*Response.* An exception has been added to the final rule for rides that are controlled by the rider requiring such rides to only provide an accessible route to the ride and maneuvering space in the load and unload areas. The Board plans to gather additional information for making these rides accessible for potential rulemaking in the future. In the interim, designers and operators may use the applicable provisions in ADAAG and this final rule as a guide in providing access.

With respect to the issue of control, the exception is not intended to apply to those rides where patrons may affect some incidental movements of the ride, but otherwise have no control.

#### *Exception 3*

*Comment.* The proposed rule did not distinguish between those rides designed for adults and those designed

for young children, also known as "kiddie rides." Many amusement park operators and ride manufacturers commented that "kiddie rides" should be exempt from compliance with the provisions of 15.1.1. Most indicated that size restrictions will prohibit compliance with several of the provisions.

*Response.* Because of their size restrictions, an exception has been added to the final rule for "kiddie" rides requiring such rides to only provide an accessible route to and maneuvering space in the load and unload area. The requirement for an accessible route will provide access for adults and family members assisting children on and off these rides. An amusement industry definition for "kiddie rides" includes rides designed for children up to the age of 12. The Board does not support an exemption for rides designed for children up to age 12. Rather, the exception is limited to those rides designed "primarily" for children, where children are assisted on and off the ride by an adult. The Board intends that this exception be limited to those rides designed for children and not for the occasional adult user.

#### *Exception 4*

*Comment.* Some commenters interpreted the proposed rule to apply to amusement rides without seats.

*Response.* Section 15.1 of the proposed rule limited the application of this section to rides "containing fixed seats". Exception 4 is added in the final rule to further clarify that 15.1 does not apply to amusement rides without ride seats. Amusement rides without seats are required to be served by an accessible route and connect to accessible load and unload areas.

#### *Section 15.1.2 Alterations to Amusement Rides*

Section 15.1 applies to amusement rides that are altered. This section clarifies that a modification to an existing amusement ride is an alteration if one or more of the following conditions apply: (1) The amusement ride's structural or operation characteristics are changed to the extent that the ride's performance differs from that specified by the manufacturer or the original design criteria; or (2) the load and unload area of the amusement ride is newly designed and constructed.

*Comment.* The majority of commenters questioned how the proposed rule applied to existing amusement rides. Many commenters believed that the guidelines require that all existing amusement rides be accessible. Others inquired about the

requirements for existing rides that are modified and the type of modification that would trigger the alteration provisions.

*Response.* The final rule addresses alterations to existing amusement rides. See the discussion at the beginning of this preamble for further information on ADA obligations for existing amusement rides.

Where an existing amusement ride is modified in a way that does not change the ride's structural or operational characteristics to the extent that the ride's performance differs from that specified by the manufacturer's or original design criteria, the amusement ride is not required to comply with 15.1.1. Routine maintenance, painting, and changing of story boards are examples of activities that do not constitute an alteration.

As with other elements or facilities subject to the alterations provisions in ADAAG, "technical infeasibility" applies to alterations of amusement rides. In this case, compliance with the technical provisions is required except where the nature of the existing ride makes it virtually impossible to comply fully. In these circumstances, the alteration should provide the maximum accessibility feasible.

*Comment.* Commenters requested clarification regarding how the guidelines apply where amusement rides are moved.

*Response.* In response to this question, a provision has been added that requires a ride to be accessible when a new load and unload area is designed and constructed for the ride. This provision applies where a ride is moved either within a park or to another park and a new load and unload area is designed and constructed. The ride must comply with 15.1.1. Operators have a choice of providing either a wheelchair space, ride a seat designed for transfer, or a transfer device. In most cases with an existing amusement ride, providing a transfer device may be the most appropriate. This option does not require modification to the ride. Where an amusement ride is moved and the load and unload area is not modified, the provisions of 15.1.1 do not apply. In this case, the on-going obligations of "readily achievable barrier removal" or "program accessibility" will apply.

#### *Section 15.1.3 Number Required*

This section requires each amusement ride to provide at least one wheelchair space complying with 15.1.7, or at least one amusement ride seat designed for transfer complying with 15.1.8, or at least one transfer device complying with 15.1.9.

*Comment.* The proposed rule required one wheelchair space per 100 fixed seats and one transfer seat per 100 fixed seats to be provided on each amusement ride. An exception permitted two transfer seats in lieu of a wheelchair space where a wheelchair space is not operationally or structurally feasible. Significant comment was received on this provision during the comment period. Amusement park operators stated that the number of accessible spaces (both wheelchair and transfer seats) was too high. Several amusement park operators cited safety concerns with respect to evacuation where more than one wheelchair user may be on a ride at one time. Others expressed concern about lengthening the load and unload time. Groups representing persons with disabilities were concerned that the number of wheelchair spaces and transfer seats in the proposed rule was too low. The Eastern Paralyzed Veterans Association (EPVA) wanted the number doubled from the proposed rule, potentially requiring two wheelchair spaces and two transfer seats per ride.

*Response.* The final rule requires that each ride provide: (1) A wheelchair space, or (2) a ride seat designed for transfer, or (3) a device to facilitate the transfer of a person in a wheelchair from the load or unload area to a ride seat. This represents a decrease in the number of accessible spaces from the proposed rule and is no longer dependent on the number of seats per ride. Designers and operators have the choice of deciding which of the three types of access is appropriate for a given ride. Where a manufactured ride does not permit space for a wheelchair, for example, a ride seat designed for transfer or a transfer device may be provided to help an individual transfer into the ride seat.

The Board is aware of amusement rides in certain parks that currently exceed this minimum and provide more than one wheelchair space on a given ride. In these cases, more persons with disabilities and their families are able to ride at the same time. Amusement park operators are encouraged to exceed the minimum with their new rides.

#### Section 15.1.4 Accessible Route

This section requires that, when in the load and unload position, amusement rides with wheelchair spaces, or ride seats designed for transfer, or transfer devices, must be served by an accessible route complying with ADAAG 4.3. Any part of an accessible route serving amusement rides with a slope greater than 1:20 is considered a ramp and must comply

with ADAAG 4.8. The accessible route is required only to the wheelchair space or transfer loading station, and not to all stations. This route can deviate from the main route in order to access the particular station designated.

Three new exceptions to 15.1.4 are provided in the final rule. Exception 1 exempts ramps from the maximum slope specified in ADAAG 4.8.2, where compliance with 4.8.2 is structurally or operationally infeasible, provided that the slope of the ramp may not exceed 1:8. Exception 2 exempts the requirements for handrails on the accessible route where compliance is structurally or operationally infeasible. Exception 3 permits that use of limited-use/limited-application elevators and platform lifts complying with ADAAG 4.11 to be part of an accessible route serving the load and unload area.

*Comment.* The proposed rule required an accessible route to connect the portion of the load and unload area serving each accessible amusement ride and to provide a maneuvering space with a slope not greater than 1:48. Commenters questioned whether the 1:48 slope applied to the accessible route on the ride and the appropriateness of this requirement for those rides where a transfer seat was provided.

*Response.* The requirements for an accessible route are maintained in the final rule, but are modified to clarify that at least one accessible route requirement applies when the ride is in the load and unload position. The requirement for a maneuvering space is moved to 15.1.4, which addresses the load and unload areas. The provision also clarifies that where the running slope serving the amusement ride or transfer devices is greater than 1:20, the provisions of ADAAG 4.8 apply.

*Comment.* Operators expressed concerns with the requirements of ADAAG 4.8 with respect to the maximum slope (1:12) and the maximum rise (30 inches) for the accessible route. They described rides where space limitations will prohibit long ramps and where fundamental changes to amusement rides would be necessary to comply with ADAAG 4.8.2.

*Response.* An exception is added in the final rule that exempts the accessible route serving accessible rides from the maximum slope specified in ADAAG 4.8.2, provided that the slope may not exceed 1:8. The exemption only applies where compliance with ADAAG 4.8.2 is "structurally or operationally" infeasible. The exception for structural or operational limitations is limited to that portion of the accessible route connecting the load and unload areas

with the amusement ride. There is no exception for other portions of the accessible route, such as the queue line leading to the load and unload areas.

*Comment.* Ride operators and designers also stated that the requirement for handrails was not practical on the portion of the accessible route connecting the load and unload areas and the ride. They again cited space limitations especially where ramps are integrated into the ride and folded out of the way when the ride is in use.

*Response.* An exception from the requirement for handrails is added in the final rule. Similar to exception 2, this exception is limited to circumstances where compliance with the handrail requirement is structurally or operationally infeasible.

*Comment.* The proposed rule did not include a provision permitting the use of a limited-use/limited-application elevator or a platform lift as a part of the accessible route in providing access to load and unload areas. The American Institute of Architects (AIA) and others in the amusement industry recommended their use in connecting these areas, especially in connecting elevated load and unload areas and those that cross tracks.

*Response.* An exception is provided in the final rule permitting the use of limited-use/limited-application elevators and platform lifts complying with ADAAG 4.11. The Board has included this option in the final rule to address some of the unique designs and elevated loading areas used within an amusement park. Where platform lifts are used, they must comply with ADAAG 4.11. Future revisions to ADAAG will include technical provisions for limited-use/limited-application elevators. At that time, appropriate provisions will be referenced for these elevators. Currently available design and safety standards should be applied in the interim.

*Comment.* Some commenters questioned whether moving turnstiles and walkways can serve as part of an accessible route connecting amusement rides.

*Response.* The Board has not specifically addressed moving turnstiles and walkways, since they are always capable of stopping or slowing to accommodate guests needing additional time. At this time there is not sufficient information to suggest a consistent safe speed for use for all persons with disabilities. Some individuals will be able to maneuver within the speed and time provided on the moving walkway or turnstile, while others will need additional time. Operators may need to

adjust the speed accordingly to reasonably accommodate guests with disabilities.

#### *Section 15.1.5 Load and Unload Areas*

This section requires load and unload areas serving amusement rides required to comply with 15.1 to provide a maneuvering space complying with ADAAG 4.2.3. The maneuvering space must have a slope not steeper than 1:48. The maneuvering space is permitted to overlap the accessible route and the required clear floor spaces.

No substantive comment was received and no changes have been made for the final rule.

#### *Section 15.1.6 Signage*

This section requires signage to be provided at the entrance of the queue or waiting line for each amusement ride to identify the type of access provided (e.g., wheelchair access or transfer access). Where an accessible unload area also serves as the accessible load area, signage must be provided at the entrance to the queue or waiting line indicating the location of the accessible load and unload area. This is important to avoid unnecessary backtracking when patrons begin the process of waiting in line for a particular ride. No substantive comments were received and no changes have been made to this provision in the final rule.

#### *Section 15.1.7 Amusement Rides With Wheelchair Spaces*

This section contains technical provisions for amusement rides with wheelchair spaces.

*Comment.* Several amusement ride designers and manufacturers raised concerns about technical provisions for wheelchair spaces on amusement rides. Most commenters believed that the space required was too large and boxy, and would significantly limit the number of amusement rides that could incorporate such a space. Some recommended that knee and toe clearances be incorporated into the space. In general, designers and operators requested more flexibility with wheelchair spaces on amusement rides.

*Response.* The Board has significantly modified the requirements for wheelchair spaces on amusement rides. The final rule includes changes which address the commenters concerns, while still requiring a minimum space that would serve most mobility devices on an amusement ride. The Board recommends that where possible, designers and manufacturers exceed the minimum space. Providing additional space will greatly enhance the ease in

loading and unloading and accommodate a greater variety of mobility devices.

#### *Section 15.1.7.1 Floor and Ground Surface*

This section contains technical provisions for floor or ground surface of wheelchair spaces.

*Comment.* The proposed rule required wheelchair spaces to comply with several provisions of ADAAG 4.5 (4.5.1, 4.5.3, 4.5.4). Commenters expressed some confusion over these references and sought clarification.

*Response.* Rather than referencing ADAAG 4.5, the final rule incorporates these provisions into 15.1.7.1 for clarity. Other editorial changes are also made within this section.

##### *Section 15.1.7.1.1 Slope*

This section requires the floor or ground surface of wheelchair spaces to have a maximum slope of 1:48 when in the load and unload position and to be firm and stable.

*Comment.* Commenters questioned the appropriateness of requiring the clear space to be level when the amusement ride is in motion.

*Response.* The section is modified to clarify that the maximum 1:48 slope is only required when the amusement ride is in the load and unload position.

##### *Section 15.1.7.1.2 Gaps*

This section requires floors of amusement rides with wheelchair spaces and floors of load and unload areas to be coordinated so that when the amusement rides are at rest in the load and unload position, the vertical difference between the floors must be within plus or minus  $\frac{5}{8}$  inches and the horizontal gap should be no greater than 3 inches under normal passenger load conditions. An exception permits that where it is not operationally or structurally feasible to meet the horizontal or vertical difference requirements, ramps, bridge plates, or similar devices complying with the applicable requirements of 36 CFR 1192.83(c) (the Board's vehicle accessibility guidelines) must be provided.

*Comment.* No substantive comment was received on this section. Several representatives from the amusement industry, however, recommended that the Board reference an ASTM Standard Practice for the Design and Manufacture of Amusement Rides and Devices where ramps, bridge plates, lifts, or similar devices are used.

*Response.* The Board carefully examined the suggested ASTM Standard Practice and determined that it was

designed as a safety standard rather than a standard that provides guidance on the minimum access requirements for ramps, bridge plates, lifts, and similar devices. Operators and manufacturers are not precluded from also following the standards in the ASTM Standard Practice for the operation of these elements. The applicable requirements of 36 CFR 1192.83(c) (ADA Accessibility Guidelines for Transportation Vehicles—Light Rail Vehicles and Systems—Mobility Aid Accessibility) are available on the Board's Web site at [www.access-board.gov/transit/html/vguide.htm#LRVM](http://www.access-board.gov/transit/html/vguide.htm#LRVM).

#### *Section 15.1.7.2 Clearances*

This section requires clearances for wheelchair spaces to comply with 15.1.7.2. Three new exceptions are added. Exception 1 permits securement devices, where provided, to overlap the required clearances of the wheelchair space. Exception 2 permits the wheelchair space to be mechanically or manually repositioned. Exception 3 permits departure from the requirements of ADAAG 4.4.2 (Head Room) for the wheelchair space.

*Comment.* The proposed rule did not specifically address securement devices in wheelchair spaces. Commenters questioned whether securement devices could be located within the minimum clear space requirements for wheelchair spaces on amusement rides. They noted that while the proposed rule did not specifically address or require these devices, many operators have provided them where wheelchair spaces are provided on amusement rides.

*Response.* The final rule adds an exception to 15.1.7.2 to permit securement devices to overlap required clearances for wheelchair spaces on amusement rides. However, the final rule does not require securement devices. The decision about whether securement devices are needed is left up to the designer or manufacturer. Where provided, these devices may overlap the required clearances for wheelchair spaces.

*Comment.* As previously discussed, the Board received a significant number of comments from representatives in the amusement industry on the need for more flexibility. Several operators of large parks demonstrated ways that wheelchair spaces were provided on rides through the use of a turntable. This permits the space to be orientated for a forward approach and later turned to be in line with the direction of the motion of the amusement ride. Commenters did not consider repositioning to be an option under the proposed rule.

*Response.* Exception 2 has been added to the final rule and permits the wheelchair space on an amusement ride to be either manually or mechanically repositioned.

*Comment.* A few amusement park designers raised concern about the head clearance requirements of ADAAG 4.4 (Protruding Objects) for the wheelchair space located on an amusement ride. Amusement rides are often designed to move through confined spaces in order to enhance the amusement experience. Since most of these rides are designed for seated patrons, designers requested exemption from this requirement.

*Response.* Exception 3 is added in the final rule and exempts wheelchair spaces on rides from ADAAG 4.4.2 (Head Room). This exception applies to circulation space and clear space requirements on the ride. It does not apply to circulation areas and accessible routes in the queue line or the load and unload areas.

#### *Section 15.1.7.2.1 Width and Length*

This section requires wheelchair spaces to have a width of 30 inches minimum and a length of 48 inches minimum measured 9 inches minimum above the ground or floor surface.

*Comment.* The proposed rule required the wheelchair space to be a minimum of 36 inches in width. This width was based on the minimum 30 inch width needed for a stationary wheelchair with the additional 6 inches necessary for repositioning in confined spaces which allows space for the front casters of a wheelchair to turn and move when backing up. Designers expressed significant concern over the 36 minimum width and questioned why it was necessary where the space is reached in a forward direction. They further cited designs where the space is manually or mechanically repositioned and therefore should not require further maneuvering. Some commenters also suggested that the depth of the clear space could be 48 inches in all cases.

*Response.* The minimum width of the wheelchair space is reduced to 30 inches in the final rule. While the Board has decreased the minimum width, it recommends that designers and manufacturers exceed the minimum where possible to allow for increased maneuvering space.

#### *Section 15.1.7.2.2 Wheelchair Spaces—Side Entry*

This section requires that where the wheelchair space can be entered only from the side, the ride must be designed to permit sufficient maneuvering space for individuals using a wheelchair or

mobility device to enter and exit the ride.

*Comment.* A few commenters questioned what the minimum space requirements would be for a ride entered from the side. They questioned whether a 32 inch side opening leading to a 30 inch wide by 48 inch long space would be sufficient.

*Response.* Section 15.1.7.2.2 is added to address rides with side entries. A center opening of 32 inches combined with a minimum space of 30 inches wide and 48 inches long is not adequate space for maneuvering. Designers must consider the position of the opening in relation to the minimum space. In some cases, additional clear space and larger openings will be necessary to allow for maneuvering a wheelchair on the ride. An appendix note is included to provide further guidance.

#### *Section 15.1.7.2.3 Protrusions in Wheelchair Space*

This section permits protrusions in the wheelchair spaces on amusement rides. Objects are permitted to protrude a distance of 6 inches maximum along the front of the wheelchair space where located 9 inches minimum and 27 inches maximum above the wheelchair space. Objects are also permitted to protrude a distance of 25 inches maximum along the front of the wheelchair space where located more than 27 inches above the wheelchair space.

*Comment.* As previously noted, amusement ride designers and operators commented that the wheelchair space clearances in the proposed rule were too restrictive and did not permit knee and toe clearances. They suggested that the clearances could be reduced without compromising the minimum space requirements.

*Response.* The final rule permits protrusions in the wheelchair space on amusement rides.

#### *Section 15.1.7.3 Openings*

This section requires that where openings are provided to access wheelchair spaces on amusement rides, the entry must provide a 32 inch minimum clear opening.

*Comment.* The proposed rule did not specify a minimum opening space where wheelchair spaces are provided on amusement rides. Commenters requested guidance on this dimension.

*Response.* A provision is added in the final rule to address the minimum width of openings where wheelchair spaces are provided on an amusement ride. This is consistent with minimum width requirements for doors and other

passageways that are part of an accessible route.

#### *Section 15.1.7.4 Approach*

This section requires one side of the wheelchair space to adjoin an accessible route.

No substantive comment was received on this provision.

#### *Section 15.1.7.5 Companion Seats*

This section requires that where the interior of an amusement ride is greater than 53 inches in width, seating is provided for more than one rider, and the wheelchair is not required to be centered within the amusement ride, a companion seat must be provided for each wheelchair space.

*Comment.* The proposed rule required companion seating where seating for more than one rider is provided. Ride manufacturers commented that providing companion seating may not be possible on rides where the center of gravity is critical to its operation. They noted that providing space for an individual seated in a wheelchair and a seated companion may increase and change the weight distribution on a ride. They supported a provision with limits that are linked to the minimum width of the ride, whether or not seating is provided for more than one rider, and whether the wheelchair space is centered on the ride.

*Response.* This section is modified in the final rule to address the concerns raised. Consistent with the proposed rule, companion seating is required only where seating is provided for more than one rider. Additionally, companion seating is required only where the interior of an amusement ride is greater than 53 inches in width and the wheelchair is not required to be centered within the amusement ride.

#### *Section 15.1.7.5.1 Shoulder-to-Shoulder Seating*

This section requires that where an amusement ride provides shoulder-to-shoulder seating, companion seats must be shoulder-to-shoulder with the adjacent wheelchair space.

*Comment.* Commenters suggested that in some circumstances, shoulder-to-shoulder seating may not be possible. They cited examples of water rides where the rider's center of gravity is critical. Adding two riders side by side can alter the balance of the ride.

*Response.* An exception is added in the final rule that shoulder-to-shoulder companion seating is required only to the maximum extent feasible, where compliance is not operationally or structurally feasible.

### Section 15.1.8 Amusement Ride Seats Designed for Transfer

This section requires that amusement rides with ride seats designed for transfer must comply with 15.1.8 when positioned for loading and unloading.

*Comment.* Significant comment was received on the technical provisions addressing transfer seats. Some interpreted the proposed rule to require a "special seat" in addition to other ride seats. Others believed that the technical provisions did not provide sufficient flexibility, especially given the diversity of rides and ride seats.

*Response.* The final rule requires that each ride provide: (1) A wheelchair space, or (2) an amusement ride seat designed for transfer, or (3) a system to facilitate the transfer of a person in a wheelchair from the load or unload area to a ride seat. Where ride seats are designed for transfer, this section applies. For the most part, the technical provisions for space and other features are applied to both the ride seat and the transfer device since both elements are designed for an individual to transfer from their wheelchair or mobility device to an element. A ride seat designed for transfer is usually a seat that is a permanent part of the ride itself.

#### Section 15.1.8.1 Clear Floor Space

This section requires clear floor space complying with ADAAG 4.2.4 to be provided in the load and unload area adjacent to amusement ride seats designed for transfer.

*Comment.* The proposed rule required the clear floor space to comply with ADAAG 4.2.4 and be positioned with the longer dimension parallel to the unobstructed side of the transfer seat. The space was also required to be located within 3 inches maximum of the transfer seat. Commenters supported the basic clear floor space requirement of 30 inches by 48 inches. Several commenters however, believed that the requirements for the orientation of the clear space were too stringent for two reasons. First, the orientation required in the proposed rule was potentially limited to a side transfer. Many individuals choose to transfer using a diagonal or front approach. Second, they were concerned about the variety of amusement rides and load and unload areas. They recommended that the orientation of the clear space with respect to its location to the ride seat be left up to the designer.

*Response.* The final rule requires a 30 inch wide by 48 inch deep clear space to be adjacent to the ride seat designed for transfer. The position of the clear space is not specified in the final rule.

Designers will decide its location based on what is best suited for transfer on a particular ride.

#### Section 15.1.8.2 Transfer Height

This section requires the height of ride transfer seats to be located 14 inches minimum to 24 inches maximum measured above the load and unload surface.

*Comment.* The proposed rule required the transfer seat to be between 17 and 19 inches based on other elements within ADAAG where individuals using wheelchairs and other mobility devices are expected to transfer. Commenters requested the range to be greater.

*Response.* The final rule provides a greater range in the height of the ride seat designed for transfer. Providing a greater range in this height should reduce reliance on transfer devices and have the effect of decreasing the number of transfers to get from one's wheelchair or mobility device to a ride seat. The Board recognizes that amusement rides have unique designs. The increase in the transfer height range is limited to amusement rides because of their unique designs. The goal is to provide designs that afford the least amount of transfers for the least amount of distance. The Board recognizes that providing a greater range in the transfer height may make transfers more difficult for some people with disabilities. Based on this concern, and the fact that the transfer height for amusement rides is new, the Board will closely monitor how well the range provides access to amusement rides. Where possible, designers are encouraged to locate the transfer seat between 17 inches and 19 inches above the load and unload surface.

#### Section 15.1.8.3 Transfer Entry

This section requires that where openings are provided to transfer to amusement ride seats, the space must be designed to provide clearance for transfer from a wheelchair or other mobility device to the amusement ride seat.

*Comment.* The proposed rule required the transfer entry on the amusement ride to be a minimum of 36 inches wide. The entry was also required to be positioned parallel and adjacent to the longer dimension of the clear floor space. Amusement ride designers and manufacturers commented that the 36 inch width was excessive and believed that few rides, if any, could comply with this dimension. They further explained that openings are generally kept to a minimum since the sides of the ride often serve as a part of the restraint or securement system for the ride.

*Response.* Due to the large variance of amusement rides and the potential interference with the securement system, the final rule requires a space to be designed to provide clearance for transfer from a wheelchair or mobility device to the amusement ride seat. Specific dimensions for the opening are not provided in the final rule.

#### Section 15.1.8.4 Wheelchair Storage Space

This section requires wheelchair storage spaces complying with ADAAG 4.2.4 to be provided in or adjacent to unload areas for each required amusement ride seat designed for transfer. The space must not overlap any required means of egress or accessible route.

*Comment.* Some commenters interpreted the provision to require some type of constructed storage space.

*Response.* Clear space is needed in the load and unload areas for individuals to leave their wheelchairs when they transfer onto amusement rides. ADAAG 4.2.4 specifies a minimum 30 inch by 48 inch space for a stationary wheelchair. For safety reasons, the space must not overlap any required means of egress or accessible route. This provision does not require a constructed element for storage, only a space. Most current designs used for load and unload areas will include sufficient space to comply with this provision.

#### Section 15.1.9 Transfer Devices for Use With Amusement Rides

This section requires that transfer devices for use with amusement rides must comply with 15.1.9 when positioned for loading and unloading.

*Comment.* As previously discussed, significant comment was received on the technical provisions addressing transfer seats. Some interpreted the proposed rule to require a "special seat" in addition to other ride seats. Others believed that the technical provisions did not provide sufficient flexibility, especially given the diversity of rides and ride seats.

*Response.* The final rule requires that each ride provide: (1) A wheelchair space, or (2) an amusement ride seat designed for transfer, or (3) a system to facilitate transfer of a person in a wheelchair from the load or unload area to a ride seat. This section applies where transfer devices are used to provide access to an amusement ride seat. A transfer device can be provided as an integral part of the ride, or as a permanent or temporary part of the facility. Significant flexibility is provided for ride designers or park

operators to develop these transfer devices. Transfer devices may include lifts, ramps, transfer platforms and steps, or other similar systems and do not require modification to manufactured rides. Information is provided in the appendix to assist operators in selecting from different types of transfer devices.

#### Section 15.1.9.1 Clear Floor Space

This section requires clear floor space complying with ADAAG 4.2.4 to be provided in the load and unload area adjacent to transfer devices.

Consistent with the clear space requirement for ride seats designed for transfer, the position of the clear space adjacent to the transfer devices is not specified in the final rule. Designers will decide its location based on what is best suited for transfer on a particular transfer device.

#### Section 15.1.9.2 Transfer Height

This section requires the height of transfer device seats to be located 14 inches minimum to 24 inches maximum measured above the load and unload surface.

The Board has applied the same range established for amusement ride seats designed for transfer to transfer devices. As previously stated, the goal is to provide designs that afford the least amount of transfers for the least amount of distance.

Where possible, designers are encouraged to locate the transfer device between 17 inches and 19 inches above the load and unload surface. Further guidance related to maximum heights for vertical movements when transferring within a transfer device is provided in the appendix.

#### Section 15.1.9.3 Wheelchair Storage Space

This section requires wheelchair storage spaces complying with ADAAG 4.2.4 to be provided in or adjacent to unload areas for each required transfer device and must not overlap any required means of egress or accessible route.

*Comment.* Some commenters interpreted the provision to require some type of constructed storage space.

*Response.* Clear space is needed in the load and unload areas for individuals to leave their wheelchairs when they transfer onto transfer devices. ADAAG 4.2.4 specifies a minimum 30 inch by 48 inch space for a stationary wheelchair. For safety reasons, the space must not overlap any required means of egress or accessible route. This provision does not require a constructed element for storage, only a

space. Most current designs used for load and unload areas will include sufficient space to comply with this provision.

#### Other Issues

##### Accessible Routes in Temporary Places of Amusement

*Comment.* The proposed rule requested comment on providing accessible routes on sites used for fairs, carnivals, and other temporary places of amusement. Usually a site such as a field or parking lot may be used for a short period of time for temporary places of amusement.

*Response.* The Board received few comments on this issue. The final rule does not include any provisions for accessible routes in temporary places of amusement. The Department of Justice has the authority to address this issue. Given the diversity of sites and complexity of agreements involved when using sites on a temporary basis, one set of guidelines is not practical. State and local government entities covered by title II may not, in determining the site or location of a facility, make selections that have the effect of excluding individuals with disabilities (28 CFR 35.130(b)(4)). Where a site is altered by installing some type of surface, that surface must be stable, firm, and slip resistant and meet other requirements in ADAAG 4.3 for the accessible route. Temporary structures are covered by ADAAG 4.1.1(4) and are required to comply with ADAAG. As with other alterations, "technical infeasibility" permits departure from technical provisions where existing physical or site constraints prohibit modification or addition of elements, spaces, or features.

#### Section 15.2 Boating Facilities

##### Section 3.5 Definitions

This section defines five terms for boating facilities.

A "boat launch ramp" is a sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.

A "boat slip" is that portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.

A "boarding pier" is a portion of a pier where a boat is temporarily secured for purposes of embarking and disembarking.

A "gangway" is a variable-sloped pedestrian walkway linking a fixed structure or land with a floating structure. This definition does not apply to gangways which connect to vessels.

A "transition plate" is a sloping pedestrian walking surface located at the end(s) of a gangway.

*Comment.* The proposed rule included definitions for boat launch ramp, boat slip, design high point, and gangway. Commenters recommended rewording these definitions. Commenters also recommended that additional definitions be added, such as handrail, landings, pier, main pier, finger pier, boarding pier, fixed and floating piers, mooring space, transient slips, and transition plate.

*Response.* The final rule provides five definitions. Definitions for boat launch ramp, boat slip, and gangway, have been retained but have been changed to improve clarity. Definitions for boarding pier and transition plate have been added, and the definition for design high point has been removed. Additional terms suggested by commenters were not added since they were not used in the technical or scoping provisions of the boating section.

##### Section 15.2.1 General

This section requires newly designed or newly constructed and altered boating facilities to comply with 15.2.

*Comment.* Some commenters did not want the rule to apply to each boating facility. They noted that designers and facility managers needed flexibility to provide reasonable accommodations in an environment which may contain extreme physical conditions. Several commenters requested that where two or more boating facilities are located within 10 miles of each other, only one facility should be accessible. Other commenters assumed that all existing facilities would have to immediately conform to the final rule.

*Response.* These guidelines apply to each newly designed or newly constructed boating facilities. Altered facilities must conform to the guidelines to the degree required by ADAAG 4.1.6. Where an existing facility is not being altered, the guidelines do not require that alterations be performed.

*Comment.* Commenters requested clarification on the term "recreational boating facility."

*Response.* This section primarily applies to piers and docks typically found at marinas where recreational boats are moored for embarking and disembarking occupants, but will apply in other non-marina settings. Where a vessel is primarily used for recreation, generally piers and docks designed and constructed to provide mooring and other services for such vessels would be covered by this section. Recreational boats range in size from small canoes to

large sailboats and power boats. The final rule is not intended to cover piers used solely by ferries or other commercial vessels, such as freighters, ocean supply vessels, and commercial fishing vessels.

Boating facilities covered by this final rule vary in size. Some contain as few as one boat slip (for example, a small campground with a short non-demarcated pier) and others are large enough to contain several thousand boat slips (for example, a large marina with many boat basins). Some have piers and boat launch ramps, while others only have piers. A boating facility may only contain a single launch ramp with no boarding pier or may contain multiple launch ramps with multiple boarding piers. In some cases, a site (such as a State park with a large lake) may contain more than one boating facility. In other cases, several boating facilities may be located in the same waterfront area, each operated by different operators.

#### Section 15.2.2 Accessible Route

This section requires that accessible routes, including gangways that are part of an accessible route, comply with ADAAG 4.3. ADAAG 4.1.2(2) requires that at least one accessible route connect accessible buildings, facilities, elements, and spaces on the same site. Therefore, an accessible route must connect accessible boat slips with other accessible elements on the same site. Eight exceptions, discussed below, have been added which modify the accessible route requirements as they relate to connecting floating piers.

No exceptions have been provided for accessing fixed piers. Therefore, accessible routes serving fixed piers must meet all the requirements of ADAAG 4.3.

#### Exception 1 Alterations to Existing Gangways

Exception 1 permits the replacement and alteration of existing gangways or series of gangways without triggering an increase in the length of the gangways, unless required by ADAAG 4.1.6(2).

*Comment.* Commenters noted that for maintenance or safety reasons, gangways are sometimes replaced or altered without any other changes being made to the floating piers and land based features located at the ends of the gangways. Under ADAAG's requirements for alterations, a replaced gangway would have to meet the requirements of section 15.2.2. The primary difficulty typically involves meeting slope requirements, rather than meeting handrail and transition plate requirements. In many cases,

compliance with section 15.2.2 would require longer gangways to be installed. To install a longer gangway, changes to adjacent structures may be needed and such changes could also lead to reductions in the number of boat slips available. Available water sheet may also prevent lengthening of the gangways in an existing boating facility.

*Response.* The final rule includes an exception that does not require an increase in the length of the gangway, where gangways are replaced or altered. However, under ADAAG 4.1.6(2), alterations to areas containing primary functions may require existing gangways and adjacent structures to be brought into conformance with section 15.2.2. ADAAG 4.1.6(2) provides that, when an area containing a primary function is altered, an accessible path of travel must be provided to the altered area unless the cost and scope of the alterations to provide an accessible path of travel is disproportionate to the overall alterations as determined under criteria established by the Department of Justice. The Department of Justice regulations for title III of the ADA deem alterations to provide an accessible path of travel to be disproportionate when the cost exceeds 20 percent of the cost of the overall alterations.<sup>6</sup>

#### Exceptions 2 and 3 Maximum Gangway Rise and Slope

Exception 2 permits gangways or series of gangways to exceed the maximum rise specified in ADAAG 4.8.2. Exception 3 permits gangways to exceed the maximum slope specified in ADAAG 4.8.2, where the total length of the gangways serving as part of a required accessible route is at least 80 feet.

*Comment.* One of the most difficult issues relating to accessibility in floating boating facilities is gangway slopes. The proposed rule permitted gangway slopes to exceed a maximum slope of 1:12 at such times as when the distance between the design high point and water level exceeded a specific value depending on the size of the pier. In addition, the proposed rule exempted gangways from the maximum rise in ADAAG 4.8.2.

Over 60 organizations and individuals responded to the above proposals. Most indicated that they did not support the provisions. The comments raised concerns about how to calculate the pier square footage and what was considered a "pier." Some asked whether levees, boardwalks, or retaining walls are fixed piers and how to measure the square

footage. Others asked about private operators using floating piers and leasing space at a city pier. They questioned whether the square footage of the city pier is included in the calculations for determining access to the privately owned floating pier. One commenter noted that facility size determinations based on square footage may tend to drive entities to reduce pier widths which could compromise safety and stability.

A few commenters questioned how the design high point was selected. They questioned whether this point was the 100 year flood line, mean high tide, extreme high tide, ordinary high water, or high pool water line. One commenter noted that what is a safe and practical upper limit is not constant and easily determined.

Some commenters were concerned that facilities located where water level fluctuations are over 40 feet, would end up with no access or only limited access. A number of commenters suggested that a maximum gangway slope be established for most conditions, if not all conditions. Recommended slope maximums ranged from 5 percent to 15 percent.

At least 10 commenters noted that the requirements should ideally be site specific because of the varying logistical problems and differing geographic conditions at locations where water level fluctuations range from a few inches to over 100 feet. These commenters said that the table in the proposed rule would create hardships for existing facilities where space limitations are present, by requiring reductions in boat slip counts and by discouraging operators from upgrading their facilities. A number of commenters recommended that accessible gangways only be required where they serve 100 or more boat slips.

Using recommendations made by a number of commenters and combined with an effort to reduce the complexity of the final rule, the Board published a summary of a draft final rule for comment. In this draft, the Board indicated that the slope of a gangway would be permitted to exceed the maximum slope of 1:12 where the linear feet of mooring space along the perimeter of the piers at a facility was less than 1,000 feet (approximately 20–30 slips) and the water fluctuation was more than one foot. The provision, which was a general exception from the maximum slope requirement, was intended to provide regulatory relief for smaller boating facilities where an extensive gangway system may be cost prohibitive. Linear feet of mooring space was used instead of the square footage

<sup>6</sup> See 28 CFR 36.403(f)(1) (<http://www.usdoj.gov/crt/ada/reg3a.html>).

of a facility to more effectively measure the size of usable space where boats can dock rather than other spaces at a boating facility.

The draft final rule also required that where the linear feet of mooring spaces along the perimeter of the piers at a facility was less than 3,000 feet (approximately 50–70 slips) and the water fluctuation was more than 5 feet, the maximum gangway slope would be permitted to be 1:8 maximum. This exception allowed for a steeper slope than generally provided in ADAAG.

Lastly, the draft final rule stated that where the water fluctuation was more than 10 feet, gangways would be permitted to exceed the maximum slope of 1:12. Providing complying gangway slopes where the water fluctuation exceeds 10 feet requires extensive gangway systems and supporting facilities. It was noted in the draft final rule that although the gangway slope was permitted to be any slope, the gangway was not allowed to consist of stairs, since stairs are not permitted to be part of an accessible route.

During two public information meetings and from written comment received on the summary of the draft final rule, commenters generally supported simplifying the rule. Some expressed concerns about allowing a 1:8 slope on gangways, and others objected to using linear feet to determine the size of smaller facilities. A few commenters noted that the maximum feasible length of a gangway is between 60 and 70 feet. These commenters indicated that providing longer gangways, or providing two or more shorter gangways as part of a gangway and ramp system, dramatically increased the costs, complexity, and maintenance of the structure. Some commenters pointed out that because gangways often depart from a landside connection which is positioned at least 3 to 4 feet above high water, a 120-foot gangway provided to handle a 10-foot water level change actually needs to be at least 156 to 168 feet long (or a series of gangways and ramps with the same aggregate length).

*Response.* It is recognized that many factors which vary throughout the country add to the complications of providing larger gangway and ramp systems to handle greater changes in water fluctuation and elevation. Factors include water level changes, distance of gangway departure points above high water marks, available water sheet to construct within, location of shipping channels into which piers and gangways cannot project, wind load on floating structures as they get bigger, types of mooring systems, dead and live loads of gangways and the size of floating

facilities to support them, currents, boat wakes, and the ability to remove floating structures when bodies of water freeze over. In the proposed rule, the Board attempted to define the level of access based on the size of a facility (*i.e.*, pier square footage). Comments noted that many other factors besides facility size, play a role in determining what is feasible. Because factors vary throughout the country and could vary between adjacent sites and adjacent facilities, selecting one factor or a list of factors to measure for determining appropriate gangway slope is not feasible.

In an effort to provide a simplified rule and establish a starting point for determining gangway access, the final rule focuses on a maximum feasible gangway length. In response to the draft final rule, a recommendation was developed by the California Department of Boating and Waterways, Oregon State Marine Board, Clean Harbor Action, and Revitalize Our Waterways (and supported by over 20 other commenters). This recommendation showed that it would be feasible in new construction to provide up to 80-foot gangways. From this comment (which also contained recommendations for different gangway slopes for varying changes in elevation), the Board developed the final rule which is based only on gangway length. Exception 3 requires that an entity either (1) provide a gangway (or series of gangways) at least 80 feet in total length, or (2) provide a gangway (or series of gangways) which does not exceed a maximum slope of 1:12. The final rule also retains the exception permitting gangways to be any length without a landing. As these exceptions only apply to gangways, ramps constructed on floating piers and ramps providing access to landside connections of gangways are not permitted to use these exceptions. Since the final rule does not use water level change as a mechanism for determining gangway accessibility, the definition for design high point was removed. The appendix includes the following two examples.

*Example 1.* Boat slips which are required to be accessible are provided at a floating pier. The vertical distance an accessible route must travel to the pier when the water is at its lowest level is 6 feet, although the water level only fluctuates 3 feet. To comply with exceptions 2 and 3, at least one design solution would provide a gangway at least 72.25 feet long which ensures the slope does not exceed 1:12.

*Example 2.* A gangway is provided to a floating pier which is required to be on an accessible route. The vertical distance is 10 feet between the elevation where the gangway departs the landside connection and

the elevation of the pier surface at the lowest water level. Exceptions 2 and 3, which modify 4.8.2, permit the gangway to be at least 80 feet long. Another design solution would be to have two 40-foot continuous gangways joined together at a float, where the float (as the water level falls) will stop dropping at an elevation five feet below the landside connection.

*Comment.* A number of commenters expressed concern that steeper gangway slopes and the absence of level landings every 30 feet created barriers for persons with disabilities. Some commenters also noted that State and local governments should be held to a higher standard than private entities.

*Response.* As water levels rise and fall, gangway slopes also rise and fall. In some areas, there will be times that a gangway slope is less than 1:20 and at other times it will be greater than 1:12. The Board has attempted to balance the needs of persons with disabilities with the cost of providing access in an environment that can vary dramatically throughout the country. The Board also decided against providing different requirements for boating facilities operated by State and local government or private entities. As this is the first time Federal accessibility guidelines have been developed to address these types of facilities, the Board plans to closely monitor how well the guidelines provide access and what new technologies are developed to provide equivalent or better access.

*Comment.* A few commenters representing passenger vessel owners were concerned that the gangway provisions would also apply to gangways serving passenger vessels.

*Response.* The gangway provisions of this rulemaking only apply to gangways which access floating piers from the land or fixed structures. The Board is working on a separate rulemaking which will address passenger vessel access. A statement has been added to the gangway definition indicating that the definition does not apply to gangways which connect to vessels.

#### *Exception 4 Small Boating Facilities With Less Than 25 Boat Slips*

Exception 4 permits gangways to exceed the maximum slope specified in ADAAG 4.8.2, where a facility contains less than 25 boat slips and where the total length of the gangway, or series of gangways, serving as part of a required accessible route is at least 30 feet.

*Comment.* Commenters were concerned about how the gangway requirements would impact smaller facilities.

*Response.* The proposed rule and the draft final rule lessened the impact on

smaller boating facilities based on pier square footage or linear feet. Most commenters recommended using number of boat slips. Since the final rule does not address piers used by transportation vessels covered by ADAAG 10.5, which are more likely to contain a limited number of very large slips, basing the exception on boat slip numbers is appropriate.

#### *Exception 5 Transition Plates*

Exception 5 permits transition plates to be located at the ends of gangways instead of the landings specified by ADAAG 4.8.4.

*Comment.* The proposed rule permitted gangways to have transition plates at the top and bottom. Comments ranged from noting the need for a definition, setting out maximum lengths and slopes, and having them meet gangway requirements.

*Response.* In the final rule, a definition for transition plate has been added to ADAAG 3.5. Where transition plates are part of an accessible route, the transition plates must comply with ADAAG 4.3, unless one of the exceptions in 15.2.2 applies. For example, ADAAG 4.3.7 and 4.8.2 would prohibit transition plates from having a slope greater than 1:12. Where the requirements of ADAAG 4.8 apply (because the slope is greater than 1:20), the transition plates must have landings complying with ADAAG 4.8.4 at the non-gangway end.

#### *Exception 6 Handrail Extensions*

Exception 6 does not require handrail extensions, where gangways and transition plates connect and both are required to have handrails. In addition, the exception provides that where handrail extensions are provided on gangways or transition plates, the extensions are not required to be parallel with the ground or floor surface.

*Comment.* The proposed rule did not require handrail extensions on gangways or landings where they connect to transition plates and did not require handrail extensions at transitions plates. Although some commenters supported the exception, others noted that handrail extensions were needed, particularly on gangways when the transition plate had no handrail. Commenters also noted the difficulty in complying with ADAAG 4.8.5, which requires handrail extensions to be parallel with the ground or floor surface. As gangway slopes change, handrails extensions at the end of gangways and transition plates are no longer parallel. Other commenters requested that transition plates always have handrails and

questioned whether gangway handrails had to be connected or continuous with landing handrails.

*Response.* The exception has been rewritten to address most of the concerns raised. The determination of whether a transition plate is required to have a handrail will be triggered by the requirements of ADAAG 4.3.7 and 4.8.5. Regarding connections to landing handrails, gangways required to comply with ADAAG 4.8.5 are required to have continuous handrails on both sides. When gangway handrail extensions are required, subject to exception 5 exclusions, the extensions would overhang landings and transition plates 12 inches minimum. ADAAG contains no requirement that these extensions connect handrails which might be provided on landings or guardrails which also may be provided.

#### *Exception 7 Cross Slope*

Exception 7 permits the cross slope of gangways, transition plates, and floating piers that are part of an accessible route to be 2 percent maximum measured in the static position.

*Comment.* Commenters representing State recreational boating agencies expressed concern about constructing floating piers and gangways which must conform to a 2 percent maximum cross slope 100 percent of the time in all weather and water conditions.

*Response.* Exception 7 was added to address this concern by specifying that the maximum cross slope is measured in the static condition. Gangways and piers which are part of an accessible route are expected to be designed and constructed to meet the 2 percent maximum cross slope. Once they are placed in the water, measurements absent live loads are to be made from a static condition without motion or wave action. Where floating piers are grounded out due to low water conditions, the slope requirements would not apply to such floating piers and associated gangways and transition plates.

#### *Exception 8 Limited-Use/Limited-Application Elevators and Platform Lifts*

Exception 8 permits limited-use/limited-application elevators or platform lifts complying with ADAAG 4.11 to be used in lieu of gangways complying with ADAAG 4.3.

*Comment.* One commenter pointed out that other methods, such as platform lifts and elevators should be used to provide access to a floating pier. Another commenter noted that a product, similar to a platform lift, had been developed for accessing floating piers. They believed that the final rule

should encourage technological developments in this area.

*Response.* ADAAG 4.3 and 15.2 allow accessible routes to consist of elevators, ramps, and (when accessing floating piers) gangways. However, under ADAAG 4.1.3(5), Exception 4, the use of a platform lift to access a pier (floating or fixed) would be prohibited in new construction. In alterations to existing facilities, this restriction does not apply. (See ADAAG 4.1.6(3)(g) regarding platform lift usage in alterations.) Exception 8 was added to allow more flexibility in providing access to floating piers and to encourage the development of other methods of access using mechanical means. This exception modifies the requirements of ADAAG 4.1.3(5) and allows the use of platform lifts and limited-use/limited-application elevators in new construction as part of an accessible route connecting floating piers.

#### *Section 15.2.3 Boat Slips: Minimum Number*

This section requires that where boat slips are provided, accessible boat slips complying with section 15.2.5 must be provided in accordance with Table 15.2.3. Boarding piers at boat launch ramps are not counted for this purpose. Where the number of boat slips is not identified, each 40 feet of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for purposes of this section.

*Comment.* The proposed rule required that where boat slips are provided, at least 3 percent of all boat slips, but not less than one boat slip, be accessible. Comments varied between supporting a range from 1 percent to 4 percent. Some comments recommended that the number of accessible boat slips be the same as the number of required accessible vehicle parking spaces. One commenter recommended that one of each type of slip be accessible. A facility operator noted that at large facilities, a 3 percent scoping provision would require more accessible boat slips than a similar number of vehicle parking spaces. Several commenters questioned whether the need for accessible slips was as high as the need for accessible parking.

*Response.* The Board is not convinced that the scoping for accessible boat slips needs to be the same as the scoping for accessible vehicle parking spaces and is concerned that the proposed 3 percent would require more accessible slips in larger facilities than a similar number of parking spaces. The final rule modifies the scoping by reducing the percentage of accessible boat slips in larger facilities. A table is added to the final

rule to show the required number of accessible boat slips. The table starts with 3 percent and reduces down to 1 percent as the number of boat slips increase. For example, a 100-slip marina would need 3 accessible slips, and a 1,450-slip marina would need 17 accessible slips. Since this is the first time Federal guidelines have addressed the minimum number of accessible boat slips, the Board plans to closely monitor how the numbers meet the needs of individuals with disabilities.

*Comment.* The proposed rule also required that where the number of slips cannot be identified, each 40 feet of mooring space provided along the perimeter of a pier be counted as one boat slip for the purpose of applying this section. Most commenters supported the requirement. A few commenters noted that most recreational boats are less than 40 feet in length and recommended a number less than 40 feet.

*Response.* Although most recreational boats are less than 40 feet, the final rule seeks to increase the likelihood that accessible slips at non-demarcated piers are long enough to accommodate most types of common recreational boats. For this reason, the final rule has retained using 40 feet as the distance for determining the number of slips at piers where slips are not demarcated. (See section 15.2.4.1 regarding lengths of boarding piers at launch ramps.) The following two examples are included in the appendix.

*Example 1.* A site contains a new boating facility which consists of a single 60-foot pier. Boats are only moored parallel with the pier on both sides to allow occupants to embark or disembark. Since the number of slips cannot be identified, section 15.2.3 requires each 40 feet of boat slip edge to be counted as one slip for purposes of determining the number of slips available and determines the number required to be accessible. The 120 feet of boat slip edge at the pier would equate with 3 boat slips.

Table 15.2.3 would require 1 slip to be accessible and comply with 15.2.5. Section 15.2.5 (excluding the exceptions within the section) requires a clear pier space 60 inches wide minimum extending the length of the slip. In this example, because the pier is at least 40 feet long, the accessible slip must contain a clear pier space at least 40 feet long which has a minimum width of 60 inches.

*Example 2.* A new boating facility consisting of a single pier 25 feet long and 3 feet wide is being planned for a site. The design intends to allow boats to moor and occupants to embark and disembark on both sides, and at one end. As the number of boat slips cannot be identified, applying section 15.2.3 would translate to 53 feet of boat slip edge at the pier. This equates with two slips. Table 15.2.5 would require 1 slip to be accessible. To comply with 15.2.5 (excluding

the exceptions within the section), the width of the pier must be increased to 60 inches. Neither (15.2.3 nor 15.2.5) requires the pier length to be increased to 40 feet.

*Comment.* The proposed rule counted boat launch ramp boarding piers as boat slips for determining the number of accessible slips required at a facility. The proposed rule also required at least one additional accessible boat slip to be provided adjacent to accessible launch ramps, where boarding piers were provided. Some commenters thought that this requirement would cause confusion. A few commenters questioned whether boat slips should be provided on boarding piers because boat slips are rented, leased or purchased, but boarding piers are used in a short-term manner. A number of commenters believed the provision required that launch ramps must have boarding piers.

*Response.* To avoid confusion, the final rule addresses scoping requirements for launch ramp boarding piers separately from boat slips. A definition has been added to ADAAG 3.5 for boarding piers.

*Comment.* Many commenters expressed concern that accessible slips had to be reserved only for persons with disabilities similar to how vehicle parking spaces are reserved.

*Response.* Accessible boat slips are not "reserved" for persons with disabilities in the same manner as accessible vehicle parking spaces. Rather, accessible boat slip use is comparable to accessible hotel rooms. The Department of Justice is responsible for addressing operational issues relating to the use of accessible facilities and elements. The Department of Justice currently advises that hotels should hold accessible rooms for persons with disabilities until all other rooms are filled. At that point, accessible rooms can be open for general use on a first come, first serve basis. This information has also been included in the appendix.

#### Section 15.2.3.1 Dispersion

This section requires that accessible boat slips be dispersed throughout the various types provided. It does not require an increase in the minimum number of boat slips required to be accessible.

*Comment.* Commenters expressed concern about how many accessible gangways would be required due to this dispersion requirement. Commenters noted that some facilities have several floating piers, each connected by an individual gangway. If accessible slips must be placed on more than one pier (due to the dispersion requirement), more than one accessible gangway system would be required.

*Response.* This provision does not prohibit accessible boat slips from being grouped at one or more piers, where such grouping does not reduce the number of type of slips that are required to be accessible. In cases where relocation of types of accessible boat slips to one pier is not possible, this dispersion provision will require more than one conforming gangway system.

*Comment.* Commenters requested more information on the different "types" of boat slips.

*Response.* Features to be considered in determining types of boat slips include the size of the boat slips, whether there are single berths or double berths, shallow water or deep water, transient, longer-term lease, covered or uncovered, and whether slips are equipped with features such as telephone, water, electricity, and cable connections. Because the term "boat slip" is intended to cover any pier area where passengers or occupants embark or disembark, unless classified as a launch ramp boarding pier, other piers not typically thought of as containing "boat slips" are covered by this dispersion requirement. Therefore, for example, a fuel pier used on a short term basis may contain boat slips, and this type of slip would be included in determining compliance with section 15.2.3.1. This information has also been included in the appendix.

*Comment.* The proposed rule required that accessible boat slips be located nearest to the amenities provided in the boating facility. Some commenters noted that adding this requirement to the dispersion provision increased the difficulty in providing accessible slips in existing facilities. It also tended to require more accessible gangways even in new construction. Commenters also questioned how to identify an amenity and if it is desirable to be located nearest an amenity. For example, being located near the toilet room might be desirable for one person but not for someone sensitive to noise and odors. Likewise, having an accessible slip located nearest the fuel pier may be beneficial for one person and not desired by others. One commenter noted that at existing facilities, corner slips are already accessible, but may not be closest to amenities.

*Response.* The "amenities" section has been removed from the final rule, because the rule intends to allow accessible boat slips to be grouped on one or more piers. In addition, the provision was removed due to comments which questioned whether being closest to an amenity is desirable.

### Section 15.2.4 Boarding Piers at Boat Launch Ramps

This section requires where boarding piers are provided at boat launch ramps, at least 5 percent, but not less than one, of the boarding piers must comply with 15.2.4 and be served by an accessible route complying with ADAAG 4.3.

Exception 1 permits accessible routes serving floating boarding piers to use the exceptions in section 15.2.2.

Exception 2 permits gangways to exceed the maximum slope and rise specified by ADAAG 4.8.2, where the total length of the gangways serving as part of a required accessible route is greater than 30 feet. Lastly, exception 3 indicates that where the accessible route serving a floating boarding pier or skid pier is located within a boat launch ramp, ADAAG 4.8 does not apply to the portion located within the boat launch ramp.

*Comment.* As noted above, some commenters thought that the proposed rule required that an accessible slip or boarding pier had to be provided at boat launch ramps.

*Response.* The proposed rule did not require that accessible boarding piers be provided at every facility with a launch ramp. Where boarding piers are provided, the proposed rule required that at least one accessible boat slip be provided adjacent to the launch ramp to ensure that at least one boarding pier complied with the pier clearance requirements. By using the term "boat slip", the Board did not intend to ensure that a rented, leased, or purchased mooring space would be available at the launch ramp, as some commenters concluded.

*Comment.* The proposed rule required that where boat launch ramps are provided with boarding piers, at least one accessible slip be provided adjacent to a boat launch ramp. A few commenters suggested that 50 percent, but not less than one boarding pier, be accessible.

*Response.* The final rule requires 5 percent, but not less than one, of boarding piers to be accessible. Most facilities with launch ramps only have one or two launch ramps. Compliance with this provision would translate to 100 percent or 50 percent access, assuming each launch ramp had its own boarding pier. Since some facilities have more than 20 launch ramps, the provision is consistent with how ADAAG addresses some conditions where multiple features are provided for the same use.

*Comment.* Some commenters were concerned that to serve an accessible floating boarding pier, the accessible

route would have to run down the launch ramp and would require the slope of the launch ramp to be 1:12 maximum. Such a slope would dramatically effect the ability to launch and retrieve trailered boats. A few commenters noted that in designs using a string of boarding piers connected together, as water levels decline, the boarding piers end up resting on the launch ramp surface. Therefore, they would match the slope of the launch ramp which is generally steeper than 1:8. In such a design, some piers actually function as gangways for a period of time.

In another design, a stationary boarding pier (also known as a skid pier) rests on the launch ramp surface, but is repositioned as water levels rise and fall. This design also allows the skid pier to be easily removed where the body of water becomes ice bound and deicing equipment is not practical. An example of a fixed boarding pier was provided which showed two levels connected by handrail equipped ramps. During high water, boaters used the upper level while the lower level and the ramp connecting it were covered by water. At low water, the lower level is used.

One commenter noted the value floating boarding piers provide for persons with disabilities when accessing a boat since the pier remains at a set height above the water. A few pointed out that accessible routes serving boarding piers were not required to run down the launch ramp but could be provided alongside the ramp. Another commenter noted that constructing switchback ramps or any other structure within the area near the shoreline was subject to more environmental limitations and was a problem particularly for providing access at existing launch ramps. Several commenters pointed out that at launch ramps, handrails and guardrails on some gangways (primarily on short gangways) are not provided because they interfere with boat lines as boats are launched or retrieved. One commenter mentioned that providing accessible boarding piers was not a problem, but providing the accessible route to it was a problem. The commenter noted that if the requirements were too difficult, entities would stop providing boarding piers.

*Response.* Anecdotal information indicates that boarding piers are not provided at all launch ramps. For example, the Michigan Department of Natural Resources reported that of their over 900 boating access sites, approximately half are provided with boarding piers (also known as courtesy

piers or docks). Since boarding piers may improve the ability for persons with disabilities to embark and disembark boats at launch ramps, the final rule seeks to not discourage entities from providing them. The Board has identified two areas of concern.

The first concern relates to accessing floating boarding piers. Boarding piers, when provided, tend to be quite small as compared to the square footage of piers used as boat slips. Many boating facilities consist of only one or two launch ramps and maybe a boarding pier, and contain no other boating structures. Providing access to floating boarding piers are subject to many of the same factors as providing access to floating piers which contain boat slips. In the final rule, the Board added exception 1 to section 15.2.4. This exception allows launch ramp boarding piers to use specified exceptions contained in section 15.2.2.

Exception 4 in section 15.2.2 allows boating facilities with less than 25 slips to have shorter gangways. To provide a similar small facility exception for boarding piers, exception 2 was added to 15.2.4. The exception exempts gangways accessing floating boarding piers at launch ramps from complying with the maximum slope requirements of ADAAG 4.8.2 where the gangways are at least 30 feet in length.

The Board's second area of concern focused on the effect of the accessible route requirements on a launch ramp, where the connection to a boarding pier is located within a launch ramp. As noted in the comments, the issue is not only the running slope requirement of an accessible route, but also includes the handrail, landing, and maximum rise requirements.

To address this concern, the Board added exception 3 to this section of the final rule. This exception provides that the requirements of ADAAG 4.8 do not apply to accessible routes located within launch ramps which serve floating boarding piers or skid piers also located within launch ramps. Although ADAAG 4.8 does not apply, other requirements of ADAAG 4.3 are applicable. For example, an accessible route with a minimum width of 36 inches must serve the boarding pier. Large "V" shaped groves which are typically provided to increase tire traction would not be allowed by ADAAG 4.3.6 (which references ADAAG 4.5) within the accessible route. Cross slopes requirements of ADAAG 4.3.7 remain 1:50 maximum. It is noted that ADAAG 4.3 does not require the entire launch ramp to meet these requirements, but does apply them to the 36 inch wide minimum accessible

route which shares the launch ramp surface and connects to the boarding pier and accessible elements on the boarding pier. Exception 3 only exempts the ramp requirements contained in ADAAG 4.8, such as maximum slope, maximum rise, handrails, and level landings. The following two examples are included in the appendix.

*Example 1.* A chain of floats are provided on a launch ramp to be used as a boarding pier which is required to be accessible by 15.2.4. At high water, the entire chain is floating and a transition plate connects the first float to the surface of the launch ramp. As the water level decreases, segments of the chain end up resting on the launch ramp surface, matching the slope of the launch ramp. As water levels drop, segments function also as gangways because one end of a segment is resting on the launch ramp surface and the other end is connecting to another floating segment in the chain.

Under ADAAG 4.1.2(2), an accessible route must serve the last float because it would function as the boarding pier at the lowest water level, before it possibly grounded out. Under exception 3, because the entire chain of floats is part of the accessible route, each float is not required to comply with ADAAG 4.8, but must meet all other requirements in ADAAG 4.3, unless exempted by exception 1. In this example, because the entire chain also functions as a boarding pier, the entire chain must comply with the requirements of 15.2.5, including the 60 inch minimum clear pier width provision.

*Example 2.* A non-floating boarding pier supported by piles divides a launching area into two launch ramps and is required to be accessible. Under ADAAG 4.1.2(2), an accessible route must connect the boarding pier with other accessible buildings, facilities, elements, and spaces on the site. Although the boarding pier is located within a launch ramp, because the pier is not a floating pier or a skid pier, none of the exceptions in 15.2.4 apply. To comply with ADAAG 4.3, either the accessible route must run down the launch ramp or the fixed boarding pier could be relocated to the side of the two launch ramps. The second option leaves the slope of the launch ramps unchanged, because the accessible route runs outside the launch ramps.

*Comment.* A few commenters questioned how the accessible route required by ADAAG 4.1.2 should connect a launch ramp which does not have a boarding pier.

*Response.* In the Recreation Access Advisory Committee, Boating and Fishing Facilities subcommittee report, the subcommittee recommended that the accessible route run to the crown of the launch ramp. In response to the ANPRM, commenters questioned how the "crown" would be determined. Because a precise spot at the launch ramp could not be identified to which the accessible route connects, neither the proposed rule nor the final rule

addresses this issue. As the final rule does not intend to change the slope of launch ramps, the accessible route required by ADAAG 4.1.2 is required to connect the launch ramp, but the specific point of connection is not set out.

#### *Section 15.2.4.1 Boarding Pier Clearances*

This section requires that at boarding piers, the entire length of the piers required to be accessible by section 15.2.4, must comply with section 15.2.5.

*Comment.* Some commenters questioned if the proposed rule required a minimum length of 40 feet for the accessible boarding piers.

*Response.* Neither the proposed rule, nor the final rule establishes a minimum length for accessible boarding piers. The accessible boarding pier would have a length which is at least equal to other boarding piers provided at the facility. Where only one boarding pier is provided, it would have a length equal to what would have been provided if no access requirements applied. The entire length of accessible boarding piers would be required to comply with the same technical provisions that apply to accessible boat slips. For example, at a launch ramp, if a 20-foot long accessible boarding pier is provided, the entire 20 feet must comply with the pier clearance requirements in section 15.2.5. Likewise, if a 60-foot long accessible boarding pier is provided, the pier clearance requirements in section 15.2.5 would apply to the entire 60 feet. An advisory note has been added to the appendix which provides similar information regarding lengths of boarding piers.

#### *Section 15.2.5 Accessible Boat Slips*

This section sets out requirements for accessible boat slips. Section 15.2.5.2 specifically addresses cleats and other boat securement devices.

##### *Section 15.2.5.1 Clearances*

This section requires that accessible boat slips be served by clear pier space 60 inches wide minimum and at least as long as the accessible boat slips. Additionally, every 10 feet maximum of linear pier edge serving the accessible boat slips must contain at least one continuous clear opening 60 inches minimum in width. The provision is unchanged from the proposed rule, although three exceptions have been added.

##### *Exception 1 Reduced Width*

Exception 1 allows the width of the clear pier space to be 36 inches minimum for a length of 24 inches

maximum, provided that multiple 36 inch wide segments are separated by segments that are 60 inches wide and 60 inches long.

*Comment.* Some commenters requested piers to be 72 to 96 inches wide to improve safety for persons who use wheelchairs. Others commenters were satisfied with the 60 inch minimum width but wanted the ability to reduce the width down to 36 inches in places to get around objects like supporting piles located within the clear pier space. One commenter requested, in response to the draft final rule, a reduced width because environmental agencies are making it harder to install finger piers wider than 4 feet.

*Response.* The 60 inch minimum width is consistent with the width required at access aisles for standard accessible parking spaces and was supported in the Recreation Access Advisory Committee, Boating and Fishing Facilities subcommittee report. Because the final rule allows obstructions to be located around the edge of the finger piers where 60 inch openings are available, unlike vehicle access aisles, it is not necessary for the entire pier to have a 60 inches clear width. Exception 1 allows reductions in the width of the pier clearance. The exception was included in the draft final rule and received little comment. An advisory note has been added to the appendix which recommends that clear pier spaces be wider than 60 inches, particularly on floating piers which are less stable, to improve the safety for persons with disabilities.

*Comment.* A number of commenters recommended that instead of the 60 inch clear width running the length of the slip, only one 60 inch by 60 inch space be required at the accessible boat slip. This space could be placed either alongside the slip or at the head of the slip on the main pier. These commenters also recommended that where finger piers at the facility are longer than 20 feet, a second 60 inch by 60 inch space should be provided at the slip.

*Response.* As recreational boats vary in shape, size, and layout, it cannot easily be known where persons with disabilities would embark or disembark a boat. By requiring the clear pier space along the entire length of the slip, access options between the boat and the pier are improved. Although the final rule does not require the entire edge of the clear pier space to be unobstructed, by extending the clear pier space the length of the slip, the number of 60 inch continuous clear openings increases which further improves access between the boat and the pier.

### Exception 2 Edge Protection

Exception 2 permits edge protection 4 inches high maximum and 2 inches deep maximum at the continuous clear openings.

*Comment.* The proposed rule required that every 120 inches maximum of linear pier edge serving the accessible boat slips contain at least one continuous clear opening 60 inches minimum. A few commenters noted that the provision would not allow edge protection to be placed within the opening.

*Response.* In response to the ANPRM, commenters had mixed views on the use of edge protection. Some maintained that edge protection was necessary to protect persons who use wheelchairs from falling off the pier edges. Others maintained that edge protection created a tripping hazard as persons moved between a pier and boat. The proposed rule did not address edge protection at piers but did prohibit its installation at the continuous clear openings at the accessible slips. The Board has not taken a position on whether edge protection should be provided at piers, but has provided exception 2 so as not to prohibit its use at the continuous clear openings. Maximum dimensions are provided to control the size of the edge protection so as not to block the clear openings.

### Exception 3 Alterations to Existing Facilities

Exception 3 provides that in alterations to existing facilities, the clear pier space can be located perpendicular to the boat slip and extend the width of the boat slip. This exception is available only if the facility has at least one boat slip complying with section 15.2.5 and where further compliance with 15.2.5 would result in a reduction in the number of boat slips available or result in a reduction in the widths of existing slips.

*Comment.* Some commenters disagreed with requiring clear pier spaces alongside accessible boat slips where finger piers are not provided within the facility. Others noted that at existing facilities, increasing finger pier widths, on which pier clearances would be provided, may reduce the number of slips available.

*Response.* Although commenters at the two information meetings on the draft final rule indicated that more recreational boats are designed to be boarded from the stern, many recreational boats still provide for side boarding. To maximize the options for persons with disabilities to board, the requirement that the clear pier space

extend the length of the accessible boat slip in newly constructed facilities has not been modified. However, exception 3 has been added to the final rule to reduce the impact of this provision on existing facilities.

### Section 15.2.5.2 Cleats and Other Boat Securement Devices

This section clarifies that cleats and other boat securement devices are not required to comply with ADAAG 4.27.3.

*Comment.* A few commenters noted that at accessible boat slips, controls and operating mechanisms (such as power receptacles, and water and sewage connections) should comply with ADAAG 4.27.

*Response.* Although section 15.2 contains requirements for recreational boating facilities, other requirements in ADAAG 4.1 still apply. Therefore, ADAAG 4.1.3(13) would require controls and operating mechanisms, such as electrical and water connections, at accessible boat slips to comply with ADAAG 4.27. However, because mooring features used to secure a boat, when raised, exert higher load pressures at the point of pier attachment, the danger of failure increases, particularly on floating piers. For this reason, section 15.2.5.2 was added which states that the reach range requirements of ADAAG 4.27.3 do not apply to boat securement devices.

### Section 15.3 Fishing Piers and Platforms

#### Section 15.3.1 General

This section requires that newly designed or newly constructed and altered fishing piers and platforms comply with section 15.3.

*Comment.* Commenters questioned how the guidelines would apply to places that people may fish from, but were not constructed for fishing (e.g., a breakwater jetty, a bridge, or a flood control dam).

*Response.* Structures that have been designed and constructed for purposes other than fishing, even though persons may use the structure for fishing, are not required to comply with this section. However, piers and platforms that are newly designed or constructed and altered for the specific purpose of fishing are required to comply with this section.

#### Section 15.3.2 Accessible Route

This section requires that accessible routes, including gangways that are part of accessible routes serving fishing piers and platforms comply with ADAAG 4.3. Exception 1 permits the accessible route, serving floating fishing piers and platforms to use exceptions 1, 2, 5, 6, 7,

and 8 in section 15.2.2. Exception 2 provides that where the total length of the gangway or series of gangways serving as part of a accessible route is at least 30 feet, the maximum slope specified by ADAAG 4.8.2 does not apply to the gangways.

*Comment.* The proposed rule required the accessible route connecting to floating fishing piers and platforms to comply with the provisions for accessible routes at boating facilities. This section received only a few comments. One commenter recommended that the square footage values in the proposed rule be reduced for application to floating fishing piers. Another commenter noted that such a requirement would discourage entities from providing fishing piers.

*Response.* The final rule references exceptions 1, 2, 5, 6, 7 and 8 of 15.2.2 (Boating Facilities) for floating fishing piers and platforms. Exception 4 in section 15.2.2 allows boating facilities with less than 25 slips to have shorter gangways. To provide a similar small facility exception for floating fishing piers, exception 2 was added to section 15.3.2 and is based on a similar exception in section 15.2.4 which applies to floating boarding piers. The following example is included in the appendix.

*Example.* To provide access to an accessible floating fishing pier, a gangway is used. The vertical distance is 60 inches between the elevation that the gangway departs the landside connection and the elevation of the pier surface at the lowest water level. Exception 2 permits the use of a gangway at least 30 feet long, or a series of connecting gangways with a total length of at least 30 feet. The length of transition plates would not be included in determining if the gangway(s) meet the requirements of the exception.

*Comment.* One designer questioned whether the proposed rule prohibited gangways which comply with ADAAG 4.8.

*Response.* ADAAG 4.1.2(2) requires at least one accessible route complying with ADAAG 4.3 to connect accessible buildings, facilities, elements, and spaces that are on a site. ADAAG 4.3.7 requires an accessible route with a running slope greater than 1:20 to comply with the ramp requirements of ADAAG 4.8. Although the final rule contains exceptions which modify the requirements of ADAAG 4.8, the use of these exceptions is not mandatory. Designers are encouraged to provide greater access for gangways and exceed the minimums contained in the exceptions and the minimum requirements of ADAAG 4.8.

### Section 15.3.3 Railings

This section requires that where railings, guards, or handrails are provided, they must comply with 15.3.3.

#### Section 15.3.3.1 Edge Protection

This provision requires edge protection that extends 2 inches minimum above the ground or deck surface. An exception provides that where the railing, guardrail, or handrail is 34 inches or less above the ground or deck surface, edge protection is not required if the deck surface extends 12 inches minimum beyond the inside face of the railing. The toe clearance must be 9 inches minimum above the ground or deck surface beyond the railing and be 30 inches minimum wide.

*Comment.* The proposed rule did not permit other options for edge protection on floating fishing piers and platforms. Commenters provided designs of fishing stations incorporating an extended deck past the rail or guard that enable a person using a wheelchair or mobility device the opportunity for toe clearance beyond the face of the railing or guard. They felt that this design should be permitted and encouraged the Board to incorporate into the final rule.

*Response.* The proposed rule required edge protection where railings are provided and did not provide the flexibility designers of fishing piers and platform requested. An exception has been added to the final rule to permit more flexibility in providing a variety of designs that promote increased levels of accessibility to anglers with disabilities.

#### Section 15.3.3.2 Height

This section requires at least 25 percent of the railings to be a maximum of 34 inches above the ground or deck surface.

The Board sought comment on the height of lowered guards and what steps have been taken to ensure that their use was permitted under applicable building codes and standards. Additionally, in light of concerns that have been raised about safety issues related to lower guards, the Board also sought information on experiences designers or operators have had where guards on floating fishing piers and platforms have been lowered to accommodate individuals using wheelchairs and other mobility devices while fishing.

*Comment.* Many commenters supported the use of lowered rails or guards to provide persons using wheelchairs or other mobility devices the opportunity to fish. Commenters gave examples of providing lowered

rails or guards for many years, in many different applications, with no reported safety or injury problems. Commenters provided descriptions of unique and innovative designs of fishing stations constructed for use by persons with disabilities.

*Response.* The final rule retains the requirement that, where provided, 25 percent of the railing must be at a lowered height. Current designs, provided by commenters, supported a maximum height of the lowered rail or guard to be at 34 inches above the ground or deck surface. The height requirement for 25 percent of the rail has been changed in the final rule to 34 inches maximum above the ground or deck surface.

*Comment.* Some commenters believed that the Occupational Safety and Health Administration (OSHA) standards apply to recreational fishing piers and platforms. The OSHA standards apply to places where employment is performed and prescribe a 42 inch high railing along open sides of platforms located 4 feet or more above the floor. 29 CFR 1910.5 and 1910.23 (c) and (e). Other commenters believed that recreational fishing piers and platforms are covered by State and local building codes, which typically prescribe 42 inch high guards along open sides of platforms located more than 30 inches above the floor. These commenters were concerned that requiring at least 25 percent of railings to be a maximum 34 inches high conflicts with the OSHA standards, and State and local building codes.

*Response.* Recreational fishing piers and platforms are subject to OSHA safety standards only if they are places of work. In some cases there may be both workers and recreational users on a pier. In those cases, OSHA standards would apply, and the pier would be exempted from the height requirements in the final rule, as discussed below.

The International Code Council has advised the Board that recreational fishing piers and platforms are not covered by model building codes unless they are an integral part of a building that is regulated by the adopting State or local authority. To avoid potential conflicts, an exception has been added to the final rule that permits a higher guard to be provided along a recreational fishing pier or platform where the guard complies with the International Building Code (IBC) (2000 edition) requirements for height (not less than 42 inches high) and opening limitations (4 inch diameter sphere cannot pass through any opening up to a height of 34 inches; and 8 inch diameter sphere cannot pass through

any opening from a height of 34 inches to 42 inches). This exception can be used if a recreational fishing pier or platform is covered by a State or local building code; or if a design professional believes that a specific location warrants enhanced safety measures; or if an employer provides a 42 inch high railing to comply with OSHA standards.

#### Section 15.3.3.3 Dispersion

This section requires that lowered railings be dispersed throughout a fishing pier or platform.

*Comment.* A commenter requested guidance on the criteria used to determine dispersion.

*Response.* Anglers who stand can fish from any part of a pier or platform and can change location depending on the fishing or water conditions. Where railings, guards, and handrails have been installed on fishing piers and platforms, the height of the railings interfere with fishing and block vision for persons who use wheelchairs and other mobility devices. This provision requires that where railings are provided, the dispersion of the lowered railings provide similar choices to fish from a variety of locations. The distribution of lower railings could include locations of different water depths with some that provide shading or are close to shore, and could take into account the tides or water fluctuations.

#### Section 15.3.4 Clear Floor or Ground Space

This section requires that at least one clear floor or ground space complying with ADAAG 4.2.4 be provided where the lowered railing height is located. Where no railings are provided, at least one clear floor or ground space complying with ADAAG 4.2.4 must be provided. No substantive comments were received and no changes were made to this provision for the final rule.

#### Section 15.3.5 Maneuvering Space

This section requires that at least one maneuvering space complying with ADAAG 4.2.3 be provided on a fishing pier or platform. The maneuvering space is permitted to overlap the accessible route and the clear floor space required by 15.3.4. No substantive comments were received and no changes were made to this provision for the final rule.

#### Golf

#### Section 3.5 Definitions

Two terms used in this section are added to ADAAG 3.5 (Definitions).

A "golf car passage" is defined as a continuous passage on which a

motorized golf car, also known as a golf cart, can operate. Designers and operators sometimes use the term "golf car path" to identify what the Board is defining as a "golf car passage." Because the term "golf car path" may connote a prepared surface, the term was not used. While a golf car passage must be usable by golf cars, it does not necessarily need to have a prepared surface.

A "teeing ground" is the starting place for a hole to be played. This definition is consistent with the United States Golf Association definition, which describes a teeing ground as a rectangular area two club-lengths in depth, with the front and sides defined by the outside limits of two tee-markers.

#### Section 15.4.1 General

This section requires newly designed or newly constructed and altered golf courses, driving ranges, practice putting greens, and practice teeing grounds to comply with 15.4.

#### Section 15.4.2 Accessible Route—Golf Courses

This section requires an accessible route to be 48 inches wide minimum, or 60 inches minimum if handrails are provided, to connect accessible elements and spaces located within the boundary of a golf course. Additionally, an accessible route must connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters.

Exception 1 permits the use of a golf car passage complying with section 15.4.7 in lieu of all or part of an accessible route. This exception does not apply to the required accessible route complying with 4.3 when connecting elements and amenities outside of the boundary of the golf course (*i.e.*, accessible vehicle parking spaces with the golf course clubhouse entrance). Exception 2 provides that handrails are not required on accessible routes within the boundary of a golf course. It is hazardous for handrails to be located through a green, or on teeing grounds, because of the danger of golf balls ricocheting off rails. Since course elements could be accessible from golf car passages in lieu of an accessible route, handrails would be of little utility along these routes.

The guidelines recognize that providing an accessible route may be impractical on a golf course for several reasons. First, the route of play for a golfer is dependent on where the ball lands and is therefore unpredictable. Secondly, there is an assumption that on many courses, golfers use a golf car to move throughout the course. Finally,

requiring an accessible route throughout a course could alter the slopes within some courses and eliminate some of the challenge of the game. The guidelines permit accessible elements and spaces within the boundary of the course and areas used for practice putting or driving and other course amenities outside the boundary of the course to be connected through either an accessible route or a golf car passage.

The 48 inch minimum width for the accessible route is necessary to ensure passage of a golf car on either the accessible route or the golf car passage. This is important where the accessible route is used to connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters. These are areas outside the boundary of the golf course, but are areas where an individual using an adapted golf car may travel. A golf car passage may not be substituted for other accessible routes, required by ADAAG 4.1.2, located outside the boundary of the course. The following example is included in the appendix.

*Example.* An accessible route connecting an accessible parking space to the entrance of a golf course clubhouse is not covered by this provision permitting a golf car passage in lieu of an accessible route required by 4.1.2.

*Comment.* The proposed rule sought comment on the option of using a golf car passage in lieu of an accessible route for smaller courses (*i.e.*, 3 or 6 holes).

*Response.* Commenters supported the use of the golf car passage on smaller courses. The final rule provides golf course designers and operators the opportunity to choose between providing either a golf car passage or an accessible route for all courses regardless of size.

*Comment.* Commenters questioned who would be responsible for providing single rider adaptive golf cars. Additionally, commenters questioned if a course could establish criteria for restricting use due to terrain conditions. Others wanted to know if there are plans to create regulations or guidelines for accessible golf cars. Persons with disabilities supported the use of adaptive or single rider golf cars and gave examples of experiences at courses currently permitting or providing access via golf cars to courses.

*Response.* The Board develops and maintains accessibility guidelines for the built environment. It is outside the jurisdiction of the Board to address the operational and procedural requirements of a golf course. Operational and procedural issues are

within the jurisdiction of the Department of Justice.

*Comment.* The requirements for an accessible route or golf car passage seek to provide access for players with disabilities to either practice or play the game of golf. The Board requested comments on how access should be provided for spectators during golf tournaments and competitions. Commenters provided examples and experiences of current accessibility practices encountered at many levels of tournaments and supported allowing the tournament committees to select holes (teeing areas, fairways, and putting greens) to provide accommodations and transportation to the selected areas throughout the golf course and surrounding areas.

*Response.* No additional requirements have been included in the final rule for spectators with disabilities attending tournaments or competitions. Facilities hosting tournaments or competitions must comply with all the other requirements of the ADA, including the general obligation to provide an equal opportunity to individuals with disabilities to enjoy the services provided. Additionally, ADAAG requires temporary facilities used during tournaments or competitions to provide access to assembly seating areas, portable restroom facilities, concessions, and all other available amenities. Access to these temporary facilities on a golf course may be achieved through either an accessible route or golf car passage.

#### Section 15.4.3 Accessible Routes—Driving Ranges

This section provides that an accessible route must connect accessible teeing stations at driving ranges with accessible parking spaces and must be 48 inches minimum in width. Where handrails are provided, the accessible route must be a minimum of 60 inches in width. An exception has also been added which permits a golf car passage to be used at driving ranges instead of an accessible route.

*Comment.* The proposed rule did not specifically address the accessible route provided at driving ranges. A commenter stated that a person who plays from a golf car would need to practice driving a golf ball from the same position and stance used when playing the game.

*Response.* The final rule requires both a stand alone driving range and a driving range located at a golf course to provide an accessible route that is 48 inches wide minimum or 60 inches minimum where handrails are provided,

to connect the accessible parking spaces to required accessible teeing stations.

#### Section 15.4.4 Teeing Grounds

This section requires teeing grounds to comply with section 15.4.4.

##### Section 15.4.4.1 Number Required

This section requires that where one or two teeing grounds are provided for a hole, one teeing ground must be accessible. Where three or more teeing grounds are provided for a hole, at least two teeing grounds serving a hole must be accessible.

*Comment.* The proposed rule required that if two teeing grounds were provided both must be accessible. Course designers and operators expressed concerns that if only two teeing grounds are provided at a hole requiring both to be accessible was too restrictive.

*Response.* The final rule has been revised to require two teeing grounds to be accessible when three or more teeing grounds are provided for a hole. The Board believes that requiring two teeing grounds to be accessible when three or more are provided will provide persons with disabilities with an option to play from different tees appropriate to their skill level and also provide course operators and designers with the flexibility they requested.

##### Section 15.4.4.2 Forward Teeing Ground

This section requires the forward teeing ground to be accessible. The forward teeing ground need not be accessible in alterations of existing courses when terrain makes compliance infeasible.

*Comment.* The proposed rule sought comment on the number of accessible teeing grounds that should be required for each hole and, if more than one accessible teeing ground is provided, whether it should be the forward tee. Commenters supported the option to play from different teeing grounds appropriate to player skill levels if multiple teeing grounds are provided per hole. Additionally, golfers with disabilities overwhelmingly supported requiring the forward teeing ground to be accessible regardless of the number of teeing grounds provided.

*Response.* The final rule provides a choice of teeing grounds for golfers with disabilities when three or more teeing grounds are provided per hole and also provides flexibility to course designers and operators. The final rule also requires that the forward teeing ground be the accessible tee regardless of the number of teeing grounds provided per hole.

*Comment.* The proposed rule did not provide an exception for alterations of existing teeing grounds from making the forward tee accessible. Commenters stated that requiring access to the forward teeing ground in alterations to existing courses may be too restrictive.

*Response.* Some teeing grounds on existing courses may be located on steep slopes and it may not be possible to provide a golf car passage to the forward teeing ground. The final rule exempts the forward teeing ground from being accessible in alterations where compliance is not feasible due to terrain.

##### Section 15.4.4.3 Teeing Grounds

This section requires accessible teeing grounds to be designed and constructed to allow a golf car to enter and exit the teeing ground.

*Comment.* The proposed rule required teeing grounds to provide a minimum clear area 10 feet by 10 feet with a surface slope not exceeding 1:48 in all directions. Course designers and operators stated that current designs of teeing grounds provide a clear area of at least 10 feet by 10 feet. Additionally, they expressed concern about maintaining a slope no greater than 1:48, and noted that settling of the soil and drainage problems occur with such a minimal slope. Others questioned how the slope of the teeing ground should be measured.

*Response.* Current design and construction practices for teeing grounds provide the needed space for golf car passages. Designers currently limit the slope of the teeing grounds to provide a level surface from which golfers tee off. The maximum slopes and minimum size requirements have been deleted from the final rule. The final rule requires teeing grounds to be designed and constructed to allow a golf car to enter and exit the teeing ground.

##### Section 15.4.5 Teeing Stations at Driving Ranges and Practice Teeing Grounds

This section requires that where teeing stations or practice teeing grounds are provided, at least 5 percent, but not less than one, of the practice teeing grounds must be accessible. This provision applies to practice facilities adjacent to a golf course, in addition to stand-alone facilities. No substantive comments were received and no changes have been made for the final rule.

##### Section 15.4.6 Weather Shelters

This section requires weather shelters that are provided on a golf course to be designed and constructed to allow a golf

car to enter and exit and have a clear floor or ground space 60 inches by 96 inches. This space will allow a golf car to be driven directly into a weather shelter. No substantive comments were received and no changes have been made for the final rule.

##### Section 15.4.7 Golf Car Passage

This section requires openings at least 60 inches wide to be provided at intervals, not exceeding 75 yards, where curbs or other man-made barriers are provided along a golf car passage that would prohibit a golf car from entering a fairway.

*Comment.* The proposed rule required the 60 inch openings at intervals of 75 yards of golf car passage. Course designers and operators expressed concern that requiring openings at a fixed distance of 75 yards would be too restrictive and would not allow enough flexibility for natural characteristics of the course, hazard placement, and erosion control.

*Response.* The final rule requires the openings at intervals not to exceed 75 yards. These openings will provide access to the course at reasonable intervals, enabling a golfer using a golf car to play the game without extended travel distances and time requirements and also provide the flexibility the course designer and course operator need.

##### Section 15.4.7.1 Width

This section requires a golf car passage to be 48 inches wide minimum.

*Comment.* Commenters supported limited technical requirements for golf car passages. Currently there are no standards that govern the design or construction of golf car passages. Commenters felt that additional requirements would restrict designers and have the potential of altering the game.

*Response.* The 48 inch minimum dimension for a golf car passage is based on the standard width of gasoline or electric powered golf cars. The golf car passage may at times coincide with the golf car path, however, it is not required to include a prepared surface. The golf car passage is a continuous passage on which a motorized golf car can operate. No additional technical provisions for golf car passages have been included in the final rule.

##### Section 15.4.8 Putting Greens

This section requires space to allow a golf car to enter and exit the green.

*Comment.* Substantial comment was received on requiring putting greens and fairways to be accessible to golfers using adaptive single rider golf cars. Course

operators are concerned that allowing golf cars access to the green will cause damage to the greens and potentially cause holes to be closed for extended periods of time. Golfers with disabilities, organizations supporting golfers with disabilities, and golf car manufacturers provided information on current courses that allow for golf car passage on putting greens which showed little or no damage to the putting green surface.

*Response.* Single rider golf cars adapted for golfers with disabilities are available from about a dozen companies. These golf cars are generally designed to be "greens friendly" and have low ground pressure that is evenly distributed on all four tires. Some manufacturers report that the ground pressure of these golf cars is less than the ground pressure of a typically standing person and cause no turf damage even in wet conditions.

*Comment.* Course operators also raised operational issues such as whether they are required to make single rider adapted golf cars available for rental and whether they can restrict the use of golf cars on fairways and greens for certain weather or agronomic conditions.

*Response.* These issues go beyond the Board's jurisdiction and the requirements in this final rule. The Board anticipates that the Department of Justice will answer these operational issues when it amends its ADA regulations to incorporate the recreation facilities guidelines as standards.

### Section 15.5 Miniature Golf

#### Section 15.5.1 General

This section requires newly designed or newly constructed and altered miniature golf courses to comply with section 15.5.

#### Section 15.5.2 Accessible Holes

This section requires at least 50 percent of all holes to be accessible and that the accessible holes be consecutive. With the reduction in the minimum number of accessible holes on a miniature golf course, the Board wants to provide a more socially integrated golfing experience for people using wheelchairs or other mobility devices. An exception also permits one break in the sequence of consecutive accessible holes, provided that the last hole on the miniature golf course is the last hole in the sequence. This exception is provided to allow some flexibility in the layout and design of a miniature golf course.

*Comment.* Significant comment was received from miniature golf course

owners and operators regarding the number of holes required to be accessible. The proposed rule required each hole on a miniature golf course to be accessible, with an exception for 50 percent of elevated holes. Commenters were asked to give the Board guidance on differentiating between level and elevated holes. Few comments were received on definition alternatives. Some owners and operators believed that the requirement for all holes to be accessible would significantly impact course design to the extent that the experience may be "fundamentally altered." Others cited space limitations, concerns about slowing the game down, and having the effect of "compromising the challenge of the game."

*Response.* The Board has significantly reduced the number of holes required to be accessible in newly constructed miniature golf courses to 50 percent of all holes.

*Comment.* During the comment period following the draft final rule, the Miniature Golf Association recommended that instead of making 50 percent of the holes accessible, miniature golf facilities should have the option of providing tools, equipment, or assistive devices to provide access. They specifically requested that assistive devices such as electric carts be permitted as an alternative to an accessible route. Several other commenters opposed the reduction in the number of accessible holes, expressing concerns about limiting the game for persons with disabilities to only half of the holes.

*Response.* The Board has maintained the requirement that a minimum of 50 percent of all holes in new construction be accessible. The final rule does not recognize the alternative use of assistive devices for providing access in new construction. Designing miniature golf course holes so electric carts can safely maneuver through the holes is likely to have as great or greater impacts than designing an accessible route. Requiring individuals with disabilities to use electric carts on miniature golf courses is also inconsistent with other provisions of the ADA which require goods, services, and facilities to be afforded in the most integrated setting appropriate.

Given the diversity of layouts and designs of miniature golf courses, the final rule does not distinguish between courses with elevated holes or those with largely level holes. The 50 percent reduction represents a compromise given the concerns presented. Other considerations relate to the accessible route connecting accessible holes. The Board has established this reduction to

give relief where courses are designed on small parcels of land with existing terrain limitations. It is recommended that all holes on a miniature golf course be made accessible where space limitations and existing steep terrain are not present.

#### Section 15.5.3 Accessible Route

This section requires that the accessible route must connect the course entrance with the first accessible hole and the start of play area on each accessible hole. Since accessible holes must be consecutive, this section also requires the course to be configured to allow exit from the last accessible hole to the course exit or entrance. The course must be designed so as not to require an individual to back track through other holes to exit or move around the course. Where the accessible route is located on the playing surface of the accessible hole, five exceptions are permitted and are discussed below.

*Comment.* Miniature golf course operators were concerned that the surface commonly used on miniature golf course holes would not meet the requirements for accessible carpet. Their concerns were centered around the thickness of the surface. ADAAG 4.5.3 includes a requirement that the maximum pile thickness must be no more than 1/2 inch and be securely attached with a firm cushion, pad, or backing. Exposed edges must be fastened to floor surfaces and must have trim along the entire length of the exposed edge.

*Response.* The Board has added Exception 1 which exempts carpet used on miniature golf course holes from the provisions of ADAAG 4.5.3. Surfaces provided as a part of an accessible route, whether on or off the playing surface, must comply with ADAAG 4.5.2. ADAAG 4.5.2 requires the surface to be "stable, firm, and slip resistant."

*Comment.* Commenters raised concern about the use of readily removable curbs permitted in the proposed rule. Operators were concerned that their removable qualities would tempt younger players to use them inappropriately. Persons with disabilities questioned who would actually move the curbs and how problems related to their use would be addressed.

*Response.* The final rule does not allow the use of "readily removable curbs". This option was included to allow for passage on and off the course while containing the ball while in play. As an alternative, Exception 2 has been added which permits a 1 inch curb for an opening distance of 32 inches where the accessible route intersects the

playing surface of a hole. This permits passage of wheelchairs while containing the ball within the hole.

*Comment.* The proposed rule permitted a maximum slope of 1:4 for a 4 inch rise where the accessible route is located on the playing surface. A few commenters questioned how close together a designer could locate these steeply sloped surfaces. They were concerned about the appropriateness where these steep slopes existed for long distances without areas to rest.

*Response.* Exception 3 permits a slope of 1:4 maximum for a 4 inch rise where the accessible route is located on the playing surface of a hole. Exception 4 specifically addresses the issue of landings where sloped surfaces are provided. This exception permits the landings to be 48 inches long with slopes no greater than 1:20. ADAAG 4.8.4(3) requires landings to be 48 inches by 60 inches minimum, where ramps change direction. Providing a separation or break from the steeper slopes is necessary for individuals with disabilities to safely maneuver on the hole.

Exception 5 states that where the accessible route is located on the playing surface of a hole, handrails are not required.

#### *Section 15.5.3.2 Accessible Route—Adjacent to the Playing Surface*

Where the accessible route is located adjacent to the playing surface, the requirements of 4.3 apply. This provision clarifies that the accessible route may be located on the playing surface of the accessible hole or adjacent to the hole.

#### *Section 15.5.4 Start of Play Areas*

This section requires start of play areas required to comply with 15.5.2 to have a slope not steeper than 1:48 and to be 48 inches minimum by 60 inches minimum.

*Comment.* The proposed rule required the minimum space for the start of play area to be 60 inches by 60 inches. Commenters questioned the need for this space and recommended a reduction where possible especially where space limitations exist. Questions were also raised regarding the appropriateness of overlapping the accessible route with the start of play area.

*Response.* The final rule reduces the space required since the start of play area will usually not require a person using a wheelchair or mobility aid to make a complete turn. Rather, space is necessary for positioning to take the first shot of the hole. Consistent with ADAAG, unless otherwise specified, the accessible route and the clear space

required at the start of play area are permitted to overlap.

#### *Section 15.5.5 Golf Club Reach Range*

This section requires all areas within accessible holes where golf balls rest to be within 36 inches maximum of an accessible route having a maximum slope of 1:20.

*Comment.* The proposed rule required that all level areas within accessible holes where golf balls rest be within 27 inches maximum of an accessible route. A few commenters questioned the appropriateness of the 27 inch dimension. They recommended an increase to include a broader range of skill levels and golf club lengths.

*Response.* The distance from the level areas has been increased to 36 inches to balance the impact on course design and incorporate the reach of a typical adult size golf club. This is a maximum distance from the accessible route which may be located either on the hole or adjacent to the hole. Where possible, designers should locate the accessible route as close as possible to the level areas on the course. This will improve the ability to reach the golf ball for a variety of users.

#### *Section 15.7 Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities*

##### *Section 15.7.1 General*

This section requires all newly designed or newly constructed and altered exercise equipment and machines, bowling lanes, and shooting facilities to comply with section 15.7.

##### *Section 15.7.2 Exercise Equipment and Machines*

This section requires at least one of each type of exercise equipment and machines to be provided with clear floor space complying with ADAAG 4.2.4 and be served by an accessible route. Clear floor space must be positioned for transfer or for use by an individual seated in a wheelchair. Clear floor spaces for more than one piece of equipment are permitted to overlap. Permitting clear spaces to overlap should reduce the space requirements within an exercise or health club facility.

*Comment.* The American Hotel and Lodging Association commented that the requirement for clear space at exercise equipment and machines created a burden for the lodging industry. Similar comments were also received from the International Health, Racquet, and Sport Club Association, who indicated that space limitations present in existing facilities will prohibit compliance with this provision.

*Response.* These guidelines apply only to newly constructed and altered buildings and facilities. Where exercise equipment and machines are altered or added to a facility, the provisions of 15.7.1 apply to those pieces that are altered or added. In the case of altered exercise equipment or machines, the provisions of ADAAG 4.1.6(1)(j) related to “technical infeasibility” will also apply. ADAAG 4.1.6(1)(j) permits departure from the technical provisions where existing physical or site constraints prohibit full compliance. Space limitations may prohibit full compliance with 15.7.2. In this case, designers and operators must comply to the “maximum extent feasible”.

Requirements for existing buildings and facilities are addressed in the Department of Justice regulations and are subject to the requirements for “readily achievable barrier removal” where the facility is covered by title III of the ADA. Facilities covered by title II of the ADA are subject to the requirements for “program accessibility”. See discussion in the background section of this preamble.

An appendix note is added to provide guidance on exercise equipment and machine layout to maximize space.

*Comment.* A few commenters requested guidance on what is intended with respect to “types” of exercise equipment and machines. Others suggested that the Board should not require access to exercise machines or equipment that require the user to stand such as tread mills or stair climbers.

*Response.* The final rule is not limited to exercise equipment or machines that do not require standing. Access to the various pieces of exercise equipment serves individuals who use mobility aids such as scooters and wheelchairs. Individuals with ambulatory disabilities including those using walkers, canes, and crutches will also benefit from an accessible route and clear floor space next to a treadmill or stationary bike or other exercise equipment. An appendix note provides guidance on the different types of exercise equipment and machines. It also suggests that owners and operators consider including exercise equipment and machines within their facilities that provide for upper body cardiovascular exercise. This will add to the diversity of exercise options for everyone.

With respect to the issue of “type”, a stationary bicycle would be considered one type. A rowing machine would also be considered a type. While both provide a cardiovascular exercise, they are considered two different types for purposes of these guidelines. In terms of strength training machines, a bench

press machine is considered a different type than a biceps curl machine. The requirement for providing access to each type is intended to cover the variety of strength training machines. Where operators provide a biceps curl machine and free weights, both are required to meet the provisions in this section, even though an individual may be able to work on their biceps through both types of equipment. Where the exercise equipment and machines are only different in that different manufacturers provide them, only one of each type of machine is required to meet these guidelines. For example, where two bench press machines are provided and each is manufactured by a different company, only one is required to comply.

#### Section 15.7.3 Bowling Lanes

This section requires that where bowling lanes are provided, at least 5 percent, but not less than one lane of each type must be accessible.

*Comment.* The Bowlers Proprietors Association expressed concern about requiring 5 percent of bowling lanes to be accessible. Their comments focused on the difficulty of providing ramps to gain access to bowling lanes within existing facilities. They also questioned how to apply the 5 percent minimum requirement where a bowling facility has multiple lanes.

*Response.* As previously indicated, these guidelines apply to newly constructed and altered facilities. When a bowling facility is altered, the provisions of 15.7.2 will apply to the lane that is undergoing an alteration and does not require all other lanes to be modified unless required by ADAAG 4.1.6 (Path of Travel). Other obligations related to existing facilities covered by titles II and III of the ADA are addressed in the Department of Justice regulations.

Where the required number of accessible elements to be provided is determined by calculations of ratios or percentages and remainders or fractions result, the next greater whole number of such elements should be provided. For example, if 18 lanes of one type are provided, one lane would be required to be accessible in new construction. If 24 bowling lanes of one type are provided in new construction, a minimum of two accessible bowling lanes would be required in new construction.

*Comment.* The Bowlers Proprietors Association also expressed concern about the number of accessible bowling lanes required in those facilities where different types of bowling is provided. They were also concerned about facilities that provide both ten pin and duck pin bowling. They believed that a

5 percent requirement for both types was excessive and recommended that the requirement be limited to the type that is dominant within a given facility. Further, the Bowlers Proprietors Association questioned what made a bowling lane accessible.

*Response.* In facilities where both ten pin and duck pin bowling are provided, the 5 percent requirement for each type will typically result in one of each type of lane being accessible.

The final rule does not include any further technical provisions for bowling lanes required to be accessible. Like other areas of sport activity, the requirement is for an accessible route to connect to the area of sport activity, in this case, the bowling lane. Specific exemptions to ADAAG 4.4 (protruding objects) and 4.5 (surfacing requirements) are applied within the area of sport activity. Therefore, bowling lanes which are necessarily waxed to allow the ball to travel, are not required to be slip resistant.

#### Section 15.7.4 Shooting Facilities

This section requires that where fixed firing positions are provided at a site, at least 5 percent, but not less than one, of each type of firing position must be accessible.

*Comment.* A few commenters questioned why the Board did not require an accessible route to the target areas as well as the fixed firing positions. Commenters also questioned the application of this section to trap and skeet facilities where the facilities are not entirely fixed. Others questioned what factors should be considered in determining the different types of firing positions.

*Response.* The Board has not included a requirement for an accessible route to the target areas since targets are often moveable, making it difficult to locate the accessible route effectively. There is also difficulty in defining what is considered the "target" area. Where facilities contain a combination of fixed and non-fixed elements, operators should consider the general nondiscrimination requirements of the ADA. Direction on these and other issues related to the use of shooting facilities should be obtained from the Department of Justice. Factors to be considered in determining the types of fixed firing positions include whether covering and lighting is provided, and which shooting events the fixed firing position is intended to support.

#### Section 15.7.4.1 Fixed Firing Positions

This section requires that accessible fixed firing positions contain a 60 inch diameter space and have a slope not

steeper than 1:48. No substantive comments were received and no changes have been made to this provision in the final rule.

#### Section 15.8 Swimming Pools, Wading Pools, and Spas

##### Section 3.5 Definitions

The final rule provides a definition for a catch pool which is defined as a pool used as a terminus for water slide flumes.

*Comment.* The proposed rule did not define the term catch pool. Commenters requested that catch pools be exempt since access is not required for water slides.

*Response.* The term "catch pool" is added to the final rule since it is used in an exception in the final rule. Exception 3 to section 15.8.1 exempts catch pools from complying with the requirements of this section, provided that an accessible route connects to the catch pool edge.

##### Section 15.8.1 General

This section requires newly designed or newly constructed and altered swimming pools, wading pools, and spas to comply with 15.8. An exception has been added to the final rule that provides that an accessible route is not required to serve raised diving boards or diving platforms provided that an accessible route is provided to the base of the raised diving board or platform.

##### Section 15.8.2 Swimming Pools

This section requires that at least two means of entry be provided for each public or common use swimming pool. A sloped entry or lift must be one of the primary means of access. The secondary means of access could include a pool lift, sloped entry, transfer wall, transfer system, or pool stairs.

*Comment.* The proposed rule permitted a moveable floor as a secondary means of entry. Commenters stated that even though moveable floors may have some practical applications they do not provide independent access and often place a person with a disability on display while the pool is evacuated and the floor raised to provide access. Additionally, commenters raised concerns regarding the removal of handrails and other means of egress prior to lifting the pool floor.

*Response.* The option of using a moveable floor as a secondary means of accessible entry in public or common use swimming pools has been deleted from the final rule.

The Board has also deleted the requirement that the second means of access not duplicate the first means of

access in larger pools in the final rule. This should give designers additional flexibility in choosing between the various means of access. An appendix note recommends that where two means of access into the water are provided, different means are recommended.

*Exception 1 Small Pools With Less Than 300 Linear Feet of Pool Wall*

Exception 1 permits public or common use swimming pools with less than 300 linear feet of pool wall to only provide one accessible means of entry by either a swimming pool lift or a sloped entry.

*Comment.* A commenter suggested that Exception 1 should be modified to refer to pool wall that is available for entry into the pool. They explained that pool walls at diving areas and pool decks where there is no available pool entry because of landscaping or adjacent structures should not be counted when determining the number of accessible means of entry required.

*Response.* Exception 1 is intended to provide small pools with relief from providing more than one accessible means of entry. It was not intended for large pools that could limit the locations of entry with landscaping or other structures from requiring additional accessible means of entry.

*Exception 2 Pools Where Access Is Limited to One Area*

Exception 2 has been added to the final rule and permits wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to only one area, to provide one accessible means of entry by either a swimming pool lift, sloped entry, or a transfer system.

*Comment.* Commenters from speciality pool operators and leisure river designers expressed concerns for safety, where there is wave action or moving water, when providing additional accessible means of entry in these unique water environments. Wave action pools typically provide a large area of zero grade entry, where everyone enters the water. Providing an accessible means of entry along the high walls could be very dangerous. Leisure rivers are constructed to provide a safe area where staff can assist individuals into the current at one location to control access to and from the moving water.

*Response.* In response to the safety concerns provided by designers and operators of these moving water experiences, only one accessible means of entry is required in the final rule, when user access is limited to one area.

*Exception 3 Catch Pools*

Exception 3 exempts catch pools from these requirements, provided that an accessible route connects to the catch pool edge.

*Comment.* The proposed rule did not include any specific requirements for access to water slides. Comments on the proposed rule and the draft final rule supported not requiring access to the top of water slides.

*Response.* An exception has been added to the final rule exempting water slides from accessibility. See ADAAG 4.1.1 (5) (b) (v). To be consistent with the water slide exception, the final rule also exempts the catch pool at the discharge area of a water slide from providing an accessible means of entry or exit from the catch pool, provided that an accessible route connects to the catch pool edge.

*Section 15.8.3 Wading Pools*

This section requires at least one accessible means of entry into each wading pool. The means of entry must be a sloped entry.

*Comment.* The proposed rule required the means of entry into wading pools to be either a sloped entry, transfer wall, or a transfer system. The proposed rule also sought comment on the appropriateness of providing a transfer wall or other transfer system as a means of access into a wading pool. Several commenters expressed concern about the potential dangers to children that may use the transfer walls or systems inappropriately for play or diving.

*Response.* The final rule limits the accessible means of entry into a wading pool to a sloped entry only. Examination of the different means of access into wading pools found zero grade entry to be the most appropriate and currently most provided means of entry.

*Section 15.8.4 Spas*

This section requires at least one accessible means of entry into spas. The means of entry must be a pool lift, transfer wall, or transfer system. An exception allows for five percent, but not less than one spa, where spas are provided in a cluster, to be accessible. No substantive comment was received and no changes have been made to this section in the final rule.

*Section 15.8.5 Pool Lifts*

This section provides the technical requirements for pool lifts.

*Section 15.8.5.1 Pool Lift Location*

This provision requires pool lifts to be located where the water level does not exceed 48 inches.

*Comment.* The proposed rule did not specify the location of a pool lift. Commenters with disabilities and individuals who work in environments where people with disabilities use pool lifts expressed concern that pool lifts may be placed in areas where the water depth would not permit assistance in the water if needed. Comments on the draft final rule supported the requirement for a pool lift to be located in a water depth of 48 inches or less whenever possible. Commenters also gave examples of when the location of a pool lift should be allowed in an area where the water depth is greater than 48 inches.

*Response.* The final rule requires a pool lift to be located where the water level does not exceed 48 inches. Two exceptions have been added to the final rule in response to comments received. Exception 1 permits the use of pool lifts at any location where the entire pool has a depth greater than 48 inches. Exception 2 permits pools with multiple pool lift locations to provide at least one where the water depth does not exceed 48 inches.

*Section 15.8.5.2 Seat Location*

This section requires the centerline of the seat, when in the raised position, to be located over the deck and 16 inches minimum from the edge of the pool. Additionally, the deck surface between the centerline of the seat and the pool edge must not have a slope greater than 1:48.

*Comment.* The proposed rule required the centerline of the seat, when in the raised position, to be located over the deck and 20 inches minimum from the pool edge. Comments from lift manufacturers expressed concern about the 20 inch minimum distance. They elaborated on the difficulties associated with providing a lift that places the user away from the pivot point of the lift a distance of 20 inches. Additionally, they commented that aquatic lifts with the centerline of the seat at least 20 inches away from the pool edge may not clear the footrest over the curbing or pool edge provided on some pools.

*Response.* Based on the concerns of commenters, the distance measured from the centerline of the lift seat to the edge of the pool has been reduced from 20 inches to 16 inches minimum. The location of the seat in relation to the edge of the pool is especially important to facilitate safe transfers. The Board is concerned about locating the seat either over the water or too close to the deck edge for safety reasons. This provision has been modified to address design limitations and incorporate the

maximum distance from the pool edge to ensure safety.

#### *Section 15.8.5.3 Clear Deck Space*

This section requires a clear deck space on the side of the seat opposite the water and parallel with the seat. The space is required to be 36 inches wide minimum and to extend forward 48 inches minimum from a line located 12 inches behind the rear edge of the seat. The clear space is specified in relationship to the seat to allow unobstructed space for either side or diagonal transfer. Additionally, the clear deck space must have a slope not greater than 1:48.

*Comment.* The proposed rule required the clear deck space to be a minimum of 30 inches wide. Commenters requested additional space to permit greater flexibility for transfer position preferences and the varied abilities of persons requiring the use of a pool lift. Commenters expressed a preference that the clear deck space should be required to provide a level surface from which to transfer from a mobility device to the lift seat.

*Response.* The final rule increases the clear deck space required on the side of the seat opposite the water to be a width of 36 inches minimum and that the clear deck space provide a surface with a slope not greater than 1:48. The additional space will facilitate the maneuvering that may be needed by a person using a mobility device preparing for a transfer to the seat of a pool lift.

#### *Section 15.8.5.4 Seat Height*

This section requires the height of a lift seat to be designed to allow a stop at 16 inches minimum to 19 inches maximum measured from the deck to the top of the seat surface when the seat is in the raised (load) position.

*Comment.* The proposed rule required the height of the lift seat to be 16 inches minimum to 18 inches maximum. Commenters requested a greater range of seat heights to transfer to or from when the lift is in the up position. They suggested a seat height that could accommodate the needs of users of all ages and abilities would be more beneficial.

*Response.* Information obtained from the Board sponsored research project supported the height requirement of a lift seat while in the upper load position to be at a height between 16 and 18 inches from the deck surface. In response to the comments received, the final rule departs slightly from the proposed rule, by permitting the lift seat to make a stop at the 16 to 19 inch height above the deck surface. The lift

could provide additional stops at various heights provided that a stop is provided between 16 and 19 inches above the surface of the deck.

#### *Section 15.8.5.5 Seat Width*

This section requires a lift seat to be 16 inches wide minimum. No substantive comment was received and no changes have been made to this section in the final rule.

*Comment.* The proposed rule sought information on the different types of seats that are available on pool lifts and whether a specific type should be required in the final rule. Commenters did not provide a consensus on either the type of pool lift seat or the type of materials preferred by pool lift users.

*Response.* The final rule does not specify the type of material or the type of seat to be provided by a pool lift. Persons with disabilities involved in the Board sponsored research project expressed interest in all types of seats. An appendix note provides additional information on pool lift seats.

#### *Section 15.8.5.6 Footrests and Armrests*

This section requires footrests to be provided and that they move in conjunction with the seat. Additionally, this provision requires that, if provided, the armrest opposite the water be removable or fold clear of the seat when the seat is in the raised (load) position.

*Comment.* The proposed rule requested information on the appropriateness of requiring armrests on pool lifts and on their size and location. Commenters supported requirements based on their own personal needs with no consistent guidance on the location or size of armrests on a pool lift. One commenter questioned the appropriateness of providing a footrest on a lift for entry into a spa due to the water depth in some smaller spas.

*Response.* An exception has been added that provides that footrests are not required on pool lifts that provide an accessible means of entry into a spa. An appendix note encourages the use of a footrest in larger spas where possible and some type of retractable leg support is recommended for pool lifts used in all spas.

#### *Section 15.8.5.7 Operation*

This section requires that a pool lift be capable of unassisted operation from both the deck and water levels. This section also requires that controls and operating mechanisms be unobstructed when a lift is in use and comply with ADAAG 4.27.4. That section requires that operating controls not require tight grasping, pinching, or twisting of the

wrist or more than 5 pounds of pressure to operate.

*Comment.* The proposed rule required that the lift controls and operating mechanisms may not require continuous manual pressure for operation. Commenters with disabilities supported the requirement of unassisted operation from both the deck and water levels. They reported the difficulty in finding the responsible person when lifts require assistance, especially in environments where pools are not routinely staffed. Commenters expressed concerns about getting out of the water, if assistance is required, especially where the pool is not staffed. Someone could be stranded in the water for extended periods of time awaiting assistance. Commenters suggested that pool lifts that require continuous manual pressure give the user greater control of their descent into the water and ascent back to the deck. Concern was expressed by a manufacturer of pool lifts that providing unassisted operation encourages individuals to swim alone and the potential dangers of causing injury are greatly increased when using an automatic lift without assistance.

*Response.* A large percentage of the respondents in the Board sponsored research project noted the importance of using a lift without assistance. Pool facility staff also indicated the importance of a device or design that could be used without pool staff assistance. While this provision requires the lift to be independently operable it does not preclude assistance from being provided. The final rule removes the requirement that pool lifts may not require continuous manual pressure for operation.

*Comment.* A few commenters expressed safety concerns where pool lifts are provided in pools that are unattended.

*Response.* Pool lifts have been commercially available for over 20 years. While the Board recognizes that inappropriate use of pool lifts may result in accident or injury, the Board is not aware of any incidents of injury or accidents involving pool lifts. The Board is also not aware of any evidence that shows that pool lifts are any less safe than other components of a pool facility, such as other means of pool entry, when they are used inappropriately. Manufacturers are also incorporating features which are intended to discourage inappropriate use, such as fold-up seats and covers.

#### *Section 15.8.5.8 Submerged Depth*

This section requires that a pool lift be designed so that the seat will

submerge to a water depth of 18 inches minimum. This depth is necessary to ensure buoyancy for the person on the lift seat once in the water. No substantive comment was received and no changes have been made to this section for the final rule.

#### *Section 15.8.5.9 Lifting Capacity*

This section requires that single person pool lifts provide a minimum weight capacity of 300 pounds. Lifts also must be capable of sustaining a static load of at least one and a half times the rated load.

*Comment.* The proposed rule required pool lifts to provide a minimum weight capacity of 300 pounds and be capable of sustaining a static load of at least three times the rated load. Several pool lift manufacturers supported the minimum weight requirement of 300 pounds. They questioned requiring a static load of three times the weight limit. They believed it was too excessive and would eliminate viable lifts from being provided. A commenter suggested that the static load requirement reference an international standard for lifts that require a static load of 1.6 times the weight capacity.

*Response.* The static load requirement has been reduced to one and a half times the weight capacity requirement.

#### *Section 15.8.6 Sloped Entries*

This section provides technical requirements for sloped entries designed to provide access into the water. Due to the similarities of this type of entry with ramps used in other buildings and facilities, existing ADAAG requirements have been referenced accordingly.

##### *Section 15.8.6.1 Sloped Entries*

This section requires sloped entries to comply with ADAAG 4.3 (Accessible Route), except for slip resistance.

*Comment.* Commenters questioned the ability of providing a slip resistant surface on a sloped entry that is under water.

*Response.* The final rule provides an exception for sloped entries from being slip resistant.

##### *Section 15.8.6.2 Submerged Depth*

This section requires sloped entries to extend to a depth of 24 to 30 inches below the stationary water level. This section also requires that where landings are required by ADAAG 4.8, at least one landing must be located between 24 and 30 inches below the stationary water level. Since wading pools are typically less than 24 to 30 inches deep, an exception provides that sloped entries are only required to

extend to the deepest part of a wading pool. No substantive comment was received and no changes have been made to this section in the final rule.

##### *Section 15.8.6.3 Handrails*

This section requires handrails that comply with ADAAG 4.8.5 on both sides of all sloped entries. The clear width between handrails must be between 33 and 38 inches. Exception 1 does not require handrail extensions to be provided at the bottom of a landing serving a sloped entry. Exception 2 does not require the clear width between handrails where a sloped entry is provided for wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area. Exception 3 exempts sloped entries in wading pools from providing handrails.

*Comment.* The proposed rule did not specifically address handrails in wading pools. Commenters expressed great concern about the potential dangers from children using handrails to play on or jump into the shallow water or the risk to other children in the wading pool.

*Response.* The Board is concerned about the potential dangers to children using handrails inappropriately. Exception 3 has been added to the final rule exempting wading pools from providing handrails.

#### *Section 15.8.7 Transfer Walls*

This section provides technical requirements for transfer walls.

##### *Section 15.8.7.1 Clear Deck Space*

This section requires clear deck space of 60 inches by 60 inches minimum with a slope not steeper than 1:48 to be provided at the base of a transfer wall. Where one grab bar is provided on a transfer wall, the clear deck space must be centered on the grab bar. This allows sufficient space for a transfer on either side of the grab bar. Where two grab bars are provided, the clear deck space must be centered on the clearance between the grab bars. No substantive comment was received and no changes have been made to this section for the final rule.

##### *Section 15.8.7.2 Height*

This section requires the height of transfer walls to be 16 to 19 inches measured from the deck below. The height requirement is consistent with pool lift seat heights and similarly addresses the needs of some children. The maximum height above the deck has been changed to 19 inches to be consistent with other transfer heights in ADAAG.

##### *Section 15.8.7.3 Wall Depth and Length*

This section requires the depth of a transfer wall to be 12 to 16 inches. As a minimum, the 12 inch depth of the transfer wall provides adequate space for a person to comfortably sit on the surface of the wall. The wall depth is limited to 16 inches maximum so that users are not required to traverse the wall to transfer to the water. The length of the transfer wall must be 60 inches minimum and must be centered on the clear deck space.

##### *Section 15.8.7.4 Surface*

This section requires that the surface of a transfer wall must not be sharp and must have rounded edges. Commenters overwhelmingly supported this section and no changes have been made to this section for the final rule.

##### *Section 15.8.7.5 Grab Bars*

This section requires at least one grab bar to be provided on a transfer wall. Grab bars are required to be perpendicular to the pool wall and extend the full depth of the wall. The top of the gripping surface must be 4 to 6 inches above the wall. Where two grab bars are provided, clearance between grab bars must be 24 inches minimum. Where one grab bar is provided, clearance must be 24 inches minimum on both sides of the grab bar. Grab bars must comply with ADAAG 4.26.

*Comment.* The proposed rule required the top of the gripping surface to be a maximum of 4 inches above the wall. Commenters expressed concern that 4 inches maximum above the wall surface, after factoring in the diameter of the grab bar, would not provide sufficient gripping space for persons transferring.

*Response.* The final rule provides a range from 4 to 6 inches above the wall to the top of the gripping surface. The range will provide greater flexibility and incorporate the diameter of the grab bar in providing users of all ages and abilities with an appropriate gripping surface.

##### *Section 15.8.8 Transfer Systems*

This section provides technical requirements for transfer systems used as a means of access into the water. A transfer system consists of a transfer platform, combined with a series of transfer steps that descend into the water. Users must transfer from their wheelchair or mobility device to the transfer platform and continue transferring from step to step.

#### Section 15.8.8.1 Transfer Platform

This section requires a transfer platform to be 19 inches deep by 24 inches wide. Transfer platforms must be provided at the head of each transfer system. No substantive comment was received and no changes have been made to this section for the final rule.

#### Section 15.8.8.2 Clear Deck Space

This section requires a clear deck space of 60 by 60 inches minimum with a slope not steeper than 1:48 at the base of the transfer platform. A level unobstructed space at the base of the transfer platform, centered along the 24 inch side, is necessary to facilitate a transfer from a wheelchair or mobility device. No substantive comment was received and no changes have been made to this section for the final rule.

#### Section 15.8.8.3 Height

This section requires the height of transfer platforms to be 16 to 19 inches measured from the deck. No substantive comment was received and no changes have been made to this section for the final rule.

#### Section 15.8.8.4 Transfer Steps

This section requires transfer steps to be 8 inches maximum in height. It also requires that transfer steps extend to a water depth of 18 inches minimum.

*Comment.* The proposed rule required transfer steps to be 7 inches maximum in height. Commenters questioned the inconsistencies between the transfer step height of 8 inches required on a play area transfer step (15.6.5.2.2) to that provided in an aquatic setting.

*Response.* The final rule has been changed to require an 8 inch maximum step height in aquatic settings to be consistent with the play areas transfer step (15.6.5.2.2). An appendix note has been included recommending the height of the transfer step be minimized whenever possible.

#### Section 15.8.8.5 Surface

This section requires that the surface of a transfer system must not be sharp and provide rounded edges. Similar to other transfer surfaces, this is necessary to reduce the potential for injury. No substantive comment was received and no changes have been made to this section in the final rule.

#### Section 15.8.8.6 Size

This section requires each transfer step to have a tread depth of 14 to 17 inches and a minimum tread width of 24 inches.

*Comment.* The proposed rule required a range for the transfer step depth from 12 to 17 inches and a tread width of 22

inches minimum. Commenters pointed out the inconsistencies between the size of the transfer step in the play areas final rule (15.6.5.2.1) and for swimming pools.

*Response.* In an effort to provide uniformity between the play areas transfer steps and those located at swimming pools, the final rule modifies the transfer step to incorporate a range of 14 to 17 inches in depth and a minimum width of 24 inches.

#### Section 15.8.8.7 Grab Bars

This section requires one grab bar to be provided on each step and the transfer platform, or a continuous grab bar serving each transfer step and the transfer platform. Where provided on each step, the top of the gripping surface must be 4 to 6 inches above each step. Where a continuous grab bar is provided, the top of the gripping surface must be 4 to 6 inches above the step nosing. Grab bars must comply with ADAAG 4.26 and be located on at least one side of the transfer system. The grab bar located at the transfer platform must not obstruct transfer.

*Comment.* As previously discussed in section 15.8.7.5, the proposed rule required the top of the gripping surface to be 4 inches above the wall.

Commenters expressed concern that 4 inches above the wall surface, after factoring in the diameter of the grab bar, would not provide sufficient space for persons transferring.

*Response.* The final rule requires the top of the gripping surface to be 4 to 6 inches above the wall. It is believed that the range will provide greater flexibility to users of all ages and abilities with an appropriate gripping surface.

#### Section 15.8.9 Pool Stairs

This section provides technical requirements for pool stairs used as a means of entry and exit to the water.

##### Section 15.8.9.1 Pool Stairs

This section requires pool stairs to comply with ADAAG 4.9 (Stairs), except as modified. ADAAG 4.9 has been referenced since stairs in pools are used in a similar manner as stairs elsewhere. No substantive comment was received and no changes have been made to this section in the final rule.

##### Section 15.8.9.2 Handrails

This section requires the width between handrails to be 20 to 24 inches. To reduce the potential for underwater protrusions, handrail extensions are not required at the bottom landing serving a pool stair.

