Although less common in today's market, solar water heating units are considerably less expensive and more reliable than they were two to three decades ago.

In this analysis, 30% of homes were estimated to be available for solar water heating systems. This technical potential is based on factors including: roof orientation, roof size, shading, load-bearing capability, and local building codes and ordinances.

(8) Energy Star® Dishwasher²¹: Dishwashers exceeding minimum qualifying efficiency standards established under Energy Star® Program with an Energy Factor (EF) >= .75 (versus the current federal standard energy factor <=.60). Energy Star® labeled dishwashers save energy by using

¹⁴ Consumer Guide to Home Energy Savings, 8th ed. ACEEE. Washington D.C. 2003.

²⁰ Consumer Guide to Home Energy Savings, 8th ed. ACEEE. Washington D.C. 2003.

²¹ Dishwashers: Key Product Criteria (www.energystar.gov)

both improved technology for the primary wash cycle, and by using less hot water to clean. Construction includes more effective washing action, energy efficient motors and other advanced technology such as sensors that determine the length of the wash cycle and the temperature of the water necessary to clean the dishes. In addition, a high efficiency dishwasher can save approximately 430 gallons of water a year if used to run an average of 4 loads per week.

(9) Energy Star® Clothes Washer²²: Clothes washers exceeding minimum qualifying efficiency standards established under Energy Star® Program with a Modified Energy Factor (MEF) >= 1.8 and a Water Factor (WF) <=7.5. The MEF measures the energy used during the washing process, including machine energy, water heating energy, and dryer energy. The higher the MEF, the more efficient the clothes washer is. Energy Star® qualified washers extract more water from clothes during the spin cycle. This reduces the drying time and saves energy and wear and tear on your clothes. In addition, substantial savings on water and sewer bills contribute to the economic benefits of high-efficiency washers. A high efficiency clothes washer can save nearly 6,542 gallons of water a year based on an average of 7.5 cycles per week.

5. SPACE HEATING & COOLING (Building Envelope Measures)

The following section describes six energy efficiency building envelope measures that were included in this analysis for homes with electric space heating and/or cooling. The nine residential energy efficiency measures covered in this section include: Ceiling Insulation, Floor Insulation, Air Infiltration, Duct Sealing, Energy Star® Windows, and Radiant Barriers. Of these, the ceiling insulation upgrades and radiant barriers are considered only for single family homes, where adequate attic space is present, and not for manufactured homes. This study examines each measure for three heating and cooling scenarios: electric AC only, electric heat pumps and electric furnace heating. Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1) Ceiling Insulation $(SF)^{23}$: Ceiling insulation levels vary greatly depending on the age of the home, type of insulation, and activity in the attic (i.e. using the attic for storage and HVAC equipment). For this analysis, measure savings are based on homes with little to no ceiling insulation improving to R-19 levels, and homes with a current ceiling insulation of R-19 increased to an efficient level of R-38.

(2) $Floor Insulation^{24}$: In an otherwise well-insulated home, as much as 20% of the total heat loss can occur through uninsulated foundation walls or floors. For this analysis, measure savings are based on a home with no floor insulation increased to R-19. Manufactured homes were assumed to have a minimum of R-11 and upgraded to R-30.

(3) Air Infiltration²⁵: Hidden air leaks cause some of the largest heating and cooling losses in older homes. Common air leakage sites include plumbing penetrations through insulated floors and ceilings, baseboard moldings, dropped ceilings above bathtubs and cabinets, attic access hatches, and doors. For this analysis, measure savings are based on a reducing a current home's air from 10 ACH₅₀ to 7 ACH₅₀.

²⁵ Consumer Guide to Home Energy Savings, 8th ed. ACEEE. Washington D.C. 2003.

(4) Duct Sealing²⁶: This measure assumes that leaky and unsealed residential air ducts are properly repaired and sealed. Mastic (a special paste) is the preferred method for duct sealing. Properly sealing leaky ducts can save significant amounts of energy needed to heat a home.

(5) Energy Star® Windows²⁷: In older homes, windows are often one of the largest sources of heat loss in winter due to their low insulating ability and high air leakage rates. Windows are also generally the major source of unwanted heat gain in the summer. As a result, windows are typically net energy losers, and can be responsible for much of the energy used to heat and cool homes. However, improved windows, combined with proper consideration of their placement and other details, can result in significant energy savings. Energy efficient windows help to reduce air leakage and heat transfer. High efficiency windows usually have double or triple glazing, have argon gas between the panes of glass, have excellent seals, and have a Low-Emissivity coating.

(6) Radiant Barriers (SF)28: Radiant heat from the sun is absorbed by roofing shingles and transferred to the roof decking below and into the attic space. Conventional insulation absorbs much of this heat and once its saturation point has been met, this heat is then transferred to the living spaces below. Radiant barriers, such as reinforced aluminum foil, reduce the flow of heat from a hot roof to the cooler ceiling insulation. By lowering the temperature in your attic, you can reduce the amount of heat transferred to your living spaces below by up to 50% giving you greater comfort in your home and lessening the strain your air conditioning unit.

6. SPACE HEATING & COOLING (HVAC Equipment)

The following section describes the energy-efficient HVAC equipment measures that were included in this analysis for homes with electric space heating and/or cooling. Seven residential energy efficiency measures are covered in this section: HVAC Tune-Up, Energy Star® Room Air Conditioners, High Efficiency Central Air Conditioners, High Efficiency Heat Pumps, Ground-Source Heat Pumps, Dual-Fuel Heat Pumps, and Electric Furnace Replacement (w/ Air Source Heat Pumps). Complete assumptions and sources for the measures can be found at the end of Appendix 2.

(1) HVAC Tune-Up²⁹: HVAC tune-up and maintenance helps to keep heat pump and central air conditioning units running at top efficiency, prevent equipment failures, and extend the life of the equipment. A tune-up by a service professional can improve unit efficiency by as much as 20%. An annual HVAC tune up includes: checking the unit's refrigerant pressure and tubing, checking and adjusting belt tension, cleaning and lubricating the indoor blower unit, cleaning inside the "A" coil, and checking the thermostat, wiring, and other electric parts.

(2) Energy Star® Room Air Conditioners^{30,31}: Room air conditioner units are typically mounted in a window so that part of the unit is outside and part is inside. An insulated divider to reduce heat transfer losses typically separates the two sides. The outdoor portion generally includes a compressor, condenser, condenser fan, fan motor, and capillary tube. The indoor portion

³⁰ Room Air Conditioners: Key Product Criterion. Energy Star website (www.energystar.gov)

³¹ Technology Summary. CEE website. www.ceel.org

generally includes an evaporator and evaporator fan. The minimum federal standard used in this analysis (based on model type and capacity) is an Energy Efficiency Ratio (EER) of at least 9.8. Currently, units with an EER of 10.8 are eligible for the Energy Star® label. This analysis assumed a room air conditioner cooling capacity of 10,000 Btu/hr for primary units in single-family homes, and 8,000 Btu/hr for all secondary units or manufactured home units.

(3) High Efficiency Central Air Conditioners^{32,33}: Central air conditioners circulate cool air through a system of supply and return ducts. Supply ducts and registers (i.e. openings in the walls, floors, or ceilings covered by grills) carry cooled air from the air conditioner to the home. This cooled air becomes warmer as it circulates though the home; then it flows back to the central air conditioner through return ducts and registers.

Central air conditioners are rated according to their seasonal energy efficiency ratio (SEER). SEER indicates the relative amount of energy need to provide a specific cooling output. New residential central air conditioner standards went into effect in January 2006. Central air conditioners manufactured after January 2006 must achieve a SEER of 13 or higher. For this analysis, the baseline replacement model has a SEER of 13 for all replace-on-burnout scenarios. The baseline for the early retirement analysis assumes existing homes currently have an average SEER 10 unit. The high efficiency central air conditioner has a SEER of 15. High efficiency central air conditioners were eligible for installation in all homes with central air conditioning.

(4) High Efficiency Electric Heat Pumps^{34,35}: Electric heat pumps operate by transferring heat from one place to another. In the heating mode, a heat pump extracts heat from outside a residence and delivers it to the house. Like a furnace, most heat pumps work with forced warm-air delivery systems. Heat pumps can also be operated to cool a house during summer months. In the cooling mode, the cycle is reversed and heat is taken from the house and transferred to the outside air. Because heat pumps rely on the outside air as the heat source in the wintertime, they are much more common in warmer climates. Heat pumps are rated for both heating and cooling – both in terms of capacity and efficiency.

Heating efficiency is indicated by the heating season performance factor (HSPF). Cooling efficiency is indicated by the seasonal energy efficiency rating (SEER). Both indicate the relative amount of energy needed to provide a specific heating or cooling output. New residential heat pump standards went into effect in January 2006. Heat pumps manufactured after January 2006 must achieve a HSPF of 7.7 and a SEER of 13 or higher. For this analysis, the baseline replacement model has a HSPF of 7.7 and a SEER of 13 (replace-on-burnout) or a HSPF of 6.8 and a SEER of 10 (early retirement). The high efficiency heat pump has a HSPF of 8.5 and a SEER of 15.

(5) Ground Source Fleat Pumps³⁶: Ground Source heat pumps, or geothermal heat pumps, use the earth or groundwater as a heat source, instead of the outside air. Stable underground temperature allow geothermal systems to be rated for heating efficiency and cooling efficiency.

³⁵ Central Air Conditioners and Heat Pumps Energy Conservation Standards. Federal Register. Volume 6:, No. 14. January 22, 2001. Pg. 31

³⁶ "Consumer Guide to Home Energy Savings' 8th ed. ACEEE. 2003.

Geothermal heat pumps may be 25-45% more efficient than air-source heat pumps, but are more expensive and difficult to install. Most geothermal systems include "loops" that are buried in the ground in shallow trenches or in vertical boreholes. As an alternative, other systems may draw in groundwater and pass it through a heat exchanger instead of refrigerant before returning the water to the aquifer. Geothermal systems may also include 'desuperheaters' which recover discharged heat to provide domestic hot water at little to no cost.

Geothermal systems currently are eligible for a federal person tax credit up to 30% of the installation costs. These credits are available through December 2016.

(6) Dual-Fuel Heat Pump: A dual-fuel heat pump is an electric heat pump and a gas furnace all in one. When temperatures are above freezing, a heat pump is an efficient way to heat the home. In instances when the temperature drops below freezing, a gas furnace is able to provide heat more economically. When the outside temperature falls below 35 degrees, the heat pump automatically switches to supplemental gas heat for better efficiency. This analysis considered the benefits of installing a dual fuel heat pump in place of either a standard electric heat pump or a central AC/Electric Furnace unit.

(7) Electric Furnace Replacement with Air Source Heat Pumps (SF)³⁷: Heat Pumps are considered to be more energy efficient than furnaces. As a result, this measure examines the possible energy savings derived from replacing an existing central AC/Electric Furnace or a central AC /Electric Furnace that has reached the end of its useful life with a new energy efficient air-source heat pump. The heat pump has a HSPF of 8.5 and a SEER of 15.

7. OTHER

Three residential energy efficiency measures are covered in this section: In Home Energy Displays, Pre-Pay Metering, and Pool pumps (single family only). Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1)In Home Energy Displays³⁸: In-home energy displays provide real-time feedback to occupants on whole-house electricity consumption. Displays collect demand data from the meter and display instantaneous power usage and cumulative energy usage over selected time periods. Providing instantaneous feedback on household electrical demand has shown the promise to reduce energy consumption in households by 5-15% through behavioral changes. Although studies have shown reduced consumption, the persistence of these savings remains relatively unknown. For this analysis, savings were assumed to persist for a period of three years.

(2)Pre-Pay Metering³⁹: Prepaid meters require consumers to purchase power in advance. In home display indicates how much money is on the account, how many kilowatts the household consumed in the last hour, day, and month, how much that power costs in dollar and cents, and when, approximately, the account will need to be replenished.

While pre-paid metering is not an applicable measure for all consumers, pre-paid metering has proven effective for credit-challenged consumers. The plan eliminates the need for a security deposit and late fees, and forces consumers to use only as much power as they afford. Utilities

³⁷ "Consumer Guide to Home Energy Savings' 8th ed. ACEEE. 2003.

³⁸ Pilot Evaluation of Energy Savings from Residential Energy Demand Feedback Devices. Florida Solar Energy Center. January 2008.

³⁹ Prepaid Meters: Pay-as-you-use consumption. Consumer Reports.

currently offering pre-pay as an option to consumers has also shown the benefit of decreased consumption by users. One utility, Salt River Project, reports pre-pay consumers used an average of 12.8% less electricity annually than regular consumers.

Similar to in-home energy displays, reduced consumption is a result of behavior change and the persistence of savings is relative unknown. This analysis assumed savings for a period of 3 years.

(3)Pool Pumps (SI⁷)⁴⁰: Residential pool pumps are used to circulate and filter swimming pool water. While large, single speed pool pumps filter pools quickly, they use substantially more energy than a multi-speed pool pump. Two-speed operation saves energy while still filtering the same amount of pool water because the pumps operate more efficiently at lower water flow rates. High speed operation is only required intermittently.

8. MULTI-FAMILY ENERGY EFFICIENT RETROFIT PACKAGE

One residential energy efficiency measures are covered in this section: Multi-Family Energy Efficiency Kit (Tier 1). Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1)Multi-Family Energy Efficiency Kit (Tier 1): Multi-family homes make a relatively small part of the Big Rivers service territory, at approximately 2% of all residential units. In addition, the likelihood of shared walls and the possibility of inhabitants merely renting the property can create some additional obstacles for installing and investing in energy efficient measures. For this analysis, GDS considered installing a relatively inexpensive package of energy efficient retrofit measures for the multi-family population. This package consisted of: 5 CFL bulbs, a low flow showerhead, and basic air sealing measures (i.e. caulking). Total savings are estimated at a conservative 4% of total annual consumption.

9. NEW HOMES CONSTRUCTION

Two residential energy efficiency programs are covered in this section: Energy Efficient New Homes Construction (Tier 1: 15% more efficient) and Energy Efficient New Homes Construction (Tier 2: 35% more efficient). Tier 2 new construction homes are limited to single-family residences. Complete assumptions and sources for the measures can be found at the end of Appendix B.

(1) Energy Efficient New Homes Construction (15% more efficient)⁴¹: In this analysis, new homes are designed to be built to Energy Star® standards: at least 15 percent more energy efficient than those built to the 2006 International Residential Code (IRC).

Builders would receive an incentive for constructing new homes designed to Energy Star® standards: at least 15 percent more energy efficient than those built to the 2006 International Residential Code (IRC). Energy Star® Homes also incorporate other energy savings features that typically make them 20–30% more efficient than standard homes. The US Environmental Protection Agency reports that 165 home builders have partnered with EPA to construct more

⁴⁰ Leading the Way: Continued Opportunities for New State Appliance & Equipment Efficiency Standards. ACEEE Report # ASAP-6/ACEEE-AO62. March 2006.

⁴¹ About Energy Star New Homes. (www.energystar.gov)

than 1,290 Energy Star[®] qualified homes in the state of Kentucky in 2010 to date. Nationwide, just over 1.1 million homes have earned the Energy Star[®] rating to date.

Energy savings are based on heating, cooling, and hot water energy use and are typically achieved through a combination of the following: high performance windows, controlled air infiltration, upgraded heating and air conditioning systems, tight duct systems, high efficiency water heating equipment, and high efficiency building envelope standards. Energy Star® Homes also encourage the use of energy-efficient lighting and appliances. These features contribute to improved home quality and homeowner comfort, and to lower energy demand and reduced air pollution.

Both single-family and manufactured homes can be built to Tier 1 (15% more efficient than code) standards.

(2) Energy Efficient New Homes Construction (35% more efficient): Similar to a Tier 1 home, homeowners would receive an incentive for purchasing new homes designed to exceed Energy Star® standards: at least 35 percent more energy efficient than those built to the 2006 International Residential Code. Tier 2 construction is limited to single family homes.

Note: In general, savings estimates for the thermal envelope were based on engineering calculations derived from the REMrate modeling software, but were adjusted down based on experience that suggests actual savings are much lower than pure engineering assumptions would suggest. This adjustment was completed by creating adjusted base cansumptions and applying the savings % found in the modeling runs to this new base usage. Additional assumptions utilized for the calculation of individual measure savings, costs, and measure saturation can be found noted in the "Residential Electric Measure Sources and Notes" table.

COMMERCIAL/INDUSTRIAL SECTOR DATA (ENERGY EFFICIENCY)

APPENDIX 3-1

COMMERCIAL/INDUSTRIAL MEASURE DESCRIPTIONS, ASSUMPTIONS AND SOURCES

DESCRIPTIONS OF COMMERCIAL/INDUSTRIAL ENERGY EFFICIENCY MEASURES

This technical appendix describes a broad range of commercial and industrial sector energy efficiency measures and programs where GDS has assessed the technical and achievable potential for electric energy savings for Big Rivers.

1. HEATING AND AIR CONDITIONING

The following sections describe the energy efficiency measures included in the commercial sector analysis that fall into the categories of, space heating and space cooling.

(1) High Efficiency Heat Pump': Electric heat pumps operate by transferring heat from one place to another. In the heating mode, a heat pump extracts heat from outside a structure and delivers it to the building. Like a furnace, most heat pumps work with forced warm-air delivery systems. Heat pumps can also be operated to cool a building during summer months. In the cooling mode, the cycle is reversed and heat is taken from the building and transferred to the outside air. Because heat pumps rely on the outside air as the heat source in the wintertime, they are much more common in warmer climates. Heat pumps are rated for both heating and cooling – both in terms of capacity and efficiency.

This analysis assumes that a single or poly-phase packaged or split system unitary heat pump meeting CEE Tier II efficiency criteria replaces a heat pump meeting CEE Tier I efficiency criteria. High efficiency and baseline levels reflect weighted averages by size and type of units.

(2) Packaged Terminal Heat Pumps and Air Conditioning. The efficient design of the PSC motor and airflow pattern help to reduce the energy consumption of the fan. Packaged terminal heat pumps tend to be more efficient than electric heat only. In fact, operating savings may result in a payback of less than one year. During heating operation, refrigerant in the heat pump runs in the reverse direction of the cooling operation. The outside air is cooled, thereby giving up heat to the refrigerant in the heat pump. This heat is then pumped back inside, resulting in up to three Btu's of heat for every Btu of energy consumed. During cooling operation, heat is removed from the building as the air is cooled. This heat proceeds through the compression cycle and is ultimately rejected to the outside air.

(3) Centrifugal Chiller^{2,3}: Water chillers come in many different types (centrifugal, rotary, screw, scroll, reciprocating, and gas absorption) and typically reject waste heat either through air-cooled or water-cooled condensers. Centrifugal chillers are used in building types which normally use water-based cooling systems and have cooling requirements greater than 200 tons. Centrifugal chillers reject heat through a water cooled condenser or cooling tower. In general, efficiency levels for centrifugal chillers start at 0.80 kW/ton (for older units) and may go as high as 0.4 kW/ton. This measure involves installation of a high-efficiency chiller (0.51 kW per ton) versus a standard unit (0.58 kW per ton).

¹ Nexant, 2005. NYSERDA Deemed Savings Measure Database. Prepared for NYSERDA

² California Statewide Commercial Sector Energy Efficiency Potential Study, July, 2002.

³ Nexant, 2007. Arkansas Deemed Savings Quick Start Program Draft Report Commercial Measures. For Frontier Associates, LLC, March, 2007.

When a water-cooled chiller is replacing an air-cooled chiller, the additional auxiliary electrical loads for the condenser water pump and the cooling tower fan has to be considered, therefore a penalty factor of 0.109 kW needs to be used as the adjustment downward to account for the peak demand and energy savings.

(4) DX Packaged System, EER=10.9, 10 tons; Tier 2, <20 Tons; Tier 2, >20 Tons⁴: A single-package DX A/C unit consists of a single package (or cabinet housing) containing a condensing unit, a compressor, and an indoor fan/coil.

An additional benefit of package units is that there is no need for field-installed refrigerant piping, thus minimizing labor costs and the possibility of contaminating the system with dirt, metal, oxides or non-condensing gases. This measure involves installation of a TIER 2 high efficiency unit (EER=10.9) versus a standard unit (EER=10.3).

2. WATER HEATING

Standard electric water heaters use resistance heating elements to transfer heat to a reservoir in a storage tank system or instantaneously as the water passes through the heater in a point-of-use or on-demand water heater system. Thermal efficiency is relatively constant for electric resistance water heaters, with slight efficiency improvements available through improved insulation to minimize standby losses. Significant efficiency savings may be achieved through the installation of heat pump water heaters that capture heat from the air and transfer it to the water in the tank.