*Comment.* The proposed rule required a 22 inch maximum width between

handrails on pool stairs. Commenters expressed concern that a maximum distance of 22 inches may be too close for people that are large in size. Commenters with mobility impairments supported the handrail distance of 22 inches for providing the needed support while entering a pool by stairs.

*Response.* The final rule increases the maximum width between handrails to 24 inches. Separating the handrails more than 24 inches apart would make them too far apart for a larger class of people that require the support on pool stairs.

#### Section 15.8.10 Water Play Components

This section requires that where water play components are provided, the provisions of 15.6 (Play Areas) and ADAAG 4.3 apply, except where modified by this section.

*Comment.* The proposed rule sought comment on specific features within aquatic recreation facilities where it may be technically infeasible in new construction to comply with the proposed requirements in 15.8. Manufacturers and designers of water play components expressed concerns about having to provide ramp access to elevated play structures in standing water. Many of these components are at considerable distances from the top of the water surface and ramping would be very challenging and costly. Commenters with disabilities or individuals representing individuals with disabilities expressed a great desire to have access to these unique water experiences.

*Response.* The final rule requires that where water play components are provided, they must comply with 15.6 (Play Areas) and ADAAG 4.3, except as modified or otherwise provided in this section. The final rule is responsive to manufacturers and designers by providing an exception to providing ramp access, while providing persons with disabilities the opportunity to enjoy this unique family oriented water experience with their family and friends. Exception 1 exempts accessible routes, clear floor spaces, and maneuvering spaces that are submerged from the requirements for cross slope, running slope, and surface. Exception 2 permits transfer systems to be used in lieu of ramps to connect elevated play components.

#### Regulatory Process Matters

##### Executive Order 12866: Regulatory Planning and Review

This final rule is a significant regulatory action under Executive Order

12866 and has been reviewed by the Office of Management and Budget. The Board has assessed the benefits and costs of the rule. The assessment has been placed in the public docket and is available for inspection. The assessment is also available on the Board's Internet site (<http://www.access-board.gov>). The assessment is summarized below:

#### Benefits

The benefits of the final rule are not quantifiable, but are significant and are consistent with the President's New Freedom Initiative. The primary benefit is the fulfillment of civil rights realized by individuals with disabilities. There are 52.5 million Americans with disabilities. Almost one in five adults has some type of disability. Among individuals 15 years old and over, 25 million have difficulty walking or using stairs. The final guidelines will result in newly constructed and altered recreation facilities that are accessible to individuals with disabilities and will enable them to participate in a wide range of recreational opportunities. Individuals with disabilities can also realize significant health benefits by participating in the range of recreational opportunities made accessible as a result of the final guidelines.

#### Costs

For each type of facility addressed by the final rule, the assessment estimates the number of existing facilities and new facilities constructed annually, identifies the requirements that have cost impacts for new construction and alterations, estimates the unit costs per facility, and calculates the total annual compliance costs. The number of small entities is reported as a percentage of the facilities. To estimate cost impacts, the assessment relies on assumptions where sufficient data is not available. The assumptions are based on interviews with professionals in the affected industries and are disclosed in the assessment. The assumptions cannot be validated and may not reflect the real world. The assumptions may result in under or overestimating the impacts of the final rule. The relevant data for each facility type is presented below.

#### Amusement Rides

*Existing Facilities:* 377 amusement parks.

*New Construction:* 4 new amusement parks per year.

*Small Entities:* 81 percent of amusement parks.

*New Amusement Rides:* 343 new rides per year; 68 will be platform type rides with stepped entrances.

*New Construction Impacts:* New platform type rides with stepped entrances will need a ramp (\$4,000 to \$6,700 unit cost) or a platform lift (\$12,000 to \$15,000 unit cost) to provide an accessible route to the load and unload area; and additional space (\$1,175 unit cost) in the load and unload area to provide wheelchair turning space and wheelchair storage space if a ride seat designed for transfer or transfer device is provided. For purposes of estimating the costs of providing access to new rides, the assessment assumes that a transfer device (\$5,000 unit cost) would be provided for all new rides. New rides will need a sign (\$100 unit cost) at the entrance of the queue or waiting line indicating the type of access provided (e.g., wheelchair access or transfer access).

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* \$2.5 million.

#### Boating Facilities

*Existing Facilities:* 12,000 marinas; no data on boat launch ramps.

*New Construction:* 240 new marinas per year.

*Alterations:* 600 existing marinas per year.

*Small Entities:* 99 percent of marinas.

*New Construction Impacts:* Gangways that are part of an accessible route will need to provide a 1:12 maximum slope or a gangway at least 80 feet long. The unit cost will be site specific. The assessment assumes unit costs will range from \$15,000 to \$35,000 where the maximum vertical level change is more than 2.5 feet, but less than 10 feet; and \$33,000 to \$45,000 where the maximum vertical level change is more than 10 feet. The impacts on new accessible boat slips and new accessible boarding piers at new boat launch ramps will be minimal.

*Alterations Impacts:* Alterations to existing boat slips are a primary function area and may trigger provision of an accessible route, unless the additional cost is disproportionate to the overall costs of the alterations or compliance is technically infeasible. The impacts on altered boat slips will be minimal.

*Total Annual Compliance Costs:* \$10.8 million to \$18.0 million.

#### Fishing Piers and Platforms

*Existing Facilities:* No data.

*New Construction:* No data.

*Small Entities:* No data.

*New Construction Impacts:* Minimal.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* Minimal

#### Golf Courses

*Existing Facilities:* 17,108 golf courses.

*New Construction:* 377 to 524 new golf courses per year.

*Small Entities:* 99 percent of golf courses.

*New Construction Impacts:* Minimal.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* Minimal.

#### Miniature Golf Courses

*Existing Facilities:* 7,500 to 10,000 miniature golf courses.

*New Construction:* 150 new custom design and 170 new modular miniature golf courses per year.

*Small Entities:* 100 percent of miniature golf courses.

*New Construction Impacts:* The assessment discusses potential impacts on new custom design courses (low profile courses, challenge courses, and adventure style courses) and new modular courses (indoor courses and outdoor courses). The impacts on new custom design low profile courses will be minimal. For purposes of estimating the costs for making at least 50 percent of the holes on the other custom design courses accessible, the assessment assumes a 10 percent increase in construction costs for new challenge type courses, and a 25 percent increase for new adventure style courses. New indoor modular courses may need to lease additional space to provide an accessible route for at least 50 percent of the holes, and new outdoor modular courses that are not recessed in the ground will have to provide an accessible route for at least 50 percent of the holes. The assessment assumes the additional cost for new modular courses will \$5,000 per course.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* \$5.4 million.

#### Exercise Equipment, Bowling Lanes, and Shooting Facilities

*Existing Facilities:* 17,531 physical fitness facilities; 5,500 bowling centers; and 10,000 shooting facilities. No data on other facilities that provide exercise equipment.

*New Construction:* 800 to 1,000 new physical fitness facilities; 25 new bowling centers; and 100 new shooting facilities per year.

*Small Entities:* 99 percent of physical fitness facilities; and 100 percent of bowling centers and shooting facilities.

*New Construction Impacts:* Minimal.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* Minimal.

## Swimming Pools, Wading Pools, and Spas

*Existing Facilities:* 124,577 pools; no data on spas.

*New Construction:* 1,245 new pools per year; 565 new spas per year. The assessment assumes 715 new pools per year have less than 300 linear feet of pool wall and will need at least one means of accessible entry into the pool.

*Small Entities:* Ranges from 15 percent for private hospitals to 100 percent for camps and recreational vehicle parks.

*New Construction Impacts:* For new pools with less than 300 linear feet of pool wall, the assessment assumes that a pool lift will be provided (\$4,000 unit cost). For pools with 300 linear feet or more of pool wall, the assessment assumes 250 of these new pools per year will provide an accessible means of entry in the absence of the final rule and will add a pool lift (\$4,000 unit cost). The assessment assumes the other new pools with 300 linear feet or more of pool wall will provide a pool lift (\$4,000 unit cost) and pool stairs (\$2,500 unit cost). The impacts on wading pools will be minimal. The assessment assumes new spas will provide a pool lift (\$4,000 unit cost).

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* \$8.0 million.

### Regulatory Flexibility Act

The final regulatory flexibility analysis has been performed in conjunction with the assessment of the benefits and costs of the final rule required by Executive Order 12866 and the preparation of the preamble for the final rule. The analysis is summarized below.

#### Need for and Objectives of Guidelines

The Access Board is required to issue accessibility guidelines under the Americans with Disabilities Act (ADA) to ensure that new construction and alterations of facilities covered by the law are readily accessible to and usable by individuals with disabilities. Recreation facilities are among the facilities covered by the ADA. Recreation facilities have unique features that are not adequately addressed by the Americans with Disabilities Act Accessibility Guidelines (ADAAG). The final rule will amend ADAAG to provide supplemental guidelines for making recreation facilities accessible.

#### Significant Issues Raised During Public Comment Period

The significant comments raised during the public comment period are

summarized in the preamble to the final rule, along with the Access Board's assessment of the comments and the reason for selecting the alternative adopted in the final rule. The alternatives considered in the proposed rule and the final rule, and changes made from the proposed rule for each type of recreation facility are presented in the assessment of the benefits and costs of the final rule required by Executive Order 12866.

#### Numbers of Small Entities Affected by Final Rule

The numbers of small entities affected by the final rule are reported under the summary of the assessment of the benefits and costs of the final rule required by Executive Order 12866.

#### Reporting and Recordkeeping Requirements

There are no reporting and recordkeeping requirements.

#### Steps Taken To Minimize Significant Economic Impact on Small Entities

The Access Board has taken steps to minimize the significant economic impact on small entities for each of the different types of recreation facilities addressed in the final rule. These steps are listed below.

- *Amusement Rides*—The final rule allows designers and operators of new amusement rides the choice of providing at least one wheelchair space, or an amusement ride seat designed for transfer, or a transfer device. The final rule limits application of the guidelines to existing rides that are altered. The final rule also allows designers and operators greater flexibility in applying ADAAG to amusement rides.

- *Boating Facilities*—The final rule permits gangways that are part of an accessible route to exceed the 1:12 maximum slope requirement for ramps where the total length of the gangways is at least 80 feet (30 feet for smaller facilities with fewer than 25 boat slips). The final rule reduces the number of boat slips required to be accessible in new construction, and modifies the requirements for accessible boat slips in alterations so no more than one boat slip is lost. The final rule also allows designers and operators greater flexibility in applying ADAAG to boating facilities.

- *Fishing Piers and Platforms*—The final rule permits gangways that are part of an accessible route to exceed the maximum 1:12 requirement for ramps where the total length of the gangways is at least 30 feet. The final rule also exempts guards that comply with certain sections of the International

Building Code from the maximum 34 inch height requirement.

- *Golf Courses*—The final rule permits a golf car passage to be provided on golf courses and driving ranges, instead of an accessible route.

- *Miniature Golf Courses*—The final rule requires at least 50 percent of holes on miniature golf courses to be accessible, and permits one break in the sequence of accessible holes provided the last hole in the sequence is the last hole on the course. The final rule also allows designers and operators greater flexibility in applying ADAAG to miniature golf courses.

- *Swimming Pools, Wading Pools, and Spas*—The final rule permits small pools with less than 300 linear feet of pool wall to provide at least one means of access into the water, and permits water play components to use transfer systems to connect elevated water play components.

#### Technical Assistance

The Access Board will provide technical assistance materials to help small entities understand the accessibility guidelines for recreation facilities. The Access Board also operates a toll-free technical assistance service to answer questions from the public about the guidelines.

#### Executive Order 13132: Federalism

The final rule adheres to the fundamental federalism principles and policy making criteria in Executive Order 13132. The final rule implements Federal civil rights legislation that was enacted pursuant to the Congress' authority to enforce the fourteenth amendment and to regulate commerce. Ensuring the civil rights of groups who have experienced irrational discrimination has long been recognized as a national issue and a proper function of the Federal government. The ADA was enacted "to provide a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities \* \* \* and to ensure that the Federal government plays a central role in enforcing the standards established in this chapter on behalf of individuals with disabilities." 42 U.S.C. 12101(b)(1) and (3). The ADA recognizes the authority of State and local governments to enact and enforce laws that "provide greater or equal protection for the rights of individuals with disabilities than are afforded by this chapter." 42 U.S.C. 12201(b). The final rule establishes minimum guidelines. States and local governments can adopt accessibility standards that provide individuals with

disabilities equal or greater access to recreation facilities.

The Access Board has consulted with State and local governments throughout the rulemaking process. The National Recreation and Park Association, States Organization for Boating Access, New Jersey Department of Community Affairs, San Francisco Department of Public Works, and the Hawaii Disability and Communication Access Board represented the interests of State and local governments on the Recreation Access Advisory Committee. State and local governments participated in the public hearings and information meetings held on the NPRM and the draft final rule, and submitted more than 70 comments. Most of the comments were centered on boating facilities. The California Department of Boating and Waterways, Oregon State Marine Board, and Michigan Department of Natural Resources were actively involved in providing information and alternative proposals for consideration during the rulemaking. Approximately 30 other State and local governments joined in supporting the

various proposals submitted by those States.

*Unfunded Mandates Reform Act*

The Unfunded Mandates Reform Act does not apply to proposed or final rules that enforce constitutional rights of individuals or enforce any statutory rights that prohibit discrimination on the basis of race, color, sex, national origin, age, handicap, or disability. Since the final rule is issued under the authority of the Americans with Disabilities Act, an assessment of the rule's effects on State, local, and tribal governments, and the private sector is not required by the Unfunded Mandates Reform Act.

**List of Subjects in 36 CFR Part 1191**

Buildings and facilities, Civil rights, Incorporation by reference, Individuals with disabilities, Transportation.

**Thurman M. Davis, Sr.,**

*Chair, Architectural and Transportation Barriers Compliance Board.*

For the reasons stated in the preamble, part 1191 of title 36 of the Code of Federal Regulations is amended as follows:

**PART 1191—AMERICANS WITH DISABILITIES ACT (ADA) ACCESSIBILITY GUIDELINES FOR BUILDINGS AND FACILITIES**

1. The authority citation for 36 CFR Part 1191 continues to read as follows:

**Authority:** 42 U.S.C. 12204.

2. Appendix A to Part 1191 is amended as follows:

a. By revising the title page and pages i, ii, 1A, 2, 3, 4, 4A, 5 through 11, 58A, and 76 through 81 as set forth below.

b. By removing the blank page following the title page.

c. By adding pages 4B, 11A, 58B, and 82 through 96 as set forth below.

d. In the appendix to Appendix A by revising pages A1, A1A, A16, and A22 through A25 and adding pages A1B, A16A, and A26 through A32 as set forth below.

The additions and revisions read as follows:

**Appendix A to Part 1191—Americans With Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities**

BILLING CODE 8150-01-P

# **Americans with Disabilities Act (ADA)**

### 2.3 Incorporation by Reference.

**2.3.1 General.** The publications listed in 2.3.2 are incorporated by reference in this document. The Director of the Federal Register has approved these materials for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies of the referenced publications may be inspected at the Architectural and Transportation Barriers Compliance Board, 1331 F Street, NW., Suite 1000, Washington, DC; at the Department of Justice, Civil Rights Division, Disability Rights Section, 1425 New York Avenue, NW., Washington, DC; or at the Office of the Federal Register, 800 North Capitol Street, NW., Suite 700, Washington, DC.

**2.3.2 Referenced Publications.** The specific edition of the publications listed below are referenced in this document. Where differences occur between this document and the referenced publications, this document applies.

**2.3.2.1 American Society for Testing and Materials (ASTM) Standards.** Copies of the referenced publications may be obtained from the American Society for Testing and Materials, 100 Bar Harbor Drive, West Conshohocken, Pennsylvania 19428 (<http://www.astm.org>).

ASTM F 1292-99 Standard Specification for Impact Attenuation of Surface Systems Under and Around Playground Equipment (see 15.6.7.2 Ground Surfaces, Use Zones).

ASTM F 1487-98 Standard Consumer Safety Performance Specification for Playground Equipment for Public Use (see 3.5 Definitions, Use Zone).

ASTM F 1951-99 Standard Specification for Determination of Accessibility of Surface Systems Under and Around Playground Equipment (see 15.6.7.1 Ground Surfaces, Accessibility).

**2.3.2.2 International Code Council (ICC) Codes.** Copies of the referenced publications may be obtained from the International Code Council, 5203 Leesburg Pike, Suite 600, Falls Church, VA 22041-3401 (<http://www.intlcode.org>).

International Building Code 2000 (see 15.3.3.2 Height).

### 3.0 Miscellaneous Instructions and Definitions

## 3. MISCELLANEOUS INSTRUCTIONS AND DEFINITIONS.

**3.1 Graphic Conventions.** Graphic conventions are shown in Table 1. Dimensions that are not marked minimum or maximum are absolute, unless otherwise indicated in the text or captions.

**3.2 Dimensional Tolerances.** All dimensions are subject to conventional building industry tolerances for field conditions.

**3.3 Notes.** The text of these guidelines does not contain notes or footnotes. Additional information, explanations, and advisory materials are located in the Appendix.

### 3.4 General Terminology.

comply with. Meet one or more specifications of *these guidelines*.

if, if ... then. Denotes a specification that applies only when the conditions described are present.

may. Denotes an option or alternative.

shall. Denotes a mandatory specification or requirement.

should. Denotes an advisory specification or recommendation.

### 3.5 Definitions.

**Access Aisle.** An accessible pedestrian space between elements, such as parking spaces, seating, and desks, that provides clearances appropriate for use of the elements.

**Accessible.** Describes a site, building, facility, or portion thereof that complies with *these guidelines*.

**Accessible Element.** An *element* specified by *these guidelines* (for example, telephone, controls, and the like).

**Accessible Route.** A continuous unobstructed path connecting all accessible elements and spaces of a building or facility. Interior accessible routes may include corridors, floors, ramps, elevators, lifts, and clear floor space at fixtures. Exterior accessible routes may include parking access aisles, curb ramps, *crosswalks at vehicular ways*, walks, ramps, and lifts.

**Accessible Space.** Space that complies with *these guidelines*.

**Adaptability.** The ability of certain building spaces and elements, such as kitchen counters, sinks, and grab bars, to be added or altered so as to accommodate the needs of *individuals with or without disabilities* or to accommodate the needs of persons with different types or degrees of disability.

**Addition.** *An expansion, extension, or increase in the gross floor area of a building or facility.*

**Administrative Authority.** A governmental agency that adopts or enforces regulations and *guidelines* for the design, construction, or *alteration* of buildings and facilities.

**Alteration.** *An alteration is a change to a building or facility that affects or could affect the usability of the building or facility or part thereof. Alterations include, but are not limited to, remodeling, renovation, rehabilitation, reconstruction, historic restoration, resurfacing of circulation paths or vehicular ways, changes or rearrangement of the structural parts or elements, and changes or rearrangement in the plan configuration of walls and full-height partitions. Normal maintenance, reroofing, painting or wallpapering, or changes to mechanical and electrical systems are not alterations unless they affect the usability of the building or facility.*

**Amusement Attraction.** *Any facility, or portion of a facility, located within an amusement park or theme park which provides amusement without*

*the use of an amusement device. Examples include, but are not limited to, fun houses, barrels, and other attractions without seats.*

**Amusement Ride.** *A system that moves persons through a fixed course within a defined area for the purpose of amusement.*

**Amusement Ride Seat.** *A seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers.*

**Area of Rescue Assistance.** *An area, which has direct access to an exit, where people who are unable to use stairs may remain temporarily in safety to await further instructions or assistance during emergency evacuation.*

**Area of Sport Activity.** *That portion of a room or space where the play or practice of a sport occurs.*

**Assembly Area.** *A room or space accommodating a group of individuals for recreational, educational, political, social, civic, or amusement purposes, or for the consumption of food and drink.*

**Automatic Door.** *A door equipped with a power-operated mechanism and controls that open and close the door automatically upon receipt of a momentary actuating signal. The switch that begins the automatic cycle may be a photoelectric device, floor mat, or manual switch (see power-assisted door).*

**Boarding Pier.** *A portion of a pier where a boat is temporarily secured for the purpose of embarking or disembarking.*

**Boat Launch Ramp.** *A sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.*

**Boat Slip.** *That portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.*

**Building.** *Any structure used and intended for supporting or sheltering any use or occupancy.*

**Catch Pool.** *A pool or designated section of a pool used as a terminus for water slide flumes.*

**Circulation Path.** *An exterior or interior way of passage from one place to another for pedestrians, including, but not limited to, walks, hallways, courtyards, stairways, and stair landings.*

**Clear.** *Unobstructed.*

**Clear Floor Space.** *The minimum unobstructed floor or ground space required to accommodate a single, stationary wheelchair and occupant.*

**Closed Circuit Telephone.** *A telephone with dedicated line(s) such as a house phone, courtesy phone or phone that must be used to gain entrance to a facility.*

**Common Use.** *Refers to those interior and exterior rooms, spaces, or elements that are made available for the use of a restricted group of people (for example, occupants of a homeless shelter, the occupants of an office building, or the guests of such occupants).*

**Cross Slope.** *The slope that is perpendicular to the direction of travel (see running slope).*

**Curb Ramp.** *A short ramp cutting through a curb or built up to it.*

**Detectable Warning.** *A standardized surface feature built in or applied to walking surfaces or other elements to warn visually impaired people of hazards on a circulation path.*

**Egress, Means of.** *A continuous and unobstructed way of exit travel from any point in a building or facility to a public way. A means of egress comprises vertical and horizontal travel and may include intervening room spaces, doorways, hallways, corridors, passageways, balconies, ramps, stairs, enclosures, lobbies, horizontal exits, courts and yards. An accessible means of egress is one that complies with these guidelines and does not include stairs, steps, or escalators. Areas of rescue assistance or evacuation elevators*

### 3.5 Definitions

may be included as part of accessible means of egress.

**Element.** *An architectural or mechanical component of a building, facility, space, or site, e.g., telephone, curb ramp, door, drinking fountain, seating, or water closet.*

**Elevated Play Component.** *A play component that is approached above or below grade and that is part of a composite play structure consisting of two or more play components attached or functionally linked to create an integrated unit providing more than one play activity.*

**Entrance.** *Any access point to a building or portion of a building or facility used for the purpose of entering. An entrance includes the approach walk, the vertical access leading to the entrance platform, the entrance platform itself, vestibules if provided, the entry door(s) or gate(s) and the hardware of the entry door(s) or gate(s).*

**Facility.** *All or any portion of buildings, structures, site improvements, complexes, equipment, roads, walks, passageways, parking lots, or other real or personal property located on a site.*

**Gangway.** *A variable-sloped pedestrian walkway that links a fixed structure or land with a floating structure. Gangways which connect to vessels are not included.*

**Golf Car Passage.** *A continuous passage on which a motorized golf car can operate.*

**Ground Floor.** *Any occupiable floor less than one story above or below grade with direct access to grade. A building or facility always has at least one ground floor and may have more than one ground floor as where a split level entrance has been provided or where a building is built into a hillside.*

**Ground Level Play Component.** *A play component that is approached and exited at the ground level.*

**Mezzanine or Mezzanine Floor.** *That portion of a story which is an intermediate floor level placed within the story and having occupiable space above and below its floor.*

**Marked Crossing.** *A crosswalk or other identified path intended for pedestrian use in crossing a vehicular way.*

**Multifamily Dwelling.** *Any building containing more than two dwelling units.*

**Occupiable.** *A room or enclosed space designed for human occupancy in which individuals congregate for amusement, educational or similar purposes, or in which occupants are engaged at labor, and which is equipped with means of egress, light, and ventilation.*

**Operable Part.** *A part of a piece of equipment or appliance used to insert or withdraw objects, or to activate, deactivate, or adjust the equipment or appliance (for example, coin slot, push button, handle).*

**Path of Travel.** (Reserved).

**Play Area.** *A portion of a site containing play components designed and constructed for children.*

**Play Component.** *An element intended to generate specific opportunities for play, socialization, or learning. Play components may be manufactured or natural, and may be stand alone or part of a composite play structure.*

**Power-assisted Door.** *A door used for human passage with a mechanism that helps to open the door, or relieves the opening resistance of a door, upon the activation of a switch or a continued force applied to the door itself.*

**Private Facility.** *A place of public accommodation or a commercial facility subject to title III of the ADA and 28 CFR part 36 or a transportation facility subject to title III of the ADA and 49 CFR 37.45.*

**Public Facility.** *A facility or portion of a facility constructed by, on behalf of, or for the use of a public entity subject to title II of the ADA and 28 CFR part 35 or to title II of the ADA and 49 CFR 37.41 or 37.43.*

**Public Use.** Describes interior or exterior rooms or spaces that are made available to the general public. Public use may be provided at a building or facility that is privately or publicly owned.

**Ramp.** A walking surface which has a running slope greater than 1:20.

**Running Slope.** The slope that is parallel to the direction of travel (see cross slope).

**Service Entrance.** An entrance intended primarily for delivery of goods or services.

**Signage.** *Displayed* verbal, symbolic, *tactile*, and pictorial information.

**Site.** A parcel of land bounded by a property line or a designated portion of a public right-of-way.

**Site Improvement.** Landscaping, paving for pedestrian and vehicular ways, outdoor lighting, recreational facilities, and the like, added to a site.

**Sleeping Accommodations.** Rooms in which people sleep; for example, dormitory and hotel or motel guest rooms or suites.

**Soft Contained Play Structure.** *A play structure made up of one or more components where the user enters a fully enclosed play environment that utilizes pliable materials (e.g., plastic, netting, fabric).*

**Space.** *A definable area, e.g., room, toilet room, hall, assembly area, entrance, storage room, alcove, courtyard, or lobby.*

**Story.** *That portion of a building included between the upper surface of a floor and upper surface of the floor or roof next above. If such portion of a building does not include occupiable space, it is not considered a story for purposes of these guidelines. There may be more than one*

*floor level within a story as in the case of a mezzanine or mezzanines.*

**Structural Frame.** The structural frame shall be considered to be the columns and the girders, beams, trusses and spandrels having direct connections to the columns and all other members which are essential to the stability of the building as a whole.

**TDD.** *(Telecommunication Devices for the Deaf). See text telephone.*

**TTY (Tele-Typewriter).** *See text telephone.*

**Tactile.** Describes an object that can be perceived using the sense of touch.

**Technically Infeasible.** *See 4.1.6(1)(j) EXCEPTION.*

**Teeing Ground.** *In golf, the starting place for the hole to be played.*

**Text Telephone (TTY).** *Machinery or equipment that employs interactive text based communications through the transmission of coded signals across the standard telephone network. Text telephones can include, for example, devices known as TDDs (telecommunication display devices or telecommunication devices for deaf persons) or computers with special modems. Text telephones are also called TTYs, an abbreviation for tele-typewriter.*

**Transient Lodging.\*** *A building, facility, or portion thereof, excluding inpatient medical care facilities and residential facilities, that contains sleeping accommodations. Transient lodging may include, but is not limited to, resorts, group homes, hotels, motels, and dormitories.*

**Transfer Device.** *Equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat.*

**Transition Plate.** *A sloping pedestrian walking surface located at the end(s) of a gangway.*

### 3.5 Definitions

**Use Zone.** *The ground level area beneath and immediately adjacent to a play structure or equipment that is designated by ASTM F 1487 Standard Consumer Safety Performance Specification for Playground Equipment for Public Use (incorporated by reference, see 2.3.2) for unrestricted circulation around the equipment and on whose surface it is predicted that a user would land when falling from or exiting the equipment.*

**Vehicular Way.** A route intended for vehicular traffic, such as a street, driveway, or parking lot.

**Walk.** An exterior pathway with a prepared surface intended for pedestrian use, including general pedestrian areas such as plazas and courts.

## 4.0 Accessible Elements and Spaces: Scope and Technical Requirements

Note: Sections 4.1.1 through 4.1.7 are different from ANSI A117.1 in their entirety and are printed in standard type (ANSI A117.1 does not include scoping provisions).

### **4. ACCESSIBLE ELEMENTS AND SPACES: SCOPE AND TECHNICAL REQUIREMENTS.**

#### **4.1 Minimum Requirements**

##### **4.1.1\* Application.**

(1) General. All areas of newly designed or newly constructed buildings and facilities and altered portions of existing buildings and facilities shall comply with section 4, unless otherwise provided in this section or as modified in a special application section.

(2) Application Based on Building Use. Special application sections provide additional requirements based on building use. When a building or facility contains more than one use covered by a special application section, each portion shall comply with the requirements for that use.

(3)\* Areas Used Only by Employees as Work Areas. Areas that are used only as work areas shall be designed and constructed so that individuals with disabilities can approach, enter, and exit the areas. These guidelines do not require that any areas used only as work areas be constructed to permit maneuvering within the work area or be constructed or equipped (i.e., with racks or shelves) to be accessible.

(4) Temporary Structures. These guidelines cover temporary buildings or facilities as well as permanent facilities. Temporary buildings and facilities are not of permanent construction but are extensively used or are essential for public use for a period of time. Examples of temporary buildings or facilities covered by these guidelines include, but are not limited to: reviewing stands, temporary classrooms, bleacher areas, exhibit

areas, temporary banking facilities, temporary health screening services, or temporary safe pedestrian passageways around a construction site. Structures, sites and equipment directly associated with the actual processes of construction, such as scaffolding, bridging, materials hoists, or construction trailers are not included.

##### (5) General Exceptions.

(a) In new construction, a person or entity is not required to meet fully the requirements of these guidelines where that person or entity can demonstrate that it is structurally impracticable to do so. Full compliance will be considered structurally impracticable only in those rare circumstances when the unique characteristics of terrain prevent the incorporation of accessibility features. If full compliance with the requirements of these guidelines is structurally impracticable, a person or entity shall comply with the requirements to the extent it is not structurally impracticable. Any portion of the building or facility which can be made accessible shall comply to the extent that it is not structurally impracticable.

##### (b) Accessibility is not required to or in:

(i) raised areas used primarily for purposes of security or life or fire safety, including, but not limited to, observation or lookout galleries, prison guard towers, fire towers, or fixed life guard stands;

(ii) non-occupiable spaces accessed only by ladders, catwalks, crawl spaces, very narrow passageways, tunnels, or freight (non-passenger) elevators, and frequented only by service personnel for maintenance, repair, or occasional monitoring of equipment; such spaces may include, but are not limited to, elevator pits, elevator penthouses, piping or equipment catwalks, water or sewage treatment pump rooms and stations, electric substations and transformer vaults, and highway and tunnel utility facilities;

(iii) single occupant structures accessed only by a passageway that is below grade or that is

**4.1.2 Accessible Sites and Exterior Facilities: New Construction**

elevated above standard curb height, including, but not limited to, toll booths accessed from underground tunnels;

(iv) raised structures used solely for refereeing, judging, or scoring a sport;

(v) water slides;

(vi) animal containment areas that are not for public use; or

(vii) raised boxing or wrestling rings.

**4.1.2 Accessible Sites and Exterior Facilities: New Construction.** An accessible site shall meet the following minimum requirements:

(1) At least one accessible route complying with 4.3 shall be provided within the boundary of the site from public transportation stops, accessible parking spaces, passenger loading zones if provided, and public streets or sidewalks, to an accessible building entrance.

(2) (a) At least one accessible route complying with 4.3 shall connect accessible buildings, accessible facilities, accessible elements, and accessible spaces that are on the same site.

(b)\* Court Sports: An accessible route complying with 4.3 shall directly connect both sides of the court in court sports.

(3) All objects that protrude from surfaces or posts into circulation paths shall comply with 4.4.

EXCEPTION: The requirements of 4.4 shall not apply within an area of sport activity.

(4) Ground surfaces along accessible routes and in accessible spaces shall comply with 4.5.

EXCEPTION 1\*: The requirements of 4.5 shall not apply within an area of sport activity.

EXCEPTION 2\*: Animal containment areas designed and constructed for public use shall not be required to provide stable, firm, and slip resistant ground and floor surfaces and shall not be required to comply with 4.5.2.

(5) (a) If parking spaces are provided for self-parking by employees or visitors, or both, then accessible spaces complying with 4.6 shall be provided in each such parking area in conformance with the table below. Spaces required by the table need not be provided in the particular lot. They may be provided in a different location if equivalent or greater accessibility, in terms of distance from an accessible entrance, cost and convenience is ensured.

TOTAL PARKING IN LOT	REQUIRED MINIMUM NUMBER OF ACCESSIBLE SPACES
1 to 25	1
26 to 50	2
51 to 75	3
76 to 100	4
101 to 150	5
151 to 200	6
201 to 300	7
301 to 400	8
401 to 500	9
501 to 1000	2 percent of total
1001 and over	20 plus 1 for each 100 over 1000

Except as provided in (b), access aisles adjacent to accessible spaces shall be 60 in (1525 mm) wide minimum.

(b) One in every eight accessible spaces, but not less than one, shall be served by an access aisle 96 in (2440 mm) wide minimum and shall be designated "van accessible" as required by 4.6.4. The vertical clearance at such spaces shall comply with 4.6.5. All such spaces may be grouped on one level of a parking structure.

EXCEPTION: Provision of all required parking spaces in conformance with "Universal Parking Design" (see appendix A4.6.3) is permitted.

(c) If passenger loading zones are provided, then at least one passenger loading zone shall comply with 4.6.6.

(d) At facilities providing medical care and other services for persons with mobility

### 4.1.3 Accessible Buildings: New Construction

impairments, parking spaces complying with 4.6 shall be provided in accordance with 4.1.2(5)(a) except as follows:

(i) Outpatient units and facilities: 10 percent of the total number of parking spaces provided serving each such outpatient unit or facility;

(ii) Units and facilities that specialize in treatment or services for persons with mobility impairments: 20 percent of the total number of parking spaces provided serving each such unit or facility.

(e)\* Valet parking: Valet parking facilities shall provide a passenger loading zone complying with 4.6.6 located on an accessible route to the entrance of the facility. Paragraphs 5(a), 5(b), and 5(d) of this section do not apply to valet parking facilities.

(6) If toilet facilities are provided on a site, then each such public or common use toilet facility shall comply with 4.22. If bathing facilities are provided on a site, then each such public or common use bathing facility shall comply with 4.23.

For single user portable toilet or bathing units clustered at a single location, at least five percent but no less than one toilet unit or bathing unit complying with 4.22 or 4.23 shall be installed at each cluster whenever typical inaccessible units are provided. Accessible units shall be identified by the International Symbol of Accessibility.

EXCEPTION: Portable toilet units at construction sites used exclusively by construction personnel are not required to comply with 4.1.2(6).

(7) Building Signage. Signs which designate permanent rooms and spaces shall comply with 4.30.1, 4.30.4, 4.30.5 and 4.30.6. Other signs which provide direction to, or information about, functional spaces of the building shall comply with 4.30.1, 4.30.2, 4.30.3, and 4.30.5. Elements and spaces of accessible facilities which shall be identified by the International Symbol of

Accessibility and which shall comply with 4.30.7 are:

(a) Parking spaces designated as reserved for individuals with disabilities;

(b) Accessible passenger loading zones;

(c) Accessible entrances when not all are accessible (inaccessible entrances shall have directional signage to indicate the route to the nearest accessible entrance);

(d) Accessible toilet and bathing facilities when not all are accessible.

**4.1.3 Accessible Buildings: New Construction.** Accessible buildings and facilities shall meet the following minimum requirements:

(1) (a) At least one accessible route complying with 4.3 shall connect accessible building or facility entrances with all accessible spaces and elements within the building or facility.

(b)\* Court Sports: An accessible route complying with 4.3 shall directly connect both sides of the court in court sports.

(2) All objects that overhang or protrude into circulation paths shall comply with 4.4.

EXCEPTION: The requirements of 4.4 shall not apply within an area of sport activity.

(3) Ground and floor surfaces along accessible routes and in accessible rooms and spaces shall comply with 4.5.

EXCEPTION 1\*: The requirements of 4.5 shall not apply within an area of sport activity.

EXCEPTION 2\*: Animal containment areas designed and constructed for public use shall not be required to provide stable, firm, and slip resistant ground and floor surfaces and shall not be required to comply with 4.5.2.

(4) Interior and exterior stairs connecting levels that are not connected by an elevator, ramp, or

### 4.1.3 Accessible Buildings: New Construction

other accessible means of vertical access shall comply with 4.9.

(5)\* One passenger elevator complying with 4.10 shall serve each level, including mezzanines, in all multi-story buildings and facilities unless exempted below. If more than one elevator is provided, each passenger elevator shall comply with 4.10.

EXCEPTION 1: Elevators are not required in:

(a) private facilities that are less than three stories or that have less than 3000 square feet per story unless the building is a shopping center, a shopping mall, or the professional office of a health care provider, or another type of facility as determined by the Attorney General; or

(b) public facilities that are less than three stories and that are not open to the general public if the story above or below the accessible ground floor houses no more than five persons and is less than 500 square feet. Examples may include, but are not limited to, drawbridge towers and boat traffic towers, lock and dam control stations, and train dispatching towers.

The elevator exemptions set forth in paragraphs (a) and (b) do not obviate or limit in any way the obligation to comply with the other accessibility requirements established in section 4.1.3. For example, floors above or below the accessible ground floor must meet the requirements of this section except for elevator service. If toilet or bathing facilities are provided on a level not served by an elevator, then toilet or bathing facilities must be provided on the accessible ground floor. In new construction, if a building or facility is eligible for exemption but a passenger elevator is nonetheless planned, that elevator shall meet the requirements of 4.10 and shall serve each level in the building. A passenger elevator that provides service from a garage to only one level of a building or facility is not required to serve other levels.

EXCEPTION 2: Elevator pits, elevator penthouses, mechanical rooms, piping or equipment catwalks are exempted from this requirement.

EXCEPTION 3: Accessible ramps complying with 4.8 may be used in lieu of an elevator.

EXCEPTION 4: Platform lifts (wheelchair lifts) complying with 4.11 of this guideline and applicable State or local codes may be used in lieu of an elevator only under the following conditions:

(a) To provide an accessible route to a performing area in an assembly occupancy.

(b) To comply with the wheelchair viewing position line-of-sight and dispersion requirements of 4.33.3.

(c) To provide access to incidental occupiable spaces and rooms which are not open to the general public and which house no more than five persons, including but not limited to equipment control rooms and projection booths.

(d) To provide access where existing site constraints or other constraints make use of a ramp or an elevator infeasible.

(e) To provide access to raised judges' benches, clerks' stations, speakers' platforms, jury boxes and witness stands or to depressed areas such as the well of a court.

(f)\* To provide access to player seating areas serving an area of sport activity.

EXCEPTION 5: Elevators located in air traffic control towers are not required to serve the cab and the floor immediately below the cab.

(6) Windows: (Reserved).

(7) Doors:

(a) At each accessible entrance to a building or facility, at least one door shall comply with 4.13.

(b) Within a building or facility, at least one door at each accessible space shall comply with 4.13.

(c) Each door that is an element of an accessible route shall comply with 4.13.

### 4.1.3 Accessible Buildings: New Construction

(d) Each door required by 4.3.10, Egress, shall comply with 4.13.

(8)\* The requirements in (a) and (b) below shall be satisfied independently:

(a)(i) At least 50 percent of all public entrances (excluding those in (b) below) shall comply with 4.14. At least one must be a ground floor entrance. Public entrances are any entrances that are not loading or service entrances.

(ii) Accessible public entrances must be provided in a number at least equivalent to the number of exits required by the applicable building or fire codes. (This paragraph does not require an increase in the total number of public entrances planned for a facility.)

(iii) An accessible public entrance must be provided to each tenancy in a facility (for example, individual stores in a strip shopping center).

(iv) In detention and correctional facilities subject to section 12, public entrances that are secured shall be accessible as required by 12.2.1.

One entrance may be considered as meeting more than one of the requirements in (a). Where feasible, accessible public entrances shall be the entrances used by the majority of people visiting or working in the building.

(b)(i) In addition, if direct access is provided for pedestrians from an enclosed parking garage to the building, at least one direct entrance from the garage to the building must be accessible.

(ii) If access is provided for pedestrians from a pedestrian tunnel or elevated walkway, one entrance to the building from each tunnel or walkway must be accessible.

(iii) In judicial, legislative, and regulatory facilities subject to section 11, restricted and secured entrances shall be accessible in the number required by 11.1.1.

One entrance may be considered as meeting more than one of the requirements in (b).

Because entrances also serve as emergency exits whose proximity to all parts of buildings and facilities is essential, it is preferable that all entrances be accessible.

(c) If the only entrance to a building, or tenancy in a facility, is a service entrance, that entrance shall be accessible.

(d) Entrances which are not accessible shall have directional signage complying with 4.30.1, 4.30.2, 4.30.3, and 4.30.5, which indicates the location of the nearest accessible entrance.

(9)\* In buildings or facilities, or portions of buildings or facilities, required to be accessible, accessible means of egress shall be provided in the same number as required for exits by local building/life safety regulations. Where a required exit from an occupiable level above or below a level of accessible exit discharge is not accessible, an area of rescue assistance shall be provided on each such level (in a number equal to that of inaccessible required exits). Areas of rescue assistance shall comply with 4.3.11. A horizontal exit, meeting the requirements of local building/life safety regulations, shall satisfy the requirement for an area of rescue assistance.

EXCEPTION: Areas of rescue assistance are not required in buildings or facilities having a supervised automatic sprinkler system.

(10)\* Drinking Fountains:

(a) Where only one drinking fountain is provided on a floor there shall be a drinking fountain which is accessible to individuals who use wheelchairs in accordance with 4.15 and one accessible to those who have difficulty bending or stooping. (This can be accommodated by the use of a "hi-lo" fountain; by providing one fountain accessible to those who use wheelchairs and one fountain at a standard height convenient for those who have difficulty bending; by providing a fountain accessible under 4.15 and a water cooler; or by such other means as would achieve the required accessibility for each group on each floor.)

**4.1.3 Accessible Buildings: New Construction**

(b) Where more than one drinking fountain or water cooler is provided on a floor, 50% of those provided shall comply with 4.15 and shall be on an accessible route.

(11) Toilet Facilities: If toilet rooms are provided, then each public and common use toilet room shall comply with 4.22. Other toilet rooms provided for the use of occupants of specific spaces (i.e., a private toilet room for the occupant of a private office) shall be adaptable. If bathing rooms are provided, then each public and common use bathroom shall comply with 4.23. Accessible toilet rooms and bathing facilities shall be on an accessible route.

(12) Storage, Shelving and Display Units:

(a) If fixed or built-in storage facilities such as cabinets, shelves, closets, and drawers are provided in accessible spaces, at least one of each type provided shall contain storage space complying with 4.25. Additional storage may be provided outside of the dimensions required by 4.25.

(b) Shelves or display units allowing self-service by customers in mercantile occupancies shall be located on an accessible route complying with 4.3. Requirements for accessible reach range do not apply.

(c)\* Where lockers are provided in accessible spaces, at least 5 percent, but not less than one, of each type of locker shall comply with 4.25.

(13) Controls and operating mechanisms in accessible spaces, along accessible routes, or as parts of accessible elements (for example, light switches and dispenser controls) shall comply with 4.27.

EXCEPTION: The requirements of 4.27 shall not apply to exercise machines.

(14) If emergency warning systems are provided, then they shall include both audible alarms and visual alarms complying with 4.28. Sleeping accommodations required to comply with 9.3 shall have an alarm system complying

with 4.28. Emergency warning systems in medical care facilities may be modified to suit standard health care alarm design practice.

(15) Detectable warnings shall be provided at locations as specified in 4.29.

(16) Building Signage:

(a) Signs which designate permanent rooms and spaces shall comply with 4.30.1, 4.30.4, 4.30.5 and 4.30.6.

(b) Other signs which provide direction to or information about functional spaces of the building shall comply with 4.30.1, 4.30.2, 4.30.3, and 4.30.5.

EXCEPTION: Building directories, menus, and all other signs which are temporary are not required to comply.

(17) Public Telephones:

(a) If public pay telephones, public closed circuit telephones, or other public telephones are provided, then they shall comply with 4.31.2 through 4.31.8 to the extent required by the following table:

<b>Number of each type of telephone provided on each floor</b>	<b>Number of telephones required to comply with 4.31.2 through 4.31.8<sup>1</sup></b>
--	---

1 or more single unit	1 per floor
1 bank <sup>2</sup>	1 per floor
2 or more banks <sup>2</sup>	1 per bank. Accessible unit may be installed as a single unit in proximity (either visible or with signage) to the bank. At least one public telephone per floor shall meet the requirements for a forward reach telephone <sup>3</sup>

<sup>1</sup> Additional public telephones may be installed at any height. Unless otherwise specified, accessible

### 4.1.3 Accessible Buildings: New Construction

telephones may be either forward or side reach telephones.

<sup>2</sup> A bank consists of two or more adjacent public telephones, often installed as a unit.

<sup>3</sup> EXCEPTION: For exterior installations only, if dial tone first service is available, then a side reach telephone may be installed instead of the required forward reach telephone.

(b)\* All telephones required to be accessible and complying with 4.31.2 through 4.31.8 shall be equipped with a volume control. In addition, 25 percent, but never less than one, of all other public telephones provided shall be equipped with a volume control and shall be dispersed among all types of public telephones, including closed circuit telephones, throughout the building or facility. Signage complying with applicable provisions of 4.30.7 shall be provided.

(c) The following shall be provided in accordance with 4.31.9:

(i) If four or more public pay telephones (including both interior and exterior telephones) are provided at a site of a private facility, and at least one is in an interior location, then at least one interior public text telephone (TTY) shall be provided. If an interior public pay telephone is provided in a public use area in a building of a public facility, at least one interior public text telephone (TTY) shall be provided in the building in a public use area.

(ii) If an interior public pay telephone is provided in a private facility that is a stadium or arena, a convention center, a hotel with a convention center, or a covered mall, at least one interior public text telephone (TTY) shall be provided in the facility. In stadiums, arenas and convention centers which are public facilities, at least one public text telephone (TTY) shall be provided on each floor level having at least one interior public pay telephone.

(iii) If a public pay telephone is located in or adjacent to a hospital emergency room, hospital recovery room, or hospital waiting room,

one public text telephone (TTY) shall be provided at each such location.

(iv) If an interior public pay telephone is provided in the secured area of a detention or correctional facility subject to section 12, then at least one public text telephone (TTY) shall also be provided in at least one secured area. Secured areas are those areas used only by detainees or inmates and security personnel.

(d) Where a bank of telephones in the interior of a building consists of three or more public pay telephones, at least one public pay telephone in each such bank shall be equipped with a shelf and outlet in compliance with 4.31.9(2).

EXCEPTION: This requirement does not apply to the secured areas of detention or correctional facilities where shelves and outlets are prohibited for purposes of security or safety.

(18) If fixed or built-in seating or tables (including, but not limited to, study carrels and student laboratory stations), are provided in accessible public or common use areas, at least five percent (5%), but not less than one, of the fixed or built-in seating areas or tables shall comply with 4.32. An accessible route shall lead to and through such fixed or built-in seating areas, or tables.

(19)\* Assembly Areas:

(a) In places of assembly with fixed seating accessible wheelchair locations shall comply with 4.33.2, 4.33.3, and 4.33.4 and shall be provided consistent with the following table:

Capacity of Seating in Assembly Areas	Number of Required Wheelchair Locations
4 to 25	1
26 to 50	2
51 to 300	4
301 to 500	6
over 500	6 plus 1 additional space for each total seating capacity increase of 100

#### 4.1.5 Accessible Buildings: Additions

In addition, one percent, but not less than one, of all fixed seats shall be aisle seats with no armrests on the aisle side, or removable or folding armrests on the aisle side. Each such seat shall be identified by a sign or marker. Signage notifying patrons of the availability of such seats shall be posted at the ticket office. Aisle seats are not required to comply with 4.33.4.

(b) This paragraph applies to assembly areas where audible communications are integral to the use of the space (e.g., concert and lecture halls, playhouses and movie theaters, meeting rooms, etc.). Such assembly areas, if (1) they accommodate at least 50 persons, or if they have audio-amplification systems, and (2) they have fixed seating, shall have a permanently installed assistive listening system complying with 4.33. For other assembly areas, a permanently installed assistive listening system, or an adequate number of electrical outlets or other supplementary wiring necessary to support a portable assistive listening system shall be provided. The minimum number of receivers to be provided shall be equal to 4 percent of the total number of seats, but in no case less than two. Signage complying with applicable provisions of 4.30 shall be installed to notify patrons of the availability of a listening system.

(c) Where a team or player seating area contains fixed seats and serves an area of sport activity, the seating area shall contain the number of wheelchair spaces required by 4.1.3(19)(a), but not less than one wheelchair space. Wheelchair spaces shall comply with 4.33.2, 4.33.3, 4.33.4, and 4.33.5.

EXCEPTION 1: Wheelchair spaces in team or player seating areas shall not be required to provide a choice of admission price or lines of sight comparable to those for members of the general public.

EXCEPTION 2: This provision shall not apply to team or player seating areas serving bowling lanes not required to be accessible by 15.7.2.

(20) Where automated teller machines (ATMs) are provided, each ATM shall comply with the

requirements of 4.34 except where two or more are provided at a location, then only one must comply.

EXCEPTION: Drive-up-only automated teller machines are not required to comply with 4.27.2, 4.27.3 and 4.34.3.

(21) Where dressing, fitting, or locker rooms are provided, the rooms shall comply with 4.35.

EXCEPTION: Where dressing, fitting, or locker rooms are provided in a cluster, at least 5 percent, but not less than one, of the rooms for each type of use in each cluster shall comply with 4.35.

(22) Where saunas or steam rooms are provided, the rooms shall comply with 4.36.

EXCEPTION: Where saunas or steam rooms are provided in a cluster, at least 5 percent, but not less than one, of the rooms for each type of use in each cluster shall comply with 4.36.

#### 4.1.4 (Reserved)

**4.1.5 Accessible Buildings: Additions.** Each addition to an existing building or facility shall be regarded as an alteration. Each space or element added to the existing building or facility shall comply with the applicable provisions of 4.1.1 to 4.1.3, Minimum Requirements (for New Construction) and the applicable technical specifications of section 4 and the special application sections. Each addition that affects or could affect the usability of an area containing a primary function shall comply with 4.1.6(2).

## 4.35 Dressing, Fitting, and Locker Rooms

**4.34.5 Equipment for Persons with Vision Impairments.** Instructions and all information for use shall be made accessible to and independently usable by persons with vision impairments.

### 4.35 Dressing, Fitting, and Locker Rooms.

**4.35.1 General.** Dressing, fitting, and locker rooms required to be accessible by 4.1 shall comply with 4.35 and shall be on an accessible route.

**4.35.2 Clear Floor Space.** A clear floor space allowing a person using a wheelchair to make a 180-degree turn shall be provided in every accessible dressing room entered through a swinging or sliding door. No door shall swing into any part of the turning space. Turning space shall not be required in a private dressing room entered through a curtained opening at least 32 in (815 mm) wide if clear floor space complying with section 4.2 renders the dressing room usable by a person using a wheelchair.

**4.35.3 Doors.** All doors to accessible dressing rooms shall be in compliance with section 4.13.

**4.35.4 Bench.** A bench complying with 4.37 shall be provided within the room.

**4.35.5 Mirror.** Where mirrors are provided in dressing rooms of the same use, then in an accessible dressing room, a full-length mirror, measuring at least 18 in wide by 54 in high (460 mm by 1370 mm), shall be mounted in a position affording a view to a person on the bench as well as to a person in a standing position.

### 4.36 Saunas and Steam Rooms.

**4.36.1 General.** Saunas and steam rooms required to be accessible by 4.1 shall comply with 4.36.

**4.36.2\* Wheelchair Turning Space.** A wheelchair turning space complying with 4.2.3 shall be provided within the room.

*EXCEPTION:* Wheelchair turning space shall be permitted to be obstructed by readily removable seats.

**4.36.3 Sauna and Steam Room Bench.** Where seating is provided, at least one bench shall be provided and shall comply with 4.37.

**4.36.4 Door Swing.** Doors shall not swing into any part of the clear floor or ground space required at a bench complying with 4.37.

### 4.37 Benches.

**4.37.1 General.** Benches required to be accessible by 4.1 shall comply with 4.37.

**4.37.2 Clear Floor or Ground Space.** Clear floor or ground space complying with 4.2.4 shall be provided and shall be positioned for parallel approach to a short end of a bench seat.

*EXCEPTION:* Clear floor or ground space required by 4.37.2 shall be permitted to be obstructed by readily removable seats in saunas and steam rooms.

**4.37.3\* Size.** Benches shall be fixed and shall have seats that are 20 inches (510 mm) minimum to 24 inches (610 mm) maximum in depth and 42 inches (1065 mm) minimum in length (see Fig. 47).

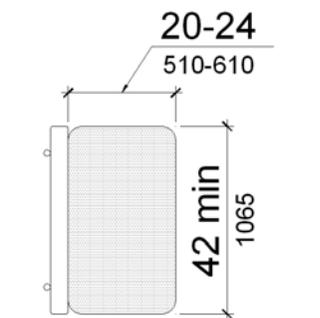

Fig. 47  
Size of Bench

## 4.37 Benches

**4.37.4 Back Support.** Benches shall have back support that is 42 inches (1065 mm) minimum in length and that extends from a point 2 inches (51 mm) maximum above the seat to a point 18 inches (455 mm) minimum above the seat (see Fig. 48).

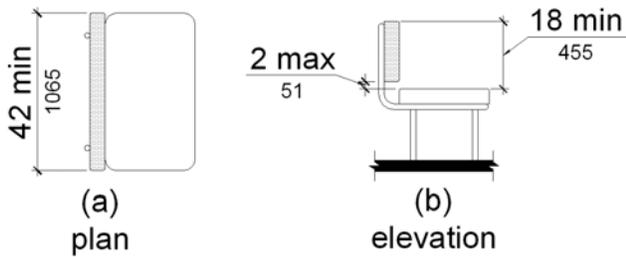

Fig. 48  
Bench Back Support

**4.37.5 Seat Height.** Bench seats shall be 17 inches (430 mm) minimum to 19 inches (485 mm) maximum above the floor or ground.

**4.37.6 Structural Strength.** Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 lbs. (1112 N) is applied at any point on the seat, fastener, mounting device, or supporting structure.

**4.37.7 Wet Locations.** The surface of benches installed in wet locations shall be slip-resistant and shall not accumulate water.

**12.6 Visible Alarms and Telephones**

back support (e.g., attachment to wall). The structural strength of the bench attachments shall comply with 4.26.3.

(7) Storage. Fixed or built-in storage facilities, such as cabinets, shelves, closets, and drawers, shall contain storage space complying with 4.25.

(8) Controls. All controls intended for operation by inmates shall comply with 4.27.

(9) Accommodations for persons with hearing impairments required by 12.4.3 and complying with 12.6 shall be provided in accessible cells or rooms.

**12.6 Visible Alarms and Telephones.** Where audible emergency warning systems are provided to serve the occupants of holding or housing cells or rooms, visual alarms complying with 4.28.4 shall be provided. Where permanently installed telephones are provided within holding or housing cells or rooms, they shall have volume controls complying with 4.31.5.

EXCEPTION: Visual alarms are not required where inmates or detainees are not allowed independent means of egress.

**13. RESIDENTIAL HOUSING.  
(Reserved).**

**14. PUBLIC RIGHTS-OF-WAY.  
(Reserved).**

**15. RECREATION FACILITIES.**

Newly designed or newly constructed and altered recreation facilities shall comply with the applicable requirements of section 4 and the special application sections, except as modified or otherwise provided in this section.

**15.1\* Amusement Rides.**

**15.1.1 General.** Newly designed or newly constructed and altered amusement rides shall comply with 15.1.

EXCEPTION 1\*: Mobile or portable amusement rides shall not be required to comply with 15.1.

EXCEPTION 2\*: Amusement rides which are controlled or operated by the rider shall be required to comply only with 15.1.4 and 15.1.5.

EXCEPTION 3\*: Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, shall be required to comply only with 15.1.4 and 15.1.5.

EXCEPTION 4: Amusement rides without amusement ride seats shall be required to comply only with 15.1.4 and 15.1.5.

**15.1.2\* Alterations to Amusement Rides.** A modification to an existing amusement ride is an alteration subject to 15.1 if one or more of the following conditions apply:

(1) The amusement ride’s structural or operational characteristics are changed to the extent that the ride’s performance differs from that specified by the manufacturer or the original design criteria; or

(2) The load and unload area of the amusement ride is newly designed and constructed.

**15.1.3 Number Required.** Each amusement ride shall provide at least one wheelchair space complying with 15.1.7, or at least one amusement ride seat designed for transfer complying with 15.1.8, or at least one transfer device complying with 15.1.9.

**15.1.4\* Accessible Route.** When in the load and unload position, amusement rides required to comply with 15.1 shall be served by an accessible route complying with 4.3. Any part of an accessible route serving amusement rides with a slope greater than 1:20 shall be considered a ramp and shall comply with 4.8.

EXCEPTION 1: The maximum slope specified in 4.8.2 shall not apply in the load and unload areas or on the amusement ride where compliance is structurally or operationally infeasible, provided that the slope of the ramp shall not exceed 1:8.

EXCEPTION 2: Handrails shall not be required in the load and unload areas or on the amusement ride where compliance is structurally or operationally infeasible.

EXCEPTION 3: Limited-use/limited-application elevators and platform lifts complying with 4.1.1 shall be permitted to be part of an accessible route serving the load and unload area.

**15.1.5 Load and Unload Areas.** Load and unload areas serving amusement rides required to comply with 15.1 shall provide a maneuvering space complying with 4.2.3. The maneuvering space shall have a slope not steeper than 1:48.

**15.1.6 Signage.** Signage shall be provided at the entrance of the queue or waiting line for each amusement ride to identify the type of access provided. Where an accessible unload area also serves as the accessible load area, signage shall be provided at the entrance to the queue or waiting line indicating the location of the accessible load and unload area.

**15.1.7 Amusement Rides with Wheelchair Spaces.** Amusement rides with wheelchair spaces shall comply with 15.1.7.

**15.1.7.1 Floor or Ground Surface.** The floor or ground surface of wheelchair spaces shall comply with 15.1.7.1.

**15.1.7.1.1 Slope.** The floor or ground surface of wheelchair spaces shall have a slope not steeper than 1:48 when in the load and unload position and shall be stable and firm.

**15.1.7.1.2\* Gaps.** Floors of amusement rides with wheelchair spaces and floors of load and unload areas shall be coordinated so that, when the amusement rides are at rest in the load and unload position, the vertical difference between the floors shall be within plus or minus 5/8 inches

(16 mm) and the horizontal gap shall be no greater than 3 inches (75 mm) under normal passenger load conditions.

EXCEPTION: Where compliance is not operationally or structurally feasible, ramps, bridge plates, or similar devices complying with the applicable requirements of 36 CFR 1192.83(c) shall be provided.

**15.1.7.2 Clearances.** Clearances for wheelchair spaces shall comply with 15.1.7.2.

EXCEPTION 1: Where provided, securement devices shall be permitted to overlap required clearances.

EXCEPTION 2: Wheelchair spaces shall be permitted to be mechanically or manually repositioned.

EXCEPTION 3\*: Wheelchair spaces shall not be required to comply with 4.4.2.

**15.1.7.2.1 Width and Length.** Wheelchair spaces shall provide a clear width of 30 inches (760 mm) minimum and a clear length of 48 inches (1220 mm) minimum measured to 9 inches (230 mm) minimum above the floor surface.

**15.1.7.2.2\* Wheelchair Spaces - Side Entry.** Where the wheelchair space can be entered only from the side, the ride shall be designed to permit sufficient maneuvering space for individuals using a wheelchair or mobility device to enter and exit the ride.

**15.1.7.2.3 Protrusions in Wheelchair Spaces.** Objects are permitted to protrude a distance of 6 inches (150 mm) maximum along the front of the wheelchair space where located 9 inches (230 mm) minimum and 27 inches (685 mm) maximum above the floor or ground surface of the wheelchair space. Objects are permitted to protrude a distance of 25 inches (635 mm) maximum along the front of the wheelchair space, where located more than 27 inches (685 mm) above the floor or ground surface of the wheelchair space (see Fig. 58).

## 15.1 Amusement Rides

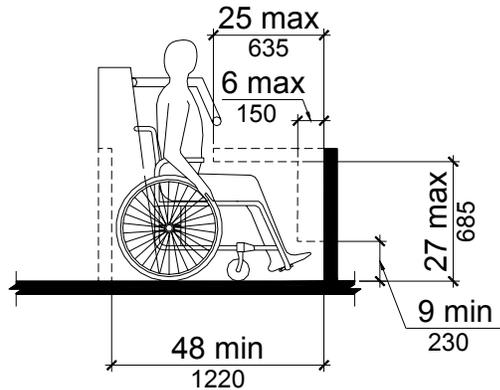

Fig. 58  
Protrusions in Wheelchair Spaces

**15.1.7.3 Openings.** Where openings are provided to access wheelchair spaces on amusement rides, the entry shall provide a 32 inch (815 mm) minimum clear opening.

**15.1.7.4 Approach.** One side of the wheelchair space shall adjoin an accessible route.

**15.1.7.5 Companion Seats.** Where the interior width of the amusement ride is greater than 53 inches (1346 mm), seating is provided for more than one rider, and the wheelchair is not required to be centered within the amusement ride, a companion seat shall be provided for each wheelchair space.

**15.1.7.5.1 Shoulder-to-Shoulder Seating.** Where an amusement ride provides shoulder-to-shoulder seating, companion seats shall be shoulder-to-shoulder with the adjacent wheelchair space.

**EXCEPTION:** Where shoulder-to-shoulder companion seating is not operationally or structurally feasible, compliance with this provision shall be required to the maximum extent feasible.

**15.1.8\* Amusement Ride Seats Designed for Transfer.** Amusement ride seats designed for transfer shall comply with 15.1.8 when positioned for loading and unloading.

**15.1.8.1 Clear Floor or Ground Space.** Clear floor or ground space complying with 4.2.4 shall be provided in the load and unload area adjacent to the amusement ride seats designed for transfer.

**15.1.8.2 Transfer Height.** The height of the amusement ride seats shall be 14 inches (355 mm) minimum to 24 inches (610mm) maximum measured above the load and unload surface.

**15.1.8.3 Transfer Entry.** Where openings are provided to transfer to amusement ride seats, the space shall be designed to provide clearance for transfer from a wheelchair or mobility device to the amusement ride seat.

**15.1.8.4 Wheelchair Storage Space.** Wheelchair storage spaces complying with 4.2.4 shall be provided in or adjacent to unload areas for each required amusement ride seat designed for transfer and shall not overlap any required means of egress or accessible route.

**15.1.9\* Transfer Devices for Use with Amusement Rides.** Transfer devices for use with amusement rides shall comply with 15.1.9 when positioned for loading and unloading.

**15.1.9.1 Clear Floor or Ground Space.** Clear floor or ground space complying with 4.2.4 shall be provided in the load and unload area adjacent to the transfer devices.

**15.1.9.2 Transfer Height.** The height of the transfer device seats shall be 14 inches (355 mm) minimum to 24 inches (610 mm) maximum measured above the load and unload surface.

**15.1.9.3 Wheelchair Storage Space.** Wheelchair storage spaces complying with 4.2.4 shall be provided in or adjacent to unload areas for each required transfer device and shall not overlap any required means of egress or accessible route.

**15.2 Boating Facilities.**

**15.2.1 General.** Newly designed or newly constructed and altered boating facilities shall comply with 15.2.

**15.2.2\* Accessible Route.** Accessible routes, including gangways that are part of accessible routes, shall comply with 4.3.

EXCEPTION 1: Where an existing gangway or series of gangways is replaced or altered, an increase in the length of the gangway is not required to comply with 15.2.2, unless required by 4.1.6(2).

EXCEPTION 2: The maximum rise specified in 4.8.2 shall not apply to gangways.

EXCEPTION 3: Where the total length of the gangway or series of gangways serving as part of a required accessible route is at least 80 feet (24 m), the maximum slope specified in 4.8.2 shall not apply to the gangways.

EXCEPTION 4: In facilities containing fewer than 25 boat slips and where the total length of the gangways or series of gangways serving as part of a required accessible route is at least 30 feet (9140 mm), the maximum slope specified in 4.8.2 shall not apply to the gangways.

EXCEPTION 5: Where gangways connect to transition plates, landings specified by 4.8.4 shall not be required.

EXCEPTION 6: Where gangways and transition plates connect and are required to have handrails, handrail extensions specified by 4.8.5 shall not be required. Where handrail extensions are provided on gangways or transition plates, such extensions are not required to be parallel with the ground or floor surface.

EXCEPTION 7: The cross slope of gangways, transition plates, and floating piers that are part of an accessible route shall be 1:50 maximum measured in the static position.

EXCEPTION 8: Limited-use/limited-application elevators or platform lifts complying with 4.11 shall be permitted in lieu of gangways complying with 4.3.

**15.2.3\* Boat Slips: Minimum Number.** Where boat slips are provided, boat slips complying with 15.2.5 shall be provided in accordance with Table 15.2.3. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

**Table 15.2.3**

Total Boat Slips in Facility	Minimum Number of Required Accessible Boat Slips
1 to 25	1
26 to 50	2
51 to 100	3
101 to 150	4
151 to 300	5
301 to 400	6
401 to 500	7
501 to 600	8
601 to 700	9
701 to 800	10
801 to 900	11
901 to 1000	12
1001 and over	12 plus 1 for each 100 or fraction thereof over 1000

**15.2.3.1\* Dispersion.** Accessible boat slips shall be dispersed throughout the various types of slips provided. This provision does not require an increase in the minimum number of boat slips required to be accessible.

**15.2.4\* Boarding Piers at Boat Launch Ramps.** Where boarding piers are provided at boat launch ramps, at least 5 percent, but not less than one of the boarding piers shall comply with 15.2.4 and shall be served by an accessible route complying with 4.3.

## 15.2 Boating Facilities

EXCEPTION 1: Accessible routes serving floating boarding piers shall be permitted to use exceptions 1, 2, 5, 6, 7, and 8 in 15.2.2.

EXCEPTION 2: Where the total length of the gangway or series of gangways serving as part of a required accessible route is at least 30 feet (9140 mm), the maximum slope specified by 4.8.2 shall not apply to the gangways.

EXCEPTION 3: Where the accessible route serving a floating boarding pier or skid pier is located within a boat launch ramp, the portion of the accessible route located within the boat launch ramp shall not be required to comply with 4.8.

**15.2.4.1\* Boarding Pier Clearances.** The entire length of the piers shall comply with 15.2.5.

**15.2.5\* Accessible Boat Slips.** Accessible boat slips shall comply with 15.2.5.

**15.2.5.1 Clearances.** Accessible boat slips shall be served by clear pier space 60 inches (1525 mm) wide minimum and at least as long as the accessible boat slips. Every 10 feet (3050 mm) maximum of linear pier edge serving the accessible boat slips shall contain at least one continuous clear opening 60 inches (1525 mm) minimum in width (see Fig. 59).

EXCEPTION 1: The width of the clear pier space shall be permitted to be 36 inches (915 mm) minimum for a length of 24 inches (610 mm) maximum, provided that multiple 36 inch (915 mm) wide segments are separated by segments that are 60 inches (1525 mm) minimum clear in width and 60 inches (1525 mm) minimum clear in length (see Fig. 60).

EXCEPTION 2: Edge protection 4 inches (100 mm) high maximum and 2 inches (51 mm) deep maximum shall be permitted at the continuous clear openings (see Fig. 61).

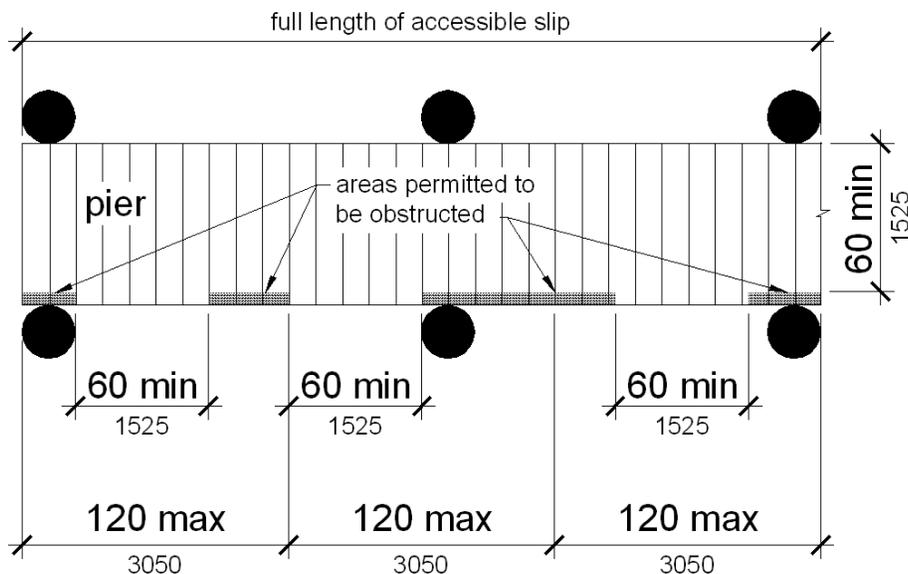

Fig. 59  
Pier Clearances

**EXCEPTION 3\*:** In alterations to existing facilities, clear pier space shall be permitted to be located perpendicular to the boat slip and shall extend the width of the boat slip, where the facility has at least one boat slip complying with 15.2.5, and further compliance with 15.2.5 would result in a reduction in the number of boat slips available or result in a reduction of the widths of existing slips.

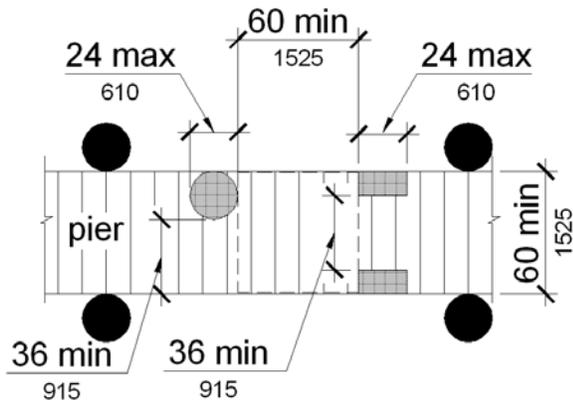

Fig. 60  
Pier Clear Space Reduction

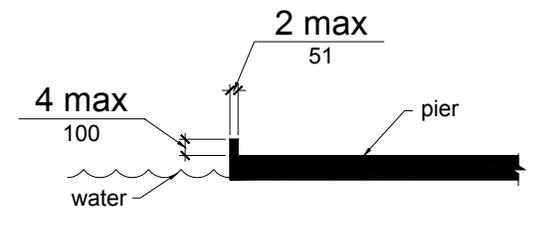

Fig. 61  
Edge Protection at Pier

**15.2.5.2 Cleats and Other Boat Securement Devices.** Cleats and other boat securement devices shall not be required to comply with 4.27.3.

**15.3 Fishing Piers and Platforms.**

**15.3.1 General.** Newly designed or newly constructed and altered fishing piers and platforms shall comply with 15.3.

**15.3.2 Accessible Route.** Accessible routes, including gangways that are part of accessible routes, serving fishing piers and platforms shall comply with 4.3.

**EXCEPTION 1:** Accessible routes serving floating fishing piers and platforms shall be permitted to use exceptions 1, 2, 5, 6, 7, and 8 in 15.2.2.

**EXCEPTION 2\*:** Where the total length of the gangway or series of gangways serving as part of a required accessible route is at least 30 feet (9140 mm), the maximum slope specified by 4.8.2 shall not apply to the gangways.

**15.3.3 Railings.** Where railings, guards, or handrails are provided, they shall comply with 15.3.3.

**15.3.3.1\* Edge Protection.** Edge protection shall be provided and shall extend 2 inches (51 mm) minimum above the ground or deck surface.

**EXCEPTION:** Where the railing, guard, or handrail is 34 inches (865 mm) or less above the ground or deck surface, edge protection shall not be required if the deck surface extends 12 inches (305 mm) minimum beyond the inside face of the railing. Toe clearance shall be 9 inches (230 mm) minimum above the ground or deck surface beyond the railing. Toe clearance shall be 30 inches (760 mm) minimum wide (see Fig. 62).

**15.3.3.2 Height.** At least 25 percent of the railings, guards, or handrails shall be 34 inches (865 mm) maximum above the ground or deck surface.

**EXCEPTION:** This provision shall not apply to that portion of a fishing pier or platform where a guard which complies with sections 1003.2.12.1 (Height) and 1003.2.12.2 (Opening limitations) of the International Building Code (incorporated by reference, see 2.3.2) is provided.

## 15.4 Golf

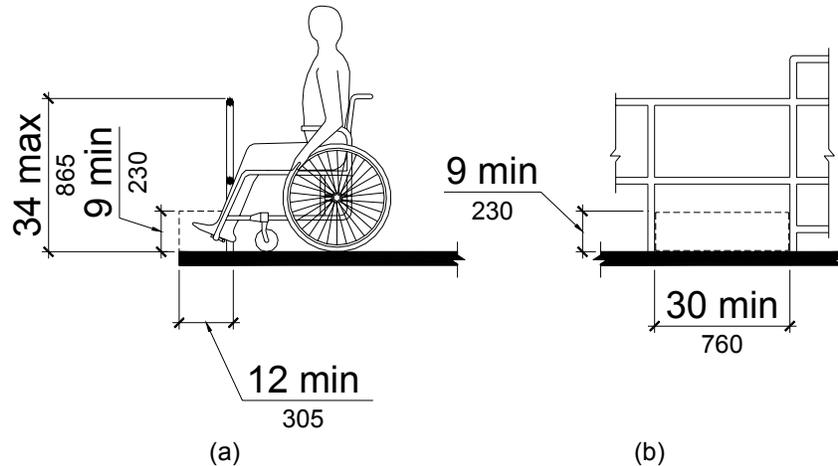

Fig. 62  
Edge Protection at Fishing Piers

**15.3.3.3\* Dispersion.** Railings required to comply with 15.3.3.2 shall be dispersed throughout a fishing pier or platform.

**15.3.4 Clear Floor or Ground Space.** At least one clear floor or ground space complying with 4.2.4 shall be provided where the railing height required by 15.3.3.2 is located. Where no railings are provided, at least one clear floor or ground space complying with 4.2.4 shall be provided.

**15.3.5 Maneuvering Space.** At least one maneuvering space complying with 4.2.3 shall be provided on the fishing pier or platform.

### 15.4 Golf.

**15.4.1 General.** Newly designed or newly constructed and altered golf courses, driving ranges, practice putting greens, and practice teeing grounds shall comply with 15.4.

**15.4.2\* Accessible Route - Golf Course.** An accessible route shall connect accessible elements and spaces within the boundary of the golf course.

In addition, an accessible route shall connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters. The accessible route required by this section shall be 48 inches (1220 mm) minimum wide. Where handrails are provided, the accessible route shall be 60 inches (1525 mm) minimum wide.

**EXCEPTION 1:** A golf car passage complying with 15.4.7 shall be permitted in lieu of all or part of an accessible route required by 15.4.2.

**EXCEPTION 2:** The handrail requirements of 4.8.5 shall not apply to an accessible route located within the boundary of a golf course.

**15.4.3\* Accessible Route - Driving Ranges.** An accessible route shall connect accessible teeing stations at driving ranges with accessible parking spaces and shall be 48 inches (1220 mm) wide minimum. Where handrails are provided, the accessible route shall be 60 inches (1525 mm) wide minimum.

EXCEPTION: A golf car passage complying with 15.4.7 shall be permitted in lieu of all or part of an accessible route required by 15.4.3.

**15.4.4 Teeing Grounds.** Teeing grounds shall comply with 15.4.4.

**15.4.4.1 Number Required.** Where one or two teeing grounds are provided for a hole, at least one teeing ground serving the hole shall comply with 15.4.4.3. Where three or more teeing grounds are provided for a hole, at least two teeing grounds shall comply with 15.4.4.3.

**15.4.4.2 Forward Teeing Ground.** The forward teeing ground shall be accessible.

EXCEPTION: In alterations, the forward teeing ground shall not be required to be accessible where compliance is not feasible due to terrain.

**15.4.4.3 Teeing Grounds.** Teeing grounds required by 15.4.4.1 and 15.4.4.2 shall be designed and constructed so that a golf car can enter and exit the teeing ground.

**15.4.5 Teeing Stations at Driving Ranges and Practice Teeing Grounds.** Where teeing stations or practice teeing grounds are provided, at least 5 percent of the practice teeing stations or practice teeing grounds, but not less than one, shall comply with 15.4.4.3.

**15.4.6 Weather Shelters.** Where weather shelters are provided on a golf course, each weather shelter shall have a clear floor or ground space 60 inches (1525 mm) minimum by 96 inches (2440 mm) minimum and shall be designed and constructed so that a golf car can enter and exit.

**15.4.7 Golf Car Passage.** Where curbs or other constructed barriers are provided along a golf car passage to prohibit golf cars from entering a fairway, openings at least 60 inches (1525 mm) wide shall be provided at intervals not to exceed 75 yds (69 m).

**15.4.7.1 Width.** The golf car passage shall be 48 inches (1220 mm) minimum wide.

**15.4.8 Putting Greens.** Each putting green shall be designed and constructed so that a golf car can enter and exit the putting green.

**15.5\* Miniature Golf.**

**15.5.1 General.** Newly designed or newly constructed and altered miniature golf courses shall comply with 15.5.

**15.5.2 Accessible Holes.** At least fifty percent of holes on a miniature golf course shall comply with 15.5.3 through 15.5.5 and shall be consecutive.

EXCEPTION: One break in the sequence of consecutive accessible holes shall be permitted, provided that the last hole on a miniature golf course is the last hole in the sequence.

**15.5.3\* Accessible Route.** An accessible route complying with 4.3 shall connect the course entrance with the first accessible hole and the start of play area on each accessible hole. The course shall be configured to allow exit from the last accessible hole to the course exit or entrance and shall not require travel back through other holes.

**15.5.3.1 Accessible Route - Located On the Playing Surface.** Where the accessible route is located on the playing surface of the accessible hole, exceptions 1-5 shall be permitted.

EXCEPTION 1: Where carpet is provided, the requirements of 4.5.3 shall not apply.

EXCEPTION 2: Where the accessible route intersects the playing surface of a hole, a 1 inch (26 mm) maximum curb shall be permitted for a width of 32 inches (815 mm) minimum.

EXCEPTION 3: A slope of 1:4 maximum for a 4 inch (100 mm) maximum rise shall be permitted.

EXCEPTION 4: Landings required by 4.8.4 shall be permitted to be 48 inches (1220 mm) in length minimum. Landing size required by 4.8.4(3) shall be permitted to be 48 inches (1220 mm) minimum by 60 inches (1525 mm) minimum.

## 15.6 Play Areas

Landing slopes shall be permitted to be 1:20 maximum.

EXCEPTION 5: Handrail requirements of 4.8.5 shall not apply.

**15.5.3.2 Accessible Route - Adjacent to the Playing Surface.** Where the accessible route is located adjacent to the playing surface, the requirements of 4.3 shall apply.

**15.5.4 Start of Play Areas.** Start of play areas at holes required to comply with 15.5.2 shall have a slope not steeper than 1:48 and shall be 48 inches (1220 mm) minimum by 60 inches (1525 mm) minimum.

**15.5.5\* Golf Club Reach Range.** All areas within accessible holes where golf balls rest shall be within 36 inches (915 mm) maximum of an accessible route having a maximum slope of 1:20 for 48 inches (1220 mm) in length (see Fig. 63).

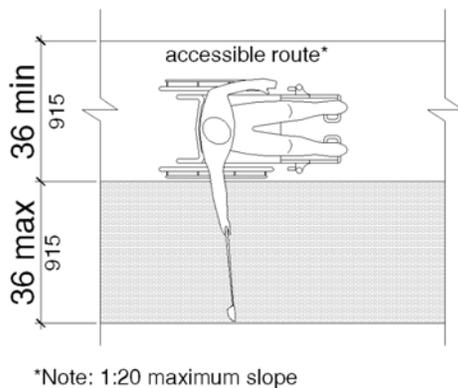

Fig. 63  
Golf Club Reach Range

### 15.6 Play Areas.

**15.6.1\* General.** Newly designed and newly constructed play areas for children ages 2 and over and altered portions of existing play areas shall comply with the applicable provisions of section 4, except as modified or otherwise provided by this section. Where separate play

areas are provided within a site for specified age groups, each play area shall comply with this section. Where play areas are designed or constructed in phases, this section shall be applied so that when each successive addition is completed, the entire play area complies with all the applicable provisions of this section.

EXCEPTION 1: Play areas located in family child care facilities where the proprietor actually resides shall not be required to comply with 15.6.

EXCEPTION 2: Where play components are relocated in existing play areas for the purpose of creating safe use zones, 15.6 shall not apply, provided that the ground surface is not changed or extended for more than one use zone.

EXCEPTION 3: Where play components are altered and the ground surface is not altered, the ground surface shall not be required to comply with 15.6.7, unless required by 4.1.6(2).

EXCEPTION 4: The provisions of 15.6.1 through 15.6.7 shall not apply to amusement attractions.

EXCEPTION 5: Compliance with 4.4 shall not be required within the boundary of the play area.

EXCEPTION 6: Stairs shall not be required to comply with 4.9.

### 15.6.2\* Ground Level Play Components.

Ground level play components shall be provided in the number and types required by 15.6.2.1 and 15.6.2.2. Ground level play components that are provided to comply with 15.6.2.1 shall be permitted to satisfy the number required by 15.6.2.2, provided that the minimum required types of play components are provided. Where more than one ground level play component required by 15.6.2.1 and 15.6.2.2 is provided, the play components shall be integrated in the play area.

**15.6.2.1 General.** Where ground level play components are provided, at least one of each type provided shall be located on an accessible route complying with 15.6.4 and shall comply with 15.6.6.

**15.6.2.2 Additional Number and Types.** Where elevated play components are provided, ground level play components shall be provided in accordance with Table 15.6.2.2. Ground level play components required by 15.6.2.2 shall be located on an accessible route complying with 15.6.4 and shall comply with 15.6.6.

EXCEPTION: If at least 50 percent of the elevated play components are connected by a ramp, and if at least 3 of the elevated play components connected by the ramp are different types of play components, 15.6.2.2 shall not apply.

**15.6.3\* Elevated Play Components.** Where elevated play components are provided, at least 50 percent shall be located on an accessible route complying with 15.6.4. Elevated play components connected by a ramp shall comply with 15.6.6.

**15.6.4\* Accessible Routes.** At least one accessible route complying with 4.3, as modified by 15.6.4, shall be provided.

EXCEPTION 1: Transfer systems complying with 15.6.5 shall be permitted to connect elevated play components, except where 20 or more elevated play components are provided, no more than 25 percent of the elevated play components shall be permitted to be connected by transfer systems.

EXCEPTION 2: Where transfer systems are provided, an elevated play component shall be permitted to connect to another elevated play component in lieu of an accessible route.

EXCEPTION 3: Platform lifts (wheelchair lifts) complying with 4.1.1 and applicable State or local codes shall be permitted to be used as part of an accessible route.

**Table 15.6.2.2 Number and Types of Ground Level Play Components Required to be on Accessible Route**

Number of Elevated Play Components Provided	Minimum Number of Ground Level Play Components Required to be on Accessible Route	Minimum Number of Different Types of Ground Level Play Components Required to be on Accessible Route
1	Not applicable	Not applicable
2 to 4	1	1
5 to 7	2	2
8 to 10	3	3
11 to 13	4	3
14 to 16	5	3
17 to 19	6	3
20 to 22	7	4
23 to 25	8	4
More than 25	8 plus 1 for each additional 3 over 25, or fraction thereof	5

## 15.6 Play Areas

**15.6.4.1 Location.** Accessible routes shall be located within the boundary of the play area and shall connect ground level play components as required by 15.6.2.1 and 15.6.2.2 and elevated play components as required by 15.6.3, including entry and exit points of the play components.

**15.6.4.2 Protrusions.** Objects shall not protrude into ground level accessible routes at or below 80 in (2030 mm) above the ground or floor surface.

**15.6.4.3 Clear Width.** The clear width of accessible routes within play areas shall comply with 15.6.4.3.

**15.6.4.3.1 Ground Level.** The clear width of accessible routes at ground level shall be 60 in (1525 mm) minimum.

EXCEPTION 1: In play areas less than 1,000 square feet, the clear width of accessible routes shall be permitted to be 44 in (1120 mm) minimum, provided that at least one turning space complying with 4.2.3 is provided where the restricted accessible route exceeds 30 feet (9.14 m) in length.

EXCEPTION 2: The clear width of accessible routes shall be permitted to be 36 in (915 mm) minimum for a distance of 60 in (1525 mm) maximum, provided that multiple reduced width segments are separated by segments that are 60 in (1525 mm) minimum in width and 60 in (1525 mm) minimum in length.

**15.6.4.3.2 Elevated.** The clear width of accessible routes connecting elevated play components shall be 36 in (915 mm).

EXCEPTION 1: The clear width of accessible routes connecting elevated play components shall be permitted to be reduced to 32 in (815 mm) minimum for a distance of 24 in (610 mm) maximum provided that reduced width segments are separated by segments that are 48 in (1220 mm) minimum in length and 36 in (915 mm) minimum in width.

EXCEPTION 2: The clear width of transfer systems connecting elevated play components

shall be permitted to be 24 in (610 mm) minimum.

**15.6.4.4 Ramp Slope and Rise.** Any part of an accessible route with a slope greater than 1:20 shall be considered a ramp and shall comply with 4.8, as modified by 15.6.4.4.

**15.6.4.4.1 Ground Level.** The maximum slope for ramps connecting ground level play components within the boundary of a play area shall be 1:16.

**15.6.4.4.2 Elevated.** Where a ramp connects elevated play components, the maximum rise of any ramp run shall be 12 in (305 mm).

**15.6.4.5 Handrails.** Where required on ramps, handrails shall comply with 4.8.5, as modified by 15.6.4.5.

EXCEPTION 1: Handrails shall not be required at ramps located within ground level use zones.

EXCEPTION 2: Handrail extensions shall not be required.

**15.6.4.5.1 Handrail Gripping Surface.** Handrails shall have a diameter or width of 0.95 in (24.1 mm) minimum to 1.55 in (39.4 mm) maximum, or the shape shall provide an equivalent gripping surface.

**15.6.4.5.2 Handrail Height.** The top of handrail gripping surfaces shall be 20 in (510 mm) minimum to 28 in (710 mm) maximum above the ramp surface.

**15.6.5\* Transfer Systems.** Where transfer systems are provided to connect elevated play components, the transfer systems shall comply with 15.6.5.

**15.6.5.1 Transfer Platforms.** Transfer platforms complying with 15.6.5.1 shall be provided where transfer is intended to be from a wheelchair or other mobility device (see Fig. 64).

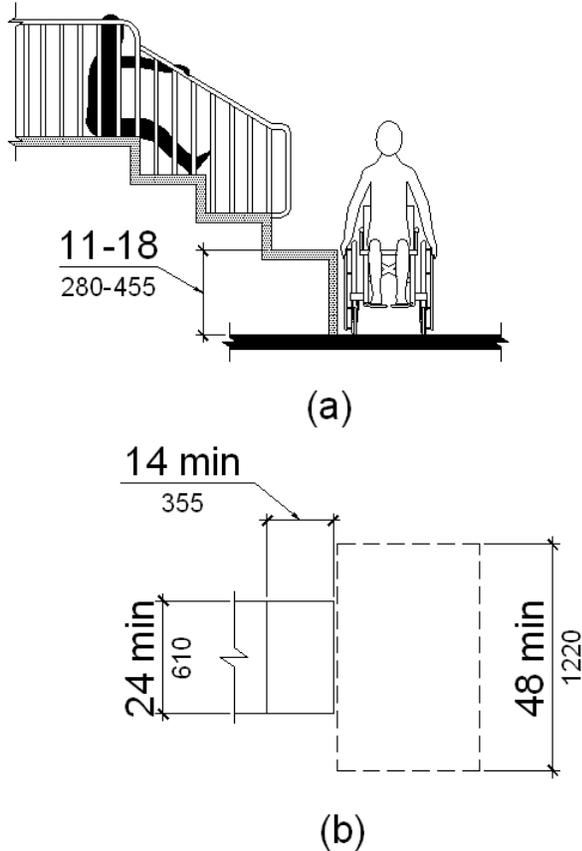

Fig. 64

**15.6.5.1.1 Size.** Platforms shall have a level surface 14 in (355 mm) minimum in depth and 24 in (610 mm) minimum in width.

**15.6.5.1.2 Height.** Platform surfaces shall be 11 in (280 mm) minimum to 18 in (455 mm) maximum above the ground or floor surface.

**15.6.5.1.3 Transfer Space.** A level space complying with 4.2.4 shall be centered on the 48 in (1220 mm) long dimension parallel to the 24 in (610 mm) minimum long unobstructed side of the transfer platform.

**15.6.5.1.4 Transfer Supports.** A means of support for transferring shall be provided.

**15.6.5.2 Transfer Steps.** Transfer steps complying with 15.6.5.2 shall be provided where movement is intended from a transfer platform to a level with elevated play components required to be located on an accessible route (see Fig. 65).

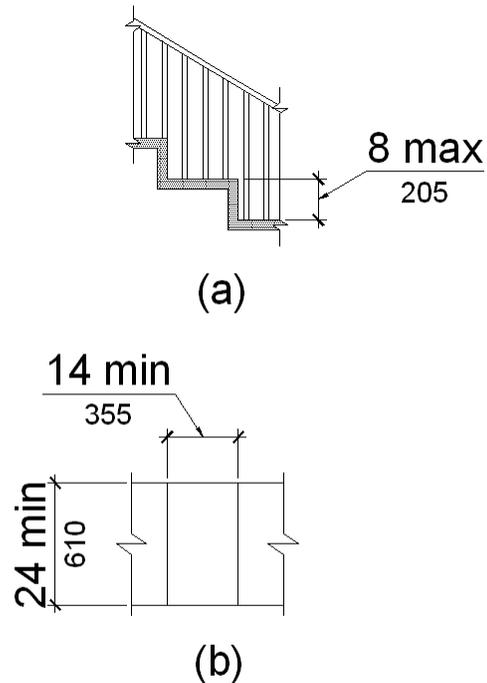

Fig. 65

**15.6.5.2.1 Size.** Transfer steps shall have a level surface 14 in (355 mm) minimum in depth and 24 in (610 mm) minimum in width.

**15.6.5.2.2 Height.** Each transfer step shall be 8 in (205 mm) maximum high.

**15.6.5.2.3 Transfer Supports.** A means of support for transferring shall be provided.

**15.6.6\* Play Components.** Ground level play components located on accessible routes and

## 15.7 Exercise Equipment and Machines

elevated play components connected by ramps shall comply with 15.6.6.

**15.6.6.1 Maneuvering Space.** Maneuvering space complying with 4.2.3 shall be provided on the same level as the play components. Maneuvering space shall have a slope not steeper than 1:48 in all directions. The maneuvering space required for a swing shall be located immediately adjacent to the swing.

**15.6.6.2 Clear Floor or Ground Space.** Clear floor or ground space shall be provided at the play components and shall be 30 in (760 mm) by 48 in (1220 mm) minimum. Clear floor or ground space shall have a slope not steeper than 1:48 in all directions.

**15.6.6.3 Play Tables: Height and Clearances.** Where play tables are provided, knee clearance 24 in (610 mm) high minimum, 17 in deep (430 mm) minimum, and 30 in (760 mm) wide minimum shall be provided. The tops of rims, curbs, or other obstructions shall be 31 in (785 mm) high maximum.

EXCEPTION: Play tables designed or constructed primarily for children ages 5 and under shall not be required to provide knee clearance if the clear floor or ground space required by 15.6.6.2 is arranged for a parallel approach and if the rim surface is 31 in (785 mm) high maximum.

**15.6.6.4 Entry Points and Seats: Height.** Where a play component requires transfer to the entry point or seat, the entry point or seat shall be 11 in (280 mm) minimum and 24 in (610 mm) maximum above the clear floor or ground space.

EXCEPTION: The entry point of a slide shall not be required to comply with 15.6.6.4.

**15.6.6.5 Transfer Supports.** Where a play component requires transfer to the entry point or seat, a means of support for transferring shall be provided.

**15.6.7\* Ground Surfaces.** Ground surfaces along accessible routes, clear floor or ground

spaces, and maneuvering spaces within play areas shall comply with 4.5.1 and 15.6.7.

**15.6.7.1 Accessibility.** Ground surfaces shall comply with ASTM F 1951 Standard Specification for Determination of Accessibility of Surface Systems Under and Around Playground Equipment (incorporated by reference, see 2.3.2). Ground surfaces shall be inspected and maintained regularly and frequently to ensure continued compliance with ASTM F 1951.

**15.6.7.2 Use Zones.** If located within use zones, ground surfaces shall comply with ASTM F 1292 Standard Specification for Impact Attenuation of Surface Systems Under and Around Playground Equipment (incorporated by reference, see 2.3.2).

**15.6.8 Soft Contained Play Structures.** Soft contained play structures shall comply with 15.6.8.

**15.6.8.1 Accessible Routes to Entry Points.** Where three or fewer entry points are provided, at least one entry point shall be located on an accessible route. Where four or more entry points are provided, at least two entry points shall be located on an accessible route. Accessible routes shall comply with 4.3.

EXCEPTION: Transfer systems complying with 15.6.5 or platform lifts (wheelchair lifts) complying with 4.1.1 and applicable State or local codes shall be permitted to be used as part of an accessible route.

### **15.7 Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities.**

**15.7.1 General.** Newly designed or newly constructed and altered exercise equipment and machines, bowling lanes, and shooting facilities shall comply with 15.7.

**15.7.2\* Exercise Equipment and Machines.** At least one of each type of exercise equipment and machines shall be provided with clear floor or ground space complying with 4.2.4 and shall be served by an accessible route. Clear floor or ground space shall be positioned for transfer or

## 15.8 Swimming Pools, Wading Pools, and Spas

for use by an individual seated in a wheelchair. Clear floor or ground spaces for more than one piece of equipment shall be permitted to overlap .

**15.7.3 Bowling Lanes.** Where bowling lanes are provided, at least 5 percent, but not less than one of each type of lane shall be served by an accessible route.

**15.7.4\* Shooting Facilities.** Where fixed firing positions are provided at a site, at least 5 percent, but not less than one, of each type of firing position shall comply with 15.7.4.1.

**15.7.4.1 Fixed Firing Position.** Fixed firing positions shall contain a 60 inch (1525 mm) diameter space and shall have a slope not steeper than 1:48.

### 15.8 Swimming Pools, Wading Pools, and Spas.

**15.8.1 General.** Newly designed or newly constructed and altered swimming pools, wading pools, and spas shall comply with 15.8.

EXCEPTION: An accessible route shall not be required to serve raised diving boards or diving platforms.

**15.8.2\* Swimming Pools.** At least two accessible means of entry shall be provided for each public use and common use swimming pool. The primary means of entry shall comply with 15.8.5 (Swimming Pool Lifts) or 15.8.6 (Sloped Entries). The secondary means of entry shall comply with one of the following: 15.8.5 (Swimming Pool Lifts), 15.8.6 (Sloped Entries), 15.8.7 (Transfer Walls), 15.8.8 (Transfer Systems), or 15.8.9 (Pool Stairs).

EXCEPTION 1\*: Where a swimming pool has less than 300 linear feet (91 m) of swimming pool wall, at least one accessible means of entry shall be provided and shall comply with 15.8.5 (Swimming Pool Lifts) or 15.8.6 (Sloped Entries).

EXCEPTION 2: Wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area, shall provide at least one accessible means of entry that complies with

15.8.5 (Swimming Pool Lifts), 15.8.6 (Sloped Entries), or 15.8.8 (Transfer Systems).

EXCEPTION 3: Catch pools shall be required only to be served by an accessible route that connects to the pool edge.

**15.8.3 Wading Pools.** At least one accessible means of entry complying with 15.8.6 (Sloped Entries) shall be provided for each wading pool.

**15.8.4 Spas.** At least one accessible means of entry complying with 15.8.5 (Swimming Pool Lifts), 15.8.7 (Transfer Walls), or 15.8.8 (Transfer Systems) shall be provided for each spa.

EXCEPTION: Where spas are provided in a cluster, 5 percent, but not less than one, in each cluster shall be accessible.

**15.8.5\* Pool Lifts.** Pool lifts shall comply with 15.8.5.

**15.8.5.1 Pool Lift Location.** Pool lifts shall be located where the water level does not exceed 48 inches (1220 mm).

EXCEPTION 1: Where the entire pool depth is greater than 48 inches (1220 mm), 15.8.5.1 shall not apply.

EXCEPTION 2: Where multiple pool lift locations are provided, no more than one shall be required to be located in an area where the water level does not exceed 48 inches (1220 mm).

**15.8.5.2 Seat Location.** In the raised position, the centerline of the seat shall be located over the deck and 16 inches (405 mm) minimum from the edge of the pool. The deck surface between the centerline of the seat and the pool edge shall have a slope not greater than 1:48 (see Fig. 68).

## 15.8 Swimming Pools, Wading Pools, and Spas

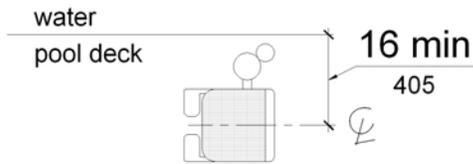

Fig. 68  
Pool Lift Seat Location

**15.8.5.3 Clear Deck Space.** On the side of the seat opposite the water, a clear deck space shall be provided parallel with the seat. The space shall be 36 inches (915 mm) wide minimum and shall extend forward 48 inches (1220 mm) minimum from a line located 12 inches (305 mm) behind the rear edge of the seat. The clear deck space shall have a slope not greater than 1:48 (see Fig. 69).

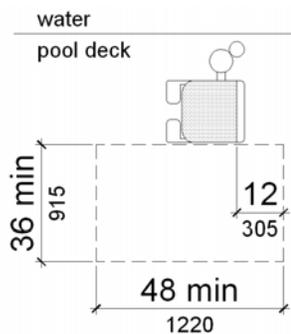

Fig. 69  
Clear Deck Space at Pool Lifts

**15.8.5.4 Seat Height.** The height of the lift seat shall be designed to allow a stop at 16 inches (405 mm) minimum to 19 inches (485 mm) maximum measured from the deck to the top of the seat

surface when in the raised (load) position (see Fig. 70).

**15.8.5.5 Seat Width.** The seat shall be 16 inches (405 mm) minimum wide.

**15.8.5.6\* Footrests and Armrests.** Footrests shall be provided and shall move with the seat. If provided, armrests positioned opposite the water shall be removable or shall fold clear of the seat when the seat is in the raised (load) position.

EXCEPTION: Footrests shall not be required on pool lifts provided in spas.

**15.8.5.7\* Operation.** The lift shall be capable of unassisted operation from both the deck and water levels. Controls and operating mechanisms shall be unobstructed when the lift is in use and shall comply with 4.27.4.

**15.8.5.8 Submerged Depth.** The lift shall be designed so that the seat will submerge to a water depth of 18 inches (455 mm) minimum below the stationary water level (see Fig. 71).

**15.8.5.9\* Lifting Capacity.** Single person pool lifts shall have a minimum weight capacity of 300 lbs. (136 kg) and be capable of sustaining a static load of at least one and a half times the rated load.

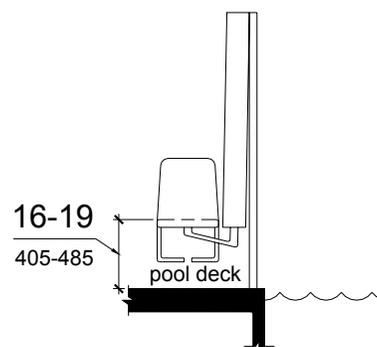

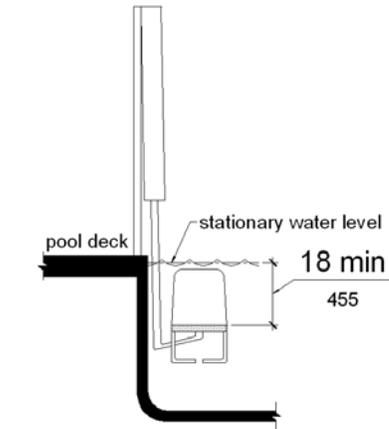

Fig. 70  
Pool Lift Seat Height

**15.8 Swimming Pools, Wading Pools, and Spas**

**Fig 71**  
Pool Lift Submerged Depth

minimum to 30 inches (760 mm) maximum below the stationary water level. Where landings are required by 4.8, at least one landing shall be located 24 inches (610 mm) minimum to 30 inches (760 mm) maximum below the stationary water level (see Fig. 72).

**EXCEPTION:** In wading pools, the sloped entry and landings, if provided, shall extend to the deepest part of the wading pool.

**15.8.6.3\* Handrails.** Handrails shall be provided on both sides of the sloped entry and shall comply with 4.8.5. The clear width between handrails shall be 33 inches (840 mm) minimum and 38 inches (965 mm) maximum (see Fig. 73).

**EXCEPTION 1:** Handrail extensions specified by 4.8.5 shall not be required at the bottom landing serving a sloped entry.

**EXCEPTION 2:** Where a sloped entry is provided for wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area, the required clear width between handrails shall not apply.

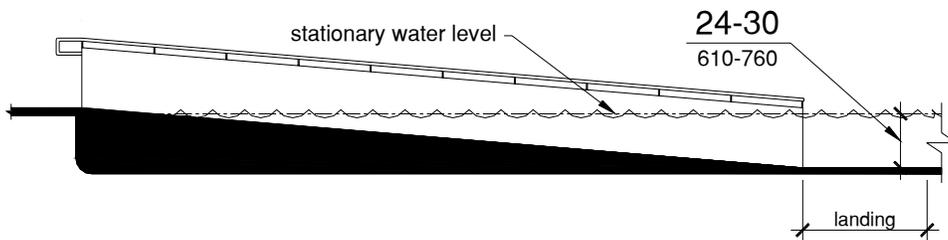

**EXCEPTION 3:** The handrail requirements of 4.8.5 and 15.8.6.3 shall not be required on sloped entries in wading pools.

**15.8.6 Sloped Entries.** Sloped entries designed to provide access into the water shall comply with 15.8.6.

**15.8.6.1\* Sloped Entries.** Sloped entries shall comply with 4.3, except as modified below.

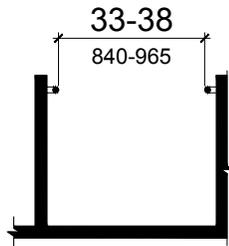

**EXCEPTION:** Where sloped entries are provided, the surfaces shall not be required to be slip resistant.

**15.8.6.2 Submerged Depth.** Sloped entries shall extend to a depth of 24 inches (610 mm)

**Fig. 72**  
Sloped Entry Submerged Depth

**15.8 Swimming Pools, Wading Pools, and Spas**

**Fig. 73**  
Sloped Entry Handrails

**15.8.7 Transfer Walls.** Transfer walls shall comply with 15.8.7.

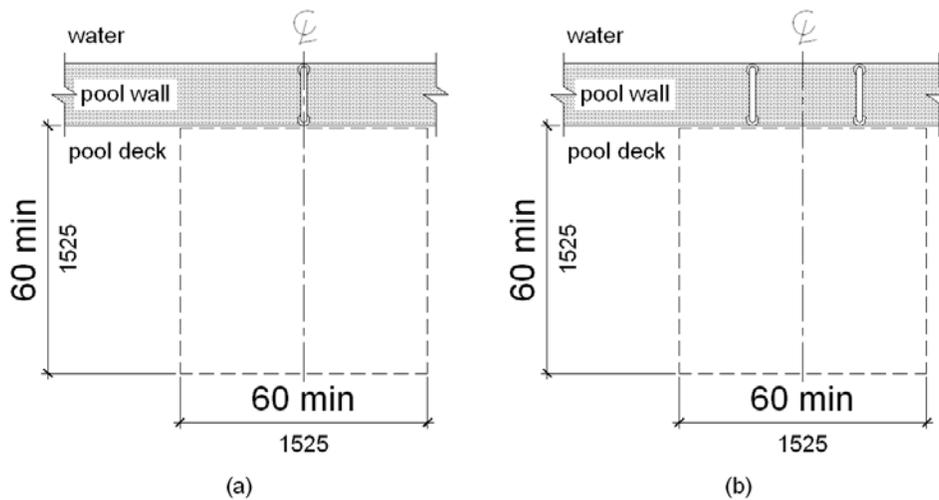

**15.8.7.1 Clear Deck Space.** A clear deck space of 60 inches (1525 mm) minimum by 60 inches (1525 mm) minimum with a slope not steeper

than 1:48 shall be provided at the base of the transfer wall. Where one grab bar is provided, the clear deck space shall be centered on the grab bar. Where two grab bars are provided, the clear deck space shall be centered on the clearance between the grab bars (see Fig. 74).

**15.8.7.2 Height.** The height of the transfer wall shall be 16 inches (405 mm) minimum to 19 inches (485 mm) maximum measured from the deck (see Fig. 75).

**15.8.7.3 Wall Depth and Length.** The depth of the transfer wall shall be 12 inches (305 mm) minimum to 16 inches (405 mm) maximum. The length of the transfer wall shall be 60 inches (1525 mm) minimum and shall be centered on the clear deck space (see Fig. 76).

**15.8.7.4 Surface.** Surfaces of transfer walls shall not be sharp and shall have rounded edges.

**Fig. 74**  
Clear Deck Space at Transfer Walls

**15.8 Swimming Pools, Wading Pools, and Spas**

**15.8.7.5 Grab Bars.** At least one grab bar shall be provided on the transfer wall. Grab bars shall be perpendicular to the pool wall and shall extend the full depth of the transfer wall. The top of the gripping surface shall be 4 inches (100 mm) minimum and 6 inches (150 mm) maximum above walls. Where one grab bar is provided, clearance shall be 24 inches (610 mm) minimum on both sides of the grab bar. Where two grab bars are provided, clearance between grab bars

shall be 24 inches (610 mm) minimum. Grab bars shall comply with 4.26 (see Fig. 77).

**15.8.8 Transfer Systems.** Transfer systems shall comply with 15.8.8.

**15.8.8.1 Transfer Platform.** A transfer platform 19 inches (485 mm) minimum clear depth by 24 inches (610 mm) minimum clear width shall be provided at the head of each transfer system (see Fig. 78).

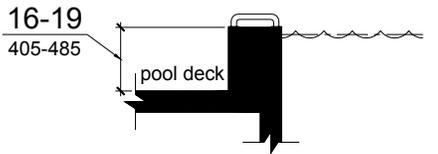

Fig. 75  
Transfer Wall Height

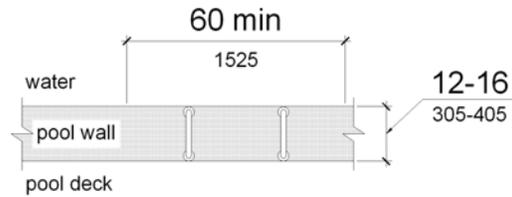

Fig. 76  
Transfer Wall Depth and Length

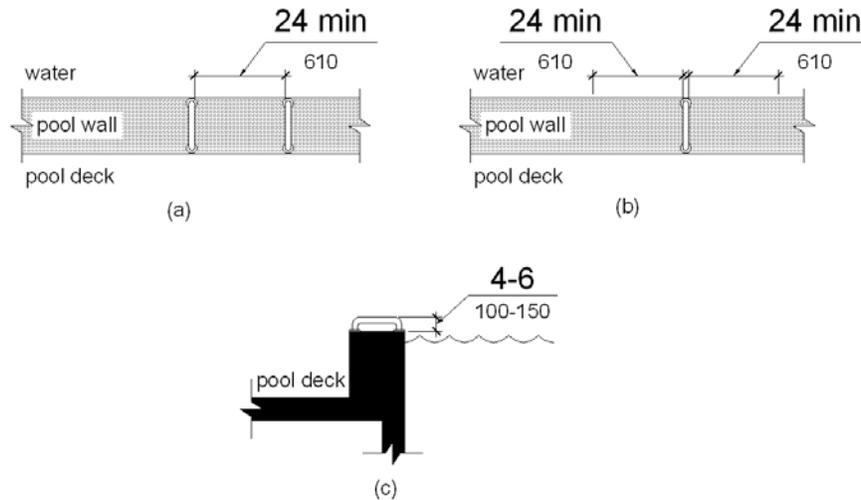

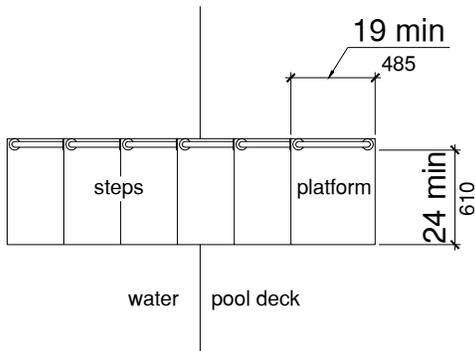

Fig. 77  
Grab Bars at Transfer Walls

**15.8 Swimming Pools, Wading Pools, and Spas**

**Fig. 78**  
Transfer System Platform

**15.8.8.2 Clear Deck Space.** A clear deck space of 60 inches (1525 mm) minimum by 60 inches (1525 mm) minimum with a slope not steeper than 1:48 shall be provided at the base of the

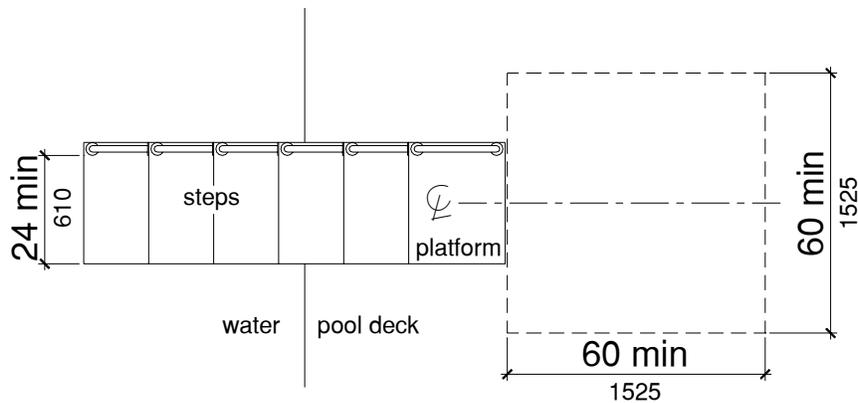

transfer platform surface and shall be centered along a 24 inch (610 mm) minimum unobstructed side of the transfer platform (see Fig. 79).

**15.8.8.3 Height.** The height of the transfer platform shall comply with 15.8.7.2.

**15.8.8.4\* Transfer Steps.** Transfer step height shall be 8 inches (205 mm) maximum. Transfer steps shall extend to a water depth of 18 inches (455 mm) minimum below the stationary water level (see Fig. 80).

**15.8.8.5 Surface.** The surface of the transfer system shall not be sharp and shall have rounded edges.

**15.8.8.6 Size.** Each transfer step shall have a tread clear depth of 14 inches (355 mm) minimum and 17 inches (430 mm) maximum and shall have a tread clear width of 24 inches (610 mm) minimum (see Fig. 81).

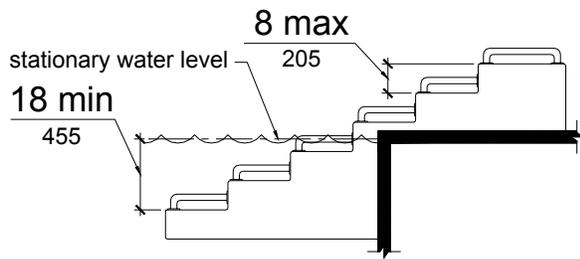

**Fig. 79**  
Clear Deck Space at Transfer Systems

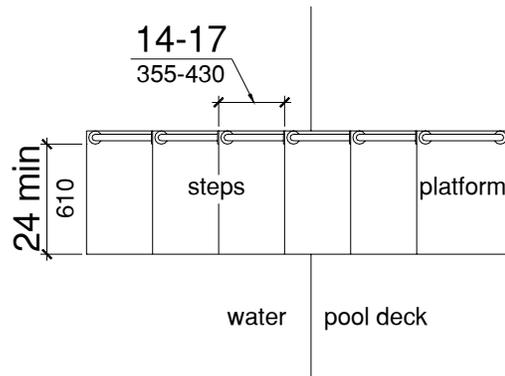

**15.8 Swimming Pools, Wading Pools, and Spas**

**15.8.8.7\* Grab Bars.** At least one grab bar on each transfer step and the transfer platform, or a continuous grab bar serving each transfer step and the transfer platform, shall be provided. Where provided, the top of the gripping surface shall be 4 inches (100 mm) minimum and 6 inches (150 mm) maximum above each step and transfer platform. Where a continuous grab bar is

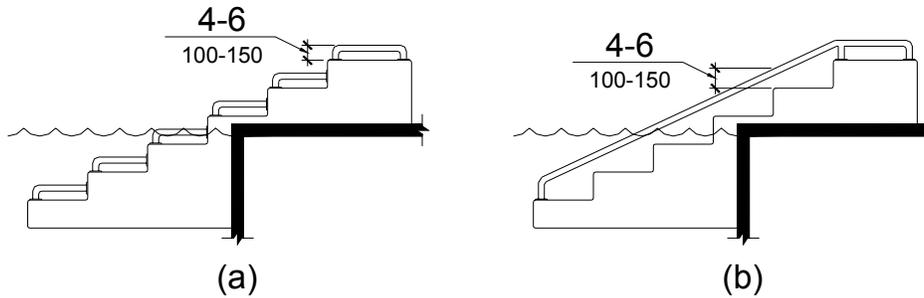

provided, the top of the gripping surface shall be 4 inches (100 mm) minimum and 6 inches (150 mm) maximum above the step nosing and transfer platform. Grab bars shall comply with 4.26 and be located on at least one side of the transfer system. The grab bar located at the transfer platform shall not obstruct transfer (see Fig. 82).

**Fig. 80**  
Transfer System Steps

**Fig. 81**  
Size of Transfer System Steps

**Fig. 82**  
Grab Bars at Transfer Systems

## 15.8 Swimming Pools, Wading Pools, and Spas

**15.8.9 Pool Stairs.** Pool stairs shall comply with 15.8.9.

**15.8.9.1 Pool Stairs.** Pool stairs shall comply with 4.9, except as modified below.

**15.8.9.2 Handrails.** The width between handrails shall be 20 inches (510 mm) minimum and 24 inches (610 mm) maximum. Handrail extensions required by 4.9.4 shall not be required at the bottom landing serving a pool stair.

**15.8.10\* Water Play Components.** Where water play components are provided, the provisions of 15.6 and 4.3 shall apply, except as modified or otherwise provided in this section.

EXCEPTION 1: Where the surface of the accessible route, clear floor or ground spaces and maneuvering spaces connecting play components is submerged, the provisions of 15.6 and 4.3 for cross slope, running slope, and surface shall not apply.

EXCEPTION 2: Transfer systems complying with 15.6.5 shall be permitted to be used in lieu of ramps to connect elevated play components.

## APPENDIX

This appendix contains materials of an advisory nature and provides additional information that should help the reader to understand the minimum requirements of the guidelines or to design buildings or facilities for greater accessibility. The paragraph numbers correspond to the sections or paragraphs of the guideline to which the material relates and are therefore not consecutive (for example, A4.2.1 contains additional information relevant to 4.2.1). Sections of the guidelines for which additional material appears in this appendix have been indicated by an asterisk. Nothing in this appendix shall in any way obviate any obligation to comply with the requirements of the guidelines itself.

### A2.0 General.

**A2.2 Equivalent Facilitation.** Specific examples of equivalent facilitation are found in the following sections:

4.1.6(3)(c)	Elevators in Alterations
4.31.9	Text Telephones
7.2	Sales and Service Counters, Teller Windows, Information Counters
9.1.4	Classes of Sleeping Accommodations
9.2.2(6)(d)	Requirements for Accessible Units, Sleeping Rooms, and Suites

### A3.0 Miscellaneous Instructions and Definitions.

#### A3.5 Definitions.

**Transient Lodging.** The Department of Justice's policy and rules further define what is covered as transient lodging.

### A4.0 Accessible Elements and Spaces: Scope and Technical Requirements.

#### A4.1.1 Application.

**A4.1.1(3) Areas Used Only by Employees as Work Areas.** Where there are a series of individual work stations of the same type (e.g., laboratories, service counters, ticket booths), 5%, but not less

than one, of each type of work station should be constructed so that an individual with disabilities can maneuver within the work stations. Rooms housing individual offices in a typical office building must meet the requirements of the guidelines concerning doors, accessible routes, etc. but do not need to allow for maneuvering space around individual desks. Modifications required to permit maneuvering within the work area may be accomplished as a reasonable accommodation to individual employees with disabilities under Title I of the ADA.

Consideration should also be given to placing shelves in employee work areas at a convenient height for accessibility or installing commercially available shelving that is adjustable so that reasonable accommodations can be made in the future.

If work stations are made accessible they should comply with the applicable provisions of 4.2 through 4.35.

#### A4.1.2 Accessible Sites and Exterior Facilities: New Construction.

**A4.1.2(2)(b) Court Sports:** The accessible route must be direct and connect both sides of the court without requiring players on one side of the court to traverse through or around another court to get to the other side of the court.

**A4.1.2(4) Exception 1.** An accessible route is required to connect to the boundary of the area of sport activity. The term "area of sport activity" distinguishes that portion of a room or space where the play or practice of a sport occurs from adjacent areas. Examples of areas of sport activity include: basketball courts, baseball fields, running tracks, bowling lanes, skating rinks, and the area surrounding a piece of gymnastic equipment. While the size of an area of sport activity may vary from sport to sport, each includes only the space needed to play. The following example is provided for additional clarification.

*Example.* Boundary lines define the field where a football game is played. A safety border is also provided around the field. The game may

### A4.1.3 Accessible Buildings: New Construction

temporarily be played in the space between the boundary lines and the safety border when players are pushed out of bounds or momentum carries them forward while receiving a pass. In the game of football, the space between the boundary line and the safety border is used to play the game. This space and the football field are included in the area of sport activity.

**A4.1.2(4) Exception 2.** Public circulation routes where animals may also travel, such as in petting zoos and passageways alongside animal pens in State fairs, are not eligible for the exception.

**A4.1.2(5)(e)** Valet parking is not always usable by individuals with disabilities. For instance, an individual may use a type of vehicle controls that render the regular controls inoperable or the driver's seat in a van may be removed. In these situations, another person cannot park the vehicle. It is recommended that some self-parking spaces be provided at valet parking facilities for individuals whose vehicles cannot be parked by another person and that such spaces be located on an accessible route to the entrance of the facility.

#### A4.1.3 Accessible Buildings: New Construction.

**4.1.3(1)(b) Court Sports:** The accessible route must be direct and connect both sides of the court without requiring players on one side of the court to traverse through or around another court to get to the other side of the court.

**4.1.3(3) Exception 1.** An accessible route is required to connect to the boundary of the area of sport activity. The term "area of sport activity" distinguishes that portion of a room or space where the play or practice of a sport occurs from adjacent areas. Examples of areas of sport activity include: basketball courts, baseball fields, running tracks, bowling lanes, skating rinks, and the area surrounding a piece of fixed gymnastic equipment. While the size of an area of sport activity may vary from sport to sport, each includes only the space needed to play. The following example is provided for additional clarification.

*Example.* Boundary lines define the field where a football game is played. A safety border is also provided around the field. The game may temporarily be played in the space between the boundary lines and the safety border when players are pushed out of bounds or momentum carries them forward while receiving a pass. In the game of football, the space between the boundary line and the safety border is used to play the game. This space and the football field are included in the area of sport activity.

**4.1.3(3) Exception 2.** Public circulation routes where animals may also travel, such as in petting zoos and passageways alongside animal pens in State fairs, are not eligible for the exception.

**A4.1.3(5)** Only passenger elevators are covered by the accessibility provisions of 4.10. Materials and equipment hoists, freight elevators not intended for passenger use, dumbwaiters, and construction elevators are not covered by these guidelines. If a building is exempt from the elevator requirement, it is not necessary to provide a platform lift or other means of vertical access in lieu of an elevator.

Under Exception 4, platform lifts are allowed where existing conditions make it impractical to install a ramp or elevator. Such conditions generally occur where it is essential to provide access to small raised or lowered areas where space may not be available for a ramp. Examples include, but are not limited to, raised pharmacy platforms, commercial offices raised above a sales floor, or radio and news booths.