(1) Pre-Rinse Sprayer, Low Flow, Commercial Applications⁵: Pre-rinse sprayers are an essential component of kitchen operations—they are used to get the leftover food and grease off dishes, pots and pans before they go into a dishwasher. While conventional sprayers use between 2.5 and 4 gallons of water per minute (gpm), the low-flow sprayers use from 1.6 to 2.65 gallons per minute, according to the Energy Ideas Clearinghouse of the Washington State University Extension Energy Program in Olympia, Wash. Hot water is used in the sprayers and so low-flow spray valves lead to reduced water heating bills.

(2) Water Heater Blanket⁶: Water heater jackets are designed to wrap around an existing water heater tank to improve insulation, prevent heat loss, and save energy. Installing an insulating blanket can reduce water heating energy use by 3-9%.

(3) On Demand⁷: Demand (tankless or instantaneous) water heaters provide hot water only as it is needed. Demand water heaters heat water directly without the use of a storage tank. Therefore, they avoid the standby heat losses associated with storage water heaters. Typically, demand water heaters provide hot water at a rate of 2–5 gallons (7.6–15.2 liters) per minute.

(4) High Efficiency Storage Tank⁸: In a high efficiency storage tank, Water is kept hot and ready for use at all times in insulated storage tanks with capacities ranging from 20 to 80 gallons. Many

fuel options are available, including electricity, natural gas, oil, and propane. One drawback of these units is the energy used to keep the water hot at all times, otherwise known as "standby losses."

3. LIGHTING

*Controls*⁹: There are several varieties of automatic lighting controls, including wall or ceiling mounted occupancy sensors, integral occupancy sensors (including bi-level controls), photocells, and time clocks. Demand and Energy savings were reviewed for lighting control measures to confirm the appropriateness of current values.

(1) Occupancy Sensors - wall; ceiling; HID; bi-level controls¹⁰: Occupancy sensors (infrared or ultrasonic motion detection devices) turn lights on upon entry of a person into a room, and then turn the lights off from $\frac{1}{2}$ minute to 20 minutes after they have left. Occupancy sensors in commercial buildings require proper installation and calibration. Their savings depend on the mounting type, but typical energy savings for these controls are 20% over lights not equipped with occupancy sensors.

Fixtures¹¹: A variety of high efficiency fixtures, ballasts and lamps exist in the market today, producing the same amount of lumens, while consuming less electricity. Deemed lighting savings are mature components of utility sponsored DSM offerings around the country. The operating hours and demand factors for the different building types listed in this report are based on an in-depth research on a wide array of information available in the market.

(2) Super T8 Fixture - from 34W T12; from standard T8¹²: "High-Performance" or "Super" T8 lamp/ballast systems have higher lumens per watt than standard T8 systems. This results in lamp/ballast systems that produce equal or greater light than standard T8 systems, while using fewer watts. When used in a high-bay application, high-performance T8 fixtures can provide equal light to HID High-Bay fixtures, while using fewer watts.

(3) T5 Fluorescent High-Bay Fixtures; Troffer/Wrap; Industrial Strip; Indirect¹³: A T5 high-bay fixture has a fixture efficiency of over 91%, while a metal-halide fixture has a fixture efficiency of approximately 70%. By using a more efficient fixture, a space can be lit with fewer watts or fixtures. Typically, a 4-lamp F54T5HO system using 240 watts will provide as much light on a target surface as a standard 400 watt metal-halide fixture using 455 watts.

(4) CFL Fixture; CFL Screw-in¹⁴: An existing incandescent lamp is replaced with a lower wattage compact fluorescent lamp in either a hardwired fixture or screw-in fixture. CFLs have become an icon of energy efficiency and are commonly used as simple substitutes for incandescent lamps due to their significantly longer life and better energy efficiency. CFL's use approximately ¹/₄ of the electricity as compared to a similar incandescent lamp and CFL's

¹³ Ibid.

¹⁴ Efficiency Vermont Technical Reference User Manual (TRM) No. 2006-41

last between 8 and 10 times longer than a typical incandescent lamp. Dimmable CFL lamps are available. Much of the original concern over the performance of CFL's has been addressed through instant-start lamps (no flicker) and the use of electronic ballasts that function at much higher frequencies than their magnetic counterparts (no noticeable strobe effect)

(5) LED Exit Sign¹⁵: Exit sign illuminated with light emitting diodes (LED).

(6) Pulse Start Metal Halide¹⁶: Unlike incandescent lamps, which generate lighting by heating a filament, discharge lamps ionize a vapor to produce light. Metal halide high-intensity discharge ("HID") lamps that provide an intense cone of light are widely used because they are about three times as efficient as incandescent lamps. Traditional probe-start metal halide lamps do not use an igniter and require three electrical contacts to ignite the gas and remain lit. Recently developed pulse-start metal halide lamps use only two contacts and use an igniter located inside the ballast pod. Pulse-start lamps offer several benefits: higher light output per unit of electric power, higher light output as lamps age, longer lamp life, more stable color rendering as lamps age, and quicker startup – pulse-start lamps can reach full brightness in two to four minutes instead the five to ten minutes needed by probe-start lamps.

4. COOKING

The cooking end-use measures used in this study were taken from the Arkansas *Food Service Deemed Savings* manual.¹⁷ Although the manual only refers to gas-fired food service equipment replacing existing gas equipment, the deemed savings include interactive electricity savings associated with each technology. All of the potential savings associated with cooking measures in this study result from the interactive electricity savings listed in the manual.

(1) Energy Star Ovens¹⁸: Commercial convection ovens are the most widely used appliances in the foodservice industry. These are the workhorses of the commercial kitchen, with a wide variety of uses from baking and roasting to warming and reheating. In addition to traditional uses, convection ovens are used for nearly all types of food preparation, including foods typically prepared using other types of appliances (e.g., griddles, fryers, etc.). Commercial ovens that have earned the ENERGY STAR are about 20 percent more energy efficient than standard models.

(2) Energy Star Griddles¹⁹: ENERGY STAR qualified griddles include thermostatically controlled, gas and electric, single- and double-sided models. It must also be 10 percent more energy efficient than standard models.

(3) Energy Star Steamers²⁰: Steam cookers, also known as "compartment steamers", that have earned the ENERGY STAR are up to 50 percent more energy efficient than standard models. ENERGY STAR qualified steam cookers include both electric and gas models. Steam cookers that earn the ENERGY STAR must meet a minimum cooking efficiency* of 50 percent

¹⁵ Ibid.

¹⁶ Definition provided by Natural Resources Canada. www.nrcan.gc.ca

¹⁸www.energystar.gov

¹⁹Ibid.

²⁰ Ibid.

(electric) and 38 percent (gas) while also meeting maximum idle energy rates. Idle energy rates are given for 3-, 4-, 5-, and 6-pan sizes. Energy efficient steam cookers that have earned the ENERGY STAR offer shorter cook times, higher production rates, and reduced heat loss due to better insulation and more efficient steam delivery system.

(4) Energy Star Fryers²¹: Fryers that have earned the ENERGY STAR are up to 30 percent more energy efficient than standard models. ENERGY STAR qualified fryers include both gas and electric open deep-fat models. Fryers that earn the ENERGY STAR must meet a minimum cooking efficiency of 50 percent (gas) and 80 percent (electric) while also meeting a maximum idle energy rate of 9,000 Btu/hr (gas) and 1,000 watts (electric). Energy efficient fryers that have earned the ENERGY STAR offer shorter cook times and higher production rates through advanced burner and heat exchanger designs. Fry pot insulation reduces standby losses resulting in a lower idle energy rate.

(5) Energy Star Hot Food Holding Cabinets²²: Hot food holding cabinets that have earned the ENERGY STAR are 65 percent more energy efficient than standard models. Hot food holding cabinet models that earn the ENERGY STAR must meet a maximum idle energy rate of 40 watts/ft³. This means that ENERGY STAR qualified hot food holding cabinets are more efficient at maintaining food temperature while using less energy. Models that meet this requirement incorporate better insulation, reducing heat loss, and may also offer additional energy saving devices such as magnetic door gaskets, auto-door closures, or dutch doors. The insulation of the cabinet also offers better temperature uniformity within the cabinet from top to bottom.

5. REFRIGERATION

Commercial refrigerators and freezers are commonly found in restaurants and other food service industries. Reach in, solid door refrigerators and freezers are significantly more efficient than regular refrigerators and freezers due to better insulation and higher efficiency components. There are recognized high-efficiency designations, Tier 1 or Tier 2, for these types of refrigerators and freezers, which relate the volume of the appliance to its daily energy consumption. Tier 1 corresponds to Energy Star minimum efficiency levels while Tier 2 is the minimum efficiency level set by the Consortium for Energy Efficiency (CEE). Tier 2 refrigerators and freezers are 40% and 30% more efficient than Tier 1 refrigerators and freezers respectively. The three most common size refrigerators and freezers, one, two and three door, at both Tier 1 and Tier 2 levels, were analyzed for this report.²³

(1) High Efficiency Refrigerators²⁴: The measure described here is a high-efficiency packaged commercial reach-in refrigerator with solid doors, typically used by foodservice establishments. This includes one, two and three solid door reach-in, roll-in/through and pass-through commercial refrigerators. Beverage merchandisers – a special type of reach-in refrigerator with glass doors – are not included in this characterization. A high efficiency reach-in refrigerator can fall into one of two tiers: Tier 1 – those meeting the ENERGY STAR specifications, or Tier 2 – those meeting ENERGY STAR plus 40% more efficient.

²¹ Ibid

²² Ibid

²³ Nexant, 2007. Arkansas Deemed Savings Quick Start Program Draft Report Commercial Measures. For Frontier Associates, LLC, March, 2007.

²⁴ Efficiency Vermont Technical Reference User Manual (TRM) No. 2006-41

(2) High Efficiency Freezers²⁵: The measure described here is a high-efficiency packaged commercial reach-in freezer with solid doors, typically used by foodservice establishments. This includes one, two and three solid door reach-in, roll-in/through and pass-through commercial freezers. A high efficiency reach-in freezer can fall into one of two tiers: Tier 1 – those meeting the ENERGY STAR specifications, or Tier 2 – those meeting ENERGY STAR plus 40% more efficient.

(3) Night Covers for Refrigerator and Freezer Display Cases²⁶: Installing film or blanket type night covers on display cases can significantly reduce the infiltration of warm ambient air into the refrigerated space. This reduction in display case loads in turn reduces the electric use of the central plant, including compressors and condensers, thus saving energy. The target market for this measure is small, independently owned grocery stores and other stores that are typically closed at night and restock their shelves during the day. The target cases are vertical displays, with a single- or double-air curtain, and tub (coffin) type cases. [CA pg A-20].

(4) Vender Miser²⁷: The Vending Miser is an energy control device for refrigerated vending machines. Using an occupancy sensor, during times of inactivity the Vending Miser turns off the machine's lights and duty cycles the compressor based on the ambient air temperature. The Vending Miser is applicable for conditioned indoor installations. The Baseline is a soft-drink vending machine without a Vending Miser device (typical usage of 3555 kWh).

(5) Demand Defrost Controls²⁸: Defrost of evaporator coils in freezer displays is normally completed on a timed basis, but this is wasteful, as the time interval is designed to remove ice around the coil under worst case humidity levels. Demand defrost sensor and control systems are designed to optimize coil defrost. Demand defrost controls can work in conjunction with both electric heat defrost and hot gas defrost systems. Unfortunately, at the time, industry experts suggest that this technology is still in an early stage of design and not yet ready for the market. However, in the near future this technology should be viewed as a substantial opportunity for energy savings.

(6) Humidistat Controls²⁹: A humidistat control is a control device to turn refrigeration display case anti-sweat heaters off when ambient relative humidity is low enough that sweating will not occur. Anti-sweat heaters evaporate moisture by heating the door rails, case frame and glass of display cases. Savings result from reducing the operating hours of the anti-sweat heaters, which without a humidistat control generally run continuously. There are various types of control strategies including cycling on a fixed schedule.

(7) High Efficiency Fan and Compressor Motors³⁰: Packaged refrigeration equipment is estimated to account for more than half of the electricity used by refrigeration systems in the commercial sector. In the U.S., the ENERGY STAR-labeled commercial refrigerators and freezers are generally at least 25% more efficient than some products in the market. However, the existing

²⁵ Efficiency Vermont Technical Reference User Manual (TRM) No. 2006-41

²⁶ California Statewide Commercial Sector Energy Efficiency Potential Study, July, 2002.

³⁰ Efficient Fan Motor Options for Commercial Refrigeration, Emerging Technologies & Practices, ACEEE, 2004

http://www.aceee.org/pubs/a042_r3.pdf#search=%22fan%20motors%20measure%20description%22

stock of packaged refrigeration equipment is considered very inefficient due to the focus by most purchasers on first cost and the lack of effort from manufacturers to differentiate equipment on the basis of energy efficiency.

Fans and fan motors used in the condensers and evaporators account for 20% of the annual energy use and operate at overall efficiencies as low as 7 to 15%. These low efficiencies are due to both inefficient fans and low cost shaded pole (SP) motors with low efficiencies. New axial fan designs enable improved fan performance and advanced electric motors such as brushless DC or electronically commutated motors (ECM) offer motor performance solutions.

It appears that the majority of currently installed evaporator and condenser fan-motor sets can be replaced with advanced units that can achieve energy savings as high as 70% of the fan-motor energy. The input fan power of an evaporator and condenser in a typical 48 ft3 two-door reachin commercial refrigerator can be reduced from 70W (35W per component) to 20W (10W per component) with use of the energy-efficient fans and motors. Incremental costs range from a low of approximately \$20 for a better fan with a brushless DC motor to \$50 for an ECM motor. The total incremental cost for a commercial fridge would be in the range of \$40 to \$100.

(8) Compressor VSD Retrofit³¹: A variable speed compressor is a screw or reciprocating compressor whose current is modulated by a frequency inverter. A controller senses the compressor suction pressure and modulates the current and therefore the motor speed in response to changes in this pressure. When low load conditions exist, the current to the compressor motor is decreased, decreasing the compressor work done on the refrigerant.

(9) Walk-in Cooler/Freezer Controls and Economizers³²: Economizers save energy in walk-in coolers by bringing in outside air when it is sufficiently cool, rather than operating the compressor. High efficiency is a walk-in refrigeration system with an outside air economizer.

(10) Ice Machine, Energy Star, Self-Contained³³: Ice makers are also classified as batch or continuous in operation. Batch models tend to produce ice that is purer than its source water, because the freezing process separates out the impurities. In continuous units, chemicals tend to remix in an ice/water combination. Controls for batch ice makers are more complicated—they must end the freezing process at the proper time to start a thawing cycle, and resume the freezing process after the ice has been harvested.

(11) Zero Energy Doors and Frames³⁴: doors/frames are highly insulated, with either double- or triple-pane units and low-E glass coatings or low-conductivity filler gas (e.g., argon). They are also doors and frames that are completely free of electric resistance heating (i.e., no heaters in door frames).

(12) Commercial Refrigeration Tune Up: Operational maintenance of commercial refrigeration unit that includes cleaning of dirty coils, re-lubricating refrigeration lines, and making sure connections to the unit are not faulty. The tune up extends the elascity and the durability of the refrigeration unit.

³¹ California Statewide Commercial Sector Energy Efficiency Potential Study, July, 2002.

³² Efficiency Vermont Technical Reference User Manual (TRM) No. 2006-41

^{33 &}quot;Ice Makers." http://www.mge.com/business/saving/BEA

³⁴ "2009 Rebate Application: Commercial Refrigeration Equipment.", Efficiency Vermont

(13) Advanced Refrigeration Technologies Fan Controller³⁵: the Advanced Refrigeration Technologies (ART) Fan Controller can reduce the costs of using these refrigeration units up to 50%. The ART Evaporator Fan Controller is inexpensive and easy to install. It regulates the speed of the evaporator fan motors to meet the need of each phase of the refrigeration cycle. Just as energy is saved by turning off the lights in an unoccupied room, this controller saves energy by running the fans only as fast as the refrigerator needs at the time.

(14) LED Case Lighting¹⁶: Higher energy efficiency and better performance at low temperatures allows LED case lighting to use up to 50 percent less energy than fluorescent systems. Additionally, LED systems emit less heat, which means the refrigeration compressor does not have to work as hard to remove heat as with fluorescent systems. LED fixtures efficiently direct the light where it is truly needed, eliminating wasteful light that spills out onto the floor. LEDs are also able to illuminate shelves in a more uniform manner. LED lighting contains no mercury. Also, its reduced energy consumption will aid in preventing unnecessary green house gas emissions associated with energy production.

6. OFFICE EQUIPMENT

(1) Plug Sensors³⁷: Plug load occupancy sensors are devices that control low wattage devices (<150 watts) using an occupancy sensor. Common applications are computer monitors, desk lamps, printers, and other desktop equipment. Two size tiers were analyzed based on available products in the market: 50 and 150 watt.

7. MOTORS (VENTILATION AND NON-VENTILATION)

(1) Motors - Variable Frequency Drives³⁸: Installation of Variable Speed Drives (VSDs) will ensure that pumps are performing at maximum efficiency at partial-load conditions. The power required to operate a pump motor is proportional to the cube of the operating speed. For example, in a pump system with a VSD, a load reduction that results in a 10-percent reduction in motor speed reduces energy consumption by 27 percent [0.9 x 3 = 0.27].

(2) NEMA Premium Efficiency Motors³⁹: NEMA motors (National Electrical Manufacturers Association) for the North American market distinguish themselves as a result of their new design – and especially as a result of their efficiency. NEMA motors are suitable in all types of industries, in sectors such as the automobile, textile, printing, chemical branches as well as in cross-industry applications – for example in conveyor technology. The HVAC sector (Heating, Ventilating & Air Conditioning), which requires extremely light motors are typical applications for our so-called General Purpose motors – either with gray cast iron or aluminum frames. Severe duty motors in a full gray cast iron design are suitable for use in tough ambient conditions – for instance in the pulp and paper industry. The Severe Duty SD100 IEEE 841 motor version even exceeds the stringent IEEE 841 Standards applicable in the crude oil and chemical industries.

8. COMPRESSED AIR

(1) Compressed Air Leaks⁴⁰: Leaks are a significant source of wasted energy in a compressed air system, often wasting as much as 20-30% of the compressor's output. Compressed air leaks can also contribute to problems with system operations, including fluctuating system pressure, which can cause air tools and other air-operated equipment to function less efficiently, possibly affecting production, excess compressor capacity, resulting in higher than necessary costs, and decreased service life and increased maintenance of supply equipment (including the compressor package) due to unnecessary cycling and increased run time.

(2) Engineered Nozzles⁽¹⁾: Engineered Nozzles reduce air consumption and noise levels; ordinary nozzles cannot compete. Engineered Nozzles maintain safety features and can qualify for an energy savings rebate from a local utility; ordinary nozzles fall short. Open blow off or homemade blow off applications typically violate OSHA safety standards; Engineered Nozzles do not.

BIG RIVERS ELECTRIC CORPORATION

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 12. Identify the energy savings in MWhs and peak demand
2	reduction in MWs that Big Rivers achieved through DSM, including
3	demand-response, interruptible load, and efficiency programs, in 2012.
4	
5	Response) Please see the attached DSM Report which was submitted to the
6	Public Service Commission in January 2013.

Program Summary

Big Rivers Electric Corporation has taken a proactive approach to advance the goal of Strategy 1 of the 2008 Governor's Intelligent Energy Choices plan "to improve the efficiency of Kentucky's homes, buildings, industries and transportation fleet by establishing a goal of offsetting at least 18 percent of Kentucky's projected 2025 energy demand."

The purpose of this DSM report is to provide descriptions and data about DSM programs currently being offered.

DSM/Energy Efficiency Programs

- 1. Residential Lighting Replacement Program (CFL distribution)
- 2. Residential ENERGY STAR® Clothes Washer Replacement
- 3. Residential ENERGY STAR® Refrigerator Replacement
- 4. Residential ENERGY STAR® Heating, Ventilation and Air Conditioning (HVAC) Program
- 5. Residential Weatherization Program Primary Heating Electric
- 6. Residential Weatherization Program Primary Heating Gas
- 7. Residential Touchstone Energy® New Home Construction Program
- 8. Residential and Commercial HVAC & Refrigeration Tune-Up Program
- 9. Commercial/Industrial High Efficiency Lighting Replacement Program
- 10. Commercial/Industrial General Energy Efficiency Program

2012 DSM/Energy Efficiency Results

The 2012 Year-End DSM Program Results are shown in the table at the top of the following page.