While the use of platform lifts is allowed, ramps are recommended to provide access to player seating areas serving an area of sport activity.

**A4.1.3(9)** Supervised automatic sprinkler systems have built in signals for monitoring features of the system such as the opening and closing of water control valves, the power supplies for needed pumps, water tank levels, and for indicating conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of

### A4.1.3 Accessible Buildings: New Construction

satisfactory performance and response to fire conditions.

**A4.1.3(10)** If an odd number of drinking fountains is provided on a floor, the requirement in 4.1.3(10)(b) may be met by rounding down the odd number to an even number and calculating 50% of the even number. When more than one drinking fountain on a floor is required to comply with 4.15, those fountains should be dispersed to allow wheelchair users convenient access. For example, in a large facility such as a convention center that has water fountains at several locations on a floor, the accessible water fountains should be located so that wheelchair users do not have to travel a greater distance than other people to use a drinking fountain.

**A4.1.3(12)(c)** Different types of lockers may include full-size and half-size lockers, as well as those specifically designed for storage of various sports equipment.

#### A4.33.6 Placement of Listening Systems

within the seating area are provided. This will allow choice in viewing and price categories.

Building and life safety codes set minimum distances between rows of fixed seats with consideration of the number of seats in a row, the exit aisle width and arrangement, and the location of exit doors. "Continental" seating, with a greater number of seats per row and a commensurate increase in row spacing and exit doors, facilitates emergency egress for all people and increases ease of access to mid-row seats especially for people who walk with difficulty. Consideration of this positive attribute of "continental" seating should be included along with all other factors in the design of fixed seating areas.

Removable armrests are recommended on fixed companion seats provided in assembly areas in amusement facilities. This provides the option for an individual using a wheelchair or other mobility device to transfer into a seat where motion and other effects may be provided as part of the amusement experience.

**A4.33.6 Placement of Listening Systems.** A distance of 50 ft (15 m) allows a person to distinguish performers' facial expressions.

**A4.33.7 Types of Listening Systems.** An assistive listening system appropriate for an assembly area for a group of persons or where the specific individuals are not known in advance, such as a playhouse, lecture hall or movie theater, may be different from the system appropriate for a particular individual provided as an auxiliary aid or as part of a reasonable accommodation. The appropriate device for an individual is the type that individual can use, whereas the appropriate system for an assembly area will necessarily be geared toward the "average" or aggregate needs of various individuals. A listening system that can be used from any seat in a seating area is the most flexible way to meet this specification. Earphone jacks with variable volume controls can benefit only people who have slight hearing loss and do not help people who use hearing aids. At the present time, magnetic induction loops are the most feasible type of

listening system for people who use hearing aids equipped with "T- coils," but people without hearing aids or those with hearing aids not equipped with inductive pick-ups cannot use them without special receivers. Radio frequency systems can be extremely effective and inexpensive. People without hearing aids can use them, but people with hearing aids need a special receiver to use them as they are presently designed. If hearing aids had a jack to allow a bypass of microphones, then radio frequency systems would be suitable for people with and without hearing aids. The Department of Justice's regulations implementing titles II and III of the ADA require public entities and public accommodations to provide appropriate auxiliary aids and services to ensure effective communication. See 28 CFR 35.160, 28CFR 35.164, and 28 CFR 36.303. Where assistive listening systems are used to provide effective communication, the Department of Justice considers it essential that a portion of receivers be compatible with hearing aids.

Some listening systems may be subject to interference from other equipment and feedback from hearing aids of people who are using the systems. Such interference can be controlled by careful engineering design that anticipates feedback sources in the surrounding area.

Table A2, shows some of the advantages and disadvantages of different types of assistive listening systems. In addition, the Access Board has published a pamphlet on Assistive Listening Systems which lists demonstration centers across the country where technical assistance can be obtained in selecting and installing appropriate systems. The state of New York has also adopted a detailed technical specification which may be useful.

**A4.36.2 Saunas and Steam Rooms.** A 60-inch turning diameter space or a T-shaped space is required within the sauna or steam room. Removable benches or seats are permitted to obstruct the 60-inch or T-shaped space.

**A4.37.3 Benches.** Back support may be achieved through locating benches adjacent to walls or by other designs that will meet the minimum dimensions specified.

**A5.0 Restaurants and Cafeterias.**

**A5.1 General.** Dining counters (where there is no service) are typically found in small carry-out restaurants, bakeries, or coffee shops and may only be a narrow eating surface attached to a wall. This section requires that where such a dining counter is provided, a portion of the counter shall be at the required accessible height.

**A7.0 Business, Mercantile and Civic.**

**A7.2(3)(iii) Counter or Teller Windows with Partitions.** Methods of facilitating voice communication may include grilles, slats, talk-through baffles, and other devices mounted directly into the partition which users can speak directly into for effective communication. These methods are required to be designed or placed so that they are accessible to a person who is standing or seated. However, if the counter is only used by persons in a seated position, then a method of facilitating communication which is accessible to standing persons would not be necessary.

## A15.0 Recreation Facilities

### A15.0 Recreation Facilities.

Unless otherwise modified in Section 4 or specifically addressed in section 15, all other ADAAG provisions apply for the design and construction of recreation facilities and elements. The provisions in this section apply wherever these elements are provided. For example, office buildings may contain a room with exercise equipment and these sections therefore apply.

### A15.1 Amusement Rides.

These guidelines apply to newly designed or newly constructed amusement rides. A custom designed and constructed ride is new upon its "first use," which is the first time amusement park patrons take the ride. With respect to amusement rides purchased from other entities, "new" refers to the first permanent installation of the ride, whether it is used "off the shelf" or it is modified before it is installed. Where amusement rides are moved after several seasons to another area of the park or to another park, the ride would not be considered newly designed or newly constructed.

Amusement rides designed primarily for children, amusement rides that are controlled or operated by the rider, and amusement rides without seats, are not required to provide wheelchair spaces, transfer seats, or transfer systems, and need not meet the signage requirements in 15.1.6. The load and unload areas of these rides must, however, be on an accessible route and must provide maneuvering space under 15.1.4 and 15.1.5.

The scoping and technical provisions of the guidelines were developed to address common amusement rides. There will be other amusement attractions that have unique designs and features which are not adequately addressed by the guidelines. In those situations, the guidelines are to be applied to the extent possible.

An accessible route must be provided to these areas. Where an attraction or ride has unique features for which there are no applicable scoping provisions, then a reasonable number, but at least one, of the features must be located on an

accessible route. Where there are appropriate technical provisions, they must be applied to the elements that are covered by the scoping provisions. Where an attraction has unique designs for which the technical provisions are not appropriate, the operators of those attractions are still subject to all the other requirements of the ADA, including program accessibility, barrier removal and the general obligation to provide individuals with disabilities an equal opportunity to enjoy the goods and services provided by their facilities. An example of an amusement ride not specifically addressed by the guidelines includes "virtual reality" rides where the device does not move through a fixed course within a defined area.

**A15.1 Exception 1.** Mobile or temporary rides are those set up for short periods of time such as traveling carnivals, State and county fairs, and festivals. The amusement rides that are covered by section 15.1 are ones that are not regularly assembled and disassembled.

**A15.1 Exception 2.** The exception does not apply to those rides where patrons may cause the ride to make incidental movements, but where the patron otherwise has no control over the ride.

**A15.1 Exception 3.** The exception is limited to those rides designed "primarily" for children, where children are assisted on and off the ride by an adult. This exception is limited to those rides designed for children and not for the occasional adult user. An accessible route to and maneuvering space in the load and unload area will provide access for adults and family members assisting children on and off these rides.

### A15.1.2 Alterations to Amusement Rides.

Routine maintenance, painting, and changing of theme boards are examples of activities that do not constitute an alteration subject to section 15.1.2. Where existing amusement rides are moved and not altered, section 15.1 does not apply unless the load and unload area of the amusement ride is newly designed and constructed. If a load or unload area is altered, the alteration provisions of ADAAG 4.1.6 must be applied to the altered area.

**A15.1.4 Accessible Route.** Steeper slopes are permitted (not to exceed 1:8) where the accessible route connects to the amusement ride in the load and unload position. This is permitted only where compliance with 4.8.2 (maximum slope 1:12) is “structurally or operationally infeasible”. In most cases, this will be limited to areas where the accessible route leads directly to the amusement ride and where there are space limitations on the ride, not the queue line. Where possible, the least possible slope should be used on the accessible route that serves the amusement ride.

**A15.1.7.1.2 Amusement Rides with Wheelchair Spaces.** 36 CFR 1192.83(c) ADA Accessibility Guidelines for Transportation Vehicles - Light Rail Vehicles and Systems - Mobility Aid Accessibility is available at [www.access-board.gov/transit/html/vguide.htm#LRVM](http://www.access-board.gov/transit/html/vguide.htm#LRVM). It references provisions for bridge plates and ramps used for gaps between wheelchair spaces and floors of load and unload areas.

**A15.1.7.2 Exception 3.** This exception for protruding objects applies to the ride devices, not to circulation areas or accessible routes in the queue lines or the load and unload areas.

**A15.1.7.2.2 Wheelchair Spaces - Side Entry.** Under certain circumstances, a 32-inch clear opening will not provide sufficient width to accommodate a turn into an amusement ride. The amount of clear space needed within the ride, and the size and position of the opening are interrelated. Additional space for maneuvering and a wider door will be needed where a side opening is centered on the ride. For example, where a 42-inch opening is provided, a minimum clear space of 60 inches in length and 36 inches in depth is needed (see Fig. A9). This is necessary to ensure adequate space for maneuvering. For additional guidance refer to Figure 3 (Wheelchair Turning Space) and Figure 4 (Minimum Clear Floor Space for Wheelchairs) on minimum space requirements.

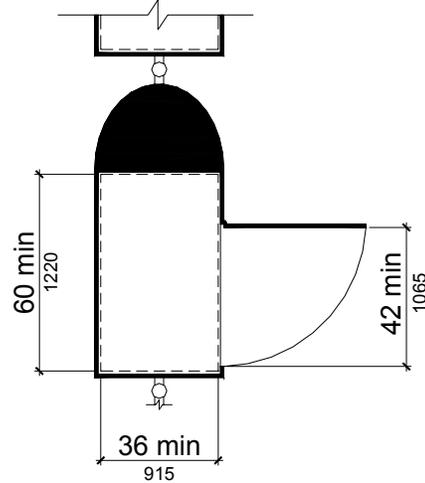

Fig. A9  
Wheelchair Spaces - Side Entry

**A15.1.8 Amusement Ride Seats Designed for Transfer.** There are many different ways that individuals transfer to and from their wheelchairs or mobility devices. The proximity of the clear floor or ground space next to an element and the height of the element one is transferring to are both critical for a safe and independent transfer. Providing additional clear floor or ground space both in front of and diagonally to the element will provide flexibility and increased usability for a more diverse population of individuals with disabilities. Ride seats designed for transfer should involve only one transfer. Where possible, designers are encouraged to locate the ride seat no higher than 17 to 19 inches above the load and unload surface. Where greater distances are required for transfers, consideration should be given to providing gripping surfaces, seat padding, and avoiding sharp or protruding objects in the path of transfer to better facilitate the transfer process.

**A15.1.9 Transfer Devices for Use with Amusement Rides.** Transfer devices for use with

## A15.2 Boating Facilities

amusement rides should permit individuals to make independent transfers to and from their wheelchairs or mobility devices. There are a variety of transfer devices available that could be adapted to provide access onto an amusement ride. Examples of devices that may provide for transfers include, but are not limited to, transfer systems (see 15.8.8), lifts, mechanized seats, and other custom designed systems. Operators and designers have flexibility in developing designs that will facilitate individuals to transfer onto amusement rides. These systems or devices should be designed to be reliable and sturdy. A transfer board, for example, would not be sufficient because it will not provide enough support or stability and may cause injury.

Designs which limit the number of transfers required from one's wheelchair or mobility device to the ride seat are encouraged. When using a transfer device to access an amusement ride, the least amount of transfers for the least amount of distance is desired. Where possible, designers are encouraged to locate the transfer device seat no higher than 17 to 19 inches above the load and unload surface. Where greater distances are required for transfers, consideration should be given to providing gripping surfaces, seat padding, and avoiding sharp or protruding objects in the path of transfer to better facilitate the transfer process. Where a series of transfers are required to reach the amusement ride seat, each vertical transfer should not exceed 8 inches.

As discussed with amusement rides seats designed for transfer, there are many different ways that individuals transfer to and from their wheelchairs or mobility devices. The proximity of the clear floor or ground space next to an element and the height of the element one is transferring to are both critical for a safe and independent transfer. Providing additional clear floor or ground space both in front of and diagonally to the element will provide flexibility and increased usability for a more diverse population of individuals with disabilities.

### A15.2 Boating Facilities.

**A15.2.2 Accessible Route.** The following two examples apply exceptions two and three.

Example 1. Boat slips which are required to be accessible are provided at a floating pier. The vertical distance an accessible route must travel to the pier when the water is at its lowest level is six feet, although the water level only fluctuates three feet. To comply with exceptions 2 and 3, at least one design solution would provide a gangway at least 72.25 feet long which ensures the slope does not exceed 1:12.

Example 2. A gangway is provided to a floating pier which is required to be on an accessible route. The vertical distance is 10 feet between the elevation where the gangway departs the landside connection and the elevation of the pier surface at the lowest water level. Exceptions 2 and 3, which modify 4.8.2, permit the gangway to be at least 80 feet long. Another design solution would be to have two 40-foot continuous gangways joined together at a float, where the float (as the water level falls) will stop dropping at an elevation five feet below the landside connection.

### A15.2.3 Boat Slips: Minimum Number.

Accessible boat slips are not "reserved" for persons with disabilities in the same manner as accessible vehicle parking spaces. Rather, accessible boat slip use is comparable to accessible hotel rooms. The Department of Justice is responsible for addressing operational issues relating to the use of accessible facilities and elements. The Department of Justice currently advises that hotels should hold accessible rooms for persons with disabilities until all other rooms are filled. At that point, accessible rooms can be open for general use on a first come, first serve basis.

The following two examples apply to a boating facility with a single non-demarked pier.

Example 1. A site contains a new boating facility which consists of a single 60-foot pier. Boats are only moored parallel with the pier on both sides to allow occupants to embark or disembark.

Since the number of slips cannot be identified, section 15.2.3 requires each 40 feet of boat slip edge to be counted as one slip for purposes of determining the number of slips available and determines the number required to be accessible. The 120 feet of boat slip edge at the pier would equate with 3 boat slips. Table 15.2.3 would require 1 slip to be accessible and comply with 15.2.5. Section 15.2.5 (excluding the exceptions within the section) requires a clear pier space 60 inches wide minimum extending the length of the slip. In this example, because the pier is at least 40 feet long, the accessible slip must contain a clear pier space at least 40 feet long which has a minimum width of 60 inches.

**Example 2.** A new boating facility consisting of a single pier 25 feet long and 3 feet wide is being planned for a site. The design intends to allow boats to moor and occupants to embark and disembark on both sides, and at one end. As the number of boat slips cannot be identified, applying section 15.2.3 would translate to 53 feet of boat slip edge at the pier. This equates with two slips. Table 15.2.5 would require 1 slip to be accessible. To comply with 15.2.5 (excluding the exceptions within the section), the width of the pier must be increased to 60 inches. Neither 15.2.3 or 15.2.5 requires the pier length to be increased to 40 feet.

**A15.2.3.1 Dispersion.** Types of boat slips are based on the size of the boat slips; whether single berths or double berths, shallow water or deep water, transient or longer-term lease, covered or uncovered; and whether slips are equipped with features such as telephone, water, electricity and cable connections. The term “boat slip” is intended to cover any pier area where recreational boats embark or disembark, unless classified as a launch ramp boarding pier. For example, a fuel pier may contain boat slips, and this type of short term slip would be included in determining compliance with 15.2.3.1.

**A15.2.4 Boarding Piers at Boat Launch Ramps.** The following two examples apply to a boat launch ramp boarding pier.

**Example 1.** A chain of floats is provided on a launch ramp to be used as a boarding pier which is required to be accessible by 15.2.4. At high water, the entire chain is floating and a transition plate connects the first float to the surface of the launch ramp. As the water level decreases, segments of the chain end up resting on the launch ramp surface, matching the slope of the launch ramp. As water levels drop, segments function also as gangways because one end of a segment is resting on the launch ramp surface and the other end is connecting to another floating segment in the chain.

Under ADAAG 4.1.2(2), an accessible route must serve the last float because it would function as the boarding pier at the lowest water level. Under exception 3 in 15.2.4, each float is not required to comply with ADAAG 4.8, but must meet all other requirements in ADAAG 4.3, unless exempted by exception 1 in 15.2.4. In this example, because the entire chain also functions as a boarding pier, the entire chain must comply with the requirements of 15.2.5, including the 60-inch minimum clear pier width provision.

**Example 2.** A non-floating boarding pier supported by piles divides a launching area into two launch ramps and is required to be accessible. Under ADAAG 4.1.2(2), an accessible route must connect the boarding pier with other accessible buildings, facilities, elements, and spaces on the site. Although the boarding pier is located within a launch ramp, because the pier is not a floating pier or a skid pier, none of the exceptions in 15.2.4 apply. To comply with ADAAG 4.3, either the accessible route must run down the launch ramp or the fixed boarding pier could be relocated to the side of the two launch ramps. The second option leaves the slope of the launch ramps unchanged, because the accessible route runs outside the launch ramps.

**A15.2.4.1 Boarding Pier Clearances.** The guidelines do not establish a minimum length for accessible boarding piers at boat launch ramps. The accessible boarding pier would have a length which is at least equal to other boarding piers provided at the facility. If no other boarding pier

### A15.3 Fishing Piers and Platforms

is provided, the pier would have a length equal to what would have been provided if no access requirements applied. The entire length of accessible boarding piers would be required to comply with the same technical provisions that apply to accessible boat slips. For example, at a launch ramp, if a 20-foot long accessible boarding pier is provided, the entire 20 feet must comply with the pier clearance requirements in 15.2.5. Likewise, if a 60-foot long accessible boarding pier is provided, the pier clearance requirements in 15.2.5 would apply to the entire 60 feet.

**A15.2.5 Accessible Boat Slips.** Although the minimum width of the clear pier space is 60 inches, it is recommended that piers be wider than 60 inches to improve the safety for persons with disabilities, particularly on floating piers.

**A15.2.5.1 Clearances, Exception 3.** Where the conditions in exception 3 are satisfied, existing facilities are only required to have one accessible boat slip with a pier clearance which runs the length of the slip. All other accessible slips are allowed to have the required pier clearance at the head of the slip. Under this exception, at piers with perpendicular boat slips, the width of most “finger piers” will remain unchanged. However, where mooring systems for floating piers are replaced as part of pier alteration projects, an opportunity may exist for increasing accessibility. Piers may be reconfigured to allow an increase in the number of wider finger piers, and serve as accessible boat slips.

#### A15.3 Fishing Piers and Platforms.

**A15.3.3.1 Edge Protection.** Edge protection is required only where railings, guards, or handrails are provided on a fishing pier or platform. Edge protection will prevent wheelchairs or other mobility devices from slipping off the fishing pier or platform. Extending the deck of the fishing pier or platform 12 inches where the 34-inch high railing is provided is an alternative design, permitting individuals using a wheelchair or other mobility device to pull into a clear space and move beyond the face of the railing. In such a design, edge protection is not required.

**A15.3.2 Accessible Route, Exception 2.** For example, to provide access to an accessible floating fishing pier, a gangway is used. The vertical distance is 60 inches between the elevation that the gangway departs the landside connection and the elevation of the pier surface at the lowest water level. Exception 2 permits the use of a gangway at least 30 feet long, or a series of connecting gangways with a total length of at least 30 feet. The length of transition plates would not be included in determining if the gangway(s) meet the requirements of the exception.

**A15.3.3.3 Dispersion.** Portions of the railings that are lowered to provide fishing opportunities for persons with disabilities must be located in a variety of locations on the fishing pier or platform to give people a variety of locations to fish. Different fishing locations may provide varying water depths, shade (at certain times of the day), vegetation, and proximity to the shoreline or bank.

#### A15.4 Golf.

**A15.4.2 Accessible Routes.** The accessible route or golf car passage must serve accessible elements and spaces located within the boundary of a golf course. The 48-inch minimum width for the accessible route is necessary to ensure passage of a golf car on either the accessible route or the golf car passage. This is important where the accessible route is used to connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters. These are areas outside the boundary of the golf course, but are areas where an individual using an adapted golf car may travel. A golf car passage may not be substituted for other accessible routes, required by ADAAG 4.1.2, located outside the boundary of the course. For example, an accessible route connecting an accessible parking space to the entrance of a golf course clubhouse is not covered by this provision.

**A15.4.3 Accessible Route - Driving Ranges.** Both a stand alone driving range or a driving range next to a golf course must provide an

accessible route or golf car passage that connects accessible teeing stations with accessible parking spaces. The accessible route must be a minimum width of 48 inches; 60 inches if handrails are provided. The additional width permits the use of a golf car on the accessible route. Providing a golf car passage will permit a person that uses a golf car to practice driving a golf ball from the same position and stance used when playing the game. Additionally, the space required for a person using a golf car to enter and exit the teeing stations required to be accessible should be considered.

**A15.5 Miniature Golf.**

Where possible, providing access to all holes on a miniature golf course is recommended. If a course is designed with the minimum 50 percent accessible holes, designers or operators are encouraged to select holes which provide for an equivalent experience to the maximum extent possible. Accessible holes are required to be consecutive with one break permitted, if the last hole on the course is in the sequence.

**A15.5.3 Accessible Route.** Where only the minimum 50 percent of the holes are accessible, an accessible route from the last accessible hole to the course exit or entrance must not require travel back through other holes. In some cases, this may require an additional route. Other options include increasing the number of accessible holes in a way that limits the distance needed to connect the last accessible hole with the course exit or entrance. In any case, careful consideration to the layout of the course will be important to minimize space impacts.

The 1-inch curb for a 32-inch minimum opening can be located in an area where the ball is less likely to ricochet. Where the accessible route on the hole is provided, steeper slopes are permitted for a limited distance. A landing or level area must separate each of these steeper sloping segments. This will provide a resting area between the steeper segments.

**A15.5.5 Golf Club Reach Range.** Accessible holes on a miniature golf course may be provided with an accessible route leading through the hole

or with the accessible route next to the hole. Where the accessible route is provided adjacent to the hole, the route must be located within the golf club reach range. This allows individuals sufficient space and reach to play the game outside of the hole. Where possible, the distance between the level areas and the accessible route should be as close as possible, affording more opportunities for play.

**A15.6 Play Areas.**

**A15.6.1 General.** This section is to be applied during the design, construction, and alteration of play areas for children ages 2 and over. Play areas are the portion of a site where play components are provided. This section does not apply to other portions of a site where elements such as sports fields, picnic areas, or other gathering areas are provided. Those areas are addressed by other sections of ADAAG. Play areas may be located on exterior sites or within a building. Where separate play areas are provided within a site for children in specified age groups (e.g., preschool (ages 2 to 5) and school age (ages 5 to 12)), each play area must comply with this section. Where play areas are provided for the same age group on a site but are geographically separated (e.g., one is located next to a picnic area and another is located next to a softball field), they are considered separate play areas and each play area must comply with this section.

**A15.6.2 Ground Level Play Components.** A ground level play component is a play component approached and exited at the ground level. Examples of ground level play components include spring rockers, swings, diggers, and stand alone slides. When distinguishing between the different types of ground level play components, consider the general experience provided by the play component. Examples of different types of experiences include, but are not limited to, rocking, swinging, climbing, spinning, and sliding. A spiral slide may provide a slightly different experience from a straight slide, but sliding is the general experience and therefore a spiral slide is not considered a different type of play component than a straight slide.

## A15.6 Play Areas

The number of ground level play components is not dependent on the number of children who can play on the play component. A large seesaw designed to accommodate ten children at once is considered one ground level play component.

Where a large play area includes two or more composite play structures designed for the same age group, the total number of elevated play components on all the composite play structures must be added to determine the additional number and types of ground level play components that must be provided on an accessible route, and the type of accessible route (e.g., ramps or transfer systems) that must be provided to the elevated play components.

Ground level play components accessed by children with disabilities must be integrated in the play area. Designers should consider the optimal layout of ground level play components accessed by children with disabilities to foster interaction and socialization among all children. Grouping all ground level play components accessed by children with disabilities in one location is not considered integrated.

**A15.6.3 Elevated Play Components.** Elevated play components are approached above or below grade and are part of a composite play structure. A double or triple slide that is part of a composite play structure is one elevated play component. For purposes of this section, ramps, transfer systems, steps, decks, and roofs are not considered elevated play components. These elements are generally used to link other elements on a composite play structure. Although socialization and pretend play can occur on these elements, they are not primarily intended for play. Some play components that are attached to a composite play structure can be approached or exited at the ground level or above grade from a platform or deck. For example, a climber attached to a composite play structure can be approached or exited at the ground level or above grade from a platform or deck on a composite play structure. Play components that are attached to a composite play structure and can be approached from a platform or deck (e.g.,

climbers and overhead play components), are considered elevated play components. These play components are not considered ground level play components also, and do not count toward the requirements in 15.6.2 regarding the number of ground level play components that must be located on an accessible route.

**A15.6.4 Accessible Routes.** Accessible routes within the boundary of the play area must comply with 15.6.4. Accessible routes connecting the play area to parking, drinking fountains, and other elements on a site must comply with 4.3. Accessible routes provide children who use wheelchairs or other mobility devices the opportunity to access play components. Accessible routes should coincide with the general circulation path used within the play area. Careful placement and consideration of the layout of accessible routes will enhance the ability of children with disabilities to socialize and interact with other children.

Where possible, designers and operators are encouraged to provide wider ground level accessible routes within the play area or consider designing the entire ground surface to be accessible. Providing more accessible spaces will enhance the integration of all children within the play area and provide access to more play components. A maximum slope of 1:16 is required for ground level ramps; however, a lesser slope will enhance access for those children who have difficulty negotiating the 1:16 maximum slope. Handrails are not required on ramps located within ground level use zones.

Where a stand alone slide is provided, an accessible route must connect the base of the stairs at the entry point, and the exit point of the slide. A ramp or transfer system to the top of the slide is not required. Where a sand box is provided, an accessible route must connect to the border of the sand box. Accessibility to the sand box would be enhanced by providing a transfer system into the sand or by providing a raised sand table with knee clearance complying with 15.6.6.3.

Elevated accessible routes must connect the entry and exit points of at least 50 percent of elevated play components. Ramps are preferred over transfer systems since not all children who use wheelchairs or other mobility devices may be able to use or may choose not to use transfer systems. Where ramps connect elevated play components, the maximum rise of any ramp run is limited to 12 inches. Where possible, designers and operators are encouraged to provide ramps with a lesser slope than the 1:12 maximum. Berms or sculpted dirt may be used to provide elevation and may be part of an accessible route to composite play structures.

Platform lifts complying with 4.11 and applicable State and local codes are permitted as a part of an accessible route. Because lifts must be independently operable, operators should carefully consider the appropriateness of their use in unsupervised settings.

**A15.6.5 Transfer Systems.** Transfer systems are a means of accessing composite play structures. Transfer systems generally include a transfer platform and a series of transfer steps. Children who use wheelchairs or other mobility devices transfer from their wheelchair or mobility devices onto the transfer platform and lift themselves up or down the transfer steps and scoot along the decks or platforms to access elevated play components. Some children may be unable or may choose not to use transfer systems. Where transfer systems are provided, consideration should be given to the distance between the transfer system and the elevated play components. Moving between a transfer platform and a series of transfer steps requires extensive exertion for some children. Designers should minimize the distance between the points where a

child transfers from a wheelchair or mobility device and where the elevated play components are located. Where elevated play components are used to connect to another elevated play component in lieu of an accessible route, careful consideration should be used in the selection of the play components used for this purpose. Transfer supports are required on transfer platforms and transfer steps to assist children when transferring. Some examples of supports include a rope loop, a loop type handle, a slot in the edge of a flat horizontal or vertical member, poles or bars, or D rings on the corner posts.

**A15.6.6 Play Components.** Clear floor or ground spaces, maneuvering spaces, and accessible routes may overlap within play areas. A specific location has not been designated for the clear floor or ground spaces or maneuvering spaces, except swings, because each play component may require that the spaces be placed in a unique location. Where play components include a seat or entry point, designs that provide for an unobstructed transfer from a wheelchair or other mobility device are recommended. This will enhance the ability of children with disabilities to independently use the play component.

When designing play components with manipulative or interactive features, consider appropriate reach ranges for children seated in wheelchairs. The following table provides guidance on reach ranges for children seated in wheelchairs. These dimensions apply to either forward or side reaches. The reach ranges are appropriate for use with those play components that children seated in wheelchairs may access and reach. Where transfer systems provide access to elevated play components, the reach ranges are not appropriate.

**Children's Reach Ranges**

<b>Forward or Side Reach</b>	<b>Ages 3 and 4</b>	<b>Ages 5 through 8</b>	<b>Ages 9 through 12</b>
<b>High (maximum)</b>	36 in (915 mm)	40 in (1015 mm)	44 in (1120 mm)
<b>Low (minimum)</b>	20 in (510 mm)	18 in (455 mm)	16 in (405 mm)

## A15.7 Exercise Equipment and Machines

Where a climber is located on a ground level accessible route, some of the climbing rings should be within the reach ranges. A careful balance of providing access to play components but not eliminating the challenge and nature of the activity is encouraged.

**A15.6.7 Ground Surfaces.** Ground surfaces along clear floor or ground spaces, maneuvering spaces, and accessible routes must comply with the ASTM F 1951 Standard Specification for Determination of Accessibility to Surface Systems Under and Around Playground Equipment. The ASTM F 1951 standard is available from the American Society for Testing and Materials (ASTM), 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959, telephone (610) 832-9585. The ASTM F 1951 standard may be ordered online from ASTM (<http://www.astm.org>). The ASTM F 1951 standard determines the accessibility of a surface by measuring the work required to propel a wheelchair across the surface. The standard includes tests of effort for both straight ahead and turning movement, using a force wheel on a rehabilitation wheelchair as the measuring device. To meet the standard, the force required must be less than that required to propel the wheelchair up a ramp with a 1:14 slope. When evaluating ground surfaces, operators should request information about compliance with the ASTM F 1951 standard.

Ground surfaces must be inspected and maintained regularly and frequently to ensure continued compliance with the ASTM F 1951 standard. The type of surface material selected and play area use levels will determine the frequency of inspection and maintenance activities.

When using a combination of surface materials, careful design is necessary to provide appropriate transitions between the surfaces. Where a rubber surface is installed on top of asphalt to provide impact attenuation, the edges of the rubber surface may create a change in level between the adjoining ground surfaces. Where the change in level is greater than ½ inch, a sloped surface with a maximum slope of 1:12 must be provided.

Products are commercially available that provide a 1:12 slope at transitions. Transitions are also necessary where the combination of surface materials include loose fill products. Where edging is used to prevent the loose surface from moving onto the firmer surface, the edging may create a tripping hazard. Where possible, the transition should be designed to allow for a smooth and gradual transition between the two surfaces.

### **A15.7 Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities.**

#### **A15.7.2 Exercise Equipment and Machines.**

Fitness facilities often provide a range of choices of exercise equipment. At least one of each type of exercise equipment and machine must be served by an accessible route. Most strength training equipment and machines are considered different types. For example, a bench press machine is considered a different type than a biceps curl machine. The requirement for providing access to each type is intended to cover the variety of strength training machines. Where operators provide a biceps curl machine and free weights, both are required to meet the provisions in this section, even though an individual may be able to work on their biceps through both types of equipment. Where the exercise equipment and machines provided are only different in that different manufacturers provide them, only one of each type of machine is required to meet these guidelines. For example, where two bench press machines are provided and each is manufactured by a different company, only one is required to comply.

Similarly, there are many types of cardiovascular exercise machines, such as stationary bicycles, rowing machines, stair climbers, and treadmills. Each machine provides a cardiovascular exercise and is considered a different type for purposes of these guidelines.

One clear floor or ground space is permitted to be shared between two pieces of exercise equipment. Designers should carefully consider layout

## A15.8 Swimming Pools, Wading Pools, and Spas

options to maximize space such as connecting ends of the row and center aisle spaces.

The position of the clear floor space may vary greatly depending on the use of the equipment or machine. For example, to make a shoulder press accessible, clear floor space next to the seat would be appropriate to allow for transfer. Clear floor space for a bench press machine designed for use by an individual seated in a wheelchair, however, will most likely be centered on the operating mechanisms.

Designers and operators are encouraged to select exercise equipment and machines that provide fitness opportunities for persons with lower body extremity disabilities. Upper body exercise equipment and machines that offer either cardiovascular or strength training will enhance fitness opportunities for persons with disabilities from a wheelchair or mobility device. Examples include: equipment or machines that provide arm ergometry, free weights, and weighted pulley systems that are usable from a wheelchair or mobility device.

**A15.7.4. Shooting Facilities.** Examples of different types of firing positions include, but are not limited to: positions having different admission prices, positions with or without weather covering or lighting, and positions supporting different shooting events such as argon, muzzle loading rifle, small bore rifle, high power rifle, bull's eye pistol, action pistol, silhouette, trap, skeet, and archery (bow and crossbow).

### **A15.8 Swimming Pools, Wading Pools, and Spas.**

**A15.8.2 Swimming Pools.** Where more than one means of access is provided into the water, it is recommended that the means be different. Providing different means of access will better serve the varying needs of people with disabilities in getting into and out of a swimming pool. It is also recommended that where two or more means of access are provided, they not be provided in the same location in the pool. Different locations will

provide increased options for entry and exit, especially in larger pools.

**A15.8.2 Swimming Pools, Exception 1.** Pool walls at diving areas and areas along pool walls where there is no pool entry because of landscaping or adjacent structures should be counted when determining the number of accessible means of entry required.

**A15.8.5 Pool Lifts.** There are a variety of seats available on pool lifts ranging from sling seats to those that are preformed or molded. Pool lift seats with backs will enable a larger population of persons with disabilities to use the lift. Pool lift seats that consist of materials that resist corrosion and provide a firm base to transfer will be usable by a wider range of people with disabilities. Additional options such as armrests, head rests, seat belts, and leg support will enhance accessibility and better accommodate people with a wide range of disabilities.

**A15.8.5.6 Footrests and Armrests.** Footrests are encouraged on lifts used in larger spas, where the foot well water depth is 34 inches or greater. Providing footrests, especially ones that support the entire foot, will facilitate safe and independent transfers by a larger population of persons with disabilities.

**A15.8.5.7 Operation.** Pool lifts must be capable of unassisted operation from both the deck and water levels. This will permit a person to call the pool lift when the pool lift is in the opposite position. It is extremely important for a person who is swimming alone to be able to call the pool lift when it is in the up position so he or she will not be stranded in the water for extended periods of time awaiting assistance. The requirement for a pool lift to be independently operable does not preclude assistance from being provided.

**A15.8.5.9 Lifting Capacity.** Single person pool lifts must be capable of supporting a minimum weight of 300 pounds and sustaining a static load of at least one and a half times the rated load. Pool lifts should be provided that meet the needs of the population it is serving. Providing a pool lift

## A15.8 Swimming Pools, Wading Pools and Spas

with a weight capacity greater than 300 pounds may be advisable.

**A15.8.6.1 Sloped Entries.** Personal wheelchairs and mobility devices may not be appropriate for submerging in water. Some may have batteries, motors, and electrical systems that when submerged in water may cause damage to the personal mobility device or wheelchair or may contaminate the pool water. Providing an aquatic wheelchair made of non-corrosive materials and designed for access into the water will protect the water from contamination and avoid damage to personal wheelchairs or other mobility aids.

**A15.8.6.3 Handrails.** Handrails on both sides of a sloped entry provides stability to both persons with mobility impairments and persons using wheelchairs. For safety reasons, a single handrail is permitted on sloped entries provided at wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area.

**A15.8.8.4 Transfer Steps.** Where possible, the height of the transfer step should be as minimal as possible. This will decrease the distance an individual is required to lift up or move down to reach the next step to gain access.

**A15.8.8.7 Grab Bars.** Pool operators have the choice of providing a grab bar on one side of each step and transfer platform or a continuous grab bar on one side serving each transfer step and the transfer platform. If provided on each step, the top of the gripping surface must be 4 to 6 inches above each step. Where a continuous grab bar is provided, the top of the gripping surface must be 4 to 6 inches above the step nosing. Each type has its advantages. A continuous handrail allows the person that is transferring to maintain a constant grip on the handrail while moving up or down the transfer steps. Grab bars provided on each step provide the gripping surface parallel to each step rather than on a diagonal.

**A15.8.10 Water Play Components.** Personal wheelchairs and mobility devices may not be appropriate for submerging in water when accessing play components located in water.

Some may have batteries, motors, and electrical systems that when submerged in water may cause damage to the personal mobility device or wheelchair or may contaminate the water. Providing an aquatic wheelchair made of non-corrosive materials and designed for access into the water will protect the water from contamination and avoid damage to personal wheelchairs.

## Introduction

The Architectural and Transportation Barriers Compliance Board (Access Board) is an independent federal agency devoted to accessibility for people with disabilities. The Access Board is responsible for developing and maintaining accessibility guidelines to ensure that newly constructed and altered buildings and facilities covered by the Americans with Disabilities Act and the Architectural Barriers Act are accessible to and usable by people with disabilities. In November 1999, the Access Board issued a proposed rule to revise and update its accessibility guidelines. During the public comment period on the proposed rule, the Access Board received approximately 600 comments from individuals with multiple chemical sensitivities (MCS) and electromagnetic sensitivities (EMS). They reported that chemicals released from products and materials used in construction, renovation, and maintenance of buildings, electromagnetic fields, and inadequate ventilation are barriers that deny them access to most buildings.

Americans spend about 90 percent of their time indoors, where concentrations of air pollutants are often much higher than those outside. According to the U.S. EPA Healthy Buildings, Healthy People: A Vision for the 21st Century, [www.epa.gov/iaq/hbhp/hbhptoc.html](http://www.epa.gov/iaq/hbhp/hbhptoc.html) "Known health effects of indoor pollutants include asthma; cancer; developmental defects and delays, including effects on vision, hearing, growth, intelligence, and learning; and effects on the cardiovascular system (heart and lungs). Pollutants found in the indoor environment may also contribute to other health effects, including those of the reproductive and immune systems." (p. 4). The report further notes that "Most chemicals in commercial use have not been tested for possible health effects. (p. 8).

There are a significant number of people who are sensitive to chemicals and electromagnetic fields. Surveys conducted by the California and New Mexico Departments of Health and by medical researchers in North Carolina found 16 to 33 percent of the people interviewed reported that they are unusually sensitive to chemicals, and in the California and New Mexico health departments' surveys 2 percent to 6 percent reported that they have been diagnosed as having multiple chemical sensitivities. C. Miller and N. Ashford, "Multiple Chemical Intolerance and Indoor Air Quality," in *Indoor Air Quality Handbook* Chapter 27.8 (McGraw-Hill 2001). Another California Department of Health Services survey has found that 3 percent of the people interviewed reported that they are unusually sensitive to electric appliances or power lines. P. LeVallois, et al., "Prevalence and Risk Factors of Self-Reported Hypersensitivity to Electromagnetic Fields in California," in California EMF Program, "An Evaluation of the Possible Risks From Electric and Magnetic Fields (EMFs From Power Lines, Internal Wiring, Electrical Occupations and Appliances, Draft 3 for Public Comment, April 2001" Appendix 3 (<http://www.dhs.ca.gov/ehib/emf/RiskEvaluation/riskeval.html>).

Individuals with multiple chemical sensitivities and electromagnetic sensitivities, who submitted written comments and/or attended the public information meetings on the draft final rule, requested that the Access Board include provisions in the final rule to make buildings and facilities accessible for them.

The Board has not included such provisions in their rules, but they have taken the commentary very seriously and acted upon it. As stated in the Background for its Final Rule **Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Recreation Facilities**: <http://www.access-board.gov/recreation/final.htm>

"The Board recognizes that multiple chemical sensitivities and electromagnetic sensitivities may be considered disabilities under the ADA if they so severely impair the neurological, respiratory or other functions of an individual that it substantially limits one or more of the

individual's major life activities. The Board plans to closely examine the needs of this population, and undertake activities that address accessibility issues for these individuals.

The Board plans to develop technical assistance materials on best practices for accommodating individuals with multiple chemical sensitivities and electromagnetic sensitivities. The Board also plans to sponsor a project on indoor environmental quality. In this project, the Board will bring together building owners, architects, building product manufacturers, model code and standard-setting organizations, individuals with multiple chemical sensitivities and electromagnetic sensitivities, and other individuals. This group will examine building design and construction issues that affect the indoor environment, and develop an action plan that can be used to reduce the level of chemicals and electromagnetic fields in the built environment.”

This report and the recommendations included within are a direct outgrowth from that public comment process. The Access Board contracted with the National Institute of Building Sciences (NIBS) to establish this Indoor Environmental Quality Project as a first step in implementing that action plan.

A broad and distinguished Steering Committee was established and met in January 2004 in Bethesda, Maryland, to review the project objectives. Subsequently four task teams (committees) were established to address specific issues in buildings related to Operations & Maintenance, Cleaner Air Rooms, Design and Construction, and Products and Materials. The following reports from these four committees offer recommendations for improving IEQ in buildings. They also list valuable resources and references to allow readers to investigate the pertinent issues in greater depth. The focus of the project was on commercial and public buildings, but many of the issues addressed and recommendations offered are applicable in residential settings.

Many volunteers worked diligently to create the recommendations in this report. These individuals are listed in the separate committee sections of the report, but special thanks go to the committee chairs: respectively Hal Levin, Building Ecology Research Group; Michael Mankin, California Division of the State Architect; Roger Morse, Morse-Zentner Associates; and Brent Kynoch, Kynoch Environmental Management, Inc. Lastly, an enormous debt of gratitude is owed to four amazing individuals who made significant contributions to the work of all four committees: Mary Lamielle, National Center for Environmental Health Strategies; Ann McCampbell, MD, Multiple Chemical Sensitivities Task Force of New Mexico; Susan Molloy, National Coalition for the Chemically Injured; and Toni Temple, Ohio Network for the Chemically Injured.

The overall objectives of this project were to establish a collaborative process among a range of stakeholders to recommend practical, implementable actions to both improve access to buildings for people with MCS and EMS while at the same time raising the bar and improving indoor environmental quality to create healthier buildings for the entire population.

This IEQ project supports and helps achieve the goals of the Healthy Buildings, Healthy People project, which acknowledges that "We will create indoor environments that are healthier for everyone by making indoor environments safer for the most vulnerable among us, especially children." (p.17)

## **Summary Recommendations**

The recommendations in this report are only a first step toward the action plan envisioned by the Access Board.

The NIBS IEQ committee offers several recommendations for further action. It is recommended that a follow-on project organize and convene one, or more, workshops to deliberate the issues and recommendations in this report. It is also recommended that a project be organized to develop a single guidelines document. Such guidelines would be built on refinement and coordination of the recommendations of the Design & Construction and Products & Materials committees in this report. This same, or a separate project, should develop new building code provisions to accelerate the implementation of improved IEQ. Lastly, it is recommended that a project be organized to develop guidelines for the design of an “ideal space” for people with MCS and EMS. The recommended follow-up projects should involve collaborative effort and funding from a range of organizations across the building community; e.g., American Institute of Architects (AIA), Associated General Contractors of America (AGC), Building Owners & Managers Association International (BOMA), American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), Environmental Protection Agency (EPA), and, of course, the Access Board.

## **INTRODUCTION AND OVERVIEW**

### **Problem Summary**

The operation and maintenance of commercial and public buildings can affect their accessibility for people with asthma and multiple chemical and/or electromagnetic sensitivities. The presence of many products or conditions involved in cleaning, maintaining, using, and operating buildings often contributes to poor indoor environmental quality and are access barriers for these individuals.

Problematic substances include, but are not limited to, pesticides, fragrances, disinfectants, many cleaners and new building materials and furnishings, and smoke and other engine exhaust. Inadequate ventilation of a building further contributes to poor indoor environmental quality.

The presence of electromagnetic fields from office equipment and other sources is a barrier for those with electromagnetic sensitivities. Noise and vibration can adversely affect some people with chemical and/or electromagnetic sensitivities and trigger seizures in susceptible individuals.

### **General Solutions**

Measures taken to improve indoor environmental quality, such as reducing air pollutants, noise and electromagnetic fields in buildings, will increase their accessibility for people with asthma and chemical and/or electromagnetic sensitivities, as well as provide a more healthful environment for all building occupants.

While “green” and “environmentally-friendly” practices and products for construction and maintenance of buildings sometimes provide more healthful indoor environments and improves access for those with asthma and multiple chemical sensitivities, this is not always the case. The U.S. EPA notes that there is growing concern that standards being promoted by the green building movement, such as Green Seal and Green Guard standards, are not sufficiently protective of health (1).

For example, some measures recommended to promote energy and water conservation -- such as reducing outdoor air supplied and/or reducing time of HVAC usage, using motion sensors that can create electromagnetic fields, using waterless urinals that require continuous chemical treatments, recommending cold water for cleaning, and promoting the use of alcohol hand wipes instead of hand washing – can cause or lead to increased indoor pollution and less healthful and accessible environments.

In addition, “greener cleaners” often promote the use of citrus- and/or pine-based products, which can react with even low levels of oxidants, such as ozone, to produce hazardous byproducts, as well as make buildings inaccessible for many people with chemical sensitivities. The addition of either synthetic or natural fragrances to cleaning and other products is also problematic for chemically sensitive individuals.

Other common green building recommendations, such as building on brownfields, using tuck-under parking, and putting heliports or gardens on roofs can also lead to diminished indoor air quality and create barriers for people with chemical sensitivities.

Lastly, the green building community has yet to provide guidance on the issue of electromagnetic fields.

## **BARRIERS & ISSUES**

### **Fragrances**

The presence of perfume, cologne, scented cleaners and other scented products contributes to poor indoor air quality and is one of the major access barriers for people with asthma and multiple chemical sensitivities.

“Fragrances” are chemical compounds added to a product to give it a scent. There are approximately 3000 chemicals used in the manufacture of fragrances. Most of these chemicals are synthetic and derived from petroleum. Chemicals found in fragrance formulations include toluene, alcohols, formaldehyde, styrene, benzene, limonene, phthalates, and musk. An individual fragrance formula may contain over 100 chemicals, but their identity is protected as a trade secret. Fragrances do not have to be tested for safety before they are put on the market (2).

Exposure to fragrances can trigger asthma attacks and migraine headaches, and aggravate sinus conditions. In those who are chemically sensitive, fragrance exposures can also cause irregular heartbeat, memory loss, confusion, fatigue, and neurological, vascular, and other problems. In addition, some fragrance chemicals are implicated in causing cancer and/or damaging the liver, kidneys, and central nervous system. Fragrance chemicals can enter the body via inhalation, skin absorption, or nasal passageways.

According to a 1986 U.S. House of Representatives Report:

*"In 1986, the National Academy of Sciences targeted fragrances as one of the six categories of chemicals that should be given high priority for neurotoxicity testing. The other groups include insecticides, heavy metals, solvents, food additives and certain air pollutants. The report states that 95 percent of chemicals used in fragrances are synthetic compounds derived from petroleum. They include benzene derivatives, aldehydes, and many other known toxics and sensitizers, which are capable of causing cancer, birth defects, central nervous system disorders and allergic reactions "* (3)

If a product label lists “fragrance” as an ingredient on the back of the label, it contains added fragrance, even if the front label says the product is “unscented” or “fragrance-free”. If “fragrance” is not listed as an ingredient, it may still contain fragrance chemicals or contain natural fragrances.

The main sources of fragrances in buildings are from 1) fragrance-emitting devices (FEDS), sprays, and deodorizers, 2) other scented cleaning and maintenance products, 3) perfume; cologne; essential oils; and scented skin and hair products, cosmetics, and other personal care products, 4) clothing that has been laundered with scented detergents, fabric softeners, or dryer sheets, and 5) potpourri, incense and scented candles (even when incense or scented candles are not burning). Sometimes fragrance is added to and dispersed by a building’s ventilation system.

### **Pesticides**

Pesticides are hazardous chemicals designed to kill or repel insects, plants, and other pests. The term pesticide applies to insecticides, herbicides (weed-killers), fungicides, rodenticides, disinfectants, and other substances used to control pests. Many pesticides contain volatile and/or semi-volatile chemicals that contribute to poor indoor air and environmental quality (IAQ/IEQ).

A pesticide product consists of the active ingredient(s) and “inert” ingredients. Active ingredients are the chemicals that kill or repel the pest. The rest of the product is composed of “inert” ingredients, which often comprise over 95% of the pesticide product. “Inert” ingredients are commonly solvents and may be as, or more, toxic than the active ingredient(s).

Individuals exposed to pesticides are at risk for both acute and chronic health effects (4, 5, 6, 7). Pesticide exposures can exacerbate asthma and cause nausea, headaches, rashes, dizziness, fatigue and memory loss. Many pesticides are also linked with causing cancer, birth defects, neurological and reproductive disorders, and the onset and exacerbation of chemical sensitivities. Pesticide exposure can occur long after its application because pesticide products are often designed to be persistent in the environment.

For people who are chemically sensitive, exposure to even minute amounts of pesticides from, for example, pesticide drift from neighborhood lawn treatments, driving on a road where herbicides have been sprayed weeks earlier, or being in a building that was treated with pesticides even several years earlier, can cause severe, sometimes, life-threatening and/or prolonged illness (8). Thus the presence of pesticides is one of the greatest access barriers for people with chemical sensitivities.

The use of pesticides can be eliminated or significantly reduced through implementation of Integrated Pest Management (IPM) programs. IPM is a program of prevention, monitoring, record-keeping, and control that eliminates or drastically reduces the use of pesticides. The focus of IPM is to prevent pest problems by reducing or eliminating sources of pest food, water, and shelter and by maintaining healthy lawns and landscapes. The first approach to controlling a pest outbreak is to improve sanitation, make structural repairs (such as fixing leaky pipes and caulking cracks), and using physical or mechanical controls such as screens, traps and mechanical weed cutters. A least hazardous chemical is used only when other strategies have failed.

IPM strategies are being increasingly implemented in schools, parks, government facilities, and hospitals nationwide. One needs to be aware, however, that the term IPM is sometimes inappropriately used for pest management programs that use or recommend the use of significant amounts of pesticides.

### **Cleaning Products & Disinfectants**

Many toxic chemicals are found in janitorial cleaning supplies used in industrial and commercial facilities. They often emit volatile organic compounds (VOC's) (9), contribute to poor indoor air quality (IAQ), and create access barriers for people with asthma, allergies, and/or chemical sensitivities. Some of these chemicals are associated with human health effects, including cancer, damage to major organs, interference with normal reproduction and development, and even death. (10).

Even “greener cleaners” may contain volatile substances, like citrus or pine, that can cause adverse health effects in building occupants.

There is a wide range of cleaning and maintenance products that include, but are not limited to, air fresheners, deodorizers, bathroom and tile cleaners, dusting aids, engine and other degreasers, lubricants, fabric protectants, floor polishes and waxes, furniture polish, general purpose cleaners, glass cleaners, laundry products, oven cleaners, carpet and upholstery cleaners, graffiti remover, and floor strippers. One of the most hazardous cleaning operations for workers and building occupants is the stripping and refinishing of floors.

Some cleaning products also contain disinfectants. The U.S. EPA notes that one major concern from a health standpoint is the increased incorporation of antimicrobial agents and fragrances in cleaners and air fresheners marketed to reduce indoor air contamination (1).

Many commonly used disinfectant or sanitizer products contain chlorine, phenol, quaternary ammonium compounds, and isopropyl and other alcohols. These produce hazardous fumes and present access barriers for people with chemical sensitivities.

### **Electromagnetic Fields**

For people who are electromagnetically sensitive, the presence of cell phones and towers, portable telephones, computers, fluorescent lighting, unshielded transformers and wiring, battery re-chargers, wireless devices, security and scanning equipment, microwave ovens, electric ranges and numerous other electrical appliances can make a building inaccessible.

The National Institute for Occupational Safety and Health (NIOSH) notes that scientific studies have raised questions about the possible health effects of EMF's. NIOSH recommends the following measures for those wanting to reduce EMF exposure – informing workers and employers about possible hazards of magnetic fields, increasing workers' distance from EMF sources, using low-EMF designs wherever possible (e.g., for layout of office power supplies), and reducing EMF exposure times (11).

### **Renovation/Remodeling/Furniture**

Many new building materials, such as paints, adhesives, wallboard, carpet, and insulation, as well as upholstered furniture, particleboard cabinets, and other furnishings emit hazardous volatile organic compounds (VOC's), contribute to poor indoor air quality (IAQ) and create significant access barriers for people with asthma and/or chemical sensitivities. These materials often outgas and are problematic for prolonged periods of time.

### **Smoke & Combustion**

Many people with asthma and most people with chemical sensitivities are made sick by exposure to: 1) smoke, such as that from tobacco, fireplaces, candles, incense, and barbeques, and other outdoor fires, 2) vehicle and other engine exhaust, especially exhaust from vehicles using diesel or oxygenated fuel, and 3) combustion appliances burning kerosene, propane, or natural gas (natural gas usually being better tolerated than kerosene or propane). If combustion appliances are used, they should be directly vented to the outdoors. Electrical appliances are preferred by people with chemical sensitivities.

### **Noise & Vibration**

Noise and vibration from HVAC systems, vacuums, pumps, helicopters and other sources can trigger severe symptoms, including seizures, in susceptible individuals.

### **Synergistic Effects of Indoor Air Pollutants**

Indoor air is a "chemical soup" made up of a variety of chemicals emitted by building materials, cleaning products, pesticides, personal care and consumer products, emissions from building equipment and activities, etc. While individual chemicals may be hazardous, combinations of chemicals can be even more hazardous through additive or synergistic effects. Synergistic effects

occur when the health impacts of a chemical combination is greater than the sum of the impacts of the individual chemicals.

### **Indoor Air Chemistry**

In indoor air, chemicals can react with one another to form other compounds that are more hazardous than the original chemicals. Increasing evidence has shown that ozone and hydroxyl radicals formed by other oxidants can react with alkenes (such as limonene found in citrus and fragrance formulations, as well as terpenes emitted by many wood products) to generate secondary pollutants, including formaldehyde, as well as hydroxy radicals that can react with organics to form other potentially toxic air pollutants. The toxicity of many of these secondary pollutants is well-established while for others it has yet to be evaluated (12, 13, 14, 15, 16). These reactions can be limited by employing carbon-based filters in locations where outdoor ozone concentrations commonly approach or exceed the National Ambient Air Quality Standards (NAAQS) promulgated by the U.S. EPA.

### **Persistence of Indoor Air Pollutants**

Many porous building materials and furnishings, such as carpeting, couches, drapes, and wallboard, absorb cleaning chemicals, fragrances, pesticides, and other air pollutants. Chemicals adsorb to virtually all indoor surfaces but more strongly to rough rather than smooth surfaces. These processes are known as the “sink effect”. These chemicals can be re-emitted into the air for long periods of time leading to prolonged air pollution. For example, it is not uncommon for a building to retain the odor of a fragrance-emitting device (FED) months after it has been removed. Similarly, residual tobacco smoke can still be detected in buildings long after a no-smoking policy is implemented. Air pollutants clear more readily from buildings that contain a higher percentage of hard impermeable surfaces.

## **RECOMMENDED ACTIONS FOR FACILITY MANAGERS AND OPERATIONS & MAINTENANCE STAFF**

The O & M Committee identified *pesticides* (indoors & outdoors), *fragrances* (especially fragrance-emitting devices/FEDS, air fresheners, and deodorizers), and volatile *cleaners* (including citrus & pine) as the biggest access barriers for people with chemical sensitivities related to operations and maintenance of a building. Cell phone use was identified as a significant barrier for people with electromagnetic sensitivities.

The Committee developed recommendations for making buildings more accessible for people with chemical and/or electromagnetic sensitivities in the areas of pest control, cleaning & disinfecting, mechanical / HVAC, landscape maintenance, and enclosure maintenance. They are listed in bullet form in the Appendix and summarized in the body of the report below.

In addition, recommendations are given for renovation, remodeling, and furnishings and for adoption of policies on smoking, fragrances, cell phone use, notification of building activities, and vehicle idling.

The Committee recognizes that the list of recommendations is long and that few buildings will be able to implement all of them. The recommendations are the ideal goal towards which to strive. Any steps taken to reduce the levels of the problematic substances or conditions listed above will improve access for people with chemical and/or electromagnetic sensitivities and create a healthier building.

Some of the recommendations will not apply to certain types of buildings or geographic areas. The recommendations are given in sufficient detail to help those who need to address a specific issue. Resources from which to obtain more information or guidance are also provided in the Appendix and at the end of the document in Additional Resources.

### **Recommendations for Pest Control**

Adopt an Integrated Pest Management (IPM) program for building interiors and grounds as described in “Healthy Hospitals, Controlling Pests Without Harmful Pesticides” (17). The Los Angeles Unified School District also has an exemplary plan for an IPM program (18).

IPM is a program of prevention, monitoring, record-keeping, and control that eliminates or drastically reduces the use of pesticides. The focus of IPM is to prevent pest problems by reducing or eliminating sources of pest food, water, and shelter and by maintaining healthy lawns (19) and landscapes.

The first approach in controlling a pest outbreak is to improve sanitation, make structural repairs (such as fixing leaky pipes and caulking cracks), and using physical or mechanical controls such as screens, traps, vacuums, and mechanical weed cutters. Increased sanitation measures include more frequent trash removal, restricting eating to designated areas, securing trash container lids, and steam cleaning trash containers. The IPM approach uses knowledge of a pest’s biology, habitat, and needs to time specific interventions to prevent and control pests. A least hazardous chemical is used only when other strategies have failed.

Pesticide use is discouraged in a true IPM program. If pesticides are used indoors or outdoors, however, the following precautions should be taken -- notification of applications (even for “spot” or crack & crevice treatments) should be given through posting of signs (before, during, and after applications) and by other means to building occupants, especially those on a pesticide notification

registry (20), applications should only be made by a licensed applicator, applications should not be made inside buildings by spraying, fogging, bombing, or tenting, and applications should not be made in occupied areas or areas that may become occupied during the 24 hours (at a minimum) following an application. In buildings that are constantly occupied, pesticide applications should be made when they are least occupied. It is recommended that pesticides be applied when there is the longest time before the area will be re-occupied, such as at the beginning of a weekend or vacation period.

The Committee recommends that certain pesticides, such as organophosphates, carbamates, pyrethroids, and other neurotoxic insecticides; 2,4-D, other phenoxy herbicides, and glyphosate; and fungicides such as mancozeb, chlorothalonil, and maneb, never be used.

### **Recommendations for Cleaning & Disinfecting**

Use fragrance-free, low-VOC cleaning products. Do not use fragrance-emitting devices (FEDS), plug-ins, or sprays; urinal or toilet blocks; or other deodorizer/re-odorizer products. Reduce odors by increasing cleaning and ventilation and/or using baking soda or zeolite to absorb odors. Do not use products containing paradichlorobenzene (21) or naphthalene, which are common ingredients in FEDS.

Do not use cleaner/disinfectant combination products. Avoid or limit the use of products containing chlorine, ammonia, quaternary ammonium, phenol, isopropyl and other alcohols, formaldehyde, and other petroleum distillates. Do not use citrus- or pine-based products. Hydrogen peroxide-based products are the preferred disinfectants, but still should be used with caution and care. Use hot water for cleaning to reduce the need for soaps, detergents, and disinfectants.

Use disinfectants only in areas and at strengths (i.e., levels of disinfection) required by law. Check with local health department to obtain details of all legal requirements. Clean surfaces thoroughly before disinfecting. Leave disinfectants in place for the correct amount of time before wiping surfaces clean.

Audit cleaning chemicals currently in use and develop a plan to replace with safer alternatives.

Vacuum frequently and thoroughly using vacuums with HEPA filters and strong suction. If carpets must be cleaned, use steam or least toxic all-purpose cleaner or carpet cleaner that does not contain petroleum solvents. Spot clean whenever possible. Clean stains while they are fresh to avoid the need for aggressive cleaning later. Dust hard surfaces with a lint-free cloth, or with water only.

Spray cleaning products on to cloths rather than on to surfaces or into the air. Dry all washed surfaces with a dry cloth or mop to reduce chemical residue and chance of mold growth. Minimize the use of floor waxes and buffing.

Ventilate well when using cleaning products. Post signs during cleaning. Make cleaning schedule available to employees or others upon request.

Schedule heavy cleaning, repairs and maintenance during low or no-occupancy periods whenever possible.

Prohibit occupant usage of cleaning chemicals except as authorized. Establish a list of least toxic, low-VOC cleaning products (and/or provide them to employees) which they can use to clean computers, erase felt pen writing on white board, and perform other similar activities.

In decorative building fountains, use the minimum amount of chlorine necessary for disinfection, avoid the use of bromine, use closed ozone water treatment systems to the maximum extent possible, and make use of newer, less-toxic disinfecting technologies as they become available.

Avoid the use of wall-mounted devices, similar to fragrance-emitting devices (FEDS), that operate automatically or by pushing a button to dispense deodorizers, disinfectants, and pesticides.

### **Recommendations for Mechanical Equipment / HVAC**

Adhere to a strict maintenance schedule for HVAC equipment and make sure it is working properly. Use the highest efficiency filters compatible with current HVAC system, and if necessary, consider retrofitting the system to increase filtration capabilities. Maintain relative humidity between 30% and 50%.

Use non-chemical methods to maintain HVAC ducts free of particulate matter, dust, and debris, such as physical removal or use of vacuums. Do not use the HVAC system to disperse fragrances or other materials.

Seal return air openings into HVAC system during remodeling and exhaust directly to the outdoors, by temporarily removing window glazing if necessary.

Use demand controlled ventilation (DCV) that provides liberal amounts of air flow and outdoor air ventilation. Before a building is re-occupied in the morning or after weekends, flush with at least three complete outdoor air exchanges.

Create door and window-opening protocol to maintain proper pressure relationships and air flow in the building. Educate and provide protocol to staff and other building occupants. Policy should include provision that allows chemically sensitive and other individuals to open windows on a temporary or regular basis, as needed because of a health condition. Windows should also be permitted to be opened by occupants when the HVAC system is not working or shut off, such as may occur during nights and weekends.

Make maximum use of economizer cycle. Avoid energy conservation practices that reduce intake of outside air below minimum requirements.

Avoid or minimize the use of humidifiers in the building's HVAC system. Prohibit the use of personal humidifiers except when an occupant has a medical need for one. Maintain the cleanliness of all humidifier equipment and use the minimum amount of water treatment chemicals necessary to control dissolved solids and pH and prevent antimicrobial contamination. Do not allow the use of portable air "cleaners" that emit ozone.

Repair plumbing with least toxic, low-VOC materials. Use snakes or other mechanical methods to clear clogged drains. Use bacterial enzymes to prevent drain clogs. Inspect floor and other drains, especially those that are infrequently used, to ensure there is water in the P-traps, thereby avoiding sewer gas backup. Treat grease traps daily with bacterial enzymes.

### **Recommendations for Landscape Maintenance**

Maintain lawns and gardens organically. Use integrated pest management (IPM) to eliminate or minimize the use of herbicides, fungicides, insecticides, and other pesticides. Maintain soil health. Avoid the use of synthetic fertilizers.

Pull, mow, or use mechanical weed cutters to remove weeds. Vinegar can be used to kill weeds along fence lines and other hard to reach places.

Avoid dust-blowing equipment like leaf blowers. Sweeping, raking, and use of vacuums are the preferred methods for removing debris.

Avoid diesel-powered and 2-cycle engine equipment. Use electric lawn and landscape equipment whenever possible.

Use rock, gravel, flat stones, or pavers for mulch, and/or use tytar landscape barrier to suppress weeds. Avoid organic mulches, like cocoa beans, peat moss, wood chips, and bark, especially near operable windows and doors of buildings. These mulches usually emit volatile fumes and may produce or harbor mold.

Avoid the use of CCA wood or wood chips because they contain arsenic and other toxic chemicals which can leach into the environment. Do not use railroad ties because they contain creosote.

Apply pesticide, fertilizers, and lime only when there is little or no wind and apply them in a manner that prevents drift. Post signs and provide advance notification to building occupants before starting these applications.

Use least toxic, low-VOC paints, stains, and finishes on outside equipment, like benches, poles, decks, and porches.

### **Recommendations for Enclosure Maintenance**

It is important to properly maintain the building envelop in order to prevent mold problems and block pest entry.

Routinely inspect and clean roof and gutters to make sure they are draining properly. Promptly repair roof or plumbing leaks. Regularly inspect walls and foundations, especially all utility entrance seals (e.g., phone, water, electric, and cable) for cracks and repair promptly if found. Insulate cold pipes to prevent condensation.

Promptly remove wet ceiling tiles and wall panels.

Remove excess water from carpeting damaged by clean water and quickly dry it to avoid mold buildup. Do not use disinfectants or moldicides (other than hydrogen peroxide-based ones). Instead, utilize a steam extraction carpet cleaning system with a hydrogen peroxide-based cleaner/disinfectant. Inspect carpet after it is completely dried to ensure there is no mold or mildew. Those with asthma or chemical sensitivities should be removed from areas where there is wet carpeting. Remove carpeting if it has been wet longer than 24 hours.

Immediately remove and do not re-use any wet carpeting that has been contaminated with sewer water, heavy dirt and soils, or toxic chemicals.

Seal rusted surfaces with a least toxic low VOC sealant to minimize emissions of airborne particles.

### **Recommendations for Renovation/Remodeling/Furnishings**

It is recommended that buildings and furnishings be well maintained to reduce the need for renovation and remodeling. Chemically sensitive individuals often tolerate older building materials and furnishings better than new ones because older materials have usually outgassed and emit lower levels of VOCs.

If renovation and remodeling is done, however, efforts should be made to limit activities to select areas, rather than being done on a wide scale. They should be performed when the areas are unoccupied (or the least occupied in buildings that are in constant use).

If new materials and finishes are applied (especially wet-applied products such as paints, sealants, caulks, and adhesives), maximum outdoor air ventilation with no recirculation should be employed during and for a reasonable period of time after the application.

When possible, new furnishings should be thoroughly aired out before being brought into the occupied space.

## **GENERAL RECOMMENDATIONS**

### **Indoor Air & Environmental Quality Program**

The O & M Committee recommends that facilities adopt an Indoor Air & Environmental Quality Program (IAQ/IEQ) to promote practices that prevent or reduce the contamination of indoor air, thereby contributing to a safe, healthy, productive and comfortable environment for building occupants. Benefits of good IAQ/IEQ may include improved health of occupants, decrease in the spread of infectious disease, protection of susceptible populations, increased productivity of occupants, improved relationships/fewer complaints, reduction in potential building closures (due to unhealthful conditions), less deterioration of buildings and equipment, reduced maintenance costs, and decreased liability and risk (22).

An IAQ/IEQ Program should include the maintenance of a log that records building problems and health complaints reported by building occupants.

### **Policies**

The O & M committee recommends the following policies be adopted in commercial and public buildings:

#### **No Smoking Policy**

It is recommended that smoking be prohibited inside buildings. Smoking should be restricted to designated outdoor smoking areas that are 100 feet from paths of travel, entryways, operable windows, and air intakes.

#### **Fragrance-Free Policy**

It is recommended that a fragrance-free policy include prohibition of fragrance-emitting devices (FEDS) and sprays; use of fragrance-free maintenance, laundry, paper and other products; restrictions on perfume, cologne, and other scented personal care products used by employees, visitors, and other occupants; and prohibitions on use of potpourri and burning incense and scented candles.

An important first step is educating staff and others about the need for and benefits of reducing or eliminating the use of fragranced products.

### **Resources**

No Scents Makes Sense brochure, Lung Association of New Brunswick:  
<http://www.nb.lung.ca/pdf/NoScentsMakeSense.pdf>

Guidelines on Wearing Scented Products and We Share the Air posters, University of Waterloo, Ontario, Canada, [www.safetyoffice.uwaterloo.ca/hspm/hspmm\\_intro/safety\\_manual\\_index.htm](http://www.safetyoffice.uwaterloo.ca/hspm/hspmm_intro/safety_manual_index.htm), (under 12. Hygiene).

See “*Steps for Implementing a Scent-free Policy in the Workplace*” in Additional Resources.

#### **Cell Phone Use Policy**

It is recommended that cell phone use be prohibited in areas of a building when requested by an electromagnetically sensitive individual who needs to work or visit that area. Also, see information on use of a Cleaner Air Symbol in the Designated Cleaner Air Room report.

### **Notification Policy**

It is recommended that facilities adopt a posting and notification policy to notify staff, visitors, and other building occupants of pesticide applications, cleaning and maintenance activities, renovation and construction, and other activities that may produce hazardous fumes or dust.

### **Vehicle Idling Policy**

It is recommended that facilities limit or prohibit idling of vehicles, especially diesel vehicles, near entryways, loading docks, operable windows, and air intakes (23).

### **Recommendations for Future Actions**

1. The O & M Committee recommends that the U.S. Access Board sponsor a meeting with stakeholders, including architects, building owners and managers, government officials, scientists, advocates, sensitive and vulnerable individuals, and others to evaluate the recommendations of this report (Operations & Maintenance). This meeting should provide a forum for increasing awareness of the report, facilitating dialogue among stakeholders, assessing the feasibility of the recommendations, and identifying ways to advance the recommendations.

2. The recommendations on cleaning products and practices in this report are based on information that is currently available. The O & M committee found that much more information and research is needed to better define cleaning products and practices that are effective and that will best protect occupant health. Some of the data gaps or problems the Committee identified are lack of information on labels and Material Safety Data Sheets, lack of information on fragrance ingredients combined with incomplete information on their health effects, and safety questions about citrus- and pine-based cleaning products because, among other things, they react with ozone to produce hazardous byproducts.

We, therefore, recommend that the U.S. Access Board and/or NIBS, in conjunction with U.S. EPA and other stakeholders, sponsor a workshop to examine existing information on cleaning products and practices, identify those products and practices that have the least adverse impact on indoor environmental quality and occupant health (including impacts on sensitive and vulnerable individuals), develop best practices, and determine research needs.

## **APPENDIX - DETAILED RECOMMENDATIONS**

### **Detailed Recommendations for Pest Control**

#### ***Use Integrated Pest Management:***

Use integrated pest management (IPM) – a program of pest prevention, monitoring, record-keeping, and control that eliminates or drastically reduces the use of pesticides.

Follow recommendations for integrated pest management (IPM) in "Healthy Hospitals, Controlling Pests Without Harmful Pesticides". The Los Angeles Unified School District also has an exemplary plan for an IPM Program.

Eliminate the use of chemical pesticides or minimize their use to the greatest possible extent.

Pest management program should be part of an overall Indoor Air & Environmental Quality (IAQ/IEQ) program.

Designate an IPM coordinator.

When contracting for IPM services, give clear instructions on the type of service requested, including which, if any, pesticides are acceptable for use under specific conditions.

Eliminate all scheduled or routine use of pesticides. Use chemical pesticides only as a last resort when non-chemical methods have failed to control a pest problem.

Use organic methods to maintain lawns and landscape vegetation.

Do not use fertilizers that contain herbicides (e.g., "weed and feed" products).

Do not use herbicides to kill grass, shrubs, or other unwanted vegetation prior to removal or replacement.

If control methods are needed, preference should be given to physical (e.g., barriers), mechanical (e.g., mouse traps, pulling weeds, vacuuming, fly swatters, hosing insects off plants), and cultural (e.g., improved soil health, proper watering and pruning) controls, using bio-controls (e.g., natural predator insects) if those methods fail, and only using chemical pesticides as a last resort.

#### ***Prevent Pests:***

Emphasize pest prevention through non-chemical means.

To avoid creating conditions attractive to pests, clean thoroughly, promptly fix building cracks and plumbing leaks, restrict eating to designated areas, and promptly dispose of waste.

Adopt and adhere to strict maintenance schedules to determine and repair points of possible pest entry, such as torn screens, cracks and holes in walls, and damaged or improperly placed door seals and sweeps.

Initiate additional housekeeping routines to reduce the chances of pest infestation, including more frequent trash removal, securing trash container lids, and steam cleaning trash containers.

Locate trash cans and dumpsters, compactors, and recycling areas away from the building.

Maintain healthy lawns and landscape vegetation to increase resistance to pests.

To maximize health of lawns, develop healthy soils, mow often and with sharp blades, reduce thatch, and water deeply but not too often.

Maintain soil health. Avoid the use of synthetic fertilizers.

Prevent mosquitoes from breeding by draining stagnant water from bird baths, swimming pool covers, buckets, tires and other areas where water may be collecting. Drill holes in bottom of recycling bins that must be kept outside. Check rain gutters to ensure they are draining properly.

Discourage the introduction or presence of indoor plants because they attract pests, encourage pesticide use, and often promote mold growth.

If indoor plants are present, minimize mold growth by being careful not to over water, loosening the top layer of soil every week, and not keeping plants in wicker baskets. Do not use synthetic fertilizers or pesticides on indoor plants.

Change the water in flower vases frequently.

***Pesticides:***

**USE PESTICIDES ONLY AS A LAST RESORT WHEN NON-CHEMICAL METHODS HAVE FAILED TO CONTROL A PEST PROBLEM**

Use the least toxic pesticide in the least amount necessary to accomplish the job. Spot treatments are preferred.

Least hazardous pest management materials include:

- Boric acid and disodium octoborate tetrahydrate;
- Soybean oil and corn gluten meal;
- Diatomaceous earth;
- Nonvolatile insect and rodent baits in tamper-resistant containers or for use in crack and crevices;
- Microbe-based insecticides (such as *Bacillus thuringiensis*, B.t.);
- Botanical insecticides that do not contain synthetic pyrethroids or toxic synergists;
- Biological control agents, such as parasites and predators; and
- Soap-based products.

[Note that due to individual variations in sensitivities, some people with allergies, asthma, or chemical sensitivities may not tolerate one or more of the above least hazardous materials.]

Least hazardous physical pest management methods include the use of liquid nitrogen for cold treatment of termites.

Pesticide applications should only be made by a licensed pest control applicator.

The O & M Committee recommends that certain pesticides, such as organophosphates, carbamates, pyrethroids, and other neurotoxic insecticides; 2,4-D, other phenoxy herbicides, and glyphosate; and fungicides such as mancozeb, chlorothalonil, and maneb, never be used.

Do not apply pesticides to buildings by fogging, bombing, or tenting or by space, broadcast, or baseboard spraying.

Do not apply pesticides in occupied areas or areas that may become occupied during the 24 hours (at a minimum) following an application. In buildings that are constantly occupied, pesticide applications should be made when they are least occupied. It is recommended that pesticides be applied when there is the longest time before the area will be re-occupied, such as at the beginning of a weekend or vacation period.

Minimize contamination of the HVAC system by sealing all inlets and outlets to the area where pesticides are applied. When the seals are removed, ventilate the area with 100% outside air with no recirculation at least until the building is re-occupied.

No application of pesticides should be made along paths of travel or in the vicinity of entrances, windows, or outside air intakes.

Do not use pesticides that contain added fragrance.

Ensure proper training of all personnel working with pesticides.

Prohibit other staff and building occupants from using pesticide products.

In the event of a scheduled structural or lawn care pesticide application (including spot or crack & crevice treatments), provide pre-notification and post signage in appropriate disability formats before, during, and after the application.

Signage for pesticide applications should include the name of the pesticide product applied and EPA registration number, date and time of application, name of the applicator, and the name and number of contact person from whom to obtain more information. For examples of notification requirements, see Healthy Hospitals report (17) and New Jersey regulations (20) under References.

Require that pest control applicators provide the building manager or designated agent copies of Material Safety Data Sheet(s) and product label(s) for all pesticides used inside the building or on facility grounds. These documents should be provided to building occupants and the public upon request. Note, however, that neither the MSDS or product label provide complete information on product ingredients or their potential health effects.

Maintain a voluntary registry of persons at increased risk of injury or harm from pesticide exposures who wish to receive individual notification prior to pesticide applications (or notified after an emergency application).

Reasonable accommodation to programs, services, and employment needs to be readily available to people whose disabilities require that they avoid exposures to pesticides.

Maintain secured separate storage for pesticides and limit access to authorized personnel only.

Store any pesticide and disinfectant products away from food, laundry areas, paper product storage, areas occupied by children, and HVAC air intakes.

Maintain separate equipment, including mixing containers, for use with pesticides. Avoid cross contamination with equipment used for cleaning and other maintenance activities.

Establish a reporting procedure and encourage individuals who are experiencing adverse health effects from a pesticide exposure to report the incident to the building manager and the U. S. Environmental Protection Agency. See EPA Pesticide Health Incident Reporting, <http://www.epa.gov/pesticides/health/reporting.htm>

## **Detailed Recommendations for Cleaning & Disinfecting**

Do not use fragrance-emitting devices (FEDS), plug-ins, or sprays; urinal or toilet blocks; or other deodorizer/re-odorizer products.

To reduce odors, increase cleaning and ventilation and/or use baking soda or zeolite to absorb odors.

Do not use products containing paradichlorobenzene or naphthalene (common ingredients in FEDS).

Avoid or limit the use of products containing chlorine, ammonia, quaternary ammonium, phenol, isopropyl and other alcohols, formaldehyde, and other petroleum distillates.

Discourage the use of alcohol-based hand washes.

Do not use products that contain or have a fragrance.

Do not use citrus- or pine-based products.

Use vegetable-based surfactants rather than petroleum-based ones. Do not use citrus- or pine-based solvents.

Cleaning and disinfecting programs should be part of an overall Indoor Air & Environmental Quality (IAQ/IEQ) program.

Establish an audit of all cleaning chemicals currently in use. Develop a priority list and plan to establish alternatives for chemicals and cleaning methods.

Raise awareness among building maintenance staff and occupants that "green" and "environmentally friendly" products are not necessarily good for occupant health.

Minimize the number of cleaning and disinfecting products used.

Perform cleaning maintenance on an as needed basis – use spot or area cleaning rather than broad-based cleaning.

Clean stains while they are fresh to avoid need for aggressive cleaning later.

Choose cleaning products and disinfectants that emit the lowest levels of volatile fumes.

Dust with a dry lint-free cloth, or with water only. Avoid or minimize the use of polish dusting products.

Avoid perfumed and/or chemically-treated cleaning products and supplies, such as cleaning rags, vacuum bags, trash bags, tissue, toilet paper, and hand soaps.

Increase scrubbing and other mechanical methods of cleaning to reduce the need for chemicals.

Inspect areas to insure there has been proper cleaning using visual inspection, white cloth, or ultraviolet light.

Do not use cleaner/disinfectant combination products.

Hot water should be available for hand washing and cleaning.

Whenever possible, clean with hot water to reduce the amount of soap, detergent, and disinfectant that must be used.

Spray cleaning products on to cloths rather than on to surfaces or into the air.

If carpets must be cleaned, use steam or least-toxic all-purpose cleaner or carpet cleaner that does not contain petroleum solvents. Spot clean whenever possible.

Adopt fast-drying methods for carpet cleaning, 4 hours maximum. Steam cleaning + highest extraction + higher dry air flow = fast drying.

Dry all washed surfaces and floors with a dry cloth or mop to minimize chemical residues and reduce the chance of mold growth.

Use vacuums with HEPA (High Efficiency Particulate Attenuation) filters and strong suction. Vacuum frequently and thoroughly.

Minimize the use of floor waxes and buffing, and if done, notify employees and the public.

Order cleaning products for use with pumps rather than spray or aerosol dispensers to minimize chemical contamination of the air and HVAC system.

Take control of your own dispensing to ensure proper measurements. Establish minimal dosing for applications. When chemical has multiple uses, dispense separately for each use. A good dispensing program can save 25% to 40% in chemical consumption and costs.

Educate staff that mixing cleaning chemicals is dangerous because it can create new compounds that are more toxic than the original products.

Initiate protocol to authorize, supervise, and provide safe areas to mix authorized chemicals.

Store cleaning chemicals securely, separated from paper, cloth, or other absorbent materials.

Post signs during cleaning activities. Make cleaning schedule available to employees or others upon request.

Schedule heavy cleaning, repairs and maintenance during low or no-occupancy periods whenever possible.

Maintain strict protocol for training employees who use hazardous products or materials.  
Maintain an active list of those authorized to perform those duties.

Restrict cleaning to authorized personnel only.

Prohibit occupant usage of cleaning chemicals except as authorized. Establish a list of least toxic, low-VOC cleaning products (and/or provide them to employees) which they can use to clean computers, erase felt pen writing on white board, and perform other similar activities.

Use micro vacuums for cleaning electronic equipment. Do not use solvent cleaners.

Increase air intake to a building to dilute cleaning products present in indoor air, especially during major cleaning activities such as cleaning of carpet, walls, etc.

Provide a well-ventilated room with exhaust fans in which to service computers and other portable equipment whenever toxic chemicals are involved in the repair process.

Develop protocol to dispose of cleaning solutions safely.

Reduce tracked-in dirt by using mats and grills in entryways. Where appropriate, exhaust air between separated doorway entrances.

Replace wet entrance mats and dry wet floors and carpeting as soon as possible.

Utilize only those floor mats that do not emit odors/fumes or particles.

Reasonable accommodation to programs, services, and employment needs to be readily available to people whose disabilities require that they avoid exposures to cleaning, disinfecting, and maintenance chemicals.

Waterless urinals should be maintained using products containing bacterial enzymes that biodegrade urea.

### ***Disinfectants***

Eliminate combined cleaner/disinfectant products.

Use disinfectants only when and where necessary. This includes:

- 1) Knowing what organisms need to be reduced/disinfected. Disinfectants are formulated to target certain organisms or combination of organisms. It is important to use the right product in the right place.
- 2) Knowing what surfaces do (or do not) need to be disinfected, and how often.
- 3) Cleaning surfaces thoroughly before disinfecting. Disinfectants can only be effective through contact. A layer of surface grime is likely to prevent sufficient contact.
- 4) Using proper disinfectant mixing and cleaning procedures. This includes leaving disinfectants in place for the correct amount of time before wiping surfaces clean.

Limit or avoid the use of disinfectant or cleaning products containing chlorine, quaternary ammonium, phenol, and isopropyl and other alcohols.

Hydrogen peroxide-based disinfectants are preferred, but should be used judiciously with caution and care.

Use disinfectants only in areas and at strengths (i.e., levels of disinfection) required by law. Check with local health department to obtain details of all legal requirements.

Restrict or eliminate the use of alcohol-based hand washes.

Do not use hand soaps containing triclosan or other disinfectants.

### **Resources**

See Addendum B for more information on Cleaning

### **Detailed Recommendations for Mechanical Equipment & HVAC Systems**

If a building has poor indoor air quality, investigate the extent to which outdoor air contaminants are contributing to the problem.

In areas where poor outdoor air is a problem, use the highest efficiency filters compatible with current HVAC system, and if necessary, consider retrofitting system to increase filtration capabilities.

Use demand controlled ventilation (DCV) that utilize sensors in occupied spaces to determine when ventilation should be increased due to increased occupancy or other loads. Be wary of using motion sensors that can create significant electromagnetic fields.

Provide liberal amounts of ventilation. It is better to have more ventilation than necessary rather than too little.

Where there is an adjoining parking garage or busy roadway, or nearby heliport, anticipate the need to decrease air exchange and ventilation in buildings prior to and during “rush hours” or times of usage, respectively. During periods of decreased outdoor air ventilation, increase recirculation and filtration of recirculated air.

Adhere to a strict maintenance plan for all HVAC equipment to make sure it is working properly. This will reduce the chance of air contamination, maintain optimal efficiency, and minimize noise and vibration.

Create door and window-opening protocol to maintain proper pressure relationships and air flow in the building. Educate and provide protocol to staff and other building occupants. Policy should include provision that allows chemically sensitive and other individuals to open windows on a temporary or regular basis, as needed because of a health condition. Windows should also be permitted to be opened by occupants when the HVAC system is not working or shut off, such as may occur during nights and weekends. Policy should address emergency situations in which opening windows could exacerbate the crisis.

Maintain HVAC ducts free of particulate matter, dust, and debris. Use non-chemical methods, such as physical removal or use of vacuums.

Do not use HVAC system to disperse fragrances or other chemicals.

Before a building is re-occupied (e.g., in the mornings or after weekends), flush with at least three complete outdoor air exchanges.

Make maximum use of economizer cycle. Avoid energy conservation practices that reduce intake of outside air below minimum requirements.

Make sure the supply and return air diffusers, grills, and registers are working correctly.

Test for stagnant air areas where furniture, wall partitions, or equipment may be blocking air movement. Use ribbons or dry ice rather than smoke to study air flow patterns.

Maintain relative humidity between 30 and 50%.

Avoid or minimize the use of humidifiers in the buildings HVAC system. Maintain the cleanliness of all humidifier equipment and use the minimum amount of water treatment chemicals necessary to prevent antimicrobial contamination and to control dissolved solids and pH.

Prohibit the use of personal humidifiers except where there is a medical need.

Isolate and contain construction chemicals and particulate matter from HVAC system by covering registers and diffusers and using negative-pressure air systems.

Seal return air openings into HVAC system during remodeling and exhaust directly to the outdoors, by temporarily removing window glazing if necessary.

Quickly evacuate a building if the HVAC system becomes contaminated with a solvent, pesticide, toxic gas, or other harmful chemical at a level that can cause adverse health impacts in occupants, including sensitive and more vulnerable individuals.

Eliminate storage of toxic and/or volatile chemicals near HVAC intakes.

Do not allow the use of portable air “cleaners” that emit ozone.

Repair plumbing with least toxic, low-VOC materials.

To clear clogged drains, use mechanical methods such as snakes, or steam cleaning.

Utilize bacterial enzymes to prevent drain clogs, instead of using acids, solvents and alkalines which deteriorate pipes and necessitate repairs.

Inspect floor and other drains, especially those that are infrequently used, to ensure there is water in the P-traps, thereby avoiding sewer gas backup in the building.

Treat grease traps daily with preventive dose of bacterial enzymes, to avoid the need to use strong chemical cleaners if they become clogged.

In decorative fountains, use the minimum amount of chlorine necessary for disinfection, avoid the use of bromine, use closed ozone water treatment systems to the maximum extent possible, and make use of newer, less-toxic disinfecting technologies as they become available.

EPA, Indoor Air Quality Building Education and Assessment Guidance (I-BEAM) Software package, can be downloaded for free from EPA website at [http://www.epa.gov/iaq/largebldgs/ibeam\\_page.htm](http://www.epa.gov/iaq/largebldgs/ibeam_page.htm), or can be obtained on CD from IAQ Clearinghouse at 1-800-438-4318 or via e-mail at [iaqinfo@aol.com](mailto:iaqinfo@aol.com) (ask for EPA 402-C-01-001).

See references regarding HVAC in Building Design & Construction report

### **Detailed Recommendations for Landscape Maintenance**

Use integrated pest management (IPM) to eliminate or minimize the use of herbicides, fungicides, insecticides, and other pesticides. (See recommendations for Pest Control).

Maintain lawn and gardens organically.

Maintain soil health.

Avoid the use of synthetic fertilizer.

Do not use fertilizer products that contain herbicides (e.g., “weed and feed” products).

Maintain healthy lawns and landscape vegetation to increase resistance to pests.

To maximize health of lawns, develop healthy soils, mow often and with sharp blades, reduce thatch, and water deeply but not too often.

Pull, mow, or use mechanical weed cutter to control weeds. Vinegar can be used to kill weeds along fence lines or other hard to reach areas.

Avoid dust-blowing equipment, such as leaf blowers. Sweeping, raking, and use of a vacuum are the preferred methods for removing debris.

If string or other mechanical weed cutter is used, attempt to minimize dispersal of dust, dirt, and debris.

Avoid diesel-powered or 2-cycle engine equipment, use electric lawn equipment instead.

Close windows during grass cutting, or prior to pesticide, fertilizer, or lime applications, or use of gas-powered equipment or vehicles on building grounds.

Use least toxic low-VOC paints, stains and finishes on outside equipment, including benches, poles, decks, and porches, as is recommended for interior and exterior of buildings (see recommendations in Building Products & Materials report).

Use rock, gravel, flat stones, or pavers for mulch and/or use tytar landscape barrier to suppress weeds. Avoid organic mulches (e.g., cocoa beans, peat moss, wood chips, bark), especially near windows and doors of buildings. These mulches emit volatile fumes and may harbor mold.

Avoid the use of CCA wood or wood chips because they contain arsenic and other toxic chemicals which can leach into the environment.

Do not use railroad ties because they contain creosote.

Remove plants that are chronically ill and/or frequently attract insect pests.

When replacing plants or redesigning landscape, follow recommendations in Building Construction & Design report.

Apply pesticide, fertilizers, and lime only when there is little or no wind present and in a manner that prevents drift.

Provide prenotification by posting signs prior to pesticide, synthetic fertilizer, or lime applications.

### **Resources**

Allergy-Free Gardening, Thomas Leo Ogren, [www.allergyfree-gardening.com](http://www.allergyfree-gardening.com)

### **Detailed Recommendations for Enclosure Maintenance**

Routinely inspect and clean roof and gutters to make sure they are draining properly.

Promptly repair roof or plumbing leaks.

Regularly inspect walls and foundations, especially all utility entrance seals (e.g., phone, water, electric, cable) for cracks and repair promptly if found.

Insulate cold pipes to prevent condensation.

Promptly remove wet ceiling tiles and wall panels.

Seal rusted surfaces to minimize emissions of airborne particulates using least toxic low-VOC sealant.

Include proper seal of the building in commissioning and re-commissioning programs for the building.

Remove excess water from carpeting damaged by clean water and quickly dry it to avoid mold buildup. Do not use disinfectants or moldicides (other than hydrogen peroxide-based ones). Instead, utilize a steam extraction carpet cleaning system with a hydrogen peroxide-based cleaner/disinfectant. Inspect carpet after it is completely dried to ensure there is no mold or mildew. Those with asthma or chemical sensitivities should be removed from areas where there is wet carpeting. Remove carpeting if it has been wet longer than 24 hours.

Immediately remove and do not re-use any wet carpeting that has been contaminated with sewer water, heavy dirt and soils, or toxic chemicals.

Seal rusted surfaces with a least toxic low VOC sealant to minimize emissions of airborne particles.

Include proper seal of the building in commissioning and re-commissioning programs for the building.

#### **Outdoor Air Intakes & Building Pressurization**

The outside air intakes for positively pressurized buildings have a history of poor location. Many public buildings with utility or service entrances and loading docks have the outside air intake louvers near pollution sources that allow exhaust fumes from trucks to be drawn into the building. Some high-rise office buildings place air intakes in the path of drift from cooling towers on roofs, where contaminants such as bacteria that have caused Legionnaires' disease can enter the ventilation system. Air intakes of other rooftop installations have entrained roof sealants that are emitted into the air. Still others have entrained emissions from plumbing vent stacks resulting in sewer gas entrainment. Roosting birds can also be a source of contaminants that are entrained in outdoor air supply streams.

Outdoor air intakes are often poorly maintained and the areas are dirty. Getting good intake air - either by shielding or relocating intakes or by fine particle filtration eliminates the many contaminants from outside, as well as avoiding the added burden to cleaning inside. Mechanical rooms and nearby areas may also be the location for chemical storage and janitors' closets for many buildings. Mixing chemicals there sends vapors into the ventilation systems of the building. These are cleaning issues that affect indoor air quality.

Since most positively pressurized buildings do not provide for door or window ventilation, all cleaning activities create polluted air until gases and particles are diluted and removed by outside air supply and exhaust. Some older buildings, where the outdoor air supply rates are grandfathered into the energy saving criteria established in the era of President Carter and the 1970's oil embargo, have special problems with indoor air quality. They generally have lower levels of outside air ventilation and, thus, lower levels of dilution.

#### **First Reduce Soil and Dirt:**

Put emphasis on entryways. Reduce tracking in of outside soils and other particulate matter to make inside areas less difficult to clean. Mats, entryway grids, and special ventilation of vestibules reduces intake of soil and dust.

Evaluate high traffic patterns for use of removable matting that can be cleaned away from personnel in order to reduce the overall general cleaning required for carpet.

Limit eating to designated areas that can be cleaned by wiping and light mopping.

Quickly identify and clean spills and stains to eliminate the need for harsher treatments later.

Increase the light wipe and cleaning of hard floors to lessen the required stripping and finishing required. Much of this can be done with water or very light dilutions of an all-purpose cleaner.

Caution on use of the wrong mop is important because residual chemicals on an unrinsed mop can start stripping the finish from the floor, which then requires more frequent refinishing.

Employ better vacuums. Use HEPA (High Efficiency Particulate Attenuation) filtered vacuums with continuous suction. Higher suction not only reduces the amount of soil in buildings, it substantially reduces both hard floor and carpet cleaning. The removal rate makes the cost of high quality equipment worth the investment. The machines are larger, harder to manipulate, and because they have more suction, do not move as fast across the floor. Using a HEPA vacuum following a typical upright vacuum can make a visible difference in the brighter color of a carpet as the floor wand passes over a surface. Ground-in dirt is substantially reduced as is the need to clean the carpet.

Building occupants should be prohibited from having and using cleaning chemicals.

### **Selection of cleaning methods/general rules:**

Chemicals are used to make water work better in cleaning. Chemicals add surface wetting agents, soil reduction and rinsing agents, evaporative qualities, and at times mild coating to prevent re-deposition of soils or the re-appearance of soils. The lower the soil level, the less water needs help to clean.

Higher temperature water dissolves better, cuts greasy soils, and requires less agitation. Increased agitation requires less chemical action to cut into soils.

Wiping and general rinsing after cleaning eliminate the need for many rinsing additives. Most all-purpose cleaners, window cleaners, and other hard surface cleaners have an alternative available in vegetable-based surfactant chemistry. Using many of the alternative products can eliminate alcohol, which lingers in the air long after use. Many of these products can be used in higher dilutions and thus less product is required.

Wiping needs to replace spraying. Many companies have gone to dispensing systems that fill spray bottles. Spraying not only diffuses a solution into the air as well as on the surface, it generally wastes product by over-wetting a surface - thus the need for adding evaporative alcohol to the product. By wetting a wipe lightly and applying to a surface, the excess from spraying does not require the additional labor to work off the hard surface, which saves labor.

Water can be used in general dusting of non-wood surfaces, as can lint-free wipes for most surfaces. Spray devices can be used to dispense into a wipe and this is the most efficient application method.

There is no cleaning need for fragrances and they all need to be eliminated.

There are products on the market which are advertised as deodorizers/re-odorizers that have four times the level of quaternary ammonia as a disinfectant. They are not listed as a disinfectant because they are purportedly for cleaning and reodorizing. This is not uncommon in the labeling of janitorial products.

Fragrances are leading culprits in accessibility problems related to indoor air quality.

Detergent with warm or hot water disinfects as well as disinfectant cleaners most of the time. For quality assurance, use of an ultraviolet light detects bacterial growth and areas which are evading cleaning. In problem areas that are frequently not reached – as behind toilets, around urinals, and beneath the nozzle of soap dispensers - personnel need to be trained and instructed to thoroughly clean the affected area.

Peroxides (as stabilized additives) are capable of disinfecting in more critical areas. Bathrooms, food service areas, and dining areas all follow this general guideline.

Dispensers are most often provided by the companies that sell chemicals. They install the dispensers and set the dilutions. Use of dispensers when building ownership or management is in control of the dispensers is appropriate. Supervisory control over dilutions is essential.

Carpet cleaning often results in off-gassing of toxic solvents for days and even weeks. Use of steam, non-petroleum based cleaners - even in some cases peroxides - and fast drying has proven essential to reducing the impact of cleaning.

Carpets are typically treated with numerous products, including insecticides, sealants, and optical brighteners. No matter what method is used to clean it, e.g., washing, dry-cleaning, or steam cleaning, all cause the release of the built-in chemistry of the carpet.

While it is a general rule to dry carpet in less than 24 hours to reduce the chance for mold growth, optimal drying time is less than 4 hours. This may require selecting less humid days to do the work. It may require increased airflow in the building. It may require blowers and heating to the affected area. It may require higher, more efficient extraction after chemical application. Faster drying shortens the time for the air to recover from the cleaning.

Hard floor finishing is often a process that results in off-gassing for weeks. It is recommended that the work be completed during unoccupied or low occupancy times for the building, using higher air flows for drying, and maintaining maximum dilution with outside air until off-gassing is complete.

Frequent inspections of floors and refinishing only the areas necessary reduces chemical usage and impact. Scheduled finishing may not be the best practice. Using an “inspect and finish as necessary” program allows for limited work to preserve the floors while reducing labor requirements and chemical usage.

Some gel strippers may have lower off-gassing levels and should be evaluated for potential usage. Experiment with strippers to find the lowest effective concentration to achieve the work. Refinishing material as well as strippers should be managed carefully by dispensing in proper amounts to ensure proper usage and to avoid over-usage.

Carpet de-spotting can be accomplished by using mild detergent and baking soda. This old remedy can remove many stains, particularly when fresh. Using the mixture in hot water (120 degrees) and rubbing inward from the outside of the stain can remove many without the use of strong chemicals.

Bathroom fixtures, urinal, and toilets are subject to staining. Where possible, peroxide-based cleaners are preferable. Baking soda provides a mild cleaner-abrasive capability. Use of acids in

difficult circumstances may be necessary. When this is done, the bathroom should be completely ventilated before reopening it for use.

A continuous audit of building practices, education of building personnel, and control of chemical usages by occupants will go a long way in reducing the adverse chemical impacts associated with cleaning. Safer alternative products exist for almost all cleaning needs. Cleaning protocols do not need to change much and can be phased into a building's existing program. While one may look for one practice to save the day, there is no magic bullet. Only one change in cleaning will leave others to create problems. A comprehensive approach is necessary and can be implemented step by step.

### **Checklist Guidance**

Building managers can use the following list of questions as a guide to assess their office building cleaning efforts and to determine where to start transitioning cleaning activities. The checklist does not actually tell a building manager how to set up a cleaning program, but it serves as a starting point for educating everyone involved in a safer air cleaning program—managers, occupants, and janitors—about what they need to do to make it a successful program.

### **Building Considerations**

- How are various areas within the building used? Determine which require the most cleaning, and why (e.g., public restrooms, kitchen areas). What are the hours of use and are there preferred times to clean when personnel are not present?
- Where do people eat (e.g., individual offices throughout the building, designated areas)?
- Are there any special considerations related to the building itself (e.g., is it an historical building that has special preservation requirements or security issues)?
- Do any office furnishings have special cleaning requirements (e.g., thick carpets, antique furniture)?
- Are there any known at-risk populations who may be more adversely affected by the use of some chemicals (e.g., children, people with asthma, allergies or chemical sensitivities, and pregnant women)?
- Does the building have an adequate ventilation system to circulate air throughout the building?
- Does the building have any plumbing or moisture problems?
- Is there a method in place to keep dirt from entering the building (e.g., mats at the front door, double-door entryways)?

### Cleaning Checklist

<b>PROCEDURE</b>	<b>FREQUENCY</b>	<b>PRODUCT BRAND</b> (indicate whether it is purchased in concentrate or ready-to-use form)	<b>MONTHLY PRODUCT USEAGE</b>	<b>CLEANING PROCEDURE</b>
Clean furniture				
Clean walls				
Clean bathrooms				
Disinfection – Bathroom				
Disinfection – General				
Clean washroom fixtures				
Carpet spot removal				
Carpet cleaning				
Gum removal				
Concrete cleaning				
Graffiti removal				
Glass cleaning				
Metal cleaning				
Hard floor – routine cleaning				
Floor stripping				
Floor refinishing				
Other all purpose cleaning				

### **Adequacy of Current Cleaning Program**

- What are issues of concern to management, cleaning personnel, and building occupants? Conduct interviews with all stakeholders rather than on a representative basis.
- Review the log of tenant complaints over the last year. What are the items that come up consistently?
- How is the quality of cleaning currently being evaluated/measured? How often are inspections performed? Are there trends in the problems that are identified?

### **Cleaning Materials Usage**

- List the janitorial products that are currently in use for each of the following categories and identify how often the cleaning task is performed and how much of the product is used per month.
- Are there any reasons to change the procedure or frequency for these cleaning applications? In what manner can chemicals be eliminated or reduced? Seek methods to eliminate usage, reduce usage, and change products to those better for air quality.

### **Selecting Chemicals**

In selecting chemicals for cleaning, there can be considerable confusion. “Green,” “environmentally safe” and various other claims as to the safety of cleaning products do not provide adequate guidance for determining which products do not adversely affect air quality. Below is a list of some terms with which a buyer of chemical products needs to become familiar. The list also includes comments and discussion of alternatives to potentially hazardous chemicals.

Bio-Degradable: The product will break down in the environment over time into supposedly harmless materials. This does not mean the product is safe for the environment, including soil, water, or air.

Chlorine-free: Contains no chlorine, a toxic chemical responsible for substantial problems in air quality as well as more poisonings each year than any other chemical. Oxygen bleaches, the chlorine-free alternatives for bleaching action, are less stable than chlorine bleaches, but much has been done to stabilize oxygen bleaches in the past few years. Do not use concentrated hydrogen peroxide in pure form for disinfection because its application to a flammable surface can cause it to ignite. For scouring, use of baking soda, borax and scrub pads provides additional cleaning capacity. Using a compound containing stabilized peroxide is useful for bleaching.

Natural: Implies the product does not contain synthetic ingredients. Since the use of this term is unregulated and the claim can only be verified by checking with the manufacturer, do not rely upon it for any selection criteria. And since naturally-occurring substances can also be harmful, this term does not have meaning with respect to air quality.

Neutral pH: The product is neither alkaline, nor acidic. These are most useful for products that require handling or mixing or are intended for application to bare skin. Even if a product has a neutral pH, it may have been refined from petroleum and other hydrocarbons and emit volatile fumes. For better air quality, it is often preferable to use a non-petroleum *alkaline* product rather than a solvent or petroleum-based *neutral* product. Very acidic or alkaline products that become airborne can cause irritation and even severe damage to skin, eyes, and lungs.

Non-Toxic: Supposedly only a very large amount will cause damage. Since this term is unregulated in its use, it has little meaning. Fewer than 5% of all cleaning compounds have been tested for safety. A few manufacturers test for skin irritation or ingestion effects. Since a product

can impact air quality and affect people with a large range of sensitivities, a product claiming to be non-toxic may still cause adverse health effects.

Oxygenated: Helps whiten and brighten by releasing oxygen which breaks up stains, and eliminates mildew and mold. See Chlorine above. Oxygenated products, such as those containing hydrogen peroxide, can be as effective as chlorine when used in proper doses and according to safety instructions.

Phosphate-free: Generally meaningless term. Phosphates are allowed by law only in certain automatic dish detergents. Not a criterion for most purchases.

Surfactant: This is the active ingredient in most detergent cleaners, such as all-purpose cleaners, floor cleaners, dish detergents, fabric softeners, and hard surface cleaners. Most often they are created from petroleum and are neutral in pH. Surfactants are used to alter the surface properties of the surface being cleaned. This can make the surface more penetrable, easier to rinse, and less able to be adhered to and more repellent of dirt. Numerous surfactants have been used as reducing agents to dissolve heavy greases and soils. Surfactants are now available in non-petroleum-based (vegetable) forms and the newer surfactants offer interesting new chemistry for air quality. In general they have higher flash points. The vegetable-based surfactants rarely have alcohol or other solvents. They can easily be wiped on and off and do not require evaporative assistance, such as adding alcohol and ether to most window cleaners.

Deodorizer/Re-odorizer: This group of products may contain higher concentrations of quaternary ammonia than disinfectants. They also frequently contain strong fragrances and/or masking agents that diminish the sense of smell. Paradichlorobenzene and naphthalene are common ingredients in fragrance-emitting devices. Deodorizer products are often used in public bathrooms found in restaurants, motels, theaters, subways, trains, airports, airplanes, and other public facilities. The use of deodorizer/re-odorizer products can be avoided by increasing ventilation/air flow and thoroughly cleaning with mildly alkaline non-surfactant detergents followed by the use of disinfectants, preferably peroxide-based ones. Inspection by ultraviolet light is recommended after all intensive cleaning to verify that surfaces have been adequately cleaned

Fragrance: This is an air pollutant that is intended to give the false impression that air is clean. Truly clean air has no smell. Fragrance formulas can contain benzene, toluene, styrene, and formaldehyde, along with other ingredients. Fragrance chemicals can enter the body through the lungs, skin, and nasal passageways. They can affect the brain and nervous system in a matter of seconds, either by their presence in the brain or via stimulation of olfactory nerves. Avoid all products that list fragrance as an ingredient or have a fragrant odor. Be aware that even if "fragrance" is not listed as an ingredient, fragrance chemicals may have been added to a product for another purpose, or claimed to be added for another purpose - such as an anti-microbial stabilizer, blending agent, or enhancer.

Solvent: Water is a solvent. Using alcohol, petroleum, and coal tar-based solvents for floor refinishing, metal cleaning, stain removal, and graffiti control is commonplace. To preserve air quality, use water as a solvent whenever possible. Use petroleum-based solvents only as a last resort. Non-water-based solvents should be used in controlled programs, with substantial increased ventilation, pre-notification of building occupants, use during low building occupancy, and retesting of air to make sure it is clear before a space is re-occupied. The use of many solvent products, such as spot stain-removers, can be eliminated by promptly cleaning stains, using mild

detergent and baking soda with a gentle rubbing action and working in from the outside perimeter of the stain.

Vinegar: An acidic fluid usable for basic surface cleaning, window cleaning, and bathroom fixture wiping. The mild acidic properties provide the ability to remove hard water spots and cut soap films. Note that while vinegar is considered a less-toxic cleaner, some chemically sensitive individuals may react adversely to it.

### **Getting Started**

Eliminating fragranced products is perhaps the quickest and easiest step to improving air quality.

Eliminate air fresheners and fragrance-emitting devices. Do not use urinal or toilet deodorizer blocks which contain paradichlorobenzene, naphthalene, solvents or fragrances. Substitute vegetable-based surfactants combined with microbe-based urea reducing properties. Choose non-fragranced cleaners, hand soaps, and lotions. Choose basic paper items that do not contain fragrances. Do not use cleaner/disinfectant combination products. Disinfectants should be used after a surface is clean for optimal deep cleaning, which should be done on an as needed basis. Inspect cleaned areas using ultraviolet light to verify that the surface has been adequately cleaned. Concentrate heaviest cleaning on essential areas. This will control odor.

Find and remove room deodorizers and dispensing devices. Establish a policy restricting occupant usage of fragrance-emitting plug-ins.

Inventory all current products. Discontinue any product that has fragrance as an ingredient or has a strong odor – such as cleaners containing pine, tea tree oil, orange, lemon, or citrus.

### **Using Above Chart on Cleaning Materials Usage**

Select products used most frequently. This is most often an all-purpose cleaner, a window cleaner, and disinfectant cleaner or straight disinfectant.

Most of these products are overused. In addition, suitable substitutes can almost always be found that have less impact on air quality.

Experiment with dosages to find the minimum amount of cleaning product that will accomplish the job. This is best done after selecting a new vegetable surfactant-based all-purpose cleaner, window cleaner, or oxygen-based disinfectant for bathrooms. Control dispensers to make sure that the minimum dosages necessary are dispensed.

Make increased use of mechanical/physical methods of cleaning to reduce chemical usage.

Vacuuming: Vacuuming extracts soil at a rate of barely 60% when done with typical upright vacuum systems found today. Carpets tend to absorb particles from the air as well as tracked-in grease and other contaminants. Using a stronger vacuum system with continuous suction (non-pumping action) combined with a slower motion increases the extraction rate to above 85%. Keeping vacuumed dirt and fumes from escaping from the vacuum and re-contaminating a room requires strong filtration. HEPA systems work well to remove particulate matter, but care needs to be taken to insure there are no air leaks around the filter. An activated charcoal impregnated membrane will absorb and trap gasses.

A strong vacuuming program that includes daily and thorough vacuuming is the first guard against the need for frequent carpet cleaning. Secondly, evaluate traffic patterns and use throw rugs and entry mats to protect carpeting in heavily trafficked areas that quickly become dirty. Only clean spots or small areas of carpet that require cleaning. Clean carpet on an “as-needed” basis rather than on a regular schedule.

For widespread carpet cleaning, employ extraction methods using steam; mild cleaners that do not contain fragrances or solvents; or peroxide-based cleaners and fast four hour drying to reduce impacts on air quality and chances of mold growth.

Dusting: Wipe surfaces for dusting with lint-free cloths or damp clean rags. This is usually as effective as using chemical dusting products.

Mopping & Buffing: Damp mop hard floors using soft water in high traffic areas. Wipe with a dry mop on return pattern. Frequent mopping protects the floors and reduces the need for buffing and refinishing. Buff floors during off hours using the minimum amount of product necessary to refinish the floor.

Floor Refinishing: Refinish floors based on need rather than a fixed schedule. Keep service records that include the date and area where floor was refinished and the products used. Mandate that only the minimum amount of product necessary to accomplish the job will be used. Provide personnel with information on tracking and the goal of chemical reduction. All stripping and refinishing needs to be done during non-occupancy periods with substantial increases in outside air flow.

### **Keep Track**

Using a computer, create an ongoing tracking system on reductions in the amount and number of chemicals used, changes in chemicals used, and eliminations of chemicals. This overall program needs to be continuously evaluated and communicated to building owners, managers, and occupants.

## Steps for Implementing a Scent-Free Policy in the Workplace

(Adapted from the Canadian Centre for Occupational Health and Safety)

### What steps should I take when implementing a scent-free policy in the workplace?

The situation may arise and create the need for a scent-free policy. As with most workplace policies, be sure to consider the following:

- Conduct an assessment or survey of the employees to determine the extent of the problem. Collect opinions and suggestions at the same time to help you develop a policy appropriate to your workplace.
- Designate one key person to oversee the project and its development. If you work at a large company, it may be better to create a committee with members representing all groups (employees, unions, management).
- Involve the health and safety committee, and get management commitment from the beginning.
- Set and stick to deadlines for creating a draft policy, a review of the policy, and for implementation.
- Be sure that all employees have been fully informed of the policy and that they know what they have to do before the policy becomes effective.
- Educate the employees. You may choose to include brochures or flyers in payroll envelopes, publish articles in company newsletter, or give presentations. In any case, the goal is to inform all employees of the health concerns related to scents and why the policy is needed.
- Address any concerns the employees raise openly and honestly. Reinforce the idea that this policy is being implemented as a result of medical concerns - not merely because of a dislike for a certain smell.
- Make it clear that the policy applies to everyone (including visitors, patients, etc).
- Search local legislation for any supporting documentation.
- Do not limit the scent free policy to perfumes and colognes. Many cleaning and personal care products also have scents.
- Post a list of "approved" unscented products and where they are available locally.
- Review all MSDSs for the products currently used and for those you are considering using. Make sure that the ingredients are acceptable. Remember that some products which claim to be scent-free may be using additional chemicals to mask smells instead of truly being "unscented".
- Conduct trials in limited areas before purchasing large quantities of a product.
- Post notices that waxing, shampooing, painting, or spraying (etc.) will be conducted one week beforehand so that affected personnel can make arrangements or have their duties modified during that time.
- Put the policy statement notice on all appointment cards, stationery, room booking notices, employment postings, etc.
- Decide on wording for 'Scent Free' signs and where the signs will be posted.
- Let everyone know that the policy will be reviewed and can be changed because of experience or new knowledge.

### What is an example of a policy?

Policies should be based on the health concerns of employees - especially those who have sought medical help. Keep the policy short, but specific. The policy must also apply uniformly throughout the company.

<b>Sample: Scent-Free Policy</b>
<p><b>Policy:</b></p> <p>Due to the health concerns arising from exposure to scented products, ABC Company Inc. has instituted this policy to provide a scent-free environment for all employees and visitors.</p>
<p><b>Definitions:</b></p> <p>The use of scented products will not be allowed within the building at any time. In addition, all materials used for cleaning will be scent-free (where ever possible).</p> <p>A list of locally available scent-free products is available from the health and safety office.</p>
<p><b>Procedure:</b></p> <p>Employees will be informed of this policy through signs posted in buildings, the policy manual, promotional materials and will receive orientation and training.</p> <p>Visitors will be informed of this policy through signs and it will be explained to them by their host.</p> <p>Any violations of this policy will be handled through standard disciplinary procedures.</p> <p>This policy is effective on 01/01/01.</p>

**What should the 'posted notice' say?**

Signs should be posted near the entrances to company building(s). In addition, statements on business cards, letter head or promotional materials may be helpful if you receive a lot of visitors.

Examples include:

Some people who work at ABC Company report sensitivities to various chemical-based or scented products. We ask for everyone's cooperation in our efforts to accommodate their health concerns.

In response to health concerns, ABC Company has developed a Scent-Free Policy. Scented products such as hair spray, perfume, and deodorant can trigger reactions such as respiratory distress and headaches. Staff and visitors are asked to not use these products when reporting to this office.

ABC Company is a Scent-free environment. Please do not use scented products while at work.

**MCS Nursing Protocol**

**INTRODUCTION AND OVERVIEW**

Individuals with multiple chemical and/or electromagnetic sensitivities have identified the availability of designated cleaner air rooms and paths of travel in public and commercial buildings as highly important for improving access. The Designated Cleaner Air Rooms Committee examined the rationale for having Designated Cleaner Air Rooms, the types of

buildings or occupancies that may be appropriate for having such rooms, the minimum criteria for such a designation, and who would benefit from having these rooms.

### **Promising Practices**

In November 2001 the State of California adopted a Cleaner Air Symbol and Conditions of Use in its building code to identify areas in publicly funded or leased facilities owned by the State of California that are accessible to and useable by people who are adversely impacted by airborne chemicals or particulate(s) and/or the use of certain electrical fixtures or devices.(1) The symbol can be used when minimum conditions established in the code are met. Use of the designation is voluntary.

A fact sheet on the California Cleaner Air Symbol and Criteria can be found at:

[http://www.documents.dgs.ca.gov/dsa/pubs/cleanerair\\_factsheet.pdf](http://www.documents.dgs.ca.gov/dsa/pubs/cleanerair_factsheet.pdf)

See *1117B.5.11 Cleaner air symbol* (page 109) of the California Code of Regulations for the code language: (see Appendix A)

[www.documents.dgs.ca.gov/dsa/pubs/regulations\\_02-16-05.pdf](http://www.documents.dgs.ca.gov/dsa/pubs/regulations_02-16-05.pdf)

### **Recommended Actions**

The Committee was charged with

- 1) reviewing the California symbol and criteria and investigating where it has been implemented, how it has worked, and what modifications and improvements, if any, are necessary to recommend broader usage;
- 2) developing and promoting a national Cleaner Air Symbol and Conditions of Use as appropriate; and
- 3) defining the scope of guidelines for creating an ideal zone (room and path of travel) hereafter referred to as a Clean Air Room in buildings for people with chemical and/or electromagnetic sensitivities.

During the project, the scope of work was expanded to include a brief discussion of accommodations for people with multiple chemical and/or electromagnetic sensitivities to address the needs of those individuals for whom a Cleaner Air Room would not provide adequate access or for those situations when such a designation would not be possible or feasible. Resources that address access and accommodations for people with multiple chemical and/or electromagnetic sensitivities at work, at school, at public meetings, and in hospitals are included at the end of this report.

### **Committee Recommendations**

- The Committee highly recommends that the Access Board and/or the National Institute of Building Sciences (NIBS) fund or seek funding for FY2006 to develop specifications for designing and constructing a Clean Air Room and Path of Travel, the ideal or model room. This project is a natural outgrowth of the work of the other three committees.
- The Committee proposes a Pilot Project for FY2006 to implement a national Cleaner Air Symbol, as promulgated by the State of California, and Conditions of Use, as modified in the National Cleaner Air Signage, Conditions of Use section below, in

select public and commercial buildings such as independent living centers, disability organizations, schools and other educational institutions, public meeting places, or other business or government entities. The Committee recommends that one or more committee members in conjunction with the Access Board and/or the National Institute of Building Sciences assist in its implementation, track its use, analyze how well it has worked, and determine whether modifications or improvements are necessary prior to recommending promotion nationally. This same group would also examine implementation of the California Signage which is expected to take place during the same time frame.

- The Committee recommends that the Access Board, or a committee created by the Board, identify, review, summarize, and publish best practices for accommodations for people with multiple chemical and/or electromagnetic sensitivities on the website. Such a project was previously proposed by Access Board officials and discussed with members of this Committee but was not part of the charge of the current project.

## **NATIONAL CLEANER AIR SIGNAGE**

### **Background:**

In November 2001 the State of California adopted the California Cleaner Air Symbol, California Building Code, Title 24, Parts 2 and 12, 1117B.5.11ff., which established a symbol and criteria for conditions of use to identify a room, facility, and paths of travel that are accessible to and useable by people who are adversely impacted by airborne chemicals or particulate(s) and/or the use of electrical fixtures and/or devices. Installation and use of the Cleaner Air Symbol is on a voluntary basis in state buildings. The Committee learned that the Cleaner Air Symbol has yet to be implemented in California although members of our group are aware of individuals in California and in other states who are using the symbol as a means of advocating for or obtaining individual access needs.

The California Cleaner Air Symbol and Conditions of Use were also proposed for adoption at the meeting of the Accredited Standards Committee A117 on Architectural Features and Site Design of Public Buildings and Residential Structures for Persons with Disabilities in December 2001.(2) The Cleaner Air Symbol received a favorable vote. It was later dropped prior to the issuance of the final standard in 2003: International Code Council, American National Standard-Accessible and Useable Buildings and Facilities, ICC/ANSI A117.1-2003. The Cleaner Air Symbol is expected to be reintroduced for consideration during a new standard cycle that will begin shortly. The Standard must be adopted by a state or locality to be enforceable.

The Committee also discussed the identification of state buildings in California that might qualify for the Cleaner Air Symbol either due to a building's unique ability to meet the implementation criteria, or the need to make public meeting rooms accessible for those with chemical and/or electromagnetic sensitivities. Committee members are also aware of the need to encourage residents of California who may need to access state buildings to seek to implement the Cleaner Air Symbol.

### **Purpose:**

To provide voluntary guidelines for a Cleaner Air Symbol that can be used nationally or adapted for state and local use.

### **Proposed Language:**

National Cleaner Air Symbol: The national symbol shall be the standard used to identify a room, facility, and paths of travel that are more accessible to and useable by people who are adversely impacted by airborne pollutants, such as those with chemical sensitivities, asthma, and other respiratory conditions, and/or people who are adversely impacted by electromagnetic fields from electrical fixtures and equipment such as those with electromagnetic sensitivities.

The Symbol will comply with the specifications as described in the California code.

When the Cleaner Air designation symbol is used, the following requirements must be met:

- The symbol and text, "Cleaner Air" is displayed within a minimum 6-inch square;
- The "Cleaner Air" text is located under the symbol, as shown
- The Cleaner Air Symbol is shown as either a negative or positive image.
- The symbol and text are posted in either black and white, or in Federal Blue and white. When blue is used, Federal Blue Color No. 15090, Federal Standard 595B, is used.
- There is at least a 70% color contrast between the backgrounds of the sign and the surface that it is mounted on.

### **Conditions of Use**

The Cleaner Air Symbol may be posted to identify the room and path of travel if there is verification that the room, facility, and path of travel to the room meet all of the Cleaner Air Requirements as indicated below:

- No Smoking
- Fragrance-Free
- Pesticide-Free (Indoors and Outdoors)
- Least Toxic/Risk Cleaning Products
- No Recent Construction or Remodeling Including Carpet Installation
- Cell phones turned off
- Ability to turn off or unplug computers and other electrical equipment by occupant or staff
- Ability to turn off fluorescent lighting by occupant or staff
- Ability to adjust temperature and air flow by occupant or staff, or the availability of operable window(s)

### **Paths of Travel**

Every effort should be made to make the Paths of Travel as accessible as possible for those with multiple chemical and/or electromagnetic sensitivities even though the paths of travel might not meet all of the criteria of the Cleaner Air Room. It is important that the Path of Travel from the building entrance to the Cleaner Air Room be as short as possible. The building entrance should also be fully accessible to those with mobility and other impairments.