Big Rivers Electric Corporation 2012 Demand Side Management/Energy Efficiency Program Results

DSM Program	Units	Total Meas.	Total Spend
Residential Lighting Program	Lamps	51,792	\$101,914.00
Residential Energy Star (ES) Appliances	-	-	-
Energy Star Clothes Washer	Washers	563	56,300
Energy Star Refrigerator	Refrigerators	383	38,300

Commercial/Industrial Efficient Equipment Program	KW	27	9,495
Promotional Expense		, metalalah tahun kang pang pang pang berta dari pang pang pang pang pang pang pang pang	75,013
Total	nganaga garantigan tangkatan (katala da centri in tanah artistan da para garanti di katala da sebagai da sebag - -	n andre en en andre Andre en a An	\$588,096

The Energy Efficiency programs are being offered at all three of Big Rivers' Member Cooperatives. Meade County Rural Electric Cooperative Corporation ("MCRECC") has been offering the programs since January 2012. Kenergy Corp. ("Kenergy") began program offerings in May 2012. Jackson Purchase Energy Corporation ("Jackson Purchase") began offering programs to retail members in July 2012. Many of the programs have significant lead times, such as commercial programs, new home construction and residential weatherization and the delayed start reduced the spend in 2012 in many of the programs.

The actual spend for 2012 was \$588,096 or slightly less that 59% of projected. Promotional expenses were \$75,013 or 37% of projected.

The programs are currently under review and will be evaluated for potential improvements. The DSM/EE working group will examine the recommended changes, which may result in modifications to the current programs and potential new programs in 2013.

2012 Budget

The table on the following page shows the 2012 energy efficiency program targets and spending levels for each program. This table also quantifies the deemed impact of each target on energy consumption and peak kW. Appendix A of this report shows the year-end results of 2012 and descriptions of each program.

The 2012 budget of \$1,000,000 was split into two segments. The first segment addresses incentives or direct payments to Members when a measure is implemented. The total incentive budget was \$800,000. The second segment involves the additional \$200,000 set aside for promotional and regulatory administrative costs associated with the program.

Specific program budgets are flexible and are tailored to retail member response to each program. Member Cooperatives are able to adjust or shift budgets to address successful programs. Program requirements for each individual program plans are minimum standards; Member Cooperatives may establish more stringent requirements at their discretion.

Member Cooperatives collect required documentation and submit an invoice, with a summary spreadsheet for each program to Big Rivers for reimbursement monthly. The invoice contains the following information for each incentive paid:

- 1. Date
- 2. Account Number
- 3. Name
- 4. Service Address
- 5. City
- 6. Zip Code
- 7. Incentive Description Details
- 8. Incentive Amount

Each program has a separate summary spreadsheet. Multiple program summary spreadsheets may be combined on the same invoice. Promotional reimbursement requires a copy of the advertisement used in printed media. Radio advertising is submitted with a script.

Big Rivers 2012 DSM/Energy Efficiency Program Actual

Program: Residential Lighting Replacement Program (CFL Distribution)

Overview

This program promotes increased use of ENERGY STAR® rated Compact Fluorescent Light ("CFL") lamps among the retail members of Big Rivers' Member Cooperatives by providing reimbursement to Member Cooperatives for CFL lamps distributed to their retail members.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

Big Rivers will reimburse the Member Cooperatives for the purchase of CFL lamps that the Member Cooperative buys and distributes to its retail members for use in the Member Cooperative's service area. Member Cooperatives must submit invoices to Big Rivers and must include proper documentation of the purchase from the CFL supplier and of the distribution to retail members. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$100,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Residential ENERGY STAR® Clothes Washer Replacement Program

Overview

This program promotes increased use of ENERGY STAR® rated clothes washing machines.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

Big Rivers will provide an incentive payment of \$100 for each ENERGY STAR® rated clothes washer that is purchased and installed in the Member Cooperative's system. Member Cooperatives must submit invoices to Big Rivers and must include proper documentation of the purchase and installation from a legitimate retail appliance supplier. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$40,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Residential ENERGY STAR® Refrigerator Replacement Program

Overview

This program promotes increased use of ENERGY STAR® rated refrigerators and the removal from operation of existing older, low-efficiency refrigerators.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

Big Rivers will provide an incentive payment of \$100 for each ENERGY STAR® rated refrigerator that is purchased and installed in the Member Cooperative's system. Member Cooperatives must submit invoices to Big Rivers and must include proper documentation of the purchase and installation of the new appliance, and the removal of the old appliance from legitimate retail appliance suppliers. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$40,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Residential ENERGY STAR® Heating, Ventilation and Air Conditioning ("HVAC") Program

Overview

This program promotes increased use of high efficiency HVAC systems among the retail members of the member cooperatives by providing reimbursement to member cooperative members for upgrading their HVAC systems beyond contractor grade minimums to one of three ENERGY STAR®-rated HVAC systems.

Target Participants

Target participants of this program for Big Rivers include its three member cooperatives. The target end users are the retail members of the member cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

Big Rivers will reimburse the member cooperatives for the HVAC efficiency upgrades by a retail member on the member cooperative's system. Member cooperatives must submit invoices to Big Rivers and must include proper documentation. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

The following is the program administrative process:

- 1. The retail consumer will provide a receipt of installation and purchase of equipment from a licensed contractor dated within the eligibility timeframe of the program selected by the member cooperative.
- 2. The member cooperative will be responsible for verification of installation.
- 3. The initial incentives shall be the following per replacement unit installed:

•	Geothermal	\$750
---	------------	-------

 Dual Fuel 	\$500
-------------------------------	-------

• Air Source \$200

Annual Budget

The 2012 budget for this program is \$50,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Program: Residential ENERGY STAR® Heating, Ventilation and Air Conditioning ("HVAC") Program (*continued*)

Evaluation, Measurement and Verification ("EM&V")

Program: Residential Weatherization Programs – Primary Heating Electric and Primary Heating Gas

Overview

This program promotes the implementation of weatherization measures among the retail members of the member cooperatives by providing reimbursement to member cooperatives for undertaking weatherization improvements at their homes.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the retail members of the Member Cooperatives. This program is available to any retail residential member of the Member Cooperative taking service under the Big Rivers Rural Delivery Service ("RDS") tariff, with an all-electric home to maximize the benefit of the program.

Member Incentives

Sherlock Homes is a weatherization contractor headquartered in Bloomington Indiana, which has been performing weatherization projects for Hoosier Energy for the last two years with tremendous success. To-date Sherlock Homes has weatherized nearly 2,000 site-built and manufactured homes in Indiana.

Big Rivers will provide 50% of the cost of the weatherization for residential members with an electric primary heating system (Primary Heating Electric), or 25% of the cost for members with a non-electric primary heating system (Primary Heating Gas). Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$200,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Residential Touchstone Energy® New Home Construction Program

Overview

This program provides incentives to home owners and builders to use energy efficient building standards as outlined in the Touchstone Energy® certification program, which requires a Home Energy Rating System ("HERS") rating of 85 or lower.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

The incentive is based on the HVAC system installed in the retail member's Touchstone Energy® Certified Home. The following incentives apply:

Geothermal Heat Pump (ground coupled heat pump)	\$2,000
Air Source Heat Pump	\$1,000
Dual Fuel Heat Pump (ASHP w/ Gas back-up)	\$1,200
Gas Heat	\$ 750

The Member Cooperative will provide a copy of the original certification document and the analysis form used to determine the HERS score and a copy of the receipt from a licensed HVAC contractor specifying the HVAC system installed in the home of the retail member. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$100,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Residential and Commercial HVAC & Refrigeration Tune-Up Program

Overview

This program promotes the initiation of annual maintenance on heating and air conditioning equipment among the retail members of the Member Cooperatives by providing reimbursement to Member Cooperative retail members that have their heating and cooling systems professionally cleaned and serviced.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the residential and commercial retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

Big Rivers will offer incentives to Member Cooperatives for retail member homeowners and commercial businesses that have their heating and cooling systems professionally cleaned and serviced.

Member Cooperatives will receive a \$25 incentive for each residential unit and \$50 for each commercial unit that is cleaned and serviced.

For retail members with multiple units, each incentive paid will require an individual receipt from a licensed HVAC contractor.

Member Cooperatives must submit invoices to Big Rivers and must include proper documentation. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$50,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Commercial / Industrial High Efficiency Lighting Replacement Program

Overview

This program provides an incentive to commercial and industrial retail member consumers for whom service is taken under Big Rivers' RDS tariff to upgrade poorly designed and low efficiency lighting systems.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the commercial and industrial retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

The following are the project steps:

- 1. The lighting contractor, supplier, electrical contractor or electrician will provide to the retail member the documented changes made to the facility lighting system. The retail member will also be required to provide an invoice for materials and installation services associated with the project.
- 2. The Member Cooperative will verify the installation of the new lighting system and collect a copy of the specification of the lighting system conversion impact, signed by the retail member, with the following information:
 - Lamp and ballast (or fixture) specifications prior to conversion including total wattage
 - New fixture specifications including total wattage
 - Estimated hours of operation
 - Estimated kWh saved per year
 - Total kW demand reduction
- 3. The Member Cooperative shall submit an invoice to Big Rivers with copies of individual lighting project specification documents with the following information:
 - Member Name
 - Account Number
 - Service Address
 - kW Reduction Total
 - Annual Hours of Operation
 - Incentive Amount

Program: Commercial / Industrial High Efficiency Lighting Replacement Program (continued)

4. The initial incentive shall be set at \$350 per kW reduction. This amount will be evaluated continuously and adjusted depending on reaction by retail members qualifying.

Each of the incentive payments will require the fixture/lamp change be verified by the Member Cooperative personnel or third party. A worksheet is provided to determine the change in demand of the lighting system The retail member will also be required to provide the project costs for planning purposes. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$190,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

Program: Commercial / Industrial General Energy Efficiency Program

Overview

This program provides an incentive to retail commercial and industrial retail member-consumers served under the Big Rivers RDS tariff to upgrade all aspects of cost-effective energy efficiency achievable in individual facilities.

Target Participants

Target participants of this program for Big Rivers include its three Member Cooperatives. The target end users are the commercial and industrial retail members of the Member Cooperatives taking service under the Big Rivers Rural Delivery Service ("RDS") tariff.

Member Incentives

The requirements of the program are:

- 1. The retail member, contractor, supplier, electrical contractor or electrician will provide to the retail member the documented changes made to the facility equipment resulting in the demand reduction. The retail member will also be required to provide an invoice for materials and installation services associated with the project.
- 2. The Member Cooperative will verify the installation of the new equipment and collect a copy of the specification of the equipment conversion impact, signed by the retail member, with the following information:
 - Equipment specifications of existing equipment, including total wattage
 - Replacement equipment specifications, including total wattage
 - Estimated hours of operation
 - Estimated kWh saved per year
 - Total kW demand reduction
- 3. The Member Cooperative shall submit an invoice to Big Rivers with copies of individual project specification documents and a printed summary excel spreadsheet with the following information:
 - Member Name
 - Account Number
 - Service Address
 - kW Reduction Total
 - Annual Hours of Operation
 - Incentive Amount

Program: Commercial / Industrial General Energy Efficiency Program (continued)

4. The initial incentive shall be set at \$350 per kW reduction with a maximum incentive of \$10,000 per project unless approved by Big Rivers on an individual basis. This amount will be assessed continuously and adjusted depending on reaction by retail commercial members qualifying under this program.