### **Restrooms**

If possible, restrooms that are already fully accessible to those with mobility and other impairments should be designated for use by those individuals using the Cleaner Air Room. These restrooms should be located along the path of travel or as close as possible to the Cleaner Air Room. The restrooms should meet as many of the criteria as possible. The restrooms should prohibit smoking and be free of perfumes, fragranced products, air fresheners, deodorizers, and pesticides. Cleaning should be done with the same least toxic products used in the Cleaner Air Room. Cell phones should be turned off along the path of travel and in the restrooms.

**Contact Information** for the building/facilities manager or the designated agent responsible for maintaining and/or recording activity in the Cleaner Air Room should be posted at the Cleaner Air Room and at the accessible entrance, if possible, and be readily available to anyone seeking additional information by telephone, fax, e-mail, or mail.

### **Maintaining a Cleaner Air Record Log**

A log shall be maintained on site, accessible to the public either in person or by telephone, fax, e-mail, mail or other accessible means as requested. One or more individuals shall be designated to maintain the log. The log shall record any product or practice used in the designated Cleaner Air Room, the path of travel, and accessible restrooms, as well as scheduled activities that may impact the Cleaner Air designation. The log shall also include the product label and Material Safety Data Sheet(s), as available, for any products used. Note, however, that neither the MSDS nor the product label provides complete information on product ingredients or their potential health effects.

### **Removal of The Symbol**

If the path of travel, room and/or facility restrooms identified by the Cleaner Air Symbol should temporarily or permanently cease to meet the minimum conditions as set forth above, the Cleaner Air symbol shall be removed and shall not be replaced until the minimum conditions are again met.

### **Temporary Use of Cleaner Air Symbol**

The Cleaner Air Symbol may be used to identify a room, path of travel, and restrooms that meet the conditions of use on a temporary basis.

### **Further Explanation of the Criteria for Conditions of Use:**

**No Smoking:** Smoking is prohibited in the path of travel, Cleaner Air Room, and restrooms serving the room. To qualify as a Cleaner Air Room, the room, path of travel, restrooms and surrounding area must be free of tobacco residue. Those who smoke, or who have tobacco residue on their person, would be prohibited from using the room. Smoking should be restricted to outdoor, designated smoking areas that are at a minimum of 100 feet from paths of travel, entryways, operable windows, and air intakes. (See No Smoking Policy, Operations and Maintenance Report)

**Fragrance-Free:** Prohibit fragrance-emitting devices (FEDS), air fresheners, deodorizers, and similar products. Recommend that no fragranced, citrus-and/or pine-based products be used in cleaning or maintaining the room, path of travel, and restrooms. Any persons with perfume, cologne, aftershave, as well as fragranced personal care and laundry products, would be prohibited from using the room. (See Fragrance-Free Policy, Operations and Maintenance Report)

### **Pesticide-Free Indoors and Outdoors:**

Practice Integrated Pest Management. Use least hazardous pest management materials such as non-volatile baits, sticky traps, and boric acid with knowledge and input from those using the path of travel and Cleaner Air Room. The sign should be removed in the event of a least hazardous pesticide application for 24-48 hours because it is likely that the certified pest control applicator is in regular contact with chemical pesticides and could leave residue from clothing or equipment. In addition, some chemically sensitive individuals may be made sick by exposure to even least hazardous pesticides especially when they are first applied.

In the event of a chemical pesticide application made to the building or grounds, other than a least hazardous pesticide such as those listed above, remove the sign and consult with those who use the space and others regarding the length of time that the room would need to be closed to protect affected populations based on the product(s) used. (See Operations and Maintenance for least hazardous pest management materials and cautions in the event that a chemical pesticide application is considered for use in the Cleaner Air Room, Path of Travel, Restrooms, or the building or grounds.)

**Least Toxic/Risk Cleaning Products:**

Avoid or limit the use of products containing chlorine, ammonia, quaternary ammonium, phenol, isopropyl and other alcohols, formaldehyde, and other petroleum distillates. Do not use fragranced, citrus-and/or pine-based cleaning products as mentioned above. Consult those who plan to use the Cleaner Air Room and Path of Travel for cleaning product recommendations. Follow the recommendations of Operations and Maintenance Report for best practices.

**No Recent Construction or Remodeling Including Carpet Installation:**

Every effort should be made to avoid remodeling activities in the Cleaner Air Room, path of travel, and restrooms. Any remodeling activity would require removal of the signage. The length of time for removal should be determined by the type of activity, extent of the remodeling, and the products and materials selected for use. It is important to choose the least toxic, least problematic products and practices. Except for minimal touch up painting, for example, it would not be unusual to have the signage removal in effect for a period of 3- 6 months to a year or more depending on the nature and extent of the remodeling activity. Be sure to consult building occupants with existing health problems and those who are using the Cleaner Air Room for their input and to help determine when the Cleaner Air Room may again be safe for use. (See Products and Materials Report and Design and Construction Report for more information)

**Cell Phones Turned Off:**

Protect those with electromagnetic sensitivities and others who may be adversely affected by electrical equipment.

**Ability to turn off or unplug computers and other electrical equipment by occupant or staff:**

Protect those with electromagnetic sensitivities and others who may be adversely affected by computers and electrical equipment.

**Ability to turn off fluorescent lighting by occupant or staff:**

LEED (Leadership in Energy and Environmental Design) recommendations for new construction call for individual control of lighting.(3) Newer fluorescents that contain electronic rather than magnetic ballasts may be less problematic for some people with electromagnetic sensitivities because they do not produce a visible flicker or audible hum. They are also less prone to trigger seizures.

**Ability to adjust temperature and air flow by occupant or staff, or the availability of operable window(s):**

LEED recommendations for new construction include individual control of temperature and ventilation.(3) Opening an operable window may improve the air quality or air flow in a Cleaner Air Room and compensate for situations when individual control of temperature and air flow is not possible.

The text below is duplicated on the website

\*\*\*\*\*

## RECOMMENDATIONS FOR ACCOMMODATIONS

People with chemical and/or electromagnetic sensitivities can experience debilitating reactions from exposure to extremely low levels of common chemicals such as pesticides, cleaning products, fragrances, and remodeling activities, and from electromagnetic fields emitted by computers, cell phones, and other electrical equipment.

The severity of sensitivities varies among people with chemical and/or electromagnetic sensitivities. Some people can enter certain buildings with minor accommodations while others may be so severely impacted that they are unable to enter these same spaces without debilitating reactions. Furthermore tolerances to specific exposures can vary greatly from one individual to the next. Meanwhile some exposures, such as the application of certain pesticides or extensive remodeling, for example, may be devastating to all chemically sensitive people and make a building or facility inaccessible for a substantial period of time.

According to the Americans with Disabilities Act (ADA) and other disability laws, public and commercial buildings are required to provide reasonable accommodations for those disabled by chemical and/or electromagnetic sensitivities. These accommodations are best achieved on a case-by-case basis.

Reasonable accommodations for a chemically sensitive and/or electromagnetically sensitive individual can include providing a space or meeting area that addresses one or more of the Cleaner Air criteria, upon request, such as

- Remove fragrance-emitting devices (FEDS)
- Delay or postpone indoor or outdoor pesticide applications, carpet cleaning, or other cleaning or remodeling until after the meeting
- Provide room or meeting area near exterior door or with window(s) that can be opened
- Require cell phones and computers be turned off
- Provide incandescent lighting in lieu of fluorescent lighting
- Provide at least one nonsmoking, fragrance-free person per shift to provide services (e.g. nurse, police officer, security guard, clerk )

For individuals who are unable to use or meet in a building or facility, or who are too severely impacted by chemical and/or electromagnetic exposures to use a designated Cleaner Air Room, accommodations may include:

- Meet an individual at the door or outside to conduct business
- Allow a person to wait outside or in car until appointment
- Provide a means, such as a phone, intercom, bell, or buzzer to summon staff to an outside door for assistance
- Permit business to be conducted by phone, fax, mail, or e-mail rather than in person
- Allow participation in a meeting by speakerphone

**End duplicated text**

**SPECIAL ACKNOWLEDGEMENT:** The Committee extends a generous thank you to Sharon Toji, Access Communications, for designing the Cleaner Air Symbol and making it available for public use.

## APPENDICES

**Appendix A - 1117B.5.11 Cleaner air symbol** (page 109) of the California Code of Regulations

*1117B.5.11 Cleaner air symbol. “STRICTLY FOR PUBLICLY FUNDED FACILITIES OR ANY FACILITIES LEASED OR RENTED BY STATE OF CALIFORNIA. NOT CONCESSIONAIRES”. This symbol shall be the standard used to identify a room, facility and paths of travel that are accessible to and usable by people who are adversely impacted by airborne chemicals or particulate(s) and/or the use of electrical fixtures and/or devices. When used, the symbol shall comply with Figure 11B-40.*

*1117B.5.11.1 Color and size of symbol. The symbol shall be used when the following minimum conditions are met. The symbol, which shall include the text “Cleaner Air” as shown, shall be displayed either as a negative or positive image within a square that is a minimum of 6 inches on each side. The symbol may be shown in black and white or in color. When color is used, it shall be Federal Blue (Color No. 15090 Federal Standard 595B) on white, or white on Federal Blue. There shall be at least a 70% color contrast between the background of the sign from the surface that it is mounted on.*

*Strictly for publicly funded public facilities or any facilities leased or rented by State of California. Not concessionaires.*

\* In 1117B.5.8.1 (Symbols of Accessibility) the title of this section is incorrectly worded, which is causing misunderstanding regarding proper standard reference. Change title to read ‘International Symbol of Accessibility.’ This will be submitted for correction in Rulemaking.  
CALIFORNIA ACCESS COMPLIANCE REFERENCE MANUAL . DIVISION OF THE  
STATE ARCHITECT

**1117B.5.11.2 Conditions of use.** *Use of the cleaner air symbol is voluntary. The cleaner air symbol shall be permitted for use to identify a path of travel, and a room or a facility when the following is met.*

- 1. Floor or wall coverings, floor or wall covering adhesives, carpets, formaldehyde-emitting particleboard cabinetry, cupboards or doors have not been installed or replaced in the previous 12 months.*
- 2. Incandescent lighting provided in lieu of fluorescent or halogen lighting, and electrical systems and equipment shall be operable by or on behalf of the occupant or user of the room, facility or path of travel.*
- 3. Heating, ventilation, air conditioning and their controls shall be operable by or on behalf of the occupant or user.*
- 4. To maintain "cleaner-air" designation only nonirritating, nontoxic products will be used in cleaning, maintenance, disinfection, pest management or for any minimal touch-ups that are essential for occupancy of the area. Deodorizers or Fragrance Emission Devices and Systems (FEDS) shall not be used in the designated area. Pest control practices for cleaner-air areas shall include the use of bait stations using boric acid, sticky traps and silicon caulk for sealing cracks and crevices. Areas shall be routinely monitored for pest problems. Additional nontoxic treatment methods, such as temperature extremes for termites, may be employed in the event of more urgent problems. These pest control practices shall not be used 48 hours prior to placement of the sign, and the facility shall be ventilated with outside air for a minimum of 24 hours following use or application.*
- 5. Signage shall be posted requesting occupants or users not to smoke or wear perfumes, colognes or scented personal care products. Fragranced products shall not be used in the designated cleaner-air room, facility or path of travel.*
- 6. A log shall be maintained on site, accessible to the public either in person or by telephone, e-mail, fax or other accessible means as requested. One or more individuals shall be designated to maintain the log. The log shall record any product or practice used in the cleaner-air designated room, facility or path of travel, as well as scheduled activities, that may impact the Cleaner-Air designation. The log shall also include the product label as well as the \*Material Safety Data Sheets (MSDS).*

**1117B.5.11.3 Removal of symbol.** *If the path of travel, room and/or facility identified by the cleaner air symbol should temporarily or permanently cease to meet the minimum conditions as set forth above, the cleaner air symbol shall be removed and shall not be replaced until the minimum conditions are again met.*

## **Appendix B – SOUTHWEST COMMUNITY HEALTH SYSTEM POLICY GUIDELINE**

Southwest General Health Center (SWGHC)

Middleburg Heights, OH

**EFFECTIVE DATE: July, 2002**

**Revision Dates:**

**POLICY 742**

**Page 1 of 7**

**POLICY NAME: MULTIPLE CHEMICAL SENSITIVITY SYNDROME (MCS)**

### **POLICY:**

Southwest General Health Center will provide guidelines to ensure optimal care of the patient experiencing Multiple Chemical Sensitivity (MCS) which is mutually established with the patient, family/significant other and health care team.

### **I. INTERPRETATION:**

Multiple Chemical Sensitivity (MCS), also referred to as environmental illness or chemical injury is a medical condition in which individuals develop symptoms from exposure to very low level of chemicals in the environment. The interdisciplinary team at SWGHC uses a collaborative process with the patient, physician, family/significant other and the health care associates to establish a safe environment, to promote healing and ensure comfort.

### **II. OBJECTIVES:**

An organizational approach to patient management with multiple chemical sensitivities includes:

- A. Method to ensure patient is placed in a safe environment.
- B. Method to facilitate identification of a MCS patient.
- C. Method to verify competency of all associates providing direct and supportive care to the patient with MCS
- D. Method to ensure patient's participation in developing their care plan.
- E. Method to ensure patient/their families/significant others are educated about the need to communicate about any special care required.

### **III. OVERSIGHT AND RESPONSIBILITY**

A coordinated organizational program to care for MCS patients will be developed by an interdisciplinary team. This committee will have the responsibility for assuring that all provisions of this policy are adhered to throughout the organization. The team will have representatives from:

- A. Medical Staff
- B. Nursing Services
- C. Central Sterile Supply
- D. Protection Services

SOUTHWEST GENERAL HEALTH CENTER

- E. Nutritional Services
- F. Plant Operations
- G. Environmental Services
- H. SSA's
- I. Pharmacy
- J. Social Services
- K. Administration

**IV. SPECIFIC ROLES AND RESPONSIBILITIES OF INTERDISCIPLINARY TEAM**

- A. Medical Staff -Physician: Provides special instructions, treatments, diagnostic tests and medication orders. No treatments/medications should be administered to an MCS patient without prior approval of patient's private physician unless a life threatening emergency exists.
- B. Nursing Services  
Role and responsibilities:
  - 1. Identify the patient with MCS
  - 2. Provide a safe patient care environment.
  - 3. Develop an awareness, sensitivity and respect of patients' physical and emotional needs.
  - 4. Develop a plan of care on daily basis with minimum of one staff member per each shift to attend medical needs of the patient.
  - 5. Comply with the following when caring for the MCS patient:
    - a) be perfume and scent free (ie., no hair spray, no mousse gels, lotions, cigarette/smoking smells).
    - b) Do not use aerosol products (ie hair spray, deodorants). Non-scented, potassium salts, pump deodorant is acceptable. Baking soda (dry).
    - c) Do not wear new clothing which has not been laundered.
    - d) Do not wear clothing which has been freshly dry-cleaned.
    - e) Use only latex free gloves
    - f) Wash hands and apply gloves before entering the patient's room.
    - g) Be alert for any environmental triggers when following normal hospital procedures.
- C. Central Sterile: Provides and ensures the unit with
  - 1. Latex free products
  - 2. Adequate supply of sterile linens

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY
------	--	--------

3. Adequate supply of other medical core items (ie. Sponges, dressings, securing devices).
  4. Patient can provide their own linens if other methods are not satisfactory.
- D. Protection Services: Provides assistance from the vehicle to hospital in a safe manner. (Turn vehicle engines off)
- E. Nutritional Services: Recognizes different food sensitivities and follows certain guidelines to accommodate and meet individualized needs of the MCS patient.
- Special provisions may include but will not necessarily be limited to the following:
1. No processed foods of any kind including instant oatmeal, instant potatoes, and other prepackaged mixes, ie., gravies, sauces, and flavor packets as they may contain many additives.
  2. Use no dyes, preservatives, sulfites, artificial flavoring or MSG.
  3. Use no aerosol cooking sprays.
  4. Use no artificial sweeteners.
  5. Distilled water in glass containers to be provided by Nutrition Services, or patient may supply his/her own tolerated water for drinking.
  6. Serve beverages which have not been processed with chemicals.
  7. Nutrition Services will provide lactose free milk or a substitute such as soy or rice milk to those who require it.
  8. Rigidly follow physician's orders regarding food restrictions.
  9. Review food allergies within the food service to avoid allergic reactions.
  10. Permit patient to supply his/her own tolerated food products. Nursing will provide a proper storage area for them.
  11. Do not serve food or liquids in plastic or Styrofoam. Use only glass or ceramic dishes and cups which have been well rinsed to remove all traces of soap and chemical residues. Cellophane or plastic wrap packaging on room temperature food (i.e., crackers) is typically not a problem, however, caution must be used if toxic inks are used. Anything noticeably odorous can be a problem.
  12. Remove treated i.d. menu paper from the tray and replace tray liners that may have become wet during transport.
- F. Plant Operations: Plant Operations will not perform remodeling or painting within close proximity to MCS patient's room. These activities can be coordinated with the leadership of patient care area.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 4 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY 742
----------------	--	---------------

- G. Environmental Services: will perform terminal cleaning.
1. Refer to Environmental Services Policy for MCS room cleaning.
  2. Staff will check with the floor nurse before entering the patients room.
  3. Environmental Services will coordinate with the patient's nurse for cleaning of the patient's room or performing any special cleaning tasks in the general area (i.e., floor waxing or floor wax removal in the halls). Whenever there is a question of what may affect the health of an MCS patient, the floor nurse must be consulted.
  4. Scented products, air fresheners, deodorizers or other additives should not be placed in any vacuum cleaner bag used anywhere in the health center. Use only unscented vacuum cleaner bags.
  5. Do not use any other housekeeping products (garbage bags, paper towels, cleaning solutions) which contain fragrances or pesticides. These products should be stored in an area separate from disinfectants, soaps and other cleaning products. Do not store toilet paper, facial tissues or other patient items near fragranced or pesticide products.
- H. SSA's: Will perform daily cleaning of the patient's room by using the following guidelines.
1. SSA's must wear clean gowns and caps when cleaning the room of MCS patient when patient is in the room.
  2. Do not use any other housekeeping products (any plastic bags, paper towels, cleaning solutions which contain fragrances or pesticides). Do not use any air fresheners or deodorizers in patient's room.
  3. Dust with a clean cotton cloth moistened with only water.
  4. Use baking soda or Bon Ami cleanser for tubs, sinks and toilet.
  5. Remove trash at least twice daily. Do not use plastic liners.
  6. Do not leave patient trays in the room after meals.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 5 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY
----------------	--	--------

I. Pharmacy

Provides pharmaceutical care guidelines to patient, family and health care team members. The following guidelines are helpful in providing medications to patients with MCS:

1. Have patient bring medications to the hospital that he/she is currently using. If the physician desires the patient to continue using these medications, an order shall be written to state such.
2. Use glass bottles for IV solutions and any prescription medications that are to be administered intravenously.
3. Do not use any substitutions or generic drugs for medications ordered without patient or MD approval.
4. Be alert for standard ingredients MCS patients typically react to including but not limited to dyes, preservatives, artificial sweeteners and flavoring. Consider capsules instead of tablets.
5. Monitor medication by listing the patient's specific allergies on the patient's medication profiles.

J. Social Services

Provides psychological support and interventions, assists patient and family with community resources and discharge planning.

K. Administration

Provides support and assistance in developing a safe environment for MCS patient.

PROCEDURE:

- A. Admitting will adhere to the following to assist all health care center personnel in caring for the patient:
- 1) Flag patient's chart clearly and boldly with MCS under the allergies.
  - 2) Flag patient's chart to notify all other health center departments in advance of treating the patient so proper precautions can be made for necessary equipment and special supplies.
  - 3) Indicate "MCS" on patient's allergy band.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 6 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY 742
----------------	--	---------------

B. Emergency Department:

Will assist health care center personnel in diminishing any unnecessary discomfort and possible risks when MCS patient is brought into the Emergency Room. The following is initiated:

- 1) Immediately contact patient's physician for special instructions.
- 2) Immediately isolate patient from all other patients and visitors.
- 3) Place patient in an area which is not used to store any medical supplies or medications.
- 4) Keep a supply of sterile linens and gowns in the emergency room area.
- 5) Provide the least toxic pharmaceutical supplies and equipment.
- 6) Coordinate with all other health center departments to meet patients' needs.
- 7) Monitor the general environment the patient is placed in.

C. Patient's Room

Staff will implement numerous measures to prevent unnecessary exposure.

Prior to patient's occupancy:

- Contact Environmental Services for terminal cleaning of the room.
- Place new sharps container in the room
- Contact CSS for sterile linen.

During Patient's Occupancy:

- Patient should be isolated from other patients and their visitors at all times to prevent reactions to products these people are wearing or using.
- Place sign on patient's door stating: "Check at the nurses station before entering room".
- Keep patient's door closed at all times and if necessary provide a clean cloth to seal bottom of door from hall odors.
- Health care center personnel must wash their hands and apply hypo allergenic, non-latex gloves prior to entering the room of the MCS patient as these activities can trigger reactions in the patient.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 7 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY 742
----------------	--	---------------

- No live plants or flowers permitted in the patient's room (mold and pesticides trigger MCS reactions).
- No newspapers or treated paper permitted in patient's room. (3-part copy papers or chlorinated papers can be highly toxic and may affect breathing).

APPROVED:

**Appendix C – MULTIPLE CHEMICAL SENSITIVITY (MCS) PROTOCOL**  
 Southwest General Health Center (SWGHC)  
 Middleburg Heights, OH

INITIATED	DISCONTINUED
Date	Date
Time	Time
RN	RN

SOUTHWEST GENERAL HEALTH CENTER  
 NURSING SERVICES

**MULTIPLE CHEMICAL SENSITIVITY (MCS) PROTOCOL**

- PURPOSE:** To outline the management and nursing responsibilities caring for a patient experiencing multiple chemical sensitivity (MCS).
- LEVEL:** Independent
- SUPPORTIVE DATA:** MCS is an acquired chronic disorder characterized by recurrent symptoms occurring in response to low levels of exposure to multiple unrelated chemicals. The symptoms generally occur in one of four categories: central nervous system, circulatory, respiratory and mucous irritation or metabolic that would include enzymes, blood, kidneys, GI tract, etc.. Patient with a history of maladaptive reactions to chemicals found in perfumes pesticides, detergents, household cleaners, etc. may have or develop multiple chemical sensitivities. Approximately 75% of those affected are women, possibly due to endocrine disruption. People in their 30s and 40s are most strongly affected as well as children and others who are more susceptible to the effects of pesticides and products containing toxic chemicals. The population most strongly identified with this condition include: industrial workers, teachers, nurses, sick building occupants and those living in chemically contaminated communities. Refer to *Latex Sensitivity/Allergy Protocol* and *Hospital Policy #742 Multiple Chemical Sensitivity (MCS) Patient*.
- CONTENT:**
- Identify individuals at risk on admission in Emergency Room or Admitting.
  - Assign the patient to private room.
  - Contact CSR for free tote (or nursing supervisor during night shift).
  - Notify Environmental Services, Central Sterile, Pharmacy, Nutritional Services, and SSA of MCS patient admission.
  - Assess all patients on admission for allergies and maladaptive reactions.
  - Place green allergy band on patient; mark Multiple Chemical Sensitivity (MCS).
  - Place sign on patient’s door stating:
- Prior to Admission*
- Admission Assessment*

“Check at the nurses station before entering patient’s room.”

***Admission  
Assessment (cont’d)***

8. Enter Multiple Chemical Sensitivity on all the orders sent in Cerner in Comments Box.
9. Observe patient for following symptoms.
  - Fatigue
  - Memory loss
  - Depression
  - Nervousness
  - Lack of motivation
  - Visual problems
  - Hearing problems
  - Dizziness
  - Sleep disorders
  - Edema
  - Disorientation
  - Confusion
  - Irritability
  - Loss of logic sequencing ability
  - Loss of coordination
  - Hoarseness
  - SOB
  - Headache
  - Chest pain
  - Joint pain
  - Digestive difficulties
  - Sun or other rashes
  - Cold or heat sensitivity
  - Nausea
  - Tingling or numbness of extremities
  - Sinusitis
  - Pallor
  - Anemia
  - Salivation (usually from pesticides)

10. Refer to Latex Sensitivity/Allergy Protocol

***Patient Care***

11. Report signs and symptoms exhibited by patient to physician.
12. Obtain physician order for a special diet.
13. Encourage patient to select their own menu.
14. Allow patient to supply his/her own tolerated food products and dietary supplements.
15. Retain patients dietary requirements in the patient’s medical record for future reference.
16. Encourage use of personal respirator and other protection methods while in Health Care Center.

***Patient Safety***

17. Reinforce all hospital employees and visitors to check with patient’s nurse prior to entering patient’s room.
18. Maintain patient isolation from other patients and their visitors at all times.
19. Transport patient with R-95 mask or personal respirator.

***Patient Safety  
(cont'd)***

20. Refrain staff caring for patient from wearing perfumes, scented lotions, hair spray, deodorants or other scented products.
21. Educate hospital staff to wash their hands with unscented soap.
22. Apply hypo-allergenic, non-latex gloves prior to entering the room.
23. Instruct patient's family not to bring plants or flowers to the patient's room.
24. Restrict newspaper in patient's room.

***Patient Education***

25. Discuss with patient/family Multiple Chemical Sensitivity if newly diagnosed patient.
26. Reassure the patient with understanding of their chemically sensitive condition.
27. Refer patient to Social Services to provide list of Community Services.

***Documentation***

28. Document Multiple Chemical Sensitivity in the patient's medical record, in the front of the chart, medication record and computer system.
29. Record implementation/modification/discontinuation of protocols.
30. Document vital signs and assessment findings on appropriate flow sheet.
31. Document evaluative statement of the patient's response to interventions and lack of complications.

***Emergency  
Interventions***

32. If known, remove the offending object or person from patient's room.
33. If necessary, remove patient from room to fresh air outside the building.
34. Utilize charcoal and baking soda to absorb and remove odors from the room. Open windows if possible.
35. Refer to patient's personal emergency protocol for reducing and diluting chemical reactions (water, food, baking soda, tri-salts, etc.)

***Emergency  
Interventions  
(cont'd)***

36. Communicate and cooperate with the patient whenever possible as the patient generally knows what will help.

**Committee**

## **INTRODUCTION**

The Building Design & Construction Committee was charged with making recommendations for designing commercial and public buildings that would be more accessible for people with multiple chemical and/or electromagnetic sensitivities and provide healthier environments for all occupants.

The Committee found that major access barriers for chemically sensitive individuals are factors that contribute to poor air quality, such as pesticides, new carpets, tobacco smoke, inadequate ventilation, mold, certain building materials, and building activities that generate air pollutants. For electromagnetically sensitive individuals, access barriers include fluorescent lighting, unshielded transformers and wiring, security and scanning equipment and numerous other electrical appliances.

The recommendations that follow, therefore, focus on minimizing or eliminating these barriers through designing

- for pest prevention to reduce the need for or the use of pesticides,
- for preventing moisture and mold growth,
- for optimum ventilation via HVAC systems and operable windows,
- for exhausting air contaminants,
- for minimizing use of carpet and other flooring that emit volatiles, and
- for shielding occupants from electromagnetic fields.

Although many building materials can be problematic for chemically sensitive people, the Committee made minimal suggestions regarding product choices as this was the charge of the Building Products and Materials Committee.

### **Recommendations for Future Actions**

The Committee recommends that the Access Board, NIBS, or other entity create a Design Manual using the outline in this report. This Manual would provide more detailed guidance than is provided here.

The Committee acknowledges that while the scientific evidence may be inconclusive about whether ambient electromagnetic fields pose a substantial health risk to the general population, the presence of EMF is an access barrier for people who are electromagnetically sensitive. Therefore, the Committee recommends that measures be taken to reduce EMF whenever possible in order to increase access for these individuals as well as taking a precautionary approach to protecting the health of all.

## **RECOMMENDATIONS**

### **Site and General Building Design**

Select site to minimize potential exposure to air and soil pollutants and electromagnetic fields (EMF). (Appendix 1)

Visit the site on several occasions to assess site criteria.

Note microclimate: wind direction, sun exposure.

Avoid sites near wetlands/stagnant water, low lying areas; sites should be well above 100 year flood plain.

To minimize moisture infiltration at the foundation, avoid earth berm construction and provide positive drainage from building.

Avoid below-grade occupied space.

Avoid tuck-under parking and indoor parking.

Roof gardens should be avoided because soil and water can foster mold growth. (Appendix 2)

Arrange drop-offs, loading docks, helicopter pads, and other vehicular access points to eliminate or minimize exhaust fumes from entering building directly or being drawn into the HVAC system.

Avoid the use of indoor plants because they can attract pests, stimulate pesticide use, trigger allergies, and foster mold growth.

If smoking on site is permitted, dedicate an outdoor location that is remote from entries, main pedestrian paths and air intakes.

Group and isolate uses within a building that emit contaminants and could affect air quality.

High ceilings are preferred in order to dilute contaminants.

Avoid decorative indoor fountains.

### **Enclosure**

Design for a tight building envelope to maximize the performance of the HVAC system. Meet or exceed Energy Star leakage area (less than 1.25 s.i./100 sf. (Reference 1)

- Building should be able to be sealed off from exterior events that would raise outdoor pollutant levels such as, toxic spills, pesticide spraying, fires, traffic accidents, and rush hour traffic.

- Operable windows are preferred. Being able to open windows is an important access issue for chemically sensitive individuals and can be beneficial for other occupants in certain situations. Operable windows should be detailed to minimize air infiltration.

Design to prevent pest problems. (Appendix 3)

- Use inert pest resistant materials. When treatment of wood is required, treating with disodium octaborate tetrahydrate may be among the safer options.
- Incorporate pest barriers such as termite shields, window screens, and bird screens in construction details. Bird and bat droppings pose great IAQ risks.
- Some pesticides such as boric acid are considered environmentally safe. If used, granular or gel forms are preferred. Care should be taken to ensure that particles do not infiltrate interior habitable space.

Shield occupants from external sources of EMF. Windows with low e glazing, metal roof, and siding components may reduce certain interior EMF. (Reference 2)

Roof Design

- Pitched roofs are preferred, because they shed water quickly, clean the roof of pollutants and potential toxins, and are less prone to leakage.
- Inert roofing materials, such as coated metal or clay tile, are ideal. Note that galvanized metal presents a rust hazard and should be avoided.
- Flat roofs are not preferred. If used, membrane and high albedo (highly reflective to heat) type are recommended. Asphalt or modified bitumen built-up roofs are less preferable. (Reference 3)

Wall Design

- Use best design practices to prevent moisture and condensation within walls. Calculate dew points for each exterior wall (and roof) type to verify performance at each condition. Provide detail for all flashing and counter-flashing locations.

Foundation Design

- Provide under-slab vapor barriers, insulation, and damp-proofing to prevent moisture infiltration and condensation.

Protect stored building materials from water damage and mold growth.

Avoid use of water-damaged or mold-affected materials.

## **Plumbing, Mechanical and Electrical Equipment**

Properly insulate pipes to prevent condensation, especially within walls.

Use modeling software to determine airflow and to ensure isolation of pollutant sources and adequate ventilation.

Ventilate areas occupied by people with chemical sensitivities with goal of eliminating odors (ideally entire building). These ventilation rates meet or exceed all worldwide standards. (Reference 4)

Provide local control of temperature and airflow (ideally for every occupant). (Reference 5)

Utilize Displacement Air Distribution method to move pollutants away from occupants.

Dedicate building as Smoke-Free. (Reference 6)

Isolate mechanical equipment from occupied areas.

Provide direct exhaust from rooms and areas that have pollutant-generating sources or activities. These include but are not limited to: (see Appendix 5)

- Bathrooms (code requirement).
- Kitchens or office kitchenettes (this is in addition to code-required hoods or stove exhausts).
- Copy and print rooms.
- Computer rooms.

Ductwork

- Avoid insulation inside ductwork. Use external insulation wrap of non-friable (airborne particle creating) material.
- Oil coatings used in fabrication of sheet metal stock can affect air quality. Prior to installation, thoroughly clean ductwork with a low VOC product. Use methods that do not leave residue or cause oxidation. (Reference 7)

Prohibit the use of fragrances and disinfectants in air distribution systems.

Maintain relative humidity between 30%-50%.

Locate outside air louvers away from pollutant sources.

Filtration (Reference 8)

- Carbon and HEPA filters are preferred.
- Avoid ozone generating air-purification systems.
- Avoid electrostatic air cleaning due to ozone.

In renovation work, re-evaluate HVAC system performance to ensure that original design standards are met.

Shield occupants from internal EMF. Design electrical systems to minimize EMF. Maximum recommended magnetic field levels of 2.5 milligauss (preferably 1 milligauss in occupied areas) and as low as technically achievable in areas to be occupied by people with sensitivities.

## **Finishes and Furnishings**

Refer to Products and Materials Group report for specific recommendations on materials.

Floor Coverings

- Use inert materials wherever possible, such as, but not limited to:
  - Stone, tile, terra-cotta, brick, ceramic tiles,
  - Terrazzo,

- Sealed concrete.
- Minimize the use of carpeting. Note that carpet that meets Carpet and Rug Institute Green Label Plus standards can still be problematic for chemically sensitive people. (Appendix 4)
- Use carpet systems that allow for small area replacement, such as certain of the self-adhesive backing carpet squares.
- Avoid glue-down carpet installations or use low-VOC adhesives. (see Products & Materials Committee recommendations)
- Cork and linoleum may contain linseed oil and should be avoided. Rubber flooring can also pose problems for chemically sensitive individuals and should be avoided.
- Use low-or no VOC materials for all flooring. (Appendix 4)

### **Construction Related Activities for Renovations**

Provide advance notice to all occupants of any upcoming renovation work.

Post signs to alert occupants of renovation work.

Provide alternate accessible locations for affected individuals when occupied space will be rendered inaccessible due to the renovation.

Physically isolate renovation work areas from occupied portions of building.

Isolate the HVAC system from renovation work.

Implement a dust-control plan that identifies work methods and cleanup procedures.

Provide negative pressure in area of renovation work.

### **Occupancy**

Establish policies for renovation and chemical usage in lease agreements.

Designate a Smoke-Free building.

Leases should include language to ensure that occupant activity does not degrade original design standards and building performance.

Provide a list of areas and uses requiring separate exhaust air systems.

Designate areas free from use of cell phones, two-way radios, and wireless equipment.

### **Commissioning**

Develop a commissioning plan that includes the items listed above.

After construction or renovation provide a minimum flush-out period of two weeks prior to occupancy.

Re-commission buildings periodically. Building use shall be taken into account when determining the re-commissioning schedule.

## **Exterior Landscaping**

- Gardens (see Appendix 6)
  - Design gardens that can be maintained organically without pesticides.
  - Avoid plants with fragrances that may provoke allergies.
  - Exterior gardens and landscape should be free of all plantings that require pesticides, synthetic fertilizers, lime, or other chemical applications.
  - Use indigenous plant materials that are hardy, naturally pest-resistant, require minimal maintenance, and low water use.
  - Use xeriscaping principles.

## APPENDICES

### Appendix 1 - Site Selection: Potential Sources of Pollutants and EMF.

The Committee recognizes that few, if any, building sites are likely to be free of all the pollutant sources listed below. The recommendation is to minimize proximity to as many of these sources as possible in order to maximize outdoor environmental quality and hence indoor environmental quality.

Table A-1 Potential Sources of Pollutants and EMF

General (Air, Soil)	Engine Exhaust	Pesticides	Industrial/Commercial	EMF
Recognized area of poor air quality Smog Smoke (chimney, industrial, etc.)  Superfund Sites Brownfields Landfills Hazardous waste sites Compost sites Underground storage tanks  Floodplains Wetlands Filled-in wetlands  Military bases	Heavy traffic Highways Interstates Diesel exhaust Airports	Agriculture (unless organic) Golf courses Mosquito spraying Parks & Forests Roadside spraying Dairies Chicken & hog farms Other intensive livestock operations	Refineries Mines Chemical plants Cement plants Power plants Manufacturing Logging/Pulp mills Incinerators Sewage treatment plants Gas stations Dry cleaners Other commercial sources that emit air pollutants (See Appendix 5 on Use and Occupancy)	Substations Cell phone towers Radio towers Transponders Transformers High tension lines Electrical distribution lines Radar installations Military bases Airports Electrical Transportation Power-generating dams

### Appendix 2 - Roof Gardens

Roof gardens involve a range of potential issues related to moisture penetration and mold growth. Flat roofs are prone to pooling water and leaking. Foot traffic can cause or accelerate deterioration leading to leaking. Roof repair is more difficult under gardens. Plants may attract pests that subsequently encourage pesticide use. Planting soils can create dust. Plants can emit volatile fumes and pollen. Plants can drop leaves and fruit that rot and become moldy. Selected plants should be low allergen plants without strong fragrance (See Exterior Landscaping above). If used, roof gardens should be located away from air intakes, operable windows, and doors. Design should ensure that moisture will not penetrate the roof membrane or cause conditions of standing water.

## **Appendix 3 - Pest Prevention**

### **Exterior Design:**

Remove lights on or near building that may attract night-flying insects.

Maintain a plant-free zone of about 12 inches around buildings to discourage insects from entering.

Design weep-holes in window frames to prevent access by paper wasps. Design windows to prevent harborage and access for pests, without clear passageways to inside.

Correct structural features that provide opportunities for bird roosting and nesting.

Avoid locating decorative lattices over entrances to food services facilities that may inadvertently serve as bird roosts.

Install bird-proof barriers that are designed to prevent both pigeon and sparrow access to preferred nesting sites.

Design exterior light fixtures so that birds cannot roost or nest on or in them.

Fit eave roof tiles with bird stops (that will also exclude bats, bees and wasps).

Correct structural features that provide opportunities for rodent harborage and burrowing.

Screen or otherwise eliminate animal access under decks, porches, stairways. Seal porches and ramps to the building foundation with ¼-inch hardware cloth screen mesh to form a barrier to digging pests such as rats and skunks. This screen must extend 12 inches into the ground and must have a right-angled, 6 inches wide, outward extending shelf to prevent burrowing under the screen.

Screen ventilation louvers with ¼-inch hardware cloth screen mesh to exclude birds, rodents, cats, etc., (coordinate with mechanical requirements).

Maintain a 2-foot pea gravel strip around buildings to prevent rodent burrowing.

Use a 3" layer of sand barrier underneath slab construction. Use 1-3 mm particle size in place of unsifted sand to provide a permanent sand barrier to termites (both western subterranean and Formosan termites). This will prevent termites from penetrating cracks in slab construction.

For wood not in contact with the ground or concrete, use wood pre-soaked in disodium octoborate tetrahydrate.

### **Refuse and Recycling Areas:**

Place outdoor garbage containers, dumpsters, and compactors on hard, cleanable surfaces and away from building entrances (at least 50 feet from doorways). Design site with properly graded concrete or asphalt pads to help prevent rats from establishing burrows beneath them.

Design site with solid enclosure that extends all the way to the ground. Use metal or synthetic materials, as opposed to chain-link, wood, etc. to prevent rodents from gnawing and climbing the enclosure.

Design trash storage areas that can be closed off from the rest of the building.

Locate storage areas for boxes, paper supplies, and other materials in areas separate from where food or trash is stored. When stored together, these materials put food and shelter together, attracting pests.

## **Landscaped Areas**

Choose proven performers, plants known to do well in the intended planting area. Avoid plants with history of pest problems. Use resistant plant species and cultivars when available. Check with your university or cooperative extension service for recommendations.

Give preference to plants that shed a minimum of seeds and fruits, that may attract and support insects, rodents, and undesired birds.

Design with diversity. Include a wide variety of plants in the landscape to reduce the pest damage potential.

Provide a properly prepared site. Site selection is critical; the site must be compatible with the plants' requirements.

Design landscaped areas with flexibility to allow for campus additions, which may change drainage, exposure to sunlight, ventilation, or other plant requirements.

Avoid crowding of landscape plantings.

Group plantings with similar cultural requirements.

Install or retrofit fence lines and other turf or landscape borders with concrete mowing strips.

Avoid planting vegetation directly against buildings as this provides shelter and sheltered runways for rodents. For the same reason, avoid planting dense vegetation that completely covers the ground.

Do not plant vines which climb building walls, as these create runways for rodents and harborage for undesired bird species.

Plant trees away from buildings to prevent easy access to buildings for insects and rodents.

Give careful consideration to placement of deciduous trees. Leaves which accumulate along foundations provide harborage and sheltered runways for rodents.

## **Interior**

Food Preparation and Serving Areas (main kitchen, dining room, teachers' lounge, snack area, vending machines, and food storage rooms):

- Ensure that new kitchen appliances and fixtures are of pest-resistant design, i.e., open design, few or no hiding places for roaches, freestanding and on casters for easy, thorough cleaning.
- Provide space under and around appliances and equipment in kitchen areas to allow maximum ventilation and ease of (steam) cleaning.
- Use coving at floor-to-wall junctures to minimize build-up of debris and to facilitate cleaning.
- Slope floors in kitchen areas to provide good drainage after cleaning.
- Do not install pegboard in kitchens, animal rooms, or laboratories.
- Insure that all pipe insulation has a smooth surface and that there are no gaps between pieces.
- Refrigerate trash/recycling storage rooms.

### **Classrooms and Offices**

Ensure that new office and classroom furniture that is rarely moved (e.g., staff desks, bookcases, filing cabinets) is designed to permit complete cleaning under and around the furniture, or to allow ready movement for cleaning purposes.

Design or retrofit construction to provide adequate ventilation, preventing trapped moisture and condensation.

### **Storage Areas**

Equip area with self-closing doors.

### **Building Perimeter**

Seal all plumbing and electrical service entrances.

Keep doors closed tightly; equip doors with self-closures and door sweeps.

### **Appendix 4 - Carpet**

Stone, terra cotta, granite, marble, terrazzo, ceramic, brick, or sealed concrete flooring is best tolerated by individuals with chemical sensitivities. Wood flooring that has not been recently stripped or refinished is also often well tolerated by people with chemical sensitivities.

Carpet systems contain a myriad of chemicals in their fiber, dyes, backing, padding, bonding agents, adhesives, antimicrobials, flame retardants, and stain resistance, anti-static, and color fast agents. They also are reservoirs for tracked-in pesticides, dust, dust mites; foster mold growth; and absorb and remit volatile organic chemicals like fragrances and

paint fumes. In addition, many solvent-based agents used to clean carpets emit toxic fumes.

The Carpet and Rug Institute (CRI) has established a rating system and testing program (Green Label Plus) that may be used in lieu of the emissions testing criteria of California's Collaborative for High Performance School (CHPS) Section 01350 (See Products & Materials Committee).

Some people with chemical sensitivities have found that carpet squares with self-adhesive backing have been the best tolerated new carpeting. Others have reacted adversely to such products. More research is necessary to determine what factors in these carpets and/or which brands are best tolerated.

Older carpets are usually better tolerated by people with chemical sensitivities than new ones, as long as they have not become moldy.

Recommendations regarding carpeting (design, materials, and O&M issues):

- Minimize the use of carpeting.
- Use area rugs in place of carpeting whenever possible.
- Consider using self-adhesive carpet squares.
- Tack rather than glue down (unless using self-adhesive carpet).
- If glue down, use low or no VOC adhesive.
- Air out carpet for at least two weeks prior to installation.
- Exceed building flush-out of two weeks if possible.
- Reduce the need for and the frequency of carpet replacement through good maintenance (e.g., thorough vacuuming and frequent cleaning with low toxic products and procedures -- see recommendations by O&M).
- Minimize amount of carpet that is replaced, limit replacement to damaged areas. (A major advantage of carpet square systems is that smaller sections can be replaced).

## Appendix - 5 Use and Occupancy

Non industrial businesses/activities that may generate chemical pollutants include, but are not limited to:

Hair and Nail Salons	Dry Cleaners	Labs (eyeglasses, medical, etc.)
Spas	Laundromats	Dental offices
Restaurants	Nurseries (Plants)	Dialysis Centers
Grills & BBQ	Landscaping, Pest Control	

Furniture stores	Florists	
Woodworking and crafts shops	Candle/Soap/bath shops	
Art/Pottery studios	Pet Shops	
Auto Parts	Photo/Printing/Copy shops	
Taverns/Bars	Specialty foods stores	
Tobacco Shops	Leather goods stores	
Tattoo Parlors	Perfume shops or departments	

Areas that should be vented directly to the outside include: kitchens, labs, computer rooms, copy/fax areas, printer or blueprint rooms, storage areas for toxic materials, showers, locker rooms, and areas where animals are present.

### **Appendix 6 - Landscaping**

Use low allergen plants (See Ogren Plant Allergy Scale).

Plant female trees and shrubs (they do not produce pollen).

Avoid the use of plants that have strong fragrances, such as jasmine, lavender, peppermint, and roses.

Avoid or minimize lawn/turf areas to reduce mowing emissions and chemical usage.

Use low growing fine fescue, buffalo grass, or other turf grass which requires little or no mowing.

Use a wide variety of plant materials.

Group plants with similar water and cultural needs.

Do not crowd plants.

Leave gaps in groundcover to create less hospitable habitat for pests.

Plant deciduous shade trees on the south and west sides of buildings. The shade reduces interior temperatures and reduces A/C usage during summer months.

Use low or no VOC paints, stains and finishes on outside equipment including benches, poles, decks, and other outdoor equipment (See recommendations from Building Products & Materials group.)

Avoid organic mulches (cocoa beans, peat moss, bark, wood chips) as they emit volatile fumes and may harbor mold.

Avoid railroad ties as they contain creosote.

Utilize stone, clay, concrete, and other hard, non-volatile materials to create borders and frame gardens.

*“EMF reduction: The team reviewed available literature on EMF and their threat to health and determined that while EMF radiation could be measured, its threat to humans had not yet been proven or disproved. Nevertheless, the team recommended adopting a philosophy of prudent avoidance toward EMF risks and undertook modifications of the building design to reduce occupant exposure. EMF radiation can be mitigated by distance and by shielding. Distance offers maximum protection and is “low-tech,” while the costs associated with shielding are high and the results are difficult to measure. Consequently, the design team chose to create “buffer zones” to reduce prolonged exposures in portions of the building that are occupied for long periods of time, such as the laboratories and offices. The largest sources of EMF were identified as the building’s transformers, the electrical rooms with their many cables, and the electrical conduit that was routed under the building atria. As a first step circulation and utility spaces were used to maximize the separation between a source and any potential receptors.”*

**Introduction**

The goal of the NIBS – IEQ Products & Materials Committee was to develop procedures and guidelines to aid persons in making informed material selections in order to construct a building that will be accessible to persons with multiple chemical sensitivities (MCS) and/or electromagnetic sensitivities (EMS). The NIBS IEQ-Materials Committee has reviewed existing standards and guidance for materials selection in building construction. The group has determined that certain features of the existing standards offer a reasonable starting point for the selection of building materials, and in some respects can offer a more accessible environment to persons with MCS and/or EMS. These existing standards are designed to create healthier indoor air quality by making appropriate building material selections, among other things. Though the existing standards may not result in material selections that will make a building accessible to the majority of persons with MCS and/or EMS, they will produce a healthier building, than one constructed without regard to these standards. Healthier buildings would be useable by people with other health conditions such as asthma and other respiratory conditions, allergies and migraine headaches.

The NIBS IEQ Materials Committee has attempted to take the best ideas or practices from the existing standards and guidelines to recommend material selections that will provide for healthier, more accessible buildings. If a designer follows the suggestions provided herein, it will result in a building that has the lowest chance of IEQ problems stemming from the materials and that has the best likelihood of being accessible to persons with MCS and/or EMS.

The standards reviewed by the Materials Group include:

- Collaborative for High Performance Schools (CHPS) Section 01350
- Green Guard Environmental Institute - Certification Standards for Low Emitting Products for the Indoor Environment
- Green Seal – Environmental Standards
- Green Guidelines for Healthcare – Materials and Resources
- Reducing Occupant Exposure to Volatile Organic Compounds (VOCs) from Office Building Construction Materials: Non-Binding Guidelines - California Department of Health Services

Two of the key elements involved in the materials selection process are a component content screening (what chemicals and compounds are known to be a part of the material) and an emissions testing protocol. Both the California Section 1350 Specification and the Green Guard Standards recommend emissions testing based on the ASTM Method ASTM standards D-5116-97 and D- 6670-01. The Committee believes that both of these elements must be involved in making appropriate building material selections.

### **Overview - Design**

The Products & Materials Committee believes that particular attention is critical during building design to assure that the needs of chemically and electromagnetically sensitive people are accommodated to the greatest extent possible. In general, this means selection of construction materials that are low-emitting or non-emitting and selection of finishes that do not absorb or react with chemicals emitted by other materials or products in the building. To begin to address some of the concerns of electromagnetically sensitive persons, areas of the building can be designed to have reduced electromagnetic fields. By making indoor environments that are safer for the most vulnerable among us, we can create indoor environments that are healthier for everyone, especially children.

Generally, this means selection of materials that are “hard” or non-porous where possible so that any chemicals that contact these materials are not retained in and re-emitted from them. Also, particular attention should be paid to selection of materials that will not require VOC-emitting chemicals later as part of maintenance. For instance, in designing building foundations and structures, particular attention should be paid to the need for preventing termite problems, since the pesticides commonly used to control termites can have a deleterious effect on humans, especially persons with multiple chemical sensitivities. So, even though the material itself might be low-emitting, the use of products meant to “preserve, protect, or maintain” the material selected might emit volatile fumes that degrade indoor environmental quality and result in a building that is not suitable for persons with MCS.

In addition, during building design particular attention must be paid to choice of electrical appliances, equipment and products that may produce higher than necessary electromagnetic fields. The NIBS-IEQ Materials Committee recognizes that there are selections that can be made during building design and construction that can provide a more healthful environment for persons with electromagnetic sensitivities. A few of these considerations are:

- Incorporation of a foil vapor barrier or other metal shielding feature into the walls around electric equipment can reduce certain electromagnetic fields.

- Wireless (“bluetooth” type) connections should be avoided, or areas of their use should be "contained" by using foil-backed drywall or other incorporation of a foil or metal barrier.
- New construction should use twisted metal clad wiring and/or twisted wire placed in metal conduit.
- Fiber optic connectivity is preferred for computer networks communication because these data lines may be run without concern for stray emissions.

## **Overview – Building Operations and Maintenance**

Vigilance is required to assure that materials brought into the building throughout the course of its life are consistent with the standards provided herein, and are consistent with the design intent of the building.

For example, the Products & Materials Committee realizes that building operations and maintenance products might introduce materials that are not consistent with the initial design for an accessible, healthy building.

Building managers must also pay close attention to materials brought into the building environment by tenants or others to assure that these materials are consistent with provision of an accessible, healthy building for persons with multiple chemical sensitivities, electromagnetic sensitivities, and/or other health disorders. For instance, a tenant may bring furniture in that does not meet the design criteria presented in this document, and these materials could have detrimental effects on air quality within the entire building, depending on the design of the HVAC system. In addition, the chemicals and compounds used for maintenance can degrade environmental quality and seriously affect persons with multiple chemical sensitivities. Other products that can have detrimental effects on IEQ and/or certain individuals include paints and other finishes, carpeting, appliances and other electrical equipment, and others.

## **CHPS Section 01350 Part 1.3B and 1.4D and GREENGUARD Allowable Emission Levels**

The NIBS – IEQ Products & Materials Committee believes that the CHPS Indoor Air Quality Emissions Testing Standards and the Green Guard Allowable Emission Levels offer tested and reviewed approaches to material and product selection for buildings. Given the range of guidance and standards available for material selection, these two standards provide the most widely accepted processes for making material selections to construct buildings that are healthier for the general public. It should be noted that the NIBS –IEQ Products & Materials Committee does not believe that either of these standards offers an entirely acceptable solution for persons with MCS and EMS. However, they provide a starting point in making material selections, and they provide the best available guidance on component screening and materials emission limits. Making materials selections that meet either the CHPS or the Green Guard allowable emission levels should be considered an absolute minimum requirement in creating a building or environment that is accessible to persons with MCS and EMS. No designer or other person making material selections should choose any materials that do not at least meet these standards. Even then, the other considerations discussed herein should be a part of the selection process to provide the best

opportunity that the building will provide an environment accessible to persons with MCS and EMS.

The Green Guard Certification Standards list allowable emissions for a range of building products. A designer or other individual making a material selection must investigate product literature, for the material under consideration, to determine if the product meets at least the Green Guard standards. The Green Guard web site lists products that have been tested and have met their standards. However, it is possible that a product manufacturer has not submitted their product for certification to either Green Guard or CHPS. In this case, the person making a material selection must seek any published emissions testing data and product component data available from the manufacturer. Some manufacturers publish data on emissions from their products, and other manufacturers are moving quickly to provide such data. If such data is not currently published, the manufacturer must have the product or material tested in accordance with the testing regimen specified in the Green Guard or CHPS 01350 Certification Standards.

The CHPS Section 01350 protocols and the Green Guard Certification for IAQ data require the same chamber testing. The CHPS protocols and calculations go further than the Green Guard Certification Standards in that the designer is required to take published emissions rates and perform calculations based on the amount of material to be installed in the building and the zones and air handling capabilities of the HVAC systems in those zones. Also, the allowable emission level for formaldehyde is lower in the CHPS standard than the Green Guard standard. See the discussion below for more information on formaldehyde.

For both standards, all building materials are required to be tested in dynamic environmental chambers following ASTM standards D-5116-97 and D-6670-01, the U.S. Environmental Protection Agency's testing protocol for furniture and the State of Washington's protocol for interior furnishings and construction materials. Products are measured for emission levels according to the parameters set forth in the ASTM Standard for emissions testing.

California - Practice for Testing of VOC's from Building Materials Using Small Chambers

<http://www.dhs.ca.gov/ps/deodc/ehlb/iaq/VOCS/Practice.htm>

The allowable emission levels of both standards can be found by clicking on the links below. In some cases, the Green Guard standards may appear to have lower standards for emissions of some VOCs than the CHPS Section 1350 standards. However, the person selecting materials for the building must bear in mind that the CHPS standard requires a detailed calculation for the building, the amount of material to be installed and the air change rate of the HVAC systems. Green Guard emissions standards are based on a "standard" model of a building, and a "standard" exchange rate of fresh air in the building.

## **Formaldehyde**

Formaldehyde is widely used by industry to manufacture building materials and numerous consumer products. It is also a by-product of combustion and certain other natural processes. Formaldehyde, by itself or in combination with other chemicals, serves a number of purposes in manufactured products. For example, it is used to add permanent-press qualities to clothing and draperies, as a component of glues and adhesives, and as a preservative in some paints and coating products.

In building materials, the most significant sources of formaldehyde are likely to be pressed wood products made using adhesives that contain urea-formaldehyde (UF) resins. Pressed wood products include: particleboard (used as sub-flooring and shelving and in cabinetry and furniture); hardwood-veneer plywood paneling (used for decorative wall covering and used in cabinets and furniture); and medium density fiberboard (used for drawer fronts, cabinets, and furniture tops). Medium density fiberboard contains a higher resin-to-wood ratio than any other UF pressed wood product and is generally recognized as being the highest formaldehyde-emitting pressed wood product.

Other pressed wood products, such as softwood plywood and flake or oriented strandboard, are produced for exterior construction use and contain the dark, or red/black-colored phenol-formaldehyde (PF) resin. Although formaldehyde is present in both types of resins, pressed woods that contain PF resin generally emit formaldehyde at considerably lower rates than those containing UF resin.

The NIBS – IEQ Products & Materials Committee is concerned about human exposure to formaldehyde, especially for individuals with multiple chemical sensitivities. The widespread use of formaldehyde, its known health effects, and the hyper-sensitivities of certain individuals create this concern. It may not be possible to make material selections that are completely free of formaldehyde, but where possible, the individual making material selections should make every effort to avoid products manufactured with formaldehyde. New soy-based adhesives are coming on to the market to replace formaldehyde resins used in many manufactured wood products. It may soon be possible to choose alternative products that are not formulated with this volatile organic compound (VOC).

The California Office of Environmental Health Hazard Assessment has determined that the lowest, reasonably achievable level of formaldehyde (because it is equal to ambient air

concentrations) is 33 (milligrams per cubic meter)  $\text{ug}/\text{m}^3$ , or 23 (parts per billion) ppb. Thus, the CHPS 01350 standard requires that a material must not emit a level of formaldehyde that results in a concentration of  $\frac{1}{2}$  of this level, or  $16 \text{ ug}/\text{m}^3$  (11 ppb). This limit is lower than the allowable emission level of the Green Guard standard. The NIBS – IEQ Products & Materials Committee believes that the  $16 \text{ ug}/\text{m}^3$  (11 ppb) level is a minimum requirement for formaldehyde emissions from building materials.

***Following is a list of typical building materials and some considerations for selection. Note that the considerations listed below are in addition to the recommended emissions standards from CHPS 1350 and Green Guard.***

### **Adhesives and Sealants**

One objective of the IEQ-Products & Materials Committee is to reduce the quantity of indoor air contaminants created by adhesives and sealants that are potentially irritating and/or harmful to occupants of buildings. The use of VOC-emitting adhesives and/or sealants should be minimized to the greatest extent possible in order to create an accessible, comfortable environment for the greatest numbers of people.

The designer should specify application of only the minimum amounts of these materials necessary for satisfactory completion of each installation task. Additionally, the designer should select products that have the lowest possible VOC emissions, according to the emissions testing information provided, while still meeting other performance requirements. Caution should be exercised when interpreting adhesive emission data because such data are usually provided without the associated installed products (e.g., flooring materials) and emissions from installed assemblies may differ from manufacturers' reported adhesive emission rates. If possible, adhesives that contain formaldehyde should be avoided.

The Committee also recommends that paints and finishes be selected that do not contain biocides.

In any building where adhesive use is necessary, it is a good practice to ensure that maximum ventilation is supplied during and after application of these products.

### **Appliances**

Appliances can emit volatile fumes as well as create electromagnetic fields.

Electromagnetic fields and radiofrequencies can jeopardize the functioning and safe access of electromagnetically sensitive individuals. Examples of indoor appliances which can provoke health problems include:

- cell and portable telephones,
- fluorescent lights,
- unshielded transformers and wiring,
- battery re-chargers,

- wireless devices including computers and personal communication services (“PCS”),
- security and scanning equipment,
- numerous common work place and household electronic appliances.

Many electrical appliances and equipment can be improved to varying degrees by appropriate shielding, and/or by being located in areas remote from vulnerable individuals.

It is not recommended that such equipment be eliminated from the built environment, but that exposure of vulnerable individuals to such equipment be voluntary or easily avoidable.

## **Ceilings**

Of particular concern to the NIBS-IEQ Products & Materials Committee are T-bar suspended ceilings used as return air plenums in buildings, because both sides of the panels come in contact with indoor air. In addition, penetrations for sprinklers, alarms, and smoke detectors may significantly increase the area exposed to emissions. Temperatures near ceiling surfaces and in return air plenums are usually higher than those in occupied zones and, as a result, increased emissions from ceiling materials may occur. The individual selecting ceiling materials should carefully consider the acoustic, fire, and aesthetic requirements for each space prior to material selection. Nonporous materials are now available that combine aesthetic, acoustical, and fire code requirements.

Ceiling materials that contain organic materials present the possibility of mold contamination if the ceiling system becomes wet. Porous ceilings and ceiling finishes can also act as receptors for toxins and VOCs that are brought into the building and later re-emit them. Many ceiling tile products are made using urea formaldehyde. No products using urea formaldehyde should be allowed.

## **Composite Wood Products (plywood, particle board, OSB, paneling, etc.)**

Because they emit formaldehyde and other VOCs, use of composite wood products should be minimized, if not eliminated. If it is absolutely necessary to use such products, the designer should select materials that meet the specified building criteria and are the lowest emitting products available according to emissions testing data. Formaldehyde emissions are of particular concern in composite wood products. Note that VOC-emitting wood preservatives may be used in some of these products. There are a number of manufacturers that are replacing formaldehyde adhesives in composite wood products with non-emitting adhesives and the Committee recommends using these alternative products whenever possible.

## **Fireproofing**

The use of fireproofing chemicals should be minimized when possible. Spray-on fireproofing can cause indoor air quality problems when chemical components are released into the air as a result of mechanical damage, air erosion, or deterioration of the binder. Also because spray-on materials have large, porous surface areas, they can act as sinks for adsorption and re-emittance of VOCs. If possible, seal the surface of spray-on fireproofing to reduce adsorption of VOCs. Ensure that the sealer: (a) will not change fire characteristics of the original fireproofing material; and (b) is not a high-VOC emitter. Also seal any

penetrations of surfaces sprayed with fireproofing material to prevent damage of the material in the vicinity of penetrations.

## **Flooring and Floor Systems**

The NIBS-IEQ Products & Materials committee recommends use of flooring products that are low or non-emitting and are non-porous. Consideration should also be given to maintenance products that will be necessary for the type of flooring selected. For instance, stripping and refinishing of wood flooring introduces hazardous chemicals into the air and are intolerable for persons with multiple chemical sensitivities. When selecting a floor system, the type of adhesives used with the flooring system must also be considered.

Stone, terra cotta, granite, marble, terrazzo, ceramic, brick, or sealed concrete flooring are best tolerated by individuals with chemical sensitivities, and provide a healthy, comfortable environment for the greatest number of people.

Wood flooring that has not been recently stripped or refinished and older vinyl flooring is also often well tolerated by people with chemical sensitivities.

Rubber, linoleum, and cork flooring are not recommended.

The Resilient Floor Covering Institute (RFCI) has recently introduced a new certification program for low emitting flooring products called the FloorScore™ program. The FloorScore program is a building materials emissions testing program that requires both independent laboratory testing and third-party certification to show compliance with CCHPS 01350 VOC emissions limits and includes certified site audit and documented control system requirements. The third-party certifier, Scientific Certification Systems, Inc. (SCS), not only reviews the results of the product VOC emissions report but also reviews raw material inputs and manufacturing processes to ensure that a product is consistently manufactured. SCS conducts site audits of manufacturing plants to ensure a quality management plan exists for continuing compliance of the product as defined in SCS-EC-10-2004 Environmental Certification Program – Indoor Air Quality Performance.

Resilient Floor Covering Institute – “Floor Score” Program

Floor Score List of Certified Products

[http://www.rfci.com/int\\_FS-ProdCert.htm](http://www.rfci.com/int_FS-ProdCert.htm)

Carpet systems contain a myriad of chemicals in their fiber, dyes, backing, padding, bonding agents, adhesives, antimicrobials, flame retardants, and stain resistance, anti-static, and color fast agents. They are reservoirs for tracked-in pesticides, dust, dust mites; foster mold growth; and absorb and re-emit volatile organic chemicals like fragrances and paint fumes. In addition, many solvent-based agents used to clean carpets emit toxic fumes.

The Carpet and Rug Institute (CRI) has established a rating system that involves emission testing that is based on CHPS Section 01350, and includes additional requirements. Carpets labeled with the CRI Green Label Plus are expected to have lower emissions than most

carpets. However, even carpets emitting low levels of volatile organic chemicals (VOC's) can cause adverse health effects in certain individuals.

CRI Green Label Plus link

[http://www.carpet-rug.org/drill\\_down\\_2.cfm?page=8&sub=3&requesttimeout=350](http://www.carpet-rug.org/drill_down_2.cfm?page=8&sub=3&requesttimeout=350)

Some people with multiple chemical sensitivities have found that carpet squares with self-adhesive backing have been the best tolerated new carpeting. Others have reacted adversely to such products. More research is necessary to determine what factors in these carpets and/or which brands are best tolerated.

Older carpets are usually better tolerated by people with chemical sensitivities than new ones, as long as they have not become moldy.

Recommendations regarding carpeting (design, materials, and O&M issues):

1. Minimize the use of carpeting
2. Use area rugs in place of carpeting whenever possible
3. Consider using self-adhesive carpet squares
4. Tack rather than glue down (unless using self-adhesive carpet)
5. If glue down, use low or no VOC adhesive
6. Air out carpet for at least two weeks prior to installation
7. Ventilate building with 100% outside (or fresh) air for as long as possible after installation
8. Reduce the frequency of carpet replacement by maintaining them well (e.g., vacuum thoroughly and frequently and clean with low toxic products and procedures – (see recommendations by Operations & Maintenance Committee).
9. Minimize amount of carpet that is replaced, limit replacement to damaged areas (an advantage of carpet square systems is that smaller sections can be more easily replaced).

## **Insulation**

The NIBS-IEQ Products & Materials committee realizes that insulation is an essential component in building systems to assure a comfortable environment. Insulation and insulating materials are generally hidden or covered, however emissions can still be encountered by building occupants. The Committee believes that polystyrene foam insulation is best tolerated by persons with multiple chemical sensitivities. Other insulating products, such as fiberglass, cellulose, or cotton/polyester blend insulating products may produce particulates, harbor mold, or emit problematic volatile fumes, depending on the product and the manufacturing techniques used.

The Committee has particular concerns about interior lined ductwork, due to the insulation's ability to collect and trap chemical contaminants, dusts, microbes and fungi, as well as emissions from the adhesives used to secure the insulation. It is recommended that no interior-lined ductwork be used in the construction of buildings meant to be accessible to persons with MCS.

Lastly, insulation used anywhere in buildings must not contain urea-formaldehyde resins.

## **Paint**

The NIBS-IEQ Products & Materials Committee determined that for some individuals, 100% acrylic paint and paints containing low-VOC emissions can be acceptable. Paints containing styrene-butadiene latex combinations, enamels, strippers and paint thinners are all problematic and should be avoided or their use minimized.

For some individuals, well-hardened enamel paint, baked-on enamel finish, or porcelainized steel provide optimum safety. These products provide a hard, durable surface that can be easily cleaned using non-toxic products.

Paints with biocides or biocide additives (mold/mildew resistant) should not be selected.

## **Textiles**

The NIBS-IEQ Products & Materials committee recommends sparing or no use of textiles in buildings. Though it may be possible to introduce textiles with no emissions, textiles provide a porous medium to trap chemical contaminants, dusts and microbes that can create an unhealthy environment. In addition, the dry cleaning and laundering of textiles pose additional problems due to the cleaning products.

## **Walls**

Gypsum wallboard: Gypsum may be reasonably inert and extremely low in VOC emissions. However, additives used to produce mold-proof gypsum wallboard (i.e., "green board"), fire-resistant gypsum wallboard, or to improve the workability of the slurry during manufacture may include compounds that emit VOCs. Careful product selection and review of emissions testing data is necessary to assure that appropriate materials are chosen. Recycled paper covering both sides of gypsum wallboard may contain chemicals from previous uses, and additives or chemicals used in the production of the paper itself. Note that VOC emissions from gypsum wallboard can sometimes be significantly reduced by "painting" or laminating the surfaces. The more impervious the coating or covering, the greater will be the reduction in VOC emissions from gypsum wallboard. However, VOC emissions from surface treatment materials must be considered.

Gypsum wallboard can act as a sink for other VOCs in indoor air. Avoid exposing unpainted gypsum wallboard to indoor environments where emissions from other VOC sources exist. Taping and topping compounds can contain considerable quantities of VOCs, so emissions testing data for these products are also critically important. Use ventilation and heat to accelerate the drying process of these materials. Protect wallboard from exposure to contaminants and excessive moisture prior to installation.

Where possible, select material to reduce the need for paints, wallcoverings, or porous wall finishes in buildings. Most commercial structures are built using metal studs, a good selection for persons with MCS. Wood studs can emit terpenes and pinenes

## **Wallcovering**

Wallpapers may contain vinyl, plasticizers, styrene-butadiene latex combinations and other chemicals that can seal and trap moisture between the wallpaper and the wall fostering mold growth. The water-based pastes and glues used to adhere the wallpaper to the wall may

contain mold retardants and pesticides. Adhesives can emit volatile fumes. For these reasons we recommend that wallpapers not be used.

## **Conclusion & Recommendations**

In order to minimize the level of air pollutants emitted from building materials and create healthier indoor environments, the NIBS Products & Materials Committee recommends that inert, non-porous materials be used to the greatest extent possible. This will increase access for the greatest number of chemically sensitive individuals. Choosing appliances and other equipment that create the lowest level of electromagnetic fields will increase access for those with electromagnetic sensitivities.

If materials are used that emit volatile fumes, the Committee recommends that these materials meet or exceed the CHPS Indoor Air Quality Emissions Testing Standards or Green Guard Allowable Emission Levels, as well as contain no formaldehyde or biocides. The Committee also recommends that, whenever possible, products and materials be aired out (preferably outside or in a separate well-ventilated space) for two weeks prior to being installed in a building.

While the Committee acknowledges that the CHPS Indoor Air Quality Emissions Testing Standards and Green Guard Allowable Emission Levels are the best current standards for selecting building materials that create healthier buildings, the Committee is concerned that these standards may not sufficiently protect the health of building occupants, especially those with chemical sensitivities and other vulnerable individuals.

Therefore, the Committee supports:

- 1) Creation of more stringent emission standards and development of a wider range of less volatile and less hazardous building materials, especially in the areas of resilient flooring and carpeting.
- 2) Full disclosure of product ingredients (on product labels or available upon request) to enable builders to make more informed decisions regarding selection of building materials.
- 3) Consulting with chemically and electromagnetically sensitive individuals or organizations, especially employees and others who frequently use a building, prior to making final decisions regarding product selection.

## Executive Committee

### American Academy of Environmental Medicine Recommendations Regarding Electromagnetic and Radiofrequency Exposure

#### President

Physicians of the American Academy of Environmental Medicine recognize that patients are being adversely impacted by electromagnetic frequency (EMF) and radiofrequency (RF) fields and are becoming more electromagnetically sensitive.

#### President-Elect

The AAEM recommends that physicians consider patients' total electromagnetic exposure in their diagnosis and treatment, as well as recognition that electromagnetic and radiofrequency field exposure may be an underlying cause of a patient's disease process.

#### Secretary

Based on double-blinded, placebo controlled research in humans,<sup>1</sup> medical conditions and disabilities that would more than likely benefit from avoiding electromagnetic and radiofrequency exposure include, but are not limited to:

#### Treasurer

- Neurological conditions such as paresthesias, somnolence, cephalgia, dizziness, unconsciousness, depression
- Musculoskeletal effects including pain, muscle tightness, spasm, fibrillation
- Heart disease and vascular effects including arrhythmia, tachycardia, flushing, edema

#### Immediate Past President

#### Advisor

- Pulmonary conditions including chest tightness, dyspnea, decreased pulmonary function
- Gastrointestinal conditions including nausea, belching
- Ocular (burning)
- Oral (pressure in ears, tooth pain)
- Dermal (itching, burning, pain)
- Autonomic nervous system dysfunction (dysautonomia).

#### Board of Directors

Based on numerous studies showing harmful biological effects from EMF and RF exposure, medical conditions and disabilities that would more than likely benefit from avoiding exposure include, but are not limited to:

#### Continuing Medical Education

- Neurodegenerative diseases (Parkinson's Disease, Alzheimer's Disease, and Amyotrophic Lateral Sclerosis).<sup>2-6</sup>
- Neurological conditions (Headaches, depression, sleep disruption, fatigue, dizziness, tremors, autonomic nervous system dysfunction, decreased memory, attention deficit disorder, anxiety, visual disruption).<sup>7-10</sup>
- Fetal abnormalities and pregnancy.<sup>11,12</sup>
- Genetic defects and cancer.<sup>2,3,13-19</sup>
- Liver disease and genitourinary disease.<sup>12,20</sup>

#### Executive Director

Because Smart Meters produce Radiofrequency emissions, it is recommended that patients with the above conditions and disabilities be accommodated to protect their health. The AAEM recommends: that no Smart Meters be on these patients' homes, that Smart Meters be removed within a reasonable distance of patients' homes depending on the patients' perception and/or symptoms, and that no collection meters be placed near patients' homes depending on patients' perception and/or symptoms.

Submitted by: Amy L. Dean, DO and William J. Rea, MD

Approved July 12, 2012 by the Executive Committee of the American Academy of Environmental Medicine

Re: ET Docket No. 13-84

Dear Federal Communications Commission Commissioners:

The American Academy of Environmental Medicine is writing to request that the FCC review radiofrequency (RF) exposure limits (reference is made to the FCC's NOI sections 48, 51, 52, 53, 56, 60, 65 and 69), recognize non-thermal effects of RF exposure (NOI sections 66 and 69), and lower limits of RF exposure to protect the public from the adverse health effects of radiofrequency emissions (NOI sections 48, 52, 54, 65 and 71).

Founded in 1965 as a non-profit medical association, the AAEM is an international association of physicians and scientists who study and treat the effects of the environment on human health. With an elite membership of highly trained physicians and clinicians, AAEM is committed to education, public awareness and research regarding Environmental Medicine.

It became clear to AAEM physicians that by the mid 1990's patients were experiencing adverse health reactions and disease as a result of exposure to electromagnetic fields. In the last five years with the advent of wireless devices, there has been an exponential increase in the number of patients with radiofrequency induced disease and hypersensitivity.

Numerous peer reviewed, published studies correlate radiofrequency exposure with a wide range of health conditions and diseases. (NOI sections 54, 59, 60 and 65) These include neurological and neurodegenerative diseases such as Parkinson's Disease, ALS, paresthesias, dizziness, headaches and sleep disruption as well as cardiac, gastrointestinal and immune disease, cancer, developmental and reproductive disorders, and electromagnetic sensitivity. The World Health Organization has classified RF emissions as a group 2 B carcinogen. This research is reviewed and cited in the following attached documents: *AAEM Electromagnetic and Radiofrequency Fields Effect on Human Health* and *AAEM Recommendations Regarding Electromagnetic and Radiofrequency Exposure*.

The scientific literature proves that non-thermal adverse effects of RF exposure exist and negatively impact health and physiology. New guidelines based on measurements of non-thermal effects and lowering limits of exposure are needed and critical to protect public health.

In fact, electromagnetic sensitivity and the health effects of low level RF exposure have already been acknowledged by the federal government. In 2002, the Architectural and Transportation Barriers Compliance Board stated:

*“The Board recognizes...electromagnetic sensitivities may be considered disabilities under the ADA if they so severely impair the neurological, respiratory or other functions on an individual that it substantially limits one or more of the individual’s major life activities”*

Additionally, in 2005, the National Institute of Building Sciences, an organization established by the U.S. Congress in 1974, issued an Indoor Environmental Quality Report which concluded:

*“For people who are electromagnetically sensitive, the presence of cell phones and towers, portable telephones, computers,... wireless devices, security and scanning equipment, microwave ovens, electric ranges and numerous other electrical appliances can make a building inaccessible.”*

By recognizing electromagnetic sensitivity, the federal government and affiliated organizations are clearly acknowledging the existence of non-thermal effects. The AAEM urges the FCC to recognize that non-thermal effects of RF exposure exist and cause symptoms and disease. (NOI sections 66 and 69) The AAEM also requests that the FCC base guidelines of RF exposure on measurements of non-thermal effects and lower the limits of RF exposure to protect the health of the public. (NOI sections 48, 52, 54, 65 and 71)

Sincerely ,

A handwritten signature in black ink, appearing to read "Amy L. Dean, DO.", with a stylized flourish at the end.

**Americans With Disabilities Act (ADA)  
Accessibility Guidelines for Buildings  
and Facilities; Recreation Facilities**

**AGENCY:** Architectural and  
Transportation Barriers Compliance  
Board.

**ACTION:** Final rule.

**SUMMARY:** The Architectural and Transportation Barriers Compliance Board (Access Board) is issuing final accessibility guidelines to serve as the basis for standards to be adopted by the Department of Justice for new construction and alterations of recreation facilities covered by the Americans with Disabilities Act (ADA). The guidelines include scoping and technical provisions for amusement rides, boating facilities, fishing piers and platforms, golf courses, miniature golf, sports facilities, and swimming pools and spas. The guidelines will ensure that newly constructed and altered recreation facilities meet the requirements of the ADA and are readily accessible to and usable by individuals with disabilities.

**DATES:** The guidelines are effective October 3, 2002. The incorporation by reference of certain publications listed in the guidelines is approved by the Director of the Federal Register as of October 3, 2002.

**FOR FURTHER INFORMATION CONTACT:** Peggy Greenwell, Office of Technical and Information Services, Architectural and Transportation Barriers Compliance Board, 1331 F Street, NW., suite 1000, Washington, DC 20004–1111. Telephone number (202) 272–0017 (Voice); (202) 272–0082 (TTY). E-mail address: [greenwell@access-board.gov](mailto:greenwell@access-board.gov).

**SUPPLEMENTARY INFORMATION:**

**Availability of Copies and Electronic Access**

Single copies of this publication may be obtained at no cost by calling the Access Board's automated publications order line (202) 272–0080, by pressing 2 on the telephone keypad, then 1, and requesting publication S–43 (Recreation Facilities Final Rule). Persons using a TTY should call (202) 272–0082. Please record a name, address, telephone number and request publication S–43. This document is available in alternate formats upon request. Persons who want

a copy in an alternate format should specify the type of format (cassette tape, Braille, large print, or ASCII disk). This document is also available on the Board's Internet site (<http://www.access-board.gov/recreation/final.htm>).

**Background**

The Americans with Disabilities Act recognizes and protects the civil rights of people with disabilities.<sup>1</sup> Titles II and III of the ADA require, among other things, that newly constructed and altered State and local government facilities, places of public accommodation, and commercial facilities be readily accessible to and usable by individuals with disabilities. Recreation facilities are among the types of facilities covered by titles II and III of the ADA.

The ADA designates the Access Board as the agency responsible for developing minimum accessibility guidelines to ensure that new construction and alterations of facilities covered by titles II and III of the ADA are readily accessible to and usable by individuals with disabilities.<sup>2</sup> The Access Board initially issued the Americans with Disabilities Act Accessibility Guidelines (ADAAG) in 1991.<sup>3</sup> Current ADAAG contains general scoping and technical provisions (ADAAG 1 to 4) that apply to all types of facilities, and special application sections (ADAAG 5 to 12) that include additional scoping and technical provisions for certain types of facilities.<sup>4</sup> As discussed in more detail below, this final rule will amend section 4, and create a new section 15 (Recreation Facilities).

The Department of Justice is responsible for issuing regulations to

implement titles II and III of the ADA. The regulations issued by the Department of Justice must include accessibility standards for newly constructed and altered facilities covered by titles II and III of the ADA. The standards must be consistent with the minimum accessibility guidelines issued by the Access Board. The Department of Justice has adopted ADAAG as the Standard for Accessible Design for title III of the ADA.<sup>5</sup>

This final rule amends ADAAG by adding a new special application section for amusement rides, boating facilities, fishing piers and platforms, golf courses, miniature golf, sports facilities, and swimming pools and spas. This rulemaking has had a long history. In 1993, the Access Board established an advisory committee of 27 members to make recommendations on guidelines for recreation facilities. The Recreation Access Advisory Committee met from July 1993 to May 1994 and submitted a report to the Board, "Recommendations for Accessibility Guidelines: Recreational Facilities and Outdoor Developed Areas". After receiving the committee's report, the Board published it as an advance notice of proposed rulemaking (59 FR 48542, September 21, 1994). Over 600 comments were received on the report and questions asked in the advance notice. To obtain additional information for this rulemaking, the Board also sponsored research on access to swimming pools in 1995; held informational meetings and conducted site visits on access to miniature golf facilities in September 1996; and held informational meetings and conducted site visits on accessible amusement rides in December 1999 and March and April 2000.

A notice of proposed rulemaking (NPRM) was published in the **Federal Register** on July 9, 1999. (64 FR 37326, July 9, 1999). The comment period was originally scheduled to close on November 8, 1999, but was extended until December 8, 1999 to allow more time for the public to submit comments. These comments were submitted electronically, in writing, and as oral testimony received during two public hearings held in Dallas, TX (August 26,

<sup>1</sup> See 42 U.S.C. 12101 *et seq.* (<http://www.usdoj.gov/crt/ada/pubs/ada.txt>).

<sup>2</sup> The Access Board is an independent Federal agency established by section 502 of the Rehabilitation Act whose primary mission is to promote accessibility for individuals with disabilities. The Access Board consists of 25 members. Thirteen are appointed by the President from among the public, a majority of whom are required to be individuals with disabilities. The other twelve are heads of the following Federal agencies or their designees whose positions are Executive Level IV or above: The Departments of Health and Human Services, Education, Transportation, Housing and Urban Development, Labor, Interior, Defense, Justice, Veterans Affairs, and Commerce; General Services Administration; and United States Postal Service.

<sup>3</sup> See 36 CFR part 1191, Appendix A (<http://www.access-board.gov/adaag/html/adaag.html>).

<sup>4</sup> The special application sections cover the following facilities: restaurants and cafeterias (ADAAG 5); medical care facilities (ADAAG 6); business, mercantile and civic (ADAAG 7); libraries (ADAAG 8); transient lodging (ADAAG 9); transportation facilities (ADAAG 10); judicial, legislative, and regulatory facilities (ADAAG 11); and detention and correctional facilities (ADAAG 12). ADAAG 13 is reserved for housing and ADAAG 14 is reserved for public rights-of-way.

<sup>5</sup> See 28 CFR part 36, Appendix A (<http://www.usdoj.gov/crt/ada/reg3a.html>). The Department of Justice standards currently include ADAAG 1 to 10. State and local governments currently have the option of using ADAAG or an earlier standard, the Uniform Federal Accessibility Standards (UFAS), when constructing or altering facilities under the Department of Justice regulations for title II of the ADA. See 28 CFR 35.151(c) (<http://www.usdoj.gov/crt/ada/reg2/html>). The Department of Justice has issued a notice of proposed rulemaking to eliminate this option. 59 FR 31808 (June 20, 1994).

1999) and Boston, MA (November 17, 1999). Over 200 people attended these hearings and approximately 54 people provided testimony. The Board received approximately 300 comments during the public comment period.

The Access Board created an ad hoc committee of Board members to review the comments received on the proposed rule. The ad hoc committee discussed significant issues associated with the comments and made recommendations to the full Board for the final rule. In an effort to provide the public with more opportunities for input into the provisions for the final rule, on July 21, 2000 the Board published a summary of the ad hoc committee's recommendations and put the summary in the rulemaking docket for public review (65 FR 4533, July 21, 2000). The comment period on the summary closed on September 19, 2000. Approximately 70 comments were received during the public comment period. Afterwards, the Board held informational meetings on the summary in Washington, DC (August 21–22, 2000) and San Francisco, CA (September 6–7, 2000).

#### General Issues

##### *Incorporating the Final Rule on Recreation Facilities Into Future Revisions to ADAAG*

A complete review of ADAAG has been underway for several years. ADAAG was first published on July 26, 1991. The Board is committed to ensuring that ADAAG continues to reflect technological developments and is improved in terms of usability. Efforts also include coordination with changes in national standards and model code organizations and reconciling differences between ADAAG and national consensus standards, where possible. The Board published a notice of proposed rulemaking on November 16, 1999 with proposed revisions to ADAAG. The Board plans to issue final changes to ADAAG in the near future.

The Board is issuing the final guidelines for recreation facilities prior to the publication of the final ADAAG revision. The Board then plans to incorporate these final guidelines into the final revisions to ADAAG. To effectively incorporate these guidelines into the new format, some minor formatting changes will be made. For instance, the revised ADAAG will include a new format and numbering system. This rule will need to be formatted to fit that system. Some of the provisions will also be modified slightly to avoid redundancy. No substantive changes to the text are planned. Once incorporated, the Board will develop a

guide to assist users with the new ADAAG.

The incorporation of the final recreation guidelines into the revised ADAAG will enhance the usability of the accessibility guidelines for architects, designers, manufacturers, operators and others using ADAAG. For example, accessibility guidelines for accessible parking spaces, toilet rooms, amusement rides, swimming pools, and exercise facilities will be combined into one document. Other improvements in the format of ADAAG will reduce redundancy through the use of basic technical provisions known as "building blocks," which will provide consistent dimensions for clear spaces, turning spaces, and knee and toe clearances for elements. These basic technical provisions will apply unless otherwise modified in the section containing accessibility guidelines for recreation facilities. For example, handrail requirements for sloped entries into swimming pools modify the requirements otherwise required in the ramp provisions (ADAAG 4.8.5).

##### *Multiple Chemical Sensitivities and Electromagnetic Sensitivities*

Individuals with multiple chemical sensitivities and electromagnetic sensitivities submitted a substantial number of written comments and attended the public information meetings on the draft final rule. They reported that chemicals used in recreation facilities, such as chlorine used in swimming pools and spas, and pesticides and synthetic fertilizers used on golf courses, are barriers that deny them access to those facilities. They requested the Board to include provisions in the final rule to make recreation facilities accessible for them.

The Board recognizes that multiple chemical sensitivities and electromagnetic sensitivities may be considered disabilities under the ADA if they so severely impair the neurological, respiratory or other functions of an individual that it substantially limits one or more of the individual's major life activities. The Board plans to closely examine the needs of this population, and undertake activities that address accessibility issues for these individuals.

The Board plans to develop technical assistance materials on best practices for accommodating individuals with multiple chemical sensitivities and electromagnetic sensitivities. The Board also plans to sponsor a project on indoor environmental quality. In this project, the Board will bring together building owners, architects, building product manufacturers, model code and

standard-setting organizations, individuals with multiple chemical sensitivities and electromagnetic sensitivities, and other individuals. This group will examine building design and construction issues that affect the indoor environment, and develop an action plan that can be used to reduce the level of chemicals and electromagnetic fields in the built environment.

Neither the proposed rule nor the draft final rule included provisions for multiple chemical sensitivities or electromagnetic sensitivities. The Board believes these issues require a thorough examination and public review before they are addressed through rulemaking. The Board does not address these issues in the final rule.

##### *Existing Recreation Facilities*

The Board received a significant number of comments related to the impact of these accessibility guidelines on existing facilities. Some commenters interpreted the proposed rule and the draft final rule to require all existing recreation facilities or elements of these facilities to be modified to meet the new accessibility guidelines. They expressed concern that the guidelines would have a significant economic impact on existing recreation facilities.

To clarify, ADAAG and the final accessibility guidelines for recreation facilities apply to newly designed or newly constructed buildings and facilities and to existing facilities when they are altered. ADAAG and the Department of Justice regulations address whether a change to a building or facility is considered an alteration. The publication of this final rule does not require that all existing facilities be modified to meet these guidelines. State and local governments who provide recreation facilities have a separate obligation under title II of the ADA to provide program accessibility which may require the removal of architectural barriers in existing facilities. See 28 CFR 35.150 (<http://www.usdoj.gov/crt/ada/reg2.html>). Private entities who own, lease (or lease to), or operate recreation facilities have a separate obligation under title III of the ADA to remove architectural barriers in existing facilities where it is readily achievable (*i.e.*, easily accomplishable and able to be carried out without much difficulty or expense). See 28 CFR 36.304 (<http://www.usdoj.gov/crt/ada/reg3a.html>).

Federal tax credits and deductions are available to private entities for architectural barrier removal in existing facilities. Federal funds also are available through the Community Development Block Grant Program to

remove architectural barriers in existing facilities. State and local governments may use Community Development Block Grant funds to remove architectural barriers in publicly and privately operated facilities. Entities requesting guidance on their obligations for existing facilities should contact the Department of Justice.

#### *Equivalent Facilitation*

Commenters addressing various sections of the recreation rule indicated the need for flexibility in designing and constructing accessible recreation facilities and elements. Commenters wanted to ensure that alternative designs would be permitted for providing accessibility with some of the unique elements and facilities addressed in this rule. Specific concerns were raised in comments related to accessible amusement rides and miniature golf courses.

The Board recognizes that many of the facilities and elements addressed in this rule are unique and supports the need for flexibility in making them accessible. Section 2.2 of ADAAG currently permits "departures from particular technical and scoping requirements of this guideline by the use of other designs and technologies \* \* \* where the alternative designs and technologies used will provide substantially equivalent or greater access to and usability of the facility." This provision applies to all facilities and elements addressed by ADAAG, including recreation facilities.

#### *Section-by-Section Analysis*

This section of the preamble contains a concise summary of the final rule and an analysis of the comments the Board received on each section. The final rule amends several existing sections of ADAAG and adds a new special application section. Section 4 of ADAAG has been amended to include provisions addressing miscellaneous sports facilities and elements as explained below.

#### *Miscellaneous Sports Facilities and Elements*

The accessibility guidelines for recreation facilities are primarily set forth in Section 15. Several changes, however, were also required within ADAAG section 4 to adequately address some of the unique sports facilities and elements.

#### *Section 3.5 Definitions "Area of Sport Activity"*

An area of sport activity is defined as "that portion of a room or space where the play or practice of a sport occurs."

The term is defined in order to clarify the requirements for connecting an accessible route with this type of space. The term is used broadly to define spaces where the play or practice of a sport occurs. It includes, but is not limited to, field sports such as softball, football, lacrosse, baseball, and soccer; court sports such as tennis, racquetball, and volleyball; and other sports such as gymnastics.

*Comment.* A few commenters suggested that further clarification would be helpful in the use of the term "sport" and "practice" of a sport.

*Response.* Providing an exhaustive list of sports is not practical, since it may inadvertently omit a sport, or fail to recognize an emerging sport of the future. The "area of sport activity" will vary from sport to sport. Exceptions to technical provisions in ADAAG 4.1.2 (3) and (4) and 4.1.3 (2) and (3) clarify that accessibility is not required in the "area of sport activity." This is consistent with the recommendations of the Recreation Access Advisory Committee and supports access to each "area of sport activity," while not affecting the nature of the sport.

#### *Section 4.1.1(5)(b) General Exceptions*

The following recreation facilities or portions of recreation facilities are exempt from accessibility requirements: Raised structures used for refereeing, judging, or scoring a sport; water slides; animal containment areas not for public use; and raised boxing rings and wrestling rings.

*Comment.* The proposed rule exempted structures used solely for refereeing a sport. A commenter questioned whether structures used for "judging" or "scoring" a sport would also be considered exempt.

*Response.* The exception has been modified in the final rule to include the term "judging" and "scoring." The Board considers the structures used for these activities to be consistent with the intent of this exception.

*Comment.* The proposed rule did not include any specific requirements for access to water slides. Question 4 in the proposed rule requested comments on this issue. Most of the commenters did not support providing access to the top of water slides. A few commenters suggested that access be required to the top of smaller water slides with an exemption for larger slides.

*Response.* An exception has been added in the final rule exempting water slides, including the structure supporting the water slide, from the guidelines. Providing access to water slides would require extensive ramping or elevators which would make the

slides cost prohibitive. Designers and operators are encouraged to provide access to smaller water slides, where possible. Recent designs for "leisure pools" have incorporated an accessible route to the top of water slides using the different elevations on a site. These designs provide increased access for individuals with disabilities.

*Comment.* The proposed rule did not specifically address access to "life guard stands." A few commenters recommended that structures such as life guard stands be addressed.

*Response.* ADAAG 4.1.1(5)(b) specifically exempts life guard stands and was added during a rulemaking for State and local government facilities (63 FR 2000, January 13, 1998).

*Comment.* The proposed rule included exceptions to technical provisions for accessible routes in animal containment areas. The International Association of Amusement Parks and Attractions expressed concern about general requirements for accessibility in animal containment areas that are not open to the public and are specifically limited to animal handlers.

*Response.* An exception has been added in the final rule to clarify that accessibility is not required to animal containment areas that are not for "public use." Where animal containment areas are open to public use such as petting farms, the provisions of ADAAG 4.3 apply. Several exceptions to the provisions of ADAAG 4.3 in animal containment areas are also included in the final rule.

*Comment.* The proposed rule exempted raised boxing rings from accessibility. A few commenters suggested that raised wrestling rings be added to this exception.

*Response.* The exception has been modified in the final rule to add wrestling rings to the exemption.

#### *Section 4.1.2(2)(b) and 4.1.3(1)(b) Accessible Routes for Court Sports*

These sections are amended to require an accessible route complying with ADAAG 4.3 to directly connect both sides of the court in court sports.

*Comment.* The proposed rule required an accessible route to connect both sides of the court in court sports. The American Institute of Architects (AIA) was concerned that an accessible route connecting the two sides of a court may not be a direct route and could require one to go around a multitude of courts to get to the other side of the court where a sport requires changing sides. This is especially critical in sports such as tennis, where changing sides of the court is part of the game.

*Response.* The accessible route must be a direct route from one side of the court to the other side. Requiring players on one side of the court to traverse through or around another court to get to the other side is not permitted.

*Section 4.1.2(3) and 4.1.3(2)  
Protruding Objects in Areas of Sport Activity*

Areas of sport activity are exempt from the requirements of ADAAG 4.4 (Protruding Objects).

No substantive comments were received and no changes have been made for the final rule.

*Section 4.1.2 (4) and 4.1.3(3) Ground Surfaces in Areas of Sport Activity and Animal Containment Areas*

Two exceptions are added to these sections which require ground surfaces along accessible routes and in accessible spaces to comply with ADAAG 4.5. ADAAG 4.5 requires ground and floor surfaces along accessible routes to be stable, firm, and slip resistant. ADAAG 4.5 also addresses changes in level (ADAAG 4.5.2), carpet (ADAAG 4.5.3), and gratings ADAAG (4.5.4). Exception 1 exempts areas of sport activity from all requirements of ADAAG 4.5. Exception 2 exempts animal containment areas designed and constructed for public use from the requirements of ADAAG 4.5.2 and from providing a stable, firm, and slip resistant ground or floor surface.

*Comment.* The proposed rule required an accessible route to connect to each area of sport activity. A commenter questioned the feasibility of this requirement when connecting multiple sand volleyball courts on a beach.

*Response.* The final rule requires an accessible route to each area of sport activity in newly constructed facilities. For example, where a new sports field is planned with multiple fields, an accessible route is required to each field.

With respect to sand volleyball courts located at beaches, the Board plans to more specifically address the accessible route requirement in a future rulemaking on outdoor facilities, including trails, picnic and camping facilities, and beaches. It is expected that this future rule will address accessible routes on beaches, including their location to various elements on a beach.

*Comment.* The proposed rule exempted animal containment areas for hooved animals from the requirements of a stable, firm, and slip resistant surface. Commenters questioned why the exception was limited to "hooved" animal containment areas. Others suggested that other provisions such as

ADAAG 4.5.2 (Changes in Level) not apply within these areas.

*Response.* This exception has been amended in the final rule to include all animal containment areas and is not limited to those for "hooved" animals. The Board agrees that there often are areas where many different types of animals are contained and are not limited solely to hooved animals. Exemption from the requirements to ADAAG 4.5.2 (Changes in Level) has also been included since absorbent surfaces used to ensure the care and health of animals may conflict with this provision. As previously discussed, an exception has been added to ADAAG 4.1.1(5)(b) to clarify that accessibility is not required in animal containment areas that are not for public use.

*Section 4.1.3(5) Exception 4(f)  
Platform Lifts for Team or Player Seating Areas*

An exception is added to this section permitting the use of a platform lift in new construction as a means of providing access to team or player seating areas serving areas of sport activity.

*Comment.* The proposed rule did not include an option to use a platform lift in new construction to provide access to team or player seating areas. The AIA and several architects representing a firm that specializes in sports facilities commented that platform lifts should be an option. They were particularly concerned about providing access to dugouts and other recessed team player seating areas in major league stadiums. They believed that providing a ramp parallel to the playing field presents a dangerous tripping and falling hazard for players attempting to field foul balls. Other groups representing persons with disabilities commended the Board for not allowing platform lifts in this environment in new construction. Among other issues, they cited the problems associated with relying on a mechanical device to provide access in newly constructed buildings and facilities.

*Response.* The final rule includes an option to use a platform lift as part of an accessible route connecting team or player seating areas. While the Board includes this as an option in new construction, it is recommended that where possible, ramps be utilized. This will reduce reliance for persons with disabilities on a mechanical device when providing access. Several minor league stadiums have incorporated a ramp into their design in recent years. It is the Board's understanding that there have been no reported incidents of accidents related to the ramps.

Information on major league stadiums is not available since ramps have not been incorporated into their designs.

*Section 4.1.3(12)(c) Lockers*

This section is amended to require that where lockers are provided, at least 5 percent, but not less than one, of each type of locker, must comply with ADAAG 4.25.

No substantive comments were received and no changes have been made for the final rule.

*Section 4.1.3(13) Controls and Operating Mechanisms for Exercise Equipment and Machines*

An exception is added to this section to exempt exercise machines from the requirements of ADAAG 4.27 (Controls and Operating Mechanisms).

No substantive comments were received and no changes have been made for the final rule.

*Section 4.1.3(19)(c) Team or Player Seating Areas*

This section is amended to require that where team or player seating areas contain fixed seats and serve an accessible area of sport activity, the seating area must contain the number of wheelchair spaces required by ADAAG 4.1.3(19)(a), but not less than one space. Wheelchair spaces must comply with ADAAG 4.33.2, 4.33.3, 4.33.4, and 4.33.5.

An accessible route is required to connect to the team player seating areas. An accessible route is also required to connect to the area of sport activity which is defined as "that portion of a room or space where the practice or play of a sport occurs." For the most part, the requirement is intended to provide access to the boundary of where the sport is played. In some cases, this will provide for a "level" entry to the area of sport activity such as a softball field or football field. In other cases, there may be changes in level and non-accessible surfaces. The Board recognizes that the accessible route requirement may, in some cases, not ensure access directly onto the area of sport activity. Where possible, designers are encouraged to provide for a smooth transition to the area of sport activity. This requirement is not intended to change the nature of the sport to provide access.

*Comment.* The AIA questioned how wheelchair spaces in team or player seating areas could meet the requirements of ADAAG 4.33.3. ADAAG 4.33.3 requires, among other things, that the wheelchair spaces provide a choice of admission prices or lines of sight

comparable to those afforded members of the general public.

*Response.* An exception has been added in the final rule exempting the wheelchair spaces in team or player seating areas from requirements related to choice of admission price or lines of sight comparable to those for members of the general public. Section 4.1.3(19)(c) is intended to ensure that at least one wheelchair space is provided in team or player seating areas. This can easily be accomplished through clear space adjacent to a fixed bench, for example. Bench seating will also serve as companion seating. Where designers and operators are planning facilities to serve a variety of wheelchair sports, it is recommended that the minimum be exceeded to more adequately accommodate wheelchair sports team.

Exception 2 is added to clarify that the requirements for accessible team or player seating does not apply to bowling lanes that are not required to be on an accessible route. Section 15.7.3 requires 5 percent, but not less than one, of each type of bowling lane to be served by an accessible route. Only those team or player seating areas that serve the bowling lanes required to be on an accessible route must have accessible team or player seating.

*Comment.* The proposed rule included an exception to ADAAG 4.1.3(19) for assembly seating in amusement facilities. The exception permitted use of a transfer seat complying with 15.1.4 where the motion of the seats is an integral part of the amusement experience. A few commenters questioned why this was permitted and recommended that wheelchair spaces be designed so as to provide the same general experience or effects as other seats.

*Response.* This exception has been deleted in the final rule. The Board is aware of amusement facilities where the various effects provided within the wheelchair space. Many of the effects, such as misting or smoke, may be easy to incorporate into the wheelchair space. Others effects, such as aggressive seat motion, may be extremely difficult to incorporate and may possibly be unsafe. The Board expects that designers will provide the same effects for the wheelchair space as other seats, to the extent possible. An appendix note also recommends that providing companion seats with removable armrests will provide an option for persons using wheelchairs to transfer into the seat in these venues, if desired.

#### *Section 4.1.3(21) Dressing, Fitting, or Locker Rooms*

This section requires that where dressing, fitting, or locker rooms are provided, the rooms must comply with ADAAG 4.35. An exception permits 5 percent, but not less than one, of the rooms to be accessible when they are provided in a cluster.

No substantive comments were received and no changes have been made for the final rule.

#### *Section 4.1.3(22) Saunas and Steam Rooms*

This section requires where saunas and steam rooms are provided, the rooms must comply with ADAAG 4.36. An exception permits 5 percent, but not less than one, of the rooms to be accessible when they are provided in a cluster.

No substantive comments were received and no changes have been made for the final rule.

#### *Section 4.35 Dressing, Fitting, and Locker Rooms*

##### *Section 4.35.1 General*

This section requires dressing, fitting, and locker rooms required to be accessible by ADAAG 4.1 to comply with ADAAG 4.35 and to be on an accessible route.

No substantive comments were received and no changes have been made for the final rule.

##### *Section 4.35.4 Benches in Accessible Dressing Rooms, Fitting Rooms, and Locker Rooms*

This section requires benches complying with ADAAG 4.37 in accessible dressing, fitting, and locker rooms.

No substantive comments were received and no changes have been made for the final rule.

#### *Section 4.36 Saunas and Steam Rooms*

##### *Section 4.36.1 General*

This section requires saunas and steam rooms required to be accessible by ADAAG 4.1 to comply with ADAAG 4.36.

*Comment.* Several commenters questioned whether an operator would be required to provide a heat resistant wheelchair in accessible saunas and steam rooms.

*Response.* The provision of heat resistant chairs is an operational issue and outside the jurisdiction of the Board. Questions regarding the operational issues related to the use of accessible facilities and elements will be addressed by the Department of Justice

when it adopts accessibility standards for recreation facilities.

##### *Section 4.36.2 Wheelchair Turning Space*

This section requires wheelchair turning space complying with ADAAG 4.2.3 to be provided within a sauna or steam room. An exception permits the wheelchair turning space to be obstructed by readily removable seats.

*Comment.* The proposed rule permitted the maneuvering space to be "temporarily" obstructed by readily removable seats. Commenters questioned what would be considered "temporary".

*Response.* The term "temporarily" has been deleted in the final rule. The intent of the provision is to permit a seat or bench to be located within the required maneuvering space within a room, provided that it can be readily removed. The focus of the exception is on the seat being "readily removable" to enable persons using wheelchairs to avail themselves of smaller saunas and steam rooms.

##### *Section 4.36.3 Sauna and Steam Room Bench*

This section requires that where seating is provided in a sauna or steam room, at least one bench complying with ADAAG 4.37 must be provided. An exception permits the clear floor space required by ADAAG 4.37.1 to be obstructed by readily removable seats.

*Comment.* The proposed rule permitted readily removable seats to "temporarily" obstruct the clear floor space and commenters questioned what would be considered "temporary".

*Response.* As discussed above, the term "temporarily" has been deleted in the final rule.

##### *Section 4.36.4 Door Swing*

This section requires that doors shall not swing into any part of the clear floor space required at an accessible bench.

No substantive comments were received and no changes have been made for the final rule.

#### *Section 4.37 Benches*

##### *Section 4.37.1 General*

Benches required to be accessible by 4.1 must comply with 4.37. No substantive comments were received and no changes have been made for the final rule.

##### *Section 4.37.2 Clear Floor or Ground Space*

This section requires clear floor or ground space complying with ADAAG 4.2.4 to be provided and be positioned for a parallel approach to a short end of

a bench seat. An exception permits the clear floor or ground space required by 4.37.2 to be obstructed by readily removable seats in saunas and steam rooms.

No substantive comments were received and no changes have been made to this provision in the final rule.

#### Section 4.37.3 Size

The final rule requires benches to be fixed and have seats that are 20 inches minimum to 24 inches maximum in depth and 42 inches minimum in length.

*Comment.* A few comments questioned whether a portable bench would meet the requirements for accessible benches.

*Response.* This provision has been modified in the final rule to include the term "fixed".

#### Section 4.37.4 Back Support

This section requires benches to have back support that is 42 inches minimum in length and that extends from a point 2 inches maximum above the seat to a point 18 inches minimum above the bench.

*Comment.* The proposed rule included the requirement for back support under ADAAG 4.37.2 (Size). Commenters expressed confusion over the requirements for back support for benches and some questioned whether back support was required.

*Response.* Back support is required for an accessible bench in a sauna or steam room, or a dressing room. To clarify this requirement, the technical provisions that were part of ADAAG 4.37.2 in the proposed rule have been included in a separate provision, ADAAG 4.37.3, in the final rule.

#### Section 4.37.5 Seat Height

This section requires benches to be 17 inches minimum to 19 inches maximum above the floor or ground.

No substantive comments were received and no changes have been made for the final rule.

#### Section 4.37.6 Structural Strength

This section requires that benches be strong enough to withstand a vertical or horizontal force of 250 pounds applied at any point on the seat, fastener, mounting device, or supporting structure.

No substantive comments were received and no changes have been made for the final rule.

#### Section 4.37.7 Wet Locations

This section requires that where installed in wet locations, the surface of benches must be slip-resistant and shall not accumulate water.

No substantive comments were received and no changes have been made for the final rule.

#### Section 10.5 Boat and Ferry Docks

This section is deleted in the final rule.

*Comment.* The proposed rule applied the accessibility guidelines for recreational boating facilities to boat and ferry docks located at transportation facilities, covered by ADAAG Section 10. This section of the proposed rule received little comment.

*Response.* The Board is concerned that those involved in the design and construction of boat and ferry docks may not have been fully aware of the proposed rule and therefore may not have evaluated its impact on such facilities. In addition, through the proposed rule, the Board sought information to establish access provisions for gangways based on the size of vessels using floating piers. Few commenters responded to the question, and none provided the type of information the Board was seeking.

The Board is not addressing commercial boat and ferry docks at transportation facilities at this time. In the future, the Board will consider whether such transportation facilities should be treated differently than recreational boating facilities covered by 15.2. As a result, ADAAG 10.5 has been deleted.

#### Section 15 Recreation Facilities

Section 15 has been added to ADAAG and contains accessibility guidelines for amusement rides, boating facilities, fishing piers and platforms, golf courses, miniature golf courses, exercise equipment and machines, bowling lanes, shooting facilities, and swimming pools and spas. Unless otherwise modified in section 4 or specifically addressed in 15, all other ADAAG provisions apply. For example, special technical provisions have not been included in section 15 for toilet rooms or for accessible parking. In this case, other appropriate provisions in ADAAG 4.22 and ADAAG 4.6 apply. The accessibility guidelines for play areas, which were issued on October 18, 2000 (65 FR 62498) are reprinted in Section 15.

*Comment.* A few commenters suggested that the term "recreation facilities" be defined. They suggested that the lack of definition leaves some doubt about how to apply the provisions in this section. They questioned whether locker rooms for a professional sports team, for example, would be considered a "recreation facility".

*Response.* Recreation facilities is not defined in the final rule. The term is used generally to address the types of elements and facilities covered by this section. The term is inclusive and applies to buildings and facilities designed and constructed for recreation, as well as elements and spaces located in a facility. For example, section 15.7.1 would apply to exercise equipment and machines located in an office building as a part of employee health club. Also, these provisions would apply to locker rooms for professional and other sports teams.

#### Section 15.1 Amusement Rides

Significant comment on amusement ride accessibility was received on the proposed rule. The proposed rule would have required that one wheelchair space and one transfer seat be provided for each 100 seats on new amusement rides and proposed technical provisions for the wheelchair spaces and transfer seats. The majority of comments were from amusement park operators, and amusement ride manufacturers and designers. The Board also received comments from groups representing persons with disabilities.

Overall, commenters did not support the provisions in the proposed rule for access to amusement rides. The commenters stated that the proposed rule lacked flexibility, making it impossible for most rides to comply with the guidelines given the uniqueness of this industry. They also raised concern about the lack of available manufactured rides that would meet the proposed provisions. Most rides are manufactured outside the United States where there is an absence of accessibility requirements. The ride manufacturers in the United States indicated significant hardship on their businesses to retool to meet some of the proposed technical provisions. Amusement park operators interpreted the proposed rule to require operators to modify manufactured rides. Most indicated that they were either unwilling or unable to modify a ride in a way that would differ from the manufacturer's specifications because they were not willing to accept the liability associated with modifying the ride or did not have sufficient engineering expertise to do so.

Additionally, several groups representing persons with disabilities expressed concern that some rides, such as walk through attractions and fun houses, would be exempt along with rides in traveling carnivals. They wanted the accessibility guidelines to encourage ride manufacturers to make all rides accessible. The Eastern

Paralyzed Veterans Association (EPVA) wanted the number of accessible amusement rides to be doubled from the proposed rule.

Because of these comments, the Board held several information meetings with representatives from the amusement industry and others to gather additional information. Site visits were also made to several amusement parks to better understand the issues raised. The information gained from these meetings and site visits have shaped the amusement ride section of the final rule.

Based on this information, the final rule differs significantly from the proposed rule. The final rule makes major changes in the number of accessible spaces per ride and in the options for providing access. It also includes different requirements for wheelchair spaces and for ride seats designed for individuals to transfer from their wheelchair or other mobility device. The final rule provides the flexibility requested by commenters in this unique environment, while still providing a high level of accessibility to persons with disabilities.

Since this is the first time national accessibility guidelines have been established for amusement rides, the Board intends to monitor the implementation of these guidelines. As with other accessibility guidelines developed by the Board, future updates and revisions are planned to ensure that the guidelines reflect new designs and technology.

### Section 3.5 Definitions

Three terms are defined for amusement rides.

An "amusement ride" is a system that moves persons through a fixed course within a defined area for the purpose of amusement. Editorial changes are made in the final rule to be consistent with terms used within the amusement industry.

*Comment.* A few commenters questioned whether this section would apply to a ski lift, tram, or a gondola. Trams and gondolas are provided at some amusement parks.

*Response.* Section 15.1 is not intended to apply to ski lifts, trams, or gondolas. These devices are designed primarily for the purpose of transporting people from one point to another. While a ride on a ski lift or tram may be enjoyable, it is not designed primarily for the "purpose of amusement". Trams and similar vehicles are already addressed in the ADA Accessibility Guidelines for Transportation Vehicles (Vehicle Guidelines). See 36 CFR 1192.179.

An "amusement ride seat" is defined as a seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers. This is a new term which has been added to the final rule.

"Amusement ride seats" are referenced in several of the technical provisions.

*Comment.* The proposed rule did not include the term "amusement ride seat." Several commenters including those representing the International Association of Amusement Parks and Attractions (IAAPA) questioned the differences between the transfer seat and the amusement ride seat in the proposed rule. Questions were also raised about the application of the guidelines to rides without seats or those designed with a variety of riding postures, such as toboggan style.

*Response.* A definition for amusement ride seats is added to the final rule. The Board intends the guidelines to apply to amusement rides with seats. Specific technical provisions included in this section address clear floor or ground space and maneuvering space requirements for amusement ride seats where transfer access is provided. Technical provisions focus on ensuring that people can transfer from their wheelchairs or mobility aids to the ride seats. With respect to the various riding postures, the Board intends these guidelines to apply to those amusement rides with ride seats, including toboggan style, but not to those amusement rides where the rider is expected to be in the prone position or standing. In these cases, however, an accessible route complying with ADAAG 4.3 is required to the load and unload area.

A "transfer device" is defined as equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat. Several new scoping and technical provisions included in the final rule specify a "transfer device." An appendix note provides additional information on available transfer devices, including ways to provide equipment that will provide for a safe and independent transfer from a wheelchair or other mobility device.

### Section 15.1.1 General

Newly designed or newly constructed and altered amusement rides are required to comply with 15.1.1. Four exceptions are included in the final rule. Under Exception 1, portable or mobile amusement rides are not covered by the guidelines. Exceptions 2, 3, and 4 clarify that amusement rides that are controlled or operated by the rider; amusement rides designed primarily for

children, where children are assisted on and off the ride by an adult; and amusement rides without amusement ride seats are only required to comply with 15.1.4 and 15.1.5, which requires an accessible route to and maneuvering space in the load and unload areas.

*Comment.* Amusement park operators requested clarification regarding how the guidelines apply to existing rides.

*Response.* As previously mentioned, the final rule is significantly different from the proposed rule. The term "new" is included in 15.1.1 to clarify that this section applies to "new" rides and not to existing rides. The Department of Justice has the rulemaking authority to address existing rides.

A custom manufactured ride is new upon its "first use", which is the first time amusement park patrons take the ride. With respect to amusement rides purchased from other entities, "new" refers to the first permanent installation of a ride, whether the ride is used "off the shelf" or is modified before it is installed. The application of these guidelines to existing amusement rides that are altered is discussed elsewhere in this preamble. The final rule provides operators with the requested flexibility. Providing opportunities for access for persons with disabilities may be accomplished under the final rule without modifying the ride itself.

*Comment.* The preamble of the proposed rule explained that the guidelines applied to permanent amusement rides with fixed seats that are set up for a long duration and are not regularly assembled and disassembled. Amusement rides set up for short periods of time such as rides that are part of traveling carnivals, State and county fairs, festivals, and other special events are not addressed by these guidelines. The majority of amusement ride manufacturers supported this approach and considered it appropriate given the uniqueness of these rides. However, the commenters were concerned that the proposed rule did not specifically exempt temporary rides. Others suggested that a time frame be attached to this concept of "temporary" to clarify specifically what is meant. They suggested a 90 day or less time frame be used to define how long such rides can operate at the same location. Several groups representing persons with disabilities believed that temporary rides should also be accessible. They believed that manufacturers should be encouraged to make temporary rides as accessible as permanent rides.

*Response.* Exception 1 is added to specify that mobile or portable amusement rides are not covered by

15.1. The Department of Justice is authorized to determine the applicable requirement for these rides.

While mobile rides are not specifically addressed by these guidelines, other ADA requirements including general nondiscrimination obligations, program accessibility, and barrier removal provisions of the ADA apply to covered entities operating mobile or portable amusement rides. Mobile amusement rides are subject to a variety of site conditions that affect the load and unload areas. Because the rides are transported over the road, their size and weight is also restricted. This can limit the size available for the load and unload areas along with the accessible route to the ride.

Ride operators and manufacturers are encouraged to apply the provisions of this section to mobile amusement rides, where possible. Mobile rides are available that provide roll-on access and others may be close to providing transfer access with some minor adaptations in the load and unload areas. The Board will, upon request, work with interested manufacturers to provide guidance on providing either roll-on access or transfer access for someone using a wheelchair or mobility device.

#### *Exception 2*

*Comment.* The proposed rule excluded from the definition of amusement rides, those rides which are controlled or operated by the rider such as bumper cars and go-carts. A few commenters suggested that these types of rides also be addressed by this section. Several commenters requested guidance on whether making a ride turn faster or shake faster would be considered "control".

*Response.* An exception has been added to the final rule for rides that are controlled by the rider requiring such rides to only provide an accessible route to the ride and maneuvering space in the load and unload areas. The Board plans to gather additional information for making these rides accessible for potential rulemaking in the future. In the interim, designers and operators may use the applicable provisions in ADAAG and this final rule as a guide in providing access.

With respect to the issue of control, the exception is not intended to apply to those rides where patrons may affect some incidental movements of the ride, but otherwise have no control.

#### *Exception 3*

*Comment.* The proposed rule did not distinguish between those rides designed for adults and those designed

for young children, also known as "kiddie rides." Many amusement park operators and ride manufacturers commented that "kiddie rides" should be exempt from compliance with the provisions of 15.1.1. Most indicated that size restrictions will prohibit compliance with several of the provisions.

*Response.* Because of their size restrictions, an exception has been added to the final rule for "kiddie" rides requiring such rides to only provide an accessible route to and maneuvering space in the load and unload area. The requirement for an accessible route will provide access for adults and family members assisting children on and off these rides. An amusement industry definition for "kiddie rides" includes rides designed for children up to the age of 12. The Board does not support an exemption for rides designed for children up to age 12. Rather, the exception is limited to those rides designed "primarily" for children, where children are assisted on and off the ride by an adult. The Board intends that this exception be limited to those rides designed for children and not for the occasional adult user.

#### *Exception 4*

*Comment.* Some commenters interpreted the proposed rule to apply to amusement rides without seats.

*Response.* Section 15.1 of the proposed rule limited the application of this section to rides "containing fixed seats". Exception 4 is added in the final rule to further clarify that 15.1 does not apply to amusement rides without ride seats. Amusement rides without seats are required to be served by an accessible route and connect to accessible load and unload areas.

#### *Section 15.1.2 Alterations to Amusement Rides*

Section 15.1 applies to amusement rides that are altered. This section clarifies that a modification to an existing amusement ride is an alteration if one or more of the following conditions apply: (1) The amusement ride's structural or operation characteristics are changed to the extent that the ride's performance differs from that specified by the manufacturer or the original design criteria; or (2) the load and unload area of the amusement ride is newly designed and constructed.

*Comment.* The majority of commenters questioned how the proposed rule applied to existing amusement rides. Many commenters believed that the guidelines require that all existing amusement rides be accessible. Others inquired about the

requirements for existing rides that are modified and the type of modification that would trigger the alteration provisions.

*Response.* The final rule addresses alterations to existing amusement rides. See the discussion at the beginning of this preamble for further information on ADA obligations for existing amusement rides.

Where an existing amusement ride is modified in a way that does not change the ride's structural or operational characteristics to the extent that the ride's performance differs from that specified by the manufacturer's or original design criteria, the amusement ride is not required to comply with 15.1.1. Routine maintenance, painting, and changing of story boards are examples of activities that do not constitute an alteration.

As with other elements or facilities subject to the alterations provisions in ADAAG, "technical infeasibility" applies to alterations of amusement rides. In this case, compliance with the technical provisions is required except where the nature of the existing ride makes it virtually impossible to comply fully. In these circumstances, the alteration should provide the maximum accessibility feasible.

*Comment.* Commenters requested clarification regarding how the guidelines apply where amusement rides are moved.

*Response.* In response to this question, a provision has been added that requires a ride to be accessible when a new load and unload area is designed and constructed for the ride. This provision applies where a ride is moved either within a park or to another park and a new load and unload area is designed and constructed. The ride must comply with 15.1.1. Operators have a choice of providing either a wheelchair space, ride a seat designed for transfer, or a transfer device. In most cases with an existing amusement ride, providing a transfer device may be the most appropriate. This option does not require modification to the ride. Where an amusement ride is moved and the load and unload area is not modified, the provisions of 15.1.1 do not apply. In this case, the on-going obligations of "readily achievable barrier removal" or "program accessibility" will apply.

#### *Section 15.1.3 Number Required*

This section requires each amusement ride to provide at least one wheelchair space complying with 15.1.7, or at least one amusement ride seat designed for transfer complying with 15.1.8, or at least one transfer device complying with 15.1.9.

*Comment.* The proposed rule required one wheelchair space per 100 fixed seats and one transfer seat per 100 fixed seats to be provided on each amusement ride. An exception permitted two transfer seats in lieu of a wheelchair space where a wheelchair space is not operationally or structurally feasible. Significant comment was received on this provision during the comment period. Amusement park operators stated that the number of accessible spaces (both wheelchair and transfer seats) was too high. Several amusement park operators cited safety concerns with respect to evacuation where more than one wheelchair user may be on a ride at one time. Others expressed concern about lengthening the load and unload time. Groups representing persons with disabilities were concerned that the number of wheelchair spaces and transfer seats in the proposed rule was too low. The Eastern Paralyzed Veterans Association (EPVA) wanted the number doubled from the proposed rule, potentially requiring two wheelchair spaces and two transfer seats per ride.

*Response.* The final rule requires that each ride provide: (1) A wheelchair space, or (2) a ride seat designed for transfer, or (3) a device to facilitate the transfer of a person in a wheelchair from the load or unload area to a ride seat. This represents a decrease in the number of accessible spaces from the proposed rule and is no longer dependent on the number of seats per ride. Designers and operators have the choice of deciding which of the three types of access is appropriate for a given ride. Where a manufactured ride does not permit space for a wheelchair, for example, a ride seat designed for transfer or a transfer device may be provided to help an individual transfer into the ride seat.

The Board is aware of amusement rides in certain parks that currently exceed this minimum and provide more than one wheelchair space on a given ride. In these cases, more persons with disabilities and their families are able to ride at the same time. Amusement park operators are encouraged to exceed the minimum with their new rides.

#### Section 15.1.4 Accessible Route

This section requires that, when in the load and unload position, amusement rides with wheelchair spaces, or ride seats designed for transfer, or transfer devices, must be served by an accessible route complying with ADAAG 4.3. Any part of an accessible route serving amusement rides with a slope greater than 1:20 is considered a ramp and must comply

with ADAAG 4.8. The accessible route is required only to the wheelchair space or transfer loading station, and not to all stations. This route can deviate from the main route in order to access the particular station designated.

Three new exceptions to 15.1.4 are provided in the final rule. Exception 1 exempts ramps from the maximum slope specified in ADAAG 4.8.2, where compliance with 4.8.2 is structurally or operationally infeasible, provided that the slope of the ramp may not exceed 1:8. Exception 2 exempts the requirements for handrails on the accessible route where compliance is structurally or operationally infeasible. Exception 3 permits that use of limited-use/limited-application elevators and platform lifts complying with ADAAG 4.11 to be part of an accessible route serving the load and unload area.

*Comment.* The proposed rule required an accessible route to connect the portion of the load and unload area serving each accessible amusement ride and to provide a maneuvering space with a slope not greater than 1:48. Commenters questioned whether the 1:48 slope applied to the accessible route on the ride and the appropriateness of this requirement for those rides where a transfer seat was provided.

*Response.* The requirements for an accessible route are maintained in the final rule, but are modified to clarify that at least one accessible route requirement applies when the ride is in the load and unload position. The requirement for a maneuvering space is moved to 15.1.4, which addresses the load and unload areas. The provision also clarifies that where the running slope serving the amusement ride or transfer devices is greater than 1:20, the provisions of ADAAG 4.8 apply.

*Comment.* Operators expressed concerns with the requirements of ADAAG 4.8 with respect to the maximum slope (1:12) and the maximum rise (30 inches) for the accessible route. They described rides where space limitations will prohibit long ramps and where fundamental changes to amusement rides would be necessary to comply with ADAAG 4.8.2.

*Response.* An exception is added in the final rule that exempts the accessible route serving accessible rides from the maximum slope specified in ADAAG 4.8.2, provided that the slope may not exceed 1:8. The exemption only applies where compliance with ADAAG 4.8.2 is "structurally or operationally" infeasible. The exception for structural or operational limitations is limited to that portion of the accessible route connecting the load and unload areas

with the amusement ride. There is no exception for other portions of the accessible route, such as the queue line leading to the load and unload areas.

*Comment.* Ride operators and designers also stated that the requirement for handrails was not practical on the portion of the accessible route connecting the load and unload areas and the ride. They again cited space limitations especially where ramps are integrated into the ride and folded out of the way when the ride is in use.

*Response.* An exception from the requirement for handrails is added in the final rule. Similar to exception 2, this exception is limited to circumstances where compliance with the handrail requirement is structurally or operationally infeasible.

*Comment.* The proposed rule did not include a provision permitting the use of a limited-use/limited-application elevator or a platform lift as a part of the accessible route in providing access to load and unload areas. The American Institute of Architects (AIA) and others in the amusement industry recommended their use in connecting these areas, especially in connecting elevated load and unload areas and those that cross tracks.

*Response.* An exception is provided in the final rule permitting the use of limited-use/limited-application elevators and platform lifts complying with ADAAG 4.11. The Board has included this option in the final rule to address some of the unique designs and elevated loading areas used within an amusement park. Where platform lifts are used, they must comply with ADAAG 4.11. Future revisions to ADAAG will include technical provisions for limited-use/limited-application elevators. At that time, appropriate provisions will be referenced for these elevators. Currently available design and safety standards should be applied in the interim.

*Comment.* Some commenters questioned whether moving turnstiles and walkways can serve as part of an accessible route connecting amusement rides.

*Response.* The Board has not specifically addressed moving turnstiles and walkways, since they are always capable of stopping or slowing to accommodate guests needing additional time. At this time there is not sufficient information to suggest a consistent safe speed for use for all persons with disabilities. Some individuals will be able to maneuver within the speed and time provided on the moving walkway or turnstile, while others will need additional time. Operators may need to

adjust the speed accordingly to reasonably accommodate guests with disabilities.

#### *Section 15.1.5 Load and Unload Areas*

This section requires load and unload areas serving amusement rides required to comply with 15.1 to provide a maneuvering space complying with ADAAG 4.2.3. The maneuvering space must have a slope not steeper than 1:48. The maneuvering space is permitted to overlap the accessible route and the required clear floor spaces.

No substantive comment was received and no changes have been made for the final rule.

#### *Section 15.1.6 Signage*

This section requires signage to be provided at the entrance of the queue or waiting line for each amusement ride to identify the type of access provided (e.g., wheelchair access or transfer access). Where an accessible unload area also serves as the accessible load area, signage must be provided at the entrance to the queue or waiting line indicating the location of the accessible load and unload area. This is important to avoid unnecessary backtracking when patrons begin the process of waiting in line for a particular ride. No substantive comments were received and no changes have been made to this provision in the final rule.

#### *Section 15.1.7 Amusement Rides With Wheelchair Spaces*

This section contains technical provisions for amusement rides with wheelchair spaces.

*Comment.* Several amusement ride designers and manufacturers raised concerns about technical provisions for wheelchair spaces on amusement rides. Most commenters believed that the space required was too large and boxy, and would significantly limit the number of amusement rides that could incorporate such a space. Some recommended that knee and toe clearances be incorporated into the space. In general, designers and operators requested more flexibility with wheelchair spaces on amusement rides.

*Response.* The Board has significantly modified the requirements for wheelchair spaces on amusement rides. The final rule includes changes which address the commenters concerns, while still requiring a minimum space that would serve most mobility devices on an amusement ride. The Board recommends that where possible, designers and manufacturers exceed the minimum space. Providing additional space will greatly enhance the ease in

loading and unloading and accommodate a greater variety of mobility devices.

#### *Section 15.1.7.1 Floor and Ground Surface*

This section contains technical provisions for floor or ground surface of wheelchair spaces.

*Comment.* The proposed rule required wheelchair spaces to comply with several provisions of ADAAG 4.5 (4.5.1, 4.5.3, 4.5.4). Commenters expressed some confusion over these references and sought clarification.

*Response.* Rather than referencing ADAAG 4.5, the final rule incorporates these provisions into 15.1.7.1 for clarity. Other editorial changes are also made within this section.

##### *Section 15.1.7.1.1 Slope*

This section requires the floor or ground surface of wheelchair spaces to have a maximum slope of 1:48 when in the load and unload position and to be firm and stable.

*Comment.* Commenters questioned the appropriateness of requiring the clear space to be level when the amusement ride is in motion.

*Response.* The section is modified to clarify that the maximum 1:48 slope is only required when the amusement ride is in the load and unload position.

##### *Section 15.1.7.1.2 Gaps*

This section requires floors of amusement rides with wheelchair spaces and floors of load and unload areas to be coordinated so that when the amusement rides are at rest in the load and unload position, the vertical difference between the floors must be within plus or minus  $\frac{5}{8}$  inches and the horizontal gap should be no greater than 3 inches under normal passenger load conditions. An exception permits that where it is not operationally or structurally feasible to meet the horizontal or vertical difference requirements, ramps, bridge plates, or similar devices complying with the applicable requirements of 36 CFR 1192.83(c) (the Board's vehicle accessibility guidelines) must be provided.

*Comment.* No substantive comment was received on this section. Several representatives from the amusement industry, however, recommended that the Board reference an ASTM Standard Practice for the Design and Manufacture of Amusement Rides and Devices where ramps, bridge plates, lifts, or similar devices are used.

*Response.* The Board carefully examined the suggested ASTM Standard Practice and determined that it was

designed as a safety standard rather than a standard that provides guidance on the minimum access requirements for ramps, bridge plates, lifts, and similar devices. Operators and manufacturers are not precluded from also following the standards in the ASTM Standard Practice for the operation of these elements. The applicable requirements of 36 CFR 1192.83(c) (ADA Accessibility Guidelines for Transportation Vehicles—Light Rail Vehicles and Systems—Mobility Aid Accessibility) are available on the Board's Web site at [www.access-board.gov/transit/html/vguide.htm#LRVM](http://www.access-board.gov/transit/html/vguide.htm#LRVM).

#### *Section 15.1.7.2 Clearances*

This section requires clearances for wheelchair spaces to comply with 15.1.7.2. Three new exceptions are added. Exception 1 permits securement devices, where provided, to overlap the required clearances of the wheelchair space. Exception 2 permits the wheelchair space to be mechanically or manually repositioned. Exception 3 permits departure from the requirements of ADAAG 4.4.2 (Head Room) for the wheelchair space.

*Comment.* The proposed rule did not specifically address securement devices in wheelchair spaces. Commenters questioned whether securement devices could be located within the minimum clear space requirements for wheelchair spaces on amusement rides. They noted that while the proposed rule did not specifically address or require these devices, many operators have provided them where wheelchair spaces are provided on amusement rides.

*Response.* The final rule adds an exception to 15.1.7.2 to permit securement devices to overlap required clearances for wheelchair spaces on amusement rides. However, the final rule does not require securement devices. The decision about whether securement devices are needed is left up to the designer or manufacturer. Where provided, these devices may overlap the required clearances for wheelchair spaces.

*Comment.* As previously discussed, the Board received a significant number of comments from representatives in the amusement industry on the need for more flexibility. Several operators of large parks demonstrated ways that wheelchair spaces were provided on rides through the use of a turntable. This permits the space to be orientated for a forward approach and later turned to be in line with the direction of the motion of the amusement ride. Commenters did not consider repositioning to be an option under the proposed rule.

*Response.* Exception 2 has been added to the final rule and permits the wheelchair space on an amusement ride to be either manually or mechanically repositioned.

*Comment.* A few amusement park designers raised concern about the head clearance requirements of ADAAG 4.4 (Protruding Objects) for the wheelchair space located on an amusement ride. Amusement rides are often designed to move through confined spaces in order to enhance the amusement experience. Since most of these rides are designed for seated patrons, designers requested exemption from this requirement.

*Response.* Exception 3 is added in the final rule and exempts wheelchair spaces on rides from ADAAG 4.4.2 (Head Room). This exception applies to circulation space and clear space requirements on the ride. It does not apply to circulation areas and accessible routes in the queue line or the load and unload areas.

#### *Section 15.1.7.2.1 Width and Length*

This section requires wheelchair spaces to have a width of 30 inches minimum and a length of 48 inches minimum measured 9 inches minimum above the ground or floor surface.

*Comment.* The proposed rule required the wheelchair space to be a minimum of 36 inches in width. This width was based on the minimum 30 inch width needed for a stationary wheelchair with the additional 6 inches necessary for repositioning in confined spaces which allows space for the front casters of a wheelchair to turn and move when backing up. Designers expressed significant concern over the 36 minimum width and questioned why it was necessary where the space is reached in a forward direction. They further cited designs where the space is manually or mechanically repositioned and therefore should not require further maneuvering. Some commenters also suggested that the depth of the clear space could be 48 inches in all cases.

*Response.* The minimum width of the wheelchair space is reduced to 30 inches in the final rule. While the Board has decreased the minimum width, it recommends that designers and manufacturers exceed the minimum where possible to allow for increased maneuvering space.

#### *Section 15.1.7.2.2 Wheelchair Spaces—Side Entry*

This section requires that where the wheelchair space can be entered only from the side, the ride must be designed to permit sufficient maneuvering space for individuals using a wheelchair or

mobility device to enter and exit the ride.

*Comment.* A few commenters questioned what the minimum space requirements would be for a ride entered from the side. They questioned whether a 32 inch side opening leading to a 30 inch wide by 48 inch long space would be sufficient.

*Response.* Section 15.1.7.2.2 is added to address rides with side entries. A center opening of 32 inches combined with a minimum space of 30 inches wide and 48 inches long is not adequate space for maneuvering. Designers must consider the position of the opening in relation to the minimum space. In some cases, additional clear space and larger openings will be necessary to allow for maneuvering a wheelchair on the ride. An appendix note is included to provide further guidance.

#### *Section 15.1.7.2.3 Protrusions in Wheelchair Space*

This section permits protrusions in the wheelchair spaces on amusement rides. Objects are permitted to protrude a distance of 6 inches maximum along the front of the wheelchair space where located 9 inches minimum and 27 inches maximum above the wheelchair space. Objects are also permitted to protrude a distance of 25 inches maximum along the front of the wheelchair space where located more than 27 inches above the wheelchair space.

*Comment.* As previously noted, amusement ride designers and operators commented that the wheelchair space clearances in the proposed rule were too restrictive and did not permit knee and toe clearances. They suggested that the clearances could be reduced without compromising the minimum space requirements.

*Response.* The final rule permits protrusions in the wheelchair space on amusement rides.

#### *Section 15.1.7.3 Openings*

This section requires that where openings are provided to access wheelchair spaces on amusement rides, the entry must provide a 32 inch minimum clear opening.

*Comment.* The proposed rule did not specify a minimum opening space where wheelchair spaces are provided on amusement rides. Commenters requested guidance on this dimension.

*Response.* A provision is added in the final rule to address the minimum width of openings where wheelchair spaces are provided on an amusement ride. This is consistent with minimum width requirements for doors and other

passageways that are part of an accessible route.

#### *Section 15.1.7.4 Approach*

This section requires one side of the wheelchair space to adjoin an accessible route.

No substantive comment was received on this provision.

#### *Section 15.1.7.5 Companion Seats*

This section requires that where the interior of an amusement ride is greater than 53 inches in width, seating is provided for more than one rider, and the wheelchair is not required to be centered within the amusement ride, a companion seat must be provided for each wheelchair space.

*Comment.* The proposed rule required companion seating where seating for more than one rider is provided. Ride manufacturers commented that providing companion seating may not be possible on rides where the center of gravity is critical to its operation. They noted that providing space for an individual seated in a wheelchair and a seated companion may increase and change the weight distribution on a ride. They supported a provision with limits that are linked to the minimum width of the ride, whether or not seating is provided for more than one rider, and whether the wheelchair space is centered on the ride.

*Response.* This section is modified in the final rule to address the concerns raised. Consistent with the proposed rule, companion seating is required only where seating is provided for more than one rider. Additionally, companion seating is required only where the interior of an amusement ride is greater than 53 inches in width and the wheelchair is not required to be centered within the amusement ride.

#### *Section 15.1.7.5.1 Shoulder-to-Shoulder Seating*

This section requires that where an amusement ride provides shoulder-to-shoulder seating, companion seats must be shoulder-to-shoulder with the adjacent wheelchair space.

*Comment.* Commenters suggested that in some circumstances, shoulder-to-shoulder seating may not be possible. They cited examples of water rides where the rider's center of gravity is critical. Adding two riders side by side can alter the balance of the ride.

*Response.* An exception is added in the final rule that shoulder-to-shoulder companion seating is required only to the maximum extent feasible, where compliance is not operationally or structurally feasible.

### *Section 15.1.8 Amusement Ride Seats Designed for Transfer*

This section requires that amusement rides with ride seats designed for transfer must comply with 15.1.8 when positioned for loading and unloading.

*Comment.* Significant comment was received on the technical provisions addressing transfer seats. Some interpreted the proposed rule to require a "special seat" in addition to other ride seats. Others believed that the technical provisions did not provide sufficient flexibility, especially given the diversity of rides and ride seats.

*Response.* The final rule requires that each ride provide: (1) A wheelchair space, or (2) an amusement ride seat designed for transfer, or (3) a system to facilitate the transfer of a person in a wheelchair from the load or unload area to a ride seat. Where ride seats are designed for transfer, this section applies. For the most part, the technical provisions for space and other features are applied to both the ride seat and the transfer device since both elements are designed for an individual to transfer from their wheelchair or mobility device to an element. A ride seat designed for transfer is usually a seat that is a permanent part of the ride itself.

#### *Section 15.1.8.1 Clear Floor Space*

This section requires clear floor space complying with ADAAG 4.2.4 to be provided in the load and unload area adjacent to amusement ride seats designed for transfer.

*Comment.* The proposed rule required the clear floor space to comply with ADAAG 4.2.4 and be positioned with the longer dimension parallel to the unobstructed side of the transfer seat. The space was also required to be located within 3 inches maximum of the transfer seat. Commenters supported the basic clear floor space requirement of 30 inches by 48 inches. Several commenters however, believed that the requirements for the orientation of the clear space were too stringent for two reasons. First, the orientation required in the proposed rule was potentially limited to a side transfer. Many individuals choose to transfer using a diagonal or front approach. Second, they were concerned about the variety of amusement rides and load and unload areas. They recommended that the orientation of the clear space with respect to its location to the ride seat be left up to the designer.

*Response.* The final rule requires a 30 inch wide by 48 inch deep clear space to be adjacent to the ride seat designed for transfer. The position of the clear space is not specified in the final rule.

Designers will decide its location based on what is best suited for transfer on a particular ride.

#### *Section 15.1.8.2 Transfer Height*

This section requires the height of ride transfer seats to be located 14 inches minimum to 24 inches maximum measured above the load and unload surface.

*Comment.* The proposed rule required the transfer seat to be between 17 and 19 inches based on other elements within ADAAG where individuals using wheelchairs and other mobility devices are expected to transfer. Commenters requested the range to be greater.

*Response.* The final rule provides a greater range in the height of the ride seat designed for transfer. Providing a greater range in this height should reduce reliance on transfer devices and have the effect of decreasing the number of transfers to get from one's wheelchair or mobility device to a ride seat. The Board recognizes that amusement rides have unique designs. The increase in the transfer height range is limited to amusement rides because of their unique designs. The goal is to provide designs that afford the least amount of transfers for the least amount of distance. The Board recognizes that providing a greater range in the transfer height may make transfers more difficult for some people with disabilities. Based on this concern, and the fact that the transfer height for amusement rides is new, the Board will closely monitor how well the range provides access to amusement rides. Where possible, designers are encouraged to locate the transfer seat between 17 inches and 19 inches above the load and unload surface.

#### *Section 15.1.8.3 Transfer Entry*

This section requires that where openings are provided to transfer to amusement ride seats, the space must be designed to provide clearance for transfer from a wheelchair or other mobility device to the amusement ride seat.

*Comment.* The proposed rule required the transfer entry on the amusement ride to be a minimum of 36 inches wide. The entry was also required to be positioned parallel and adjacent to the longer dimension of the clear floor space. Amusement ride designers and manufacturers commented that the 36 inch width was excessive and believed that few rides, if any, could comply with this dimension. They further explained that openings are generally kept to a minimum since the sides of the ride often serve as a part of the restraint or securement system for the ride.

*Response.* Due to the large variance of amusement rides and the potential interference with the securement system, the final rule requires a space to be designed to provide clearance for transfer from a wheelchair or mobility device to the amusement ride seat. Specific dimensions for the opening are not provided in the final rule.

#### *Section 15.1.8.4 Wheelchair Storage Space*

This section requires wheelchair storage spaces complying with ADAAG 4.2.4 to be provided in or adjacent to unload areas for each required amusement ride seat designed for transfer. The space must not overlap any required means of egress or accessible route.

*Comment.* Some commenters interpreted the provision to require some type of constructed storage space.

*Response.* Clear space is needed in the load and unload areas for individuals to leave their wheelchairs when they transfer onto amusement rides. ADAAG 4.2.4 specifies a minimum 30 inch by 48 inch space for a stationary wheelchair. For safety reasons, the space must not overlap any required means of egress or accessible route. This provision does not require a constructed element for storage, only a space. Most current designs used for load and unload areas will include sufficient space to comply with this provision.

#### *Section 15.1.9 Transfer Devices for Use With Amusement Rides*

This section requires that transfer devices for use with amusement rides must comply with 15.1.9 when positioned for loading and unloading.

*Comment.* As previously discussed, significant comment was received on the technical provisions addressing transfer seats. Some interpreted the proposed rule to require a "special seat" in addition to other ride seats. Others believed that the technical provisions did not provide sufficient flexibility, especially given the diversity of rides and ride seats.

*Response.* The final rule requires that each ride provide: (1) A wheelchair space, or (2) an amusement ride seat designed for transfer, or (3) a system to facilitate transfer of a person in a wheelchair from the load or unload area to a ride seat. This section applies where transfer devices are used to provide access to an amusement ride seat. A transfer device can be provided as an integral part of the ride, or as a permanent or temporary part of the facility. Significant flexibility is provided for ride designers or park

operators to develop these transfer devices. Transfer devices may include lifts, ramps, transfer platforms and steps, or other similar systems and do not require modification to manufactured rides. Information is provided in the appendix to assist operators in selecting from different types of transfer devices.

#### Section 15.1.9.1 Clear Floor Space

This section requires clear floor space complying with ADAAG 4.2.4 to be provided in the load and unload area adjacent to transfer devices.

Consistent with the clear space requirement for ride seats designed for transfer, the position of the clear space adjacent to the transfer devices is not specified in the final rule. Designers will decide its location based on what is best suited for transfer on a particular transfer device.

#### Section 15.1.9.2 Transfer Height

This section requires the height of transfer device seats to be located 14 inches minimum to 24 inches maximum measured above the load and unload surface.

The Board has applied the same range established for amusement ride seats designed for transfer to transfer devices. As previously stated, the goal is to provide designs that afford the least amount of transfers for the least amount of distance.

Where possible, designers are encouraged to locate the transfer device between 17 inches and 19 inches above the load and unload surface. Further guidance related to maximum heights for vertical movements when transferring within a transfer device is provided in the appendix.

#### Section 15.1.9.3 Wheelchair Storage Space

This section requires wheelchair storage spaces complying with ADAAG 4.2.4 to be provided in or adjacent to unload areas for each required transfer device and must not overlap any required means of egress or accessible route.

*Comment.* Some commenters interpreted the provision to require some type of constructed storage space.

*Response.* Clear space is needed in the load and unload areas for individuals to leave their wheelchairs when they transfer onto transfer devices. ADAAG 4.2.4 specifies a minimum 30 inch by 48 inch space for a stationary wheelchair. For safety reasons, the space must not overlap any required means of egress or accessible route. This provision does not require a constructed element for storage, only a

space. Most current designs used for load and unload areas will include sufficient space to comply with this provision.

#### Other Issues

##### Accessible Routes in Temporary Places of Amusement

*Comment.* The proposed rule requested comment on providing accessible routes on sites used for fairs, carnivals, and other temporary places of amusement. Usually a site such as a field or parking lot may be used for a short period of time for temporary places of amusement.

*Response.* The Board received few comments on this issue. The final rule does not include any provisions for accessible routes in temporary places of amusement. The Department of Justice has the authority to address this issue. Given the diversity of sites and complexity of agreements involved when using sites on a temporary basis, one set of guidelines is not practical. State and local government entities covered by title II may not, in determining the site or location of a facility, make selections that have the effect of excluding individuals with disabilities (28 CFR 35.130(b)(4)). Where a site is altered by installing some type of surface, that surface must be stable, firm, and slip resistant and meet other requirements in ADAAG 4.3 for the accessible route. Temporary structures are covered by ADAAG 4.1.1(4) and are required to comply with ADAAG. As with other alterations, "technical infeasibility" permits departure from technical provisions where existing physical or site constraints prohibit modification or addition of elements, spaces, or features.

#### Section 15.2 Boating Facilities

##### Section 3.5 Definitions

This section defines five terms for boating facilities.

A "boat launch ramp" is a sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.

A "boat slip" is that portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.

A "boarding pier" is a portion of a pier where a boat is temporarily secured for purposes of embarking and disembarking.

A "gangway" is a variable-sloped pedestrian walkway linking a fixed structure or land with a floating structure. This definition does not apply to gangways which connect to vessels.

A "transition plate" is a sloping pedestrian walking surface located at the end(s) of a gangway.

*Comment.* The proposed rule included definitions for boat launch ramp, boat slip, design high point, and gangway. Commenters recommended rewording these definitions. Commenters also recommended that additional definitions be added, such as handrail, landings, pier, main pier, finger pier, boarding pier, fixed and floating piers, mooring space, transient slips, and transition plate.

*Response.* The final rule provides five definitions. Definitions for boat launch ramp, boat slip, and gangway, have been retained but have been changed to improve clarity. Definitions for boarding pier and transition plate have been added, and the definition for design high point has been removed. Additional terms suggested by commenters were not added since they were not used in the technical or scoping provisions of the boating section.

##### Section 15.2.1 General

This section requires newly designed or newly constructed and altered boating facilities to comply with 15.2.

*Comment.* Some commenters did not want the rule to apply to each boating facility. They noted that designers and facility managers needed flexibility to provide reasonable accommodations in an environment which may contain extreme physical conditions. Several commenters requested that where two or more boating facilities are located within 10 miles of each other, only one facility should be accessible. Other commenters assumed that all existing facilities would have to immediately conform to the final rule.

*Response.* These guidelines apply to each newly designed or newly constructed boating facilities. Altered facilities must conform to the guidelines to the degree required by ADAAG 4.1.6. Where an existing facility is not being altered, the guidelines do not require that alterations be performed.

*Comment.* Commenters requested clarification on the term "recreational boating facility."

*Response.* This section primarily applies to piers and docks typically found at marinas where recreational boats are moored for embarking and disembarking occupants, but will apply in other non-marina settings. Where a vessel is primarily used for recreation, generally piers and docks designed and constructed to provide mooring and other services for such vessels would be covered by this section. Recreational boats range in size from small canoes to

large sailboats and power boats. The final rule is not intended to cover piers used solely by ferries or other commercial vessels, such as freighters, ocean supply vessels, and commercial fishing vessels.

Boating facilities covered by this final rule vary in size. Some contain as few as one boat slip (for example, a small campground with a short non-demarcated pier) and others are large enough to contain several thousand boat slips (for example, a large marina with many boat basins). Some have piers and boat launch ramps, while others only have piers. A boating facility may only contain a single launch ramp with no boarding pier or may contain multiple launch ramps with multiple boarding piers. In some cases, a site (such as a State park with a large lake) may contain more than one boating facility. In other cases, several boating facilities may be located in the same waterfront area, each operated by different operators.

#### Section 15.2.2 Accessible Route

This section requires that accessible routes, including gangways that are part of an accessible route, comply with ADAAG 4.3. ADAAG 4.1.2(2) requires that at least one accessible route connect accessible buildings, facilities, elements, and spaces on the same site. Therefore, an accessible route must connect accessible boat slips with other accessible elements on the same site. Eight exceptions, discussed below, have been added which modify the accessible route requirements as they relate to connecting floating piers.

No exceptions have been provided for accessing fixed piers. Therefore, accessible routes serving fixed piers must meet all the requirements of ADAAG 4.3.

#### Exception 1 Alterations to Existing Gangways

Exception 1 permits the replacement and alteration of existing gangways or series of gangways without triggering an increase in the length of the gangways, unless required by ADAAG 4.1.6(2).

*Comment.* Commenters noted that for maintenance or safety reasons, gangways are sometimes replaced or altered without any other changes being made to the floating piers and land based features located at the ends of the gangways. Under ADAAG's requirements for alterations, a replaced gangway would have to meet the requirements of section 15.2.2. The primary difficulty typically involves meeting slope requirements, rather than meeting handrail and transition plate requirements. In many cases,

compliance with section 15.2.2 would require longer gangways to be installed. To install a longer gangway, changes to adjacent structures may be needed and such changes could also lead to reductions in the number of boat slips available. Available water sheet may also prevent lengthening of the gangways in an existing boating facility.

*Response.* The final rule includes an exception that does not require an increase in the length of the gangway, where gangways are replaced or altered. However, under ADAAG 4.1.6(2), alterations to areas containing primary functions may require existing gangways and adjacent structures to be brought into conformance with section 15.2.2. ADAAG 4.1.6(2) provides that, when an area containing a primary function is altered, an accessible path of travel must be provided to the altered area unless the cost and scope of the alterations to provide an accessible path of travel is disproportionate to the overall alterations as determined under criteria established by the Department of Justice. The Department of Justice regulations for title III of the ADA deem alterations to provide an accessible path of travel to be disproportionate when the cost exceeds 20 percent of the cost of the overall alterations.<sup>6</sup>

#### Exceptions 2 and 3 Maximum Gangway Rise and Slope

Exception 2 permits gangways or series of gangways to exceed the maximum rise specified in ADAAG 4.8.2. Exception 3 permits gangways to exceed the maximum slope specified in ADAAG 4.8.2, where the total length of the gangways serving as part of a required accessible route is at least 80 feet.

*Comment.* One of the most difficult issues relating to accessibility in floating boating facilities is gangway slopes. The proposed rule permitted gangway slopes to exceed a maximum slope of 1:12 at such times as when the distance between the design high point and water level exceeded a specific value depending on the size of the pier. In addition, the proposed rule exempted gangways from the maximum rise in ADAAG 4.8.2.

Over 60 organizations and individuals responded to the above proposals. Most indicated that they did not support the provisions. The comments raised concerns about how to calculate the pier square footage and what was considered a "pier." Some asked whether levees, boardwalks, or retaining walls are fixed piers and how to measure the square

footage. Others asked about private operators using floating piers and leasing space at a city pier. They questioned whether the square footage of the city pier is included in the calculations for determining access to the privately owned floating pier. One commenter noted that facility size determinations based on square footage may tend to drive entities to reduce pier widths which could compromise safety and stability.

A few commenters questioned how the design high point was selected. They questioned whether this point was the 100 year flood line, mean high tide, extreme high tide, ordinary high water, or high pool water line. One commenter noted that what is a safe and practical upper limit is not constant and easily determined.

Some commenters were concerned that facilities located where water level fluctuations are over 40 feet, would end up with no access or only limited access. A number of commenters suggested that a maximum gangway slope be established for most conditions, if not all conditions. Recommended slope maximums ranged from 5 percent to 15 percent.

At least 10 commenters noted that the requirements should ideally be site specific because of the varying logistical problems and differing geographic conditions at locations where water level fluctuations range from a few inches to over 100 feet. These commenters said that the table in the proposed rule would create hardships for existing facilities where space limitations are present, by requiring reductions in boat slip counts and by discouraging operators from upgrading their facilities. A number of commenters recommended that accessible gangways only be required where they serve 100 or more boat slips.

Using recommendations made by a number of commenters and combined with an effort to reduce the complexity of the final rule, the Board published a summary of a draft final rule for comment. In this draft, the Board indicated that the slope of a gangway would be permitted to exceed the maximum slope of 1:12 where the linear feet of mooring space along the perimeter of the piers at a facility was less than 1,000 feet (approximately 20–30 slips) and the water fluctuation was more than one foot. The provision, which was a general exception from the maximum slope requirement, was intended to provide regulatory relief for smaller boating facilities where an extensive gangway system may be cost prohibitive. Linear feet of mooring space was used instead of the square footage

<sup>6</sup> See 28 CFR 36.403(f)(1) (<http://www.usdoj.gov/crt/ada/reg3a.html>).

of a facility to more effectively measure the size of usable space where boats can dock rather than other spaces at a boating facility.

The draft final rule also required that where the linear feet of mooring spaces along the perimeter of the piers at a facility was less than 3,000 feet (approximately 50–70 slips) and the water fluctuation was more than 5 feet, the maximum gangway slope would be permitted to be 1:8 maximum. This exception allowed for a steeper slope than generally provided in ADAAG.

Lastly, the draft final rule stated that where the water fluctuation was more than 10 feet, gangways would be permitted to exceed the maximum slope of 1:12. Providing complying gangway slopes where the water fluctuation exceeds 10 feet requires extensive gangway systems and supporting facilities. It was noted in the draft final rule that although the gangway slope was permitted to be any slope, the gangway was not allowed to consist of stairs, since stairs are not permitted to be part of an accessible route.

During two public information meetings and from written comment received on the summary of the draft final rule, commenters generally supported simplifying the rule. Some expressed concerns about allowing a 1:8 slope on gangways, and others objected to using linear feet to determine the size of smaller facilities. A few commenters noted that the maximum feasible length of a gangway is between 60 and 70 feet. These commenters indicated that providing longer gangways, or providing two or more shorter gangways as part of a gangway and ramp system, dramatically increased the costs, complexity, and maintenance of the structure. Some commenters pointed out that because gangways often depart from a landside connection which is positioned at least 3 to 4 feet above high water, a 120-foot gangway provided to handle a 10-foot water level change actually needs to be at least 156 to 168 feet long (or a series of gangways and ramps with the same aggregate length).

*Response.* It is recognized that many factors which vary throughout the country add to the complications of providing larger gangway and ramp systems to handle greater changes in water fluctuation and elevation. Factors include water level changes, distance of gangway departure points above high water marks, available water sheet to construct within, location of shipping channels into which piers and gangways cannot project, wind load on floating structures as they get bigger, types of mooring systems, dead and live loads of gangways and the size of floating

facilities to support them, currents, boat wakes, and the ability to remove floating structures when bodies of water freeze over. In the proposed rule, the Board attempted to define the level of access based on the size of a facility (*i.e.*, pier square footage). Comments noted that many other factors besides facility size, play a role in determining what is feasible. Because factors vary throughout the country and could vary between adjacent sites and adjacent facilities, selecting one factor or a list of factors to measure for determining appropriate gangway slope is not feasible.

In an effort to provide a simplified rule and establish a starting point for determining gangway access, the final rule focuses on a maximum feasible gangway length. In response to the draft final rule, a recommendation was developed by the California Department of Boating and Waterways, Oregon State Marine Board, Clean Harbor Action, and Revitalize Our Waterways (and supported by over 20 other commenters). This recommendation showed that it would be feasible in new construction to provide up to 80-foot gangways. From this comment (which also contained recommendations for different gangway slopes for varying changes in elevation), the Board developed the final rule which is based only on gangway length. Exception 3 requires that an entity either (1) provide a gangway (or series of gangways) at least 80 feet in total length, or (2) provide a gangway (or series of gangways) which does not exceed a maximum slope of 1:12. The final rule also retains the exception permitting gangways to be any length without a landing. As these exceptions only apply to gangways, ramps constructed on floating piers and ramps providing access to landside connections of gangways are not permitted to use these exceptions. Since the final rule does not use water level change as a mechanism for determining gangway accessibility, the definition for design high point was removed. The appendix includes the following two examples.

*Example 1.* Boat slips which are required to be accessible are provided at a floating pier. The vertical distance an accessible route must travel to the pier when the water is at its lowest level is 6 feet, although the water level only fluctuates 3 feet. To comply with exceptions 2 and 3, at least one design solution would provide a gangway at least 72.25 feet long which ensures the slope does not exceed 1:12.

*Example 2.* A gangway is provided to a floating pier which is required to be on an accessible route. The vertical distance is 10 feet between the elevation where the gangway departs the landside connection and

the elevation of the pier surface at the lowest water level. Exceptions 2 and 3, which modify 4.8.2, permit the gangway to be at least 80 feet long. Another design solution would be to have two 40-foot continuous gangways joined together at a float, where the float (as the water level falls) will stop dropping at an elevation five feet below the landside connection.

*Comment.* A number of commenters expressed concern that steeper gangway slopes and the absence of level landings every 30 feet created barriers for persons with disabilities. Some commenters also noted that State and local governments should be held to a higher standard than private entities.

*Response.* As water levels rise and fall, gangway slopes also rise and fall. In some areas, there will be times that a gangway slope is less than 1:20 and at other times it will be greater than 1:12. The Board has attempted to balance the needs of persons with disabilities with the cost of providing access in an environment that can vary dramatically throughout the country. The Board also decided against providing different requirements for boating facilities operated by State and local government or private entities. As this is the first time Federal accessibility guidelines have been developed to address these types of facilities, the Board plans to closely monitor how well the guidelines provide access and what new technologies are developed to provide equivalent or better access.

*Comment.* A few commenters representing passenger vessel owners were concerned that the gangway provisions would also apply to gangways serving passenger vessels.

*Response.* The gangway provisions of this rulemaking only apply to gangways which access floating piers from the land or fixed structures. The Board is working on a separate rulemaking which will address passenger vessel access. A statement has been added to the gangway definition indicating that the definition does not apply to gangways which connect to vessels.

#### *Exception 4 Small Boating Facilities With Less Than 25 Boat Slips*

Exception 4 permits gangways to exceed the maximum slope specified in ADAAG 4.8.2, where a facility contains less than 25 boat slips and where the total length of the gangway, or series of gangways, serving as part of a required accessible route is at least 30 feet.

*Comment.* Commenters were concerned about how the gangway requirements would impact smaller facilities.

*Response.* The proposed rule and the draft final rule lessened the impact on

smaller boating facilities based on pier square footage or linear feet. Most commenters recommended using number of boat slips. Since the final rule does not address piers used by transportation vessels covered by ADAAG 10.5, which are more likely to contain a limited number of very large slips, basing the exception on boat slip numbers is appropriate.

#### *Exception 5 Transition Plates*

Exception 5 permits transition plates to be located at the ends of gangways instead of the landings specified by ADAAG 4.8.4.

*Comment.* The proposed rule permitted gangways to have transition plates at the top and bottom. Comments ranged from noting the need for a definition, setting out maximum lengths and slopes, and having them meet gangway requirements.

*Response.* In the final rule, a definition for transition plate has been added to ADAAG 3.5. Where transition plates are part of an accessible route, the transition plates must comply with ADAAG 4.3, unless one of the exceptions in 15.2.2 applies. For example, ADAAG 4.3.7 and 4.8.2 would prohibit transition plates from having a slope greater than 1:12. Where the requirements of ADAAG 4.8 apply (because the slope is greater than 1:20), the transition plates must have landings complying with ADAAG 4.8.4 at the non-gangway end.

#### *Exception 6 Handrail Extensions*

Exception 6 does not require handrail extensions, where gangways and transition plates connect and both are required to have handrails. In addition, the exception provides that where handrail extensions are provided on gangways or transition plates, the extensions are not required to be parallel with the ground or floor surface.

*Comment.* The proposed rule did not require handrail extensions on gangways or landings where they connect to transition plates and did not require handrail extensions at transitions plates. Although some commenters supported the exception, others noted that handrail extensions were needed, particularly on gangways when the transition plate had no handrail. Commenters also noted the difficulty in complying with ADAAG 4.8.5, which requires handrail extensions to be parallel with the ground or floor surface. As gangway slopes change, handrails extensions at the end of gangways and transition plates are no longer parallel. Other commenters requested that transition plates always have handrails and

questioned whether gangway handrails had to be connected or continuous with landing handrails.

*Response.* The exception has been rewritten to address most of the concerns raised. The determination of whether a transition plate is required to have a handrail will be triggered by the requirements of ADAAG 4.3.7 and 4.8.5. Regarding connections to landing handrails, gangways required to comply with ADAAG 4.8.5 are required to have continuous handrails on both sides. When gangway handrail extensions are required, subject to exception 5 exclusions, the extensions would overhang landings and transition plates 12 inches minimum. ADAAG contains no requirement that these extensions connect handrails which might be provided on landings or guardrails which also may be provided.

#### *Exception 7 Cross Slope*

Exception 7 permits the cross slope of gangways, transition plates, and floating piers that are part of an accessible route to be 2 percent maximum measured in the static position.

*Comment.* Commenters representing State recreational boating agencies expressed concern about constructing floating piers and gangways which must conform to a 2 percent maximum cross slope 100 percent of the time in all weather and water conditions.

*Response.* Exception 7 was added to address this concern by specifying that the maximum cross slope is measured in the static condition. Gangways and piers which are part of an accessible route are expected to be designed and constructed to meet the 2 percent maximum cross slope. Once they are placed in the water, measurements absent live loads are to be made from a static condition without motion or wave action. Where floating piers are grounded out due to low water conditions, the slope requirements would not apply to such floating piers and associated gangways and transition plates.

#### *Exception 8 Limited-Use/Limited-Application Elevators and Platform Lifts*

Exception 8 permits limited-use/limited-application elevators or platform lifts complying with ADAAG 4.11 to be used in lieu of gangways complying with ADAAG 4.3.

*Comment.* One commenter pointed out that other methods, such as platform lifts and elevators should be used to provide access to a floating pier. Another commenter noted that a product, similar to a platform lift, had been developed for accessing floating piers. They believed that the final rule

should encourage technological developments in this area.

*Response.* ADAAG 4.3 and 15.2 allow accessible routes to consist of elevators, ramps, and (when accessing floating piers) gangways. However, under ADAAG 4.1.3(5), Exception 4, the use of a platform lift to access a pier (floating or fixed) would be prohibited in new construction. In alterations to existing facilities, this restriction does not apply. (See ADAAG 4.1.6(3)(g) regarding platform lift usage in alterations.) Exception 8 was added to allow more flexibility in providing access to floating piers and to encourage the development of other methods of access using mechanical means. This exception modifies the requirements of ADAAG 4.1.3(5) and allows the use of platform lifts and limited-use/limited-application elevators in new construction as part of an accessible route connecting floating piers.

#### *Section 15.2.3 Boat Slips: Minimum Number*

This section requires that where boat slips are provided, accessible boat slips complying with section 15.2.5 must be provided in accordance with Table 15.2.3. Boarding piers at boat launch ramps are not counted for this purpose. Where the number of boat slips is not identified, each 40 feet of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for purposes of this section.

*Comment.* The proposed rule required that where boat slips are provided, at least 3 percent of all boat slips, but not less than one boat slip, be accessible. Comments varied between supporting a range from 1 percent to 4 percent. Some comments recommended that the number of accessible boat slips be the same as the number of required accessible vehicle parking spaces. One commenter recommended that one of each type of slip be accessible. A facility operator noted that at large facilities, a 3 percent scoping provision would require more accessible boat slips than a similar number of vehicle parking spaces. Several commenters questioned whether the need for accessible slips was as high as the need for accessible parking.

*Response.* The Board is not convinced that the scoping for accessible boat slips needs to be the same as the scoping for accessible vehicle parking spaces and is concerned that the proposed 3 percent would require more accessible slips in larger facilities than a similar number of parking spaces. The final rule modifies the scoping by reducing the percentage of accessible boat slips in larger facilities. A table is added to the final

rule to show the required number of accessible boat slips. The table starts with 3 percent and reduces down to 1 percent as the number of boat slips increase. For example, a 100-slip marina would need 3 accessible slips, and a 1,450-slip marina would need 17 accessible slips. Since this is the first time Federal guidelines have addressed the minimum number of accessible boat slips, the Board plans to closely monitor how the numbers meet the needs of individuals with disabilities.

*Comment.* The proposed rule also required that where the number of slips cannot be identified, each 40 feet of mooring space provided along the perimeter of a pier be counted as one boat slip for the purpose of applying this section. Most commenters supported the requirement. A few commenters noted that most recreational boats are less than 40 feet in length and recommended a number less than 40 feet.

*Response.* Although most recreational boats are less than 40 feet, the final rule seeks to increase the likelihood that accessible slips at non-demarcated piers are long enough to accommodate most types of common recreational boats. For this reason, the final rule has retained using 40 feet as the distance for determining the number of slips at piers where slips are not demarcated. (See section 15.2.4.1 regarding lengths of boarding piers at launch ramps.) The following two examples are included in the appendix.

*Example 1.* A site contains a new boating facility which consists of a single 60-foot pier. Boats are only moored parallel with the pier on both sides to allow occupants to embark or disembark. Since the number of slips cannot be identified, section 15.2.3 requires each 40 feet of boat slip edge to be counted as one slip for purposes of determining the number of slips available and determines the number required to be accessible. The 120 feet of boat slip edge at the pier would equate with 3 boat slips.

Table 15.2.3 would require 1 slip to be accessible and comply with 15.2.5. Section 15.2.5 (excluding the exceptions within the section) requires a clear pier space 60 inches wide minimum extending the length of the slip. In this example, because the pier is at least 40 feet long, the accessible slip must contain a clear pier space at least 40 feet long which has a minimum width of 60 inches.

*Example 2.* A new boating facility consisting of a single pier 25 feet long and 3 feet wide is being planned for a site. The design intends to allow boats to moor and occupants to embark and disembark on both sides, and at one end. As the number of boat slips cannot be identified, applying section 15.2.3 would translate to 53 feet of boat slip edge at the pier. This equates with two slips. Table 15.2.5 would require 1 slip to be accessible. To comply with 15.2.5 (excluding

the exceptions within the section), the width of the pier must be increased to 60 inches. Neither (15.2.3 nor 15.2.5) requires the pier length to be increased to 40 feet.

*Comment.* The proposed rule counted boat launch ramp boarding piers as boat slips for determining the number of accessible slips required at a facility. The proposed rule also required at least one additional accessible boat slip to be provided adjacent to accessible launch ramps, where boarding piers were provided. Some commenters thought that this requirement would cause confusion. A few commenters questioned whether boat slips should be provided on boarding piers because boat slips are rented, leased or purchased, but boarding piers are used in a short-term manner. A number of commenters believed the provision required that launch ramps must have boarding piers.

*Response.* To avoid confusion, the final rule addresses scoping requirements for launch ramp boarding piers separately from boat slips. A definition has been added to ADAAG 3.5 for boarding piers.

*Comment.* Many commenters expressed concern that accessible slips had to be reserved only for persons with disabilities similar to how vehicle parking spaces are reserved.

*Response.* Accessible boat slips are not "reserved" for persons with disabilities in the same manner as accessible vehicle parking spaces. Rather, accessible boat slip use is comparable to accessible hotel rooms. The Department of Justice is responsible for addressing operational issues relating to the use of accessible facilities and elements. The Department of Justice currently advises that hotels should hold accessible rooms for persons with disabilities until all other rooms are filled. At that point, accessible rooms can be open for general use on a first come, first serve basis. This information has also been included in the appendix.

#### Section 15.2.3.1 Dispersion

This section requires that accessible boat slips be dispersed throughout the various types provided. It does not require an increase in the minimum number of boat slips required to be accessible.

*Comment.* Commenters expressed concern about how many accessible gangways would be required due to this dispersion requirement. Commenters noted that some facilities have several floating piers, each connected by an individual gangway. If accessible slips must be placed on more than one pier (due to the dispersion requirement), more than one accessible gangway system would be required.

*Response.* This provision does not prohibit accessible boat slips from being grouped at one or more piers, where such grouping does not reduce the number of type of slips that are required to be accessible. In cases where relocation of types of accessible boat slips to one pier is not possible, this dispersion provision will require more than one conforming gangway system.

*Comment.* Commenters requested more information on the different "types" of boat slips.

*Response.* Features to be considered in determining types of boat slips include the size of the boat slips, whether there are single berths or double berths, shallow water or deep water, transient, longer-term lease, covered or uncovered, and whether slips are equipped with features such as telephone, water, electricity, and cable connections. Because the term "boat slip" is intended to cover any pier area where passengers or occupants embark or disembark, unless classified as a launch ramp boarding pier, other piers not typically thought of as containing "boat slips" are covered by this dispersion requirement. Therefore, for example, a fuel pier used on a short term basis may contain boat slips, and this type of slip would be included in determining compliance with section 15.2.3.1. This information has also been included in the appendix.

*Comment.* The proposed rule required that accessible boat slips be located nearest to the amenities provided in the boating facility. Some commenters noted that adding this requirement to the dispersion provision increased the difficulty in providing accessible slips in existing facilities. It also tended to require more accessible gangways even in new construction. Commenters also questioned how to identify an amenity and if it is desirable to be located nearest an amenity. For example, being located near the toilet room might be desirable for one person but not for someone sensitive to noise and odors. Likewise, having an accessible slip located nearest the fuel pier may be beneficial for one person and not desired by others. One commenter noted that at existing facilities, corner slips are already accessible, but may not be closest to amenities.

*Response.* The "amenities" section has been removed from the final rule, because the rule intends to allow accessible boat slips to be grouped on one or more piers. In addition, the provision was removed due to comments which questioned whether being closest to an amenity is desirable.

### Section 15.2.4 Boarding Piers at Boat Launch Ramps

This section requires where boarding piers are provided at boat launch ramps, at least 5 percent, but not less than one, of the boarding piers must comply with 15.2.4 and be served by an accessible route complying with ADAAG 4.3.

Exception 1 permits accessible routes serving floating boarding piers to use the exceptions in section 15.2.2.

Exception 2 permits gangways to exceed the maximum slope and rise specified by ADAAG 4.8.2, where the total length of the gangways serving as part of a required accessible route is greater than 30 feet. Lastly, exception 3 indicates that where the accessible route serving a floating boarding pier or skid pier is located within a boat launch ramp, ADAAG 4.8 does not apply to the portion located within the boat launch ramp.

*Comment.* As noted above, some commenters thought that the proposed rule required that an accessible slip or boarding pier had to be provided at boat launch ramps.

*Response.* The proposed rule did not require that accessible boarding piers be provided at every facility with a launch ramp. Where boarding piers are provided, the proposed rule required that at least one accessible boat slip be provided adjacent to the launch ramp to ensure that at least one boarding pier complied with the pier clearance requirements. By using the term "boat slip", the Board did not intend to ensure that a rented, leased, or purchased mooring space would be available at the launch ramp, as some commenters concluded.

*Comment.* The proposed rule required that where boat launch ramps are provided with boarding piers, at least one accessible slip be provided adjacent to a boat launch ramp. A few commenters suggested that 50 percent, but not less than one boarding pier, be accessible.

*Response.* The final rule requires 5 percent, but not less than one, of boarding piers to be accessible. Most facilities with launch ramps only have one or two launch ramps. Compliance with this provision would translate to 100 percent or 50 percent access, assuming each launch ramp had its own boarding pier. Since some facilities have more than 20 launch ramps, the provision is consistent with how ADAAG addresses some conditions where multiple features are provided for the same use.

*Comment.* Some commenters were concerned that to serve an accessible floating boarding pier, the accessible

route would have to run down the launch ramp and would require the slope of the launch ramp to be 1:12 maximum. Such a slope would dramatically effect the ability to launch and retrieve trailered boats. A few commenters noted that in designs using a string of boarding piers connected together, as water levels decline, the boarding piers end up resting on the launch ramp surface. Therefore, they would match the slope of the launch ramp which is generally steeper than 1:8. In such a design, some piers actually function as gangways for a period of time.

In another design, a stationary boarding pier (also known as a skid pier) rests on the launch ramp surface, but is repositioned as water levels rise and fall. This design also allows the skid pier to be easily removed where the body of water becomes ice bound and deicing equipment is not practical. An example of a fixed boarding pier was provided which showed two levels connected by handrail equipped ramps. During high water, boaters used the upper level while the lower level and the ramp connecting it were covered by water. At low water, the lower level is used.

One commenter noted the value floating boarding piers provide for persons with disabilities when accessing a boat since the pier remains at a set height above the water. A few pointed out that accessible routes serving boarding piers were not required to run down the launch ramp but could be provided alongside the ramp. Another commenter noted that constructing switchback ramps or any other structure within the area near the shoreline was subject to more environmental limitations and was a problem particularly for providing access at existing launch ramps. Several commenters pointed out that at launch ramps, handrails and guardrails on some gangways (primarily on short gangways) are not provided because they interfere with boat lines as boats are launched or retrieved. One commenter mentioned that providing accessible boarding piers was not a problem, but providing the accessible route to it was a problem. The commenter noted that if the requirements were too difficult, entities would stop providing boarding piers.

*Response.* Anecdotal information indicates that boarding piers are not provided at all launch ramps. For example, the Michigan Department of Natural Resources reported that of their over 900 boating access sites, approximately half are provided with boarding piers (also known as courtesy

piers or docks). Since boarding piers may improve the ability for persons with disabilities to embark and disembark boats at launch ramps, the final rule seeks to not discourage entities from providing them. The Board has identified two areas of concern.

The first concern relates to accessing floating boarding piers. Boarding piers, when provided, tend to be quite small as compared to the square footage of piers used as boat slips. Many boating facilities consist of only one or two launch ramps and maybe a boarding pier, and contain no other boating structures. Providing access to floating boarding piers are subject to many of the same factors as providing access to floating piers which contain boat slips. In the final rule, the Board added exception 1 to section 15.2.4. This exception allows launch ramp boarding piers to use specified exceptions contained in section 15.2.2.

Exception 4 in section 15.2.2 allows boating facilities with less than 25 slips to have shorter gangways. To provide a similar small facility exception for boarding piers, exception 2 was added to 15.2.4. The exception exempts gangways accessing floating boarding piers at launch ramps from complying with the maximum slope requirements of ADAAG 4.8.2 where the gangways are at least 30 feet in length.

The Board's second area of concern focused on the effect of the accessible route requirements on a launch ramp, where the connection to a boarding pier is located within a launch ramp. As noted in the comments, the issue is not only the running slope requirement of an accessible route, but also includes the handrail, landing, and maximum rise requirements.

To address this concern, the Board added exception 3 to this section of the final rule. This exception provides that the requirements of ADAAG 4.8 do not apply to accessible routes located within launch ramps which serve floating boarding piers or skid piers also located within launch ramps. Although ADAAG 4.8 does not apply, other requirements of ADAAG 4.3 are applicable. For example, an accessible route with a minimum width of 36 inches must serve the boarding pier. Large "V" shaped groves which are typically provided to increase tire traction would not be allowed by ADAAG 4.3.6 (which references ADAAG 4.5) within the accessible route. Cross slopes requirements of ADAAG 4.3.7 remain 1:50 maximum. It is noted that ADAAG 4.3 does not require the entire launch ramp to meet these requirements, but does apply them to the 36 inch wide minimum accessible

route which shares the launch ramp surface and connects to the boarding pier and accessible elements on the boarding pier. Exception 3 only exempts the ramp requirements contained in ADAAG 4.8, such as maximum slope, maximum rise, handrails, and level landings. The following two examples are included in the appendix.

*Example 1.* A chain of floats are provided on a launch ramp to be used as a boarding pier which is required to be accessible by 15.2.4. At high water, the entire chain is floating and a transition plate connects the first float to the surface of the launch ramp. As the water level decreases, segments of the chain end up resting on the launch ramp surface, matching the slope of the launch ramp. As water levels drop, segments function also as gangways because one end of a segment is resting on the launch ramp surface and the other end is connecting to another floating segment in the chain.

Under ADAAG 4.1.2(2), an accessible route must serve the last float because it would function as the boarding pier at the lowest water level, before it possibly grounded out. Under exception 3, because the entire chain of floats is part of the accessible route, each float is not required to comply with ADAAG 4.8, but must meet all other requirements in ADAAG 4.3, unless exempted by exception 1. In this example, because the entire chain also functions as a boarding pier, the entire chain must comply with the requirements of 15.2.5, including the 60 inch minimum clear pier width provision.

*Example 2.* A non-floating boarding pier supported by piles divides a launching area into two launch ramps and is required to be accessible. Under ADAAG 4.1.2(2), an accessible route must connect the boarding pier with other accessible buildings, facilities, elements, and spaces on the site. Although the boarding pier is located within a launch ramp, because the pier is not a floating pier or a skid pier, none of the exceptions in 15.2.4 apply. To comply with ADAAG 4.3, either the accessible route must run down the launch ramp or the fixed boarding pier could be relocated to the side of the two launch ramps. The second option leaves the slope of the launch ramps unchanged, because the accessible route runs outside the launch ramps.

*Comment.* A few commenters questioned how the accessible route required by ADAAG 4.1.2 should connect a launch ramp which does not have a boarding pier.

*Response.* In the Recreation Access Advisory Committee, Boating and Fishing Facilities subcommittee report, the subcommittee recommended that the accessible route run to the crown of the launch ramp. In response to the ANPRM, commenters questioned how the "crown" would be determined. Because a precise spot at the launch ramp could not be identified to which the accessible route connects, neither the proposed rule nor the final rule

addresses this issue. As the final rule does not intend to change the slope of launch ramps, the accessible route required by ADAAG 4.1.2 is required to connect the launch ramp, but the specific point of connection is not set out.

#### *Section 15.2.4.1 Boarding Pier Clearances*

This section requires that at boarding piers, the entire length of the piers required to be accessible by section 15.2.4, must comply with section 15.2.5.

*Comment.* Some commenters questioned if the proposed rule required a minimum length of 40 feet for the accessible boarding piers.

*Response.* Neither the proposed rule, nor the final rule establishes a minimum length for accessible boarding piers. The accessible boarding pier would have a length which is at least equal to other boarding piers provided at the facility. Where only one boarding pier is provided, it would have a length equal to what would have been provided if no access requirements applied. The entire length of accessible boarding piers would be required to comply with the same technical provisions that apply to accessible boat slips. For example, at a launch ramp, if a 20-foot long accessible boarding pier is provided, the entire 20 feet must comply with the pier clearance requirements in section 15.2.5. Likewise, if a 60-foot long accessible boarding pier is provided, the pier clearance requirements in section 15.2.5 would apply to the entire 60 feet. An advisory note has been added to the appendix which provides similar information regarding lengths of boarding piers.

#### *Section 15.2.5 Accessible Boat Slips*

This section sets out requirements for accessible boat slips. Section 15.2.5.2 specifically addresses cleats and other boat securement devices.

##### *Section 15.2.5.1 Clearances*

This section requires that accessible boat slips be served by clear pier space 60 inches wide minimum and at least as long as the accessible boat slips. Additionally, every 10 feet maximum of linear pier edge serving the accessible boat slips must contain at least one continuous clear opening 60 inches minimum in width. The provision is unchanged from the proposed rule, although three exceptions have been added.

##### *Exception 1 Reduced Width*

Exception 1 allows the width of the clear pier space to be 36 inches minimum for a length of 24 inches

maximum, provided that multiple 36 inch wide segments are separated by segments that are 60 inches wide and 60 inches long.

*Comment.* Some commenters requested piers to be 72 to 96 inches wide to improve safety for persons who use wheelchairs. Others commenters were satisfied with the 60 inch minimum width but wanted the ability to reduce the width down to 36 inches in places to get around objects like supporting piles located within the clear pier space. One commenter requested, in response to the draft final rule, a reduced width because environmental agencies are making it harder to install finger piers wider than 4 feet.

*Response.* The 60 inch minimum width is consistent with the width required at access aisles for standard accessible parking spaces and was supported in the Recreation Access Advisory Committee, Boating and Fishing Facilities subcommittee report. Because the final rule allows obstructions to be located around the edge of the finger piers where 60 inch openings are available, unlike vehicle access aisles, it is not necessary for the entire pier to have a 60 inches clear width. Exception 1 allows reductions in the width of the pier clearance. The exception was included in the draft final rule and received little comment. An advisory note has been added to the appendix which recommends that clear pier spaces be wider than 60 inches, particularly on floating piers which are less stable, to improve the safety for persons with disabilities.

*Comment.* A number of commenters recommended that instead of the 60 inch clear width running the length of the slip, only one 60 inch by 60 inch space be required at the accessible boat slip. This space could be placed either alongside the slip or at the head of the slip on the main pier. These commenters also recommended that where finger piers at the facility are longer than 20 feet, a second 60 inch by 60 inch space should be provided at the slip.

*Response.* As recreational boats vary in shape, size, and layout, it cannot easily be known where persons with disabilities would embark or disembark a boat. By requiring the clear pier space along the entire length of the slip, access options between the boat and the pier are improved. Although the final rule does not require the entire edge of the clear pier space to be unobstructed, by extending the clear pier space the length of the slip, the number of 60 inch continuous clear openings increases which further improves access between the boat and the pier.

### Exception 2 Edge Protection

Exception 2 permits edge protection 4 inches high maximum and 2 inches deep maximum at the continuous clear openings.

*Comment.* The proposed rule required that every 120 inches maximum of linear pier edge serving the accessible boat slips contain at least one continuous clear opening 60 inches minimum. A few commenters noted that the provision would not allow edge protection to be placed within the opening.

*Response.* In response to the ANPRM, commenters had mixed views on the use of edge protection. Some maintained that edge protection was necessary to protect persons who use wheelchairs from falling off the pier edges. Others maintained that edge protection created a tripping hazard as persons moved between a pier and boat. The proposed rule did not address edge protection at piers but did prohibit its installation at the continuous clear openings at the accessible slips. The Board has not taken a position on whether edge protection should be provided at piers, but has provided exception 2 so as not to prohibit its use at the continuous clear openings. Maximum dimensions are provided to control the size of the edge protection so as not to block the clear openings.

### Exception 3 Alterations to Existing Facilities

Exception 3 provides that in alterations to existing facilities, the clear pier space can be located perpendicular to the boat slip and extend the width of the boat slip. This exception is available only if the facility has at least one boat slip complying with section 15.2.5 and where further compliance with 15.2.5 would result in a reduction in the number of boat slips available or result in a reduction in the widths of existing slips.

*Comment.* Some commenters disagreed with requiring clear pier spaces alongside accessible boat slips where finger piers are not provided within the facility. Others noted that at existing facilities, increasing finger pier widths, on which pier clearances would be provided, may reduce the number of slips available.

*Response.* Although commenters at the two information meetings on the draft final rule indicated that more recreational boats are designed to be boarded from the stern, many recreational boats still provide for side boarding. To maximize the options for persons with disabilities to board, the requirement that the clear pier space

extend the length of the accessible boat slip in newly constructed facilities has not been modified. However, exception 3 has been added to the final rule to reduce the impact of this provision on existing facilities.

### Section 15.2.5.2 Cleats and Other Boat Securement Devices

This section clarifies that cleats and other boat securement devices are not required to comply with ADAAG 4.27.3.

*Comment.* A few commenters noted that at accessible boat slips, controls and operating mechanisms (such as power receptacles, and water and sewage connections) should comply with ADAAG 4.27.

*Response.* Although section 15.2 contains requirements for recreational boating facilities, other requirements in ADAAG 4.1 still apply. Therefore, ADAAG 4.1.3(13) would require controls and operating mechanisms, such as electrical and water connections, at accessible boat slips to comply with ADAAG 4.27. However, because mooring features used to secure a boat, when raised, exert higher load pressures at the point of pier attachment, the danger of failure increases, particularly on floating piers. For this reason, section 15.2.5.2 was added which states that the reach range requirements of ADAAG 4.27.3 do not apply to boat securement devices.

### Section 15.3 Fishing Piers and Platforms

#### Section 15.3.1 General

This section requires that newly designed or newly constructed and altered fishing piers and platforms comply with section 15.3.

*Comment.* Commenters questioned how the guidelines would apply to places that people may fish from, but were not constructed for fishing (e.g., a breakwater jetty, a bridge, or a flood control dam).

*Response.* Structures that have been designed and constructed for purposes other than fishing, even though persons may use the structure for fishing, are not required to comply with this section. However, piers and platforms that are newly designed or constructed and altered for the specific purpose of fishing are required to comply with this section.

#### Section 15.3.2 Accessible Route

This section requires that accessible routes, including gangways that are part of accessible routes serving fishing piers and platforms comply with ADAAG 4.3. Exception 1 permits the accessible route, serving floating fishing piers and platforms to use exceptions 1, 2, 5, 6, 7,

and 8 in section 15.2.2. Exception 2 provides that where the total length of the gangway or series of gangways serving as part of a accessible route is at least 30 feet, the maximum slope specified by ADAAG 4.8.2 does not apply to the gangways.

*Comment.* The proposed rule required the accessible route connecting to floating fishing piers and platforms to comply with the provisions for accessible routes at boating facilities. This section received only a few comments. One commenter recommended that the square footage values in the proposed rule be reduced for application to floating fishing piers. Another commenter noted that such a requirement would discourage entities from providing fishing piers.

*Response.* The final rule references exceptions 1, 2, 5, 6, 7 and 8 of 15.2.2 (Boating Facilities) for floating fishing piers and platforms. Exception 4 in section 15.2.2 allows boating facilities with less than 25 slips to have shorter gangways. To provide a similar small facility exception for floating fishing piers, exception 2 was added to section 15.3.2 and is based on a similar exception in section 15.2.4 which applies to floating boarding piers. The following example is included in the appendix.

*Example.* To provide access to an accessible floating fishing pier, a gangway is used. The vertical distance is 60 inches between the elevation that the gangway departs the landside connection and the elevation of the pier surface at the lowest water level. Exception 2 permits the use of a gangway at least 30 feet long, or a series of connecting gangways with a total length of at least 30 feet. The length of transition plates would not be included in determining if the gangway(s) meet the requirements of the exception.

*Comment.* One designer questioned whether the proposed rule prohibited gangways which comply with ADAAG 4.8.

*Response.* ADAAG 4.1.2(2) requires at least one accessible route complying with ADAAG 4.3 to connect accessible buildings, facilities, elements, and spaces that are on a site. ADAAG 4.3.7 requires an accessible route with a running slope greater than 1:20 to comply with the ramp requirements of ADAAG 4.8. Although the final rule contains exceptions which modify the requirements of ADAAG 4.8, the use of these exceptions is not mandatory. Designers are encouraged to provide greater access for gangways and exceed the minimums contained in the exceptions and the minimum requirements of ADAAG 4.8.

### Section 15.3.3 Railings

This section requires that where railings, guards, or handrails are provided, they must comply with 15.3.3.

#### Section 15.3.3.1 Edge Protection

This provision requires edge protection that extends 2 inches minimum above the ground or deck surface. An exception provides that where the railing, guardrail, or handrail is 34 inches or less above the ground or deck surface, edge protection is not required if the deck surface extends 12 inches minimum beyond the inside face of the railing. The toe clearance must be 9 inches minimum above the ground or deck surface beyond the railing and be 30 inches minimum wide.

*Comment.* The proposed rule did not permit other options for edge protection on floating fishing piers and platforms. Commenters provided designs of fishing stations incorporating an extended deck past the rail or guard that enable a person using a wheelchair or mobility device the opportunity for toe clearance beyond the face of the railing or guard. They felt that this design should be permitted and encouraged the Board to incorporate into the final rule.

*Response.* The proposed rule required edge protection where railings are provided and did not provide the flexibility designers of fishing piers and platform requested. An exception has been added to the final rule to permit more flexibility in providing a variety of designs that promote increased levels of accessibility to anglers with disabilities.

#### Section 15.3.3.2 Height

This section requires at least 25 percent of the railings to be a maximum of 34 inches above the ground or deck surface.

The Board sought comment on the height of lowered guards and what steps have been taken to ensure that their use was permitted under applicable building codes and standards. Additionally, in light of concerns that have been raised about safety issues related to lower guards, the Board also sought information on experiences designers or operators have had where guards on floating fishing piers and platforms have been lowered to accommodate individuals using wheelchairs and other mobility devices while fishing.

*Comment.* Many commenters supported the use of lowered rails or guards to provide persons using wheelchairs or other mobility devices the opportunity to fish. Commenters gave examples of providing lowered

rails or guards for many years, in many different applications, with no reported safety or injury problems. Commenters provided descriptions of unique and innovative designs of fishing stations constructed for use by persons with disabilities.

*Response.* The final rule retains the requirement that, where provided, 25 percent of the railing must be at a lowered height. Current designs, provided by commenters, supported a maximum height of the lowered rail or guard to be at 34 inches above the ground or deck surface. The height requirement for 25 percent of the rail has been changed in the final rule to 34 inches maximum above the ground or deck surface.

*Comment.* Some commenters believed that the Occupational Safety and Health Administration (OSHA) standards apply to recreational fishing piers and platforms. The OSHA standards apply to places where employment is performed and prescribe a 42 inch high railing along open sides of platforms located 4 feet or more above the floor. 29 CFR 1910.5 and 1910.23 (c) and (e). Other commenters believed that recreational fishing piers and platforms are covered by State and local building codes, which typically prescribe 42 inch high guards along open sides of platforms located more than 30 inches above the floor. These commenters were concerned that requiring at least 25 percent of railings to be a maximum 34 inches high conflicts with the OSHA standards, and State and local building codes.

*Response.* Recreational fishing piers and platforms are subject to OSHA safety standards only if they are places of work. In some cases there may be both workers and recreational users on a pier. In those cases, OSHA standards would apply, and the pier would be exempted from the height requirements in the final rule, as discussed below.

The International Code Council has advised the Board that recreational fishing piers and platforms are not covered by model building codes unless they are an integral part of a building that is regulated by the adopting State or local authority. To avoid potential conflicts, an exception has been added to the final rule that permits a higher guard to be provided along a recreational fishing pier or platform where the guard complies with the International Building Code (IBC) (2000 edition) requirements for height (not less than 42 inches high) and opening limitations (4 inch diameter sphere cannot pass through any opening up to a height of 34 inches; and 8 inch diameter sphere cannot pass through

any opening from a height of 34 inches to 42 inches). This exception can be used if a recreational fishing pier or platform is covered by a State or local building code; or if a design professional believes that a specific location warrants enhanced safety measures; or if an employer provides a 42 inch high railing to comply with OSHA standards.

#### Section 15.3.3.3 Dispersion

This section requires that lowered railings be dispersed throughout a fishing pier or platform.

*Comment.* A commenter requested guidance on the criteria used to determine dispersion.

*Response.* Anglers who stand can fish from any part of a pier or platform and can change location depending on the fishing or water conditions. Where railings, guards, and handrails have been installed on fishing piers and platforms, the height of the railings interfere with fishing and block vision for persons who use wheelchairs and other mobility devices. This provision requires that where railings are provided, the dispersion of the lowered railings provide similar choices to fish from a variety of locations. The distribution of lower railings could include locations of different water depths with some that provide shading or are close to shore, and could take into account the tides or water fluctuations.

#### Section 15.3.4 Clear Floor or Ground Space

This section requires that at least one clear floor or ground space complying with ADAAG 4.2.4 be provided where the lowered railing height is located. Where no railings are provided, at least one clear floor or ground space complying with ADAAG 4.2.4 must be provided. No substantive comments were received and no changes were made to this provision for the final rule.

#### Section 15.3.5 Maneuvering Space

This section requires that at least one maneuvering space complying with ADAAG 4.2.3 be provided on a fishing pier or platform. The maneuvering space is permitted to overlap the accessible route and the clear floor space required by 15.3.4. No substantive comments were received and no changes were made to this provision for the final rule.

#### Golf

#### Section 3.5 Definitions

Two terms used in this section are added to ADAAG 3.5 (Definitions).

A "golf car passage" is defined as a continuous passage on which a

motorized golf car, also known as a golf cart, can operate. Designers and operators sometimes use the term "golf car path" to identify what the Board is defining as a "golf car passage." Because the term "golf car path" may connote a prepared surface, the term was not used. While a golf car passage must be usable by golf cars, it does not necessarily need to have a prepared surface.

A "teeing ground" is the starting place for a hole to be played. This definition is consistent with the United States Golf Association definition, which describes a teeing ground as a rectangular area two club-lengths in depth, with the front and sides defined by the outside limits of two tee-markers.

#### Section 15.4.1 General

This section requires newly designed or newly constructed and altered golf courses, driving ranges, practice putting greens, and practice teeing grounds to comply with 15.4.

#### Section 15.4.2 Accessible Route—Golf Courses

This section requires an accessible route to be 48 inches wide minimum, or 60 inches minimum if handrails are provided, to connect accessible elements and spaces located within the boundary of a golf course. Additionally, an accessible route must connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters.

Exception 1 permits the use of a golf car passage complying with section 15.4.7 in lieu of all or part of an accessible route. This exception does not apply to the required accessible route complying with 4.3 when connecting elements and amenities outside of the boundary of the golf course (*i.e.*, accessible vehicle parking spaces with the golf course clubhouse entrance). Exception 2 provides that handrails are not required on accessible routes within the boundary of a golf course. It is hazardous for handrails to be located through a green, or on teeing grounds, because of the danger of golf balls ricocheting off rails. Since course elements could be accessible from golf car passages in lieu of an accessible route, handrails would be of little utility along these routes.

The guidelines recognize that providing an accessible route may be impractical on a golf course for several reasons. First, the route of play for a golfer is dependent on where the ball lands and is therefore unpredictable. Secondly, there is an assumption that on many courses, golfers use a golf car to move throughout the course. Finally,

requiring an accessible route throughout a course could alter the slopes within some courses and eliminate some of the challenge of the game. The guidelines permit accessible elements and spaces within the boundary of the course and areas used for practice putting or driving and other course amenities outside the boundary of the course to be connected through either an accessible route or a golf car passage.

The 48 inch minimum width for the accessible route is necessary to ensure passage of a golf car on either the accessible route or the golf car passage. This is important where the accessible route is used to connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters. These are areas outside the boundary of the golf course, but are areas where an individual using an adapted golf car may travel. A golf car passage may not be substituted for other accessible routes, required by ADAAG 4.1.2, located outside the boundary of the course. The following example is included in the appendix.

*Example.* An accessible route connecting an accessible parking space to the entrance of a golf course clubhouse is not covered by this provision permitting a golf car passage in lieu of an accessible route required by 4.1.2.

*Comment.* The proposed rule sought comment on the option of using a golf car passage in lieu of an accessible route for smaller courses (*i.e.*, 3 or 6 holes).

*Response.* Commenters supported the use of the golf car passage on smaller courses. The final rule provides golf course designers and operators the opportunity to choose between providing either a golf car passage or an accessible route for all courses regardless of size.

*Comment.* Commenters questioned who would be responsible for providing single rider adaptive golf cars. Additionally, commenters questioned if a course could establish criteria for restricting use due to terrain conditions. Others wanted to know if there are plans to create regulations or guidelines for accessible golf cars. Persons with disabilities supported the use of adaptive or single rider golf cars and gave examples of experiences at courses currently permitting or providing access via golf cars to courses.

*Response.* The Board develops and maintains accessibility guidelines for the built environment. It is outside the jurisdiction of the Board to address the operational and procedural requirements of a golf course. Operational and procedural issues are

within the jurisdiction of the Department of Justice.

*Comment.* The requirements for an accessible route or golf car passage seek to provide access for players with disabilities to either practice or play the game of golf. The Board requested comments on how access should be provided for spectators during golf tournaments and competitions. Commenters provided examples and experiences of current accessibility practices encountered at many levels of tournaments and supported allowing the tournament committees to select holes (teeing areas, fairways, and putting greens) to provide accommodations and transportation to the selected areas throughout the golf course and surrounding areas.

*Response.* No additional requirements have been included in the final rule for spectators with disabilities attending tournaments or competitions. Facilities hosting tournaments or competitions must comply with all the other requirements of the ADA, including the general obligation to provide an equal opportunity to individuals with disabilities to enjoy the services provided. Additionally, ADAAG requires temporary facilities used during tournaments or competitions to provide access to assembly seating areas, portable restroom facilities, concessions, and all other available amenities. Access to these temporary facilities on a golf course may be achieved through either an accessible route or golf car passage.

#### Section 15.4.3 Accessible Routes—Driving Ranges

This section provides that an accessible route must connect accessible teeing stations at driving ranges with accessible parking spaces and must be 48 inches minimum in width. Where handrails are provided, the accessible route must be a minimum of 60 inches in width. An exception has also been added which permits a golf car passage to be used at driving ranges instead of an accessible route.

*Comment.* The proposed rule did not specifically address the accessible route provided at driving ranges. A commenter stated that a person who plays from a golf car would need to practice driving a golf ball from the same position and stance used when playing the game.

*Response.* The final rule requires both a stand alone driving range and a driving range located at a golf course to provide an accessible route that is 48 inches wide minimum or 60 inches minimum where handrails are provided,

to connect the accessible parking spaces to required accessible teeing stations.

#### Section 15.4.4 Teeing Grounds

This section requires teeing grounds to comply with section 15.4.4.

##### Section 15.4.4.1 Number Required

This section requires that where one or two teeing grounds are provided for a hole, one teeing ground must be accessible. Where three or more teeing grounds are provided for a hole, at least two teeing grounds serving a hole must be accessible.

*Comment.* The proposed rule required that if two teeing grounds were provided both must be accessible. Course designers and operators expressed concerns that if only two teeing grounds are provided at a hole requiring both to be accessible was too restrictive.

*Response.* The final rule has been revised to require two teeing grounds to be accessible when three or more teeing grounds are provided for a hole. The Board believes that requiring two teeing grounds to be accessible when three or more are provided will provide persons with disabilities with an option to play from different tees appropriate to their skill level and also provide course operators and designers with the flexibility they requested.

##### Section 15.4.4.2 Forward Teeing Ground

This section requires the forward teeing ground to be accessible. The forward teeing ground need not be accessible in alterations of existing courses when terrain makes compliance infeasible.

*Comment.* The proposed rule sought comment on the number of accessible teeing grounds that should be required for each hole and, if more than one accessible teeing ground is provided, whether it should be the forward tee. Commenters supported the option to play from different teeing grounds appropriate to player skill levels if multiple teeing grounds are provided per hole. Additionally, golfers with disabilities overwhelmingly supported requiring the forward teeing ground to be accessible regardless of the number of teeing grounds provided.

*Response.* The final rule provides a choice of teeing grounds for golfers with disabilities when three or more teeing grounds are provided per hole and also provides flexibility to course designers and operators. The final rule also requires that the forward teeing ground be the accessible tee regardless of the number of teeing grounds provided per hole.

*Comment.* The proposed rule did not provide an exception for alterations of existing teeing grounds from making the forward tee accessible. Commenters stated that requiring access to the forward teeing ground in alterations to existing courses may be too restrictive.

*Response.* Some teeing grounds on existing courses may be located on steep slopes and it may not be possible to provide a golf car passage to the forward teeing ground. The final rule exempts the forward teeing ground from being accessible in alterations where compliance is not feasible due to terrain.

##### Section 15.4.4.3 Teeing Grounds

This section requires accessible teeing grounds to be designed and constructed to allow a golf car to enter and exit the teeing ground.

*Comment.* The proposed rule required teeing grounds to provide a minimum clear area 10 feet by 10 feet with a surface slope not exceeding 1:48 in all directions. Course designers and operators stated that current designs of teeing grounds provide a clear area of at least 10 feet by 10 feet. Additionally, they expressed concern about maintaining a slope no greater than 1:48, and noted that settling of the soil and drainage problems occur with such a minimal slope. Others questioned how the slope of the teeing ground should be measured.

*Response.* Current design and construction practices for teeing grounds provide the needed space for golf car passages. Designers currently limit the slope of the teeing grounds to provide a level surface from which golfers tee off. The maximum slopes and minimum size requirements have been deleted from the final rule. The final rule requires teeing grounds to be designed and constructed to allow a golf car to enter and exit the teeing ground.

##### Section 15.4.5 Teeing Stations at Driving Ranges and Practice Teeing Grounds

This section requires that where teeing stations or practice teeing grounds are provided, at least 5 percent, but not less than one, of the practice teeing grounds must be accessible. This provision applies to practice facilities adjacent to a golf course, in addition to stand-alone facilities. No substantive comments were received and no changes have been made for the final rule.

##### Section 15.4.6 Weather Shelters

This section requires weather shelters that are provided on a golf course to be designed and constructed to allow a golf

car to enter and exit and have a clear floor or ground space 60 inches by 96 inches. This space will allow a golf car to be driven directly into a weather shelter. No substantive comments were received and no changes have been made for the final rule.

##### Section 15.4.7 Golf Car Passage

This section requires openings at least 60 inches wide to be provided at intervals, not exceeding 75 yards, where curbs or other man-made barriers are provided along a golf car passage that would prohibit a golf car from entering a fairway.

*Comment.* The proposed rule required the 60 inch openings at intervals of 75 yards of golf car passage. Course designers and operators expressed concern that requiring openings at a fixed distance of 75 yards would be too restrictive and would not allow enough flexibility for natural characteristics of the course, hazard placement, and erosion control.

*Response.* The final rule requires the openings at intervals not to exceed 75 yards. These openings will provide access to the course at reasonable intervals, enabling a golfer using a golf car to play the game without extended travel distances and time requirements and also provide the flexibility the course designer and course operator need.

##### Section 15.4.7.1 Width

This section requires a golf car passage to be 48 inches wide minimum.

*Comment.* Commenters supported limited technical requirements for golf car passages. Currently there are no standards that govern the design or construction of golf car passages. Commenters felt that additional requirements would restrict designers and have the potential of altering the game.

*Response.* The 48 inch minimum dimension for a golf car passage is based on the standard width of gasoline or electric powered golf cars. The golf car passage may at times coincide with the golf car path, however, it is not required to include a prepared surface. The golf car passage is a continuous passage on which a motorized golf car can operate. No additional technical provisions for golf car passages have been included in the final rule.

##### Section 15.4.8 Putting Greens

This section requires space to allow a golf car to enter and exit the green.

*Comment.* Substantial comment was received on requiring putting greens and fairways to be accessible to golfers using adaptive single rider golf cars. Course

operators are concerned that allowing golf cars access to the green will cause damage to the greens and potentially cause holes to be closed for extended periods of time. Golfers with disabilities, organizations supporting golfers with disabilities, and golf car manufacturers provided information on current courses that allow for golf car passage on putting greens which showed little or no damage to the putting green surface.

*Response.* Single rider golf cars adapted for golfers with disabilities are available from about a dozen companies. These golf cars are generally designed to be "greens friendly" and have low ground pressure that is evenly distributed on all four tires. Some manufacturers report that the ground pressure of these golf cars is less than the ground pressure of a typically standing person and cause no turf damage even in wet conditions.

*Comment.* Course operators also raised operational issues such as whether they are required to make single rider adapted golf cars available for rental and whether they can restrict the use of golf cars on fairways and greens for certain weather or agronomic conditions.

*Response.* These issues go beyond the Board's jurisdiction and the requirements in this final rule. The Board anticipates that the Department of Justice will answer these operational issues when it amends its ADA regulations to incorporate the recreation facilities guidelines as standards.

### Section 15.5 Miniature Golf

#### Section 15.5.1 General

This section requires newly designed or newly constructed and altered miniature golf courses to comply with section 15.5.

#### Section 15.5.2 Accessible Holes

This section requires at least 50 percent of all holes to be accessible and that the accessible holes be consecutive. With the reduction in the minimum number of accessible holes on a miniature golf course, the Board wants to provide a more socially integrated golfing experience for people using wheelchairs or other mobility devices. An exception also permits one break in the sequence of consecutive accessible holes, provided that the last hole on the miniature golf course is the last hole in the sequence. This exception is provided to allow some flexibility in the layout and design of a miniature golf course.

*Comment.* Significant comment was received from miniature golf course

owners and operators regarding the number of holes required to be accessible. The proposed rule required each hole on a miniature golf course to be accessible, with an exception for 50 percent of elevated holes. Commenters were asked to give the Board guidance on differentiating between level and elevated holes. Few comments were received on definition alternatives. Some owners and operators believed that the requirement for all holes to be accessible would significantly impact course design to the extent that the experience may be "fundamentally altered." Others cited space limitations, concerns about slowing the game down, and having the effect of "compromising the challenge of the game."

*Response.* The Board has significantly reduced the number of holes required to be accessible in newly constructed miniature golf courses to 50 percent of all holes.

*Comment.* During the comment period following the draft final rule, the Miniature Golf Association recommended that instead of making 50 percent of the holes accessible, miniature golf facilities should have the option of providing tools, equipment, or assistive devices to provide access. They specifically requested that assistive devices such as electric carts be permitted as an alternative to an accessible route. Several other commenters opposed the reduction in the number of accessible holes, expressing concerns about limiting the game for persons with disabilities to only half of the holes.

*Response.* The Board has maintained the requirement that a minimum of 50 percent of all holes in new construction be accessible. The final rule does not recognize the alternative use of assistive devices for providing access in new construction. Designing miniature golf course holes so electric carts can safely maneuver through the holes is likely to have as great or greater impacts than designing an accessible route. Requiring individuals with disabilities to use electric carts on miniature golf courses is also inconsistent with other provisions of the ADA which require goods, services, and facilities to be afforded in the most integrated setting appropriate.

Given the diversity of layouts and designs of miniature golf courses, the final rule does not distinguish between courses with elevated holes or those with largely level holes. The 50 percent reduction represents a compromise given the concerns presented. Other considerations relate to the accessible route connecting accessible holes. The Board has established this reduction to

give relief where courses are designed on small parcels of land with existing terrain limitations. It is recommended that all holes on a miniature golf course be made accessible where space limitations and existing steep terrain are not present.

#### Section 15.5.3 Accessible Route

This section requires that the accessible route must connect the course entrance with the first accessible hole and the start of play area on each accessible hole. Since accessible holes must be consecutive, this section also requires the course to be configured to allow exit from the last accessible hole to the course exit or entrance. The course must be designed so as not to require an individual to back track through other holes to exit or move around the course. Where the accessible route is located on the playing surface of the accessible hole, five exceptions are permitted and are discussed below.

*Comment.* Miniature golf course operators were concerned that the surface commonly used on miniature golf course holes would not meet the requirements for accessible carpet. Their concerns were centered around the thickness of the surface. ADAAG 4.5.3 includes a requirement that the maximum pile thickness must be no more than 1/2 inch and be securely attached with a firm cushion, pad, or backing. Exposed edges must be fastened to floor surfaces and must have trim along the entire length of the exposed edge.

*Response.* The Board has added Exception 1 which exempts carpet used on miniature golf course holes from the provisions of ADAAG 4.5.3. Surfaces provided as a part of an accessible route, whether on or off the playing surface, must comply with ADAAG 4.5.2. ADAAG 4.5.2 requires the surface to be "stable, firm, and slip resistant."

*Comment.* Commenters raised concern about the use of readily removable curbs permitted in the proposed rule. Operators were concerned that their removable qualities would tempt younger players to use them inappropriately. Persons with disabilities questioned who would actually move the curbs and how problems related to their use would be addressed.

*Response.* The final rule does not allow the use of "readily removable curbs". This option was included to allow for passage on and off the course while containing the ball while in play. As an alternative, Exception 2 has been added which permits a 1 inch curb for an opening distance of 32 inches where the accessible route intersects the

playing surface of a hole. This permits passage of wheelchairs while containing the ball within the hole.

*Comment.* The proposed rule permitted a maximum slope of 1:4 for a 4 inch rise where the accessible route is located on the playing surface. A few commenters questioned how close together a designer could locate these steeply sloped surfaces. They were concerned about the appropriateness where these steep slopes existed for long distances without areas to rest.

*Response.* Exception 3 permits a slope of 1:4 maximum for a 4 inch rise where the accessible route is located on the playing surface of a hole. Exception 4 specifically addresses the issue of landings where sloped surfaces are provided. This exception permits the landings to be 48 inches long with slopes no greater than 1:20. ADAAG 4.8.4(3) requires landings to be 48 inches by 60 inches minimum, where ramps change direction. Providing a separation or break from the steeper slopes is necessary for individuals with disabilities to safely maneuver on the hole.

Exception 5 states that where the accessible route is located on the playing surface of a hole, handrails are not required.

#### *Section 15.5.3.2 Accessible Route—Adjacent to the Playing Surface*

Where the accessible route is located adjacent to the playing surface, the requirements of 4.3 apply. This provision clarifies that the accessible route may be located on the playing surface of the accessible hole or adjacent to the hole.

#### *Section 15.5.4 Start of Play Areas*

This section requires start of play areas required to comply with 15.5.2 to have a slope not steeper than 1:48 and to be 48 inches minimum by 60 inches minimum.

*Comment.* The proposed rule required the minimum space for the start of play area to be 60 inches by 60 inches. Commenters questioned the need for this space and recommended a reduction where possible especially where space limitations exist. Questions were also raised regarding the appropriateness of overlapping the accessible route with the start of play area.

*Response.* The final rule reduces the space required since the start of play area will usually not require a person using a wheelchair or mobility aid to make a complete turn. Rather, space is necessary for positioning to take the first shot of the hole. Consistent with ADAAG, unless otherwise specified, the accessible route and the clear space

required at the start of play area are permitted to overlap.

#### *Section 15.5.5 Golf Club Reach Range*

This section requires all areas within accessible holes where golf balls rest to be within 36 inches maximum of an accessible route having a maximum slope of 1:20.

*Comment.* The proposed rule required that all level areas within accessible holes where golf balls rest be within 27 inches maximum of an accessible route. A few commenters questioned the appropriateness of the 27 inch dimension. They recommended an increase to include a broader range of skill levels and golf club lengths.

*Response.* The distance from the level areas has been increased to 36 inches to balance the impact on course design and incorporate the reach of a typical adult size golf club. This is a maximum distance from the accessible route which may be located either on the hole or adjacent to the hole. Where possible, designers should locate the accessible route as close as possible to the level areas on the course. This will improve the ability to reach the golf ball for a variety of users.

#### *Section 15.7 Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities*

##### *Section 15.7.1 General*

This section requires all newly designed or newly constructed and altered exercise equipment and machines, bowling lanes, and shooting facilities to comply with section 15.7.

##### *Section 15.7.2 Exercise Equipment and Machines*

This section requires at least one of each type of exercise equipment and machines to be provided with clear floor space complying with ADAAG 4.2.4 and be served by an accessible route. Clear floor space must be positioned for transfer or for use by an individual seated in a wheelchair. Clear floor spaces for more than one piece of equipment are permitted to overlap. Permitting clear spaces to overlap should reduce the space requirements within an exercise or health club facility.

*Comment.* The American Hotel and Lodging Association commented that the requirement for clear space at exercise equipment and machines created a burden for the lodging industry. Similar comments were also received from the International Health, Racquet, and Sport Club Association, who indicated that space limitations present in existing facilities will prohibit compliance with this provision.

*Response.* These guidelines apply only to newly constructed and altered buildings and facilities. Where exercise equipment and machines are altered or added to a facility, the provisions of 15.7.1 apply to those pieces that are altered or added. In the case of altered exercise equipment or machines, the provisions of ADAAG 4.1.6(1)(j) related to “technical infeasibility” will also apply. ADAAG 4.1.6(1)(j) permits departure from the technical provisions where existing physical or site constraints prohibit full compliance. Space limitations may prohibit full compliance with 15.7.2. In this case, designers and operators must comply to the “maximum extent feasible”.

Requirements for existing buildings and facilities are addressed in the Department of Justice regulations and are subject to the requirements for “readily achievable barrier removal” where the facility is covered by title III of the ADA. Facilities covered by title II of the ADA are subject to the requirements for “program accessibility”. See discussion in the background section of this preamble.

An appendix note is added to provide guidance on exercise equipment and machine layout to maximize space.

*Comment.* A few commenters requested guidance on what is intended with respect to “types” of exercise equipment and machines. Others suggested that the Board should not require access to exercise machines or equipment that require the user to stand such as tread mills or stair climbers.

*Response.* The final rule is not limited to exercise equipment or machines that do not require standing. Access to the various pieces of exercise equipment serves individuals who use mobility aids such as scooters and wheelchairs. Individuals with ambulatory disabilities including those using walkers, canes, and crutches will also benefit from an accessible route and clear floor space next to a treadmill or stationary bike or other exercise equipment. An appendix note provides guidance on the different types of exercise equipment and machines. It also suggests that owners and operators consider including exercise equipment and machines within their facilities that provide for upper body cardiovascular exercise. This will add to the diversity of exercise options for everyone.

With respect to the issue of “type”, a stationary bicycle would be considered one type. A rowing machine would also be considered a type. While both provide a cardiovascular exercise, they are considered two different types for purposes of these guidelines. In terms of strength training machines, a bench

press machine is considered a different type than a biceps curl machine. The requirement for providing access to each type is intended to cover the variety of strength training machines. Where operators provide a biceps curl machine and free weights, both are required to meet the provisions in this section, even though an individual may be able to work on their biceps through both types of equipment. Where the exercise equipment and machines are only different in that different manufacturers provide them, only one of each type of machine is required to meet these guidelines. For example, where two bench press machines are provided and each is manufactured by a different company, only one is required to comply.

#### Section 15.7.3 Bowling Lanes

This section requires that where bowling lanes are provided, at least 5 percent, but not less than one lane of each type must be accessible.

*Comment.* The Bowlers Proprietors Association expressed concern about requiring 5 percent of bowling lanes to be accessible. Their comments focused on the difficulty of providing ramps to gain access to bowling lanes within existing facilities. They also questioned how to apply the 5 percent minimum requirement where a bowling facility has multiple lanes.

*Response.* As previously indicated, these guidelines apply to newly constructed and altered facilities. When a bowling facility is altered, the provisions of 15.7.2 will apply to the lane that is undergoing an alteration and does not require all other lanes to be modified unless required by ADAAG 4.1.6 (Path of Travel). Other obligations related to existing facilities covered by titles II and III of the ADA are addressed in the Department of Justice regulations.

Where the required number of accessible elements to be provided is determined by calculations of ratios or percentages and remainders or fractions result, the next greater whole number of such elements should be provided. For example, if 18 lanes of one type are provided, one lane would be required to be accessible in new construction. If 24 bowling lanes of one type are provided in new construction, a minimum of two accessible bowling lanes would be required in new construction.

*Comment.* The Bowlers Proprietors Association also expressed concern about the number of accessible bowling lanes required in those facilities where different types of bowling is provided. They were also concerned about facilities that provide both ten pin and duck pin bowling. They believed that a

5 percent requirement for both types was excessive and recommended that the requirement be limited to the type that is dominant within a given facility. Further, the Bowlers Proprietors Association questioned what made a bowling lane accessible.

*Response.* In facilities where both ten pin and duck pin bowling are provided, the 5 percent requirement for each type will typically result in one of each type of lane being accessible.

The final rule does not include any further technical provisions for bowling lanes required to be accessible. Like other areas of sport activity, the requirement is for an accessible route to connect to the area of sport activity, in this case, the bowling lane. Specific exemptions to ADAAG 4.4 (protruding objects) and 4.5 (surfacing requirements) are applied within the area of sport activity. Therefore, bowling lanes which are necessarily waxed to allow the ball to travel, are not required to be slip resistant.

#### Section 15.7.4 Shooting Facilities

This section requires that where fixed firing positions are provided at a site, at least 5 percent, but not less than one, of each type of firing position must be accessible.

*Comment.* A few commenters questioned why the Board did not require an accessible route to the target areas as well as the fixed firing positions. Commenters also questioned the application of this section to trap and skeet facilities where the facilities are not entirely fixed. Others questioned what factors should be considered in determining the different types of firing positions.

*Response.* The Board has not included a requirement for an accessible route to the target areas since targets are often moveable, making it difficult to locate the accessible route effectively. There is also difficulty in defining what is considered the "target" area. Where facilities contain a combination of fixed and non-fixed elements, operators should consider the general nondiscrimination requirements of the ADA. Direction on these and other issues related to the use of shooting facilities should be obtained from the Department of Justice. Factors to be considered in determining the types of fixed firing positions include whether covering and lighting is provided, and which shooting events the fixed firing position is intended to support.

#### Section 15.7.4.1 Fixed Firing Positions

This section requires that accessible fixed firing positions contain a 60 inch diameter space and have a slope not

steeper than 1:48. No substantive comments were received and no changes have been made to this provision in the final rule.

#### Section 15.8 Swimming Pools, Wading Pools, and Spas

##### Section 3.5 Definitions

The final rule provides a definition for a catch pool which is defined as a pool used as a terminus for water slide flumes.

*Comment.* The proposed rule did not define the term catch pool. Commenters requested that catch pools be exempt since access is not required for water slides.

*Response.* The term "catch pool" is added to the final rule since it is used in an exception in the final rule. Exception 3 to section 15.8.1 exempts catch pools from complying with the requirements of this section, provided that an accessible route connects to the catch pool edge.

##### Section 15.8.1 General

This section requires newly designed or newly constructed and altered swimming pools, wading pools, and spas to comply with 15.8. An exception has been added to the final rule that provides that an accessible route is not required to serve raised diving boards or diving platforms provided that an accessible route is provided to the base of the raised diving board or platform.

##### Section 15.8.2 Swimming Pools

This section requires that at least two means of entry be provided for each public or common use swimming pool. A sloped entry or lift must be one of the primary means of access. The secondary means of access could include a pool lift, sloped entry, transfer wall, transfer system, or pool stairs.

*Comment.* The proposed rule permitted a moveable floor as a secondary means of entry. Commenters stated that even though moveable floors may have some practical applications they do not provide independent access and often place a person with a disability on display while the pool is evacuated and the floor raised to provide access. Additionally, commenters raised concerns regarding the removal of handrails and other means of egress prior to lifting the pool floor.

*Response.* The option of using a moveable floor as a secondary means of accessible entry in public or common use swimming pools has been deleted from the final rule.

The Board has also deleted the requirement that the second means of access not duplicate the first means of

access in larger pools in the final rule. This should give designers additional flexibility in choosing between the various means of access. An appendix note recommends that where two means of access into the water are provided, different means are recommended.

*Exception 1 Small Pools With Less Than 300 Linear Feet of Pool Wall*

Exception 1 permits public or common use swimming pools with less than 300 linear feet of pool wall to only provide one accessible means of entry by either a swimming pool lift or a sloped entry.

*Comment.* A commenter suggested that Exception 1 should be modified to refer to pool wall that is available for entry into the pool. They explained that pool walls at diving areas and pool decks where there is no available pool entry because of landscaping or adjacent structures should not be counted when determining the number of accessible means of entry required.

*Response.* Exception 1 is intended to provide small pools with relief from providing more than one accessible means of entry. It was not intended for large pools that could limit the locations of entry with landscaping or other structures from requiring additional accessible means of entry.

*Exception 2 Pools Where Access Is Limited to One Area*

Exception 2 has been added to the final rule and permits wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to only one area, to provide one accessible means of entry by either a swimming pool lift, sloped entry, or a transfer system.

*Comment.* Commenters from speciality pool operators and leisure river designers expressed concerns for safety, where there is wave action or moving water, when providing additional accessible means of entry in these unique water environments. Wave action pools typically provide a large area of zero grade entry, where everyone enters the water. Providing an accessible means of entry along the high walls could be very dangerous. Leisure rivers are constructed to provide a safe area where staff can assist individuals into the current at one location to control access to and from the moving water.

*Response.* In response to the safety concerns provided by designers and operators of these moving water experiences, only one accessible means of entry is required in the final rule, when user access is limited to one area.

*Exception 3 Catch Pools*

Exception 3 exempts catch pools from these requirements, provided that an accessible route connects to the catch pool edge.

*Comment.* The proposed rule did not include any specific requirements for access to water slides. Comments on the proposed rule and the draft final rule supported not requiring access to the top of water slides.

*Response.* An exception has been added to the final rule exempting water slides from accessibility. See ADAAG 4.1.1 (5) (b) (v). To be consistent with the water slide exception, the final rule also exempts the catch pool at the discharge area of a water slide from providing an accessible means of entry or exit from the catch pool, provided that an accessible route connects to the catch pool edge.

*Section 15.8.3 Wading Pools*

This section requires at least one accessible means of entry into each wading pool. The means of entry must be a sloped entry.

*Comment.* The proposed rule required the means of entry into wading pools to be either a sloped entry, transfer wall, or a transfer system. The proposed rule also sought comment on the appropriateness of providing a transfer wall or other transfer system as a means of access into a wading pool. Several commenters expressed concern about the potential dangers to children that may use the transfer walls or systems inappropriately for play or diving.

*Response.* The final rule limits the accessible means of entry into a wading pool to a sloped entry only. Examination of the different means of access into wading pools found zero grade entry to be the most appropriate and currently most provided means of entry.

*Section 15.8.4 Spas*

This section requires at least one accessible means of entry into spas. The means of entry must be a pool lift, transfer wall, or transfer system. An exception allows for five percent, but not less than one spa, where spas are provided in a cluster, to be accessible. No substantive comment was received and no changes have been made to this section in the final rule.

*Section 15.8.5 Pool Lifts*

This section provides the technical requirements for pool lifts.

*Section 15.8.5.1 Pool Lift Location*

This provision requires pool lifts to be located where the water level does not exceed 48 inches.

*Comment.* The proposed rule did not specify the location of a pool lift. Commenters with disabilities and individuals who work in environments where people with disabilities use pool lifts expressed concern that pool lifts may be placed in areas where the water depth would not permit assistance in the water if needed. Comments on the draft final rule supported the requirement for a pool lift to be located in a water depth of 48 inches or less whenever possible. Commenters also gave examples of when the location of a pool lift should be allowed in an area where the water depth is greater than 48 inches.

*Response.* The final rule requires a pool lift to be located where the water level does not exceed 48 inches. Two exceptions have been added to the final rule in response to comments received. Exception 1 permits the use of pool lifts at any location where the entire pool has a depth greater than 48 inches. Exception 2 permits pools with multiple pool lift locations to provide at least one where the water depth does not exceed 48 inches.

*Section 15.8.5.2 Seat Location*

This section requires the centerline of the seat, when in the raised position, to be located over the deck and 16 inches minimum from the edge of the pool. Additionally, the deck surface between the centerline of the seat and the pool edge must not have a slope greater than 1:48.

*Comment.* The proposed rule required the centerline of the seat, when in the raised position, to be located over the deck and 20 inches minimum from the pool edge. Comments from lift manufacturers expressed concern about the 20 inch minimum distance. They elaborated on the difficulties associated with providing a lift that places the user away from the pivot point of the lift a distance of 20 inches. Additionally, they commented that aquatic lifts with the centerline of the seat at least 20 inches away from the pool edge may not clear the footrest over the curbing or pool edge provided on some pools.

*Response.* Based on the concerns of commenters, the distance measured from the centerline of the lift seat to the edge of the pool has been reduced from 20 inches to 16 inches minimum. The location of the seat in relation to the edge of the pool is especially important to facilitate safe transfers. The Board is concerned about locating the seat either over the water or too close to the deck edge for safety reasons. This provision has been modified to address design limitations and incorporate the

maximum distance from the pool edge to ensure safety.

#### *Section 15.8.5.3 Clear Deck Space*

This section requires a clear deck space on the side of the seat opposite the water and parallel with the seat. The space is required to be 36 inches wide minimum and to extend forward 48 inches minimum from a line located 12 inches behind the rear edge of the seat. The clear space is specified in relationship to the seat to allow unobstructed space for either side or diagonal transfer. Additionally, the clear deck space must have a slope not greater than 1:48.

*Comment.* The proposed rule required the clear deck space to be a minimum of 30 inches wide. Commenters requested additional space to permit greater flexibility for transfer position preferences and the varied abilities of persons requiring the use of a pool lift. Commenters expressed a preference that the clear deck space should be required to provide a level surface from which to transfer from a mobility device to the lift seat.

*Response.* The final rule increases the clear deck space required on the side of the seat opposite the water to be a width of 36 inches minimum and that the clear deck space provide a surface with a slope not greater than 1:48. The additional space will facilitate the maneuvering that may be needed by a person using a mobility device preparing for a transfer to the seat of a pool lift.

#### *Section 15.8.5.4 Seat Height*

This section requires the height of a lift seat to be designed to allow a stop at 16 inches minimum to 19 inches maximum measured from the deck to the top of the seat surface when the seat is in the raised (load) position.

*Comment.* The proposed rule required the height of the lift seat to be 16 inches minimum to 18 inches maximum. Commenters requested a greater range of seat heights to transfer to or from when the lift is in the up position. They suggested a seat height that could accommodate the needs of users of all ages and abilities would be more beneficial.

*Response.* Information obtained from the Board sponsored research project supported the height requirement of a lift seat while in the upper load position to be at a height between 16 and 18 inches from the deck surface. In response to the comments received, the final rule departs slightly from the proposed rule, by permitting the lift seat to make a stop at the 16 to 19 inch height above the deck surface. The lift

could provide additional stops at various heights provided that a stop is provided between 16 and 19 inches above the surface of the deck.

#### *Section 15.8.5.5 Seat Width*

This section requires a lift seat to be 16 inches wide minimum. No substantive comment was received and no changes have been made to this section in the final rule.

*Comment.* The proposed rule sought information on the different types of seats that are available on pool lifts and whether a specific type should be required in the final rule. Commenters did not provide a consensus on either the type of pool lift seat or the type of materials preferred by pool lift users.

*Response.* The final rule does not specify the type of material or the type of seat to be provided by a pool lift. Persons with disabilities involved in the Board sponsored research project expressed interest in all types of seats. An appendix note provides additional information on pool lift seats.

#### *Section 15.8.5.6 Footrests and Armrests*

This section requires footrests to be provided and that they move in conjunction with the seat. Additionally, this provision requires that, if provided, the armrest opposite the water be removable or fold clear of the seat when the seat is in the raised (load) position.

*Comment.* The proposed rule requested information on the appropriateness of requiring armrests on pool lifts and on their size and location. Commenters supported requirements based on their own personal needs with no consistent guidance on the location or size of armrests on a pool lift. One commenter questioned the appropriateness of providing a footrest on a lift for entry into a spa due to the water depth in some smaller spas.

*Response.* An exception has been added that provides that footrests are not required on pool lifts that provide an accessible means of entry into a spa. An appendix note encourages the use of a footrest in larger spas where possible and some type of retractable leg support is recommended for pool lifts used in all spas.

#### *Section 15.8.5.7 Operation*

This section requires that a pool lift be capable of unassisted operation from both the deck and water levels. This section also requires that controls and operating mechanisms be unobstructed when a lift is in use and comply with ADAAG 4.27.4. That section requires that operating controls not require tight grasping, pinching, or twisting of the

wrist or more than 5 pounds of pressure to operate.

*Comment.* The proposed rule required that the lift controls and operating mechanisms may not require continuous manual pressure for operation. Commenters with disabilities supported the requirement of unassisted operation from both the deck and water levels. They reported the difficulty in finding the responsible person when lifts require assistance, especially in environments where pools are not routinely staffed. Commenters expressed concerns about getting out of the water, if assistance is required, especially where the pool is not staffed. Someone could be stranded in the water for extended periods of time awaiting assistance. Commenters suggested that pool lifts that require continuous manual pressure give the user greater control of their descent into the water and ascent back to the deck. Concern was expressed by a manufacturer of pool lifts that providing unassisted operation encourages individuals to swim alone and the potential dangers of causing injury are greatly increased when using an automatic lift without assistance.

*Response.* A large percentage of the respondents in the Board sponsored research project noted the importance of using a lift without assistance. Pool facility staff also indicated the importance of a device or design that could be used without pool staff assistance. While this provision requires the lift to be independently operable it does not preclude assistance from being provided. The final rule removes the requirement that pool lifts may not require continuous manual pressure for operation.

*Comment.* A few commenters expressed safety concerns where pool lifts are provided in pools that are unattended.

*Response.* Pool lifts have been commercially available for over 20 years. While the Board recognizes that inappropriate use of pool lifts may result in accident or injury, the Board is not aware of any incidents of injury or accidents involving pool lifts. The Board is also not aware of any evidence that shows that pool lifts are any less safe than other components of a pool facility, such as other means of pool entry, when they are used inappropriately. Manufacturers are also incorporating features which are intended to discourage inappropriate use, such as fold-up seats and covers.

#### *Section 15.8.5.8 Submerged Depth*

This section requires that a pool lift be designed so that the seat will

submerge to a water depth of 18 inches minimum. This depth is necessary to ensure buoyancy for the person on the lift seat once in the water. No substantive comment was received and no changes have been made to this section for the final rule.

#### *Section 15.8.5.9 Lifting Capacity*

This section requires that single person pool lifts provide a minimum weight capacity of 300 pounds. Lifts also must be capable of sustaining a static load of at least one and a half times the rated load.

*Comment.* The proposed rule required pool lifts to provide a minimum weight capacity of 300 pounds and be capable of sustaining a static load of at least three times the rated load. Several pool lift manufacturers supported the minimum weight requirement of 300 pounds. They questioned requiring a static load of three times the weight limit. They believed it was too excessive and would eliminate viable lifts from being provided. A commenter suggested that the static load requirement reference an international standard for lifts that require a static load of 1.6 times the weight capacity.

*Response.* The static load requirement has been reduced to one and a half times the weight capacity requirement.

#### *Section 15.8.6 Sloped Entries*

This section provides technical requirements for sloped entries designed to provide access into the water. Due to the similarities of this type of entry with ramps used in other buildings and facilities, existing ADAAG requirements have been referenced accordingly.

##### *Section 15.8.6.1 Sloped Entries*

This section requires sloped entries to comply with ADAAG 4.3 (Accessible Route), except for slip resistance.

*Comment.* Commenters questioned the ability of providing a slip resistant surface on a sloped entry that is under water.

*Response.* The final rule provides an exception for sloped entries from being slip resistant.

##### *Section 15.8.6.2 Submerged Depth*

This section requires sloped entries to extend to a depth of 24 to 30 inches below the stationary water level. This section also requires that where landings are required by ADAAG 4.8, at least one landing must be located between 24 and 30 inches below the stationary water level. Since wading pools are typically less than 24 to 30 inches deep, an exception provides that sloped entries are only required to

extend to the deepest part of a wading pool. No substantive comment was received and no changes have been made to this section in the final rule.

##### *Section 15.8.6.3 Handrails*

This section requires handrails that comply with ADAAG 4.8.5 on both sides of all sloped entries. The clear width between handrails must be between 33 and 38 inches. Exception 1 does not require handrail extensions to be provided at the bottom of a landing serving a sloped entry. Exception 2 does not require the clear width between handrails where a sloped entry is provided for wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area. Exception 3 exempts sloped entries in wading pools from providing handrails.

*Comment.* The proposed rule did not specifically address handrails in wading pools. Commenters expressed great concern about the potential dangers from children using handrails to play on or jump into the shallow water or the risk to other children in the wading pool.

*Response.* The Board is concerned about the potential dangers to children using handrails inappropriately. Exception 3 has been added to the final rule exempting wading pools from providing handrails.

#### *Section 15.8.7 Transfer Walls*

This section provides technical requirements for transfer walls.

##### *Section 15.8.7.1 Clear Deck Space*

This section requires clear deck space of 60 inches by 60 inches minimum with a slope not steeper than 1:48 to be provided at the base of a transfer wall. Where one grab bar is provided on a transfer wall, the clear deck space must be centered on the grab bar. This allows sufficient space for a transfer on either side of the grab bar. Where two grab bars are provided, the clear deck space must be centered on the clearance between the grab bars. No substantive comment was received and no changes have been made to this section for the final rule.

##### *Section 15.8.7.2 Height*

This section requires the height of transfer walls to be 16 to 19 inches measured from the deck below. The height requirement is consistent with pool lift seat heights and similarly addresses the needs of some children. The maximum height above the deck has been changed to 19 inches to be consistent with other transfer heights in ADAAG.

##### *Section 15.8.7.3 Wall Depth and Length*

This section requires the depth of a transfer wall to be 12 to 16 inches. As a minimum, the 12 inch depth of the transfer wall provides adequate space for a person to comfortably sit on the surface of the wall. The wall depth is limited to 16 inches maximum so that users are not required to traverse the wall to transfer to the water. The length of the transfer wall must be 60 inches minimum and must be centered on the clear deck space.

##### *Section 15.8.7.4 Surface*

This section requires that the surface of a transfer wall must not be sharp and must have rounded edges. Commenters overwhelmingly supported this section and no changes have been made to this section for the final rule.

##### *Section 15.8.7.5 Grab Bars*

This section requires at least one grab bar to be provided on a transfer wall. Grab bars are required to be perpendicular to the pool wall and extend the full depth of the wall. The top of the gripping surface must be 4 to 6 inches above the wall. Where two grab bars are provided, clearance between grab bars must be 24 inches minimum. Where one grab bar is provided, clearance must be 24 inches minimum on both sides of the grab bar. Grab bars must comply with ADAAG 4.26.

*Comment.* The proposed rule required the top of the gripping surface to be a maximum of 4 inches above the wall. Commenters expressed concern that 4 inches maximum above the wall surface, after factoring in the diameter of the grab bar, would not provide sufficient gripping space for persons transferring.

*Response.* The final rule provides a range from 4 to 6 inches above the wall to the top of the gripping surface. The range will provide greater flexibility and incorporate the diameter of the grab bar in providing users of all ages and abilities with an appropriate gripping surface.

##### *Section 15.8.8 Transfer Systems*

This section provides technical requirements for transfer systems used as a means of access into the water. A transfer system consists of a transfer platform, combined with a series of transfer steps that descend into the water. Users must transfer from their wheelchair or mobility device to the transfer platform and continue transferring from step to step.

#### *Section 15.8.8.1 Transfer Platform*

This section requires a transfer platform to be 19 inches deep by 24 inches wide. Transfer platforms must be provided at the head of each transfer system. No substantive comment was received and no changes have been made to this section for the final rule.

#### *Section 15.8.8.2 Clear Deck Space*

This section requires a clear deck space of 60 by 60 inches minimum with a slope not steeper than 1:48 at the base of the transfer platform. A level unobstructed space at the base of the transfer platform, centered along the 24 inch side, is necessary to facilitate a transfer from a wheelchair or mobility device. No substantive comment was received and no changes have been made to this section for the final rule.

#### *Section 15.8.8.3 Height*

This section requires the height of transfer platforms to be 16 to 19 inches measured from the deck. No substantive comment was received and no changes have been made to this section for the final rule.

#### *Section 15.8.8.4 Transfer Steps*

This section requires transfer steps to be 8 inches maximum in height. It also requires that transfer steps extend to a water depth of 18 inches minimum.

*Comment.* The proposed rule required transfer steps to be 7 inches maximum in height. Commenters questioned the inconsistencies between the transfer step height of 8 inches required on a play area transfer step (15.6.5.2.2) to that provided in an aquatic setting.

*Response.* The final rule has been changed to require an 8 inch maximum step height in aquatic settings to be consistent with the play areas transfer step (15.6.5.2.2). An appendix note has been included recommending the height of the transfer step be minimized whenever possible.

#### *Section 15.8.8.5 Surface*

This section requires that the surface of a transfer system must not be sharp and provide rounded edges. Similar to other transfer surfaces, this is necessary to reduce the potential for injury. No substantive comment was received and no changes have been made to this section in the final rule.

#### *Section 15.8.8.6 Size*

This section requires each transfer step to have a tread depth of 14 to 17 inches and a minimum tread width of 24 inches.

*Comment.* The proposed rule required a range for the transfer step depth from 12 to 17 inches and a tread width of 22

inches minimum. Commenters pointed out the inconsistencies between the size of the transfer step in the play areas final rule (15.6.5.2.1) and for swimming pools.

*Response.* In an effort to provide uniformity between the play areas transfer steps and those located at swimming pools, the final rule modifies the transfer step to incorporate a range of 14 to 17 inches in depth and a minimum width of 24 inches.

#### *Section 15.8.8.7 Grab Bars*

This section requires one grab bar to be provided on each step and the transfer platform, or a continuous grab bar serving each transfer step and the transfer platform. Where provided on each step, the top of the gripping surface must be 4 to 6 inches above each step. Where a continuous grab bar is provided, the top of the gripping surface must be 4 to 6 inches above the step nosing. Grab bars must comply with ADAAG 4.26 and be located on at least one side of the transfer system. The grab bar located at the transfer platform must not obstruct transfer.

*Comment.* As previously discussed in section 15.8.7.5, the proposed rule required the top of the gripping surface to be 4 inches above the wall.

Commenters expressed concern that 4 inches above the wall surface, after factoring in the diameter of the grab bar, would not provide sufficient space for persons transferring.

*Response.* The final rule requires the top of the gripping surface to be 4 to 6 inches above the wall. It is believed that the range will provide greater flexibility to users of all ages and abilities with an appropriate gripping surface.

#### *Section 15.8.9 Pool Stairs*

This section provides technical requirements for pool stairs used as a means of entry and exit to the water.

##### *Section 15.8.9.1 Pool Stairs*

This section requires pool stairs to comply with ADAAG 4.9 (Stairs), except as modified. ADAAG 4.9 has been referenced since stairs in pools are used in a similar manner as stairs elsewhere. No substantive comment was received and no changes have been made to this section in the final rule.

##### *Section 15.8.9.2 Handrails*

This section requires the width between handrails to be 20 to 24 inches. To reduce the potential for underwater protrusions, handrail extensions are not required at the bottom landing serving a pool stair.

*Comment.* The proposed rule required a 22 inch maximum width between

handrails on pool stairs. Commenters expressed concern that a maximum distance of 22 inches may be too close for people that are large in size. Commenters with mobility impairments supported the handrail distance of 22 inches for providing the needed support while entering a pool by stairs.

*Response.* The final rule increases the maximum width between handrails to 24 inches. Separating the handrails more than 24 inches apart would make them too far apart for a larger class of people that require the support on pool stairs.

#### *Section 15.8.10 Water Play Components*

This section requires that where water play components are provided, the provisions of 15.6 (Play Areas) and ADAAG 4.3 apply, except where modified by this section.

*Comment.* The proposed rule sought comment on specific features within aquatic recreation facilities where it may be technically infeasible in new construction to comply with the proposed requirements in 15.8. Manufacturers and designers of water play components expressed concerns about having to provide ramp access to elevated play structures in standing water. Many of these components are at considerable distances from the top of the water surface and ramping would be very challenging and costly.

Commenters with disabilities or individuals representing individuals with disabilities expressed a great desire to have access to these unique water experiences.

*Response.* The final rule requires that where water play components are provided, they must comply with 15.6 (Play Areas) and ADAAG 4.3, except as modified or otherwise provided in this section. The final rule is responsive to manufacturers and designers by providing an exception to providing ramp access, while providing persons with disabilities the opportunity to enjoy this unique family oriented water experience with their family and friends. Exception 1 exempts accessible routes, clear floor spaces, and maneuvering spaces that are submerged from the requirements for cross slope, running slope, and surface. Exception 2 permits transfer systems to be used in lieu of ramps to connect elevated play components.

#### **Regulatory Process Matters**

##### *Executive Order 12866: Regulatory Planning and Review*

This final rule is a significant regulatory action under Executive Order

12866 and has been reviewed by the Office of Management and Budget. The Board has assessed the benefits and costs of the rule. The assessment has been placed in the public docket and is available for inspection. The assessment is also available on the Board's Internet site (<http://www.access-board.gov>). The assessment is summarized below:

#### Benefits

The benefits of the final rule are not quantifiable, but are significant and are consistent with the President's New Freedom Initiative. The primary benefit is the fulfillment of civil rights realized by individuals with disabilities. There are 52.5 million Americans with disabilities. Almost one in five adults has some type of disability. Among individuals 15 years old and over, 25 million have difficulty walking or using stairs. The final guidelines will result in newly constructed and altered recreation facilities that are accessible to individuals with disabilities and will enable them to participate in a wide range of recreational opportunities. Individuals with disabilities can also realize significant health benefits by participating in the range of recreational opportunities made accessible as a result of the final guidelines.

#### Costs

For each type of facility addressed by the final rule, the assessment estimates the number of existing facilities and new facilities constructed annually, identifies the requirements that have cost impacts for new construction and alterations, estimates the unit costs per facility, and calculates the total annual compliance costs. The number of small entities is reported as a percentage of the facilities. To estimate cost impacts, the assessment relies on assumptions where sufficient data is not available. The assumptions are based on interviews with professionals in the affected industries and are disclosed in the assessment. The assumptions cannot be validated and may not reflect the real world. The assumptions may result in under or overestimating the impacts of the final rule. The relevant data for each facility type is presented below.

#### Amusement Rides

*Existing Facilities:* 377 amusement parks.

*New Construction:* 4 new amusement parks per year.

*Small Entities:* 81 percent of amusement parks.

*New Amusement Rides:* 343 new rides per year; 68 will be platform type rides with stepped entrances.

*New Construction Impacts:* New platform type rides with stepped entrances will need a ramp (\$4,000 to \$6,700 unit cost) or a platform lift (\$12,000 to \$15,000 unit cost) to provide an accessible route to the load and unload area; and additional space (\$1,175 unit cost) in the load and unload area to provide wheelchair turning space and wheelchair storage space if a ride seat designed for transfer or transfer device is provided. For purposes of estimating the costs of providing access to new rides, the assessment assumes that a transfer device (\$5,000 unit cost) would be provided for all new rides. New rides will need a sign (\$100 unit cost) at the entrance of the queue or waiting line indicating the type of access provided (e.g., wheelchair access or transfer access).

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* \$2.5 million.

#### Boating Facilities

*Existing Facilities:* 12,000 marinas; no data on boat launch ramps.

*New Construction:* 240 new marinas per year.

*Alterations:* 600 existing marinas per year.

*Small Entities:* 99 percent of marinas.

*New Construction Impacts:* Gangways that are part of an accessible route will need to provide a 1:12 maximum slope or a gangway at least 80 feet long. The unit cost will be site specific. The assessment assumes unit costs will range from \$15,000 to \$35,000 where the maximum vertical level change is more than 2.5 feet, but less than 10 feet; and \$33,000 to \$45,000 where the maximum vertical level change is more than 10 feet. The impacts on new accessible boat slips and new accessible boarding piers at new boat launch ramps will be minimal.

*Alterations Impacts:* Alterations to existing boat slips are a primary function area and may trigger provision of an accessible route, unless the additional cost is disproportionate to the overall costs of the alterations or compliance is technically infeasible. The impacts on altered boat slips will be minimal.

*Total Annual Compliance Costs:* \$10.8 million to \$18.0 million.

#### Fishing Piers and Platforms

*Existing Facilities:* No data.

*New Construction:* No data.

*Small Entities:* No data.

*New Construction Impacts:* Minimal.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* Minimal

#### Golf Courses

*Existing Facilities:* 17,108 golf courses.

*New Construction:* 377 to 524 new golf courses per year.

*Small Entities:* 99 percent of golf courses.

*New Construction Impacts:* Minimal.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* Minimal.

#### Miniature Golf Courses

*Existing Facilities:* 7,500 to 10,000 miniature golf courses.

*New Construction:* 150 new custom design and 170 new modular miniature golf courses per year.

*Small Entities:* 100 percent of miniature golf courses.

*New Construction Impacts:* The assessment discusses potential impacts on new custom design courses (low profile courses, challenge courses, and adventure style courses) and new modular courses (indoor courses and outdoor courses). The impacts on new custom design low profile courses will be minimal. For purposes of estimating the costs for making at least 50 percent of the holes on the other custom design courses accessible, the assessment assumes a 10 percent increase in construction costs for new challenge type courses, and a 25 percent increase for new adventure style courses. New indoor modular courses may need to lease additional space to provide an accessible route for at least 50 percent of the holes, and new outdoor modular courses that are not recessed in the ground will have to provide an accessible route for at least 50 percent of the holes. The assessment assumes the additional cost for new modular courses will \$5,000 per course.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* \$5.4 million.