Each of the incentive payments will require that equipment changes be verified by a Member Cooperative's personnel or third party. A worksheet is provided to determine the change in demand resulting in equipment upgrades. The retail member will also be required to provide the project costs for planning purposes. Big Rivers will also reimburse a Member's reasonable costs of promoting this program, if the promotional program and its costs are pre-approved by Big Rivers.

Annual Budget

The 2012 budget for this program is \$30,000. Budget levels for future years may vary based upon the experience gained after program implementation.

Evaluation, Measurement and Verification ("EM&V")

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 13.	Refer to p. 14 lines 13-16 of the testimony submitted by Albert
2	Yockey.	
3	0	a. Explain how Big Rivers selected an annual budget for DSM
4		programs of \$1 million, rather than some other amount.
5	ł	b. State whether the \$1 million annual DSM budget is adequate
6		to achieve all cost-effective energy savings from DSM.
7	C	e. If not, explain why not and identify the annual budget level
8		that would be needed to do so.
9		
10	Respons	se)
11	a.	The 2012 budget, similar to the DSM Potential Study was established
12		at \$1 million spending, which was selected to represent approximately
13		1% of revenue from the rural load, since the energy efficiency programs
14		apply only to the rural load. The rural load does not include large
15		industrials, which have the statutory right to opt out of any DSM
16		programs.
17	b.	The \$1 million annual DSM budget is not adequate to achieve all cost-
18		effective energy savings from DSM defined in the study as the
19		economic potential.
20	С,	The DSM Potential Study did not calculate total costs for economic
21		potential (all cost-effective measures) because it is a hypothetical
22		savings that assumes every standard measure is upgraded to an

Case No. 2012-00535 Response to SC 1-13 Witness: Lindsay N. Barron Page 1 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	efficient measure (100% market penetration) and does not account for
2	market barriers. However, the study did calculate a cost associated
3	with the achievable potential (a subset of the economic potential that
4	represents the attainable savings if the market penetration of high
5	efficiency electric appliances and equipment reaches 30%) over the 10-
6	year study period. Total NPV 10-years costs in the residential sector
7	are \$56 million (\$23 million of which would be paid by Big Rivers). In
8	the C&I sector, the NPV 10-year costs are \$35.1 million (\$14.8 million
9	paid by Big Rivers). This sums to approximately \$91 million (NPV)
10	over 10 years in total costs, or \$37.8 million to Big Rivers. (Totals
11	taken from Tables 6.6 & 7.8 of the DSM Potential Study)

12

13 Witness) Lindsay N. Barron

14

Case No. 2012-00535 Response to SC 1-13 Witness: Lindsay N. Barron Page 2 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Sierra Club's First Request for Information dated February 14, 2013

April 25, 2013

1	Item 14) For each of the years 2013 through 2030:
2	a. Identify Big Rivers' projected DSM budget.
3	b. Identify the projected level of energy savings to be achieved
4	through DSM programs
5	c. Identify the projected level of peak demand reduction to be
6	achieved through DSM programs
7	d. Produce any analyses or documents evaluating the projected
8	levels of energy savings and/or peak demand reduction
9	identified in response to requests 13b and 13c
10	
11	Response)
12	a. Big Rivers only has available 2013 through 2016, as shown below:
13	YEAR DSM BUDGET
14	2013 \$1,300,000
15	2014 \$1,094,400
16	2015 \$1,127,232
17	2016 \$1,149,776
18	In the 2011 Big Rivers' rate case, Big Rivers was approved to collect
19	\$1,000,000 annually for the purpose of DSM. A proforma adjustment
20	to the budget was made to ensure only \$1,000,000 was included in the
21	request associated with this rate case. Please see Reference Schedule
22	1.12 of Exhibit Wolfram-2.

11 Witness) Robert W. Berry

Case No. 2012-00535 Response to SC 1-16 Witness: Robert W. Berry Page 2 of 2

d) Planned Outage Schedule

Outage planning is an important part of the Big Rivers 2009 — 2011 work plan. The Big Rivers system performs scheduled outages as identified below:

Coleman units 1, 2, and 3

- FGD outages 2 year interval
- Boiler and turbine valve outages 3 year interval
- Turbine generator major inspections 9 year interval

Wilson, Henderson 1, Henderson 2, Green 1 and Green 2

- Boiler outages 2 year interval
- Turbine valve outages 4 year interval
- Turbine generator major inspections 8 year interval

The	follo	wing	table	reflects	the	2009	outage	plan
	and the second se	the second s	the second s	CONTRACTOR OF THE OWNER OWNE	A	The state of the s	· · · · · · · · · · · · ·	11 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

Unit	I Start Date	End Date	Days	Hours	
HMPL 1	February 21, 2009	March 23, 2009	31	744	
Green 2	March 28, 2009	April 29, 2009	33	792	
Coleman 3	May, 2, 2009	June 2, 2009	32	768	
Wilson	September 26, 2009	November 13, 2009	49	1176	

2009 Outages / Major Objectives

Henderson Unit 1, February 21, 2009 through March 23, 2009 (744 hours)

- Boiler Inspection
 - Replace High Temperature Reheater
 - Replace Selected High Energy Pipe Hangers
 - Replace Selected Combustion Steam Coils
 - o Replace Boiler Slag Grinders
 - Inspect Boiler Casing and Repair Gas Leaks
 - Replace Selected Boiler Soot blowers
 - Replace Wet bottom Drains
 - o Replace Plant Phone & PA System
 - o Inspect (NDE) Main Steam and Reheat Steam Piping

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 1 of 10

- Inspect (NDE) Selected Boiler Steam Collection Headers
- Turbine/Generator Inspection
 - Replace Cooling Tower Hot Water Distribution Deck
 - Re tube #5 Feed water Heater
- FGD/SCR Inspection
 - Replace WDPF, FGD, & SCR Controls
 - Replace Booster Fan Blade Erosion Covers
 - Clean ME Wash and Recycle Header Nozzles
 - Clean ME Panels, Reaction Tanks & Piping
 - Remove Catalyst Sample Logs
- Balance of Plant
 - Classify Mill Balls
 - Critical Motor PM's
 - Rebuild Selected 4160 Breakers
 - o Fan and Ductwork Inspection Repair

Green Unit 2, March 28, 2009 through April 29, 2009 (792 hours)

- Boiler
 - Replace precipitator field (4th and 5th).
 - Replace fly ash hoppers.
 - Replace economizer expansion joints (2).
 - Replace west SH spray venturi.
 - Replace FD fan inlet vanes.
 - Replace air heater baskets.
 - Replace reheater tubes.
 - Replace DA trays.
 - Replace bottom ash controls.
 - Replace fly ash hopper isolation gates.
 - Replace boiler drains.
 - \circ Replace steam coils (4).
 - Chemical clean boiler.
 - Repair wet bottom refractory.
 - Inspect and repair OHA/burner nozzles.
 - Inspect igniter rods and scanners.
 - Inspect boiler walls.
 - Inspect burners.
 - High energy pipe inspection.
 - Rebuild feed water and condensate control valves.
 - Inspect ID, FD, and PA bearings, shafts, and blades.
 - Inspect and repair air heater seals.
 - Repair precipitator outlet ducts.

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 2 of 10

- Inspect soot blowers.
- Turbine
 - Replace EH fluid.
 - Clean hydrogen and lube oil coolers.
 - Inspect 4160-480 volt breakers and repair.
 - Inspect voltage regulator and field breaker.
 - Turbine instrument inspection and calibration.
- Balance of Plant
 - Replace thickener rake drive.
 - Replace cooling tower deck.
 - Replace B water service pump.
 - Upgrade CEM's.
 - Replace coal handling controls.
 - Replace scrubber controls.
 - Replace mist eliminators.
 - Replace scrubber inlet ducts.
 - Replace cooling tower fan shrouds.
 - Precipitator and outer housing repairs.
 - Recondition mill motors.
 - Recondition recycle pump motors.
 - Clean scrubber reaction tank, headers, nozzles, and screens.
 - Inspect cooling tower structure, fan gear boxes, and pumps.

Coleman Unit 3, May 2, 2009 through June 2, 2009 (768 hours)

- Boiler
 - Inspection
 - Replace rear furnace deflector wall
 - Replace primary superheater
 - Sootblower replacement
 - Boiler tube overlay
 - Boiler chemical clean
 - Furnace scaffolding
 - Penthouse casing repair
 - Insulation and lagging repairs
 - Expansion joint replacement
 - Gas leak repairs
 - Fan inspections
- Turbine
 - Valve inspection
 - Replace condenser vacuum pump

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 3 of 10

- FGD
 - Maintenance inspection of all equipment that requires a FGD shutdown
 - Scaffold absorber
 - o Booster fan inspection and repair
 - Replacement of Cl & C2 fan blades
 - Storage tank inspection and repair
 - Agitator inspection and replacement
 - Replacement of B and D blades
 - Recycle pump overhaul
 - Oxidation Air Blower inspection and PM
 - Limestone mill liner replacement
 - o Motor PMs
 - o Limestone mill liner replacement
- Balance of Plant
 - Replace A & B mill liners
 - Reclassify A & B mill balls
 - Precipitator controls replacement
 - o Motor PMs
 - Replace cold end airheater baskets
 - "B:" side 4160 volt switch gear replacement
 - A and C 480 volt MCC replacement
 - Boiler feed pump overhaul

Wilson Unit 1, September 26, 2009 through November 12, 2009 (1176 hours)

- Boiler
 - Replace "B" platen superheat section
 - Repair finishing superheat section
 - Boiler high temperature header inspection
 - High Energy pipe inspection
 - Replace 12 burners
 - Replace precipitator outlet dampers
 - Chemical clean boiler
 - Perform condition assessment of Furnace area
- Turbine / Generator
 - HP turbine inspection
 - HP rotor blade replacement
 - Generator inspection
 - Test hardness of HP rotor to determine if replacement is needed
 - FGD
 - Refurbish absorber modules

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 4 of 10

- o Replace FGD inlet and outlet dampers
- oStack inspection and cleaning
- Replace recycle pump discharge valves
- Ductwork inspection and repairs

The following table reflects the 2010 outage plan

Unit	Start Date	End Date	Days	Hours
Wilson	February 27, 2010	March 5, 2010	7	168
Coleman 2	March 6, 2010	March 30, 2010	25	600
HMPL 2	April 3, 2010	April 23, 2010	21	504
Green 1	April 24, 2010	May 21, 2010	28	672
Reid 1	May 1, 2010	May 21, 2010	21	504

2010 Outages / Major Obtectives

Wilson Unit 1, February 27, 2010 through March 5, 2010 (168 hours)

- Boiler
 - Open and inspect boiler
 - Wash airheaters
 - o Inspect burners
 - o Boiler valve replacement
- FGD
 - Open and inspect FGD
 - Stack cleaning

Coleman Unit 2, March 6, 2010 through March 30, 2010 (600 hours)

- Boiler
 - o Replace reheater hot end
 - Install alloy weld overlay on waterwalls
 - Soot blower replacement
 - o Chemical clean
 - Penthouse casing repair

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 5 of 10

- o Insulation and lagging repair
- o Expansion joint replacement
- o FD fan housings, silencers and hoods replacement

• Turbine

- Valve inspection
- Replace condenser vacuum pump
- Repair HP / IP steam seals
- Balance of Plant
 - o 480 volt MCC replacement
 - o Motor PM's
 - Boiler feed pump overhaul
 - Precipitator controls replacement

Henderson Unit 2, April 3, 2010 through April 23, 2010 (504 hours)

- Boiler Inspection
 - Replaced Selected High Energy Pipe Hangers
 - Replace Selected Combustion Steam Coils
 - Replace Boiler Slag Grinders
 - Replace Selected Boiler Soot Blowers
 - Inspect Boiler Casing and Repair Gas Leaks
 - Inspect (NDE) Main Steam and Reheat Steam Piping
 - Inspect (NDE) Selected Boiler Steam Collection Headers
 - o Replace 480 Volt MCC
 - Replace River Intake 480 Volt MCC
- Turbine/Generator Inspection
 - Replace #6 Feedwater Heater
 - Install MOV's on Feedwater Heater Extraction Valves
- FGD/SCR Inspection
 - Replace Booster Fan Blade Erosion Covers
 - Clean ME Wash and Recycle Header Nozzles
 - o Remove Catalyst Sample Logs
 - Clean Ammonia Injection Nozzles
- Balance of Plant
 - o Classify Mill Balls
 - o Perform Critical Motor PM's
 - Rebuild Selected 4160 Breakers
 - o Fan and Ductwork Inspection and Repairs

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 6 of 10

Green Unit 1, April 24, 2010 through May 21, 2010 (672 hours)

- Boiler
 - Replace ash grinder.
 - Replace economizer expansion joint.
 - Replace FD fan inlet vanes.
 - Replace air heater baskets.
 - Inspect soot blowers.
 - Wet bottom refractory repair.
 - Inspect boiler walls.
 - High energy pipe inspection.
 - Inspect FD, PA and ID fan bearings, shafts, and blades.
 - Inspect and repair igniters and scanners.
 - Inspect and repair OFA burner nozzles.
 - Turbine
 - Replace generator rectifier.
 - Replace voltage regulator.
 - Replace sequence of events recorder.
 - DCS power supply upgrade.
 - Inspect and test 4160/480 volt breakers.
 - Clean hydrogen lube oil and stator coolers.
 - Balance of Plant
 - Replace precipitator field (1st and 2nd)
 - Replace scrubber Dupont.
 - Repair scrubber structural component.
 - Replace thickener rake drive.
 - Replace cooling tower deck.
 - Replace B service water pump.
 - Replace one slaker.
 - Replace USS transformer (Scrubber).
 - Clean scrubber reaction tank headers, nozzles, and screens.
 - Inspect cooling tower structure, fan gear boxes, and pumps.

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 7 of 10

The following table reflects the 2011 outage plan

Unit	Start Date	End Date	Days	Hours
Coleman 1	February 19, 2011	March 15, 2011	25	600
Green 2	March 19, 2011	May 6, 2011	49	1176
HMPL 1	May 7, 2011	June 24, 2011	49	1176
Wilson 1	September 3, 2011	September 30, 2011	28	672

Coleman 1, February 19, 2011 through March 15, 2011 (25 days) 600 hour outage

•Boiler

- o Inspection
- Replace re-heater hot end
- Boiler tube overlay
- Boiler chemical clean
- Penthouse casing repair
- o Insulation and lagging repair
- Expansion joint replacement
- Gas leak repairs
- Fan inspections
- FD fan housings, silencers and hoods replacement
- Sootblower replacement
- Drum enclosure replacement
- Turbine
 - o Valve inspection
 - Replace condenser vacuum pump
 - o Balance of Plant
 - o 480 volt MCC replacement
 - o Motor PM' S
 - Boiler feed pump overhaul
- FGD
- o Maintenance inspection of equipment that requires a FGD shutdown, etc
- Scaffold absorber
- Booster fan inspection & repair
- Replace C3 blades

oStorage tank inspection & repair

- Agitator inspection & replacement
- Replacement of A, C, and E blades
- Recycle pump overhaul

oOxidation Air Blower inspection & PM

- o Motor PMs
- o Limestone mill liner replacement

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 8 of 10

Green Unit 2, March 19, 2011 through May 6, 2011 (1176 hours)

• Boiler

- Precipitator repair.
- Replace boiler drains.
- Replace steam coils (4).
- Repair wet bottom refractory.
- Inspect and repair OHA/burner nozzles.
- Inspect igniter rods and scanners.
- o Inspect boiler walls.
- o Inspect burners.
- High energy pipe inspection.
- Replace B ID fan shaft.
- Replace ID fan dampers
- Replace FD fan inlet vanes
- Inspect and repair air heater seals.
- Repair precipitator outlet ducts.
- Inspect soot blowers.
- Turbine
 - Replace voltage regulator
 - o Turbine / Generator overhaul
 - Replace Turbine packing (HP, IP & LP rows)
 - Replace Generator retaining rings
- Balance of Plant
 - Replace slaker and controls
 - Replace water plant controls.
 - o Replace 7A Stacker
 - Replace A telescopic chute
 - Replace controls at dewatering plant
 - Recondition mill motors.
 - Recondition recycle pump motors.
 - o Clean scrubber reaction tank, headers, nozzles, and screens.
 - o Inspect cooling tower structure, fan gear boxes, and pumps.

Henderson Unit 1, May 7, 2011 through June 24, 2011 (1176 hours)

- Boiler Inspection
 - o Replace Selected High Energy Pipe Hangers
 - o Replace Selected Combustion Steam Coils
 - Replace Boiler Slag Grinders

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 9 of 10

- o Inspect Boiler Casing and Repair Gas Leaks
- Replace Selected Boiler Soot blowers
- Replace Wet bottom Drains
- Replace Plant Phone & PA System
- Inspect (NDE) Main Steam and Reheat Steam Piping
- Inspect (NDE) Selected Boiler Steam Collection Headers
- Turbine/Generator Inspection
 - Replace Turbine Packing
 - Replace Cooling Tower Controls
 - Replace 480 volt MCC at Cooling Tower
- FGD/SCR Inspection
 - Replace Booster Fan Blade Erosion Covers
 - Clean ME Wash and Recycle Header Nozzles
 - Clean ME Panels, Reaction Tanks & Piping
 - o Remove Catalyst Sample Logs
- Balance of Plant
 - Classify Mill Balls
 - Critical Motor PM's
 - Rebuild Selected 4160 Breakers
 - Fan and Ductwork Inspection Repair
 - Replace Burners
 - Stack Liner Replacement

Wilson Unit 1, September 3, 2011 through September 30, 2011 (672 hours)

- Boiler
 - Replace finishing superheat section
 - Replace 13 burners
 - Perform condition assessment of Furnace area
 - Continue high energy pipe inspection
 - Boiler high temperature header inspection
- Turbine / Generator
 - General L.P. crawl through inspection
 - Hydrogen, exciter and lube oil cooler cleaning
- FGD
 - FGD Refurbishment
 - Ductwork inspection and repairs
 - Replace FGD inlet and outlet dampers
 - Stack inspection and cleaning

Case No. 2012-00535 Attachment to Response to SC 1-16(a) Witness: Robert W. Berry Page 10 of 10

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 17. Refer to p. 13 lines 1-10 of the testimony of Robert Berry.
2	a. Explain the basis for the budgeted off-system sales market
3	prices for 2013 and 2014 identified therein
4	a. (i) Identify and produce any analysis, report, or other
5	document upon which those budgeted off-system market
6	prices are based.
7	a. (ii) Identify the date that the budgeted off-system sales
8	market price projections were made.
9	b. Identify and explain each reason that the actual off-system
10	sales market prices for 2011 and 2012 were different than the
11	budgeted off-system sales market prices.
12	c. In light of the differences between the budgeted and actual off-
13	system sales market prices in 2011 and 2012, identify and
14	explain any steps you took to try to improve the accuracy of your
15	budgeted off-system sales market prices for 2013 and 2014.
16	d. Identify the projected off-system sales market price for each year
17	of 2015 through 2030.
18	d. (i) Identify and produce any analysis, report, or other
19	document upon which those projected off-system sales
20	market prices are based.
21	Response)
22	a. Please see Big Rivers' response to Item 21b.