#### Exercise Equipment, Bowling Lanes, and Shooting Facilities

*Existing Facilities:* 17,531 physical fitness facilities; 5,500 bowling centers; and 10,000 shooting facilities. No data on other facilities that provide exercise equipment.

*New Construction:* 800 to 1,000 new physical fitness facilities; 25 new bowling centers; and 100 new shooting facilities per year.

*Small Entities:* 99 percent of physical fitness facilities; and 100 percent of bowling centers and shooting facilities.

*New Construction Impacts:* Minimal.

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* Minimal.

## Swimming Pools, Wading Pools, and Spas

*Existing Facilities:* 124,577 pools; no data on spas.

*New Construction:* 1,245 new pools per year; 565 new spas per year. The assessment assumes 715 new pools per year have less than 300 linear feet of pool wall and will need at least one means of accessible entry into the pool.

*Small Entities:* Ranges from 15 percent for private hospitals to 100 percent for camps and recreational vehicle parks.

*New Construction Impacts:* For new pools with less than 300 linear feet of pool wall, the assessment assumes that a pool lift will be provided (\$4,000 unit cost). For pools with 300 linear feet or more of pool wall, the assessment assumes 250 of these new pools per year will provide an accessible means of entry in the absence of the final rule and will add a pool lift (\$4,000 unit cost). The assessment assumes the other new pools with 300 linear feet or more of pool wall will provide a pool lift (\$4,000 unit cost) and pool stairs (\$2,500 unit cost). The impacts on wading pools will be minimal. The assessment assumes new spas will provide a pool lift (\$4,000 unit cost).

*Alterations Impacts:* Minimal.

*Total Annual Compliance Costs:* \$8.0 million.

### Regulatory Flexibility Act

The final regulatory flexibility analysis has been performed in conjunction with the assessment of the benefits and costs of the final rule required by Executive Order 12866 and the preparation of the preamble for the final rule. The analysis is summarized below.

#### Need for and Objectives of Guidelines

The Access Board is required to issue accessibility guidelines under the Americans with Disabilities Act (ADA) to ensure that new construction and alterations of facilities covered by the law are readily accessible to and usable by individuals with disabilities. Recreation facilities are among the facilities covered by the ADA. Recreation facilities have unique features that are not adequately addressed by the Americans with Disabilities Act Accessibility Guidelines (ADAAG). The final rule will amend ADAAG to provide supplemental guidelines for making recreation facilities accessible.

#### Significant Issues Raised During Public Comment Period

The significant comments raised during the public comment period are

summarized in the preamble to the final rule, along with the Access Board's assessment of the comments and the reason for selecting the alternative adopted in the final rule. The alternatives considered in the proposed rule and the final rule, and changes made from the proposed rule for each type of recreation facility are presented in the assessment of the benefits and costs of the final rule required by Executive Order 12866.

#### Numbers of Small Entities Affected by Final Rule

The numbers of small entities affected by the final rule are reported under the summary of the assessment of the benefits and costs of the final rule required by Executive Order 12866.

#### Reporting and Recordkeeping Requirements

There are no reporting and recordkeeping requirements.

#### Steps Taken To Minimize Significant Economic Impact on Small Entities

The Access Board has taken steps to minimize the significant economic impact on small entities for each of the different types of recreation facilities addressed in the final rule. These steps are listed below.

- *Amusement Rides*—The final rule allows designers and operators of new amusement rides the choice of providing at least one wheelchair space, or an amusement ride seat designed for transfer, or a transfer device. The final rule limits application of the guidelines to existing rides that are altered. The final rule also allows designers and operators greater flexibility in applying ADAAG to amusement rides.

- *Boating Facilities*—The final rule permits gangways that are part of an accessible route to exceed the 1:12 maximum slope requirement for ramps where the total length of the gangways is at least 80 feet (30 feet for smaller facilities with fewer than 25 boat slips). The final rule reduces the number of boat slips required to be accessible in new construction, and modifies the requirements for accessible boat slips in alterations so no more than one boat slip is lost. The final rule also allows designers and operators greater flexibility in applying ADAAG to boating facilities.

- *Fishing Piers and Platforms*—The final rule permits gangways that are part of an accessible route to exceed the maximum 1:12 requirement for ramps where the total length of the gangways is at least 30 feet. The final rule also exempts guards that comply with certain sections of the International

Building Code from the maximum 34 inch height requirement.

- *Golf Courses*—The final rule permits a golf car passage to be provided on golf courses and driving ranges, instead of an accessible route.

- *Miniature Golf Courses*—The final rule requires at least 50 percent of holes on miniature golf courses to be accessible, and permits one break in the sequence of accessible holes provided the last hole in the sequence is the last hole on the course. The final rule also allows designers and operators greater flexibility in applying ADAAG to miniature golf courses.

- *Swimming Pools, Wading Pools, and Spas*—The final rule permits small pools with less than 300 linear feet of pool wall to provide at least one means of access into the water, and permits water play components to use transfer systems to connect elevated water play components.

#### Technical Assistance

The Access Board will provide technical assistance materials to help small entities understand the accessibility guidelines for recreation facilities. The Access Board also operates a toll-free technical assistance service to answer questions from the public about the guidelines.

#### Executive Order 13132: Federalism

The final rule adheres to the fundamental federalism principles and policy making criteria in Executive Order 13132. The final rule implements Federal civil rights legislation that was enacted pursuant to the Congress' authority to enforce the fourteenth amendment and to regulate commerce. Ensuring the civil rights of groups who have experienced irrational discrimination has long been recognized as a national issue and a proper function of the Federal government. The ADA was enacted "to provide a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities \* \* \* and to ensure that the Federal government plays a central role in enforcing the standards established in this chapter on behalf of individuals with disabilities." 42 U.S.C. 12101(b)(1) and (3). The ADA recognizes the authority of State and local governments to enact and enforce laws that "provide greater or equal protection for the rights of individuals with disabilities than are afforded by this chapter." 42 U.S.C. 12201(b). The final rule establishes minimum guidelines. States and local governments can adopt accessibility standards that provide individuals with

disabilities equal or greater access to recreation facilities.

The Access Board has consulted with State and local governments throughout the rulemaking process. The National Recreation and Park Association, States Organization for Boating Access, New Jersey Department of Community Affairs, San Francisco Department of Public Works, and the Hawaii Disability and Communication Access Board represented the interests of State and local governments on the Recreation Access Advisory Committee. State and local governments participated in the public hearings and information meetings held on the NPRM and the draft final rule, and submitted more than 70 comments. Most of the comments were centered on boating facilities. The California Department of Boating and Waterways, Oregon State Marine Board, and Michigan Department of Natural Resources were actively involved in providing information and alternative proposals for consideration during the rulemaking. Approximately 30 other State and local governments joined in supporting the

various proposals submitted by those States.

*Unfunded Mandates Reform Act*

The Unfunded Mandates Reform Act does not apply to proposed or final rules that enforce constitutional rights of individuals or enforce any statutory rights that prohibit discrimination on the basis of race, color, sex, national origin, age, handicap, or disability. Since the final rule is issued under the authority of the Americans with Disabilities Act, an assessment of the rule's effects on State, local, and tribal governments, and the private sector is not required by the Unfunded Mandates Reform Act.

**List of Subjects in 36 CFR Part 1191**

Buildings and facilities, Civil rights, Incorporation by reference, Individuals with disabilities, Transportation.

**Thurman M. Davis, Sr.,**

*Chair, Architectural and Transportation Barriers Compliance Board.*

For the reasons stated in the preamble, part 1191 of title 36 of the Code of Federal Regulations is amended as follows:

**PART 1191—AMERICANS WITH DISABILITIES ACT (ADA) ACCESSIBILITY GUIDELINES FOR BUILDINGS AND FACILITIES**

1. The authority citation for 36 CFR Part 1191 continues to read as follows:

**Authority:** 42 U.S.C. 12204.

2. Appendix A to Part 1191 is amended as follows:

a. By revising the title page and pages i, ii, 1A, 2, 3, 4, 4A, 5 through 11, 58A, and 76 through 81 as set forth below.

b. By removing the blank page following the title page.

c. By adding pages 4B, 11A, 58B, and 82 through 96 as set forth below.

d. In the appendix to Appendix A by revising pages A1, A1A, A16, and A22 through A25 and adding pages A1B, A16A, and A26 through A32 as set forth below.

The additions and revisions read as follows:

**Appendix A to Part 1191—Americans With Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities**

BILLING CODE 8150-01-P

# **Americans with Disabilities Act (ADA)**

## 2.3 Incorporation by Reference

### 2.3 Incorporation by Reference.

**2.3.1 General.** The publications listed in 2.3.2 are incorporated by reference in this document. The Director of the Federal Register has approved these materials for incorporation by reference in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies of the referenced publications may be inspected at the Architectural and Transportation Barriers Compliance Board, 1331 F Street, NW., Suite 1000, Washington, DC; at the Department of Justice, Civil Rights Division, Disability Rights Section, 1425 New York Avenue, NW., Washington, DC; or at the Office of the Federal Register, 800 North Capitol Street, NW., Suite 700, Washington, DC.

**2.3.2 Referenced Publications.** The specific edition of the publications listed below are referenced in this document. Where differences occur between this document and the referenced publications, this document applies.

**2.3.2.1 American Society for Testing and Materials (ASTM) Standards.** Copies of the referenced publications may be obtained from the American Society for Testing and Materials, 100 Bar Harbor Drive, West Conshohocken, Pennsylvania 19428 (<http://www.astm.org>).

ASTM F 1292-99 Standard Specification for Impact Attenuation of Surface Systems Under and Around Playground Equipment (see 15.6.7.2 Ground Surfaces, Use Zones).

ASTM F 1487-98 Standard Consumer Safety Performance Specification for Playground Equipment for Public Use (see 3.5 Definitions, Use Zone).

ASTM F 1951-99 Standard Specification for Determination of Accessibility of Surface Systems Under and Around Playground Equipment (see 15.6.7.1 Ground Surfaces, Accessibility).

**2.3.2.2 International Code Council (ICC) Codes.** Copies of the referenced publications may be obtained from the International Code Council, 5203 Leesburg Pike, Suite 600, Falls Church, VA 22041-3401 (<http://www.intlcode.org>).

International Building Code 2000 (see 15.3.3.2 Height).

### 3.0 Miscellaneous Instructions and Definitions

## 3. MISCELLANEOUS INSTRUCTIONS AND DEFINITIONS.

**3.1 Graphic Conventions.** Graphic conventions are shown in Table 1. Dimensions that are not marked minimum or maximum are absolute, unless otherwise indicated in the text or captions.

**3.2 Dimensional Tolerances.** All dimensions are subject to conventional building industry tolerances for field conditions.

**3.3 Notes.** The text of these guidelines does not contain notes or footnotes. Additional information, explanations, and advisory materials are located in the Appendix.

### 3.4 General Terminology.

comply with. Meet one or more specifications of *these guidelines*.

if, if ... then. Denotes a specification that applies only when the conditions described are present.

may. Denotes an option or alternative.

shall. Denotes a mandatory specification or requirement.

should. Denotes an advisory specification or recommendation.

### 3.5 Definitions.

**Access Aisle.** An accessible pedestrian space between elements, such as parking spaces, seating, and desks, that provides clearances appropriate for use of the elements.

**Accessible.** Describes a site, building, facility, or portion thereof that complies with *these guidelines*.

**Accessible Element.** An *element* specified by *these guidelines* (for example, telephone, controls, and the like).

**Accessible Route.** A continuous unobstructed path connecting all accessible elements and spaces of a building or facility. Interior accessible routes may include corridors, floors, ramps, elevators, lifts, and clear floor space at fixtures. Exterior accessible routes may include parking access aisles, curb ramps, *crosswalks at vehicular ways*, walks, ramps, and lifts.

**Accessible Space.** Space that complies with *these guidelines*.

**Adaptability.** The ability of certain building spaces and elements, such as kitchen counters, sinks, and grab bars, to be added or altered so as to accommodate the needs of *individuals with or without disabilities* or to accommodate the needs of persons with different types or degrees of disability.

**Addition.** *An expansion, extension, or increase in the gross floor area of a building or facility.*

**Administrative Authority.** A governmental agency that adopts or enforces regulations and *guidelines* for the design, construction, or *alteration* of buildings and facilities.

**Alteration.** *An alteration is a change to a building or facility that affects or could affect the usability of the building or facility or part thereof. Alterations include, but are not limited to, remodeling, renovation, rehabilitation, reconstruction, historic restoration, resurfacing of circulation paths or vehicular ways, changes or rearrangement of the structural parts or elements, and changes or rearrangement in the plan configuration of walls and full-height partitions. Normal maintenance, reroofing, painting or wallpapering, or changes to mechanical and electrical systems are not alterations unless they affect the usability of the building or facility.*

**Amusement Attraction.** *Any facility, or portion of a facility, located within an amusement park or theme park which provides amusement without*

*the use of an amusement device. Examples include, but are not limited to, fun houses, barrels, and other attractions without seats.*

**Amusement Ride.** *A system that moves persons through a fixed course within a defined area for the purpose of amusement.*

**Amusement Ride Seat.** *A seat that is built-in or mechanically fastened to an amusement ride intended to be occupied by one or more passengers.*

**Area of Rescue Assistance.** *An area, which has direct access to an exit, where people who are unable to use stairs may remain temporarily in safety to await further instructions or assistance during emergency evacuation.*

**Area of Sport Activity.** *That portion of a room or space where the play or practice of a sport occurs.*

**Assembly Area.** *A room or space accommodating a group of individuals for recreational, educational, political, social, civic, or amusement purposes, or for the consumption of food and drink.*

**Automatic Door.** *A door equipped with a power-operated mechanism and controls that open and close the door automatically upon receipt of a momentary actuating signal. The switch that begins the automatic cycle may be a photoelectric device, floor mat, or manual switch (see power-assisted door).*

**Boarding Pier.** *A portion of a pier where a boat is temporarily secured for the purpose of embarking or disembarking.*

**Boat Launch Ramp.** *A sloped surface designed for launching and retrieving trailered boats and other water craft to and from a body of water.*

**Boat Slip.** *That portion of a pier, main pier, finger pier, or float where a boat is moored for the purpose of berthing, embarking, or disembarking.*

**Building.** *Any structure used and intended for supporting or sheltering any use or occupancy.*

**Catch Pool.** *A pool or designated section of a pool used as a terminus for water slide flumes.*

**Circulation Path.** *An exterior or interior way of passage from one place to another for pedestrians, including, but not limited to, walks, hallways, courtyards, stairways, and stair landings.*

**Clear.** *Unobstructed.*

**Clear Floor Space.** *The minimum unobstructed floor or ground space required to accommodate a single, stationary wheelchair and occupant.*

**Closed Circuit Telephone.** *A telephone with dedicated line(s) such as a house phone, courtesy phone or phone that must be used to gain entrance to a facility.*

**Common Use.** *Refers to those interior and exterior rooms, spaces, or elements that are made available for the use of a restricted group of people (for example, occupants of a homeless shelter, the occupants of an office building, or the guests of such occupants).*

**Cross Slope.** *The slope that is perpendicular to the direction of travel (see running slope).*

**Curb Ramp.** *A short ramp cutting through a curb or built up to it.*

**Detectable Warning.** *A standardized surface feature built in or applied to walking surfaces or other elements to warn visually impaired people of hazards on a circulation path.*

**Egress, Means of.** *A continuous and unobstructed way of exit travel from any point in a building or facility to a public way. A means of egress comprises vertical and horizontal travel and may include intervening room spaces, doorways, hallways, corridors, passageways, balconies, ramps, stairs, enclosures, lobbies, horizontal exits, courts and yards. An accessible means of egress is one that complies with these guidelines and does not include stairs, steps, or escalators. Areas of rescue assistance or evacuation elevators*

### 3.5 Definitions

may be included as part of accessible means of egress.

**Element.** *An architectural or mechanical component of a building, facility, space, or site, e.g., telephone, curb ramp, door, drinking fountain, seating, or water closet.*

**Elevated Play Component.** *A play component that is approached above or below grade and that is part of a composite play structure consisting of two or more play components attached or functionally linked to create an integrated unit providing more than one play activity.*

**Entrance.** *Any access point to a building or portion of a building or facility used for the purpose of entering. An entrance includes the approach walk, the vertical access leading to the entrance platform, the entrance platform itself, vestibules if provided, the entry door(s) or gate(s) and the hardware of the entry door(s) or gate(s).*

**Facility.** *All or any portion of buildings, structures, site improvements, complexes, equipment, roads, walks, passageways, parking lots, or other real or personal property located on a site.*

**Gangway.** *A variable-sloped pedestrian walkway that links a fixed structure or land with a floating structure. Gangways which connect to vessels are not included.*

**Golf Car Passage.** *A continuous passage on which a motorized golf car can operate.*

**Ground Floor.** *Any occupiable floor less than one story above or below grade with direct access to grade. A building or facility always has at least one ground floor and may have more than one ground floor as where a split level entrance has been provided or where a building is built into a hillside.*

**Ground Level Play Component.** *A play component that is approached and exited at the ground level.*

**Mezzanine or Mezzanine Floor.** *That portion of a story which is an intermediate floor level placed within the story and having occupiable space above and below its floor.*

**Marked Crossing.** *A crosswalk or other identified path intended for pedestrian use in crossing a vehicular way.*

**Multifamily Dwelling.** *Any building containing more than two dwelling units.*

**Occupiable.** *A room or enclosed space designed for human occupancy in which individuals congregate for amusement, educational or similar purposes, or in which occupants are engaged at labor, and which is equipped with means of egress, light, and ventilation.*

**Operable Part.** *A part of a piece of equipment or appliance used to insert or withdraw objects, or to activate, deactivate, or adjust the equipment or appliance (for example, coin slot, push button, handle).*

**Path of Travel.** (Reserved).

**Play Area.** *A portion of a site containing play components designed and constructed for children.*

**Play Component.** *An element intended to generate specific opportunities for play, socialization, or learning. Play components may be manufactured or natural, and may be stand alone or part of a composite play structure.*

**Power-assisted Door.** *A door used for human passage with a mechanism that helps to open the door, or relieves the opening resistance of a door, upon the activation of a switch or a continued force applied to the door itself.*

**Private Facility.** *A place of public accommodation or a commercial facility subject to title III of the ADA and 28 CFR part 36 or a transportation facility subject to title III of the ADA and 49 CFR 37.45.*

**Public Facility.** *A facility or portion of a facility constructed by, on behalf of, or for the use of a public entity subject to title II of the ADA and 28 CFR part 35 or to title II of the ADA and 49 CFR 37.41 or 37.43.*

**Public Use.** Describes interior or exterior rooms or spaces that are made available to the general public. Public use may be provided at a building or facility that is privately or publicly owned.

**Ramp.** A walking surface which has a running slope greater than 1:20.

**Running Slope.** The slope that is parallel to the direction of travel (see cross slope).

**Service Entrance.** An entrance intended primarily for delivery of goods or services.

**Signage.** *Displayed* verbal, symbolic, *tactile*, and pictorial information.

**Site.** A parcel of land bounded by a property line or a designated portion of a public right-of-way.

**Site Improvement.** Landscaping, paving for pedestrian and vehicular ways, outdoor lighting, recreational facilities, and the like, added to a site.

**Sleeping Accommodations.** Rooms in which people sleep; for example, dormitory and hotel or motel guest rooms or suites.

**Soft Contained Play Structure.** *A play structure made up of one or more components where the user enters a fully enclosed play environment that utilizes pliable materials (e.g., plastic, netting, fabric).*

**Space.** *A definable area, e.g., room, toilet room, hall, assembly area, entrance, storage room, alcove, courtyard, or lobby.*

**Story.** *That portion of a building included between the upper surface of a floor and upper surface of the floor or roof next above. If such portion of a building does not include occupiable space, it is not considered a story for purposes of these guidelines. There may be more than one*

*floor level within a story as in the case of a mezzanine or mezzanines.*

**Structural Frame.** The structural frame shall be considered to be the columns and the girders, beams, trusses and spandrels having direct connections to the columns and all other members which are essential to the stability of the building as a whole.

**TDD.** *(Telecommunication Devices for the Deaf). See text telephone.*

**TTY (Tele-Typewriter).** *See text telephone.*

**Tactile.** Describes an object that can be perceived using the sense of touch.

**Technically Infeasible.** *See 4.1.6(1)(j) EXCEPTION.*

**Teeing Ground.** *In golf, the starting place for the hole to be played.*

**Text Telephone (TTY).** *Machinery or equipment that employs interactive text based communications through the transmission of coded signals across the standard telephone network. Text telephones can include, for example, devices known as TDDs (telecommunication display devices or telecommunication devices for deaf persons) or computers with special modems. Text telephones are also called TTYs, an abbreviation for tele-typewriter.*

**Transient Lodging.\*** *A building, facility, or portion thereof, excluding inpatient medical care facilities and residential facilities, that contains sleeping accommodations. Transient lodging may include, but is not limited to, resorts, group homes, hotels, motels, and dormitories.*

**Transfer Device.** *Equipment designed to facilitate the transfer of a person from a wheelchair or other mobility device to and from an amusement ride seat.*

**Transition Plate.** *A sloping pedestrian walking surface located at the end(s) of a gangway.*

### 3.5 Definitions

**Use Zone.** *The ground level area beneath and immediately adjacent to a play structure or equipment that is designated by ASTM F 1487 Standard Consumer Safety Performance Specification for Playground Equipment for Public Use (incorporated by reference, see 2.3.2) for unrestricted circulation around the equipment and on whose surface it is predicted that a user would land when falling from or exiting the equipment.*

**Vehicular Way.** A route intended for vehicular traffic, such as a street, driveway, or parking lot.

**Walk.** An exterior pathway with a prepared surface intended for pedestrian use, including general pedestrian areas such as plazas and courts.

## 4.0 Accessible Elements and Spaces: Scope and Technical Requirements

Note: Sections 4.1.1 through 4.1.7 are different from ANSI A117.1 in their entirety and are printed in standard type (ANSI A117.1 does not include scoping provisions).

### **4. ACCESSIBLE ELEMENTS AND SPACES: SCOPE AND TECHNICAL REQUIREMENTS.**

#### **4.1 Minimum Requirements**

##### **4.1.1\* Application.**

(1) General. All areas of newly designed or newly constructed buildings and facilities and altered portions of existing buildings and facilities shall comply with section 4, unless otherwise provided in this section or as modified in a special application section.

(2) Application Based on Building Use. Special application sections provide additional requirements based on building use. When a building or facility contains more than one use covered by a special application section, each portion shall comply with the requirements for that use.

(3)\* Areas Used Only by Employees as Work Areas. Areas that are used only as work areas shall be designed and constructed so that individuals with disabilities can approach, enter, and exit the areas. These guidelines do not require that any areas used only as work areas be constructed to permit maneuvering within the work area or be constructed or equipped (i.e., with racks or shelves) to be accessible.

(4) Temporary Structures. These guidelines cover temporary buildings or facilities as well as permanent facilities. Temporary buildings and facilities are not of permanent construction but are extensively used or are essential for public use for a period of time. Examples of temporary buildings or facilities covered by these guidelines include, but are not limited to: reviewing stands, temporary classrooms, bleacher areas, exhibit

areas, temporary banking facilities, temporary health screening services, or temporary safe pedestrian passageways around a construction site. Structures, sites and equipment directly associated with the actual processes of construction, such as scaffolding, bridging, materials hoists, or construction trailers are not included.

##### (5) General Exceptions.

(a) In new construction, a person or entity is not required to meet fully the requirements of these guidelines where that person or entity can demonstrate that it is structurally impracticable to do so. Full compliance will be considered structurally impracticable only in those rare circumstances when the unique characteristics of terrain prevent the incorporation of accessibility features. If full compliance with the requirements of these guidelines is structurally impracticable, a person or entity shall comply with the requirements to the extent it is not structurally impracticable. Any portion of the building or facility which can be made accessible shall comply to the extent that it is not structurally impracticable.

##### (b) Accessibility is not required to or in:

(i) raised areas used primarily for purposes of security or life or fire safety, including, but not limited to, observation or lookout galleries, prison guard towers, fire towers, or fixed life guard stands;

(ii) non-occupiable spaces accessed only by ladders, catwalks, crawl spaces, very narrow passageways, tunnels, or freight (non-passenger) elevators, and frequented only by service personnel for maintenance, repair, or occasional monitoring of equipment; such spaces may include, but are not limited to, elevator pits, elevator penthouses, piping or equipment catwalks, water or sewage treatment pump rooms and stations, electric substations and transformer vaults, and highway and tunnel utility facilities;

(iii) single occupant structures accessed only by a passageway that is below grade or that is

**4.1.2 Accessible Sites and Exterior Facilities: New Construction**

elevated above standard curb height, including, but not limited to, toll booths accessed from underground tunnels;

(iv) raised structures used solely for refereeing, judging, or scoring a sport;

(v) water slides;

(vi) animal containment areas that are not for public use; or

(vii) raised boxing or wrestling rings.

**4.1.2 Accessible Sites and Exterior Facilities: New Construction.** An accessible site shall meet the following minimum requirements:

(1) At least one accessible route complying with 4.3 shall be provided within the boundary of the site from public transportation stops, accessible parking spaces, passenger loading zones if provided, and public streets or sidewalks, to an accessible building entrance.

(2) (a) At least one accessible route complying with 4.3 shall connect accessible buildings, accessible facilities, accessible elements, and accessible spaces that are on the same site.

(b)\* Court Sports: An accessible route complying with 4.3 shall directly connect both sides of the court in court sports.

(3) All objects that protrude from surfaces or posts into circulation paths shall comply with 4.4.

EXCEPTION: The requirements of 4.4 shall not apply within an area of sport activity.

(4) Ground surfaces along accessible routes and in accessible spaces shall comply with 4.5.

EXCEPTION 1\*: The requirements of 4.5 shall not apply within an area of sport activity.

EXCEPTION 2\*: Animal containment areas designed and constructed for public use shall not be required to provide stable, firm, and slip resistant ground and floor surfaces and shall not be required to comply with 4.5.2.

(5) (a) If parking spaces are provided for self-parking by employees or visitors, or both, then accessible spaces complying with 4.6 shall be provided in each such parking area in conformance with the table below. Spaces required by the table need not be provided in the particular lot. They may be provided in a different location if equivalent or greater accessibility, in terms of distance from an accessible entrance, cost and convenience is ensured.

TOTAL PARKING IN LOT	REQUIRED MINIMUM NUMBER OF ACCESSIBLE SPACES
1 to 25	1
26 to 50	2
51 to 75	3
76 to 100	4
101 to 150	5
151 to 200	6
201 to 300	7
301 to 400	8
401 to 500	9
501 to 1000	2 percent of total
1001 and over	20 plus 1 for each 100 over 1000

Except as provided in (b), access aisles adjacent to accessible spaces shall be 60 in (1525 mm) wide minimum.

(b) One in every eight accessible spaces, but not less than one, shall be served by an access aisle 96 in (2440 mm) wide minimum and shall be designated "van accessible" as required by 4.6.4. The vertical clearance at such spaces shall comply with 4.6.5. All such spaces may be grouped on one level of a parking structure.

EXCEPTION: Provision of all required parking spaces in conformance with "Universal Parking Design" (see appendix A4.6.3) is permitted.

(c) If passenger loading zones are provided, then at least one passenger loading zone shall comply with 4.6.6.

(d) At facilities providing medical care and other services for persons with mobility

### 4.1.3 Accessible Buildings: New Construction

impairments, parking spaces complying with 4.6 shall be provided in accordance with 4.1.2(5)(a) except as follows:

(i) Outpatient units and facilities: 10 percent of the total number of parking spaces provided serving each such outpatient unit or facility;

(ii) Units and facilities that specialize in treatment or services for persons with mobility impairments: 20 percent of the total number of parking spaces provided serving each such unit or facility.

(e)\* Valet parking: Valet parking facilities shall provide a passenger loading zone complying with 4.6.6 located on an accessible route to the entrance of the facility. Paragraphs 5(a), 5(b), and 5(d) of this section do not apply to valet parking facilities.

(6) If toilet facilities are provided on a site, then each such public or common use toilet facility shall comply with 4.22. If bathing facilities are provided on a site, then each such public or common use bathing facility shall comply with 4.23.

For single user portable toilet or bathing units clustered at a single location, at least five percent but no less than one toilet unit or bathing unit complying with 4.22 or 4.23 shall be installed at each cluster whenever typical inaccessible units are provided. Accessible units shall be identified by the International Symbol of Accessibility.

EXCEPTION: Portable toilet units at construction sites used exclusively by construction personnel are not required to comply with 4.1.2(6).

(7) Building Signage. Signs which designate permanent rooms and spaces shall comply with 4.30.1, 4.30.4, 4.30.5 and 4.30.6. Other signs which provide direction to, or information about, functional spaces of the building shall comply with 4.30.1, 4.30.2, 4.30.3, and 4.30.5. Elements and spaces of accessible facilities which shall be identified by the International Symbol of

Accessibility and which shall comply with 4.30.7 are:

(a) Parking spaces designated as reserved for individuals with disabilities;

(b) Accessible passenger loading zones;

(c) Accessible entrances when not all are accessible (inaccessible entrances shall have directional signage to indicate the route to the nearest accessible entrance);

(d) Accessible toilet and bathing facilities when not all are accessible.

**4.1.3 Accessible Buildings: New Construction.** Accessible buildings and facilities shall meet the following minimum requirements:

(1) (a) At least one accessible route complying with 4.3 shall connect accessible building or facility entrances with all accessible spaces and elements within the building or facility.

(b)\* Court Sports: An accessible route complying with 4.3 shall directly connect both sides of the court in court sports.

(2) All objects that overhang or protrude into circulation paths shall comply with 4.4.

EXCEPTION: The requirements of 4.4 shall not apply within an area of sport activity.

(3) Ground and floor surfaces along accessible routes and in accessible rooms and spaces shall comply with 4.5.

EXCEPTION 1\*: The requirements of 4.5 shall not apply within an area of sport activity.

EXCEPTION 2\*: Animal containment areas designed and constructed for public use shall not be required to provide stable, firm, and slip resistant ground and floor surfaces and shall not be required to comply with 4.5.2.

(4) Interior and exterior stairs connecting levels that are not connected by an elevator, ramp, or

### 4.1.3 Accessible Buildings: New Construction

other accessible means of vertical access shall comply with 4.9.

(5)\* One passenger elevator complying with 4.10 shall serve each level, including mezzanines, in all multi-story buildings and facilities unless exempted below. If more than one elevator is provided, each passenger elevator shall comply with 4.10.

EXCEPTION 1: Elevators are not required in:

(a) private facilities that are less than three stories or that have less than 3000 square feet per story unless the building is a shopping center, a shopping mall, or the professional office of a health care provider, or another type of facility as determined by the Attorney General; or

(b) public facilities that are less than three stories and that are not open to the general public if the story above or below the accessible ground floor houses no more than five persons and is less than 500 square feet. Examples may include, but are not limited to, drawbridge towers and boat traffic towers, lock and dam control stations, and train dispatching towers.

The elevator exemptions set forth in paragraphs (a) and (b) do not obviate or limit in any way the obligation to comply with the other accessibility requirements established in section 4.1.3. For example, floors above or below the accessible ground floor must meet the requirements of this section except for elevator service. If toilet or bathing facilities are provided on a level not served by an elevator, then toilet or bathing facilities must be provided on the accessible ground floor. In new construction, if a building or facility is eligible for exemption but a passenger elevator is nonetheless planned, that elevator shall meet the requirements of 4.10 and shall serve each level in the building. A passenger elevator that provides service from a garage to only one level of a building or facility is not required to serve other levels.

EXCEPTION 2: Elevator pits, elevator penthouses, mechanical rooms, piping or equipment catwalks are exempted from this requirement.

EXCEPTION 3: Accessible ramps complying with 4.8 may be used in lieu of an elevator.

EXCEPTION 4: Platform lifts (wheelchair lifts) complying with 4.11 of this guideline and applicable State or local codes may be used in lieu of an elevator only under the following conditions:

(a) To provide an accessible route to a performing area in an assembly occupancy.

(b) To comply with the wheelchair viewing position line-of-sight and dispersion requirements of 4.33.3.

(c) To provide access to incidental occupiable spaces and rooms which are not open to the general public and which house no more than five persons, including but not limited to equipment control rooms and projection booths.

(d) To provide access where existing site constraints or other constraints make use of a ramp or an elevator infeasible.

(e) To provide access to raised judges' benches, clerks' stations, speakers' platforms, jury boxes and witness stands or to depressed areas such as the well of a court.

(f)\* To provide access to player seating areas serving an area of sport activity.

EXCEPTION 5: Elevators located in air traffic control towers are not required to serve the cab and the floor immediately below the cab.

(6) Windows: (Reserved).

(7) Doors:

(a) At each accessible entrance to a building or facility, at least one door shall comply with 4.13.

(b) Within a building or facility, at least one door at each accessible space shall comply with 4.13.

(c) Each door that is an element of an accessible route shall comply with 4.13.

### 4.1.3 Accessible Buildings: New Construction

(d) Each door required by 4.3.10, Egress, shall comply with 4.13.

(8)\* The requirements in (a) and (b) below shall be satisfied independently:

(a)(i) At least 50 percent of all public entrances (excluding those in (b) below) shall comply with 4.14. At least one must be a ground floor entrance. Public entrances are any entrances that are not loading or service entrances.

(ii) Accessible public entrances must be provided in a number at least equivalent to the number of exits required by the applicable building or fire codes. (This paragraph does not require an increase in the total number of public entrances planned for a facility.)

(iii) An accessible public entrance must be provided to each tenancy in a facility (for example, individual stores in a strip shopping center).

(iv) In detention and correctional facilities subject to section 12, public entrances that are secured shall be accessible as required by 12.2.1.

One entrance may be considered as meeting more than one of the requirements in (a). Where feasible, accessible public entrances shall be the entrances used by the majority of people visiting or working in the building.

(b)(i) In addition, if direct access is provided for pedestrians from an enclosed parking garage to the building, at least one direct entrance from the garage to the building must be accessible.

(ii) If access is provided for pedestrians from a pedestrian tunnel or elevated walkway, one entrance to the building from each tunnel or walkway must be accessible.

(iii) In judicial, legislative, and regulatory facilities subject to section 11, restricted and secured entrances shall be accessible in the number required by 11.1.1.

One entrance may be considered as meeting more than one of the requirements in (b).

Because entrances also serve as emergency exits whose proximity to all parts of buildings and facilities is essential, it is preferable that all entrances be accessible.

(c) If the only entrance to a building, or tenancy in a facility, is a service entrance, that entrance shall be accessible.

(d) Entrances which are not accessible shall have directional signage complying with 4.30.1, 4.30.2, 4.30.3, and 4.30.5, which indicates the location of the nearest accessible entrance.

(9)\* In buildings or facilities, or portions of buildings or facilities, required to be accessible, accessible means of egress shall be provided in the same number as required for exits by local building/life safety regulations. Where a required exit from an occupiable level above or below a level of accessible exit discharge is not accessible, an area of rescue assistance shall be provided on each such level (in a number equal to that of inaccessible required exits). Areas of rescue assistance shall comply with 4.3.11. A horizontal exit, meeting the requirements of local building/life safety regulations, shall satisfy the requirement for an area of rescue assistance.

EXCEPTION: Areas of rescue assistance are not required in buildings or facilities having a supervised automatic sprinkler system.

(10)\* Drinking Fountains:

(a) Where only one drinking fountain is provided on a floor there shall be a drinking fountain which is accessible to individuals who use wheelchairs in accordance with 4.15 and one accessible to those who have difficulty bending or stooping. (This can be accommodated by the use of a "hi-lo" fountain; by providing one fountain accessible to those who use wheelchairs and one fountain at a standard height convenient for those who have difficulty bending; by providing a fountain accessible under 4.15 and a water cooler; or by such other means as would achieve the required accessibility for each group on each floor.)

**4.1.3 Accessible Buildings: New Construction**

(b) Where more than one drinking fountain or water cooler is provided on a floor, 50% of those provided shall comply with 4.15 and shall be on an accessible route.

(11) Toilet Facilities: If toilet rooms are provided, then each public and common use toilet room shall comply with 4.22. Other toilet rooms provided for the use of occupants of specific spaces (i.e., a private toilet room for the occupant of a private office) shall be adaptable. If bathing rooms are provided, then each public and common use bathroom shall comply with 4.23. Accessible toilet rooms and bathing facilities shall be on an accessible route.

(12) Storage, Shelving and Display Units:

(a) If fixed or built-in storage facilities such as cabinets, shelves, closets, and drawers are provided in accessible spaces, at least one of each type provided shall contain storage space complying with 4.25. Additional storage may be provided outside of the dimensions required by 4.25.

(b) Shelves or display units allowing self-service by customers in mercantile occupancies shall be located on an accessible route complying with 4.3. Requirements for accessible reach range do not apply.

(c)\* Where lockers are provided in accessible spaces, at least 5 percent, but not less than one, of each type of locker shall comply with 4.25.

(13) Controls and operating mechanisms in accessible spaces, along accessible routes, or as parts of accessible elements (for example, light switches and dispenser controls) shall comply with 4.27.

EXCEPTION: The requirements of 4.27 shall not apply to exercise machines.

(14) If emergency warning systems are provided, then they shall include both audible alarms and visual alarms complying with 4.28. Sleeping accommodations required to comply with 9.3 shall have an alarm system complying

with 4.28. Emergency warning systems in medical care facilities may be modified to suit standard health care alarm design practice.

(15) Detectable warnings shall be provided at locations as specified in 4.29.

(16) Building Signage:

(a) Signs which designate permanent rooms and spaces shall comply with 4.30.1, 4.30.4, 4.30.5 and 4.30.6.

(b) Other signs which provide direction to or information about functional spaces of the building shall comply with 4.30.1, 4.30.2, 4.30.3, and 4.30.5.

EXCEPTION: Building directories, menus, and all other signs which are temporary are not required to comply.

(17) Public Telephones:

(a) If public pay telephones, public closed circuit telephones, or other public telephones are provided, then they shall comply with 4.31.2 through 4.31.8 to the extent required by the following table:

<b>Number of each type of telephone provided on each floor</b>	<b>Number of telephones required to comply with 4.31.2 through 4.31.8<sup>1</sup></b>
--	---

1 or more single unit	1 per floor
1 bank <sup>2</sup>	1 per floor
2 or more banks <sup>2</sup>	1 per bank. Accessible unit may be installed as a single unit in proximity (either visible or with signage) to the bank. At least one public telephone per floor shall meet the requirements for a forward reach telephone <sup>3</sup>

<sup>1</sup> Additional public telephones may be installed at any height. Unless otherwise specified, accessible

**4.1.3 Accessible Buildings: New Construction**

telephones may be either forward or side reach telephones.

<sup>2</sup> A bank consists of two or more adjacent public telephones, often installed as a unit.

<sup>3</sup> EXCEPTION: For exterior installations only, if dial tone first service is available, then a side reach telephone may be installed instead of the required forward reach telephone.

(b)\* All telephones required to be accessible and complying with 4.31.2 through 4.31.8 shall be equipped with a volume control. In addition, 25 percent, but never less than one, of all other public telephones provided shall be equipped with a volume control and shall be dispersed among all types of public telephones, including closed circuit telephones, throughout the building or facility. Signage complying with applicable provisions of 4.30.7 shall be provided.

(c) The following shall be provided in accordance with 4.31.9:

(i) If four or more public pay telephones (including both interior and exterior telephones) are provided at a site of a private facility, and at least one is in an interior location, then at least one interior public text telephone (TTY) shall be provided. If an interior public pay telephone is provided in a public use area in a building of a public facility, at least one interior public text telephone (TTY) shall be provided in the building in a public use area.

(ii) If an interior public pay telephone is provided in a private facility that is a stadium or arena, a convention center, a hotel with a convention center, or a covered mall, at least one interior public text telephone (TTY) shall be provided in the facility. In stadiums, arenas and convention centers which are public facilities, at least one public text telephone (TTY) shall be provided on each floor level having at least one interior public pay telephone.

(iii) If a public pay telephone is located in or adjacent to a hospital emergency room, hospital recovery room, or hospital waiting room,

one public text telephone (TTY) shall be provided at each such location.

(iv) If an interior public pay telephone is provided in the secured area of a detention or correctional facility subject to section 12, then at least one public text telephone (TTY) shall also be provided in at least one secured area. Secured areas are those areas used only by detainees or inmates and security personnel.

(d) Where a bank of telephones in the interior of a building consists of three or more public pay telephones, at least one public pay telephone in each such bank shall be equipped with a shelf and outlet in compliance with 4.31.9(2).

EXCEPTION: This requirement does not apply to the secured areas of detention or correctional facilities where shelves and outlets are prohibited for purposes of security or safety.

(18) If fixed or built-in seating or tables (including, but not limited to, study carrels and student laboratory stations), are provided in accessible public or common use areas, at least five percent (5%), but not less than one, of the fixed or built-in seating areas or tables shall comply with 4.32. An accessible route shall lead to and through such fixed or built-in seating areas, or tables.

(19)\* Assembly Areas:

(a) In places of assembly with fixed seating accessible wheelchair locations shall comply with 4.33.2, 4.33.3, and 4.33.4 and shall be provided consistent with the following table:

<b>Capacity of Seating in Assembly Areas</b>	<b>Number of Required Wheelchair Locations</b>
4 to 25	1
26 to 50	2
51 to 300	4
301 to 500	6
over 500	6 plus 1 additional space for each total seating capacity increase of 100

#### 4.1.5 Accessible Buildings: Additions

In addition, one percent, but not less than one, of all fixed seats shall be aisle seats with no armrests on the aisle side, or removable or folding armrests on the aisle side. Each such seat shall be identified by a sign or marker. Signage notifying patrons of the availability of such seats shall be posted at the ticket office. Aisle seats are not required to comply with 4.33.4.

(b) This paragraph applies to assembly areas where audible communications are integral to the use of the space (e.g., concert and lecture halls, playhouses and movie theaters, meeting rooms, etc.). Such assembly areas, if (1) they accommodate at least 50 persons, or if they have audio-amplification systems, and (2) they have fixed seating, shall have a permanently installed assistive listening system complying with 4.33. For other assembly areas, a permanently installed assistive listening system, or an adequate number of electrical outlets or other supplementary wiring necessary to support a portable assistive listening system shall be provided. The minimum number of receivers to be provided shall be equal to 4 percent of the total number of seats, but in no case less than two. Signage complying with applicable provisions of 4.30 shall be installed to notify patrons of the availability of a listening system.

(c) Where a team or player seating area contains fixed seats and serves an area of sport activity, the seating area shall contain the number of wheelchair spaces required by 4.1.3(19)(a), but not less than one wheelchair space. Wheelchair spaces shall comply with 4.33.2, 4.33.3, 4.33.4, and 4.33.5.

EXCEPTION 1: Wheelchair spaces in team or player seating areas shall not be required to provide a choice of admission price or lines of sight comparable to those for members of the general public.

EXCEPTION 2: This provision shall not apply to team or player seating areas serving bowling lanes not required to be accessible by 15.7.2.

(20) Where automated teller machines (ATMs) are provided, each ATM shall comply with the

requirements of 4.34 except where two or more are provided at a location, then only one must comply.

EXCEPTION: Drive-up-only automated teller machines are not required to comply with 4.27.2, 4.27.3 and 4.34.3.

(21) Where dressing, fitting, or locker rooms are provided, the rooms shall comply with 4.35.

EXCEPTION: Where dressing, fitting, or locker rooms are provided in a cluster, at least 5 percent, but not less than one, of the rooms for each type of use in each cluster shall comply with 4.35.

(22) Where saunas or steam rooms are provided, the rooms shall comply with 4.36.

EXCEPTION: Where saunas or steam rooms are provided in a cluster, at least 5 percent, but not less than one, of the rooms for each type of use in each cluster shall comply with 4.36.

#### 4.1.4 (Reserved)

**4.1.5 Accessible Buildings: Additions.** Each addition to an existing building or facility shall be regarded as an alteration. Each space or element added to the existing building or facility shall comply with the applicable provisions of 4.1.1 to 4.1.3, Minimum Requirements (for New Construction) and the applicable technical specifications of section 4 and the special application sections. Each addition that affects or could affect the usability of an area containing a primary function shall comply with 4.1.6(2).

## 4.35 Dressing, Fitting, and Locker Rooms

**4.34.5 Equipment for Persons with Vision Impairments.** Instructions and all information for use shall be made accessible to and independently usable by persons with vision impairments.

### 4.35 Dressing, Fitting, and Locker Rooms.

**4.35.1 General.** Dressing, fitting, and locker rooms required to be accessible by 4.1 shall comply with 4.35 and shall be on an accessible route.

**4.35.2 Clear Floor Space.** A clear floor space allowing a person using a wheelchair to make a 180-degree turn shall be provided in every accessible dressing room entered through a swinging or sliding door. No door shall swing into any part of the turning space. Turning space shall not be required in a private dressing room entered through a curtained opening at least 32 in (815 mm) wide if clear floor space complying with section 4.2 renders the dressing room usable by a person using a wheelchair.

**4.35.3 Doors.** All doors to accessible dressing rooms shall be in compliance with section 4.13.

**4.35.4 Bench.** A bench complying with 4.37 shall be provided within the room.

**4.35.5 Mirror.** Where mirrors are provided in dressing rooms of the same use, then in an accessible dressing room, a full-length mirror, measuring at least 18 in wide by 54 in high (460 mm by 1370 mm), shall be mounted in a position affording a view to a person on the bench as well as to a person in a standing position.

### 4.36 Saunas and Steam Rooms.

**4.36.1 General.** Saunas and steam rooms required to be accessible by 4.1 shall comply with 4.36.

**4.36.2\* Wheelchair Turning Space.** A wheelchair turning space complying with 4.2.3 shall be provided within the room.

*EXCEPTION:* Wheelchair turning space shall be permitted to be obstructed by readily removable seats.

**4.36.3 Sauna and Steam Room Bench.** Where seating is provided, at least one bench shall be provided and shall comply with 4.37.

**4.36.4 Door Swing.** Doors shall not swing into any part of the clear floor or ground space required at a bench complying with 4.37.

### 4.37 Benches.

**4.37.1 General.** Benches required to be accessible by 4.1 shall comply with 4.37.

**4.37.2 Clear Floor or Ground Space.** Clear floor or ground space complying with 4.2.4 shall be provided and shall be positioned for parallel approach to a short end of a bench seat.

*EXCEPTION:* Clear floor or ground space required by 4.37.2 shall be permitted to be obstructed by readily removable seats in saunas and steam rooms.

**4.37.3\* Size.** Benches shall be fixed and shall have seats that are 20 inches (510 mm) minimum to 24 inches (610 mm) maximum in depth and 42 inches (1065 mm) minimum in length (see Fig. 47).

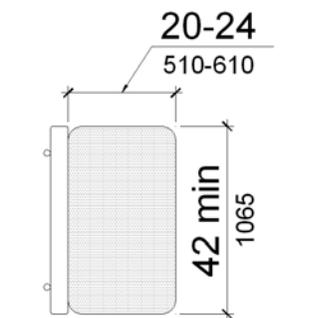

Fig. 47  
Size of Bench

## 4.37 Benches

**4.37.4 Back Support.** Benches shall have back support that is 42 inches (1065 mm) minimum in length and that extends from a point 2 inches (51 mm) maximum above the seat to a point 18 inches (455 mm) minimum above the seat (see Fig. 48).

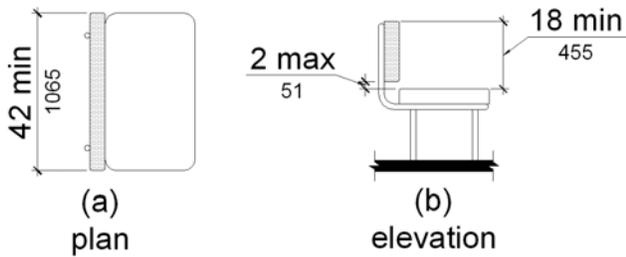

Fig. 48  
Bench Back Support

**4.37.5 Seat Height.** Bench seats shall be 17 inches (430 mm) minimum to 19 inches (485 mm) maximum above the floor or ground.

**4.37.6 Structural Strength.** Allowable stresses shall not be exceeded for materials used when a vertical or horizontal force of 250 lbs. (1112 N) is applied at any point on the seat, fastener, mounting device, or supporting structure.

**4.37.7 Wet Locations.** The surface of benches installed in wet locations shall be slip-resistant and shall not accumulate water.

**12.6 Visible Alarms and Telephones**

back support (e.g., attachment to wall). The structural strength of the bench attachments shall comply with 4.26.3.

(7) Storage. Fixed or built-in storage facilities, such as cabinets, shelves, closets, and drawers, shall contain storage space complying with 4.25.

(8) Controls. All controls intended for operation by inmates shall comply with 4.27.

(9) Accommodations for persons with hearing impairments required by 12.4.3 and complying with 12.6 shall be provided in accessible cells or rooms.

**12.6 Visible Alarms and Telephones.** Where audible emergency warning systems are provided to serve the occupants of holding or housing cells or rooms, visual alarms complying with 4.28.4 shall be provided. Where permanently installed telephones are provided within holding or housing cells or rooms, they shall have volume controls complying with 4.31.5.

EXCEPTION: Visual alarms are not required where inmates or detainees are not allowed independent means of egress.

<b>13.</b>	<b>RESIDENTIAL HOUSING. (Reserved).</b>
------------	---

<b>14.</b>	<b>PUBLIC RIGHTS-OF-WAY. (Reserved).</b>
------------	--

<b>15.</b>	<b>RECREATION FACILITIES.</b>
------------	-------------------------------

Newly designed or newly constructed and altered recreation facilities shall comply with the applicable requirements of section 4 and the special application sections, except as modified or otherwise provided in this section.

**15.1\* Amusement Rides.**

**15.1.1 General.** Newly designed or newly constructed and altered amusement rides shall comply with 15.1.

EXCEPTION 1\*: Mobile or portable amusement rides shall not be required to comply with 15.1.

EXCEPTION 2\*: Amusement rides which are controlled or operated by the rider shall be required to comply only with 15.1.4 and 15.1.5.

EXCEPTION 3\*: Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, shall be required to comply only with 15.1.4 and 15.1.5.

EXCEPTION 4: Amusement rides without amusement ride seats shall be required to comply only with 15.1.4 and 15.1.5.

**15.1.2\* Alterations to Amusement Rides.** A modification to an existing amusement ride is an alteration subject to 15.1 if one or more of the following conditions apply:

(1) The amusement ride's structural or operational characteristics are changed to the extent that the ride's performance differs from that specified by the manufacturer or the original design criteria; or

(2) The load and unload area of the amusement ride is newly designed and constructed.

**15.1.3 Number Required.** Each amusement ride shall provide at least one wheelchair space complying with 15.1.7, or at least one amusement ride seat designed for transfer complying with 15.1.8, or at least one transfer device complying with 15.1.9.

**15.1.4\* Accessible Route.** When in the load and unload position, amusement rides required to comply with 15.1 shall be served by an accessible route complying with 4.3. Any part of an accessible route serving amusement rides with a slope greater than 1:20 shall be considered a ramp and shall comply with 4.8.

EXCEPTION 1: The maximum slope specified in 4.8.2 shall not apply in the load and unload areas or on the amusement ride where compliance is structurally or operationally infeasible, provided that the slope of the ramp shall not exceed 1:8.

EXCEPTION 2: Handrails shall not be required in the load and unload areas or on the amusement ride where compliance is structurally or operationally infeasible.

EXCEPTION 3: Limited-use/limited-application elevators and platform lifts complying with 4.1.1 shall be permitted to be part of an accessible route serving the load and unload area.

**15.1.5 Load and Unload Areas.** Load and unload areas serving amusement rides required to comply with 15.1 shall provide a maneuvering space complying with 4.2.3. The maneuvering space shall have a slope not steeper than 1:48.

**15.1.6 Signage.** Signage shall be provided at the entrance of the queue or waiting line for each amusement ride to identify the type of access provided. Where an accessible unload area also serves as the accessible load area, signage shall be provided at the entrance to the queue or waiting line indicating the location of the accessible load and unload area.

**15.1.7 Amusement Rides with Wheelchair Spaces.** Amusement rides with wheelchair spaces shall comply with 15.1.7.

**15.1.7.1 Floor or Ground Surface.** The floor or ground surface of wheelchair spaces shall comply with 15.1.7.1.

**15.1.7.1.1 Slope.** The floor or ground surface of wheelchair spaces shall have a slope not steeper than 1:48 when in the load and unload position and shall be stable and firm.

**15.1.7.1.2\* Gaps.** Floors of amusement rides with wheelchair spaces and floors of load and unload areas shall be coordinated so that, when the amusement rides are at rest in the load and unload position, the vertical difference between the floors shall be within plus or minus 5/8 inches

(16 mm) and the horizontal gap shall be no greater than 3 inches (75 mm) under normal passenger load conditions.

EXCEPTION: Where compliance is not operationally or structurally feasible, ramps, bridge plates, or similar devices complying with the applicable requirements of 36 CFR 1192.83(c) shall be provided.

**15.1.7.2 Clearances.** Clearances for wheelchair spaces shall comply with 15.1.7.2.

EXCEPTION 1: Where provided, securement devices shall be permitted to overlap required clearances.

EXCEPTION 2: Wheelchair spaces shall be permitted to be mechanically or manually repositioned.

EXCEPTION 3\*: Wheelchair spaces shall not be required to comply with 4.4.2.

**15.1.7.2.1 Width and Length.** Wheelchair spaces shall provide a clear width of 30 inches (760 mm) minimum and a clear length of 48 inches (1220 mm) minimum measured to 9 inches (230 mm) minimum above the floor surface.

**15.1.7.2.2\* Wheelchair Spaces - Side Entry.** Where the wheelchair space can be entered only from the side, the ride shall be designed to permit sufficient maneuvering space for individuals using a wheelchair or mobility device to enter and exit the ride.

**15.1.7.2.3 Protrusions in Wheelchair Spaces.** Objects are permitted to protrude a distance of 6 inches (150 mm) maximum along the front of the wheelchair space where located 9 inches (230 mm) minimum and 27 inches (685 mm) maximum above the floor or ground surface of the wheelchair space. Objects are permitted to protrude a distance of 25 inches (635 mm) maximum along the front of the wheelchair space, where located more than 27 inches (685 mm) above the floor or ground surface of the wheelchair space (see Fig. 58).

## 15.1 Amusement Rides

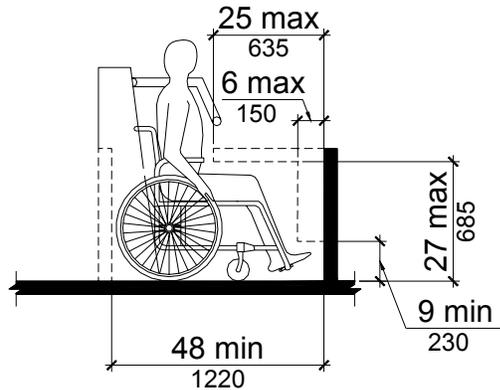

Fig. 58  
Protrusions in Wheelchair Spaces

**15.1.7.3 Openings.** Where openings are provided to access wheelchair spaces on amusement rides, the entry shall provide a 32 inch (815 mm) minimum clear opening.

**15.1.7.4 Approach.** One side of the wheelchair space shall adjoin an accessible route.

**15.1.7.5 Companion Seats.** Where the interior width of the amusement ride is greater than 53 inches (1346 mm), seating is provided for more than one rider, and the wheelchair is not required to be centered within the amusement ride, a companion seat shall be provided for each wheelchair space.

**15.1.7.5.1 Shoulder-to-Shoulder Seating.** Where an amusement ride provides shoulder-to-shoulder seating, companion seats shall be shoulder-to-shoulder with the adjacent wheelchair space.

EXCEPTION: Where shoulder-to-shoulder companion seating is not operationally or structurally feasible, compliance with this provision shall be required to the maximum extent feasible.

**15.1.8\* Amusement Ride Seats Designed for Transfer.** Amusement ride seats designed for transfer shall comply with 15.1.8 when positioned for loading and unloading.

**15.1.8.1 Clear Floor or Ground Space.** Clear floor or ground space complying with 4.2.4 shall be provided in the load and unload area adjacent to the amusement ride seats designed for transfer.

**15.1.8.2 Transfer Height.** The height of the amusement ride seats shall be 14 inches (355 mm) minimum to 24 inches (610mm) maximum measured above the load and unload surface.

**15.1.8.3 Transfer Entry.** Where openings are provided to transfer to amusement ride seats, the space shall be designed to provide clearance for transfer from a wheelchair or mobility device to the amusement ride seat.

**15.1.8.4 Wheelchair Storage Space.** Wheelchair storage spaces complying with 4.2.4 shall be provided in or adjacent to unload areas for each required amusement ride seat designed for transfer and shall not overlap any required means of egress or accessible route.

**15.1.9\* Transfer Devices for Use with Amusement Rides.** Transfer devices for use with amusement rides shall comply with 15.1.9 when positioned for loading and unloading.

**15.1.9.1 Clear Floor or Ground Space.** Clear floor or ground space complying with 4.2.4 shall be provided in the load and unload area adjacent to the transfer devices.

**15.1.9.2 Transfer Height.** The height of the transfer device seats shall be 14 inches (355 mm) minimum to 24 inches (610 mm) maximum measured above the load and unload surface.

**15.1.9.3 Wheelchair Storage Space.** Wheelchair storage spaces complying with 4.2.4 shall be provided in or adjacent to unload areas for each required transfer device and shall not overlap any required means of egress or accessible route.

**15.2 Boating Facilities.**

**15.2.1 General.** Newly designed or newly constructed and altered boating facilities shall comply with 15.2.

**15.2.2\* Accessible Route.** Accessible routes, including gangways that are part of accessible routes, shall comply with 4.3.

EXCEPTION 1: Where an existing gangway or series of gangways is replaced or altered, an increase in the length of the gangway is not required to comply with 15.2.2, unless required by 4.1.6(2).

EXCEPTION 2: The maximum rise specified in 4.8.2 shall not apply to gangways.

EXCEPTION 3: Where the total length of the gangway or series of gangways serving as part of a required accessible route is at least 80 feet (24 m), the maximum slope specified in 4.8.2 shall not apply to the gangways.

EXCEPTION 4: In facilities containing fewer than 25 boat slips and where the total length of the gangways or series of gangways serving as part of a required accessible route is at least 30 feet (9140 mm), the maximum slope specified in 4.8.2 shall not apply to the gangways.

EXCEPTION 5: Where gangways connect to transition plates, landings specified by 4.8.4 shall not be required.

EXCEPTION 6: Where gangways and transition plates connect and are required to have handrails, handrail extensions specified by 4.8.5 shall not be required. Where handrail extensions are provided on gangways or transition plates, such extensions are not required to be parallel with the ground or floor surface.

EXCEPTION 7: The cross slope of gangways, transition plates, and floating piers that are part of an accessible route shall be 1:50 maximum measured in the static position.

EXCEPTION 8: Limited-use/limited-application elevators or platform lifts complying with 4.11 shall be permitted in lieu of gangways complying with 4.3.

**15.2.3\* Boat Slips: Minimum Number.** Where boat slips are provided, boat slips complying with 15.2.5 shall be provided in accordance with Table 15.2.3. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

**Table 15.2.3**

Total Boat Slips in Facility	Minimum Number of Required Accessible Boat Slips
1 to 25	1
26 to 50	2
51 to 100	3
101 to 150	4
151 to 300	5
301 to 400	6
401 to 500	7
501 to 600	8
601 to 700	9
701 to 800	10
801 to 900	11
901 to 1000	12
1001 and over	12 plus 1 for each 100 or fraction thereof over 1000

**15.2.3.1\* Dispersion.** Accessible boat slips shall be dispersed throughout the various types of slips provided. This provision does not require an increase in the minimum number of boat slips required to be accessible.

**15.2.4\* Boarding Piers at Boat Launch Ramps.** Where boarding piers are provided at boat launch ramps, at least 5 percent, but not less than one of the boarding piers shall comply with 15.2.4 and shall be served by an accessible route complying with 4.3.

## 15.2 Boating Facilities

EXCEPTION 1: Accessible routes serving floating boarding piers shall be permitted to use exceptions 1, 2, 5, 6, 7, and 8 in 15.2.2.

EXCEPTION 2: Where the total length of the gangway or series of gangways serving as part of a required accessible route is at least 30 feet (9140 mm), the maximum slope specified by 4.8.2 shall not apply to the gangways.

EXCEPTION 3: Where the accessible route serving a floating boarding pier or skid pier is located within a boat launch ramp, the portion of the accessible route located within the boat launch ramp shall not be required to comply with 4.8.

**15.2.4.1\* Boarding Pier Clearances.** The entire length of the piers shall comply with 15.2.5.

**15.2.5\* Accessible Boat Slips.** Accessible boat slips shall comply with 15.2.5.

**15.2.5.1 Clearances.** Accessible boat slips shall be served by clear pier space 60 inches (1525 mm) wide minimum and at least as long as the accessible boat slips. Every 10 feet (3050 mm) maximum of linear pier edge serving the accessible boat slips shall contain at least one continuous clear opening 60 inches (1525 mm) minimum in width (see Fig. 59).

EXCEPTION 1: The width of the clear pier space shall be permitted to be 36 inches (915 mm) minimum for a length of 24 inches (610 mm) maximum, provided that multiple 36 inch (915 mm) wide segments are separated by segments that are 60 inches (1525 mm) minimum clear in width and 60 inches (1525 mm) minimum clear in length (see Fig. 60).

EXCEPTION 2: Edge protection 4 inches (100 mm) high maximum and 2 inches (51 mm) deep maximum shall be permitted at the continuous clear openings (see Fig. 61).

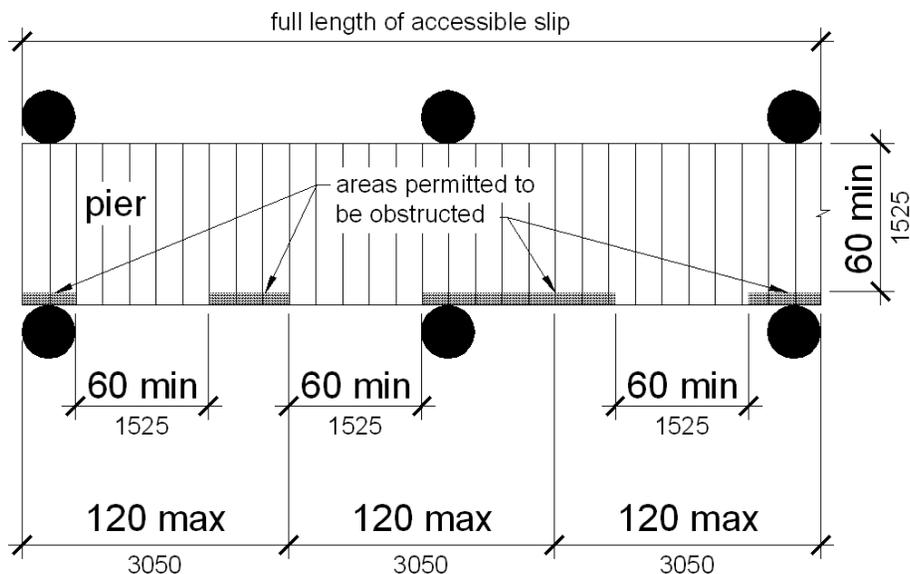

Fig. 59  
Pier Clearances

**EXCEPTION 3\*:** In alterations to existing facilities, clear pier space shall be permitted to be located perpendicular to the boat slip and shall extend the width of the boat slip, where the facility has at least one boat slip complying with 15.2.5, and further compliance with 15.2.5 would result in a reduction in the number of boat slips available or result in a reduction of the widths of existing slips.

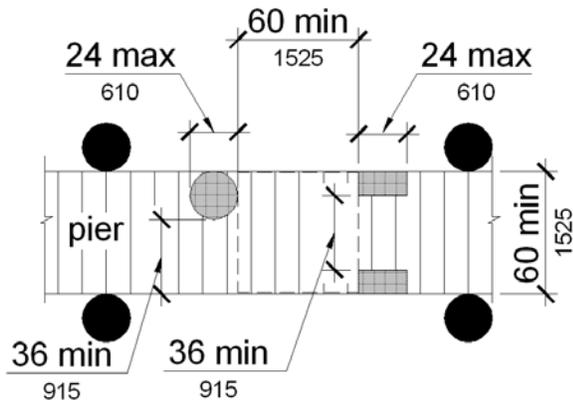

Fig. 60  
Pier Clear Space Reduction

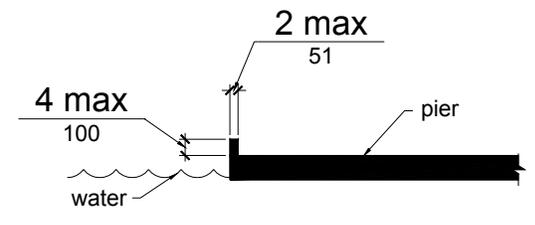

Fig. 61  
Edge Protection at Pier

**15.2.5.2 Cleats and Other Boat Securement Devices.** Cleats and other boat securement devices shall not be required to comply with 4.27.3.

**15.3 Fishing Piers and Platforms.**

**15.3.1 General.** Newly designed or newly constructed and altered fishing piers and platforms shall comply with 15.3.

**15.3.2 Accessible Route.** Accessible routes, including gangways that are part of accessible routes, serving fishing piers and platforms shall comply with 4.3.

**EXCEPTION 1:** Accessible routes serving floating fishing piers and platforms shall be permitted to use exceptions 1, 2, 5, 6, 7, and 8 in 15.2.2.

**EXCEPTION 2\*:** Where the total length of the gangway or series of gangways serving as part of a required accessible route is at least 30 feet (9140 mm), the maximum slope specified by 4.8.2 shall not apply to the gangways.

**15.3.3 Railings.** Where railings, guards, or handrails are provided, they shall comply with 15.3.3.

**15.3.3.1\* Edge Protection.** Edge protection shall be provided and shall extend 2 inches (51 mm) minimum above the ground or deck surface.

**EXCEPTION:** Where the railing, guard, or handrail is 34 inches (865 mm) or less above the ground or deck surface, edge protection shall not be required if the deck surface extends 12 inches (305 mm) minimum beyond the inside face of the railing. Toe clearance shall be 9 inches (230 mm) minimum above the ground or deck surface beyond the railing. Toe clearance shall be 30 inches (760 mm) minimum wide (see Fig. 62).

**15.3.3.2 Height.** At least 25 percent of the railings, guards, or handrails shall be 34 inches (865 mm) maximum above the ground or deck surface.

**EXCEPTION:** This provision shall not apply to that portion of a fishing pier or platform where a guard which complies with sections 1003.2.12.1 (Height) and 1003.2.12.2 (Opening limitations) of the International Building Code (incorporated by reference, see 2.3.2) is provided.

## 15.4 Golf

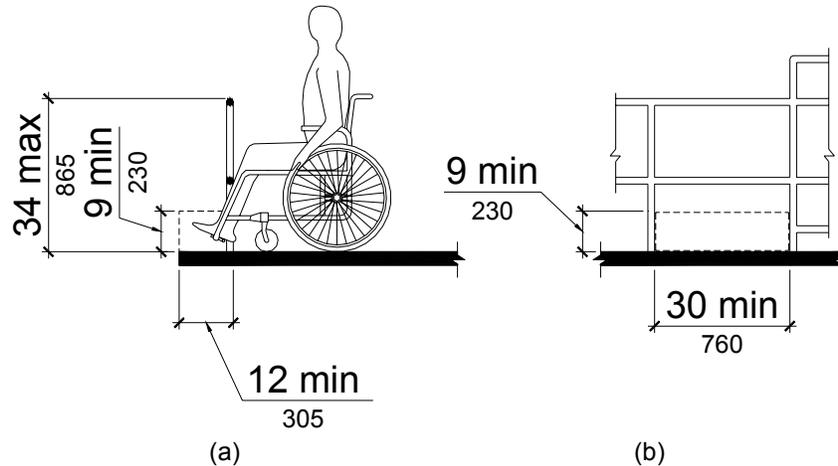

Fig. 62  
Edge Protection at Fishing Piers

**15.3.3.3\* Dispersion.** Railings required to comply with 15.3.3.2 shall be dispersed throughout a fishing pier or platform.

**15.3.4 Clear Floor or Ground Space.** At least one clear floor or ground space complying with 4.2.4 shall be provided where the railing height required by 15.3.3.2 is located. Where no railings are provided, at least one clear floor or ground space complying with 4.2.4 shall be provided.

**15.3.5 Maneuvering Space.** At least one maneuvering space complying with 4.2.3 shall be provided on the fishing pier or platform.

### 15.4 Golf.

**15.4.1 General.** Newly designed or newly constructed and altered golf courses, driving ranges, practice putting greens, and practice teeing grounds shall comply with 15.4.

**15.4.2\* Accessible Route - Golf Course.** An accessible route shall connect accessible elements and spaces within the boundary of the golf course.

In addition, an accessible route shall connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters. The accessible route required by this section shall be 48 inches (1220 mm) minimum wide. Where handrails are provided, the accessible route shall be 60 inches (1525 mm) minimum wide.

**EXCEPTION 1:** A golf car passage complying with 15.4.7 shall be permitted in lieu of all or part of an accessible route required by 15.4.2.

**EXCEPTION 2:** The handrail requirements of 4.8.5 shall not apply to an accessible route located within the boundary of a golf course.

**15.4.3\* Accessible Route - Driving Ranges.** An accessible route shall connect accessible teeing stations at driving ranges with accessible parking spaces and shall be 48 inches (1220 mm) wide minimum. Where handrails are provided, the accessible route shall be 60 inches (1525 mm) wide minimum.

EXCEPTION: A golf car passage complying with 15.4.7 shall be permitted in lieu of all or part of an accessible route required by 15.4.3.

**15.4.4 Teeing Grounds.** Teeing grounds shall comply with 15.4.4.

**15.4.4.1 Number Required.** Where one or two teeing grounds are provided for a hole, at least one teeing ground serving the hole shall comply with 15.4.4.3. Where three or more teeing grounds are provided for a hole, at least two teeing grounds shall comply with 15.4.4.3.

**15.4.4.2 Forward Teeing Ground.** The forward teeing ground shall be accessible.

EXCEPTION: In alterations, the forward teeing ground shall not be required to be accessible where compliance is not feasible due to terrain.

**15.4.4.3 Teeing Grounds.** Teeing grounds required by 15.4.4.1 and 15.4.4.2 shall be designed and constructed so that a golf car can enter and exit the teeing ground.

**15.4.5 Teeing Stations at Driving Ranges and Practice Teeing Grounds.** Where teeing stations or practice teeing grounds are provided, at least 5 percent of the practice teeing stations or practice teeing grounds, but not less than one, shall comply with 15.4.4.3.

**15.4.6 Weather Shelters.** Where weather shelters are provided on a golf course, each weather shelter shall have a clear floor or ground space 60 inches (1525 mm) minimum by 96 inches (2440 mm) minimum and shall be designed and constructed so that a golf car can enter and exit.

**15.4.7 Golf Car Passage.** Where curbs or other constructed barriers are provided along a golf car passage to prohibit golf cars from entering a fairway, openings at least 60 inches (1525 mm) wide shall be provided at intervals not to exceed 75 yds (69 m).

**15.4.7.1 Width.** The golf car passage shall be 48 inches (1220 mm) minimum wide.

**15.4.8 Putting Greens.** Each putting green shall be designed and constructed so that a golf car can enter and exit the putting green.

**15.5\* Miniature Golf.**

**15.5.1 General.** Newly designed or newly constructed and altered miniature golf courses shall comply with 15.5.

**15.5.2 Accessible Holes.** At least fifty percent of holes on a miniature golf course shall comply with 15.5.3 through 15.5.5 and shall be consecutive.

EXCEPTION: One break in the sequence of consecutive accessible holes shall be permitted, provided that the last hole on a miniature golf course is the last hole in the sequence.

**15.5.3\* Accessible Route.** An accessible route complying with 4.3 shall connect the course entrance with the first accessible hole and the start of play area on each accessible hole. The course shall be configured to allow exit from the last accessible hole to the course exit or entrance and shall not require travel back through other holes.

**15.5.3.1 Accessible Route - Located On the Playing Surface.** Where the accessible route is located on the playing surface of the accessible hole, exceptions 1-5 shall be permitted.

EXCEPTION 1: Where carpet is provided, the requirements of 4.5.3 shall not apply.

EXCEPTION 2: Where the accessible route intersects the playing surface of a hole, a 1 inch (26 mm) maximum curb shall be permitted for a width of 32 inches (815 mm) minimum.

EXCEPTION 3: A slope of 1:4 maximum for a 4 inch (100 mm) maximum rise shall be permitted.

EXCEPTION 4: Landings required by 4.8.4 shall be permitted to be 48 inches (1220 mm) in length minimum. Landing size required by 4.8.4(3) shall be permitted to be 48 inches (1220 mm) minimum by 60 inches (1525 mm) minimum.

## 15.6 Play Areas

Landing slopes shall be permitted to be 1:20 maximum.

EXCEPTION 5: Handrail requirements of 4.8.5 shall not apply.

**15.5.3.2 Accessible Route - Adjacent to the Playing Surface.** Where the accessible route is located adjacent to the playing surface, the requirements of 4.3 shall apply.

**15.5.4 Start of Play Areas.** Start of play areas at holes required to comply with 15.5.2 shall have a slope not steeper than 1:48 and shall be 48 inches (1220 mm) minimum by 60 inches (1525 mm) minimum.

**15.5.5\* Golf Club Reach Range.** All areas within accessible holes where golf balls rest shall be within 36 inches (915 mm) maximum of an accessible route having a maximum slope of 1:20 for 48 inches (1220 mm) in length (see Fig. 63).

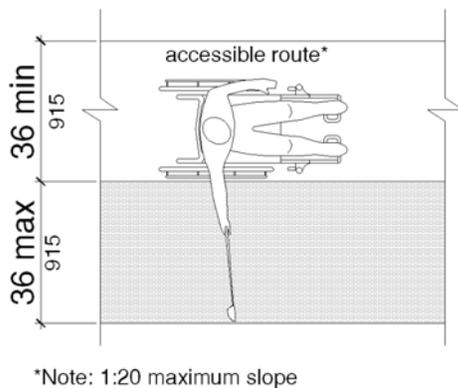

Fig. 63  
Golf Club Reach Range

### 15.6 Play Areas.

**15.6.1\* General.** Newly designed and newly constructed play areas for children ages 2 and over and altered portions of existing play areas shall comply with the applicable provisions of section 4, except as modified or otherwise provided by this section. Where separate play

areas are provided within a site for specified age groups, each play area shall comply with this section. Where play areas are designed or constructed in phases, this section shall be applied so that when each successive addition is completed, the entire play area complies with all the applicable provisions of this section.

EXCEPTION 1: Play areas located in family child care facilities where the proprietor actually resides shall not be required to comply with 15.6.

EXCEPTION 2: Where play components are relocated in existing play areas for the purpose of creating safe use zones, 15.6 shall not apply, provided that the ground surface is not changed or extended for more than one use zone.

EXCEPTION 3: Where play components are altered and the ground surface is not altered, the ground surface shall not be required to comply with 15.6.7, unless required by 4.1.6(2).

EXCEPTION 4: The provisions of 15.6.1 through 15.6.7 shall not apply to amusement attractions.

EXCEPTION 5: Compliance with 4.4 shall not be required within the boundary of the play area.

EXCEPTION 6: Stairs shall not be required to comply with 4.9.

### 15.6.2\* Ground Level Play Components.

Ground level play components shall be provided in the number and types required by 15.6.2.1 and 15.6.2.2. Ground level play components that are provided to comply with 15.6.2.1 shall be permitted to satisfy the number required by 15.6.2.2, provided that the minimum required types of play components are provided. Where more than one ground level play component required by 15.6.2.1 and 15.6.2.2 is provided, the play components shall be integrated in the play area.

**15.6.2.1 General.** Where ground level play components are provided, at least one of each type provided shall be located on an accessible route complying with 15.6.4 and shall comply with 15.6.6.

**15.6.2.2 Additional Number and Types.** Where elevated play components are provided, ground level play components shall be provided in accordance with Table 15.6.2.2. Ground level play components required by 15.6.2.2 shall be located on an accessible route complying with 15.6.4 and shall comply with 15.6.6.

EXCEPTION: If at least 50 percent of the elevated play components are connected by a ramp, and if at least 3 of the elevated play components connected by the ramp are different types of play components, 15.6.2.2 shall not apply.

**15.6.3\* Elevated Play Components.** Where elevated play components are provided, at least 50 percent shall be located on an accessible route complying with 15.6.4. Elevated play components connected by a ramp shall comply with 15.6.6.

**15.6.4\* Accessible Routes.** At least one accessible route complying with 4.3, as modified by 15.6.4, shall be provided.

EXCEPTION 1: Transfer systems complying with 15.6.5 shall be permitted to connect elevated play components, except where 20 or more elevated play components are provided, no more than 25 percent of the elevated play components shall be permitted to be connected by transfer systems.

EXCEPTION 2: Where transfer systems are provided, an elevated play component shall be permitted to connect to another elevated play component in lieu of an accessible route.

EXCEPTION 3: Platform lifts (wheelchair lifts) complying with 4.1.1 and applicable State or local codes shall be permitted to be used as part of an accessible route.

**Table 15.6.2.2 Number and Types of Ground Level Play Components Required to be on Accessible Route**

Number of Elevated Play Components Provided	Minimum Number of Ground Level Play Components Required to be on Accessible Route	Minimum Number of Different Types of Ground Level Play Components Required to be on Accessible Route
1	Not applicable	Not applicable
2 to 4	1	1
5 to 7	2	2
8 to 10	3	3
11 to 13	4	3
14 to 16	5	3
17 to 19	6	3
20 to 22	7	4
23 to 25	8	4
More than 25	8 plus 1 for each additional 3 over 25, or fraction thereof	5

## 15.6 Play Areas

**15.6.4.1 Location.** Accessible routes shall be located within the boundary of the play area and shall connect ground level play components as required by 15.6.2.1 and 15.6.2.2 and elevated play components as required by 15.6.3, including entry and exit points of the play components.

**15.6.4.2 Protrusions.** Objects shall not protrude into ground level accessible routes at or below 80 in (2030 mm) above the ground or floor surface.

**15.6.4.3 Clear Width.** The clear width of accessible routes within play areas shall comply with 15.6.4.3.

**15.6.4.3.1 Ground Level.** The clear width of accessible routes at ground level shall be 60 in (1525 mm) minimum.

EXCEPTION 1: In play areas less than 1,000 square feet, the clear width of accessible routes shall be permitted to be 44 in (1120 mm) minimum, provided that at least one turning space complying with 4.2.3 is provided where the restricted accessible route exceeds 30 feet (9.14 m) in length.

EXCEPTION 2: The clear width of accessible routes shall be permitted to be 36 in (915 mm) minimum for a distance of 60 in (1525 mm) maximum, provided that multiple reduced width segments are separated by segments that are 60 in (1525 mm) minimum in width and 60 in (1525 mm) minimum in length.

**15.6.4.3.2 Elevated.** The clear width of accessible routes connecting elevated play components shall be 36 in (915 mm).

EXCEPTION 1: The clear width of accessible routes connecting elevated play components shall be permitted to be reduced to 32 in (815 mm) minimum for a distance of 24 in (610 mm) maximum provided that reduced width segments are separated by segments that are 48 in (1220 mm) minimum in length and 36 in (915 mm) minimum in width.

EXCEPTION 2: The clear width of transfer systems connecting elevated play components

shall be permitted to be 24 in (610 mm) minimum.

**15.6.4.4 Ramp Slope and Rise.** Any part of an accessible route with a slope greater than 1:20 shall be considered a ramp and shall comply with 4.8, as modified by 15.6.4.4.

**15.6.4.4.1 Ground Level.** The maximum slope for ramps connecting ground level play components within the boundary of a play area shall be 1:16.

**15.6.4.4.2 Elevated.** Where a ramp connects elevated play components, the maximum rise of any ramp run shall be 12 in (305 mm).

**15.6.4.5 Handrails.** Where required on ramps, handrails shall comply with 4.8.5, as modified by 15.6.4.5.

EXCEPTION 1: Handrails shall not be required at ramps located within ground level use zones.

EXCEPTION 2: Handrail extensions shall not be required.

**15.6.4.5.1 Handrail Gripping Surface.** Handrails shall have a diameter or width of 0.95 in (24.1 mm) minimum to 1.55 in (39.4 mm) maximum, or the shape shall provide an equivalent gripping surface.

**15.6.4.5.2 Handrail Height.** The top of handrail gripping surfaces shall be 20 in (510 mm) minimum to 28 in (710 mm) maximum above the ramp surface.

**15.6.5\* Transfer Systems.** Where transfer systems are provided to connect elevated play components, the transfer systems shall comply with 15.6.5.

**15.6.5.1 Transfer Platforms.** Transfer platforms complying with 15.6.5.1 shall be provided where transfer is intended to be from a wheelchair or other mobility device (see Fig. 64).

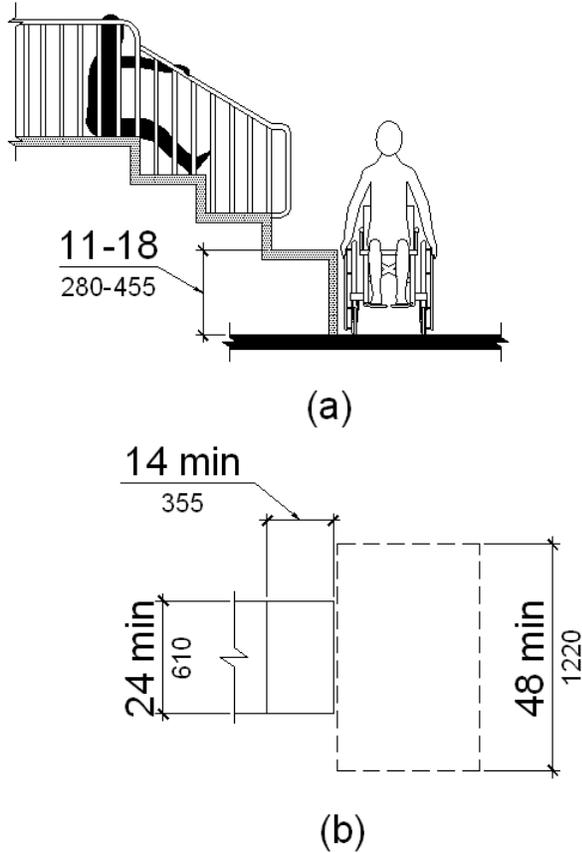

Fig. 64

**15.6.5.1.1 Size.** Platforms shall have a level surface 14 in (355 mm) minimum in depth and 24 in (610 mm) minimum in width.

**15.6.5.1.2 Height.** Platform surfaces shall be 11 in (280 mm) minimum to 18 in (455 mm) maximum above the ground or floor surface.

**15.6.5.1.3 Transfer Space.** A level space complying with 4.2.4 shall be centered on the 48 in (1220 mm) long dimension parallel to the 24 in (610 mm) minimum long unobstructed side of the transfer platform.

**15.6.5.1.4 Transfer Supports.** A means of support for transferring shall be provided.

**15.6.5.2 Transfer Steps.** Transfer steps complying with 15.6.5.2 shall be provided where movement is intended from a transfer platform to a level with elevated play components required to be located on an accessible route (see Fig. 65).

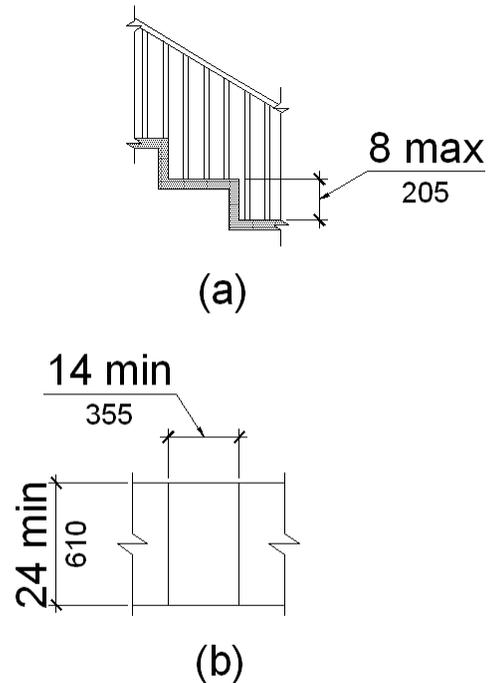

Fig. 65

**15.6.5.2.1 Size.** Transfer steps shall have a level surface 14 in (355 mm) minimum in depth and 24 in (610 mm) minimum in width.

**15.6.5.2.2 Height.** Each transfer step shall be 8 in (205 mm) maximum high.

**15.6.5.2.3 Transfer Supports.** A means of support for transferring shall be provided.

**15.6.6\* Play Components.** Ground level play components located on accessible routes and

## 15.7 Exercise Equipment and Machines

elevated play components connected by ramps shall comply with 15.6.6.

**15.6.6.1 Maneuvering Space.** Maneuvering space complying with 4.2.3 shall be provided on the same level as the play components. Maneuvering space shall have a slope not steeper than 1:48 in all directions. The maneuvering space required for a swing shall be located immediately adjacent to the swing.

**15.6.6.2 Clear Floor or Ground Space.** Clear floor or ground space shall be provided at the play components and shall be 30 in (760 mm) by 48 in (1220 mm) minimum. Clear floor or ground space shall have a slope not steeper than 1:48 in all directions.

**15.6.6.3 Play Tables: Height and Clearances.** Where play tables are provided, knee clearance 24 in (610 mm) high minimum, 17 in deep (430 mm) minimum, and 30 in (760 mm) wide minimum shall be provided. The tops of rims, curbs, or other obstructions shall be 31 in (785 mm) high maximum.

EXCEPTION: Play tables designed or constructed primarily for children ages 5 and under shall not be required to provide knee clearance if the clear floor or ground space required by 15.6.6.2 is arranged for a parallel approach and if the rim surface is 31 in (785 mm) high maximum.

**15.6.6.4 Entry Points and Seats: Height.** Where a play component requires transfer to the entry point or seat, the entry point or seat shall be 11 in (280 mm) minimum and 24 in (610 mm) maximum above the clear floor or ground space.

EXCEPTION: The entry point of a slide shall not be required to comply with 15.6.6.4.

**15.6.6.5 Transfer Supports.** Where a play component requires transfer to the entry point or seat, a means of support for transferring shall be provided.

**15.6.7\* Ground Surfaces.** Ground surfaces along accessible routes, clear floor or ground

spaces, and maneuvering spaces within play areas shall comply with 4.5.1 and 15.6.7.

**15.6.7.1 Accessibility.** Ground surfaces shall comply with ASTM F 1951 Standard Specification for Determination of Accessibility of Surface Systems Under and Around Playground Equipment (incorporated by reference, see 2.3.2). Ground surfaces shall be inspected and maintained regularly and frequently to ensure continued compliance with ASTM F 1951.

**15.6.7.2 Use Zones.** If located within use zones, ground surfaces shall comply with ASTM F 1292 Standard Specification for Impact Attenuation of Surface Systems Under and Around Playground Equipment (incorporated by reference, see 2.3.2).

**15.6.8 Soft Contained Play Structures.** Soft contained play structures shall comply with 15.6.8.

**15.6.8.1 Accessible Routes to Entry Points.** Where three or fewer entry points are provided, at least one entry point shall be located on an accessible route. Where four or more entry points are provided, at least two entry points shall be located on an accessible route. Accessible routes shall comply with 4.3.

EXCEPTION: Transfer systems complying with 15.6.5 or platform lifts (wheelchair lifts) complying with 4.1.1 and applicable State or local codes shall be permitted to be used as part of an accessible route.

### **15.7 Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities.**

**15.7.1 General.** Newly designed or newly constructed and altered exercise equipment and machines, bowling lanes, and shooting facilities shall comply with 15.7.

**15.7.2\* Exercise Equipment and Machines.** At least one of each type of exercise equipment and machines shall be provided with clear floor or ground space complying with 4.2.4 and shall be served by an accessible route. Clear floor or ground space shall be positioned for transfer or

## 15.8 Swimming Pools, Wading Pools, and Spas

for use by an individual seated in a wheelchair. Clear floor or ground spaces for more than one piece of equipment shall be permitted to overlap .

**15.7.3 Bowling Lanes.** Where bowling lanes are provided, at least 5 percent, but not less than one of each type of lane shall be served by an accessible route.

**15.7.4\* Shooting Facilities.** Where fixed firing positions are provided at a site, at least 5 percent, but not less than one, of each type of firing position shall comply with 15.7.4.1.

**15.7.4.1 Fixed Firing Position.** Fixed firing positions shall contain a 60 inch (1525 mm) diameter space and shall have a slope not steeper than 1:48.

### 15.8 Swimming Pools, Wading Pools, and Spas.

**15.8.1 General.** Newly designed or newly constructed and altered swimming pools, wading pools, and spas shall comply with 15.8.

EXCEPTION: An accessible route shall not be required to serve raised diving boards or diving platforms.

**15.8.2\* Swimming Pools.** At least two accessible means of entry shall be provided for each public use and common use swimming pool. The primary means of entry shall comply with 15.8.5 (Swimming Pool Lifts) or 15.8.6 (Sloped Entries). The secondary means of entry shall comply with one of the following: 15.8.5 (Swimming Pool Lifts), 15.8.6 (Sloped Entries), 15.8.7 (Transfer Walls), 15.8.8 (Transfer Systems), or 15.8.9 (Pool Stairs).

EXCEPTION 1\*: Where a swimming pool has less than 300 linear feet (91 m) of swimming pool wall, at least one accessible means of entry shall be provided and shall comply with 15.8.5 (Swimming Pool Lifts) or 15.8.6 (Sloped Entries).

EXCEPTION 2: Wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area, shall provide at least one accessible means of entry that complies with

15.8.5 (Swimming Pool Lifts), 15.8.6 (Sloped Entries), or 15.8.8 (Transfer Systems).

EXCEPTION 3: Catch pools shall be required only to be served by an accessible route that connects to the pool edge.

**15.8.3 Wading Pools.** At least one accessible means of entry complying with 15.8.6 (Sloped Entries) shall be provided for each wading pool.

**15.8.4 Spas.** At least one accessible means of entry complying with 15.8.5 (Swimming Pool Lifts), 15.8.7 (Transfer Walls), or 15.8.8 (Transfer Systems) shall be provided for each spa.

EXCEPTION: Where spas are provided in a cluster, 5 percent, but not less than one, in each cluster shall be accessible.

**15.8.5\* Pool Lifts.** Pool lifts shall comply with 15.8.5.

**15.8.5.1 Pool Lift Location.** Pool lifts shall be located where the water level does not exceed 48 inches (1220 mm).

EXCEPTION 1: Where the entire pool depth is greater than 48 inches (1220 mm), 15.8.5.1 shall not apply.

EXCEPTION 2: Where multiple pool lift locations are provided, no more than one shall be required to be located in an area where the water level does not exceed 48 inches (1220 mm).

**15.8.5.2 Seat Location.** In the raised position, the centerline of the seat shall be located over the deck and 16 inches (405 mm) minimum from the edge of the pool. The deck surface between the centerline of the seat and the pool edge shall have a slope not greater than 1:48 (see Fig. 68).

## 15.8 Swimming Pools, Wading Pools, and Spas

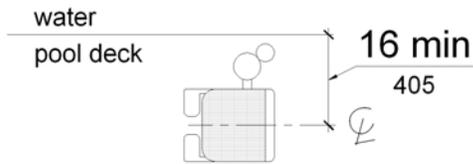

Fig. 68  
Pool Lift Seat Location

**15.8.5.3 Clear Deck Space.** On the side of the seat opposite the water, a clear deck space shall be provided parallel with the seat. The space shall be 36 inches (915 mm) wide minimum and shall extend forward 48 inches (1220 mm) minimum from a line located 12 inches (305 mm) behind the rear edge of the seat. The clear deck space shall have a slope not greater than 1:48 (see Fig. 69).

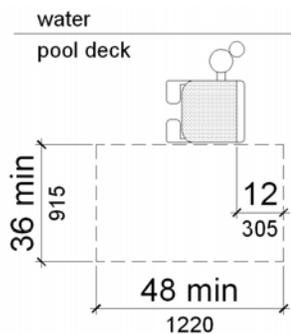

Fig. 69  
Clear Deck Space at Pool Lifts

**15.8.5.4 Seat Height.** The height of the lift seat shall be designed to allow a stop at 16 inches (405 mm) minimum to 19 inches (485 mm) maximum measured from the deck to the top of the seat

surface when in the raised (load) position (see Fig. 70).

**15.8.5.5 Seat Width.** The seat shall be 16 inches (405 mm) minimum wide.

**15.8.5.6\* Footrests and Armrests.** Footrests shall be provided and shall move with the seat. If provided, armrests positioned opposite the water shall be removable or shall fold clear of the seat when the seat is in the raised (load) position.

EXCEPTION: Footrests shall not be required on pool lifts provided in spas.

**15.8.5.7\* Operation.** The lift shall be capable of unassisted operation from both the deck and water levels. Controls and operating mechanisms shall be unobstructed when the lift is in use and shall comply with 4.27.4.

**15.8.5.8 Submerged Depth.** The lift shall be designed so that the seat will submerge to a water depth of 18 inches (455 mm) minimum below the stationary water level (see Fig. 71).

**15.8.5.9\* Lifting Capacity.** Single person pool lifts shall have a minimum weight capacity of 300 lbs. (136 kg) and be capable of sustaining a static load of at least one and a half times the rated load.

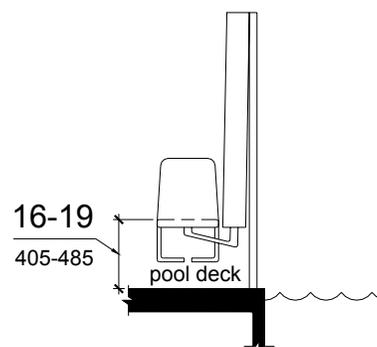

Fig. 70  
Pool Lift Seat Height

## 15.8 Swimming Pools, Wading Pools, and Spas

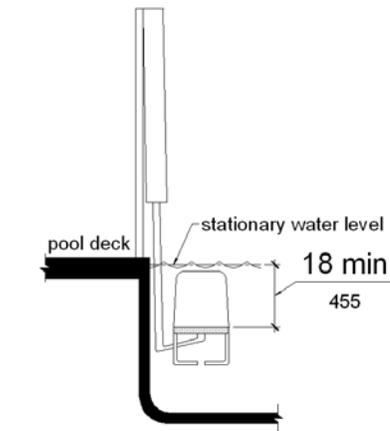

Fig 71  
Pool Lift Submerged Depth

**15.8.6 Sloped Entries.** Sloped entries designed to provide access into the water shall comply with 15.8.6.

**15.8.6.1\* Sloped Entries.** Sloped entries shall comply with 4.3, except as modified below.

EXCEPTION: Where sloped entries are provided, the surfaces shall not be required to be slip resistant.

**15.8.6.2 Submerged Depth.** Sloped entries shall extend to a depth of 24 inches (610 mm)

minimum to 30 inches (760 mm) maximum below the stationary water level. Where landings are required by 4.8, at least one landing shall be located 24 inches (610 mm) minimum to 30 inches (760 mm) maximum below the stationary water level (see Fig. 72).

EXCEPTION: In wading pools, the sloped entry and landings, if provided, shall extend to the deepest part of the wading pool.

**15.8.6.3\* Handrails.** Handrails shall be provided on both sides of the sloped entry and shall comply with 4.8.5. The clear width between handrails shall be 33 inches (840 mm) minimum and 38 inches (965 mm) maximum (see Fig. 73).

EXCEPTION 1: Handrail extensions specified by 4.8.5 shall not be required at the bottom landing serving a sloped entry.

EXCEPTION 2: Where a sloped entry is provided for wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area, the required clear width between handrails shall not apply.

EXCEPTION 3: The handrail requirements of 4.8.5 and 15.8.6.3 shall not be required on sloped entries in wading pools.

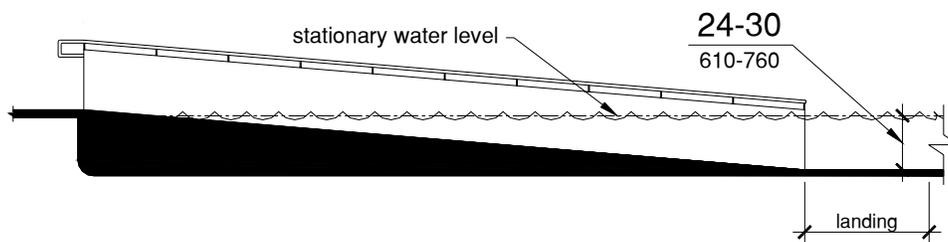

Fig. 72  
Sloped Entry Submerged Depth

## 15.8 Swimming Pools, Wading Pools, and Spas

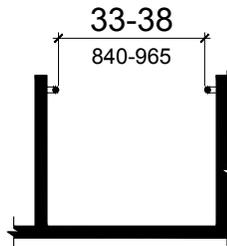

Fig. 73  
Sloped Entry Handrails

**15.8.7 Transfer Walls.** Transfer walls shall comply with 15.8.7.

**15.8.7.1 Clear Deck Space.** A clear deck space of 60 inches (1525 mm) minimum by 60 inches (1525 mm) minimum with a slope not steeper

than 1:48 shall be provided at the base of the transfer wall. Where one grab bar is provided, the clear deck space shall be centered on the grab bar. Where two grab bars are provided, the clear deck space shall be centered on the clearance between the grab bars (see Fig. 74).

**15.8.7.2 Height.** The height of the transfer wall shall be 16 inches (405 mm) minimum to 19 inches (485 mm) maximum measured from the deck (see Fig. 75).

**15.8.7.3 Wall Depth and Length.** The depth of the transfer wall shall be 12 inches (305 mm) minimum to 16 inches (405 mm) maximum. The length of the transfer wall shall be 60 inches (1525 mm) minimum and shall be centered on the clear deck space (see Fig. 76).

**15.8.7.4 Surface.** Surfaces of transfer walls shall not be sharp and shall have rounded edges.

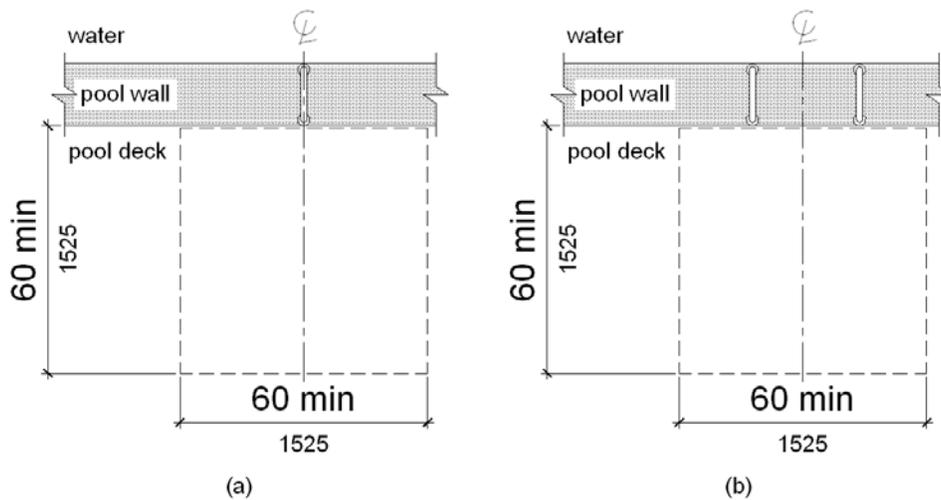

Fig. 74  
Clear Deck Space at Transfer Walls

**15.8 Swimming Pools, Wading Pools, and Spas**

**15.8.7.5 Grab Bars.** At least one grab bar shall be provided on the transfer wall. Grab bars shall be perpendicular to the pool wall and shall extend the full depth of the transfer wall. The top of the gripping surface shall be 4 inches (100 mm) minimum and 6 inches (150 mm) maximum above walls. Where one grab bar is provided, clearance shall be 24 inches (610 mm) minimum on both sides of the grab bar. Where two grab bars are provided, clearance between grab bars

shall be 24 inches (610 mm) minimum. Grab bars shall comply with 4.26 (see Fig. 77).

**15.8.8 Transfer Systems.** Transfer systems shall comply with 15.8.8.

**15.8.8.1 Transfer Platform.** A transfer platform 19 inches (485 mm) minimum clear depth by 24 inches (610 mm) minimum clear width shall be provided at the head of each transfer system (see Fig. 78).

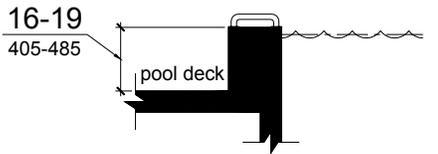

Fig. 75  
Transfer Wall Height

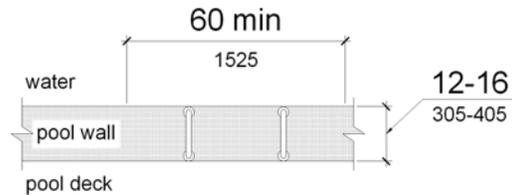

Fig. 76  
Transfer Wall Depth and Length

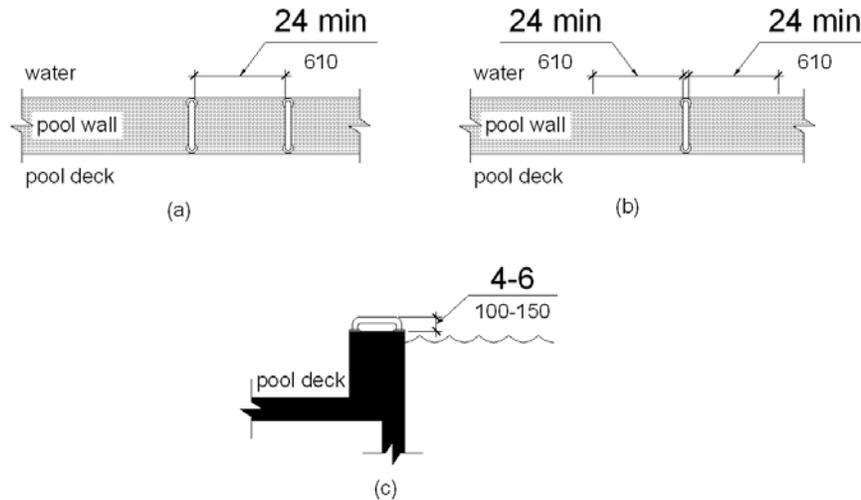

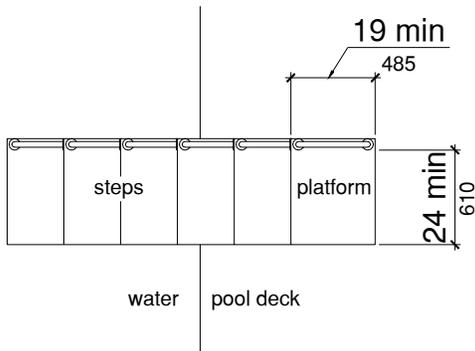

Fig. 77  
Grab Bars at Transfer Walls

**15.8 Swimming Pools, Wading Pools, and Spas**

**Fig. 78**  
Transfer System Platform

transfer platform surface and shall be centered along a 24 inch (610 mm) minimum unobstructed side of the transfer platform (see Fig. 79).

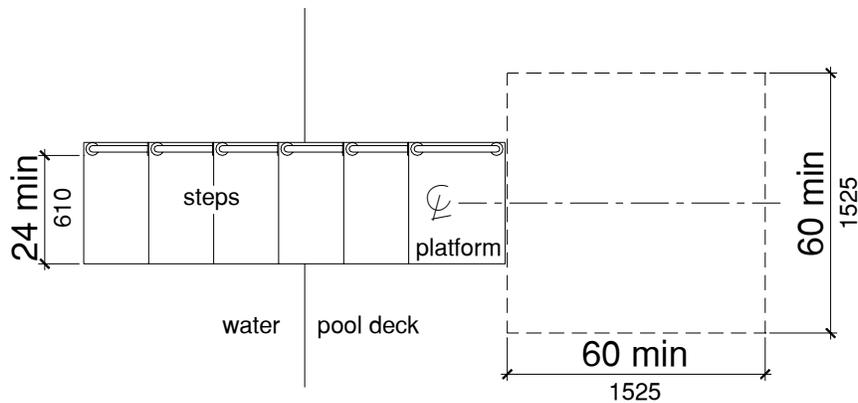

**15.8.8.3 Height.** The height of the transfer platform shall comply with 15.8.7.2.

**15.8.8.4\* Transfer Steps.** Transfer step height shall be 8 inches (205 mm) maximum. Transfer steps shall extend to a water depth of 18 inches (455 mm) minimum below the stationary water level (see Fig. 80).

**15.8.8.5 Surface.** The surface of the transfer system shall not be sharp and shall have rounded edges.

**15.8.8.6 Size.** Each transfer step shall have a tread clear depth of 14 inches (355 mm) minimum and 17 inches (430 mm) maximum and shall have a tread clear width of 24 inches (610 mm) minimum (see Fig. 81).

**15.8.8.2 Clear Deck Space.** A clear deck space of 60 inches (1525 mm) minimum by 60 inches (1525 mm) minimum with a slope not steeper than 1:48 shall be provided at the base of the

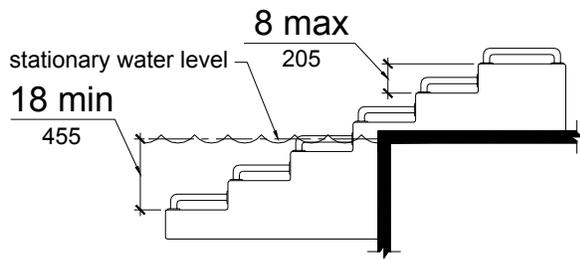

**Fig. 79**  
Clear Deck Space at Transfer Systems

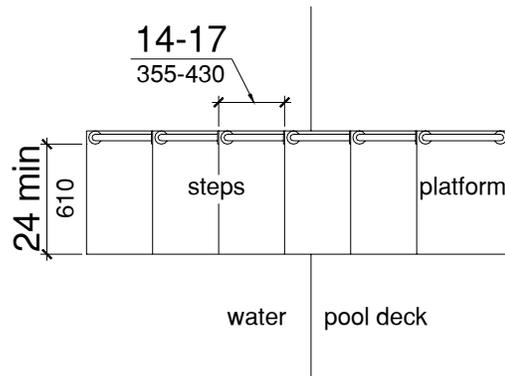

**15.8 Swimming Pools, Wading Pools, and Spas**

**15.8.8.7\* Grab Bars.** At least one grab bar on each transfer step and the transfer platform, or a continuous grab bar serving each transfer step and the transfer platform, shall be provided. Where provided, the top of the gripping surface shall be 4 inches (100 mm) minimum and 6 inches (150 mm) maximum above each step and transfer platform. Where a continuous grab bar is

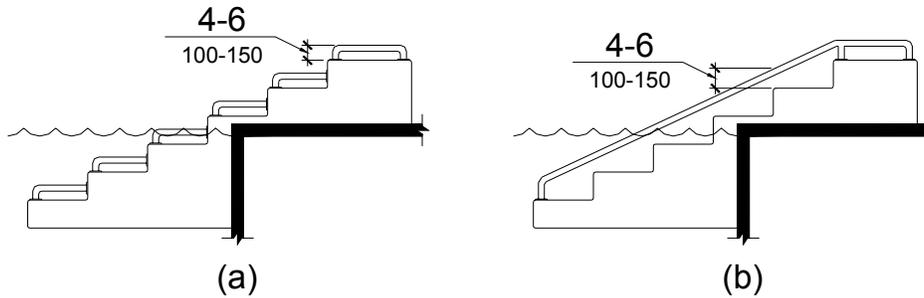

provided, the top of the gripping surface shall be 4 inches (100 mm) minimum and 6 inches (150 mm) maximum above the step nosing and transfer platform. Grab bars shall comply with 4.26 and be located on at least one side of the transfer system. The grab bar located at the transfer platform shall not obstruct transfer (see Fig. 82).

**Fig. 80**  
Transfer System Steps

**Fig. 81**  
Size of Transfer System Steps

**Fig. 82**  
Grab Bars at Transfer Systems

## 15.8 Swimming Pools, Wading Pools, and Spas

**15.8.9 Pool Stairs.** Pool stairs shall comply with 15.8.9.

**15.8.9.1 Pool Stairs.** Pool stairs shall comply with 4.9, except as modified below.

**15.8.9.2 Handrails.** The width between handrails shall be 20 inches (510 mm) minimum and 24 inches (610 mm) maximum. Handrail extensions required by 4.9.4 shall not be required at the bottom landing serving a pool stair.

**15.8.10\* Water Play Components.** Where water play components are provided, the provisions of 15.6 and 4.3 shall apply, except as modified or otherwise provided in this section.

EXCEPTION 1: Where the surface of the accessible route, clear floor or ground spaces and maneuvering spaces connecting play components is submerged, the provisions of 15.6 and 4.3 for cross slope, running slope, and surface shall not apply.

EXCEPTION 2: Transfer systems complying with 15.6.5 shall be permitted to be used in lieu of ramps to connect elevated play components.

## APPENDIX

This appendix contains materials of an advisory nature and provides additional information that should help the reader to understand the minimum requirements of the guidelines or to design buildings or facilities for greater accessibility. The paragraph numbers correspond to the sections or paragraphs of the guideline to which the material relates and are therefore not consecutive (for example, A4.2.1 contains additional information relevant to 4.2.1). Sections of the guidelines for which additional material appears in this appendix have been indicated by an asterisk. Nothing in this appendix shall in any way obviate any obligation to comply with the requirements of the guidelines itself.

### A2.0 General.

**A2.2 Equivalent Facilitation.** Specific examples of equivalent facilitation are found in the following sections:

4.1.6(3)(c)	Elevators in Alterations
4.31.9	Text Telephones
7.2	Sales and Service Counters, Teller Windows, Information Counters
9.1.4	Classes of Sleeping Accommodations
9.2.2(6)(d)	Requirements for Accessible Units, Sleeping Rooms, and Suites

### A3.0 Miscellaneous Instructions and Definitions.

#### A3.5 Definitions.

**Transient Lodging.** The Department of Justice's policy and rules further define what is covered as transient lodging.

#### A4.0 Accessible Elements and Spaces: Scope and Technical Requirements.

##### A4.1.1 Application.

**A4.1.1(3) Areas Used Only by Employees as Work Areas.** Where there are a series of individual work stations of the same type (e.g., laboratories, service counters, ticket booths), 5%, but not less

than one, of each type of work station should be constructed so that an individual with disabilities can maneuver within the work stations. Rooms housing individual offices in a typical office building must meet the requirements of the guidelines concerning doors, accessible routes, etc. but do not need to allow for maneuvering space around individual desks. Modifications required to permit maneuvering within the work area may be accomplished as a reasonable accommodation to individual employees with disabilities under Title I of the ADA.

Consideration should also be given to placing shelves in employee work areas at a convenient height for accessibility or installing commercially available shelving that is adjustable so that reasonable accommodations can be made in the future.

If work stations are made accessible they should comply with the applicable provisions of 4.2 through 4.35.

##### A4.1.2 Accessible Sites and Exterior Facilities: New Construction.

**A4.1.2(2)(b) Court Sports:** The accessible route must be direct and connect both sides of the court without requiring players on one side of the court to traverse through or around another court to get to the other side of the court.

**A4.1.2(4) Exception 1.** An accessible route is required to connect to the boundary of the area of sport activity. The term "area of sport activity" distinguishes that portion of a room or space where the play or practice of a sport occurs from adjacent areas. Examples of areas of sport activity include: basketball courts, baseball fields, running tracks, bowling lanes, skating rinks, and the area surrounding a piece of gymnastic equipment. While the size of an area of sport activity may vary from sport to sport, each includes only the space needed to play. The following example is provided for additional clarification.

*Example.* Boundary lines define the field where a football game is played. A safety border is also provided around the field. The game may

### A4.1.3 Accessible Buildings: New Construction

temporarily be played in the space between the boundary lines and the safety border when players are pushed out of bounds or momentum carries them forward while receiving a pass. In the game of football, the space between the boundary line and the safety border is used to play the game. This space and the football field are included in the area of sport activity.

**A4.1.2(4) Exception 2.** Public circulation routes where animals may also travel, such as in petting zoos and passageways alongside animal pens in State fairs, are not eligible for the exception.

**A4.1.2(5)(e)** Valet parking is not always usable by individuals with disabilities. For instance, an individual may use a type of vehicle controls that render the regular controls inoperable or the driver's seat in a van may be removed. In these situations, another person cannot park the vehicle. It is recommended that some self-parking spaces be provided at valet parking facilities for individuals whose vehicles cannot be parked by another person and that such spaces be located on an accessible route to the entrance of the facility.

#### **A4.1.3 Accessible Buildings: New Construction.**

**4.1.3(1)(b) Court Sports:** The accessible route must be direct and connect both sides of the court without requiring players on one side of the court to traverse through or around another court to get to the other side of the court.

**4.1.3(3) Exception 1.** An accessible route is required to connect to the boundary of the area of sport activity. The term "area of sport activity" distinguishes that portion of a room or space where the play or practice of a sport occurs from adjacent areas. Examples of areas of sport activity include: basketball courts, baseball fields, running tracks, bowling lanes, skating rinks, and the area surrounding a piece of fixed gymnastic equipment. While the size of an area of sport activity may vary from sport to sport, each includes only the space needed to play. The following example is provided for additional clarification.

*Example.* Boundary lines define the field where a football game is played. A safety border is also provided around the field. The game may temporarily be played in the space between the boundary lines and the safety border when players are pushed out of bounds or momentum carries them forward while receiving a pass. In the game of football, the space between the boundary line and the safety border is used to play the game. This space and the football field are included in the area of sport activity.

**4.1.3(3) Exception 2.** Public circulation routes where animals may also travel, such as in petting zoos and passageways alongside animal pens in State fairs, are not eligible for the exception.

**A4.1.3(5)** Only passenger elevators are covered by the accessibility provisions of 4.10. Materials and equipment hoists, freight elevators not intended for passenger use, dumbwaiters, and construction elevators are not covered by these guidelines. If a building is exempt from the elevator requirement, it is not necessary to provide a platform lift or other means of vertical access in lieu of an elevator.

Under Exception 4, platform lifts are allowed where existing conditions make it impractical to install a ramp or elevator. Such conditions generally occur where it is essential to provide access to small raised or lowered areas where space may not be available for a ramp. Examples include, but are not limited to, raised pharmacy platforms, commercial offices raised above a sales floor, or radio and news booths.

While the use of platform lifts is allowed, ramps are recommended to provide access to player seating areas serving an area of sport activity.

**A4.1.3(9)** Supervised automatic sprinkler systems have built in signals for monitoring features of the system such as the opening and closing of water control valves, the power supplies for needed pumps, water tank levels, and for indicating conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of

### A4.1.3 Accessible Buildings: New Construction

satisfactory performance and response to fire conditions.

**A4.1.3(10)** If an odd number of drinking fountains is provided on a floor, the requirement in 4.1.3(10)(b) may be met by rounding down the odd number to an even number and calculating 50% of the even number. When more than one drinking fountain on a floor is required to comply with 4.15, those fountains should be dispersed to allow wheelchair users convenient access. For example, in a large facility such as a convention center that has water fountains at several locations on a floor, the accessible water fountains should be located so that wheelchair users do not have to travel a greater distance than other people to use a drinking fountain.

**A4.1.3(12)(c)** Different types of lockers may include full-size and half-size lockers, as well as those specifically designed for storage of various sports equipment.

#### A4.33.6 Placement of Listening Systems

within the seating area are provided. This will allow choice in viewing and price categories.

Building and life safety codes set minimum distances between rows of fixed seats with consideration of the number of seats in a row, the exit aisle width and arrangement, and the location of exit doors. "Continental" seating, with a greater number of seats per row and a commensurate increase in row spacing and exit doors, facilitates emergency egress for all people and increases ease of access to mid-row seats especially for people who walk with difficulty. Consideration of this positive attribute of "continental" seating should be included along with all other factors in the design of fixed seating areas.

Removable armrests are recommended on fixed companion seats provided in assembly areas in amusement facilities. This provides the option for an individual using a wheelchair or other mobility device to transfer into a seat where motion and other effects may be provided as part of the amusement experience.

**A4.33.6 Placement of Listening Systems.** A distance of 50 ft (15 m) allows a person to distinguish performers' facial expressions.

**A4.33.7 Types of Listening Systems.** An assistive listening system appropriate for an assembly area for a group of persons or where the specific individuals are not known in advance, such as a playhouse, lecture hall or movie theater, may be different from the system appropriate for a particular individual provided as an auxiliary aid or as part of a reasonable accommodation. The appropriate device for an individual is the type that individual can use, whereas the appropriate system for an assembly area will necessarily be geared toward the "average" or aggregate needs of various individuals. A listening system that can be used from any seat in a seating area is the most flexible way to meet this specification. Earphone jacks with variable volume controls can benefit only people who have slight hearing loss and do not help people who use hearing aids. At the present time, magnetic induction loops are the most feasible type of

listening system for people who use hearing aids equipped with "T- coils," but people without hearing aids or those with hearing aids not equipped with inductive pick-ups cannot use them without special receivers. Radio frequency systems can be extremely effective and inexpensive. People without hearing aids can use them, but people with hearing aids need a special receiver to use them as they are presently designed. If hearing aids had a jack to allow a bypass of microphones, then radio frequency systems would be suitable for people with and without hearing aids. The Department of Justice's regulations implementing titles II and III of the ADA require public entities and public accommodations to provide appropriate auxiliary aids and services to ensure effective communication. See 28 CFR 35.160, 28CFR 35.164, and 28 CFR 36.303. Where assistive listening systems are used to provide effective communication, the Department of Justice considers it essential that a portion of receivers be compatible with hearing aids.

Some listening systems may be subject to interference from other equipment and feedback from hearing aids of people who are using the systems. Such interference can be controlled by careful engineering design that anticipates feedback sources in the surrounding area.

Table A2, shows some of the advantages and disadvantages of different types of assistive listening systems. In addition, the Access Board has published a pamphlet on Assistive Listening Systems which lists demonstration centers across the country where technical assistance can be obtained in selecting and installing appropriate systems. The state of New York has also adopted a detailed technical specification which may be useful.

**A4.36.2 Saunas and Steam Rooms.** A 60-inch turning diameter space or a T-shaped space is required within the sauna or steam room. Removable benches or seats are permitted to obstruct the 60-inch or T-shaped space.

**A4.37.3 Benches.** Back support may be achieved through locating benches adjacent to walls or by other designs that will meet the minimum dimensions specified.

**A5.0 Restaurants and Cafeterias.**

**A5.1 General.** Dining counters (where there is no service) are typically found in small carry-out restaurants, bakeries, or coffee shops and may only be a narrow eating surface attached to a wall. This section requires that where such a dining counter is provided, a portion of the counter shall be at the required accessible height.

**A7.0 Business, Mercantile and Civic.**

**A7.2(3)(iii) Counter or Teller Windows with Partitions.** Methods of facilitating voice communication may include grilles, slats, talk-through baffles, and other devices mounted directly into the partition which users can speak directly into for effective communication. These methods are required to be designed or placed so that they are accessible to a person who is standing or seated. However, if the counter is only used by persons in a seated position, then a method of facilitating communication which is accessible to standing persons would not be necessary.

## A15.0 Recreation Facilities

### A15.0 Recreation Facilities.

Unless otherwise modified in Section 4 or specifically addressed in section 15, all other ADAAG provisions apply for the design and construction of recreation facilities and elements. The provisions in this section apply wherever these elements are provided. For example, office buildings may contain a room with exercise equipment and these sections therefore apply.

### A15.1 Amusement Rides.

These guidelines apply to newly designed or newly constructed amusement rides. A custom designed and constructed ride is new upon its "first use," which is the first time amusement park patrons take the ride. With respect to amusement rides purchased from other entities, "new" refers to the first permanent installation of the ride, whether it is used "off the shelf" or it is modified before it is installed. Where amusement rides are moved after several seasons to another area of the park or to another park, the ride would not be considered newly designed or newly constructed.

Amusement rides designed primarily for children, amusement rides that are controlled or operated by the rider, and amusement rides without seats, are not required to provide wheelchair spaces, transfer seats, or transfer systems, and need not meet the signage requirements in 15.1.6. The load and unload areas of these rides must, however, be on an accessible route and must provide maneuvering space under 15.1.4 and 15.1.5.