Case No. 2012-00535 Response to SC1-17 Witness: Robert W. Berry Page 1 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

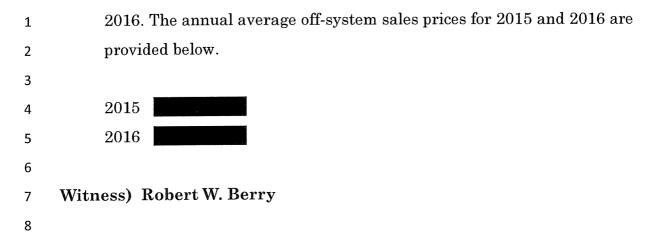

1		a.(i.). Please see Big Rivers' response to PSC 1-57. The forecasted
2		market prices can be found on the prices tab of the production cost
3		model.
4		a.(ii.) The Production Cost model was completed in September 2012.
5		
6	b.	The 2011 actual off-system sales market price was different than
7		budgeted for two reasons; the overall market price dropped in 2011 and
8		Big Rivers' off-system sales volume nearly doubled, indicating that more
9		sales were occurring in non-peak hours. The 2012 actual off-system sales
10		market price was different than budgeted because the MISO market
11		continued to significantly decline throughout 2012.
12	c.	It is often difficult to predict market prices in a rising or falling market
13		environment. The years 2010, 2011, and 2012 encompassed drastic
14		economic changes throughout our country and the wholesale power
15		market was significantly impacted. Big Rivers believes that we have
16		reached a steady state in the market and projections indicate that there
17		will be no major drivers of change in market prices in the next several
18		years.
19	d.	The off-system sales prices Big Rivers relied on for its forecasts are
20		included in the Big Rivers Financial Model provided in response to PSC 1-
21		57. The fully forecasted test period in this case is based on the Company's
22		approved budget and financial plan, which only includes 2013 through

Case No. 2012-00535 Response to SC1-17 Witness: Robert W. Berry Page 2 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

Case No. 2012-00535 Response to SC1-17 Witness: Robert W. Berry Page 3 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 18) Refer to p. 14 lines 4-6 of the testimony of Robert Berry.
2	a. State whether Big Rivers projects that its margins will
3	continue to be "derived almost exclusively from off-system
4	sales."
5	(i) If so, explain why.
6	(ii) If not, explain why not and identify how such margins will
7	be derived.
8	
9	Response)
10	a. Yes.
11	(i) For the fully-forecasted test period September 1, 2013 through
12	August 31, 2014, Big Rivers is targeting a Contract TIER of 1.24 or
13	a net margin of approximately \$9.4 million. The targeted Contract
14	TIER of 1.24 during the test period allows Big Rivers to meet its
15	minimum 1.10 MFIR requirement for the 2013 budgeted year. This
16	minimum 1.10 MFIR is required for Big Rivers to meet its debt
17	covenants. As such, for the fully-forecasted period off-system sales
18	margins comprise approximately 85% of operating margins and
19	approximately 43% percent of the net margin.
20	(ii) Not applicable.
21	
22	Witness) Robert W. Berry

Case No. 2012-00535 Response to SC 1-18 Witness: Robert W. Berry Page 1 of 1

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1 Item 19) Refer to p. 16 line 17 through p. 17 line 2 of the testimony of
2 Robert Berry. Produce any report memorializing Big Rivers' current
3 capital work plan, and any analyses, reports, or other documents upon
4 which that plan is based.
5

Response) Big Rivers' capital work plan is developed using a combination of
in-house expertise; a computerized maintenance management system; third
party inspections, studies and reports; and maintenance history information.
Please see the files on the Confidential CD accompanying these responses for a
sample of the reports, analyses, and documentation on which the plan is based.

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item	21) Refer to p. 31 line 13 to p. 32 line 5 of the testimony of Robert
2	Berry	/.
3	а.	Identify the forecasted market prices in MISO for 2013 and 2014
4		referenced therein.
5	<i>b</i> .	Explain the basis for the 2013 and 2014 MISO market price
6		forecasts referenced therein.
7	с.	Identify and produce any documents supporting the 2013 and 2014
8		MISO market price forecasts referenced therein.
9	d.	Identify when Big Rivers expects marketing all excess power when
10		the market price is greater than marginal generation cost to be an
11		effective mitigation method.
12		i. Explain the basis for such expectation.
13	е.	Identify any forecasted market prices in MISO for 2015, 2016, and
14		any future year beyond 2016, and explain how such prices were
15		incorporated into this application.
16	Resp	onse)
17	a.	Please see Big Rivers' response to PSC 1-57. The forecasted market prices
18		can be found on the prices tab of the production cost model.
19	b.	ACES provides Big Rivers with market price forecasts.
20	c.	There are no supporting documents.
21	d.	Based on the present ACES market price forecasts, Wilson is currently
22		scheduled to re-start in 2019; however it will be available to operate if

Case No. 2012-00535 Response to SC 1-21 Witness: Robert W. Berry Page 1 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	needed to cover other unit outages and to maintain all of its
2	environmental permits.
3	i. ACES market price forecasts provide the basis for this expectation.
4	Any time the market prices are above the all-in cost of generation,
5	selling into the wholesale market would contribute additional
6	revenue to Big Rivers fixed operating cost, thus reducing the
7	revenue requirements necessary as a result of Century's exit.
8	e. Please see above response to SC 1-21(a). The process for 2015, 2016 and
9	any future year beyond 2016 are not incorporated into this application
10	because the forecasted test period includes September 1, 2013 through
11	August 31, 2014 exclusively.
12

Case No. 2012-00535 Response to SC 1-21 Witness: Robert W. Berry Page 2 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25 2013

1	Item 22.	Refer to p. 22, lines 3-18 of the testimony of Robert Berry.
2	<i>a</i> .	Identify the length of time for which Big Rivers expects the
3		Wilson Station to be idled.
4	<i>b</i> .	Identify the cost of maintaining the Wilson Station while it is
5		idled.
6	с.	Identify the variable cost of production savings that Big Rivers
7		expects to achieve through the idling of the Wilson Station.
8	d.	Identify the FDE cost savings that Big Rivers expects to achieve
9		through the idling of the Wilson Station.
10	е.	State whether additional Big Rivers generating units are
11		planned to be or may need to be idled in light of Alcan's
12		announced termination of its retail electric service agreement
13		with Kenergy.
14		e. (i) If so, identify which units and the length of time of such
15		idling.
16		e. (ii) If not, explain why not.
17	f.	State whether Big Rivers has notified or applied for approval
18		from MISO for the idling of the Wilson Station.
19		f. (i) If so, produce any such notification or approval
20		application, and any response from MISO.
21		f. (ii) If not, explain why not.

Case No. 2012-00535 Response to SC 1-22 Witness: Robert W. Berry Page 1 of 3

,

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25 2013

1	g.	State whether Big Rivers has notified or applied for approval
2		from MISO for the idling of any of its other generating units.
3		g. (i) If so:
4		1. Identify the unit or units
5		2. Produce such notification or approval application
6		3. Produce any response received from MISO.
7		g. (ii) If not, explain why not.
8	Respons	se)
9	a.	Please see Big Rivers' response to PSC 2-21(c).
10	b.	Please see response in d. below.
11	c.	There will be no variable cost of production savings to Big Rivers
12		through the idling of Wilson Station. Big Rivers will have lower
13		production variable expenses but will have less revenue from MISO
14		due to less generation.
15	d.	For the 2014 – 2016 timeframe, Big Rivers expects to save
16		in production O&M fixed costs and the second in capital as
17		shown in table below.

Case No. 2012-00535 Response to SC 1-22 Witness: Robert W. Berry Page 3 of 3

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item 23) State whether Big Rivers has evaluated the retirement, rather
2	than idling, of any of its generating units as an option for mitigating the
3	impact of the termination of the Century contract and/or of the decline
4	in off-system sales revenues.
5	a. If so:
6	a. (i) Identify which unit or units were evaluated
7	a. (ii) Explain the results of that evaluation
8	a. (iii) Produce any report or other document regarding
9	that evaluation
10	b. If not, explain why not.
11	c. State whether the recent notice of termination of Alcan's retail
12	electric service agreement with Kenergy has led to the
13	evaluation of the retirement, rather than idling, of any of Big
14	Rivers' generating units.
15	c. (i) If so:
16	1. Identify which unit or units were evaluated
17	2. Explain the results of that evaluation
18	3. Produce any report or other document regarding that
19	evaluation.
20	c. (ii) If not, explain why not.
21	
22	Response) No.

Case No. 2012-00535 Response to SC 1-23 Witness: Robert W. Berry Page 1 of 2

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

a. N/A

1

2

b. Big Rivers has not evaluated the retirement, rather than idling, of any 3 of its generating units as an option for mitigating the impact of the 4 termination of the Century contract and/or the decline in off-system 5 sales. Despite the fact that current wholesale electricity market prices 6 are low, Big Rivers' generating units have significant remaining useful 7 life and Big Rivers' members would be unduly harmed if Big Rivers 8 were to retire assets instead of temporarily idling them. Although Big 9 Rivers' members will continue to incur some costs over the next three 10 years associated with idled units, Big Rivers' members will be able to 11 reap significant benefits from the units in the future, either by selling 12 wholesale power and using the proceeds to reduce member rates or by 13 supporting the Western Kentucky economy by supplying power to 14 industries. 15

c. The Alcan notice of termination has not led to the evaluation of
 retirement of any of Big Rivers generating units.

18 i.

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1	Item	24) Refer to p. 31 line 13 to p. 32 line 5 of the testimony of Robert
2	Berry	<i>V</i> .
3	a.	Identify and produce all production cost model input data that
4		Big Rivers provided to ACES.
5	<i>b</i> .	Identify which financial model ACES used, who is the vendor of the
6		model, and whether the model is a proprietary model that requires
7		a license in order to gain access to the files.
8	с.	Produce, in machine readable format with formulas intact, all of
9		the production cost modeling (including input and output files)
10		and workpapers generated by ACES.
11	d.	Identify and produce all PAR model output data that ACES
12		provided to Big Rivers.
13	е.	Please identify any changes to the input files that may be required
14		to reproduce the modeling.
15		i. If changes are required, please explain why such changes
16		were made.
17	f.	Please identify the assumptions, including any supporting
18		documentation, Big Rivers or its agents used in each base case and
19		sensitivity scenario that you modeled
20	g.	If a license is required to obtain access to any information in this
21		request, please explain how Sierra Club could obtain that license

APPLICATION OF BIG RIVERS ELECTRIC CORPORATION FOR A GENERAL ADJUSTMENT IN RATES CASE NO. 2012-00535

Response to Ben Taylor and Sierra Club's Initial Request for Information dated February 14, 2013

April 25, 2013

1 Item 28. Identify Big Rivers' projected electric energy sales in MWh and

2 projected peak demand in MW for each year of 2013 through 2030. State

3 whether these projections assume the termination of both the Century

4 and Alcan retail electric service agreements. If not, explain how those

5 projections change in light of both terminations.

6

Response) See the file provided in response to AG 1-80. These projections
assume the termination of both Century and Alcan retail electric service
agreements. Note that Big Rivers long term load forecast is for 15 years through
2027.

PUBLIC SERVICE COMMISSION

Mr. Jeff Derouen Executive Director Public Service Commission of Kentucky P.O. Box 615 211 Sower Boulevard Frankfort, KY 40602-0615

In The Matter Of: Application of Big Rivers Electric Corporation For A General Adjustment In Rates - Case No. 2012-00535

Dear Mr. Derouen:

Enclosed for filing are an original and ten (10) copies of (i) Big Rivers Electric Corporation's response to Ben Taylor and Sierra Club's initial request for information; (ii) a petition for confidential treatment; and (iii) a motion for deviation.

I certify that on this date copies of this letter, the response, the petition, and the motion have been served on those parties listed on the attached service list by either Federal Express or hand delivery.

Sincerely,

Tolp

Tyson Kamuf