The scoping and technical provisions of the guidelines were developed to address common amusement rides. There will be other amusement attractions that have unique designs and features which are not adequately addressed by the guidelines. In those situations, the guidelines are to be applied to the extent possible.

An accessible route must be provided to these areas. Where an attraction or ride has unique features for which there are no applicable scoping provisions, then a reasonable number, but at least one, of the features must be located on an

accessible route. Where there are appropriate technical provisions, they must be applied to the elements that are covered by the scoping provisions. Where an attraction has unique designs for which the technical provisions are not appropriate, the operators of those attractions are still subject to all the other requirements of the ADA, including program accessibility, barrier removal and the general obligation to provide individuals with disabilities an equal opportunity to enjoy the goods and services provided by their facilities. An example of an amusement ride not specifically addressed by the guidelines includes "virtual reality" rides where the device does not move through a fixed course within a defined area.

**A15.1 Exception 1.** Mobile or temporary rides are those set up for short periods of time such as traveling carnivals, State and county fairs, and festivals. The amusement rides that are covered by section 15.1 are ones that are not regularly assembled and disassembled.

**A15.1 Exception 2.** The exception does not apply to those rides where patrons may cause the ride to make incidental movements, but where the patron otherwise has no control over the ride.

**A15.1 Exception 3.** The exception is limited to those rides designed "primarily" for children, where children are assisted on and off the ride by an adult. This exception is limited to those rides designed for children and not for the occasional adult user. An accessible route to and maneuvering space in the load and unload area will provide access for adults and family members assisting children on and off these rides.

### A15.1.2 Alterations to Amusement Rides.

Routine maintenance, painting, and changing of theme boards are examples of activities that do not constitute an alteration subject to section 15.1.2. Where existing amusement rides are moved and not altered, section 15.1 does not apply unless the load and unload area of the amusement ride is newly designed and constructed. If a load or unload area is altered, the alteration provisions of ADAAG 4.1.6 must be applied to the altered area.

**A15.1.4 Accessible Route.** Steeper slopes are permitted (not to exceed 1:8) where the accessible route connects to the amusement ride in the load and unload position. This is permitted only where compliance with 4.8.2 (maximum slope 1:12) is “structurally or operationally infeasible”. In most cases, this will be limited to areas where the accessible route leads directly to the amusement ride and where there are space limitations on the ride, not the queue line. Where possible, the least possible slope should be used on the accessible route that serves the amusement ride.

**A15.1.7.1.2 Amusement Rides with Wheelchair Spaces.** 36 CFR 1192.83(c) ADA Accessibility Guidelines for Transportation Vehicles - Light Rail Vehicles and Systems - Mobility Aid Accessibility is available at [www.access-board.gov/transit/html/vguide.htm#LRVM](http://www.access-board.gov/transit/html/vguide.htm#LRVM). It references provisions for bridge plates and ramps used for gaps between wheelchair spaces and floors of load and unload areas.

**A15.1.7.2 Exception 3.** This exception for protruding objects applies to the ride devices, not to circulation areas or accessible routes in the queue lines or the load and unload areas.

**A15.1.7.2.2 Wheelchair Spaces - Side Entry.** Under certain circumstances, a 32-inch clear opening will not provide sufficient width to accommodate a turn into an amusement ride. The amount of clear space needed within the ride, and the size and position of the opening are interrelated. Additional space for maneuvering and a wider door will be needed where a side opening is centered on the ride. For example, where a 42-inch opening is provided, a minimum clear space of 60 inches in length and 36 inches in depth is needed (see Fig. A9). This is necessary to ensure adequate space for maneuvering. For additional guidance refer to Figure 3 (Wheelchair Turning Space) and Figure 4 (Minimum Clear Floor Space for Wheelchairs) on minimum space requirements.

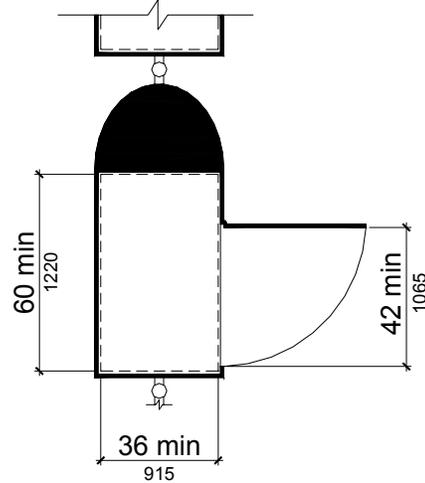

Fig. A9  
Wheelchair Spaces - Side Entry

**A15.1.8 Amusement Ride Seats Designed for Transfer.** There are many different ways that individuals transfer to and from their wheelchairs or mobility devices. The proximity of the clear floor or ground space next to an element and the height of the element one is transferring to are both critical for a safe and independent transfer. Providing additional clear floor or ground space both in front of and diagonally to the element will provide flexibility and increased usability for a more diverse population of individuals with disabilities. Ride seats designed for transfer should involve only one transfer. Where possible, designers are encouraged to locate the ride seat no higher than 17 to 19 inches above the load and unload surface. Where greater distances are required for transfers, consideration should be given to providing gripping surfaces, seat padding, and avoiding sharp or protruding objects in the path of transfer to better facilitate the transfer process.

**A15.1.9 Transfer Devices for Use with Amusement Rides.** Transfer devices for use with

## A15.2 Boating Facilities

amusement rides should permit individuals to make independent transfers to and from their wheelchairs or mobility devices. There are a variety of transfer devices available that could be adapted to provide access onto an amusement ride. Examples of devices that may provide for transfers include, but are not limited to, transfer systems (see 15.8.8), lifts, mechanized seats, and other custom designed systems. Operators and designers have flexibility in developing designs that will facilitate individuals to transfer onto amusement rides. These systems or devices should be designed to be reliable and sturdy. A transfer board, for example, would not be sufficient because it will not provide enough support or stability and may cause injury.

Designs which limit the number of transfers required from one's wheelchair or mobility device to the ride seat are encouraged. When using a transfer device to access an amusement ride, the least amount of transfers for the least amount of distance is desired. Where possible, designers are encouraged to locate the transfer device seat no higher than 17 to 19 inches above the load and unload surface. Where greater distances are required for transfers, consideration should be given to providing gripping surfaces, seat padding, and avoiding sharp or protruding objects in the path of transfer to better facilitate the transfer process. Where a series of transfers are required to reach the amusement ride seat, each vertical transfer should not exceed 8 inches.

As discussed with amusement rides seats designed for transfer, there are many different ways that individuals transfer to and from their wheelchairs or mobility devices. The proximity of the clear floor or ground space next to an element and the height of the element one is transferring to are both critical for a safe and independent transfer. Providing additional clear floor or ground space both in front of and diagonally to the element will provide flexibility and increased usability for a more diverse population of individuals with disabilities.

### A15.2 Boating Facilities.

**A15.2.2 Accessible Route.** The following two examples apply exceptions two and three.

Example 1. Boat slips which are required to be accessible are provided at a floating pier. The vertical distance an accessible route must travel to the pier when the water is at its lowest level is six feet, although the water level only fluctuates three feet. To comply with exceptions 2 and 3, at least one design solution would provide a gangway at least 72.25 feet long which ensures the slope does not exceed 1:12.

Example 2. A gangway is provided to a floating pier which is required to be on an accessible route. The vertical distance is 10 feet between the elevation where the gangway departs the landside connection and the elevation of the pier surface at the lowest water level. Exceptions 2 and 3, which modify 4.8.2, permit the gangway to be at least 80 feet long. Another design solution would be to have two 40-foot continuous gangways joined together at a float, where the float (as the water level falls) will stop dropping at an elevation five feet below the landside connection.

### A15.2.3 Boat Slips: Minimum Number.

Accessible boat slips are not "reserved" for persons with disabilities in the same manner as accessible vehicle parking spaces. Rather, accessible boat slip use is comparable to accessible hotel rooms. The Department of Justice is responsible for addressing operational issues relating to the use of accessible facilities and elements. The Department of Justice currently advises that hotels should hold accessible rooms for persons with disabilities until all other rooms are filled. At that point, accessible rooms can be open for general use on a first come, first serve basis.

The following two examples apply to a boating facility with a single non-demarcated pier.

Example 1. A site contains a new boating facility which consists of a single 60-foot pier. Boats are only moored parallel with the pier on both sides to allow occupants to embark or disembark.

Since the number of slips cannot be identified, section 15.2.3 requires each 40 feet of boat slip edge to be counted as one slip for purposes of determining the number of slips available and determines the number required to be accessible. The 120 feet of boat slip edge at the pier would equate with 3 boat slips. Table 15.2.3 would require 1 slip to be accessible and comply with 15.2.5. Section 15.2.5 (excluding the exceptions within the section) requires a clear pier space 60 inches wide minimum extending the length of the slip. In this example, because the pier is at least 40 feet long, the accessible slip must contain a clear pier space at least 40 feet long which has a minimum width of 60 inches.

**Example 2.** A new boating facility consisting of a single pier 25 feet long and 3 feet wide is being planned for a site. The design intends to allow boats to moor and occupants to embark and disembark on both sides, and at one end. As the number of boat slips cannot be identified, applying section 15.2.3 would translate to 53 feet of boat slip edge at the pier. This equates with two slips. Table 15.2.5 would require 1 slip to be accessible. To comply with 15.2.5 (excluding the exceptions within the section), the width of the pier must be increased to 60 inches. Neither 15.2.3 or 15.2.5 requires the pier length to be increased to 40 feet.

**A15.2.3.1 Dispersion.** Types of boat slips are based on the size of the boat slips; whether single berths or double berths, shallow water or deep water, transient or longer-term lease, covered or uncovered; and whether slips are equipped with features such as telephone, water, electricity and cable connections. The term “boat slip” is intended to cover any pier area where recreational boats embark or disembark, unless classified as a launch ramp boarding pier. For example, a fuel pier may contain boat slips, and this type of short term slip would be included in determining compliance with 15.2.3.1.

**A15.2.4 Boarding Piers at Boat Launch Ramps.** The following two examples apply to a boat launch ramp boarding pier.

**Example 1.** A chain of floats is provided on a launch ramp to be used as a boarding pier which is required to be accessible by 15.2.4. At high water, the entire chain is floating and a transition plate connects the first float to the surface of the launch ramp. As the water level decreases, segments of the chain end up resting on the launch ramp surface, matching the slope of the launch ramp. As water levels drop, segments function also as gangways because one end of a segment is resting on the launch ramp surface and the other end is connecting to another floating segment in the chain.

Under ADAAG 4.1.2(2), an accessible route must serve the last float because it would function as the boarding pier at the lowest water level. Under exception 3 in 15.2.4, each float is not required to comply with ADAAG 4.8, but must meet all other requirements in ADAAG 4.3, unless exempted by exception 1 in 15.2.4. In this example, because the entire chain also functions as a boarding pier, the entire chain must comply with the requirements of 15.2.5, including the 60-inch minimum clear pier width provision.

**Example 2.** A non-floating boarding pier supported by piles divides a launching area into two launch ramps and is required to be accessible. Under ADAAG 4.1.2(2), an accessible route must connect the boarding pier with other accessible buildings, facilities, elements, and spaces on the site. Although the boarding pier is located within a launch ramp, because the pier is not a floating pier or a skid pier, none of the exceptions in 15.2.4 apply. To comply with ADAAG 4.3, either the accessible route must run down the launch ramp or the fixed boarding pier could be relocated to the side of the two launch ramps. The second option leaves the slope of the launch ramps unchanged, because the accessible route runs outside the launch ramps.

**A15.2.4.1 Boarding Pier Clearances.** The guidelines do not establish a minimum length for accessible boarding piers at boat launch ramps. The accessible boarding pier would have a length which is at least equal to other boarding piers provided at the facility. If no other boarding pier

### A15.3 Fishing Piers and Platforms

is provided, the pier would have a length equal to what would have been provided if no access requirements applied. The entire length of accessible boarding piers would be required to comply with the same technical provisions that apply to accessible boat slips. For example, at a launch ramp, if a 20-foot long accessible boarding pier is provided, the entire 20 feet must comply with the pier clearance requirements in 15.2.5. Likewise, if a 60-foot long accessible boarding pier is provided, the pier clearance requirements in 15.2.5 would apply to the entire 60 feet.

**A15.2.5 Accessible Boat Slips.** Although the minimum width of the clear pier space is 60 inches, it is recommended that piers be wider than 60 inches to improve the safety for persons with disabilities, particularly on floating piers.

**A15.2.5.1 Clearances, Exception 3.** Where the conditions in exception 3 are satisfied, existing facilities are only required to have one accessible boat slip with a pier clearance which runs the length of the slip. All other accessible slips are allowed to have the required pier clearance at the head of the slip. Under this exception, at piers with perpendicular boat slips, the width of most “finger piers” will remain unchanged. However, where mooring systems for floating piers are replaced as part of pier alteration projects, an opportunity may exist for increasing accessibility. Piers may be reconfigured to allow an increase in the number of wider finger piers, and serve as accessible boat slips.

#### A15.3 Fishing Piers and Platforms.

**A15.3.3.1 Edge Protection.** Edge protection is required only where railings, guards, or handrails are provided on a fishing pier or platform. Edge protection will prevent wheelchairs or other mobility devices from slipping off the fishing pier or platform. Extending the deck of the fishing pier or platform 12 inches where the 34-inch high railing is provided is an alternative design, permitting individuals using a wheelchair or other mobility device to pull into a clear space and move beyond the face of the railing. In such a design, edge protection is not required.

**A15.3.2 Accessible Route, Exception 2.** For example, to provide access to an accessible floating fishing pier, a gangway is used. The vertical distance is 60 inches between the elevation that the gangway departs the landside connection and the elevation of the pier surface at the lowest water level. Exception 2 permits the use of a gangway at least 30 feet long, or a series of connecting gangways with a total length of at least 30 feet. The length of transition plates would not be included in determining if the gangway(s) meet the requirements of the exception.

**A15.3.3.3 Dispersion.** Portions of the railings that are lowered to provide fishing opportunities for persons with disabilities must be located in a variety of locations on the fishing pier or platform to give people a variety of locations to fish. Different fishing locations may provide varying water depths, shade (at certain times of the day), vegetation, and proximity to the shoreline or bank.

#### A15.4 Golf.

**A15.4.2 Accessible Routes.** The accessible route or golf car passage must serve accessible elements and spaces located within the boundary of a golf course. The 48-inch minimum width for the accessible route is necessary to ensure passage of a golf car on either the accessible route or the golf car passage. This is important where the accessible route is used to connect the golf car rental area, bag drop areas, practice putting greens, accessible practice teeing grounds, course toilet rooms, and course weather shelters. These are areas outside the boundary of the golf course, but are areas where an individual using an adapted golf car may travel. A golf car passage may not be substituted for other accessible routes, required by ADAAG 4.1.2, located outside the boundary of the course. For example, an accessible route connecting an accessible parking space to the entrance of a golf course clubhouse is not covered by this provision.

**A15.4.3 Accessible Route - Driving Ranges.** Both a stand alone driving range or a driving range next to a golf course must provide an

accessible route or golf car passage that connects accessible teeing stations with accessible parking spaces. The accessible route must be a minimum width of 48 inches; 60 inches if handrails are provided. The additional width permits the use of a golf car on the accessible route. Providing a golf car passage will permit a person that uses a golf car to practice driving a golf ball from the same position and stance used when playing the game. Additionally, the space required for a person using a golf car to enter and exit the teeing stations required to be accessible should be considered.

**A15.5 Miniature Golf.**

Where possible, providing access to all holes on a miniature golf course is recommended. If a course is designed with the minimum 50 percent accessible holes, designers or operators are encouraged to select holes which provide for an equivalent experience to the maximum extent possible. Accessible holes are required to be consecutive with one break permitted, if the last hole on the course is in the sequence.

**A15.5.3 Accessible Route.** Where only the minimum 50 percent of the holes are accessible, an accessible route from the last accessible hole to the course exit or entrance must not require travel back through other holes. In some cases, this may require an additional route. Other options include increasing the number of accessible holes in a way that limits the distance needed to connect the last accessible hole with the course exit or entrance. In any case, careful consideration to the layout of the course will be important to minimize space impacts.

The 1-inch curb for a 32-inch minimum opening can be located in an area where the ball is less likely to ricochet. Where the accessible route on the hole is provided, steeper slopes are permitted for a limited distance. A landing or level area must separate each of these steeper sloping segments. This will provide a resting area between the steeper segments.

**A15.5.5 Golf Club Reach Range.** Accessible holes on a miniature golf course may be provided with an accessible route leading through the hole

or with the accessible route next to the hole. Where the accessible route is provided adjacent to the hole, the route must be located within the golf club reach range. This allows individuals sufficient space and reach to play the game outside of the hole. Where possible, the distance between the level areas and the accessible route should be as close as possible, affording more opportunities for play.

**A15.6 Play Areas.**

**A15.6.1 General.** This section is to be applied during the design, construction, and alteration of play areas for children ages 2 and over. Play areas are the portion of a site where play components are provided. This section does not apply to other portions of a site where elements such as sports fields, picnic areas, or other gathering areas are provided. Those areas are addressed by other sections of ADAAG. Play areas may be located on exterior sites or within a building. Where separate play areas are provided within a site for children in specified age groups (e.g., preschool (ages 2 to 5) and school age (ages 5 to 12)), each play area must comply with this section. Where play areas are provided for the same age group on a site but are geographically separated (e.g., one is located next to a picnic area and another is located next to a softball field), they are considered separate play areas and each play area must comply with this section.

**A15.6.2 Ground Level Play Components.** A ground level play component is a play component approached and exited at the ground level. Examples of ground level play components include spring rockers, swings, diggers, and stand alone slides. When distinguishing between the different types of ground level play components, consider the general experience provided by the play component. Examples of different types of experiences include, but are not limited to, rocking, swinging, climbing, spinning, and sliding. A spiral slide may provide a slightly different experience from a straight slide, but sliding is the general experience and therefore a spiral slide is not considered a different type of play component than a straight slide.

## A15.6 Play Areas

The number of ground level play components is not dependent on the number of children who can play on the play component. A large seesaw designed to accommodate ten children at once is considered one ground level play component.

Where a large play area includes two or more composite play structures designed for the same age group, the total number of elevated play components on all the composite play structures must be added to determine the additional number and types of ground level play components that must be provided on an accessible route, and the type of accessible route (e.g., ramps or transfer systems) that must be provided to the elevated play components.

Ground level play components accessed by children with disabilities must be integrated in the play area. Designers should consider the optimal layout of ground level play components accessed by children with disabilities to foster interaction and socialization among all children. Grouping all ground level play components accessed by children with disabilities in one location is not considered integrated.

**A15.6.3 Elevated Play Components.** Elevated play components are approached above or below grade and are part of a composite play structure. A double or triple slide that is part of a composite play structure is one elevated play component. For purposes of this section, ramps, transfer systems, steps, decks, and roofs are not considered elevated play components. These elements are generally used to link other elements on a composite play structure. Although socialization and pretend play can occur on these elements, they are not primarily intended for play. Some play components that are attached to a composite play structure can be approached or exited at the ground level or above grade from a platform or deck. For example, a climber attached to a composite play structure can be approached or exited at the ground level or above grade from a platform or deck on a composite play structure. Play components that are attached to a composite play structure and can be approached from a platform or deck (e.g.,

climbers and overhead play components), are considered elevated play components. These play components are not considered ground level play components also, and do not count toward the requirements in 15.6.2 regarding the number of ground level play components that must be located on an accessible route.

**A15.6.4 Accessible Routes.** Accessible routes within the boundary of the play area must comply with 15.6.4. Accessible routes connecting the play area to parking, drinking fountains, and other elements on a site must comply with 4.3. Accessible routes provide children who use wheelchairs or other mobility devices the opportunity to access play components. Accessible routes should coincide with the general circulation path used within the play area. Careful placement and consideration of the layout of accessible routes will enhance the ability of children with disabilities to socialize and interact with other children.

Where possible, designers and operators are encouraged to provide wider ground level accessible routes within the play area or consider designing the entire ground surface to be accessible. Providing more accessible spaces will enhance the integration of all children within the play area and provide access to more play components. A maximum slope of 1:16 is required for ground level ramps; however, a lesser slope will enhance access for those children who have difficulty negotiating the 1:16 maximum slope. Handrails are not required on ramps located within ground level use zones.

Where a stand alone slide is provided, an accessible route must connect the base of the stairs at the entry point, and the exit point of the slide. A ramp or transfer system to the top of the slide is not required. Where a sand box is provided, an accessible route must connect to the border of the sand box. Accessibility to the sand box would be enhanced by providing a transfer system into the sand or by providing a raised sand table with knee clearance complying with 15.6.6.3.

Elevated accessible routes must connect the entry and exit points of at least 50 percent of elevated play components. Ramps are preferred over transfer systems since not all children who use wheelchairs or other mobility devices may be able to use or may choose not to use transfer systems. Where ramps connect elevated play components, the maximum rise of any ramp run is limited to 12 inches. Where possible, designers and operators are encouraged to provide ramps with a lesser slope than the 1:12 maximum. Berms or sculpted dirt may be used to provide elevation and may be part of an accessible route to composite play structures.

Platform lifts complying with 4.11 and applicable State and local codes are permitted as a part of an accessible route. Because lifts must be independently operable, operators should carefully consider the appropriateness of their use in unsupervised settings.

**A15.6.5 Transfer Systems.** Transfer systems are a means of accessing composite play structures. Transfer systems generally include a transfer platform and a series of transfer steps. Children who use wheelchairs or other mobility devices transfer from their wheelchair or mobility devices onto the transfer platform and lift themselves up or down the transfer steps and scoot along the decks or platforms to access elevated play components. Some children may be unable or may choose not to use transfer systems. Where transfer systems are provided, consideration should be given to the distance between the transfer system and the elevated play components. Moving between a transfer platform and a series of transfer steps requires extensive exertion for some children. Designers should minimize the distance between the points where a

child transfers from a wheelchair or mobility device and where the elevated play components are located. Where elevated play components are used to connect to another elevated play component in lieu of an accessible route, careful consideration should be used in the selection of the play components used for this purpose. Transfer supports are required on transfer platforms and transfer steps to assist children when transferring. Some examples of supports include a rope loop, a loop type handle, a slot in the edge of a flat horizontal or vertical member, poles or bars, or D rings on the corner posts.

**A15.6.6 Play Components.** Clear floor or ground spaces, maneuvering spaces, and accessible routes may overlap within play areas. A specific location has not been designated for the clear floor or ground spaces or maneuvering spaces, except swings, because each play component may require that the spaces be placed in a unique location. Where play components include a seat or entry point, designs that provide for an unobstructed transfer from a wheelchair or other mobility device are recommended. This will enhance the ability of children with disabilities to independently use the play component.

When designing play components with manipulative or interactive features, consider appropriate reach ranges for children seated in wheelchairs. The following table provides guidance on reach ranges for children seated in wheelchairs. These dimensions apply to either forward or side reaches. The reach ranges are appropriate for use with those play components that children seated in wheelchairs may access and reach. Where transfer systems provide access to elevated play components, the reach ranges are not appropriate.

**Children's Reach Ranges**

<b>Forward or Side Reach</b>	<b>Ages 3 and 4</b>	<b>Ages 5 through 8</b>	<b>Ages 9 through 12</b>
<b>High (maximum)</b>	36 in (915 mm)	40 in (1015 mm)	44 in (1120 mm)
<b>Low (minimum)</b>	20 in (510 mm)	18 in (455 mm)	16 in (405 mm)

## A15.7 Exercise Equipment and Machines

Where a climber is located on a ground level accessible route, some of the climbing rings should be within the reach ranges. A careful balance of providing access to play components but not eliminating the challenge and nature of the activity is encouraged.

**A15.6.7 Ground Surfaces.** Ground surfaces along clear floor or ground spaces, maneuvering spaces, and accessible routes must comply with the ASTM F 1951 Standard Specification for Determination of Accessibility to Surface Systems Under and Around Playground Equipment. The ASTM F 1951 standard is available from the American Society for Testing and Materials (ASTM), 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959, telephone (610) 832-9585. The ASTM F 1951 standard may be ordered online from ASTM (<http://www.astm.org>). The ASTM F 1951 standard determines the accessibility of a surface by measuring the work required to propel a wheelchair across the surface. The standard includes tests of effort for both straight ahead and turning movement, using a force wheel on a rehabilitation wheelchair as the measuring device. To meet the standard, the force required must be less than that required to propel the wheelchair up a ramp with a 1:14 slope. When evaluating ground surfaces, operators should request information about compliance with the ASTM F 1951 standard.

Ground surfaces must be inspected and maintained regularly and frequently to ensure continued compliance with the ASTM F 1951 standard. The type of surface material selected and play area use levels will determine the frequency of inspection and maintenance activities.

When using a combination of surface materials, careful design is necessary to provide appropriate transitions between the surfaces. Where a rubber surface is installed on top of asphalt to provide impact attenuation, the edges of the rubber surface may create a change in level between the adjoining ground surfaces. Where the change in level is greater than ½ inch, a sloped surface with a maximum slope of 1:12 must be provided.

Products are commercially available that provide a 1:12 slope at transitions. Transitions are also necessary where the combination of surface materials include loose fill products. Where edging is used to prevent the loose surface from moving onto the firmer surface, the edging may create a tripping hazard. Where possible, the transition should be designed to allow for a smooth and gradual transition between the two surfaces.

### **A15.7 Exercise Equipment and Machines, Bowling Lanes, and Shooting Facilities.**

#### **A15.7.2 Exercise Equipment and Machines.**

Fitness facilities often provide a range of choices of exercise equipment. At least one of each type of exercise equipment and machine must be served by an accessible route. Most strength training equipment and machines are considered different types. For example, a bench press machine is considered a different type than a biceps curl machine. The requirement for providing access to each type is intended to cover the variety of strength training machines. Where operators provide a biceps curl machine and free weights, both are required to meet the provisions in this section, even though an individual may be able to work on their biceps through both types of equipment. Where the exercise equipment and machines provided are only different in that different manufacturers provide them, only one of each type of machine is required to meet these guidelines. For example, where two bench press machines are provided and each is manufactured by a different company, only one is required to comply.

Similarly, there are many types of cardiovascular exercise machines, such as stationary bicycles, rowing machines, stair climbers, and treadmills. Each machine provides a cardiovascular exercise and is considered a different type for purposes of these guidelines.

One clear floor or ground space is permitted to be shared between two pieces of exercise equipment. Designers should carefully consider layout

## A15.8 Swimming Pools, Wading Pools, and Spas

options to maximize space such as connecting ends of the row and center aisle spaces.

The position of the clear floor space may vary greatly depending on the use of the equipment or machine. For example, to make a shoulder press accessible, clear floor space next to the seat would be appropriate to allow for transfer. Clear floor space for a bench press machine designed for use by an individual seated in a wheelchair, however, will most likely be centered on the operating mechanisms.

Designers and operators are encouraged to select exercise equipment and machines that provide fitness opportunities for persons with lower body extremity disabilities. Upper body exercise equipment and machines that offer either cardiovascular or strength training will enhance fitness opportunities for persons with disabilities from a wheelchair or mobility device. Examples include: equipment or machines that provide arm ergometry, free weights, and weighted pulley systems that are usable from a wheelchair or mobility device.

**A15.7.4. Shooting Facilities.** Examples of different types of firing positions include, but are not limited to: positions having different admission prices, positions with or without weather covering or lighting, and positions supporting different shooting events such as argon, muzzle loading rifle, small bore rifle, high power rifle, bull's eye pistol, action pistol, silhouette, trap, skeet, and archery (bow and crossbow).

### **A15.8 Swimming Pools, Wading Pools, and Spas.**

**A15.8.2 Swimming Pools.** Where more than one means of access is provided into the water, it is recommended that the means be different. Providing different means of access will better serve the varying needs of people with disabilities in getting into and out of a swimming pool. It is also recommended that where two or more means of access are provided, they not be provided in the same location in the pool. Different locations will

provide increased options for entry and exit, especially in larger pools.

**A15.8.2 Swimming Pools, Exception 1.** Pool walls at diving areas and areas along pool walls where there is no pool entry because of landscaping or adjacent structures should be counted when determining the number of accessible means of entry required.

**A15.8.5 Pool Lifts.** There are a variety of seats available on pool lifts ranging from sling seats to those that are preformed or molded. Pool lift seats with backs will enable a larger population of persons with disabilities to use the lift. Pool lift seats that consist of materials that resist corrosion and provide a firm base to transfer will be usable by a wider range of people with disabilities. Additional options such as armrests, head rests, seat belts, and leg support will enhance accessibility and better accommodate people with a wide range of disabilities.

**A15.8.5.6 Footrests and Armrests.** Footrests are encouraged on lifts used in larger spas, where the foot well water depth is 34 inches or greater. Providing footrests, especially ones that support the entire foot, will facilitate safe and independent transfers by a larger population of persons with disabilities.

**A15.8.5.7 Operation.** Pool lifts must be capable of unassisted operation from both the deck and water levels. This will permit a person to call the pool lift when the pool lift is in the opposite position. It is extremely important for a person who is swimming alone to be able to call the pool lift when it is in the up position so he or she will not be stranded in the water for extended periods of time awaiting assistance. The requirement for a pool lift to be independently operable does not preclude assistance from being provided.

**A15.8.5.9 Lifting Capacity.** Single person pool lifts must be capable of supporting a minimum weight of 300 pounds and sustaining a static load of at least one and a half times the rated load. Pool lifts should be provided that meet the needs of the population it is serving. Providing a pool lift

## A15.8 Swimming Pools, Wading Pools and Spas

with a weight capacity greater than 300 pounds may be advisable.

**A15.8.6.1 Sloped Entries.** Personal wheelchairs and mobility devices may not be appropriate for submerging in water. Some may have batteries, motors, and electrical systems that when submerged in water may cause damage to the personal mobility device or wheelchair or may contaminate the pool water. Providing an aquatic wheelchair made of non-corrosive materials and designed for access into the water will protect the water from contamination and avoid damage to personal wheelchairs or other mobility aids.

**A15.8.6.3 Handrails.** Handrails on both sides of a sloped entry provides stability to both persons with mobility impairments and persons using wheelchairs. For safety reasons, a single handrail is permitted on sloped entries provided at wave action pools, leisure rivers, sand bottom pools, and other pools where user access is limited to one area.

**A15.8.8.4 Transfer Steps.** Where possible, the height of the transfer step should be as minimal as possible. This will decrease the distance an individual is required to lift up or move down to reach the next step to gain access.

**A15.8.8.7 Grab Bars.** Pool operators have the choice of providing a grab bar on one side of each step and transfer platform or a continuous grab bar on one side serving each transfer step and the transfer platform. If provided on each step, the top of the gripping surface must be 4 to 6 inches above each step. Where a continuous grab bar is provided, the top of the gripping surface must be 4 to 6 inches above the step nosing. Each type has its advantages. A continuous handrail allows the person that is transferring to maintain a constant grip on the handrail while moving up or down the transfer steps. Grab bars provided on each step provide the gripping surface parallel to each step rather than on a diagonal.

**A15.8.10 Water Play Components.** Personal wheelchairs and mobility devices may not be appropriate for submerging in water when accessing play components located in water.

Some may have batteries, motors, and electrical systems that when submerged in water may cause damage to the personal mobility device or wheelchair or may contaminate the water. Providing an aquatic wheelchair made of non-corrosive materials and designed for access into the water will protect the water from contamination and avoid damage to personal wheelchairs.

## Introduction

The Architectural and Transportation Barriers Compliance Board (Access Board) is an independent federal agency devoted to accessibility for people with disabilities. The Access Board is responsible for developing and maintaining accessibility guidelines to ensure that newly constructed and altered buildings and facilities covered by the Americans with Disabilities Act and the Architectural Barriers Act are accessible to and usable by people with disabilities. In November 1999, the Access Board issued a proposed rule to revise and update its accessibility guidelines. During the public comment period on the proposed rule, the Access Board received approximately 600 comments from individuals with multiple chemical sensitivities (MCS) and electromagnetic sensitivities (EMS). They reported that chemicals released from products and materials used in construction, renovation, and maintenance of buildings, electromagnetic fields, and inadequate ventilation are barriers that deny them access to most buildings.

Americans spend about 90 percent of their time indoors, where concentrations of air pollutants are often much higher than those outside. According to the U.S. EPA Healthy Buildings, Healthy People: A Vision for the 21st Century, [www.epa.gov/iaq/hbhp/hbhptoc.html](http://www.epa.gov/iaq/hbhp/hbhptoc.html) "Known health effects of indoor pollutants include asthma; cancer; developmental defects and delays, including effects on vision, hearing, growth, intelligence, and learning; and effects on the cardiovascular system (heart and lungs). Pollutants found in the indoor environment may also contribute to other health effects, including those of the reproductive and immune systems." (p. 4). The report further notes that "Most chemicals in commercial use have not been tested for possible health effects. (p. 8).

There are a significant number of people who are sensitive to chemicals and electromagnetic fields. Surveys conducted by the California and New Mexico Departments of Health and by medical researchers in North Carolina found 16 to 33 percent of the people interviewed reported that they are unusually sensitive to chemicals, and in the California and New Mexico health departments' surveys 2 percent to 6 percent reported that they have been diagnosed as having multiple chemical sensitivities. C. Miller and N. Ashford, "Multiple Chemical Intolerance and Indoor Air Quality," in *Indoor Air Quality Handbook* Chapter 27.8 (McGraw-Hill 2001). Another California Department of Health Services survey has found that 3 percent of the people interviewed reported that they are unusually sensitive to electric appliances or power lines. P. LeVallois, et al., "Prevalence and Risk Factors of Self-Reported Hypersensitivity to Electromagnetic Fields in California," in California EMF Program, "An Evaluation of the Possible Risks From Electric and Magnetic Fields (EMFs From Power Lines, Internal Wiring, Electrical Occupations and Appliances, Draft 3 for Public Comment, April 2001" Appendix 3 (<http://www.dhs.ca.gov/ehib/emf/RiskEvaluation/riskeval.html>).

Individuals with multiple chemical sensitivities and electromagnetic sensitivities, who submitted written comments and/or attended the public information meetings on the draft final rule, requested that the Access Board include provisions in the final rule to make buildings and facilities accessible for them.

The Board has not included such provisions in their rules, but they have taken the commentary very seriously and acted upon it. As stated in the Background for its Final Rule **Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Recreation Facilities:** <http://www.access-board.gov/recreation/final.htm>

"The Board recognizes that multiple chemical sensitivities and electromagnetic sensitivities may be considered disabilities under the ADA if they so severely impair the neurological, respiratory or other functions of an individual that it substantially limits one or more of the

individual's major life activities. The Board plans to closely examine the needs of this population, and undertake activities that address accessibility issues for these individuals.

The Board plans to develop technical assistance materials on best practices for accommodating individuals with multiple chemical sensitivities and electromagnetic sensitivities. The Board also plans to sponsor a project on indoor environmental quality. In this project, the Board will bring together building owners, architects, building product manufacturers, model code and standard-setting organizations, individuals with multiple chemical sensitivities and electromagnetic sensitivities, and other individuals. This group will examine building design and construction issues that affect the indoor environment, and develop an action plan that can be used to reduce the level of chemicals and electromagnetic fields in the built environment.”

This report and the recommendations included within are a direct outgrowth from that public comment process. The Access Board contracted with the National Institute of Building Sciences (NIBS) to establish this Indoor Environmental Quality Project as a first step in implementing that action plan.

A broad and distinguished Steering Committee was established and met in January 2004 in Bethesda, Maryland, to review the project objectives. Subsequently four task teams (committees) were established to address specific issues in buildings related to Operations & Maintenance, Cleaner Air Rooms, Design and Construction, and Products and Materials. The following reports from these four committees offer recommendations for improving IEQ in buildings. They also list valuable resources and references to allow readers to investigate the pertinent issues in greater depth. The focus of the project was on commercial and public buildings, but many of the issues addressed and recommendations offered are applicable in residential settings.

Many volunteers worked diligently to create the recommendations in this report. These individuals are listed in the separate committee sections of the report, but special thanks go to the committee chairs: respectively Hal Levin, Building Ecology Research Group; Michael Mankin, California Division of the State Architect; Roger Morse, Morse-Zentner Associates; and Brent Kynoch, Kynoch Environmental Management, Inc. Lastly, an enormous debt of gratitude is owed to four amazing individuals who made significant contributions to the work of all four committees: Mary Lamielle, National Center for Environmental Health Strategies; Ann McCampbell, MD, Multiple Chemical Sensitivities Task Force of New Mexico; Susan Molloy, National Coalition for the Chemically Injured; and Toni Temple, Ohio Network for the Chemically Injured.

The overall objectives of this project were to establish a collaborative process among a range of stakeholders to recommend practical, implementable actions to both improve access to buildings for people with MCS and EMS while at the same time raising the bar and improving indoor environmental quality to create healthier buildings for the entire population.

This IEQ project supports and helps achieve the goals of the Healthy Buildings, Healthy People project, which acknowledges that "We will create indoor environments that are healthier for everyone by making indoor environments safer for the most vulnerable among us, especially children." (p.17)

## **Summary Recommendations**

The recommendations in this report are only a first step toward the action plan envisioned by the Access Board.

The NIBS IEQ committee offers several recommendations for further action. It is recommended that a follow-on project organize and convene one, or more, workshops to deliberate the issues and recommendations in this report. It is also recommended that a project be organized to develop a single guidelines document. Such guidelines would be built on refinement and coordination of the recommendations of the Design & Construction and Products & Materials committees in this report. This same, or a separate project, should develop new building code provisions to accelerate the implementation of improved IEQ. Lastly, it is recommended that a project be organized to develop guidelines for the design of an “ideal space” for people with MCS and EMS. The recommended follow-up projects should involve collaborative effort and funding from a range of organizations across the building community; e.g., American Institute of Architects (AIA), Associated General Contractors of America (AGC), Building Owners & Managers Association International (BOMA), American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), Environmental Protection Agency (EPA), and, of course, the Access Board.

### **Steering Committee**

## **INTRODUCTION AND OVERVIEW**

### **Problem Summary**

The operation and maintenance of commercial and public buildings can affect their accessibility for people with asthma and multiple chemical and/or electromagnetic sensitivities. The presence of many products or conditions involved in cleaning, maintaining, using, and operating buildings often contributes to poor indoor environmental quality and are access barriers for these individuals.

Problematic substances include, but are not limited to, pesticides, fragrances, disinfectants, many cleaners and new building materials and furnishings, and smoke and other engine exhaust. Inadequate ventilation of a building further contributes to poor indoor environmental quality.

The presence of electromagnetic fields from office equipment and other sources is a barrier for those with electromagnetic sensitivities. Noise and vibration can adversely affect some people with chemical and/or electromagnetic sensitivities and trigger seizures in susceptible individuals.

### **General Solutions**

Measures taken to improve indoor environmental quality, such as reducing air pollutants, noise and electromagnetic fields in buildings, will increase their accessibility for people with asthma and chemical and/or electromagnetic sensitivities, as well as provide a more healthful environment for all building occupants.

While “green” and “environmentally-friendly” practices and products for construction and maintenance of buildings sometimes provide more healthful indoor environments and improves access for those with asthma and multiple chemical sensitivities, this is not always the case. The U.S. EPA notes that there is growing concern that standards being promoted by the green building movement, such as Green Seal and Green Guard standards, are not sufficiently protective of health (1).

For example, some measures recommended to promote energy and water conservation -- such as reducing outdoor air supplied and/or reducing time of HVAC usage, using motion sensors that can create electromagnetic fields, using waterless urinals that require continuous chemical treatments, recommending cold water for cleaning, and promoting the use of alcohol hand wipes instead of hand washing – can cause or lead to increased indoor pollution and less healthful and accessible environments.

In addition, “greener cleaners” often promote the use of citrus- and/or pine-based products, which can react with even low levels of oxidants, such as ozone, to produce hazardous byproducts, as well as make buildings inaccessible for many people with chemical sensitivities. The addition of either synthetic or natural fragrances to cleaning and other products is also problematic for chemically sensitive individuals.

Other common green building recommendations, such as building on brownfields, using tuck-under parking, and putting heliports or gardens on roofs can also lead to diminished indoor air quality and create barriers for people with chemical sensitivities.

Lastly, the green building community has yet to provide guidance on the issue of electromagnetic fields.

## **BARRIERS & ISSUES**

### **Fragrances**

The presence of perfume, cologne, scented cleaners and other scented products contributes to poor indoor air quality and is one of the major access barriers for people with asthma and multiple chemical sensitivities.

“Fragrances” are chemical compounds added to a product to give it a scent. There are approximately 3000 chemicals used in the manufacture of fragrances. Most of these chemicals are synthetic and derived from petroleum. Chemicals found in fragrance formulations include toluene, alcohols, formaldehyde, styrene, benzene, limonene, phthalates, and musk. An individual fragrance formula may contain over 100 chemicals, but their identity is protected as a trade secret. Fragrances do not have to be tested for safety before they are put on the market (2).

Exposure to fragrances can trigger asthma attacks and migraine headaches, and aggravate sinus conditions. In those who are chemically sensitive, fragrance exposures can also cause irregular heartbeat, memory loss, confusion, fatigue, and neurological, vascular, and other problems. In addition, some fragrance chemicals are implicated in causing cancer and/or damaging the liver, kidneys, and central nervous system. Fragrance chemicals can enter the body via inhalation, skin absorption, or nasal passageways.

According to a 1986 U.S. House of Representatives Report:

*"In 1986, the National Academy of Sciences targeted fragrances as one of the six categories of chemicals that should be given high priority for neurotoxicity testing. The other groups include insecticides, heavy metals, solvents, food additives and certain air pollutants. The report states that 95 percent of chemicals used in fragrances are synthetic compounds derived from petroleum. They include benzene derivatives, aldehydes, and many other known toxics and sensitizers, which are capable of causing cancer, birth defects, central nervous system disorders and allergic reactions "* (3)

If a product label lists “fragrance” as an ingredient on the back of the label, it contains added fragrance, even if the front label says the product is “unscented” or “fragrance-free”. If “fragrance” is not listed as an ingredient, it may still contain fragrance chemicals or contain natural fragrances.

The main sources of fragrances in buildings are from 1) fragrance-emitting devices (FEDS), sprays, and deodorizers, 2) other scented cleaning and maintenance products, 3) perfume; cologne; essential oils; and scented skin and hair products, cosmetics, and other personal care products, 4) clothing that has been laundered with scented detergents, fabric softeners, or dryer sheets, and 5) potpourri, incense and scented candles (even when incense or scented candles are not burning). Sometimes fragrance is added to and dispersed by a building’s ventilation system.

### **Pesticides**

Pesticides are hazardous chemicals designed to kill or repel insects, plants, and other pests. The term pesticide applies to insecticides, herbicides (weed-killers), fungicides, rodenticides, disinfectants, and other substances used to control pests. Many pesticides contain volatile and/or semi-volatile chemicals that contribute to poor indoor air and environmental quality (IAQ/IEQ).

A pesticide product consists of the active ingredient(s) and “inert” ingredients. Active ingredients are the chemicals that kill or repel the pest. The rest of the product is composed of “inert” ingredients, which often comprise over 95% of the pesticide product. “Inert” ingredients are commonly solvents and may be as, or more, toxic than the active ingredient(s).

Individuals exposed to pesticides are at risk for both acute and chronic health effects (4, 5, 6, 7). Pesticide exposures can exacerbate asthma and cause nausea, headaches, rashes, dizziness, fatigue and memory loss. Many pesticides are also linked with causing cancer, birth defects, neurological and reproductive disorders, and the onset and exacerbation of chemical sensitivities. Pesticide exposure can occur long after its application because pesticide products are often designed to be persistent in the environment.

For people who are chemically sensitive, exposure to even minute amounts of pesticides from, for example, pesticide drift from neighborhood lawn treatments, driving on a road where herbicides have been sprayed weeks earlier, or being in a building that was treated with pesticides even several years earlier, can cause severe, sometimes, life-threatening and/or prolonged illness (8). Thus the presence of pesticides is one of the greatest access barriers for people with chemical sensitivities.

The use of pesticides can be eliminated or significantly reduced through implementation of Integrated Pest Management (IPM) programs. IPM is a program of prevention, monitoring, record-keeping, and control that eliminates or drastically reduces the use of pesticides. The focus of IPM is to prevent pest problems by reducing or eliminating sources of pest food, water, and shelter and by maintaining healthy lawns and landscapes. The first approach to controlling a pest outbreak is to improve sanitation, make structural repairs (such as fixing leaky pipes and caulking cracks), and using physical or mechanical controls such as screens, traps and mechanical weed cutters. A least hazardous chemical is used only when other strategies have failed.

IPM strategies are being increasingly implemented in schools, parks, government facilities, and hospitals nationwide. One needs to be aware, however, that the term IPM is sometimes inappropriately used for pest management programs that use or recommend the use of significant amounts of pesticides.

### **Cleaning Products & Disinfectants**

Many toxic chemicals are found in janitorial cleaning supplies used in industrial and commercial facilities. They often emit volatile organic compounds (VOC's) (9), contribute to poor indoor air quality (IAQ), and create access barriers for people with asthma, allergies, and/or chemical sensitivities. Some of these chemicals are associated with human health effects, including cancer, damage to major organs, interference with normal reproduction and development, and even death. (10).

Even “greener cleaners” may contain volatile substances, like citrus or pine, that can cause adverse health effects in building occupants.

There is a wide range of cleaning and maintenance products that include, but are not limited to, air fresheners, deodorizers, bathroom and tile cleaners, dusting aids, engine and other degreasers, lubricants, fabric protectants, floor polishes and waxes, furniture polish, general purpose cleaners, glass cleaners, laundry products, oven cleaners, carpet and upholstery cleaners, graffiti remover, and floor strippers. One of the most hazardous cleaning operations for workers and building occupants is the stripping and refinishing of floors.

Some cleaning products also contain disinfectants. The U.S. EPA notes that one major concern from a health standpoint is the increased incorporation of antimicrobial agents and fragrances in cleaners and air fresheners marketed to reduce indoor air contamination (1).

Many commonly used disinfectant or sanitizer products contain chlorine, phenol, quaternary ammonium compounds, and isopropyl and other alcohols. These produce hazardous fumes and present access barriers for people with chemical sensitivities.

### **Electromagnetic Fields**

For people who are electromagnetically sensitive, the presence of cell phones and towers, portable telephones, computers, fluorescent lighting, unshielded transformers and wiring, battery re-chargers, wireless devices, security and scanning equipment, microwave ovens, electric ranges and numerous other electrical appliances can make a building inaccessible.

The National Institute for Occupational Safety and Health (NIOSH) notes that scientific studies have raised questions about the possible health effects of EMF's. NIOSH recommends the following measures for those wanting to reduce EMF exposure – informing workers and employers about possible hazards of magnetic fields, increasing workers' distance from EMF sources, using low-EMF designs wherever possible (e.g., for layout of office power supplies), and reducing EMF exposure times (11).

### **Renovation/Remodeling/Furniture**

Many new building materials, such as paints, adhesives, wallboard, carpet, and insulation, as well as upholstered furniture, particleboard cabinets, and other furnishings emit hazardous volatile organic compounds (VOC's), contribute to poor indoor air quality (IAQ) and create significant access barriers for people with asthma and/or chemical sensitivities. These materials often outgas and are problematic for prolonged periods of time.

### **Smoke & Combustion**

Many people with asthma and most people with chemical sensitivities are made sick by exposure to: 1) smoke, such as that from tobacco, fireplaces, candles, incense, and barbeques, and other outdoor fires, 2) vehicle and other engine exhaust, especially exhaust from vehicles using diesel or oxygenated fuel, and 3) combustion appliances burning kerosene, propane, or natural gas (natural gas usually being better tolerated than kerosene or propane). If combustion appliances are used, they should be directly vented to the outdoors. Electrical appliances are preferred by people with chemical sensitivities.

### **Noise & Vibration**

Noise and vibration from HVAC systems, vacuums, pumps, helicopters and other sources can trigger severe symptoms, including seizures, in susceptible individuals.

### **Synergistic Effects of Indoor Air Pollutants**

Indoor air is a "chemical soup" made up of a variety of chemicals emitted by building materials, cleaning products, pesticides, personal care and consumer products, emissions from building equipment and activities, etc. While individual chemicals may be hazardous, combinations of chemicals can be even more hazardous through additive or synergistic effects. Synergistic effects

occur when the health impacts of a chemical combination is greater than the sum of the impacts of the individual chemicals.

### **Indoor Air Chemistry**

In indoor air, chemicals can react with one another to form other compounds that are more hazardous than the original chemicals. Increasing evidence has shown that ozone and hydroxyl radicals formed by other oxidants can react with alkenes (such as limonene found in citrus and fragrance formulations, as well as terpenes emitted by many wood products) to generate secondary pollutants, including formaldehyde, as well as hydroxy radicals that can react with organics to form other potentially toxic air pollutants. The toxicity of many of these secondary pollutants is well-established while for others it has yet to be evaluated (12, 13, 14, 15, 16). These reactions can be limited by employing carbon-based filters in locations where outdoor ozone concentrations commonly approach or exceed the National Ambient Air Quality Standards (NAAQS) promulgated by the U.S. EPA.

### **Persistence of Indoor Air Pollutants**

Many porous building materials and furnishings, such as carpeting, couches, drapes, and wallboard, absorb cleaning chemicals, fragrances, pesticides, and other air pollutants. Chemicals adsorb to virtually all indoor surfaces but more strongly to rough rather than smooth surfaces. These processes are known as the “sink effect”. These chemicals can be re-emitted into the air for long periods of time leading to prolonged air pollution. For example, it is not uncommon for a building to retain the odor of a fragrance-emitting device (FED) months after it has been removed. Similarly, residual tobacco smoke can still be detected in buildings long after a no-smoking policy is implemented. Air pollutants clear more readily from buildings that contain a higher percentage of hard impermeable surfaces.

## **RECOMMENDED ACTIONS FOR FACILITY MANAGERS AND OPERATIONS & MAINTENANCE STAFF**

The O & M Committee identified *pesticides* (indoors & outdoors), *fragrances* (especially fragrance-emitting devices/FEDS, air fresheners, and deodorizers), and volatile *cleaners* (including citrus & pine) as the biggest access barriers for people with chemical sensitivities related to operations and maintenance of a building. Cell phone use was identified as a significant barrier for people with electromagnetic sensitivities.

The Committee developed recommendations for making buildings more accessible for people with chemical and/or electromagnetic sensitivities in the areas of pest control, cleaning & disinfecting, mechanical / HVAC, landscape maintenance, and enclosure maintenance. They are listed in bullet form in the Appendix and summarized in the body of the report below.

In addition, recommendations are given for renovation, remodeling, and furnishings and for adoption of policies on smoking, fragrances, cell phone use, notification of building activities, and vehicle idling.

The Committee recognizes that the list of recommendations is long and that few buildings will be able to implement all of them. The recommendations are the ideal goal towards which to strive. Any steps taken to reduce the levels of the problematic substances or conditions listed above will improve access for people with chemical and/or electromagnetic sensitivities and create a healthier building.

Some of the recommendations will not apply to certain types of buildings or geographic areas. The recommendations are given in sufficient detail to help those who need to address a specific issue. Resources from which to obtain more information or guidance are also provided in the Appendix and at the end of the document in Additional Resources.

### **Recommendations for Pest Control**

Adopt an Integrated Pest Management (IPM) program for building interiors and grounds as described in “Healthy Hospitals, Controlling Pests Without Harmful Pesticides” (17). The Los Angeles Unified School District also has an exemplary plan for an IPM program (18).

IPM is a program of prevention, monitoring, record-keeping, and control that eliminates or drastically reduces the use of pesticides. The focus of IPM is to prevent pest problems by reducing or eliminating sources of pest food, water, and shelter and by maintaining healthy lawns (19) and landscapes.

The first approach in controlling a pest outbreak is to improve sanitation, make structural repairs (such as fixing leaky pipes and caulking cracks), and using physical or mechanical controls such as screens, traps, vacuums, and mechanical weed cutters. Increased sanitation measures include more frequent trash removal, restricting eating to designated areas, securing trash container lids, and steam cleaning trash containers. The IPM approach uses knowledge of a pest’s biology, habitat, and needs to time specific interventions to prevent and control pests. A least hazardous chemical is used only when other strategies have failed.

Pesticide use is discouraged in a true IPM program. If pesticides are used indoors or outdoors, however, the following precautions should be taken -- notification of applications (even for “spot” or crack & crevice treatments) should be given through posting of signs (before, during, and after applications) and by other means to building occupants, especially those on a pesticide notification

registry (20), applications should only be made by a licensed applicator, applications should not be made inside buildings by spraying, fogging, bombing, or tenting, and applications should not be made in occupied areas or areas that may become occupied during the 24 hours (at a minimum) following an application. In buildings that are constantly occupied, pesticide applications should be made when they are least occupied. It is recommended that pesticides be applied when there is the longest time before the area will be re-occupied, such as at the beginning of a weekend or vacation period.

The Committee recommends that certain pesticides, such as organophosphates, carbamates, pyrethroids, and other neurotoxic insecticides; 2,4-D, other phenoxy herbicides, and glyphosate; and fungicides such as mancozeb, chlorothalonil, and maneb, never be used.

### **Recommendations for Cleaning & Disinfecting**

Use fragrance-free, low-VOC cleaning products. Do not use fragrance-emitting devices (FEDS), plug-ins, or sprays; urinal or toilet blocks; or other deodorizer/re-odorizer products. Reduce odors by increasing cleaning and ventilation and/or using baking soda or zeolite to absorb odors. Do not use products containing paradichlorobenzene (21) or naphthalene, which are common ingredients in FEDS.

Do not use cleaner/disinfectant combination products. Avoid or limit the use of products containing chlorine, ammonia, quaternary ammonium, phenol, isopropyl and other alcohols, formaldehyde, and other petroleum distillates. Do not use citrus- or pine-based products. Hydrogen peroxide-based products are the preferred disinfectants, but still should be used with caution and care. Use hot water for cleaning to reduce the need for soaps, detergents, and disinfectants.

Use disinfectants only in areas and at strengths (i.e., levels of disinfection) required by law. Check with local health department to obtain details of all legal requirements. Clean surfaces thoroughly before disinfecting. Leave disinfectants in place for the correct amount of time before wiping surfaces clean.

Audit cleaning chemicals currently in use and develop a plan to replace with safer alternatives.

Vacuum frequently and thoroughly using vacuums with HEPA filters and strong suction. If carpets must be cleaned, use steam or least toxic all-purpose cleaner or carpet cleaner that does not contain petroleum solvents. Spot clean whenever possible. Clean stains while they are fresh to avoid the need for aggressive cleaning later. Dust hard surfaces with a lint-free cloth, or with water only.

Spray cleaning products on to cloths rather than on to surfaces or into the air. Dry all washed surfaces with a dry cloth or mop to reduce chemical residue and chance of mold growth. Minimize the use of floor waxes and buffing.

Ventilate well when using cleaning products. Post signs during cleaning. Make cleaning schedule available to employees or others upon request.

Schedule heavy cleaning, repairs and maintenance during low or no-occupancy periods whenever possible.

Prohibit occupant usage of cleaning chemicals except as authorized. Establish a list of least toxic, low-VOC cleaning products (and/or provide them to employees) which they can use to clean computers, erase felt pen writing on white board, and perform other similar activities.

In decorative building fountains, use the minimum amount of chlorine necessary for disinfection, avoid the use of bromine, use closed ozone water treatment systems to the maximum extent possible, and make use of newer, less-toxic disinfecting technologies as they become available.

Avoid the use of wall-mounted devices, similar to fragrance-emitting devices (FEDS), that operate automatically or by pushing a button to dispense deodorizers, disinfectants, and pesticides.

### **Recommendations for Mechanical Equipment / HVAC**

Adhere to a strict maintenance schedule for HVAC equipment and make sure it is working properly. Use the highest efficiency filters compatible with current HVAC system, and if necessary, consider retrofitting the system to increase filtration capabilities. Maintain relative humidity between 30% and 50%.

Use non-chemical methods to maintain HVAC ducts free of particulate matter, dust, and debris, such as physical removal or use of vacuums. Do not use the HVAC system to disperse fragrances or other materials.

Seal return air openings into HVAC system during remodeling and exhaust directly to the outdoors, by temporarily removing window glazing if necessary.

Use demand controlled ventilation (DCV) that provides liberal amounts of air flow and outdoor air ventilation. Before a building is re-occupied in the morning or after weekends, flush with at least three complete outdoor air exchanges.

Create door and window-opening protocol to maintain proper pressure relationships and air flow in the building. Educate and provide protocol to staff and other building occupants. Policy should include provision that allows chemically sensitive and other individuals to open windows on a temporary or regular basis, as needed because of a health condition. Windows should also be permitted to be opened by occupants when the HVAC system is not working or shut off, such as may occur during nights and weekends.

Make maximum use of economizer cycle. Avoid energy conservation practices that reduce intake of outside air below minimum requirements.

Avoid or minimize the use of humidifiers in the building's HVAC system. Prohibit the use of personal humidifiers except when an occupant has a medical need for one. Maintain the cleanliness of all humidifier equipment and use the minimum amount of water treatment chemicals necessary to control dissolved solids and pH and prevent antimicrobial contamination. Do not allow the use of portable air "cleaners" that emit ozone.

Repair plumbing with least toxic, low-VOC materials. Use snakes or other mechanical methods to clear clogged drains. Use bacterial enzymes to prevent drain clogs. Inspect floor and other drains, especially those that are infrequently used, to ensure there is water in the P-traps, thereby avoiding sewer gas backup. Treat grease traps daily with bacterial enzymes.

### **Recommendations for Landscape Maintenance**

Maintain lawns and gardens organically. Use integrated pest management (IPM) to eliminate or minimize the use of herbicides, fungicides, insecticides, and other pesticides. Maintain soil health. Avoid the use of synthetic fertilizers.

Pull, mow, or use mechanical weed cutters to remove weeds. Vinegar can be used to kill weeds along fence lines and other hard to reach places.

Avoid dust-blowing equipment like leaf blowers. Sweeping, raking, and use of vacuums are the preferred methods for removing debris.

Avoid diesel-powered and 2-cycle engine equipment. Use electric lawn and landscape equipment whenever possible.

Use rock, gravel, flat stones, or pavers for mulch, and/or use tytar landscape barrier to suppress weeds. Avoid organic mulches, like cocoa beans, peat moss, wood chips, and bark, especially near operable windows and doors of buildings. These mulches usually emit volatile fumes and may produce or harbor mold.

Avoid the use of CCA wood or wood chips because they contain arsenic and other toxic chemicals which can leach into the environment. Do not use railroad ties because they contain creosote.

Apply pesticide, fertilizers, and lime only when there is little or no wind and apply them in a manner that prevents drift. Post signs and provide advance notification to building occupants before starting these applications.

Use least toxic, low-VOC paints, stains, and finishes on outside equipment, like benches, poles, decks, and porches.

### **Recommendations for Enclosure Maintenance**

It is important to properly maintain the building envelop in order to prevent mold problems and block pest entry.

Routinely inspect and clean roof and gutters to make sure they are draining properly. Promptly repair roof or plumbing leaks. Regularly inspect walls and foundations, especially all utility entrance seals (e.g., phone, water, electric, and cable) for cracks and repair promptly if found. Insulate cold pipes to prevent condensation.

Promptly remove wet ceiling tiles and wall panels.

Remove excess water from carpeting damaged by clean water and quickly dry it to avoid mold buildup. Do not use disinfectants or moldicides (other than hydrogen peroxide-based ones). Instead, utilize a steam extraction carpet cleaning system with a hydrogen peroxide-based cleaner/disinfectant. Inspect carpet after it is completely dried to ensure there is no mold or mildew. Those with asthma or chemical sensitivities should be removed from areas where there is wet carpeting. Remove carpeting if it has been wet longer than 24 hours.

Immediately remove and do not re-use any wet carpeting that has been contaminated with sewer water, heavy dirt and soils, or toxic chemicals.

Seal rusted surfaces with a least toxic low VOC sealant to minimize emissions of airborne particles.

### **Recommendations for Renovation/Remodeling/Furnishings**

It is recommended that buildings and furnishings be well maintained to reduce the need for renovation and remodeling. Chemically sensitive individuals often tolerate older building materials and furnishings better than new ones because older materials have usually outgassed and emit lower levels of VOCs.

If renovation and remodeling is done, however, efforts should be made to limit activities to select areas, rather than being done on a wide scale. They should be performed when the areas are unoccupied (or the least occupied in buildings that are in constant use).

If new materials and finishes are applied (especially wet-applied products such as paints, sealants, caulks, and adhesives), maximum outdoor air ventilation with no recirculation should be employed during and for a reasonable period of time after the application.

When possible, new furnishings should be thoroughly aired out before being brought into the occupied space.

## **GENERAL RECOMMENDATIONS**

### **Indoor Air & Environmental Quality Program**

The O & M Committee recommends that facilities adopt an Indoor Air & Environmental Quality Program (IAQ/IEQ) to promote practices that prevent or reduce the contamination of indoor air, thereby contributing to a safe, healthy, productive and comfortable environment for building occupants. Benefits of good IAQ/IEQ may include improved health of occupants, decrease in the spread of infectious disease, protection of susceptible populations, increased productivity of occupants, improved relationships/fewer complaints, reduction in potential building closures (due to unhealthful conditions), less deterioration of buildings and equipment, reduced maintenance costs, and decreased liability and risk (22).

An IAQ/IEQ Program should include the maintenance of a log that records building problems and health complaints reported by building occupants.

### **Policies**

The O & M committee recommends the following policies be adopted in commercial and public buildings:

#### **No Smoking Policy**

It is recommended that smoking be prohibited inside buildings. Smoking should be restricted to designated outdoor smoking areas that are 100 feet from paths of travel, entryways, operable windows, and air intakes.

#### **Fragrance-Free Policy**

It is recommended that a fragrance-free policy include prohibition of fragrance-emitting devices (FEDS) and sprays; use of fragrance-free maintenance, laundry, paper and other products; restrictions on perfume, cologne, and other scented personal care products used by employees, visitors, and other occupants; and prohibitions on use of potpourri and burning incense and scented candles.

An important first step is educating staff and others about the need for and benefits of reducing or eliminating the use of fragranced products.

### **Resources**

No Scents Makes Sense brochure, Lung Association of New Brunswick:  
<http://www.nb.lung.ca/pdf/NoScentsMakeSense.pdf>

Guidelines on Wearing Scented Products and We Share the Air posters, University of Waterloo, Ontario, Canada, [www.safetyoffice.uwaterloo.ca/hspm/hspmm\\_intro/safety\\_manual\\_index.htm](http://www.safetyoffice.uwaterloo.ca/hspm/hspmm_intro/safety_manual_index.htm), (under 12. Hygiene).

See “*Steps for Implementing a Scent-free Policy in the Workplace*” in Additional Resources.

#### **Cell Phone Use Policy**

It is recommended that cell phone use be prohibited in areas of a building when requested by an electromagnetically sensitive individual who needs to work or visit that area. Also, see information on use of a Cleaner Air Symbol in the Designated Cleaner Air Room report.

### **Notification Policy**

It is recommended that facilities adopt a posting and notification policy to notify staff, visitors, and other building occupants of pesticide applications, cleaning and maintenance activities, renovation and construction, and other activities that may produce hazardous fumes or dust.

### **Vehicle Idling Policy**

It is recommended that facilities limit or prohibit idling of vehicles, especially diesel vehicles, near entryways, loading docks, operable windows, and air intakes (23).

### **Recommendations for Future Actions**

1. The O & M Committee recommends that the U.S. Access Board sponsor a meeting with stakeholders, including architects, building owners and managers, government officials, scientists, advocates, sensitive and vulnerable individuals, and others to evaluate the recommendations of this report (Operations & Maintenance). This meeting should provide a forum for increasing awareness of the report, facilitating dialogue among stakeholders, assessing the feasibility of the recommendations, and identifying ways to advance the recommendations.

2. The recommendations on cleaning products and practices in this report are based on information that is currently available. The O & M committee found that much more information and research is needed to better define cleaning products and practices that are effective and that will best protect occupant health. Some of the data gaps or problems the Committee identified are lack of information on labels and Material Safety Data Sheets, lack of information on fragrance ingredients combined with incomplete information on their health effects, and safety questions about citrus- and pine-based cleaning products because, among other things, they react with ozone to produce hazardous byproducts.

We, therefore, recommend that the U.S. Access Board and/or NIBS, in conjunction with U.S. EPA and other stakeholders, sponsor a workshop to examine existing information on cleaning products and practices, identify those products and practices that have the least adverse impact on indoor environmental quality and occupant health (including impacts on sensitive and vulnerable individuals), develop best practices, and determine research needs.

## **APPENDIX - DETAILED RECOMMENDATIONS**

### **Detailed Recommendations for Pest Control**

#### ***Use Integrated Pest Management:***

Use integrated pest management (IPM) – a program of pest prevention, monitoring, record-keeping, and control that eliminates or drastically reduces the use of pesticides.

Follow recommendations for integrated pest management (IPM) in "Healthy Hospitals, Controlling Pests Without Harmful Pesticides". The Los Angeles Unified School District also has an exemplary plan for an IPM Program.

Eliminate the use of chemical pesticides or minimize their use to the greatest possible extent.

Pest management program should be part of an overall Indoor Air & Environmental Quality (IAQ/IEQ) program.

Designate an IPM coordinator.

When contracting for IPM services, give clear instructions on the type of service requested, including which, if any, pesticides are acceptable for use under specific conditions.

Eliminate all scheduled or routine use of pesticides. Use chemical pesticides only as a last resort when non-chemical methods have failed to control a pest problem.

Use organic methods to maintain lawns and landscape vegetation.

Do not use fertilizers that contain herbicides (e.g., "weed and feed" products).

Do not use herbicides to kill grass, shrubs, or other unwanted vegetation prior to removal or replacement.

If control methods are needed, preference should be given to physical (e.g., barriers), mechanical (e.g., mouse traps, pulling weeds, vacuuming, fly swatters, hosing insects off plants), and cultural (e.g., improved soil health, proper watering and pruning) controls, using bio-controls (e.g., natural predator insects) if those methods fail, and only using chemical pesticides as a last resort.

#### ***Prevent Pests:***

Emphasize pest prevention through non-chemical means.

To avoid creating conditions attractive to pests, clean thoroughly, promptly fix building cracks and plumbing leaks, restrict eating to designated areas, and promptly dispose of waste.

Adopt and adhere to strict maintenance schedules to determine and repair points of possible pest entry, such as torn screens, cracks and holes in walls, and damaged or improperly placed door seals and sweeps.

Initiate additional housekeeping routines to reduce the chances of pest infestation, including more frequent trash removal, securing trash container lids, and steam cleaning trash containers.

Locate trash cans and dumpsters, compactors, and recycling areas away from the building.

Maintain healthy lawns and landscape vegetation to increase resistance to pests.

To maximize health of lawns, develop healthy soils, mow often and with sharp blades, reduce thatch, and water deeply but not too often.

Maintain soil health. Avoid the use of synthetic fertilizers.

Prevent mosquitoes from breeding by draining stagnant water from bird baths, swimming pool covers, buckets, tires and other areas where water may be collecting. Drill holes in bottom of recycling bins that must be kept outside. Check rain gutters to ensure they are draining properly.

Discourage the introduction or presence of indoor plants because they attract pests, encourage pesticide use, and often promote mold growth.

If indoor plants are present, minimize mold growth by being careful not to over water, loosening the top layer of soil every week, and not keeping plants in wicker baskets. Do not use synthetic fertilizers or pesticides on indoor plants.

Change the water in flower vases frequently.

***Pesticides:***

**USE PESTICIDES ONLY AS A LAST RESORT WHEN NON-CHEMICAL METHODS HAVE FAILED TO CONTROL A PEST PROBLEM**

Use the least toxic pesticide in the least amount necessary to accomplish the job. Spot treatments are preferred.

Least hazardous pest management materials include:

- Boric acid and disodium octoborate tetrahydrate;
- Soybean oil and corn gluten meal;
- Diatomaceous earth;
- Nonvolatile insect and rodent baits in tamper-resistant containers or for use in crack and crevices;
- Microbe-based insecticides (such as *Bacillus thuringiensis*, B.t.);
- Botanical insecticides that do not contain synthetic pyrethroids or toxic synergists;
- Biological control agents, such as parasites and predators; and
- Soap-based products.

[Note that due to individual variations in sensitivities, some people with allergies, asthma, or chemical sensitivities may not tolerate one or more of the above least hazardous materials.]

Least hazardous physical pest management methods include the use of liquid nitrogen for cold treatment of termites.

Pesticide applications should only be made by a licensed pest control applicator.

The O & M Committee recommends that certain pesticides, such as organophosphates, carbamates, pyrethroids, and other neurotoxic insecticides; 2,4-D, other phenoxy herbicides, and glyphosate; and fungicides such as mancozeb, chlorothalonil, and maneb, never be used.

Do not apply pesticides to buildings by fogging, bombing, or tenting or by space, broadcast, or baseboard spraying.

Do not apply pesticides in occupied areas or areas that may become occupied during the 24 hours (at a minimum) following an application. In buildings that are constantly occupied, pesticide applications should be made when they are least occupied. It is recommended that pesticides be applied when there is the longest time before the area will be re-occupied, such as at the beginning of a weekend or vacation period.

Minimize contamination of the HVAC system by sealing all inlets and outlets to the area where pesticides are applied. When the seals are removed, ventilate the area with 100% outside air with no recirculation at least until the building is re-occupied.

No application of pesticides should be made along paths of travel or in the vicinity of entrances, windows, or outside air intakes.

Do not use pesticides that contain added fragrance.

Ensure proper training of all personnel working with pesticides.

Prohibit other staff and building occupants from using pesticide products.

In the event of a scheduled structural or lawn care pesticide application (including spot or crack & crevice treatments), provide pre-notification and post signage in appropriate disability formats before, during, and after the application.

Signage for pesticide applications should include the name of the pesticide product applied and EPA registration number, date and time of application, name of the applicator, and the name and number of contact person from whom to obtain more information. For examples of notification requirements, see Healthy Hospitals report (17) and New Jersey regulations (20) under References.

Require that pest control applicators provide the building manager or designated agent copies of Material Safety Data Sheet(s) and product label(s) for all pesticides used inside the building or on facility grounds. These documents should be provided to building occupants and the public upon request. Note, however, that neither the MSDS or product label provide complete information on product ingredients or their potential health effects.

Maintain a voluntary registry of persons at increased risk of injury or harm from pesticide exposures who wish to receive individual notification prior to pesticide applications (or notified after an emergency application).

Reasonable accommodation to programs, services, and employment needs to be readily available to people whose disabilities require that they avoid exposures to pesticides.

Maintain secured separate storage for pesticides and limit access to authorized personnel only.

Store any pesticide and disinfectant products away from food, laundry areas, paper product storage, areas occupied by children, and HVAC air intakes.

Maintain separate equipment, including mixing containers, for use with pesticides. Avoid cross contamination with equipment used for cleaning and other maintenance activities.

Establish a reporting procedure and encourage individuals who are experiencing adverse health effects from a pesticide exposure to report the incident to the building manager and the U. S. Environmental Protection Agency. See EPA Pesticide Health Incident Reporting, <http://www.epa.gov/pesticides/health/reporting.htm>

## **Detailed Recommendations for Cleaning & Disinfecting**

Do not use fragrance-emitting devices (FEDS), plug-ins, or sprays; urinal or toilet blocks; or other deodorizer/re-odorizer products.

To reduce odors, increase cleaning and ventilation and/or use baking soda or zeolite to absorb odors.

Do not use products containing paradichlorobenzene or naphthalene (common ingredients in FEDS).

Avoid or limit the use of products containing chlorine, ammonia, quaternary ammonium, phenol, isopropyl and other alcohols, formaldehyde, and other petroleum distillates.

Discourage the use of alcohol-based hand washes.

Do not use products that contain or have a fragrance.

Do not use citrus- or pine-based products.

Use vegetable-based surfactants rather than petroleum-based ones. Do not use citrus- or pine-based solvents.

Cleaning and disinfecting programs should be part of an overall Indoor Air & Environmental Quality (IAQ/IEQ) program.

Establish an audit of all cleaning chemicals currently in use. Develop a priority list and plan to establish alternatives for chemicals and cleaning methods.

Raise awareness among building maintenance staff and occupants that "green" and "environmentally friendly" products are not necessarily good for occupant health.

Minimize the number of cleaning and disinfecting products used.

Perform cleaning maintenance on an as needed basis – use spot or area cleaning rather than broad-based cleaning.

Clean stains while they are fresh to avoid need for aggressive cleaning later.

Choose cleaning products and disinfectants that emit the lowest levels of volatile fumes.

Dust with a dry lint-free cloth, or with water only. Avoid or minimize the use of polish dusting products.

Avoid perfumed and/or chemically-treated cleaning products and supplies, such as cleaning rags, vacuum bags, trash bags, tissue, toilet paper, and hand soaps.

Increase scrubbing and other mechanical methods of cleaning to reduce the need for chemicals.

Inspect areas to insure there has been proper cleaning using visual inspection, white cloth, or ultraviolet light.

Do not use cleaner/disinfectant combination products.

Hot water should be available for hand washing and cleaning.

Whenever possible, clean with hot water to reduce the amount of soap, detergent, and disinfectant that must be used.

Spray cleaning products on to cloths rather than on to surfaces or into the air.

If carpets must be cleaned, use steam or least-toxic all-purpose cleaner or carpet cleaner that does not contain petroleum solvents. Spot clean whenever possible.

Adopt fast-drying methods for carpet cleaning, 4 hours maximum. Steam cleaning + highest extraction + higher dry air flow = fast drying.

Dry all washed surfaces and floors with a dry cloth or mop to minimize chemical residues and reduce the chance of mold growth.

Use vacuums with HEPA (High Efficiency Particulate Attenuation) filters and strong suction. Vacuum frequently and thoroughly.

Minimize the use of floor waxes and buffing, and if done, notify employees and the public.

Order cleaning products for use with pumps rather than spray or aerosol dispensers to minimize chemical contamination of the air and HVAC system.

Take control of your own dispensing to ensure proper measurements. Establish minimal dosing for applications. When chemical has multiple uses, dispense separately for each use. A good dispensing program can save 25% to 40% in chemical consumption and costs.

Educate staff that mixing cleaning chemicals is dangerous because it can create new compounds that are more toxic than the original products.

Initiate protocol to authorize, supervise, and provide safe areas to mix authorized chemicals.

Store cleaning chemicals securely, separated from paper, cloth, or other absorbent materials.

Post signs during cleaning activities. Make cleaning schedule available to employees or others upon request.

Schedule heavy cleaning, repairs and maintenance during low or no-occupancy periods whenever possible.

Maintain strict protocol for training employees who use hazardous products or materials.  
Maintain an active list of those authorized to perform those duties.

Restrict cleaning to authorized personnel only.

Prohibit occupant usage of cleaning chemicals except as authorized. Establish a list of least toxic, low-VOC cleaning products (and/or provide them to employees) which they can use to clean computers, erase felt pen writing on white board, and perform other similar activities.

Use micro vacuums for cleaning electronic equipment. Do not use solvent cleaners.

Increase air intake to a building to dilute cleaning products present in indoor air, especially during major cleaning activities such as cleaning of carpet, walls, etc.

Provide a well-ventilated room with exhaust fans in which to service computers and other portable equipment whenever toxic chemicals are involved in the repair process.

Develop protocol to dispose of cleaning solutions safely.

Reduce tracked-in dirt by using mats and grills in entryways. Where appropriate, exhaust air between separated doorway entrances.

Replace wet entrance mats and dry wet floors and carpeting as soon as possible.

Utilize only those floor mats that do not emit odors/fumes or particles.

Reasonable accommodation to programs, services, and employment needs to be readily available to people whose disabilities require that they avoid exposures to cleaning, disinfecting, and maintenance chemicals.

Waterless urinals should be maintained using products containing bacterial enzymes that biodegrade urea.

### ***Disinfectants***

Eliminate combined cleaner/disinfectant products.

Use disinfectants only when and where necessary. This includes:

- 1) Knowing what organisms need to be reduced/disinfected. Disinfectants are formulated to target certain organisms or combination of organisms. It is important to use the right product in the right place.
- 2) Knowing what surfaces do (or do not) need to be disinfected, and how often.
- 3) Cleaning surfaces thoroughly before disinfecting. Disinfectants can only be effective through contact. A layer of surface grime is likely to prevent sufficient contact.
- 4) Using proper disinfectant mixing and cleaning procedures. This includes leaving disinfectants in place for the correct amount of time before wiping surfaces clean.

Limit or avoid the use of disinfectant or cleaning products containing chlorine, quaternary ammonium, phenol, and isopropyl and other alcohols.

Hydrogen peroxide-based disinfectants are preferred, but should be used judiciously with caution and care.

Use disinfectants only in areas and at strengths (i.e., levels of disinfection) required by law. Check with local health department to obtain details of all legal requirements.

Restrict or eliminate the use of alcohol-based hand washes.

Do not use hand soaps containing triclosan or other disinfectants.

### **Resources**

See Addendum B for more information on Cleaning

### **Detailed Recommendations for Mechanical Equipment & HVAC Systems**

If a building has poor indoor air quality, investigate the extent to which outdoor air contaminants are contributing to the problem.

In areas where poor outdoor air is a problem, use the highest efficiency filters compatible with current HVAC system, and if necessary, consider retrofitting system to increase filtration capabilities.

Use demand controlled ventilation (DCV) that utilize sensors in occupied spaces to determine when ventilation should be increased due to increased occupancy or other loads. Be wary of using motion sensors that can create significant electromagnetic fields.

Provide liberal amounts of ventilation. It is better to have more ventilation than necessary rather than too little.

Where there is an adjoining parking garage or busy roadway, or nearby heliport, anticipate the need to decrease air exchange and ventilation in buildings prior to and during “rush hours” or times of usage, respectively. During periods of decreased outdoor air ventilation, increase recirculation and filtration of recirculated air.

Adhere to a strict maintenance plan for all HVAC equipment to make sure it is working properly. This will reduce the chance of air contamination, maintain optimal efficiency, and minimize noise and vibration.

Create door and window-opening protocol to maintain proper pressure relationships and air flow in the building. Educate and provide protocol to staff and other building occupants. Policy should include provision that allows chemically sensitive and other individuals to open windows on a temporary or regular basis, as needed because of a health condition. Windows should also be permitted to be opened by occupants when the HVAC system is not working or shut off, such as may occur during nights and weekends. Policy should address emergency situations in which opening windows could exacerbate the crisis.

Maintain HVAC ducts free of particulate matter, dust, and debris. Use non-chemical methods, such as physical removal or use of vacuums.

Do not use HVAC system to disperse fragrances or other chemicals.

Before a building is re-occupied (e.g., in the mornings or after weekends), flush with at least three complete outdoor air exchanges.

Make maximum use of economizer cycle. Avoid energy conservation practices that reduce intake of outside air below minimum requirements.

Make sure the supply and return air diffusers, grills, and registers are working correctly.

Test for stagnant air areas where furniture, wall partitions, or equipment may be blocking air movement. Use ribbons or dry ice rather than smoke to study air flow patterns.

Maintain relative humidity between 30 and 50%.

Avoid or minimize the use of humidifiers in the buildings HVAC system. Maintain the cleanliness of all humidifier equipment and use the minimum amount of water treatment chemicals necessary to prevent antimicrobial contamination and to control dissolved solids and pH.

Prohibit the use of personal humidifiers except where there is a medical need.

Isolate and contain construction chemicals and particulate matter from HVAC system by covering registers and diffusers and using negative-pressure air systems.

Seal return air openings into HVAC system during remodeling and exhaust directly to the outdoors, by temporarily removing window glazing if necessary.

Quickly evacuate a building if the HVAC system becomes contaminated with a solvent, pesticide, toxic gas, or other harmful chemical at a level that can cause adverse health impacts in occupants, including sensitive and more vulnerable individuals.

Eliminate storage of toxic and/or volatile chemicals near HVAC intakes.

Do not allow the use of portable air “cleaners” that emit ozone.

Repair plumbing with least toxic, low-VOC materials.

To clear clogged drains, use mechanical methods such as snakes, or steam cleaning.

Utilize bacterial enzymes to prevent drain clogs, instead of using acids, solvents and alkalines which deteriorate pipes and necessitate repairs.

Inspect floor and other drains, especially those that are infrequently used, to ensure there is water in the P-traps, thereby avoiding sewer gas backup in the building.

Treat grease traps daily with preventive dose of bacterial enzymes, to avoid the need to use strong chemical cleaners if they become clogged.

In decorative fountains, use the minimum amount of chlorine necessary for disinfection, avoid the use of bromine, use closed ozone water treatment systems to the maximum extent possible, and make use of newer, less-toxic disinfecting technologies as they become available.

### **Detailed Recommendations for Landscape Maintenance**

Use integrated pest management (IPM) to eliminate or minimize the use of herbicides, fungicides, insecticides, and other pesticides. (See recommendations for Pest Control).

Maintain lawn and gardens organically.

Maintain soil health.

Avoid the use of synthetic fertilizer.

Do not use fertilizer products that contain herbicides (e.g., “weed and feed” products).

Maintain healthy lawns and landscape vegetation to increase resistance to pests.

To maximize health of lawns, develop healthy soils, mow often and with sharp blades, reduce thatch, and water deeply but not too often.

Pull, mow, or use mechanical weed cutter to control weeds. Vinegar can be used to kill weeds along fence lines or other hard to reach areas.

Avoid dust-blowing equipment, such as leaf blowers. Sweeping, raking, and use of a vacuum are the preferred methods for removing debris.

If string or other mechanical weed cutter is used, attempt to minimize dispersal of dust, dirt, and debris.

Avoid diesel-powered or 2-cycle engine equipment, use electric lawn equipment instead.

Close windows during grass cutting, or prior to pesticide, fertilizer, or lime applications, or use of gas-powered equipment or vehicles on building grounds.

Use least toxic low-VOC paints, stains and finishes on outside equipment, including benches, poles, decks, and porches, as is recommended for interior and exterior of buildings (see recommendations in Building Products & Materials report).

Use rock, gravel, flat stones, or pavers for mulch and/or use tytar landscape barrier to suppress weeds. Avoid organic mulches (e.g., cocoa beans, peat moss, wood chips, bark), especially near windows and doors of buildings. These mulches emit volatile fumes and may harbor mold.

Avoid the use of CCA wood or wood chips because they contain arsenic and other toxic chemicals which can leach into the environment.

Do not use railroad ties because they contain creosote.

Remove plants that are chronically ill and/or frequently attract insect pests.

When replacing plants or redesigning landscape, follow recommendations in Building Construction & Design report.

Apply pesticide, fertilizers, and lime only when there is little or no wind present and in a manner that prevents drift.

Provide prenotification by posting signs prior to pesticide, synthetic fertilizer, or lime applications.

Allergy-Free Gardening, Thomas Leo Ogren, [www.allergyfree-gardening.com](http://www.allergyfree-gardening.com)

### **Detailed Recommendations for Enclosure Maintenance**

Routinely inspect and clean roof and gutters to make sure they are draining properly.

Promptly repair roof or plumbing leaks.

Regularly inspect walls and foundations, especially all utility entrance seals (e.g., phone, water, electric, cable) for cracks and repair promptly if found.

Insulate cold pipes to prevent condensation.

Promptly remove wet ceiling tiles and wall panels.

Seal rusted surfaces to minimize emissions of airborne particulates using least toxic low-VOC sealant.

Include proper seal of the building in commissioning and re-commissioning programs for the building.

Remove excess water from carpeting damaged by clean water and quickly dry it to avoid mold buildup. Do not use disinfectants or moldicides (other than hydrogen peroxide-based ones). Instead, utilize a steam extraction carpet cleaning system with a hydrogen peroxide-based cleaner/disinfectant. Inspect carpet after it is completely dried to ensure there is no mold or mildew. Those with asthma or chemical sensitivities should be removed from areas where there is wet carpeting. Remove carpeting if it has been wet longer than 24 hours.

Immediately remove and do not re-use any wet carpeting that has been contaminated with sewer water, heavy dirt and soils, or toxic chemicals.

Seal rusted surfaces with a least toxic low VOC sealant to minimize emissions of airborne particles.

Include proper seal of the building in commissioning and re-commissioning programs for the building.

#### **Outdoor Air Intakes & Building Pressurization**

The outside air intakes for positively pressurized buildings have a history of poor location. Many public buildings with utility or service entrances and loading docks have the outside air intake louvers near pollution sources that allow exhaust fumes from trucks to be drawn into the building. Some high-rise office buildings place air intakes in the path of drift from cooling towers on roofs, where contaminants such as bacteria that have caused Legionnaires' disease can enter the ventilation system. Air intakes of other rooftop installations have entrained roof sealants that are emitted into the air. Still others have entrained emissions from plumbing vent stacks resulting in sewer gas entrainment. Roosting birds can also be a source of contaminants that are entrained in outdoor air supply streams.

Outdoor air intakes are often poorly maintained and the areas are dirty. Getting good intake air - either by shielding or relocating intakes or by fine particle filtration eliminates the many contaminants from outside, as well as avoiding the added burden to cleaning inside. Mechanical rooms and nearby areas may also be the location for chemical storage and janitors' closets for many buildings. Mixing chemicals there sends vapors into the ventilation systems of the building. These are cleaning issues that affect indoor air quality.

Since most positively pressurized buildings do not provide for door or window ventilation, all cleaning activities create polluted air until gases and particles are diluted and removed by outside air supply and exhaust. Some older buildings, where the outdoor air supply rates are grandfathered into the energy saving criteria established in the era of President Carter and the 1970's oil embargo, have special problems with indoor air quality. They generally have lower levels of outside air ventilation and, thus, lower levels of dilution.

#### **First Reduce Soil and Dirt:**

Put emphasis on entryways. Reduce tracking in of outside soils and other particulate matter to make inside areas less difficult to clean. Mats, entryway grids, and special ventilation of vestibules reduces intake of soil and dust.

Evaluate high traffic patterns for use of removable matting that can be cleaned away from personnel in order to reduce the overall general cleaning required for carpet.

Limit eating to designated areas that can be cleaned by wiping and light mopping.

Quickly identify and clean spills and stains to eliminate the need for harsher treatments later.

Increase the light wipe and cleaning of hard floors to lessen the required stripping and finishing required. Much of this can be done with water or very light dilutions of an all-purpose cleaner.

Caution on use of the wrong mop is important because residual chemicals on an unrinsed mop can start stripping the finish from the floor, which then requires more frequent refinishing.

Employ better vacuums. Use HEPA (High Efficiency Particulate Attenuation) filtered vacuums with continuous suction. Higher suction not only reduces the amount of soil in buildings, it substantially reduces both hard floor and carpet cleaning. The removal rate makes the cost of high quality equipment worth the investment. The machines are larger, harder to manipulate, and because they have more suction, do not move as fast across the floor. Using a HEPA vacuum following a typical upright vacuum can make a visible difference in the brighter color of a carpet as the floor wand passes over a surface. Ground-in dirt is substantially reduced as is the need to clean the carpet.

Building occupants should be prohibited from having and using cleaning chemicals.

### **Selection of cleaning methods/general rules:**

Chemicals are used to make water work better in cleaning. Chemicals add surface wetting agents, soil reduction and rinsing agents, evaporative qualities, and at times mild coating to prevent re-deposition of soils or the re-appearance of soils. The lower the soil level, the less water needs help to clean.

Higher temperature water dissolves better, cuts greasy soils, and requires less agitation. Increased agitation requires less chemical action to cut into soils.

Wiping and general rinsing after cleaning eliminate the need for many rinsing additives. Most all-purpose cleaners, window cleaners, and other hard surface cleaners have an alternative available in vegetable-based surfactant chemistry. Using many of the alternative products can eliminate alcohol, which lingers in the air long after use. Many of these products can be used in higher dilutions and thus less product is required.

Wiping needs to replace spraying. Many companies have gone to dispensing systems that fill spray bottles. Spraying not only diffuses a solution into the air as well as on the surface, it generally wastes product by over-wetting a surface - thus the need for adding evaporative alcohol to the product. By wetting a wipe lightly and applying to a surface, the excess from spraying does not require the additional labor to work off the hard surface, which saves labor.

Water can be used in general dusting of non-wood surfaces, as can lint-free wipes for most surfaces. Spray devices can be used to dispense into a wipe and this is the most efficient application method.

There is no cleaning need for fragrances and they all need to be eliminated.

There are products on the market which are advertised as deodorizers/re-odorizers that have four times the level of quaternary ammonia as a disinfectant. They are not listed as a disinfectant because they are purportedly for cleaning and reodorizing. This is not uncommon in the labeling of janitorial products.

Fragrances are leading culprits in accessibility problems related to indoor air quality.

Detergent with warm or hot water disinfects as well as disinfectant cleaners most of the time. For quality assurance, use of an ultraviolet light detects bacterial growth and areas which are evading cleaning. In problem areas that are frequently not reached – as behind toilets, around urinals, and beneath the nozzle of soap dispensers - personnel need to be trained and instructed to thoroughly clean the affected area.

Peroxides (as stabilized additives) are capable of disinfecting in more critical areas. Bathrooms, food service areas, and dining areas all follow this general guideline.

Dispensers are most often provided by the companies that sell chemicals. They install the dispensers and set the dilutions. Use of dispensers when building ownership or management is in control of the dispensers is appropriate. Supervisory control over dilutions is essential.

Carpet cleaning often results in off-gassing of toxic solvents for days and even weeks. Use of steam, non-petroleum based cleaners - even in some cases peroxides - and fast drying has proven essential to reducing the impact of cleaning.

Carpets are typically treated with numerous products, including insecticides, sealants, and optical brighteners. No matter what method is used to clean it, e.g., washing, dry-cleaning, or steam cleaning, all cause the release of the built-in chemistry of the carpet.

While it is a general rule to dry carpet in less than 24 hours to reduce the chance for mold growth, optimal drying time is less than 4 hours. This may require selecting less humid days to do the work. It may require increased airflow in the building. It may require blowers and heating to the affected area. It may require higher, more efficient extraction after chemical application. Faster drying shortens the time for the air to recover from the cleaning.

Hard floor finishing is often a process that results in off-gassing for weeks. It is recommended that the work be completed during unoccupied or low occupancy times for the building, using higher air flows for drying, and maintaining maximum dilution with outside air until off-gassing is complete.

Frequent inspections of floors and refinishing only the areas necessary reduces chemical usage and impact. Scheduled finishing may not be the best practice. Using an “inspect and finish as necessary” program allows for limited work to preserve the floors while reducing labor requirements and chemical usage.

Some gel strippers may have lower off-gassing levels and should be evaluated for potential usage. Experiment with strippers to find the lowest effective concentration to achieve the work. Refinishing material as well as strippers should be managed carefully by dispensing in proper amounts to ensure proper usage and to avoid over-usage.

Carpet de-spotting can be accomplished by using mild detergent and baking soda. This old remedy can remove many stains, particularly when fresh. Using the mixture in hot water (120 degrees) and rubbing inward from the outside of the stain can remove many without the use of strong chemicals.

Bathroom fixtures, urinal, and toilets are subject to staining. Where possible, peroxide-based cleaners are preferable. Baking soda provides a mild cleaner-abrasive capability. Use of acids in

difficult circumstances may be necessary. When this is done, the bathroom should be completely ventilated before reopening it for use.

A continuous audit of building practices, education of building personnel, and control of chemical usages by occupants will go a long way in reducing the adverse chemical impacts associated with cleaning. Safer alternative products exist for almost all cleaning needs. Cleaning protocols do not need to change much and can be phased into a building's existing program. While one may look for one practice to save the day, there is no magic bullet. Only one change in cleaning will leave others to create problems. A comprehensive approach is necessary and can be implemented step by step.

### **Checklist Guidance**

Building managers can use the following list of questions as a guide to assess their office building cleaning efforts and to determine where to start transitioning cleaning activities. The checklist does not actually tell a building manager how to set up a cleaning program, but it serves as a starting point for educating everyone involved in a safer air cleaning program—managers, occupants, and janitors—about what they need to do to make it a successful program.

### **Building Considerations**

- How are various areas within the building used? Determine which require the most cleaning, and why (e.g., public restrooms, kitchen areas). What are the hours of use and are there preferred times to clean when personnel are not present?
- Where do people eat (e.g., individual offices throughout the building, designated areas)?
- Are there any special considerations related to the building itself (e.g., is it an historical building that has special preservation requirements or security issues)?
- Do any office furnishings have special cleaning requirements (e.g., thick carpets, antique furniture)?
- Are there any known at-risk populations who may be more adversely affected by the use of some chemicals (e.g., children, people with asthma, allergies or chemical sensitivities, and pregnant women)?
- Does the building have an adequate ventilation system to circulate air throughout the building?
- Does the building have any plumbing or moisture problems?
- Is there a method in place to keep dirt from entering the building (e.g., mats at the front door, double-door entryways)?

### Cleaning Checklist

<b>PROCEDURE</b>	<b>FREQUENCY</b>	<b>PRODUCT BRAND</b> (indicate whether it is purchased in concentrate or ready-to-use form)	<b>MONTHLY PRODUCT USEAGE</b>	<b>CLEANING PROCEDURE</b>
Clean furniture				
Clean walls				
Clean bathrooms				
Disinfection – Bathroom				
Disinfection – General				
Clean washroom fixtures				
Carpet spot removal				
Carpet cleaning				
Gum removal				
Concrete cleaning				
Graffiti removal				
Glass cleaning				
Metal cleaning				
Hard floor – routine cleaning				
Floor stripping				
Floor refinishing				
Other all purpose cleaning				

### **Adequacy of Current Cleaning Program**

- What are issues of concern to management, cleaning personnel, and building occupants? Conduct interviews with all stakeholders rather than on a representative basis.
- Review the log of tenant complaints over the last year. What are the items that come up consistently?
- How is the quality of cleaning currently being evaluated/measured? How often are inspections performed? Are there trends in the problems that are identified?

### **Cleaning Materials Usage**

- List the janitorial products that are currently in use for each of the following categories and identify how often the cleaning task is performed and how much of the product is used per month.
- Are there any reasons to change the procedure or frequency for these cleaning applications? In what manner can chemicals be eliminated or reduced? Seek methods to eliminate usage, reduce usage, and change products to those better for air quality.

### **Selecting Chemicals**

In selecting chemicals for cleaning, there can be considerable confusion. “Green,” “environmentally safe” and various other claims as to the safety of cleaning products do not provide adequate guidance for determining which products do not adversely affect air quality. Below is a list of some terms with which a buyer of chemical products needs to become familiar. The list also includes comments and discussion of alternatives to potentially hazardous chemicals.

Bio-Degradable: The product will break down in the environment over time into supposedly harmless materials. This does not mean the product is safe for the environment, including soil, water, or air.

Chlorine-free: Contains no chlorine, a toxic chemical responsible for substantial problems in air quality as well as more poisonings each year than any other chemical. Oxygen bleaches, the chlorine-free alternatives for bleaching action, are less stable than chlorine bleaches, but much has been done to stabilize oxygen bleaches in the past few years. Do not use concentrated hydrogen peroxide in pure form for disinfection because its application to a flammable surface can cause it to ignite. For scouring, use of baking soda, borax and scrub pads provides additional cleaning capacity. Using a compound containing stabilized peroxide is useful for bleaching.

Natural: Implies the product does not contain synthetic ingredients. Since the use of this term is unregulated and the claim can only be verified by checking with the manufacturer, do not rely upon it for any selection criteria. And since naturally-occurring substances can also be harmful, this term does not have meaning with respect to air quality.

Neutral pH: The product is neither alkaline, nor acidic. These are most useful for products that require handling or mixing or are intended for application to bare skin. Even if a product has a neutral pH, it may have been refined from petroleum and other hydrocarbons and emit volatile fumes. For better air quality, it is often preferable to use a non-petroleum *alkaline* product rather than a solvent or petroleum-based *neutral* product. Very acidic or alkaline products that become airborne can cause irritation and even severe damage to skin, eyes, and lungs.

Non-Toxic: Supposedly only a very large amount will cause damage. Since this term is unregulated in its use, it has little meaning. Fewer than 5% of all cleaning compounds have been tested for safety. A few manufacturers test for skin irritation or ingestion effects. Since a product

can impact air quality and affect people with a large range of sensitivities, a product claiming to be non-toxic may still cause adverse health effects.

Oxygenated: Helps whiten and brighten by releasing oxygen which breaks up stains, and eliminates mildew and mold. See Chlorine above. Oxygenated products, such as those containing hydrogen peroxide, can be as effective as chlorine when used in proper doses and according to safety instructions.

Phosphate-free: Generally meaningless term. Phosphates are allowed by law only in certain automatic dish detergents. Not a criterion for most purchases.

Surfactant: This is the active ingredient in most detergent cleaners, such as all-purpose cleaners, floor cleaners, dish detergents, fabric softeners, and hard surface cleaners. Most often they are created from petroleum and are neutral in pH. Surfactants are used to alter the surface properties of the surface being cleaned. This can make the surface more penetrable, easier to rinse, and less able to be adhered to and more repellent of dirt. Numerous surfactants have been used as reducing agents to dissolve heavy greases and soils. Surfactants are now available in non-petroleum-based (vegetable) forms and the newer surfactants offer interesting new chemistry for air quality. In general they have higher flash points. The vegetable-based surfactants rarely have alcohol or other solvents. They can easily be wiped on and off and do not require evaporative assistance, such as adding alcohol and ether to most window cleaners.

Deodorizer/Re-odorizer: This group of products may contain higher concentrations of quaternary ammonia than disinfectants. They also frequently contain strong fragrances and/or masking agents that diminish the sense of smell. Paradichlorobenzene and naphthalene are common ingredients in fragrance-emitting devices. Deodorizer products are often used in public bathrooms found in restaurants, motels, theaters, subways, trains, airports, airplanes, and other public facilities. The use of deodorizer/re-odorizer products can be avoided by increasing ventilation/air flow and thoroughly cleaning with mildly alkaline non-surfactant detergents followed by the use of disinfectants, preferably peroxide-based ones. Inspection by ultraviolet light is recommended after all intensive cleaning to verify that surfaces have been adequately cleaned

Fragrance: This is an air pollutant that is intended to give the false impression that air is clean. Truly clean air has no smell. Fragrance formulas can contain benzene, toluene, styrene, and formaldehyde, along with other ingredients. Fragrance chemicals can enter the body through the lungs, skin, and nasal passageways. They can affect the brain and nervous system in a matter of seconds, either by their presence in the brain or via stimulation of olfactory nerves. Avoid all products that list fragrance as an ingredient or have a fragrant odor. Be aware that even if "fragrance" is not listed as an ingredient, fragrance chemicals may have been added to a product for another purpose, or claimed to be added for another purpose - such as an anti-microbial stabilizer, blending agent, or enhancer.

Solvent: Water is a solvent. Using alcohol, petroleum, and coal tar-based solvents for floor refinishing, metal cleaning, stain removal, and graffiti control is commonplace. To preserve air quality, use water as a solvent whenever possible. Use petroleum-based solvents only as a last resort. Non-water-based solvents should be used in controlled programs, with substantial increased ventilation, pre-notification of building occupants, use during low building occupancy, and retesting of air to make sure it is clear before a space is re-occupied. The use of many solvent products, such as spot stain-removers, can be eliminated by promptly cleaning stains, using mild

detergent and baking soda with a gentle rubbing action and working in from the outside perimeter of the stain.

Vinegar: An acidic fluid usable for basic surface cleaning, window cleaning, and bathroom fixture wiping. The mild acidic properties provide the ability to remove hard water spots and cut soap films. Note that while vinegar is considered a less-toxic cleaner, some chemically sensitive individuals may react adversely to it.

### **Getting Started**

Eliminating fragranced products is perhaps the quickest and easiest step to improving air quality.

Eliminate air fresheners and fragrance-emitting devices. Do not use urinal or toilet deodorizer blocks which contain paradichlorobenzene, naphthalene, solvents or fragrances. Substitute vegetable-based surfactants combined with microbe-based urea reducing properties. Choose non-fragranced cleaners, hand soaps, and lotions. Choose basic paper items that do not contain fragrances. Do not use cleaner/disinfectant combination products. Disinfectants should be used after a surface is clean for optimal deep cleaning, which should be done on an as needed basis. Inspect cleaned areas using ultraviolet light to verify that the surface has been adequately cleaned. Concentrate heaviest cleaning on essential areas. This will control odor.

Find and remove room deodorizers and dispensing devices. Establish a policy restricting occupant usage of fragrance-emitting plug-ins.

Inventory all current products. Discontinue any product that has fragrance as an ingredient or has a strong odor – such as cleaners containing pine, tea tree oil, orange, lemon, or citrus.

### **Using Above Chart on Cleaning Materials Usage**

Select products used most frequently. This is most often an all-purpose cleaner, a window cleaner, and disinfectant cleaner or straight disinfectant.

Most of these products are overused. In addition, suitable substitutes can almost always be found that have less impact on air quality.

Experiment with dosages to find the minimum amount of cleaning product that will accomplish the job. This is best done after selecting a new vegetable surfactant-based all-purpose cleaner, window cleaner, or oxygen-based disinfectant for bathrooms. Control dispensers to make sure that the minimum dosages necessary are dispensed.

Make increased use of mechanical/physical methods of cleaning to reduce chemical usage.

Vacuuming: Vacuuming extracts soil at a rate of barely 60% when done with typical upright vacuum systems found today. Carpets tend to absorb particles from the air as well as tracked-in grease and other contaminants. Using a stronger vacuum system with continuous suction (non-pumping action) combined with a slower motion increases the extraction rate to above 85%. Keeping vacuumed dirt and fumes from escaping from the vacuum and re-contaminating a room requires strong filtration. HEPA systems work well to remove particulate matter, but care needs to be taken to insure there are no air leaks around the filter. An activated charcoal impregnated membrane will absorb and trap gasses.

A strong vacuuming program that includes daily and thorough vacuuming is the first guard against the need for frequent carpet cleaning. Secondly, evaluate traffic patterns and use throw rugs and entry mats to protect carpeting in heavily trafficked areas that quickly become dirty. Only clean spots or small areas of carpet that require cleaning. Clean carpet on an “as-needed” basis rather than on a regular schedule.

For widespread carpet cleaning, employ extraction methods using steam; mild cleaners that do not contain fragrances or solvents; or peroxide-based cleaners and fast four hour drying to reduce impacts on air quality and chances of mold growth.

Dusting: Wipe surfaces for dusting with lint-free cloths or damp clean rags. This is usually as effective as using chemical dusting products.

Mopping & Buffing: Damp mop hard floors using soft water in high traffic areas. Wipe with a dry mop on return pattern. Frequent mopping protects the floors and reduces the need for buffing and refinishing. Buff floors during off hours using the minimum amount of product necessary to refinish the floor.

Floor Refinishing: Refinish floors based on need rather than a fixed schedule. Keep service records that include the date and area where floor was refinished and the products used. Mandate that only the minimum amount of product necessary to accomplish the job will be used. Provide personnel with information on tracking and the goal of chemical reduction. All stripping and refinishing needs to be done during non-occupancy periods with substantial increases in outside air flow.

### **Keep Track**

Using a computer, create an ongoing tracking system on reductions in the amount and number of chemicals used, changes in chemicals used, and eliminations of chemicals. This overall program needs to be continuously evaluated and communicated to building owners, managers, and occupants.

## **Steps for Implementing a Scent-Free Policy in the Workplace**

(Adapted from the Canadian Centre for Occupational Health and Safety)

### **What steps should I take when implementing a scent-free policy in the workplace?**

The situation may arise and create the need for a scent-free policy. As with most workplace policies, be sure to consider the following:

- Conduct an assessment or survey of the employees to determine the extent of the problem. Collect opinions and suggestions at the same time to help you develop a policy appropriate to your workplace.
- Designate one key person to oversee the project and its development. If you work at a large company, it may be better to create a committee with members representing all groups (employees, unions, management).
- Involve the health and safety committee, and get management commitment from the beginning.
- Set and stick to deadlines for creating a draft policy, a review of the policy, and for implementation.
- Be sure that all employees have been fully informed of the policy and that they know what they have to do before the policy becomes effective.
- Educate the employees. You may choose to include brochures or flyers in payroll envelopes, publish articles in company newsletter, or give presentations. In any case, the goal is to inform all employees of the health concerns related to scents and why the policy is needed.
- Address any concerns the employees raise openly and honestly. Reinforce the idea that this policy is being implemented as a result of medical concerns - not merely because of a dislike for a certain smell.
- Make it clear that the policy applies to everyone (including visitors, patients, etc).
- Search local legislation for any supporting documentation.
- Do not limit the scent free policy to perfumes and colognes. Many cleaning and personal care products also have scents.
- Post a list of "approved" unscented products and where they are available locally.
- Review all MSDSs for the products currently used and for those you are considering using. Make sure that the ingredients are acceptable. Remember that some products which claim to be scent-free may be using additional chemicals to mask smells instead of truly being "unscented".
- Conduct trials in limited areas before purchasing large quantities of a product.
- Post notices that waxing, shampooing, painting, or spraying (etc.) will be conducted one week beforehand so that affected personnel can make arrangements or have their duties modified during that time.
- Put the policy statement notice on all appointment cards, stationery, room booking notices, employment postings, etc.
- Decide on wording for 'Scent Free' signs and where the signs will be posted.
- Let everyone know that the policy will be reviewed and can be changed because of experience or new knowledge.

### **What is an example of a policy?**

Policies should be based on the health concerns of employees - especially those who have sought medical help. Keep the policy short, but specific. The policy must also apply uniformly throughout the company.

<b>Sample: Scent-Free Policy</b>
<p><b>Policy:</b></p> <p>Due to the health concerns arising from exposure to scented products, ABC Company Inc. has instituted this policy to provide a scent-free environment for all employees and visitors.</p>
<p><b>Definitions:</b></p> <p>The use of scented products will not be allowed within the building at any time. In addition, all materials used for cleaning will be scent-free (where ever possible).</p> <p>A list of locally available scent-free products is available from the health and safety office.</p>
<p><b>Procedure:</b></p> <p>Employees will be informed of this policy through signs posted in buildings, the policy manual, promotional materials and will receive orientation and training.</p> <p>Visitors will be informed of this policy through signs and it will be explained to them by their host.</p> <p>Any violations of this policy will be handled through standard disciplinary procedures.</p> <p>This policy is effective on 01/01/01.</p>

**What should the 'posted notice' say?**

Signs should be posted near the entrances to company building(s). In addition, statements on business cards, letter head or promotional materials may be helpful if you receive a lot of visitors.

Examples include:

Some people who work at ABC Company report sensitivities to various chemical-based or scented products. We ask for everyone's cooperation in our efforts to accommodate their health concerns.

In response to health concerns, ABC Company has developed a Scent-Free Policy. Scented products such as hair spray, perfume, and deodorant can trigger reactions such as respiratory distress and headaches. Staff and visitors are asked to not use these products when reporting to this office.

ABC Company is a Scent-free environment. Please do not use scented products while at work.

**INTRODUCTION AND OVERVIEW**

Individuals with multiple chemical and/or electromagnetic sensitivities have identified the availability of designated cleaner air rooms and paths of travel in public and commercial buildings as highly important for improving access. The Designated Cleaner Air Rooms Committee examined the rationale for having Designated Cleaner Air Rooms, the types of

buildings or occupancies that may be appropriate for having such rooms, the minimum criteria for such a designation, and who would benefit from having these rooms.

### **Promising Practices**

In November 2001 the State of California adopted a Cleaner Air Symbol and Conditions of Use in its building code to identify areas in publicly funded or leased facilities owned by the State of California that are accessible to and useable by people who are adversely impacted by airborne chemicals or particulate(s) and/or the use of certain electrical fixtures or devices.(1) The symbol can be used when minimum conditions established in the code are met. Use of the designation is voluntary.

A fact sheet on the California Cleaner Air Symbol and Criteria can be found at:

[http://www.documents.dgs.ca.gov/dsa/pubs/cleanerair\\_factsheet.pdf](http://www.documents.dgs.ca.gov/dsa/pubs/cleanerair_factsheet.pdf)

See *1117B.5.11 Cleaner air symbol* (page 109) of the California Code of Regulations for the code language: (see Appendix A)

[www.documents.dgs.ca.gov/dsa/pubs/regulations\\_02-16-05.pdf](http://www.documents.dgs.ca.gov/dsa/pubs/regulations_02-16-05.pdf)

### **Recommended Actions**

The Committee was charged with

- 1) reviewing the California symbol and criteria and investigating where it has been implemented, how it has worked, and what modifications and improvements, if any, are necessary to recommend broader usage;
- 2) developing and promoting a national Cleaner Air Symbol and Conditions of Use as appropriate; and
- 3) defining the scope of guidelines for creating an ideal zone (room and path of travel) hereafter referred to as a Clean Air Room in buildings for people with chemical and/or electromagnetic sensitivities.

During the project, the scope of work was expanded to include a brief discussion of accommodations for people with multiple chemical and/or electromagnetic sensitivities to address the needs of those individuals for whom a Cleaner Air Room would not provide adequate access or for those situations when such a designation would not be possible or feasible. Resources that address access and accommodations for people with multiple chemical and/or electromagnetic sensitivities at work, at school, at public meetings, and in hospitals are included at the end of this report.

### **Committee Recommendations**

- The Committee highly recommends that the Access Board and/or the National Institute of Building Sciences (NIBS) fund or seek funding for FY2006 to develop specifications for designing and constructing a Clean Air Room and Path of Travel, the ideal or model room. This project is a natural outgrowth of the work of the other three committees.
- The Committee proposes a Pilot Project for FY2006 to implement a national Cleaner Air Symbol, as promulgated by the State of California, and Conditions of Use, as modified in the National Cleaner Air Signage, Conditions of Use section below, in

select public and commercial buildings such as independent living centers, disability organizations, schools and other educational institutions, public meeting places, or other business or government entities. The Committee recommends that one or more committee members in conjunction with the Access Board and/or the National Institute of Building Sciences assist in its implementation, track its use, analyze how well it has worked, and determine whether modifications or improvements are necessary prior to recommending promotion nationally. This same group would also examine implementation of the California Signage which is expected to take place during the same time frame.

- The Committee recommends that the Access Board, or a committee created by the Board, identify, review, summarize, and publish best practices for accommodations for people with multiple chemical and/or electromagnetic sensitivities on the website. Such a project was previously proposed by Access Board officials and discussed with members of this Committee but was not part of the charge of the current project.

## **NATIONAL CLEANER AIR SIGNAGE**

### **Background:**

In November 2001 the State of California adopted the California Cleaner Air Symbol, California Building Code, Title 24, Parts 2 and 12, 1117B.5.11ff., which established a symbol and criteria for conditions of use to identify a room, facility, and paths of travel that are accessible to and useable by people who are adversely impacted by airborne chemicals or particulate(s) and/or the use of electrical fixtures and/or devices. Installation and use of the Cleaner Air Symbol is on a voluntary basis in state buildings. The Committee learned that the Cleaner Air Symbol has yet to be implemented in California although members of our group are aware of individuals in California and in other states who are using the symbol as a means of advocating for or obtaining individual access needs.

The California Cleaner Air Symbol and Conditions of Use were also proposed for adoption at the meeting of the Accredited Standards Committee A117 on Architectural Features and Site Design of Public Buildings and Residential Structures for Persons with Disabilities in December 2001.(2) The Cleaner Air Symbol received a favorable vote. It was later dropped prior to the issuance of the final standard in 2003: International Code Council, American National Standard-Accessible and Useable Buildings and Facilities, ICC/ANSI A117.1-2003. The Cleaner Air Symbol is expected to be reintroduced for consideration during a new standard cycle that will begin shortly. The Standard must be adopted by a state or locality to be enforceable.

The Committee also discussed the identification of state buildings in California that might qualify for the Cleaner Air Symbol either due to a building's unique ability to meet the implementation criteria, or the need to make public meeting rooms accessible for those with chemical and/or electromagnetic sensitivities. Committee members are also aware of the need to encourage residents of California who may need to access state buildings to seek to implement the Cleaner Air Symbol.

### **Purpose:**

To provide voluntary guidelines for a Cleaner Air Symbol that can be used nationally or adapted for state and local use.

### **Proposed Language:**

National Cleaner Air Symbol: The national symbol shall be the standard used to identify a room, facility, and paths of travel that are more accessible to and useable by people who are adversely impacted by airborne pollutants, such as those with chemical sensitivities, asthma, and other respiratory conditions, and/or people who are adversely impacted by electromagnetic fields from electrical fixtures and equipment such as those with electromagnetic sensitivities.

The Symbol will comply with the specifications as described in the California code.

When the Cleaner Air designation symbol is used, the following requirements must be met:

- The symbol and text, "Cleaner Air" is displayed within a minimum 6-inch square;
- The "Cleaner Air" text is located under the symbol, as shown
- The Cleaner Air Symbol is shown as either a negative or positive image.
- The symbol and text are posted in either black and white, or in Federal Blue and white. When blue is used, Federal Blue Color No. 15090, Federal Standard 595B, is used.
- There is at least a 70% color contrast between the backgrounds of the sign and the surface that it is mounted on.

### **Conditions of Use**

The Cleaner Air Symbol may be posted to identify the room and path of travel if there is verification that the room, facility, and path of travel to the room meet all of the Cleaner Air Requirements as indicated below:

- No Smoking
- Fragrance-Free
- Pesticide-Free (Indoors and Outdoors)
- Least Toxic/Risk Cleaning Products
- No Recent Construction or Remodeling Including Carpet Installation
- Cell phones turned off
- Ability to turn off or unplug computers and other electrical equipment by occupant or staff
- Ability to turn off fluorescent lighting by occupant or staff
- Ability to adjust temperature and air flow by occupant or staff, or the availability of operable window(s)

### **Paths of Travel**

Every effort should be made to make the Paths of Travel as accessible as possible for those with multiple chemical and/or electromagnetic sensitivities even though the paths of travel might not meet all of the criteria of the Cleaner Air Room. It is important that the Path of Travel from the building entrance to the Cleaner Air Room be as short as possible. The building entrance should also be fully accessible to those with mobility and other impairments.

### **Restrooms**

If possible, restrooms that are already fully accessible to those with mobility and other impairments should be designated for use by those individuals using the Cleaner Air Room. These restrooms should be located along the path of travel or as close as possible to the Cleaner Air Room. The restrooms should meet as many of the criteria as possible. The restrooms should prohibit smoking and be free of perfumes, fragranced products, air fresheners, deodorizers, and pesticides. Cleaning should be done with the same least toxic products used in the Cleaner Air Room. Cell phones should be turned off along the path of travel and in the restrooms.

**Contact Information** for the building/facilities manager or the designated agent responsible for maintaining and/or recording activity in the Cleaner Air Room should be posted at the Cleaner Air Room and at the accessible entrance, if possible, and be readily available to anyone seeking additional information by telephone, fax, e-mail, or mail.

### **Maintaining a Cleaner Air Record Log**

A log shall be maintained on site, accessible to the public either in person or by telephone, fax, e-mail, mail or other accessible means as requested. One or more individuals shall be designated to maintain the log. The log shall record any product or practice used in the designated Cleaner Air Room, the path of travel, and accessible restrooms, as well as scheduled activities that may impact the Cleaner Air designation. The log shall also include the product label and Material Safety Data Sheet(s), as available, for any products used. Note, however, that neither the MSDS nor the product label provides complete information on product ingredients or their potential health effects.

### **Removal of The Symbol**

If the path of travel, room and/or facility restrooms identified by the Cleaner Air Symbol should temporarily or permanently cease to meet the minimum conditions as set forth above, the Cleaner Air symbol shall be removed and shall not be replaced until the minimum conditions are again met.

### **Temporary Use of Cleaner Air Symbol**

The Cleaner Air Symbol may be used to identify a room, path of travel, and restrooms that meet the conditions of use on a temporary basis.

### **Further Explanation of the Criteria for Conditions of Use:**

**No Smoking:** Smoking is prohibited in the path of travel, Cleaner Air Room, and restrooms serving the room. To qualify as a Cleaner Air Room, the room, path of travel, restrooms and surrounding area must be free of tobacco residue. Those who smoke, or who have tobacco residue on their person, would be prohibited from using the room. Smoking should be restricted to outdoor, designated smoking areas that are at a minimum of 100 feet from paths of travel, entryways, operable windows, and air intakes. (See No Smoking Policy, Operations and Maintenance Report)

**Fragrance-Free:** Prohibit fragrance-emitting devices (FEDS), air fresheners, deodorizers, and similar products. Recommend that no fragranced, citrus-and/or pine-based products be used in cleaning or maintaining the room, path of travel, and restrooms. Any persons with perfume, cologne, aftershave, as well as fragranced personal care and laundry products, would be prohibited from using the room. (See Fragrance-Free Policy, Operations and Maintenance Report)

### **Pesticide-Free Indoors and Outdoors:**

Practice Integrated Pest Management. Use least hazardous pest management materials such as non-volatile baits, sticky traps, and boric acid with knowledge and input from those using the path of travel and Cleaner Air Room. The sign should be removed in the event of a least hazardous pesticide application for 24-48 hours because it is likely that the certified pest control applicator is in regular contact with chemical pesticides and could leave residue from clothing or equipment. In addition, some chemically sensitive individuals may be made sick by exposure to even least hazardous pesticides especially when they are first applied.

In the event of a chemical pesticide application made to the building or grounds, other than a least hazardous pesticide such as those listed above, remove the sign and consult with those who use the space and others regarding the length of time that the room would need to be closed to protect affected populations based on the product(s) used. (See Operations and Maintenance for least hazardous pest management materials and cautions in the event that a chemical pesticide application is considered for use in the Cleaner Air Room, Path of Travel, Restrooms, or the building or grounds.)

**Least Toxic/Risk Cleaning Products:**

Avoid or limit the use of products containing chlorine, ammonia, quaternary ammonium, phenol, isopropyl and other alcohols, formaldehyde, and other petroleum distillates. Do not use fragranced, citrus-and/or pine-based cleaning products as mentioned above. Consult those who plan to use the Cleaner Air Room and Path of Travel for cleaning product recommendations. Follow the recommendations of Operations and Maintenance Report for best practices.

**No Recent Construction or Remodeling Including Carpet Installation:**

Every effort should be made to avoid remodeling activities in the Cleaner Air Room, path of travel, and restrooms. Any remodeling activity would require removal of the signage. The length of time for removal should be determined by the type of activity, extent of the remodeling, and the products and materials selected for use. It is important to choose the least toxic, least problematic products and practices. Except for minimal touch up painting, for example, it would not be unusual to have the signage removal in effect for a period of 3- 6 months to a year or more depending on the nature and extent of the remodeling activity. Be sure to consult building occupants with existing health problems and those who are using the Cleaner Air Room for their input and to help determine when the Cleaner Air Room may again be safe for use. (See Products and Materials Report and Design and Construction Report for more information)

**Cell Phones Turned Off:**

Protect those with electromagnetic sensitivities and others who may be adversely affected by electrical equipment.

**Ability to turn off or unplug computers and other electrical equipment by occupant or staff:**

Protect those with electromagnetic sensitivities and others who may be adversely affected by computers and electrical equipment.

**Ability to turn off fluorescent lighting by occupant or staff:**

LEED (Leadership in Energy and Environmental Design) recommendations for new construction call for individual control of lighting.(3) Newer fluorescents that contain electronic rather than magnetic ballasts may be less problematic for some people with electromagnetic sensitivities because they do not produce a visible flicker or audible hum. They are also less prone to trigger seizures.

**Ability to adjust temperature and air flow by occupant or staff, or the availability of operable window(s):**

LEED recommendations for new construction include individual control of temperature and ventilation.(3) Opening an operable window may improve the air quality or air flow in a Cleaner Air Room and compensate for situations when individual control of temperature and air flow is not possible.

The text below is duplicated on the website

## RECOMMENDATIONS FOR ACCOMMODATIONS

People with chemical and/or electromagnetic sensitivities can experience debilitating reactions from exposure to extremely low levels of common chemicals such as pesticides, cleaning products, fragrances, and remodeling activities, and from electromagnetic fields emitted by computers, cell phones, and other electrical equipment.

The severity of sensitivities varies among people with chemical and/or electromagnetic sensitivities. Some people can enter certain buildings with minor accommodations while others may be so severely impacted that they are unable to enter these same spaces without debilitating reactions. Furthermore tolerances to specific exposures can vary greatly from one individual to the next. Meanwhile some exposures, such as the application of certain pesticides or extensive remodeling, for example, may be devastating to all chemically sensitive people and make a building or facility inaccessible for a substantial period of time.

According to the Americans with Disabilities Act (ADA) and other disability laws, public and commercial buildings are required to provide reasonable accommodations for those disabled by chemical and/or electromagnetic sensitivities. These accommodations are best achieved on a case-by-case basis.

Reasonable accommodations for a chemically sensitive and/or electromagnetically sensitive individual can include providing a space or meeting area that addresses one or more of the Cleaner Air criteria, upon request, such as

- Remove fragrance-emitting devices (FEDS)
- Delay or postpone indoor or outdoor pesticide applications, carpet cleaning, or other cleaning or remodeling until after the meeting
- Provide room or meeting area near exterior door or with window(s) that can be opened
- Require cell phones and computers be turned off
- Provide incandescent lighting in lieu of fluorescent lighting
- Provide at least one nonsmoking, fragrance-free person per shift to provide services (e.g. nurse, police officer, security guard, clerk )

For individuals who are unable to use or meet in a building or facility, or who are too severely impacted by chemical and/or electromagnetic exposures to use a designated Cleaner Air Room, accommodations may include:

- Meet an individual at the door or outside to conduct business
- Allow a person to wait outside or in car until appointment
- Provide a means, such as a phone, intercom, bell, or buzzer to summon staff to an outside door for assistance
- Permit business to be conducted by phone, fax, mail, or e-mail rather than in person
- Allow participation in a meeting by speakerphone

**End duplicated text**

**SPECIAL ACKNOWLEDGEMENT:** The Committee extends a generous thank you to Sharon Toji, Access Communications, for designing the Cleaner Air Symbol and making it available for public use.

## APPENDICES

**Appendix A - 1117B.5.11 Cleaner air symbol** (page 109) of the California Code of Regulations

*1117B.5.11 Cleaner air symbol. “STRICTLY FOR PUBLICLY FUNDED FACILITIES OR ANY FACILITIES LEASED OR RENTED BY STATE OF CALIFORNIA. NOT CONCESSIONAIRES”. This symbol shall be the standard used to identify a room, facility and paths of travel that are accessible to and usable by people who are adversely impacted by airborne chemicals or particulate(s) and/or the use of electrical fixtures and/or devices. When used, the symbol shall comply with Figure 11B-40.*

*1117B.5.11.1 Color and size of symbol. The symbol shall be used when the following minimum conditions are met. The symbol, which shall include the text “Cleaner Air” as shown, shall be displayed either as a negative or positive image within a square that is a minimum of 6 inches on each side. The symbol may be shown in black and white or in color. When color is used, it shall be Federal Blue (Color No. 15090 Federal Standard 595B) on white, or white on Federal Blue. There shall be at least a 70% color contrast between the background of the sign from the surface that it is mounted on.*

*Strictly for publicly funded public facilities or any facilities leased or rented by State of California. Not concessionaires.*

\* In 1117B.5.8.1 (Symbols of Accessibility) the title of this section is incorrectly worded, which is causing misunderstanding regarding proper standard reference. Change title to read ‘International Symbol of Accessibility.’ This will be submitted for correction in Rulemaking.  
CALIFORNIA ACCESS COMPLIANCE REFERENCE MANUAL . DIVISION OF THE  
STATE ARCHITECT

**1117B.5.11.2 Conditions of use.** *Use of the cleaner air symbol is voluntary. The cleaner air symbol shall be permitted for use to identify a path of travel, and a room or a facility when the following is met.*

- 1. Floor or wall coverings, floor or wall covering adhesives, carpets, formaldehyde-emitting particleboard cabinetry, cupboards or doors have not been installed or replaced in the previous 12 months.*
- 2. Incandescent lighting provided in lieu of fluorescent or halogen lighting, and electrical systems and equipment shall be operable by or on behalf of the occupant or user of the room, facility or path of travel.*
- 3. Heating, ventilation, air conditioning and their controls shall be operable by or on behalf of the occupant or user.*
- 4. To maintain "cleaner-air" designation only nonirritating, nontoxic products will be used in cleaning, maintenance, disinfection, pest management or for any minimal touch-ups that are essential for occupancy of the area. Deodorizers or Fragrance Emission Devices and Systems (FEDS) shall not be used in the designated area. Pest control practices for cleaner-air areas shall include the use of bait stations using boric acid, sticky traps and silicon caulk for sealing cracks and crevices. Areas shall be routinely monitored for pest problems. Additional nontoxic treatment methods, such as temperature extremes for termites, may be employed in the event of more urgent problems. These pest control practices shall not be used 48 hours prior to placement of the sign, and the facility shall be ventilated with outside air for a minimum of 24 hours following use or application.*
- 5. Signage shall be posted requesting occupants or users not to smoke or wear perfumes, colognes or scented personal care products. Fragranced products shall not be used in the designated cleaner-air room, facility or path of travel.*
- 6. A log shall be maintained on site, accessible to the public either in person or by telephone, e-mail, fax or other accessible means as requested. One or more individuals shall be designated to maintain the log. The log shall record any product or practice used in the cleaner-air designated room, facility or path of travel, as well as scheduled activities, that may impact the Cleaner-Air designation. The log shall also include the product label as well as the \*Material Safety Data Sheets (MSDS).*

**1117B.5.11.3 Removal of symbol.** *If the path of travel, room and/or facility identified by the cleaner air symbol should temporarily or permanently cease to meet the minimum conditions as set forth above, the cleaner air symbol shall be removed and shall not be replaced until the minimum conditions are again met.*

**Appendix B – SOUTHWEST COMMUNITY HEALTH SYSTEM POLICY GUIDELINE**  
Southwest General Health Center (SWGHC)  
Middleburg Heights, OH

**EFFECTIVE DATE: July, 2002**

**POLICY 742**

**Revision Dates:**

**Page 1 of 7**

**POLICY NAME: MULTIPLE CHEMICAL SENSITIVITY SYNDROME (MCS)**

**POLICY:**

Southwest General Health Center will provide guidelines to ensure optimal care of the patient experiencing Multiple Chemical Sensitivity (MCS) which is mutually established with the patient, family/significant other and health care team.

**I. INTERPRETATION:**

Multiple Chemical Sensitivity (MCS), also referred to as environmental illness or chemical injury is a medical condition in which individuals develop symptoms from exposure to very low level of chemicals in the environment. The interdisciplinary team at SWGHC uses a collaborative process with the patient, physician, family/significant other and the health care associates to establish a safe environment, to promote healing and ensure comfort.

**II. OBJECTIVES:**

An organizational approach to patient management with multiple chemical sensitivities includes:

- A. Method to ensure patient is placed in a safe environment.
- B. Method to facilitate identification of a MCS patient.
- C. Method to verify competency of all associates providing direct and supportive care to the patient with MCS
- D. Method to ensure patient's participation in developing their care plan.
- E. Method to ensure patient/their families/significant others are educated about the need to communicate about any special care required.

**III. OVERSIGHT AND RESPONSIBILITY**

A coordinated organizational program to care for MCS patients will be developed by an interdisciplinary team. This committee will have the responsibility for assuring that all provisions of this policy are adhered to throughout the organization. The team will have representatives from:

- A. Medical Staff
- B. Nursing Services
- C. Central Sterile Supply
- D. Protection Services

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

----------------	--	---------------

- E. Nutritional Services
- F. Plant Operations
- G. Environmental Services
- H. SSA's
- I. Pharmacy
- J. Social Services
- K. Administration

**IV. SPECIFIC ROLES AND RESPONSIBILITIES OF INTERDISCIPLINARY TEAM**

- A. Medical Staff -Physician: Provides special instructions, treatments, diagnostic tests and medication orders. No treatments/medications should be administered to an MCS patient without prior approval of patient's private physician unless a life threatening emergency exists.
- B. Nursing Services  
Role and responsibilities:
  - 1. Identify the patient with MCS
  - 2. Provide a safe patient care environment.
  - 3. Develop an awareness, sensitivity and respect of patients' physical and emotional needs.
  - 4. Develop a plan of care on daily basis with minimum of one staff member per each shift to attend medical needs of the patient.
  - 5. Comply with the following when caring for the MCS patient:
    - a) be perfume and scent free (ie., no hair spray, no mousse gels, lotions, cigarette/smoking smells).
    - b) Do not use aerosol products (ie hair spray, deodorants). Non-scented, potassium salts, pump deodorant is acceptable. Baking soda (dry).
    - c) Do not wear new clothing which has not been laundered.
    - d) Do not wear clothing which has been freshly dry-cleaned.
    - e) Use only latex free gloves
    - f) Wash hands and apply gloves before entering the patient's room.
    - g) Be alert for any environmental triggers when following normal hospital procedures.
- C. Central Sterile: Provides and ensures the unit with
  - 1. Latex free products
  - 2. Adequate supply of sterile linens

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY
------	--	--------

3. Adequate supply of other medical core items (ie. Sponges, dressings, securing devices).
4. Patient can provide their own linens if other methods are not satisfactory.

D. Protection Services: Provides assistance from the vehicle to hospital in a safe manner. (Turn vehicle engines off)

E. Nutritional Services: Recognizes different food sensitivities and follows certain guidelines to accommodate and meet individualized needs of the MCS patient.

Special provisions may include but will not necessarily be limited to the following:

1. No processed foods of any kind including instant oatmeal, instant potatoes, and other

prepackaged mixes, ie., gravies, sauces, and flavor packets as they may contain many

additives.

2. Use no dyes, preservatives, sulfites, artificial flavoring or MSG.
3. Use no aerosol cooking sprays.
4. Use no artificial sweeteners.
5. Distilled water in glass containers to be provided by Nutrition Services, or patient may supply his/her own tolerated water for drinking.
6. Serve beverages which have not been processed with chemicals.
7. Nutrition Services will provide lactose free milk or a substitute such as soy or rice milk to those who require it.
8. Rigidly follow physician's orders regarding food restrictions.
9. Review food allergies within the food service to avoid allergic reactions.
10. Permit patient to supply his/her own tolerated food products. Nursing will provide a proper storage area for them.
11. Do not serve food or liquids in plastic or Styrofoam. Use only glass or ceramic dishes and cups which have been well rinsed to remove all traces of soap and chemical residues. Cellophane or plastic wrap packaging on room temperature food (i.e., crackers) is typically not a problem, however, caution must be used if toxic inks are used. Anything noticeably odorous can be a problem.
12. Remove treated i.d. menu paper from the tray and replace tray liners that may have become wet during transport.

F. Plant Operations: Plant Operations will not perform remodeling or painting within close proximity to MCS patient's room. These activities can be coordinated with the leadership of patient care area.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 4 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY 742
----------------	--	---------------

- G. Environmental Services: will perform terminal cleaning.
1. Refer to Environmental Services Policy for MCS room cleaning.
  2. Staff will check with the floor nurse before entering the patients room.
  3. Environmental Services will coordinate with the patient's nurse for cleaning of the patient's room or performing any special cleaning tasks in the general area (i.e., floor waxing or floor wax removal in the halls). Whenever there is a question of what may affect the health of an MCS patient, the floor nurse must be consulted.
  4. Scented products, air fresheners, deodorizers or other additives should not be placed in any vacuum cleaner bag used anywhere in the health center. Use only unscented vacuum cleaner bags.
  5. Do not use any other housekeeping products (garbage bags, paper towels, cleaning solutions) which contain fragrances or pesticides. These products should be stored in an area separate from disinfectants, soaps and other cleaning products. Do not store toilet paper, facial tissues or other patient items near fragranced or pesticide products.
- H. SSA's: Will perform daily cleaning of the patient's room by using the following guidelines.
1. SSA's must wear clean gowns and caps when cleaning the room of MCS patient when patient is in the room.
  2. Do not use any other housekeeping products (any plastic bags, paper towels, cleaning solutions which contain fragrances or pesticides). Do not use any air fresheners or deodorizers in patient's room.
  3. Dust with a clean cotton cloth moistened with only water.
  4. Use baking soda or Bon Ami cleanser for tubs, sinks and toilet.
  5. Remove trash at least twice daily. Do not use plastic liners.
  6. Do not leave patient trays in the room after meals.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 5 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY
----------------	--	--------

I. Pharmacy

Provides pharmaceutical care guidelines to patient, family and health care team members. The following guidelines are helpful in providing medications to patients with MCS:

1. Have patient bring medications to the hospital that he/she is currently using. If the physician desires the patient to continue using these medications, an order shall be written to state such.
2. Use glass bottles for IV solutions and any prescription medications that are to be administered intravenously.
3. Do not use any substitutions or generic drugs for medications ordered without patient or MD approval.
4. Be alert for standard ingredients MCS patients typically react to including but not limited to dyes, preservatives, artificial sweeteners and flavoring. Consider capsules instead of tablets.
5. Monitor medication by listing the patient's specific allergies on the patient's medication profiles.

J. Social Services

Provides psychological support and interventions, assists patient and family with community resources and discharge planning.

K. Administration

Provides support and assistance in developing a safe environment for MCS patient.

PROCEDURE:

- A. Admitting will adhere to the following to assist all health care center personnel in caring for the patient:
- 1) Flag patient's chart clearly and boldly with MCS under the allergies.
  - 2) Flag patient's chart to notify all other health center departments in advance of treating the patient so proper precautions can be made for necessary equipment and special supplies.
  - 3) Indicate "MCS" on patient's allergy band.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 6 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY 742
----------------	--	---------------

B. Emergency Department:

Will assist health care center personnel in diminishing any unnecessary discomfort and possible risks when MCS patient is brought into the Emergency Room. The following is initiated:

- 1) Immediately contact patient's physician for special instructions.
- 2) Immediately isolate patient from all other patients and visitors.
- 3) Place patient in an area which is not used to store any medical supplies or medications.
- 4) Keep a supply of sterile linens and gowns in the emergency room area.
- 5) Provide the least toxic pharmaceutical supplies and equipment.
- 6) Coordinate with all other health center departments to meet patients' needs.
- 7) Monitor the general environment the patient is placed in.

C. Patient's Room

Staff will implement numerous measures to prevent unnecessary exposure.

Prior to patient's occupancy:

- Contact Environmental Services for terminal cleaning of the room.
- Place new sharps container in the room
- Contact CSS for sterile linen.

During Patient's Occupancy:

- Patient should be isolated from other patients and their visitors at all times to prevent reactions to products these people are wearing or using.
- Place sign on patient's door stating: "Check at the nurses station before entering room".
- Keep patient's door closed at all times and if necessary provide a clean cloth to seal bottom of door from hall odors.
- Health care center personnel must wash their hands and apply hypo allergenic, non-latex gloves prior to entering the room of the MCS patient as these activities can trigger reactions in the patient.

SOUTHWEST GENERAL HEALTH CENTER  
STANDARD OF PRACTICE

PAGE 7 OF 7	MULTIPLE CHEMICAL SENSITIVITY SYNDROME	POLICY 742
----------------	--	---------------

- No live plants or flowers permitted in the patient's room (mold and pesticides trigger MCS reactions).
- No newspapers or treated paper permitted in patient's room. (3-part copy papers or chlorinated papers can be highly toxic and may affect breathing).

APPROVED:

Trilok C. Sharma, M.D.  
President, Medical Staff  
Southwest General Health Center

---

L. Jon Schurmeier,  
President  
Southwest General Health Center

**Appendix C – MULTIPLE CHEMICAL SENSITIVITY (MCS) PROTOCOL**  
 Southwest General Health Center (SWGHC)  
 Middleburg Heights, OH

INITIATED	DISCONTINUED
Date	Date
Time	Time
RN	RN

SOUTHWEST GENERAL HEALTH CENTER  
 NURSING SERVICES

**MULTIPLE CHEMICAL SENSITIVITY (MCS) PROTOCOL**

- PURPOSE:** To outline the management and nursing responsibilities caring for a patient experiencing multiple chemical sensitivity (MCS).
- LEVEL:** Independent
- SUPPORTIVE DATA:** MCS is an acquired chronic disorder characterized by recurrent symptoms occurring in response to low levels of exposure to multiple unrelated chemicals. The symptoms generally occur in one of four categories: central nervous system, circulatory, respiratory and mucous irritation or metabolic that would include enzymes, blood, kidneys, GI tract, etc.. Patient with a history of maladaptive reactions to chemicals found in perfumes pesticides, detergents, household cleaners, etc. may have or develop multiple chemical sensitivities. Approximately 75% of those affected are women, possibly due to endocrine disruption. People in their 30s and 40s are most strongly affected as well as children and others who are more susceptible to the effects of pesticides and products containing toxic chemicals. The population most strongly identified with this condition include: industrial workers, teachers, nurses, sick building occupants and those living in chemically contaminated communities. Refer to *Latex Sensitivity/Allergy Protocol* and *Hospital Policy #742 Multiple Chemical Sensitivity (MCS) Patient*.
- CONTENT:**
1. Identify individuals at risk on admission in Emergency Room or Admitting.
  - Prior to Admission* 2. Assign the patient to private room.
  3. Contact CSR for free tote (or nursing supervisor during night shift).
  4. Notify Environmental Services, Central Sterile, Pharmacy, Nutritional Services, and SSA of MCS patient admission.
  - Admission Assessment* 5. Assess all patients on admission for allergies and maladaptive reactions.
  6. Place green allergy band on patient; mark Multiple Chemical Sensitivity (MCS).
  7. Place sign on patient’s door stating:

“Check at the nurses station before entering patient’s room.”

***Admission  
Assessment (cont’d)***

8. Enter Multiple Chemical Sensitivity on all the orders sent in Cerner in Comments Box.
9. Observe patient for following symptoms.
  - Fatigue
  - Memory loss
  - Depression
  - Nervousness
  - Lack of motivation
  - Visual problems
  - Hearing problems
  - Dizziness
  - Sleep disorders
  - Edema
  - Disorientation
  - Confusion
  - Irritability
  - Loss of logic sequencing ability
  - Loss of coordination
  - Hoarseness
  - SOB
  - Headache
  - Chest pain
  - Joint pain
  - Digestive difficulties
  - Sun or other rashes
  - Cold or heat sensitivity
  - Nausea
  - Tingling or numbness of extremities
  - Sinusitis
  - Pallor
  - Anemia
  - Salivation (usually from pesticides)

10. Refer to Latex Sensitivity/Allergy Protocol

***Patient Care***

11. Report signs and symptoms exhibited by patient to physician.
12. Obtain physician order for a special diet.
13. Encourage patient to select their own menu.
14. Allow patient to supply his/her own tolerated food products and dietary supplements.
15. Retain patients dietary requirements in the patient’s medical record for future reference.
16. Encourage use of personal respirator and other protection methods while in Health Care Center.

***Patient Safety***

17. Reinforce all hospital employees and visitors to check with patient’s nurse prior to entering patient’s room.
18. Maintain patient isolation from other patients and their visitors at all times.
19. Transport patient with R-95 mask or personal respirator.

***Patient Safety  
(cont'd)***

20. Refrain staff caring for patient from wearing perfumes, scented lotions, hair spray, deodorants or other scented products.
21. Educate hospital staff to wash their hands with unscented soap.
22. Apply hypo-allergenic, non-latex gloves prior to entering the room.
23. Instruct patient's family not to bring plants or flowers to the patient's room.
24. Restrict newspaper in patient's room.

***Patient Education***

25. Discuss with patient/family Multiple Chemical Sensitivity if newly diagnosed patient.
26. Reassure the patient with understanding of their chemically sensitive condition.
27. Refer patient to Social Services to provide list of Community Services.

***Documentation***

28. Document Multiple Chemical Sensitivity in the patient's medical record, in the front of the chart, medication record and computer system.
29. Record implementation/modification/discontinuation of protocols.
30. Document vital signs and assessment findings on appropriate flow sheet.
31. Document evaluative statement of the patient's response to interventions and lack of complications.

***Emergency  
Interventions***

32. If known, remove the offending object or person from patient's room.
33. If necessary, remove patient from room to fresh air outside the building.
34. Utilize charcoal and baking soda to absorb and remove odors from the room. Open windows if possible.
35. Refer to patient's personal emergency protocol for reducing and diluting chemical reactions (water, food, baking soda, tri-salts, etc.)

***Emergency  
Interventions  
(cont'd)***

36. Communicate and cooperate with the patient whenever possible as the patient generally knows what will help.

**Committee**

## **INTRODUCTION**

The Building Design & Construction Committee was charged with making recommendations for designing commercial and public buildings that would be more accessible for people with multiple chemical and/or electromagnetic sensitivities and provide healthier environments for all occupants.

The Committee found that major access barriers for chemically sensitive individuals are factors that contribute to poor air quality, such as pesticides, new carpets, tobacco smoke, inadequate ventilation, mold, certain building materials, and building activities that generate air pollutants. For electromagnetically sensitive individuals, access barriers include fluorescent lighting, unshielded transformers and wiring, security and scanning equipment and numerous other electrical appliances.

The recommendations that follow, therefore, focus on minimizing or eliminating these barriers through designing

- for pest prevention to reduce the need for or the use of pesticides,
- for preventing moisture and mold growth,
- for optimum ventilation via HVAC systems and operable windows,
- for exhausting air contaminants,
- for minimizing use of carpet and other flooring that emit volatiles, and
- for shielding occupants from electromagnetic fields.

Although many building materials can be problematic for chemically sensitive people, the Committee made minimal suggestions regarding product choices as this was the charge of the Building Products and Materials Committee.

### **Recommendations for Future Actions**

The Committee recommends that the Access Board, NIBS, or other entity create a Design Manual using the outline in this report. This Manual would provide more detailed guidance than is provided here.

The Committee acknowledges that while the scientific evidence may be inconclusive about whether ambient electromagnetic fields pose a substantial health risk to the general population, the presence of EMF is an access barrier for people who are electromagnetically sensitive. Therefore, the Committee recommends that measures be taken to reduce EMF whenever possible in order to increase access for these individuals as well as taking a precautionary approach to protecting the health of all.

## **RECOMMENDATIONS**

### **Site and General Building Design**

Select site to minimize potential exposure to air and soil pollutants and electromagnetic fields (EMF). (Appendix 1)

Visit the site on several occasions to assess site criteria.

Note microclimate: wind direction, sun exposure.

Avoid sites near wetlands/stagnant water, low lying areas; sites should be well above 100 year flood plain.

To minimize moisture infiltration at the foundation, avoid earth berm construction and provide positive drainage from building.

Avoid below-grade occupied space.

Avoid tuck-under parking and indoor parking.

Roof gardens should be avoided because soil and water can foster mold growth. (Appendix 2)

Arrange drop-offs, loading docks, helicopter pads, and other vehicular access points to eliminate or minimize exhaust fumes from entering building directly or being drawn into the HVAC system.

Avoid the use of indoor plants because they can attract pests, stimulate pesticide use, trigger allergies, and foster mold growth.

If smoking on site is permitted, dedicate an outdoor location that is remote from entries, main pedestrian paths and air intakes.

Group and isolate uses within a building that emit contaminants and could affect air quality.

High ceilings are preferred in order to dilute contaminants.

Avoid decorative indoor fountains.

### **Enclosure**

Design for a tight building envelope to maximize the performance of the HVAC system. Meet or exceed Energy Star leakage area (less than 1.25 s.i./100 sf. (Reference 1)

- Building should be able to be sealed off from exterior events that would raise outdoor pollutant levels such as, toxic spills, pesticide spraying, fires, traffic accidents, and rush hour traffic.

- Operable windows are preferred. Being able to open windows is an important access issue for chemically sensitive individuals and can be beneficial for other occupants in certain situations. Operable windows should be detailed to minimize air infiltration.

Design to prevent pest problems. (Appendix 3)

- Use inert pest resistant materials. When treatment of wood is required, treating with disodium octaborate tetrahydrate may be among the safer options.
- Incorporate pest barriers such as termite shields, window screens, and bird screens in construction details. Bird and bat droppings pose great IAQ risks.
- Some pesticides such as boric acid are considered environmentally safe. If used, granular or gel forms are preferred. Care should be taken to ensure that particles do not infiltrate interior habitable space.

Shield occupants from external sources of EMF. Windows with low e glazing, metal roof, and siding components may reduce certain interior EMF. (Reference 2)

Roof Design

- Pitched roofs are preferred, because they shed water quickly, clean the roof of pollutants and potential toxins, and are less prone to leakage.
- Inert roofing materials, such as coated metal or clay tile, are ideal. Note that galvanized metal presents a rust hazard and should be avoided.
- Flat roofs are not preferred. If used, membrane and high albedo (highly reflective to heat) type are recommended. Asphalt or modified bitumen built-up roofs are less preferable. (Reference 3)

Wall Design

- Use best design practices to prevent moisture and condensation within walls. Calculate dew points for each exterior wall (and roof) type to verify performance at each condition. Provide detail for all flashing and counter-flashing locations.

Foundation Design

- Provide under-slab vapor barriers, insulation, and damp-proofing to prevent moisture infiltration and condensation.

Protect stored building materials from water damage and mold growth.

Avoid use of water-damaged or mold-affected materials.

## **Plumbing, Mechanical and Electrical Equipment**

Properly insulate pipes to prevent condensation, especially within walls.

Use modeling software to determine airflow and to ensure isolation of pollutant sources and adequate ventilation.

Ventilate areas occupied by people with chemical sensitivities with goal of eliminating odors (ideally entire building). These ventilation rates meet or exceed all worldwide standards. (Reference 4)

Provide local control of temperature and airflow (ideally for every occupant). (Reference 5)

Utilize Displacement Air Distribution method to move pollutants away from occupants.

Dedicate building as Smoke-Free. (Reference 6)

Isolate mechanical equipment from occupied areas.

Provide direct exhaust from rooms and areas that have pollutant-generating sources or activities. These include but are not limited to: (see Appendix 5)

- Bathrooms (code requirement).
- Kitchens or office kitchenettes (this is in addition to code-required hoods or stove exhausts).
- Copy and print rooms.
- Computer rooms.

Ductwork

- Avoid insulation inside ductwork. Use external insulation wrap of non-friable (airborne particle creating) material.
- Oil coatings used in fabrication of sheet metal stock can affect air quality. Prior to installation, thoroughly clean ductwork with a low VOC product. Use methods that do not leave residue or cause oxidation. (Reference 7)

Prohibit the use of fragrances and disinfectants in air distribution systems.

Maintain relative humidity between 30%-50%.

Locate outside air louvers away from pollutant sources.

Filtration (Reference 8)

- Carbon and HEPA filters are preferred.
- Avoid ozone generating air-purification systems.
- Avoid electrostatic air cleaning due to ozone.

In renovation work, re-evaluate HVAC system performance to ensure that original design standards are met.

Shield occupants from internal EMF. Design electrical systems to minimize EMF. Maximum recommended magnetic field levels of 2.5 milligauss (preferably 1 milligauss in occupied areas) and as low as technically achievable in areas to be occupied by people with sensitivities.

## **Finishes and Furnishings**

Refer to Products and Materials Group report for specific recommendations on materials.

Floor Coverings

- Use inert materials wherever possible, such as, but not limited to:
  - Stone, tile, terra-cotta, brick, ceramic tiles,
  - Terrazzo,

- Sealed concrete.
- Minimize the use of carpeting. Note that carpet that meets Carpet and Rug Institute Green Label Plus standards can still be problematic for chemically sensitive people. (Appendix 4)
- Use carpet systems that allow for small area replacement, such as certain of the self-adhesive backing carpet squares.
- Avoid glue-down carpet installations or use low-VOC adhesives. (see Products & Materials Committee recommendations)
- Cork and linoleum may contain linseed oil and should be avoided. Rubber flooring can also pose problems for chemically sensitive individuals and should be avoided.
- Use low-or no VOC materials for all flooring. (Appendix 4)

### **Construction Related Activities for Renovations**

Provide advance notice to all occupants of any upcoming renovation work.

Post signs to alert occupants of renovation work.

Provide alternate accessible locations for affected individuals when occupied space will be rendered inaccessible due to the renovation.

Physically isolate renovation work areas from occupied portions of building.

Isolate the HVAC system from renovation work.

Implement a dust-control plan that identifies work methods and cleanup procedures.

Provide negative pressure in area of renovation work.

### **Occupancy**

Establish policies for renovation and chemical usage in lease agreements.

Designate a Smoke-Free building.

Leases should include language to ensure that occupant activity does not degrade original design standards and building performance.

Provide a list of areas and uses requiring separate exhaust air systems.

Designate areas free from use of cell phones, two-way radios, and wireless equipment.

### **Commissioning**

Develop a commissioning plan that includes the items listed above.

After construction or renovation provide a minimum flush-out period of two weeks prior to occupancy.

Re-commission buildings periodically. Building use shall be taken into account when determining the re-commissioning schedule.

## **Exterior Landscaping**

- Gardens (see Appendix 6)
  - Design gardens that can be maintained organically without pesticides.
  - Avoid plants with fragrances that may provoke allergies.
  - Exterior gardens and landscape should be free of all plantings that require pesticides, synthetic fertilizers, lime, or other chemical applications.
  - Use indigenous plant materials that are hardy, naturally pest-resistant, require minimal maintenance, and low water use.
  - Use xeriscaping principles.

## APPENDICES

### Appendix 1 - Site Selection: Potential Sources of Pollutants and EMF.

The Committee recognizes that few, if any, building sites are likely to be free of all the pollutant sources listed below. The recommendation is to minimize proximity to as many of these sources as possible in order to maximize outdoor environmental quality and hence indoor environmental quality.

Table A-1 Potential Sources of Pollutants and EMF

General (Air, Soil)	Engine Exhaust	Pesticides	Industrial/Commercial	EMF
Recognized area of poor air quality Smog Smoke (chimney, industrial, etc.)  Superfund Sites Brownfields Landfills Hazardous waste sites Compost sites Underground storage tanks  Floodplains Wetlands Filled-in wetlands  Military bases	Heavy traffic Highways Interstates Diesel exhaust Airports	Agriculture (unless organic) Golf courses Mosquito spraying Parks & Forests Roadside spraying Dairies Chicken & hog farms Other intensive livestock operations	Refineries Mines Chemical plants Cement plants Power plants Manufacturing Logging/Pulp mills Incinerators Sewage treatment plants Gas stations Dry cleaners Other commercial sources that emit air pollutants (See Appendix 5 on Use and Occupancy)	Substations Cell phone towers Radio towers Transponders Transformers High tension lines Electrical distribution lines Radar installations Military bases Airports Electrical Transportation Power-generating dams

### Appendix 2 - Roof Gardens

Roof gardens involve a range of potential issues related to moisture penetration and mold growth. Flat roofs are prone to pooling water and leaking. Foot traffic can cause or accelerate deterioration leading to leaking. Roof repair is more difficult under gardens. Plants may attract pests that subsequently encourage pesticide use. Planting soils can create dust. Plants can emit volatile fumes and pollen. Plants can drop leaves and fruit that rot and become moldy. Selected plants should be low allergen plants without strong fragrance (See Exterior Landscaping above). If used, roof gardens should be located away from air intakes, operable windows, and doors. Design should ensure that moisture will not penetrate the roof membrane or cause conditions of standing water.

## **Appendix 3 - Pest Prevention**

### **Exterior Design:**

Remove lights on or near building that may attract night-flying insects.

Maintain a plant-free zone of about 12 inches around buildings to discourage insects from entering.

Design weep-holes in window frames to prevent access by paper wasps. Design windows to prevent harborage and access for pests, without clear passageways to inside.

Correct structural features that provide opportunities for bird roosting and nesting.

Avoid locating decorative lattices over entrances to food services facilities that may inadvertently serve as bird roosts.

Install bird-proof barriers that are designed to prevent both pigeon and sparrow access to preferred nesting sites.

Design exterior light fixtures so that birds cannot roost or nest on or in them.

Fit eave roof tiles with bird stops (that will also exclude bats, bees and wasps).

Correct structural features that provide opportunities for rodent harborage and burrowing.

Screen or otherwise eliminate animal access under decks, porches, stairways. Seal porches and ramps to the building foundation with ¼-inch hardware cloth screen mesh to form a barrier to digging pests such as rats and skunks. This screen must extend 12 inches into the ground and must have a right-angled, 6 inches wide, outward extending shelf to prevent burrowing under the screen.

Screen ventilation louvers with ¼-inch hardware cloth screen mesh to exclude birds, rodents, cats, etc., (coordinate with mechanical requirements).

Maintain a 2-foot pea gravel strip around buildings to prevent rodent burrowing.

Use a 3" layer of sand barrier underneath slab construction. Use 1-3 mm particle size in place of unsifted sand to provide a permanent sand barrier to termites (both western subterranean and Formosan termites). This will prevent termites from penetrating cracks in slab construction.

For wood not in contact with the ground or concrete, use wood pre-soaked in disodium octoborate tetrahydrate.

### **Refuse and Recycling Areas:**

Place outdoor garbage containers, dumpsters, and compactors on hard, cleanable surfaces and away from building entrances (at least 50 feet from doorways). Design site with properly graded concrete or asphalt pads to help prevent rats from establishing burrows beneath them.

Design site with solid enclosure that extends all the way to the ground. Use metal or synthetic materials, as opposed to chain-link, wood, etc. to prevent rodents from gnawing and climbing the enclosure.

Design trash storage areas that can be closed off from the rest of the building.

Locate storage areas for boxes, paper supplies, and other materials in areas separate from where food or trash is stored. When stored together, these materials put food and shelter together, attracting pests.

## **Landscaped Areas**

Choose proven performers, plants known to do well in the intended planting area. Avoid plants with history of pest problems. Use resistant plant species and cultivars when available. Check with your university or cooperative extension service for recommendations.

Give preference to plants that shed a minimum of seeds and fruits, that may attract and support insects, rodents, and undesired birds.

Design with diversity. Include a wide variety of plants in the landscape to reduce the pest damage potential.

Provide a properly prepared site. Site selection is critical; the site must be compatible with the plants' requirements.

Design landscaped areas with flexibility to allow for campus additions, which may change drainage, exposure to sunlight, ventilation, or other plant requirements.

Avoid crowding of landscape plantings.

Group plantings with similar cultural requirements.

Install or retrofit fence lines and other turf or landscape borders with concrete mowing strips.

Avoid planting vegetation directly against buildings as this provides shelter and sheltered runways for rodents. For the same reason, avoid planting dense vegetation that completely covers the ground.

Do not plant vines which climb building walls, as these create runways for rodents and harborage for undesired bird species.

Plant trees away from buildings to prevent easy access to buildings for insects and rodents.

Give careful consideration to placement of deciduous trees. Leaves which accumulate along foundations provide harborage and sheltered runways for rodents.

## **Interior**

Food Preparation and Serving Areas (main kitchen, dining room, teachers' lounge, snack area, vending machines, and food storage rooms):

- Ensure that new kitchen appliances and fixtures are of pest-resistant design, i.e., open design, few or no hiding places for roaches, freestanding and on casters for easy, thorough cleaning.
- Provide space under and around appliances and equipment in kitchen areas to allow maximum ventilation and ease of (steam) cleaning.
- Use coving at floor-to-wall junctures to minimize build-up of debris and to facilitate cleaning.
- Slope floors in kitchen areas to provide good drainage after cleaning.
- Do not install pegboard in kitchens, animal rooms, or laboratories.
- Insure that all pipe insulation has a smooth surface and that there are no gaps between pieces.
- Refrigerate trash/recycling storage rooms.

### **Classrooms and Offices**

Ensure that new office and classroom furniture that is rarely moved (e.g., staff desks, bookcases, filing cabinets) is designed to permit complete cleaning under and around the furniture, or to allow ready movement for cleaning purposes.

Design or retrofit construction to provide adequate ventilation, preventing trapped moisture and condensation.

### **Storage Areas**

Equip area with self-closing doors.

### **Building Perimeter**

Seal all plumbing and electrical service entrances.

Keep doors closed tightly; equip doors with self-closures and door sweeps.

### **Appendix 4 - Carpet**

Stone, terra cotta, granite, marble, terrazzo, ceramic, brick, or sealed concrete flooring is best tolerated by individuals with chemical sensitivities. Wood flooring that has not been recently stripped or refinished is also often well tolerated by people with chemical sensitivities.

Carpet systems contain a myriad of chemicals in their fiber, dyes, backing, padding, bonding agents, adhesives, antimicrobials, flame retardants, and stain resistance, anti-static, and color fast agents. They also are reservoirs for tracked-in pesticides, dust, dust mites; foster mold growth; and absorb and remit volatile organic chemicals like fragrances and

paint fumes. In addition, many solvent-based agents used to clean carpets emit toxic fumes.

The Carpet and Rug Institute (CRI) has established a rating system and testing program (Green Label Plus) that may be used in lieu of the emissions testing criteria of California's Collaborative for High Performance School (CHPS) Section 01350 (See Products & Materials Committee).

Some people with chemical sensitivities have found that carpet squares with self-adhesive backing have been the best tolerated new carpeting. Others have reacted adversely to such products. More research is necessary to determine what factors in these carpets and/or which brands are best tolerated.

Older carpets are usually better tolerated by people with chemical sensitivities than new ones, as long as they have not become moldy.

Recommendations regarding carpeting (design, materials, and O&M issues):

- Minimize the use of carpeting.
- Use area rugs in place of carpeting whenever possible.
- Consider using self-adhesive carpet squares.
- Tack rather than glue down (unless using self-adhesive carpet).
- If glue down, use low or no VOC adhesive.
- Air out carpet for at least two weeks prior to installation.
- Exceed building flush-out of two weeks if possible.
- Reduce the need for and the frequency of carpet replacement through good maintenance (e.g., thorough vacuuming and frequent cleaning with low toxic products and procedures -- see recommendations by O&M).
- Minimize amount of carpet that is replaced, limit replacement to damaged areas. (A major advantage of carpet square systems is that smaller sections can be replaced).

## Appendix - 5 Use and Occupancy

Non industrial businesses/activities that may generate chemical pollutants include, but are not limited to:

Hair and Nail Salons	Dry Cleaners	Labs (eyeglasses, medical, etc.)
Spas	Laundromats	Dental offices
Restaurants	Nurseries (Plants)	Dialysis Centers
Grills & BBQ	Landscaping, Pest Control	

Furniture stores	Florists	
Woodworking and crafts shops	Candle/Soap/bath shops	
Art/Pottery studios	Pet Shops	
Auto Parts	Photo/Printing/Copy shops	
Taverns/Bars	Specialty foods stores	
Tobacco Shops	Leather goods stores	
Tattoo Parlors	Perfume shops or departments	

Areas that should be vented directly to the outside include: kitchens, labs, computer rooms, copy/fax areas, printer or blueprint rooms, storage areas for toxic materials, showers, locker rooms, and areas where animals are present.

### **Appendix 6 - Landscaping**

Use low allergen plants (See Ogren Plant Allergy Scale).

Plant female trees and shrubs (they do not produce pollen).

Avoid the use of plants that have strong fragrances, such as jasmine, lavender, peppermint, and roses.

Avoid or minimize lawn/turf areas to reduce mowing emissions and chemical usage.

Use low growing fine fescue, buffalo grass, or other turf grass which requires little or no mowing.

Use a wide variety of plant materials.

Group plants with similar water and cultural needs.

Do not crowd plants.

Leave gaps in groundcover to create less hospitable habitat for pests.

Plant deciduous shade trees on the south and west sides of buildings. The shade reduces interior temperatures and reduces A/C usage during summer months.

Use low or no VOC paints, stains and finishes on outside equipment including benches, poles, decks, and other outdoor equipment (See recommendations from Building Products & Materials group.)

Avoid organic mulches (cocoa beans, peat moss, bark, wood chips) as they emit volatile fumes and may harbor mold.

Avoid railroad ties as they contain creosote.

Utilize stone, clay, concrete, and other hard, non-volatile materials to create borders and frame gardens.

*“EMF reduction: The team reviewed available literature on EMF and their threat to health and determined that while EMF radiation could be measured, its threat to humans had not yet been proven or disproved. Nevertheless, the team recommended adopting a philosophy of prudent avoidance toward EMF risks and undertook modifications of the building design to reduce occupant exposure. EMF radiation can be mitigated by distance and by shielding. Distance offers maximum protection and is “low-tech,” while the costs associated with shielding are high and the results are difficult to measure. Consequently, the design team chose to create “buffer zones” to reduce prolonged exposures in portions of the building that are occupied for long periods of time, such as the laboratories and offices. The largest sources of EMF were identified as the building’s transformers, the electrical rooms with their many cables, and the electrical conduit that was routed under the building atria. As a first step circulation and utility spaces were used to maximize the separation between a source and any potential receptors.”*

**Introduction**

The goal of the NIBS – IEQ Products & Materials Committee was to develop procedures and guidelines to aid persons in making informed material selections in order to construct a building that will be accessible to persons with multiple chemical sensitivities (MCS) and/or electromagnetic sensitivities (EMS). The NIBS IEQ-Materials Committee has reviewed existing standards and guidance for materials selection in building construction. The group has determined that certain features of the existing standards offer a reasonable starting point for the selection of building materials, and in some respects can offer a more accessible environment to persons with MCS and/or EMS. These existing standards are designed to create healthier indoor air quality by making appropriate building material selections, among other things. Though the existing standards may not result in material selections that will make a building accessible to the majority of persons with MCS and/or EMS, they will produce a healthier building, than one constructed without regard to these standards. Healthier buildings would be useable by people with other health conditions such as asthma and other respiratory conditions, allergies and migraine headaches.

The NIBS IEQ Materials Committee has attempted to take the best ideas or practices from the existing standards and guidelines to recommend material selections that will provide for healthier, more accessible buildings. If a designer follows the suggestions provided herein, it will result in a building that has the lowest chance of IEQ problems stemming from the materials and that has the best likelihood of being accessible to persons with MCS and/or EMS.

The standards reviewed by the Materials Group include:

- Collaborative for High Performance Schools (CHPS) Section 01350
- Green Guard Environmental Institute - Certification Standards for Low Emitting Products for the Indoor Environment
- Green Seal – Environmental Standards
- Green Guidelines for Healthcare – Materials and Resources
- Reducing Occupant Exposure to Volatile Organic Compounds (VOCs) from Office Building Construction Materials: Non-Binding Guidelines - California Department of Health Services

Two of the key elements involved in the materials selection process are a component content screening (what chemicals and compounds are known to be a part of the material) and an emissions testing protocol. Both the California Section 1350 Specification and the Green Guard Standards recommend emissions testing based on the ASTM Method ASTM standards D-5116-97 and D- 6670-01. The Committee believes that both of these elements must be involved in making appropriate building material selections.

### **Overview - Design**

The Products & Materials Committee believes that particular attention is critical during building design to assure that the needs of chemically and electromagnetically sensitive people are accommodated to the greatest extent possible. In general, this means selection of construction materials that are low-emitting or non-emitting and selection of finishes that do not absorb or react with chemicals emitted by other materials or products in the building. To begin to address some of the concerns of electromagnetically sensitive persons, areas of the building can be designed to have reduced electromagnetic fields. By making indoor environments that are safer for the most vulnerable among us, we can create indoor environments that are healthier for everyone, especially children.

Generally, this means selection of materials that are “hard” or non-porous where possible so that any chemicals that contact these materials are not retained in and re-emitted from them. Also, particular attention should be paid to selection of materials that will not require VOC-emitting chemicals later as part of maintenance. For instance, in designing building foundations and structures, particular attention should be paid to the need for preventing termite problems, since the pesticides commonly used to control termites can have a deleterious effect on humans, especially persons with multiple chemical sensitivities. So, even though the material itself might be low-emitting, the use of products meant to “preserve, protect, or maintain” the material selected might emit volatile fumes that degrade indoor environmental quality and result in a building that is not suitable for persons with MCS.

In addition, during building design particular attention must be paid to choice of electrical appliances, equipment and products that may produce higher than necessary electromagnetic fields. The NIBS-IEQ Materials Committee recognizes that there are selections that can be made during building design and construction that can provide a more healthful environment for persons with electromagnetic sensitivities. A few of these considerations are:

- Incorporation of a foil vapor barrier or other metal shielding feature into the walls around electric equipment can reduce certain electromagnetic fields.

- Wireless (“bluetooth” type) connections should be avoided, or areas of their use should be "contained" by using foil-backed drywall or other incorporation of a foil or metal barrier.
- New construction should use twisted metal clad wiring and/or twisted wire placed in metal conduit.
- Fiber optic connectivity is preferred for computer networks communication because these data lines may be run without concern for stray emissions.

## **Overview – Building Operations and Maintenance**

Vigilance is required to assure that materials brought into the building throughout the course of its life are consistent with the standards provided herein, and are consistent with the design intent of the building.

For example, the Products & Materials Committee realizes that building operations and maintenance products might introduce materials that are not consistent with the initial design for an accessible, healthy building.

Building managers must also pay close attention to materials brought into the building environment by tenants or others to assure that these materials are consistent with provision of an accessible, healthy building for persons with multiple chemical sensitivities, electromagnetic sensitivities, and/or other health disorders. For instance, a tenant may bring furniture in that does not meet the design criteria presented in this document, and these materials could have detrimental effects on air quality within the entire building, depending on the design of the HVAC system. In addition, the chemicals and compounds used for maintenance can degrade environmental quality and seriously affect persons with multiple chemical sensitivities. Other products that can have detrimental effects on IEQ and/or certain individuals include paints and other finishes, carpeting, appliances and other electrical equipment, and others.

## **CHPS Section 01350 Part 1.3B and 1.4D and GREENGUARD Allowable Emission Levels**

The NIBS – IEQ Products & Materials Committee believes that the CHPS Indoor Air Quality Emissions Testing Standards and the Green Guard Allowable Emission Levels offer tested and reviewed approaches to material and product selection for buildings. Given the range of guidance and standards available for material selection, these two standards provide the most widely accepted processes for making material selections to construct buildings that are healthier for the general public. It should be noted that the NIBS –IEQ Products & Materials Committee does not believe that either of these standards offers an entirely acceptable solution for persons with MCS and EMS. However, they provide a starting point in making material selections, and they provide the best available guidance on component screening and materials emission limits. Making materials selections that meet either the CHPS or the Green Guard allowable emission levels should be considered an absolute minimum requirement in creating a building or environment that is accessible to persons with MCS and EMS. No designer or other person making material selections should choose any materials that do not at least meet these standards. Even then, the other considerations discussed herein should be a part of the selection process to provide the best

opportunity that the building will provide an environment accessible to persons with MCS and EMS.

The Green Guard Certification Standards list allowable emissions for a range of building products. A designer or other individual making a material selection must investigate product literature, for the material under consideration, to determine if the product meets at least the Green Guard standards. The Green Guard web site lists products that have been tested and have met their standards. However, it is possible that a product manufacturer has not submitted their product for certification to either Green Guard or CHPS. In this case, the person making a material selection must seek any published emissions testing data and product component data available from the manufacturer. Some manufacturers publish data on emissions from their products, and other manufacturers are moving quickly to provide such data. If such data is not currently published, the manufacturer must have the product or material tested in accordance with the testing regimen specified in the Green Guard or CHPS 01350 Certification Standards.

The CHPS Section 01350 protocols and the Green Guard Certification for IAQ data require the same chamber testing. The CHPS protocols and calculations go further than the Green Guard Certification Standards in that the designer is required to take published emissions rates and perform calculations based on the amount of material to be installed in the building and the zones and air handling capabilities of the HVAC systems in those zones. Also, the allowable emission level for formaldehyde is lower in the CHPS standard than the Green Guard standard. See the discussion below for more information on formaldehyde.

For both standards, all building materials are required to be tested in dynamic environmental chambers following ASTM standards D-5116-97 and D-6670-01, the U.S. Environmental Protection Agency's testing protocol for furniture and the State of Washington's protocol for interior furnishings and construction materials. Products are measured for emission levels according to the parameters set forth in the ASTM Standard for emissions testing.

California - Practice for Testing of VOC's from Building Materials Using Small Chambers

<http://www.dhs.ca.gov/ps/deodc/ehlb/iaq/VOCS/Practice.htm>

The allowable emission levels of both standards can be found by clicking on the links below. In some cases, the Green Guard standards may appear to have lower standards for emissions of some VOCs than the CHPS Section 1350 standards. However, the person selecting materials for the building must bear in mind that the CHPS standard requires a detailed calculation for the building, the amount of material to be installed and the air change rate of the HVAC systems. Green Guard emissions standards are based on a "standard" model of a building, and a "standard" exchange rate of fresh air in the building.

## **Formaldehyde**

Formaldehyde is widely used by industry to manufacture building materials and numerous consumer products. It is also a by-product of combustion and certain other natural processes. Formaldehyde, by itself or in combination with other chemicals, serves a number of purposes in manufactured products. For example, it is used to add permanent-press qualities to clothing and draperies, as a component of glues and adhesives, and as a preservative in some paints and coating products.

In building materials, the most significant sources of formaldehyde are likely to be pressed wood products made using adhesives that contain urea-formaldehyde (UF) resins. Pressed wood products include: particleboard (used as sub-flooring and shelving and in cabinetry and furniture); hardwood-veneer plywood paneling (used for decorative wall covering and used in cabinets and furniture); and medium density fiberboard (used for drawer fronts, cabinets, and furniture tops). Medium density fiberboard contains a higher resin-to-wood ratio than any other UF pressed wood product and is generally recognized as being the highest formaldehyde-emitting pressed wood product.

Other pressed wood products, such as softwood plywood and flake or oriented strandboard, are produced for exterior construction use and contain the dark, or red/black-colored phenol-formaldehyde (PF) resin. Although formaldehyde is present in both types of resins, pressed woods that contain PF resin generally emit formaldehyde at considerably lower rates than those containing UF resin.

The NIBS – IEQ Products & Materials Committee is concerned about human exposure to formaldehyde, especially for individuals with multiple chemical sensitivities. The widespread use of formaldehyde, its known health effects, and the hyper-sensitivities of certain individuals create this concern. It may not be possible to make material selections that are completely free of formaldehyde, but where possible, the individual making material selections should make every effort to avoid products manufactured with formaldehyde. New soy-based adhesives are coming on to the market to replace formaldehyde resins used in many manufactured wood products. It may soon be possible to choose alternative products that are not formulated with this volatile organic compound (VOC).

The California Office of Environmental Health Hazard Assessment has determined that the lowest, reasonably achievable level of formaldehyde (because it is equal to ambient air

concentrations) is 33 (milligrams per cubic meter)  $\text{ug}/\text{m}^3$ , or 23 (parts per billion) ppb. Thus, the CHPS 01350 standard requires that a material must not emit a level of formaldehyde that results in a concentration of  $\frac{1}{2}$  of this level, or  $16 \text{ ug}/\text{m}^3$  (11 ppb). This limit is lower than the allowable emission level of the Green Guard standard. The NIBS – IEQ Products & Materials Committee believes that the  $16 \text{ ug}/\text{m}^3$  (11 ppb) level is a minimum requirement for formaldehyde emissions from building materials.

***Following is a list of typical building materials and some considerations for selection. Note that the considerations listed below are in addition to the recommended emissions standards from CHPS 1350 and Green Guard.***

### **Adhesives and Sealants**

One objective of the IEQ-Products & Materials Committee is to reduce the quantity of indoor air contaminants created by adhesives and sealants that are potentially irritating and/or harmful to occupants of buildings. The use of VOC-emitting adhesives and/or sealants should be minimized to the greatest extent possible in order to create an accessible, comfortable environment for the greatest numbers of people.

The designer should specify application of only the minimum amounts of these materials necessary for satisfactory completion of each installation task. Additionally, the designer should select products that have the lowest possible VOC emissions, according to the emissions testing information provided, while still meeting other performance requirements. Caution should be exercised when interpreting adhesive emission data because such data are usually provided without the associated installed products (e.g., flooring materials) and emissions from installed assemblies may differ from manufacturers' reported adhesive emission rates. If possible, adhesives that contain formaldehyde should be avoided.

The Committee also recommends that paints and finishes be selected that do not contain biocides.

In any building where adhesive use is necessary, it is a good practice to ensure that maximum ventilation is supplied during and after application of these products.

### **Appliances**

Appliances can emit volatile fumes as well as create electromagnetic fields.

Electromagnetic fields and radiofrequencies can jeopardize the functioning and safe access of electromagnetically sensitive individuals. Examples of indoor appliances which can provoke health problems include:

- cell and portable telephones,
- fluorescent lights,
- unshielded transformers and wiring,
- battery re-chargers,

- wireless devices including computers and personal communication services (“PCS”),
- security and scanning equipment,
- numerous common work place and household electronic appliances.

Many electrical appliances and equipment can be improved to varying degrees by appropriate shielding, and/or by being located in areas remote from vulnerable individuals.

It is not recommended that such equipment be eliminated from the built environment, but that exposure of vulnerable individuals to such equipment be voluntary or easily avoidable.

## **Ceilings**

Of particular concern to the NIBS-IEQ Products & Materials Committee are T-bar suspended ceilings used as return air plenums in buildings, because both sides of the panels come in contact with indoor air. In addition, penetrations for sprinklers, alarms, and smoke detectors may significantly increase the area exposed to emissions. Temperatures near ceiling surfaces and in return air plenums are usually higher than those in occupied zones and, as a result, increased emissions from ceiling materials may occur. The individual selecting ceiling materials should carefully consider the acoustic, fire, and aesthetic requirements for each space prior to material selection. Nonporous materials are now available that combine aesthetic, acoustical, and fire code requirements.

Ceiling materials that contain organic materials present the possibility of mold contamination if the ceiling system becomes wet. Porous ceilings and ceiling finishes can also act as receptors for toxins and VOCs that are brought into the building and later re-emit them. Many ceiling tile products are made using urea formaldehyde. No products using urea formaldehyde should be allowed.

## **Composite Wood Products (plywood, particle board, OSB, paneling, etc.)**

Because they emit formaldehyde and other VOCs, use of composite wood products should be minimized, if not eliminated. If it is absolutely necessary to use such products, the designer should select materials that meet the specified building criteria and are the lowest emitting products available according to emissions testing data. Formaldehyde emissions are of particular concern in composite wood products. Note that VOC-emitting wood preservatives may be used in some of these products. There are a number of manufacturers that are replacing formaldehyde adhesives in composite wood products with non-emitting adhesives and the Committee recommends using these alternative products whenever possible.

## **Fireproofing**

The use of fireproofing chemicals should be minimized when possible. Spray-on fireproofing can cause indoor air quality problems when chemical components are released into the air as a result of mechanical damage, air erosion, or deterioration of the binder. Also because spray-on materials have large, porous surface areas, they can act as sinks for adsorption and re-emittance of VOCs. If possible, seal the surface of spray-on fireproofing to reduce adsorption of VOCs. Ensure that the sealer: (a) will not change fire characteristics of the original fireproofing material; and (b) is not a high-VOC emitter. Also seal any

penetrations of surfaces sprayed with fireproofing material to prevent damage of the material in the vicinity of penetrations.

## **Flooring and Floor Systems**

The NIBS-IEQ Products & Materials committee recommends use of flooring products that are low or non-emitting and are non-porous. Consideration should also be given to maintenance products that will be necessary for the type of flooring selected. For instance, stripping and refinishing of wood flooring introduces hazardous chemicals into the air and are intolerable for persons with multiple chemical sensitivities. When selecting a floor system, the type of adhesives used with the flooring system must also be considered.

Stone, terra cotta, granite, marble, terrazzo, ceramic, brick, or sealed concrete flooring are best tolerated by individuals with chemical sensitivities, and provide a healthy, comfortable environment for the greatest number of people.

Wood flooring that has not been recently stripped or refinished and older vinyl flooring is also often well tolerated by people with chemical sensitivities.

Rubber, linoleum, and cork flooring are not recommended.

The Resilient Floor Covering Institute (RFCI) has recently introduced a new certification program for low emitting flooring products called the FloorScore™ program. The FloorScore program is a building materials emissions testing program that requires both independent laboratory testing and third-party certification to show compliance with CCHPS 01350 VOC emissions limits and includes certified site audit and documented control system requirements. The third-party certifier, Scientific Certification Systems, Inc. (SCS), not only reviews the results of the product VOC emissions report but also reviews raw material inputs and manufacturing processes to ensure that a product is consistently manufactured. SCS conducts site audits of manufacturing plants to ensure a quality management plan exists for continuing compliance of the product as defined in SCS-EC-10-2004 Environmental Certification Program – Indoor Air Quality Performance.

Resilient Floor Covering Institute – “Floor Score” Program

[http://www.rfci.com/int\\_FloorScore.htm](http://www.rfci.com/int_FloorScore.htm)

Floor Score List of Certified Products

[http://www.rfci.com/int\\_FS-ProdCert.htm](http://www.rfci.com/int_FS-ProdCert.htm)

Carpet systems contain a myriad of chemicals in their fiber, dyes, backing, padding, bonding agents, adhesives, antimicrobials, flame retardants, and stain resistance, anti-static, and color fast agents. They are reservoirs for tracked-in pesticides, dust, dust mites; foster mold growth; and absorb and re-emit volatile organic chemicals like fragrances and paint fumes. In addition, many solvent-based agents used to clean carpets emit toxic fumes.

The Carpet and Rug Institute (CRI) has established a rating system that involves emission testing that is based on CHPS Section 01350, and includes additional requirements. Carpets labeled with the CRI Green Label Plus are expected to have lower emissions than most

carpets. However, even carpets emitting low levels of volatile organic chemicals (VOC's) can cause adverse health effects in certain individuals.

CRI Green Label Plus link

[http://www.carpet-rug.org/drill\\_down\\_2.cfm?page=8&sub=3&requesttimeout=350](http://www.carpet-rug.org/drill_down_2.cfm?page=8&sub=3&requesttimeout=350)

Some people with multiple chemical sensitivities have found that carpet squares with self-adhesive backing have been the best tolerated new carpeting. Others have reacted adversely to such products. More research is necessary to determine what factors in these carpets and/or which brands are best tolerated.

Older carpets are usually better tolerated by people with chemical sensitivities than new ones, as long as they have not become moldy.

Recommendations regarding carpeting (design, materials, and O&M issues):

1. Minimize the use of carpeting
2. Use area rugs in place of carpeting whenever possible
3. Consider using self-adhesive carpet squares
4. Tack rather than glue down (unless using self-adhesive carpet)
5. If glue down, use low or no VOC adhesive
6. Air out carpet for at least two weeks prior to installation
7. Ventilate building with 100% outside (or fresh) air for as long as possible after installation
8. Reduce the frequency of carpet replacement by maintaining them well (e.g., vacuum thoroughly and frequently and clean with low toxic products and procedures – (see recommendations by Operations & Maintenance Committee).
9. Minimize amount of carpet that is replaced, limit replacement to damaged areas (an advantage of carpet square systems is that smaller sections can be more easily replaced).

## **Insulation**

The NIBS-IEQ Products & Materials committee realizes that insulation is an essential component in building systems to assure a comfortable environment. Insulation and insulating materials are generally hidden or covered, however emissions can still be encountered by building occupants. The Committee believes that polystyrene foam insulation is best tolerated by persons with multiple chemical sensitivities. Other insulating products, such as fiberglass, cellulose, or cotton/polyester blend insulating products may produce particulates, harbor mold, or emit problematic volatile fumes, depending on the product and the manufacturing techniques used.

The Committee has particular concerns about interior lined ductwork, due to the insulation's ability to collect and trap chemical contaminants, dusts, microbes and fungi, as well as emissions from the adhesives used to secure the insulation. It is recommended that no interior-lined ductwork be used in the construction of buildings meant to be accessible to persons with MCS.

Lastly, insulation used anywhere in buildings must not contain urea-formaldehyde resins.

## **Paint**

The NIBS-IEQ Products & Materials Committee determined that for some individuals, 100% acrylic paint and paints containing low-VOC emissions can be acceptable. Paints containing styrene-butadiene latex combinations, enamels, strippers and paint thinners are all problematic and should be avoided or their use minimized.

For some individuals, well-hardened enamel paint, baked-on enamel finish, or porcelainized steel provide optimum safety. These products provide a hard, durable surface that can be easily cleaned using non-toxic products.

Paints with biocides or biocide additives (mold/mildew resistant) should not be selected.

## **Textiles**

The NIBS-IEQ Products & Materials committee recommends sparing or no use of textiles in buildings. Though it may be possible to introduce textiles with no emissions, textiles provide a porous medium to trap chemical contaminants, dusts and microbes that can create an unhealthy environment. In addition, the dry cleaning and laundering of textiles pose additional problems due to the cleaning products.

## **Walls**

Gypsum wallboard: Gypsum may be reasonably inert and extremely low in VOC emissions. However, additives used to produce mold-proof gypsum wallboard (i.e., "green board"), fire-resistant gypsum wallboard, or to improve the workability of the slurry during manufacture may include compounds that emit VOCs. Careful product selection and review of emissions testing data is necessary to assure that appropriate materials are chosen. Recycled paper covering both sides of gypsum wallboard may contain chemicals from previous uses, and additives or chemicals used in the production of the paper itself. Note that VOC emissions from gypsum wallboard can sometimes be significantly reduced by "painting" or laminating the surfaces. The more impervious the coating or covering, the greater will be the reduction in VOC emissions from gypsum wallboard. However, VOC emissions from surface treatment materials must be considered.

Gypsum wallboard can act as a sink for other VOCs in indoor air. Avoid exposing unpainted gypsum wallboard to indoor environments where emissions from other VOC sources exist. Taping and topping compounds can contain considerable quantities of VOCs, so emissions testing data for these products are also critically important. Use ventilation and heat to accelerate the drying process of these materials. Protect wallboard from exposure to contaminants and excessive moisture prior to installation.

Where possible, select material to reduce the need for paints, wallcoverings, or porous wall finishes in buildings. Most commercial structures are built using metal studs, a good selection for persons with MCS. Wood studs can emit terpenes and pinenes

## **Wallcovering**

Wallpapers may contain vinyl, plasticizers, styrene-butadiene latex combinations and other chemicals that can seal and trap moisture between the wallpaper and the wall fostering mold growth. The water-based pastes and glues used to adhere the wallpaper to the wall may

contain mold retardants and pesticides. Adhesives can emit volatile fumes. For these reasons we recommend that wallpapers not be used.

## **Conclusion & Recommendations**

In order to minimize the level of air pollutants emitted from building materials and create healthier indoor environments, the NIBS Products & Materials Committee recommends that inert, non-porous materials be used to the greatest extent possible. This will increase access for the greatest number of chemically sensitive individuals. Choosing appliances and other equipment that create the lowest level of electromagnetic fields will increase access for those with electromagnetic sensitivities.

If materials are used that emit volatile fumes, the Committee recommends that these materials meet or exceed the CHPS Indoor Air Quality Emissions Testing Standards or Green Guard Allowable Emission Levels, as well as contain no formaldehyde or biocides. The Committee also recommends that, whenever possible, products and materials be aired out (preferably outside or in a separate well-ventilated space) for two weeks prior to being installed in a building.

While the Committee acknowledges that the CHPS Indoor Air Quality Emissions Testing Standards and Green Guard Allowable Emission Levels are the best current standards for selecting building materials that create healthier buildings, the Committee is concerned that these standards may not sufficiently protect the health of building occupants, especially those with chemical sensitivities and other vulnerable individuals.

Therefore, the Committee supports:

- 1) Creation of more stringent emission standards and development of a wider range of less volatile and less hazardous building materials, especially in the areas of resilient flooring and carpeting.
- 2) Full disclosure of product ingredients (on product labels or available upon request) to enable builders to make more informed decisions regarding selection of building materials.
- 3) Consulting with chemically and electromagnetically sensitive individuals or organizations, especially employees and others who frequently use a building, prior to making final decisions regarding product selection.

## **“Smart” water meters installed – so where have the birds gone?**

24 February 2013 at 3:39pm

### **Are smart meters chasing away birds from Rolling Hills?**

**Since the installation of smart water meters last month, the birds have disappeared from the rolling hills neighbourhood.**

*by Brian Beckley, Renton Reporter, 22 Feb 2013*

source: [www.rentonreporter.com/news/192319761.html](http://www.rentonreporter.com/news/192319761.html)

Paul Ouellette has been feeding birds in the Rolling Hills neighborhood for several years and said since the city installed smart water meters he has not had to buy bird feed for the multiple feeders in his yard.

Paul Ouellette has lived in the Rolling Hills neighborhood for decades and since his retirement he has spent a lot of time in his backyard, which contains several bird feeders.

Normally at this time of year, his backyard is filled with birds; finches, chickadees and even hummingbirds.

“It’s very nice to see them flying around the yard all the time,” he said.

But this year is different. This year an eerie silence has settled over Ouellette’s yard – and his entire neighborhood.

“The birds are gone,” he said this past week. “Our feeders are still full.”

Ouellette said some people tell him it’s the hawks or that this winter has been foggy and that’s thrown off the birds.

But Ouellette, a retired civil engineer, isn’t buying it. He’s seen winters like this before and there have been birds.

“If you feed the birds, you know when they’re (usually around),” he said.

But there is a difference in the neighborhood this winter.

Beginning in mid-December, the city began installing new smart-water meters on homes all throughout Rolling Hills. The meters send information to the city four times a day to help monitor water usage without having to send workers to check individual meters. By mid-January, the entire Rolling Hills North neighborhood had been equipped with the new meters.

And the birds were gone.

“Right after the meter was installed . . . I was noticing my bird feeders weren’t going down,” Ouellette said.

In the past Ouellette said he was spending about \$30 a month on bird seed.

Now?

“I haven’t bought any for two months,” he said.

Ouellette began asking his neighbors if they’d experienced anything similar.

Bruce Chase, who lives down the street from Ouellette, said he and his wife also noticed something strange this year.

“Ever since they’ve installed that smart meter, we have not seen a bird,” Chase said. “They’re just gone.”

Chase’s house sits along a greenbelt in the neighborhood and he said he and his wife specifically noticed the lack of hummingbirds at their feeders. Usually, they’d get three or four birds every hour stopping by for a quick meal.

“Now we’re lucky to see one a day,” he said.

Ouellette has taken his concerns to the city, including an appearance at the Feb. 11 City Council meeting, asking the council to look into the continued use of smart meters through out the city.

The city’s meters work by sending out a one-minute, 900 MHZ pulse of information every four hours. While that doesn’t seem like a lot, only one meter can send the information at a time so each meter in a neighborhood has to wait its turn to send the information to the controller, located in Rolling Hills on a water tower.

Because of this, there is almost a constant wave of the pulse streaming out from an area.

“It’s constantly doing it,” Ouellette said.

While there is much information and misinformation on the effects of the high-frequency pulse on the health of humans, there is little research into the effect on small wildlife such as birds. The meters operate at a frequency similar to cell phones and other portable communications devices and while some minor health effects have been reported, such as problems sleeping or dizziness or nausea, the meters are generally considered safe for humans. Ouellette said he thinks the city’s meters may be different somehow, as the power and gas meters in the neighborhood were also fitted with smart meters last year and they did not seem to have an effect on the neighborhood’s wildlife.

But since the city’s have gone on, he and Chase both said the change was obvious and immediate.

“Normally you can walk into a neighborhood and hear birds,” Chase said. “Here there’s nothing. And at this time of the year, it should be getting noisier.”

Ouellette said his research on the Internet has shown similar issues elsewhere, on small animals such as squirrels – which are also missing from the neighborhood these days, he said – and bees.

“I don’t know what the impact is,” Ouellette said. “I want the City of Renton to do some research.”

According to Utility Engineering Supervisor-Water Abdoul Gafour, the city has no information at this time on the effects of the meters on wildlife. Gafour said the city is looking into the matter further for discussion at the Utilities Committee meeting on Monday. The issue was added to the committee’s agenda after Ouellette spoke to the council.

Toby Ross, science officer for the Seattle Audubon Society also said he had not heard of this issue prior to getting a call recently from Ouellette.

Ross said there was “very little research” into the matter and is also checking with other local experts.

Ross also stressed that there could be many other reasons for missing birds, though he did not rule out the meters.

“It could just be a coincidence,” Ross said.

And while it might be a coincidence, Ouellette and his neighbors are concerned it might be the harbinger of a bigger problem.

Like the canary miners used to take into a coal mine to warn them if toxic gases were building up, Ouellette worries that once again our feathered friends are giving us a warning.

“The birds are indicators of a potential problem,” he said.

The Utilities Commission will meet at 4 p.m. Monday in the Council Committee Room, 7th floor of City Hall, Renton WA. A briefing on smart meter installation is on the scheduled agenda.

### Abstract:

The heart is a muscular organ whose regular coordinated contraction, called a heart beat, is regulated by an electrical pulse that initiates a cascade of calcium ions that carry the message into all the heart cells to initiate the contraction of the heart beat. Therefore it is biologically plausible that natural and artificial electromagnetic fields will interfere with the heart activity. It has been shown that external ELF fields cause altered calcium-concentrations in neurons and heart cells. Altered blood pressure is associated with the Schumann Resonance signal, along with its modulation of human heart disease and mortality rates in a homeostatic manner. Electrical and electronic workers, radio/TV workers are shown to have increased risks of heart disease and mortality. We all live in electromagnetic fields which act to contribute to increase the rate of cardiac disease and death. A new high risk factor is the usage of a cellphone. Cellphones have been shown to interfere with electronic pacemakers. Therefore it is very reasonable that they will interfere with biological pacemakers, that is, our hearts. The use of a cellphone is associated with significant increase of blood pressure. This is a symptom of hypertension and shows that there is a cardiac risk factor. This risk factor is strongly confirmed in the context of the Schumann Resonance signal effects, electrical workers effects and altered cardiac functions in radio, TV and radar exposed workers.

### Introduction:

A primary principle of Environmental Health is a necessity to understand how the natural system works before we can appreciate and understand how artificial signals and chemicals can alter the natural functions and cause human health effects. Muscular contraction and relaxation is regulated by the motor neuron system for skeletal muscles. Electrical signals come from the brain through a particular circuit, through the spine, to the motor neurons in the particular muscular system. This signal initiates a coordinated alteration of the calcium ion cell messengers which alters the contraction or relaxation of those muscles.

Heart muscle cells are very similar to the skeletal muscle cells, Alberts et al. (1994). Muscle contraction is initiated by a sudden rise in cytosolic calcium ions ( $\text{Ca}^{2+}$ ). For the skeletal muscle force-generating molecular interaction takes place only when a signal passes to the skeletal muscle from its motor nerve. The signal from the nerve triggers an action potential in the muscle cell plasma membrane, and this electrical excitation spreads rapidly into a series of membranous folds, the transverse tubules that extend inward from the plasma membrane around each myofibril. A signal is then laid across a small gap to the sarcoplasmic reticulum, Figure 1.

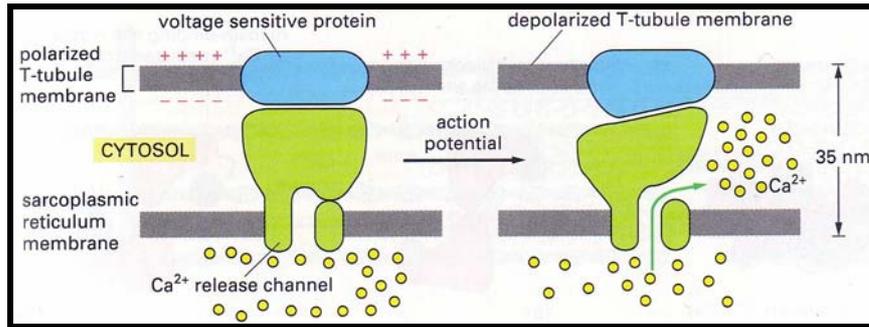

Figure 1: Schematic diagram showing how a calcium ion release channel in the sarcoplasmic reticulum membrane is thought to be opened by a voltage-sensitive transmembrane protein in the adjacent T-tubule membrane, Alberts et al. (1994).

When you see how electrical signals and ions have so many important roles in cells, controlling muscles and hearts, and many other bodily functions, through the electrical signals in the brain that are sent from the brain to the central nervous system and the motor neuron system, the opened understanding is that external electromagnetic fields can interfere with the body's systems. Certain organs such as the brain, the central nervous system and the heart, are very reliant on the electromagnetic signals and all the body's cells use many electromagnetic signals for their natural functions.

One of the earliest electromagnetic fields biological effects found and which is now well-established, is the calcium-ion efflux and influx of the cell membranes induced by extremely low-frequency (ELF) electromagnetic fields typically in the similar range of the brain EEG system frequencies. Another of the brain's most active frequencies is the alpha rhythm including 16 Hz. Dr Ross Adey's team showed that brain cells have been very strong in efflux and influx  $\text{Ca}^{2+}$  changes when exposed to 16 Hz fields and modulated RF/MW radiation Figure 2.

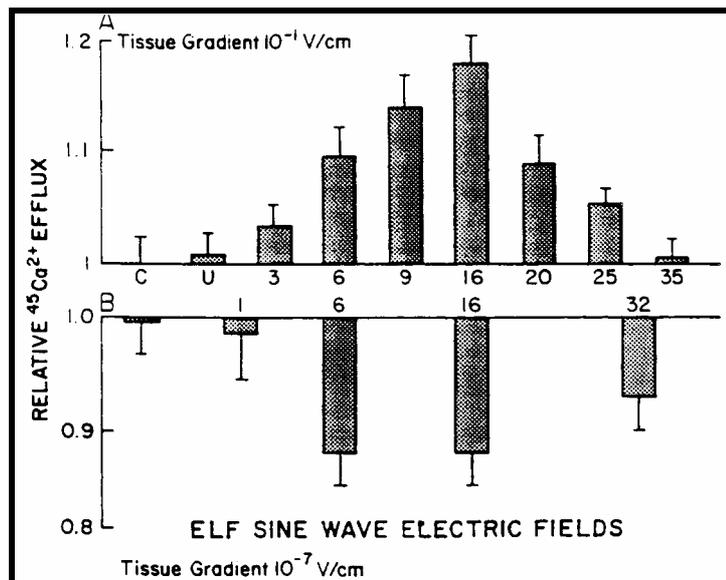

Figure 2: Relative  $\text{Ca}^{2+}$  efflux from an ELF modulated 147 MHz signal and (B) influx from the same external field strength (56V/m) but solely an ELF field, Adey (1988).

Figure 2 also indicated the strength of the induced fields in the tissue which for the RF field is 0.1V/m, a million times higher than the ELF field,  $10^{-7}$ V/m. This I call the “EMR Spectrum Principle” because it is well-established that the higher the carrier frequency the higher the induced tissue electric gradient and induced tissue current strength. This means that biological and health effects of RF/MW exposures will be found to be much higher from much lower intensities than from ELF fields.

Dr Adey was basing his insights on a fascination with discovering how neurological tissue operated and how it was altered in extremely low level RF/MW and ELF fields. The current world leader in  $\text{Ca}^{2+}$  efflux research is Dr Carl Blackman of the U.S.E.P.A. Blackman has replicated and significantly extended the studies carried out by Dr Adey's group and other groups. Dr Blackman has produced over 20 peer-reviewed publications in this area, including several major reviews.

Blackman et al. (1989) identified multiple power density windows for  $\text{Ca}^{2+}$  efflux, using a 50 MHz carrier modulated at 16 Hz. Their results, using units of  $\text{mW}/\text{cm}^2$ , are summarized as follows:

No change	0.75	2.30	4.50	5.85	7.08		8.19	8.66	10.6	14.7
Enhanced efflux		1.75	3.85	5.57	6.82	7.65	7.77		8.82	

The intensity window data was considered as an example of non-linear dynamics because there appears to be no progressive decline in the magnitude of the effects at low exposure intensities. This data is consistent with a fractal process with a non-integer dimension which is approximately 1.4, Blackman et al. (1989).

The lowest published RF intensity that has been documented to produce significant  $\text{Ca}^{2+}$  efflux is 0.00015 W/kg from Schwartz et al. (1990). They used frog hearts, exposed for 30 mins, to a 16Hz modulated 240 MHz RF signal. This has an exposure intensity of about  $0.4\mu\text{W}/\text{cm}^2$ .

Hearts use natural electric pulses to produce heart-beats. An electric pulse produces a cascade of calcium ions that cause the heart muscle to contract. The Electrocardiogram (ECG) is used to monitor heart activity and can detect heart disease through the altered electrical signals. Hence it is biologically plausible that electric signals, that are shown to interfere with artificial pacemakers, can also interfere with the natural heart-beat. This has been shown in several studies in relation to reduction of the heart rate variability (HRV). This is a known risk factor for heart disease.

Another important biophysics principal is the resonance interaction process. When an external frequency matches a natural internal frequency there is a very strong interaction from the process of resonance.

With the modern widespread use of mobile phones which expose the user's ear to much higher intensities of microwaves than radar repair workers usually receive, there is a real concern that the use of the phones and the close relation of cell site base stations near homes, cause possible or actual health effects. This review report has established that electromagnetic fields and radiation are plausibly changing non-thermal biological effects, and that resonant interactions are plausible because of the natural frequencies of the electromagnetic fields in the body. Therefore the evidence

is that natural global electromagnetic fields are associated with cardiac health effects. When the evidence of cardiac effects in electrical and electronic workers is considered, along with the evidence from radio frequency and microwave exposures for workers and military personnel, then it is found in epidemiological studies that they will also have elevated cardiac disease and mortality rates.

This review will include health effects found in physiotherapists whose work involved exposures to short waves and microwaves used for diathermy of patients.

### **Cardiac Associations with the Schumann Resonance Signal:**

Cherry (2002) shows that the Schumann Resonance (SR) signal is the highly plausible biophysics mechanism, using the melatonin mechanism, for explaining how Solar and Geomagnetic Activity (S/GMA) causes serious human health effects in homeostatic relationship to the Schumann Resonance signal intensity including cancer, cardiac, reproductive and neurological diseases and mortality. The cardiac effects are summarized below.

#### **S-GMA related Cardiac effects:**

A 35-year old cardiologist, with a family history of hypertension and stroke, used an electronic blood pressure monitor to record his blood pressure every 15 minutes for 3 years. This revealed a significant periodicity of 27.7 days in systolic and diastolic blood pressure and heart rate, which was coherent with the GMA Kp-index, Watanabe et al. (1994).

An Italian study of 447 patients with hypertension also found very significant correlations between systolic and diastolic blood pressure and GMA indices over a 5-year period, Ghione et al. (1998). A multiple correlation with potential confounding factors, such as age and date, confirmed the significant correlation with GMA. Stratifying the days into quiet, disturbed and highly disturbed GMA days consistently showed significantly higher values in the highly disturbed days for all blood pressure parameters, except for systolic night-time pressure. The difference between quiet and highly disturbed GMA days was 6 to 8 mm for the 24 hour systolic and diastolic blood pressure. The GMA indices and the blood pressure measurements contain the 27-day period. The authors concluded that these results seem to reflect a real relation between geomagnetic disturbances and blood pressure.

The solar rotation cycle is just below 28 days and it produces the same frequency in the Schumann Resonance signal, Figure 3(a), with sub-harmonic period peaks at, 28, 14, 11, 9, 7 and 3.5 days. The daily admission of patients to the Christchurch, New Zealand hospital for arrhythmic cardiac symptoms has its frequency shown in Figure 3(b) with periods of 28, 14, 9, 7, 5.6, 4.6, 3.5, 2.8 and 1.8 days. This shows a very strong relationship between the Schumann Resonance signal and the loss of synchronization of their heart's rhythm modulated by the solar 27/28 day cycle.

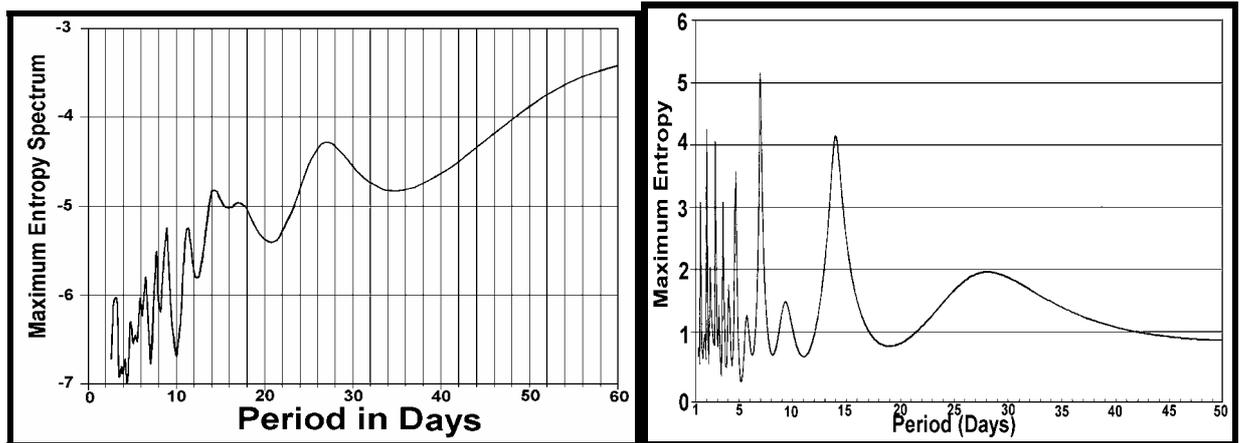

Figure 3: Maximum Entropy Spectrum of (a) The Schumann Resonance Intensity, 1997-99 (left) and (b) for the Cardiac Arrhythmia admissions to Christchurch Hospital, 1997-99 (right).

Because Melatonin is a natural highly potent antioxidant, reduced Melatonin enhances cell death. Geomagnetic activity is associated with reduced Melatonin in more than 6 published studies. Therefore it is plausible that reduced Melatonin, associated with solar and GMA, can be associated with increased rates of heart attacks. Geomagnetic Activity is also correlated with blood pressure changes in at least two independent studies. Hence a correlation with hypertension mortality was investigated and found, Table 1.

**Table 1: Correlation parameters of cardiac mortality in Thailand and Sunspot Number, The gradient is the number of Cases per 100,000 people /100 sunspots, Cherry (2003).**

Disease	Correlation Coefficient	t-value	p-value	Gradient
Hypertension (Male)	0.8497	6.2422	0.000012	0.7438
Hypertension (Female)	0.6653	3.4516	0.00329	0.5718

These correlations with Hypertension show some of the highest t-values and significance, confirming the sensitivity of the heart to altered electrical activity, the Schumann Resonance signal and reduced Melatonin.

Because the Schumann Resonance signal is extremely highly correlated with the sunspot number, Cherry (2002), I have produced graphs of the annual Hypertension mortality in Thailand with the annual sunspot number, Figure 4.

Two independent studies, Watanabe et al. (1994) and Ghione et al. (1998), show that human blood pressure is significantly correlated with GMA and a study shows that arrhythmic heart disease is correlated with acute variations in SR signal and another study produced here for the annual hypertension mortality is highly related to the SR signals and sunspot numbers.

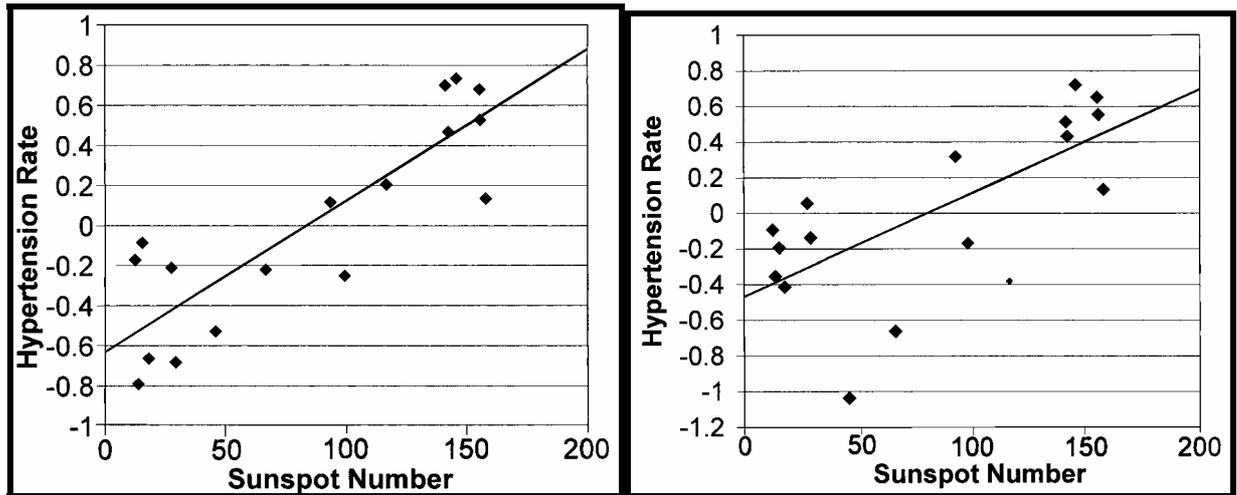

Figure 4: Annual Hypertension Mortality in Thailand related to the sunspot number as an indicator of the annual Schumann Resonance signal strength, Males (left) trend  $p=0.00012$  and Females (right) trend  $p=0.0033$ .

### Schumann Resonance-S/GMA melatonin reduction links:

Melatonin is a diurnal blood pressure regulator. S-GMA, through the Schumann Resonance signal, modulates human melatonin level, therefore these studies confirm that blood pressure change is a melatonin-related biological effect of S-GMA. Hence it is biologically plausible that extreme levels of S-GMA will cause a wide range of cardiac health effects and death.

Burch et al. (1999b) found that the strongest factor reducing melatonin in electrical workers, in addition to their occupational ELF and 3-phase exposures and cell phone usage, was the Geomagnetic Activity, in a dose-response manner, Figure 5. The Schumann Resonance signal, has a mean field strength of  $0.1\text{pW}/\text{cm}^2$  with a mean magnetic field strength about  $1\text{-}3\text{pT}$ .

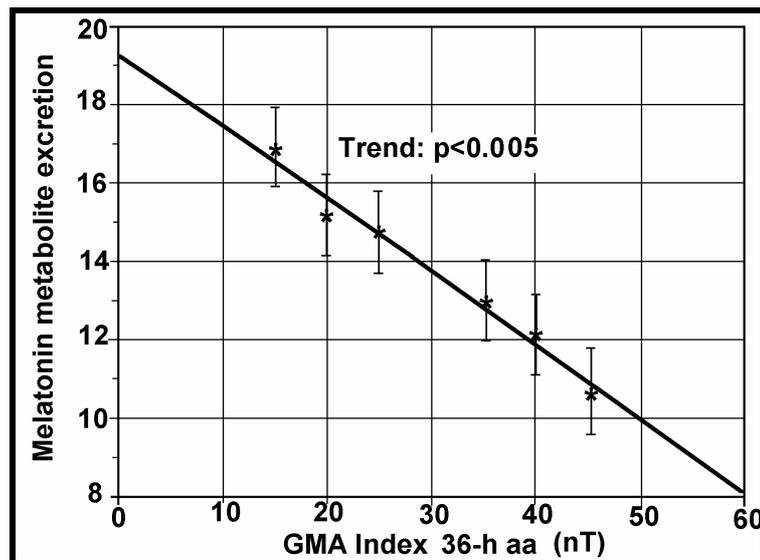

Figure 5: Reduction in the melatonin metabolite 6-OHMS in  $\mu\text{g}$  in urine from U.S. electric utility workers, as a function of the 36 hr global GMA aa-index, Burch et al. (1999).

Burch et al. (1999) showed a probable causal link between the Schumann Resonance signal and reduced melatonin, Cherry (2002). In addition there is Weydahl et al. (2001) and Rapoport et al. (1997, 1998, 2001). Bardasano et al. (1989) observed an extremely significant reduction ( $p < 0.001$ ) in synaptic ribbons of pinealocytes of rats during geomagnetic storms compared with quiet solar days. Thyroxine levels in a single limbic epileptic patient were highly correlated ( $r = 0.66$ ) in a dose-response manner, with daily GMA, O'Connor and Persinger (1996). The strongest association ( $r = 0.76$ ) was found between thyroxine levels and the Kp index during the previous night (2 am to 5 am). These analyses were carried out specifically to test the GMA Melatonin mechanism and they support it.

This is strong enough evidence to conclude that there is a causal link between reduced melatonin in people and animals and Solar/Geomagnetic Activity through the Schumann Resonance mechanism.

Reduced melatonin produces arrhythmic cardiac activity. The cardiac activity of rabbits was monitored during two GMA storms, Chibisov et al. (1995). At the initial and main phase of the storm the normal circadian structure of the cardiovascular parameter was lost. Desynchronization grew during the storm, leading to an abrupt drop of cardiac activity during the main phase of the storm. This was followed by the destruction and degradation of cardiomyocytes. The parameters of cardiac activity became significantly synchronized and the circadian rhythm restored during the storm's recovery period.

Human patients with ischemic heart disease (47-men and 33-women) were monitored for cardiac parameters daily over for 2-3 weeks, Gurfinkel et al. (1995). Changes in their microcirculations were related to GMA and to changes of atmospheric pressure. In the first day of a GMA storm pathological changes of capillary flow were detected in 71.5% of patients with acute myocardial infarction (men: 73.7%, women: 69.2%). They also observed perivascular edema, red blood aggregation, delay and slowing down of capillary flow. Similar changes were detected in 64.8% of patients with angina pectoris, (men: 73.3%, women: 56.3%). The reactions of these patients to GMA disturbances were over 2.5-times higher than the effects of atmospheric pressure changes.

GMA events are significantly correlated with increased blood coagulation and platelet aggregation, Pikin, Gurfinkel and Oraevskii (1998). Blood pressure, capillary flow, blood coagulation and aggregation changes are observed during GMA events, consistent with the effect expected with reduced melatonin in people with heart disease. Therefore, it is reasonably predicted that GMA will be associated with observable changes in cardiac disease and death when large human populations are studied.

Agadzhanian and Makarova (2001) studied changes in a number of respiration and circulation parameters during magnetic storms of varying intensities. The results were analyzed in 126 normal humans belonging to two age groups: 19-21 yr. old young men and women (29 of each) and 51-53 yr. old men ( $n = 36$ ) and women ( $n = 32$ ). Geomagnetic components D, H and Z were used. Systolic pressure, respiration volume, minute respiration volume and peak expiration rate were shown to be the most labile characteristics of the cardio-respiratory system responding by increases on magneto-disturbed days. The parameters under study exhibited sexual and age differences equally on quiescent and magneto-disturbed days. Adaptation to growing tension of the

magnetic field of Earth involves the neuroendocrine system and manifests itself by activation of the sympathetic nervous system entailing relative shifts in the cardio-respiratory parameters under study.

### **GMA Related Human Cardiac Disease and Death:**

Early correlations between S-GMA and heart attacks were assumed by some authors to be spurious, inaccurate and inconsistent, Malin and Srivastava (1979, 1980) and Knox et al. (1979). Results found in India were not confirmed in populations in the U.S. These were seen as inconsistent. The lack of a plausible mechanism also made these results not credible to some researchers. The masking of the natural signals effects by artificial EMR exposures in developed countries is a plausible explanation of the results. In the 1990's many other studies identified relationships that are highly significant and consistent with the original results.

With clinical measurement being able to identify highly significant changes in blood pressure, blood flow, aggregation and coagulation during GMA events, these results are highly plausible. They are mediated by melatonin in the normal diurnal and seasonal cycles. Since melatonin is also significantly correlated with levels of GMA during solar storms this will also have cardiac effects. Reduced melatonin is associated with cardiac arrhythmia and heart rate variability in clinical studies cited above.

De Bruyne et al. (1999) studied older heart patients (>55 years) and compared their heart rate variability (HRV) with their increased risk of mortality from myocardial infarction. They found that both decreased and increased HRV were significant risk factors, with increased HRV being the greater risk factor. This shows a timing related homeostatic relationship and GMA events are related to desynchronization of cardiac rhythms. Measured HRV also demonstrates anomalies in myocardial infarction, sudden death, heart failure, autonomic neuropathy and hypertension, Kerut, McKinnie and Giles (1999).

The EEG pattern, pulse rate, blood pressure and rate of sensomotor reaction were measured in a group of people. The parameters significantly correlated these physiological variables with the Kp-index, Doronin et al. (1998). They noted that the oscillations in the Kp-index had identical periods in the monitored EEG Alpha-Rhythm. This confirms the whole-body changes that occur in conjunction with GMA alteration by changing the brain and heart patterns. This supports the Model that suggests that the brain wave pattern is changed, involving alteration of ELF brain signals, and this is transferred through melatonin receptors and the autonomic nervous system to the cardiovascular system.

### **Cardiac Effects of High GMA:**

During periods of Active Sun and increased GMA the following statistically significant effects have been observed:

- Cardiac Arrhythmia in children, Markarov (1998).

- Novikova and Ryvkin (1977) observed a consistent and significant increase in heart attack incidence and death between active and quiet GMA conditions for 1961-66 at Sverdlovsk, USSR.
- GMA is highly correlated with daily myocardial infarction incidence rates during big GMA storms, Villaresi et. al. (1998).
- GMA activity is also correlated with sudden cardiovascular death, Sitar (1990), and Ischaemic Heart Disease mortality, Otto et al. (1982).
- Monthly solar activity was highly significantly correlated with monthly hospital admissions for cardiovascular disease, Stoupel and Shimshoni (1991). Solar activity is highly correlated with GMA and SR intensity.
- Stoupel et al. (1997) observed that during periods of low solar and geomagnetic activity, solar proton fluxes were correlated with cardiovascular deaths.
- Oraevskii et al. (1998a) found that 75 % of GMA storms caused an increased of the hospitalization of patients with myocardial infarction by 30 to 80%.
- Oraevskii et al. (1998b) report that MIR space orbital station staff experienced a significantly increased heart rate, reduced heart rate variability and decreased respiratory waves, corresponding with a specific adaptation of stress-reaction. At the same time hospital patients with ischemic heart disease had a similar reaction including deterioration of the physiological status, rheologic blood characteristics and heart rate disturbances, associated with GMA disturbances.
- Breus et al. (1998) report disturbance of cardiovascular activity among MIR astronauts during the main phase of solar storms compared to the recovery phase. Similar effects were observed in rabbits.

### **Cardiac Effects of Low GMA;**

Periods of Quiet Sun activity are significantly associated with:

- Stoupel et al. (1990) found a highly significant correlation ( $p=0.01$ ) for higher pregnancy induced hypertension for monthly periods of low GMA.
- Sudden death from cardiac arrhythmia, especially paroxymal atrial fibrillation, and stroke, Stoupel (1993) and Stoupel et al. (1995a). Stoupel, Martfel and Rotenberg (1994). Stoupel, Martfel and Rotenberg conclude that their results are consistent with previous studies showing increased heart electrical instability during periods of lowest geomagnetic activity.
- Ischaemic Heart Disease for ages >70 years. Stoupel et al. (1995b).
- Stoupel et al. (1999) found a very highly significant inverse correlation ( $r= -0.64$ ,  $p=0.0001$ ) for a 72 month period between solar activity and stroke/ischemic heart

disease death. They concluded that monthly ratio of deaths from stroke/ischemic heart disease is related to environmental physical activity.

### **Conclusions about Cardiac relationship to the Schumann Resonance Signal:**

The cardiac studies are consistent with the Schumann Resonance Hypothesis and add considerable weight to the melatonin, homeostatic and arrhythmic factors in the Hypothesis, Cherry (2002). Blood pressure, blood coagulation, heart attack, cardiac arrhythmia and sudden cardiac death are highly correlated with GMA in a homeostatic (U shaped) manner. This data is consistent with the involvement of melatonin. Being directly supported by clinical cardiovascular monitored changes of blood pressure, capillary flow and blood aggregation, multiple studies have very highly significant correlations with solar activity and GMA. This gives robust evidence supporting a causal relationship between GMA and Ischemic and arrhythmic cardiovascular disease, heart attack and death. The highly significant correlation between S-GMA and the SR signal intensity gives robust support for the SR Hypothesis through a Melatonin Mechanism.

Given the causal link to Cardiac Health and Mortality effect to the Schumann Resonance signal with a mean intensity near  $0.1\text{pW/cm}^2$  and magnetic field strength of about 1-3pT, it is extremely plausible that electrical workers chronically exposed to ELF fields about a million times higher (1-3 $\mu\text{T}$ ) electromagnetic fields will experience serious heart disease elevated rates. It is also extremely plausible that people living in vicinity to cell sites and high powered radio and TV towers, airport radars etc, with field strengths typically around 0.1 to 5 $\mu\text{W/cm}^2$ , 1 million to 50 million times higher than the SR signal, will experience significantly elevated cardiac health and mortality rates.

### **ELF Occupational Cardiac Studies:**

Satre, Cook and Graham (1998) observed significantly reduced heart rate variability (HRV) in volunteers sleeping in 60Hz fields. Reduced HRV is known to be an indication of heart disease risk.

This is a powerful set of epidemiological evidence showing that EMR across the spectrum increases the incidence and mortality from arrhythmia related heart disease and from heart attack. For the total cumulative exposure the rate of rise per year for Arrhythmic Heart mortality was  $\text{RR}/\mu\text{T-year} = 1.08$ , 96%CI: 1.03-1.12 and for Acute Myocardial Infarction,  $\text{RR}/\mu\text{T-year} = 1.04$ , 95%CI: 1.03-1.06. The following graph shows the dose-response curve for Acute Myocardial Infarction (Heart Attack) in electric utility workers, Savitz et al. (1999), Figure 6.

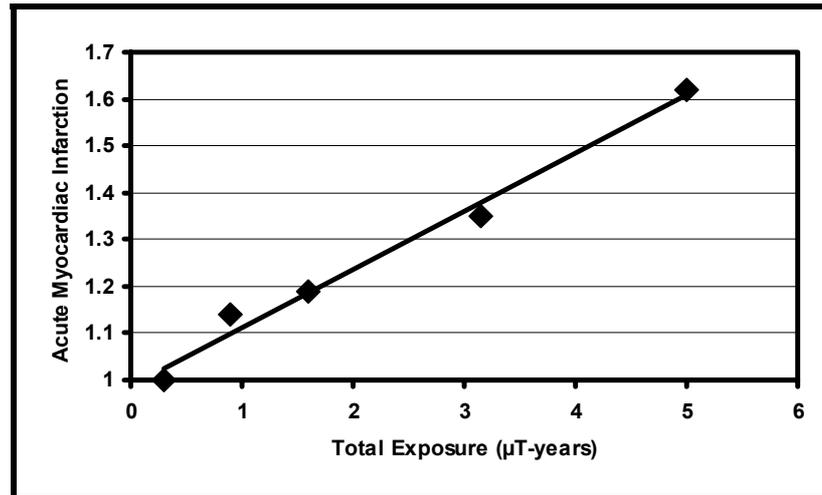

Figure 6: Acute Myocardial Infarction as a function of cumulative exposure to 60 Hz fields in U.S. electricity utility workers, Savitz et al. (1999), trend  $p < 0.001$ .

Savitz et al. (1999) shows crude dose-responses for Cardiac Arrhythmia related heart disease, Figure 7, and a highly significant dose-response for Heart Attack, Figure 6, for exposed electrical occupations and for individual occupations of electrician, lineman and power plant operator.

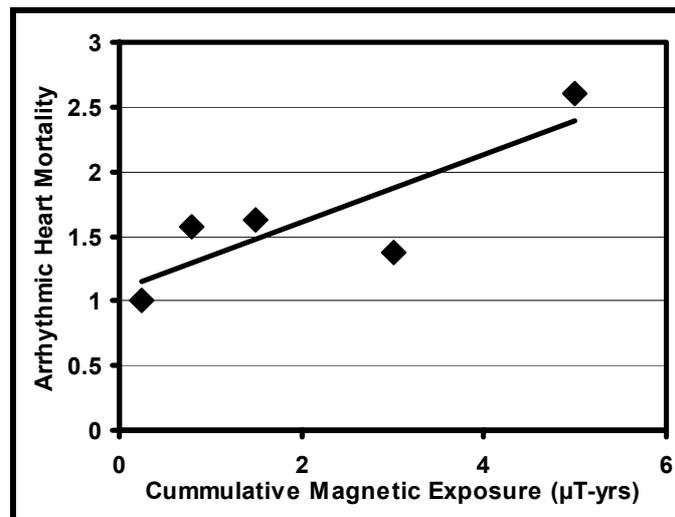

Figure 7: Arrhythmic heart disease mortality as a function of cumulative exposure to 60 Hz fields, with 5-year lag, in U.S. electricity utility workers, Savitz et al. (1999), trend  $p = 0.07$ .

### RF/MW Association with Heart Disease:

Extrinsic EMR signals interfere with hearts and cause heart disease and death. Bortkiewicz et al. (1995, 1996, 1997) and Szmigielski et al. (1998) found that RF exposure altered heart rate variability and blood pressure. Forman et al. (1982) present case studies of microwave exposed personnel with induced hypertension. Braune et al. (1998) showed that cell phone use significantly increased blood pressure.

The United States Embassy in Moscow was chronically exposed for over 10 years to a deliberately directed Soviet radar. The US State Department, after staff expressed concerns, got Professor Abraham Lillian of John Hopkins University to carry out a survey of staff health effects. Two reference groups were used. The general US public and comparison Eastern European Embassy staff and families. With years of tour service a number of illness rates rose significantly. In relation to the heart, the Vascular illness showed the strongest trends, Figure 7. The mean personal exposure was somewhat less than  $0.1\mu\text{W}/\text{cm}^2$ .

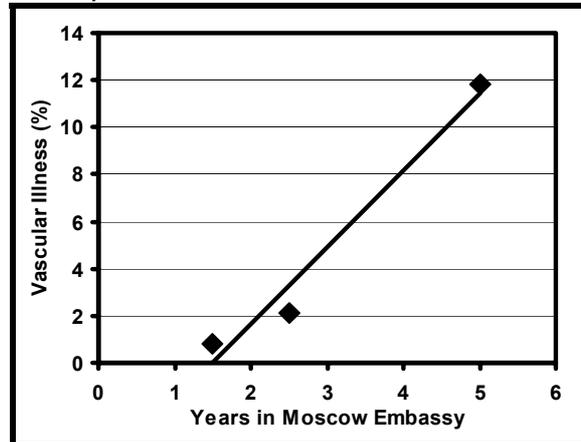

Figure 7: Vascular illness rate (%) in male staff at the United States Embassy in Moscow, for years of service while the Embassy was exposed to a very low intensity of a Soviet radar signal, Table 6.18, Lilienfeld et al. (1968). Trend  $p=0.004$ .

Seven young children of the embassy staff developed blood disorders during the first tour of duty. When compared with other US European Eastern Embassies the rate was over four times higher in the Moscow US Embassy,  $RR = 4.05$ .

The Korean War radar study, Robinette et al. (1980), assessed the relative greater radar pulse microwave exposure of U.S. Navy personnel in occupational groups of repairers versus users of the radar. Two higher exposed groups were AT and FT and a lower exposed group was ET. Comparing the cardiac mortality rate for "Diseases of the Circulatory System" in the FT+AT group compared with the ET group yields,  $RR = 1.27$ , 95%CI: 0.92-1.75,  $n=64$ . For hospital admissions, the diseases of blood forming organs yielded  $RR= 4.33$ , 95%CI: 1.53-12.3,  $p=0.001$ , and for the Circulatory system  $RR = 1.53$ , 95%CI: 1.07-2.18,  $p=0.007$ , and for Cardiovascular disease,  $RR = 2.03$ , 95%CI: 1.34-3.07,  $p<0.001$ .

These military occupational groups exposed to radar have elevated cardiac mortality and highly significantly elevated cardiac disease rates.

Hamburger, Logue and Silverman (1983) observed significant dose-responses for heart disease for male physiotherapists as a function of treatments per month with microwaves,  $OR = 2.51$  (1.09-5.78), Trend  $p<0.05$ ); shortwave,  $OR = 3.40$  (1.56-7.39), trend  $p=0.005$ ; and Combined Microwave and Shortwave,  $OR = 2.88$  (1.21-6.70), trend  $p=0.025$ .

Dose-responses and consistent and significant elevation of disease rates and mortality gives evidence of a causal relationship. Therefore a causal relationship between

radiofrequency and microwaves exposure and cardiac illness in this assessment, is causally related. This is strongly confirmed by the natural electromagnetic radiation, SR signal  $0.1\text{pW}/\text{cm}^2$ , causal link to cardiac illness and death rates. This strongly indicates that cellphone use is likely to be a major risk of Cardiac Disease because of the extremely high levels of microwave exposure from cell phone is produced for the phone users. The Moscow Embassy data also indicates that the passive cellphone exposure is very likely to enhances the risk factors are cardiac illness. This is confirmed by an Austrian study around cell sites presented at the Ischia Congress in October 2001. The study is being carried out by Prof Michael Kundi, of the University of Vienna, and shows a dose-response rate of cardiac diseases from cell site's exposures.

### **Cell Phone Radiation Cardiac Activity:**

Cardiac pacemaker interference:

- Barbaro et al. (1996); showed interference, skipped three beats.
- Hofgartner et al. (1996); significant interference,  $p < 0.05$ ,
- Chen et al. (1996); extremely highly significant interference,  $p = 0.0003$ ,

Blood Pressure increase:

- Braune et al. (1998), Cellphone usage significantly increases blood pressure.

Quite often the cellphone companies fund research to challenge the independent results studies showing adverse effects linked to exposure to cell phone radiation. However, the SR signal, over a billion times weaker than the cell phone signal exposes of the user, show a significant blood pressure alteration in people and causes cardiac disease and death. Therefore it is logical and scientifically reasonable that cell sites exposures and cell phone usage will alter the blood pressure and increase the rate of cardiac diseases and mortality.

### **Conclusions and Recommendations:**

The brain and the heart are very sensitive electromagnetically controlled organs. They work together to maintain a regulated and activity responsive circulation system to provide fluid, energy and oxygen throughout the body. Both of these organs are synchronized by the natural Schumann resonance signal. When solar energy and Geomagnetic Activity alters the Schumann Resonance signal, then neurological and

cardiac functions in human populations are modulated. Because people are sensitive and reactive to this extremely subtle signal, it is not surprising that electrical workers and radar and radio exposed workers have significant and dose-response increases in cardiac disease and death rates. It is therefore strongly scientifically plausible, and confirmed by an Austrian study, that people living in the vicinity of cell sites experienced a dose-response of increase in cardiac illness. This shows that cell phone usage and passive cell phone exposure will not only interfere with electronic cardiac pacemakers but will also interfere with the natural cardiac pacemaker, the human heart. Therefore cellphone usage and the cellphone system is enhancing the cardiac illness and mortality rate in the community.

Santini et al. (2002) show that living in the vicinity of cell site exposure produces elevated neurological effects, many of which are shown in a dose-response manner. Another symptom also shown is a significantly calibrated as cardiovascular problems. A similar study in Austria, carried out by Professor Michael Kundi, found a significant dose- response relationship between cardiac disease and cell site exposure.

This provides strong support and motivation for promoting and using much safer cellular telephone technologies and sighting strategies, and accelerating the move to place radio and TV signals in fiber-optic cables to remove the genotoxic and cardiac damaging radiation and signals from the air in which people are living.

## Smart Meters: The Winter Solstice Tsunami of 2012

By Patricia Burke

Published: November 24, 2012

During the summer of 2012, I housesat in Medfield, MA, a suburb of Boston. After a short time, I began feeling an in-rush of disruptive energy blanketing the neighborhood, inside the house and out, approximately every other hour, every day and night. I have felt this phenomenon before, on the West coast as well as the East, and because of it I have moved fourteen times in four years, without success.

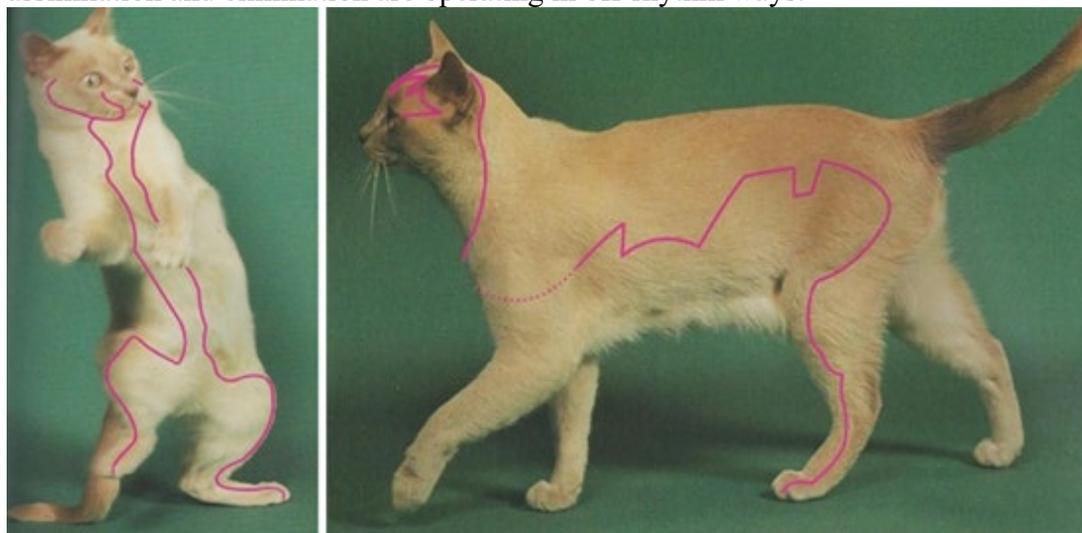

Asia with no hair on ears. (Photo by Janis Luedke)

The young cat I cared for was struggling during the summer. Now Asia is biting herself and tearing at her skin and fur with her teeth, scratching deeply enough to draw blood. She has ripped off most of her whiskers and the

hair on her ears, which are antennas for a cat.

The cat attacks herself along her Stomach and Gall Bladder meridian pathways. These are two of the twelve primary electromagnetic pathways in the human as well as the feline energy field. Because both the gallbladder and the stomach are hollow organs, they can perform bodyguard-like roles by speeding up their function to discharge dangerous energies. I know that the environment is causing my body to react, but the cat only feels the painful burning along her meridian lines, and she is instinctively lashing out at them. Like me, she also experiences urgent thirst whenever the invasive in-rush occurs. This is because our electrical systems are under siege.

Many individuals who experience symptoms attributed to stress or fatigue are using stimulants, sedatives and pain relievers that mask symptoms. Asia and I have reached the point where multiple energy systems are now involved and several organs are in a simultaneous state of overcharge and exhaustion. Our biorhythms are no longer synchronized by the sun because the energies have been diverted to defend our lives, and all aspects of digestion, assimilation and elimination are operating in off-rhythm ways.

(left) Stomach Meridian in Cat (right) Gall Bladder Meridian in Cat. Photos from Four Paws Five Directions, A Guide to Chinese Medicine for Cats and Dogs by Cheryl Schwartz, DVM. Repinted by permission.

We are each in a degenerative tailspin.

The cat lives in a neighborhood surrounded by 8 towers and 85 antennas in a four-mile radius.<sup>1</sup> Inside the home are cordless phones, cell phones and Wi-Fi each emitting different frequencies.<sup>2</sup>

What has most likely driven the cat and increasing numbers of humans to the breaking point is the new juxtaposition of pulsed microwave radiation generated by the deployment of the smart meter grid across the United States. Very few ratepayers are aware of the complexity of this new technology, and the resulting security, safety, and health hazards. Activists in communities worldwide are attempting to raise awareness, because they perceive correctly that humanity is at the eleventh hour.

Each autumn seems to be a vulnerable time for Asia, but this year the magnitude of her suffering raises the question of her quality of life. She has retreated to the downstairs bathroom, sleeping in the sink and eating, drinking and eliminating within two confined rooms at the mid-point of radiation from the antenna-laden water tower up the hill from the house and the pulsing electric meter on the other side.

Although her health was faltering when I saw her in August, by October she bears the same look I saw in college videos of animal experimentation, when electric shocks were administered randomly and the animal had no control over its experience. Bruno Bettelheim and others have written about how this technique broke the spirit of prisoners in Nazi Germany.<sup>3</sup>

Despite her constant licking and meticulous hygiene, she does not smell like a cat, and I do not smell like a human either. Asia now looks a prisoner of war who has been subjected to torture. She gazes out into space, not making eye contact, on alert and overcharge but also hopeless and exhausted.

She is 6 years old. I suspect that she will not be here in February to greet the Chinese New Year celebration of the Year of the Water Snake. She is an empty shell, and, like me, she knows that the tsunami of 2012 has already arrived.

### **Canaries in the Coal Mine, Pets and the Electromagnetic Fields**

American pets may be following the same failed trajectory as the first electrically disabled individuals in Sweden. In 1984, The Swedish Association for the ElectroHyperSensitive (FEB) was founded for individuals afflicted by electromagnetic frequencies. The presenting symptoms at the time were skin rashes and flu-like conditions in computer users. Before “electromagnetic hypersensitivity” was recognized as a disability by the Swedish government, patients were referred to dermatologists, with no recognition of the underlying cause and treated symptomatically. Pets are being heavily medicated at great expense to their owners, often with limited success. They are subjected to extensive allergy testing, antibiotics and steroid regimens.

This is occurring because the cat, rather than the cat's environment, is the focus of inquiry.

The life expectancy of family pets has nearly halved and cancer rates have nearly doubled, according to the educational video Dr. Do More, produced by Dr. Margo Roman of MASH, Main Street Animal Services of Hopkinton, MA.<sup>4</sup> Holistic veterinarians are raising concern about vaccination schedules and the unnatural diet of cheap grain products. But household pets are experiencing the same soup of artificial electromagnetic frequencies as their owners, and stress disorders, fertility issues and glandular problems are skyrocketing.

As Dr. Dietrich Klinghardt states in film footage from the up-coming documentary “[Take Back Your Power](#),” there is one overriding factor that corresponds to rising autism rates, which are doubling every 5 years, and human illnesses in every neurological category, including Parkinson's, MS, ALS, and learning and behavioral difficulties.<sup>5</sup>

Most likely, that factor is also the cause of the cat's decline. The cause is exposure to electromagnetic fields, especially in the high frequency range.

### **EMF Education by Fire**

Like the cat resting her inflamed belly in the coolness of the sink, I moved to California in 2008 in search of safe refuge, in rapidly declining health. Instead of escaping radiation from the church tower near my New England apartment, I ran headlong into the installation of the smart meter grid in northern California.

The smart meter grid is a complex microwave computer-networked electric grid that can remotely track, as well as control, energy consumption. In the United States, bursts of pulsed microwave radiation are being transmitted in the 902-928 MHz range. Wireless gas and water meters are also pulsing data, but in the 450- 470 range using one-way transmitters.

Although smart grids are being implemented worldwide, not all nations are using wireless systems. And each nation has different philosophies for human exposure limits to radiofrequency electromagnetic fields. While more safety-conscious nations have adopted cautionary stances, the United States, Canada, Japan, and parts of western Europe assert that unless tissue is actually heated, there are no biological effects. Over 5,000 research studies, (available on-line at [JustProveIt.net](#)) indicate that biological damage is occurring below the thermal threshold, and that this assumption is wrong.

### Microwave Radiation Limits

Country	Power Density expressed in microwatts/cm <sup>2</sup>

### **Building Biology, Treating the Whole Patient, and Not Just Chasing Symptoms**

Skilled holistic practitioners on the west coast recognized EHS in 2008, and evaluated the patient's environment as well as the patient. My acupuncturist lent to me his tri-field meter, and his colleague, my chiropractor, came to my house to help assess the EMF burden. A holistic dentist was also part of the collaborative effort because persistent pain in one tooth was one of many symptoms. Although removal of amalgam fillings had improved my health, one remaining metallic post was a working radio antenna.

I met three women whose lives are severely diminished by technology. Norma had a tooth that would not heal, and described the massive nosebleed, head rush and shakes she experienced when her husband installed Wii one Christmas morning. Barb had flown on an airplane with Wi-Fi, deplaned with knee pain, and had an MRI, then a shock to the head while using her phone. She lost her ability to digest and assimilate food, and could only sit in one room in her home. Louise had also undergone recent dental work that left her in ongoing pain. She, too, had experienced a shock to the head while speaking on her phone.

Louise and I both had the characteristic ruddy hue that is mistaken for a healthy tan, but actually indicates that our copper levels are elevated due to the inflammatory response, and our cortisol defenses and blood pressure are skyrocketing. We could no longer use computers, we used speakerphones on corded landlines from the other side of the room, and we had to avoid cellphone towers. EHS diminished every aspect of our lives.

We each had different yang organs overworking to discharge incompatible frequencies in different configurations. Like Asia the cat, we were each already simultaneously overcharged and exhausted according to our inborn constitution, prior to the installation of the new electric grid.

The dominant health care paradigm does not recognize differing organ resiliencies, nor does the dominant health care paradigm recognize EHS, and most western health care offices are among the most inhospitable environments for EHS. The Department of Justice's Americans with Disabilities Act began questioning how EHS sufferers will be accommodated in public buildings in 1999. In "Recognition of the Electromagnetic Sensitivity as a Disability Under the ADA" Dafna Tachover wrote, "For people who are electromagnetically sensitive, the presence of cell phones and towers, portable telephones, computers, fluorescent lighting, unshielded transformers and wiring, battery re-chargers, wireless devices, security and scanning equipment, microwave ovens, electric ranges and numerous other electrical appliances can make a building inaccessible."<sup>6</sup> Common diagnostic techniques such as dental x-rays and MRIs are triggers for EHS individuals.

Many affected patients gravitate to small independent alternative health care modalities with practitioners who are sensitized to their needs. For 2 years, I was spending all of my time and money on healthcare. Through my acupuncturist, I underwent heavy metal detoxification, as do many EHS patients. Extensive allergy testing revealed a clear pattern. I was allergic to whatever I had eaten the day before. My brain, like Asia's, was constantly calling for fuel and rehydration but my digestive tract was working overtime to divert incompatible manmade frequencies, resulting in poor digestion, mal-absorption, and inflammatory response.

Like many individuals in CA who were already in deteriorating health prior to the installation of the new meters, I was turning the power off in the house and sleeping outside in a tent. Then I crashed completely, coinciding with the installation of the new electric meter.

New England Homeowners Are Already Hooked Up To the Grid and Don't Even Know It

Returning to New England in 2010, I rented a home in a coastal community in the off-season, and gradually regained strength, walking along the ocean shore and shunning radiation. However, despite my efforts to avoid all Wi-Fi, cellphone towers, and cellphone users, I did not know that the electric meter on my North Shore rental house, manufactured in 2003, already had a radio transmitter in it. Over the years, homeowners in the northeast perceived that the new meters were being installed so that the meter reader would not need to walk up to the house. Readings could be taken from a truck in the neighborhood. Environmental groups have erroneously embraced the concept of the grid, believing that it is an energy saving technology.

What most people do not realize is that a remote network is already being constructed. As the utilities continue to build out the network of transmitters and receivers, they are able to record minute details concerning energy consumption patterns, which they can sell to third party marketers. New software allows the utilities to recognize when electricity is being used and what appliances are in use. The utilities can also remotely control smart-enabled appliances such as heating and air conditioning systems inside the home. These appliances will communicate in the 2.4 GHz range with the smart meter.

Over the winter of 2011, large white out-of-state engineering trucks blanketed the Cape Ann area, and then two trucks spent the day working on the pole outside my rental home. The next morning, I lost all the ground that I had gained in my 9 month healing incubation. Waking to a burning wave across my body as the network went live, my liver, heart and kidneys went into trauma. I called the mayor's office to protest, and was told that they have no jurisdiction over the utility company. Within 48 hours, I had to move out of the house.

Although the smart meter grid is hailed as the next generation of energy efficiency, it is having a life-altering impact on the health of countless individuals. Industry statistics indicate that only 1 in 10 Americans knows that the grid even exists. Some health officials estimate that 35% of the population is already adversely affected by electromagnetic radiation.

## Smart Meter Grid Deployment Map

In California, the grid came apparent when the new microwave radiation transmitting meters were installed on homes and businesses. Individuals who became ill immediately after the meter was installed recognized a cause and effect relationship. On the east coast, most homeowners have no knowledge of the radio transmitters already installed on their homes, schools, and businesses, now being read remotely, using equipment that may also be creating dirty electricity and unhealthy electromagnetic fields.

### Safety at All Costs?

Americans are in the ironic position of being subjected to unprecedented levels of surveillance in order to defend against terrorism, while the combination of technologies being employed to conduct surveillance is causing

unprecedented danger to life itself.

The smart meter grid, like the cellular phone network, is in part a system of surveillance. Detailed information about privacy concerns is available at [TakeBackYourPower.net](http://TakeBackYourPower.net), in an extensive interview with Glen Chase, Professor of Systems Management specializing in Environmental Economics and Statistics, Faculty Alumni USC, Cal State.

Despite prevailing belief systems of environmentalists, the grid is not a green technology.

### **What Is Green About the Smart Meter Grid is Billions of Dollars Fueling the Next Wave of Economic Growth and Investment Return, Paid for by Ratepayers**

Three state attorney generals have ruled that the smart meter deployment should be halted, citing exorbitant costs to consumers with no proven benefits: Illinois AG Lisa Madigan, Connecticut AG George Jepsen, and Michigan AG Bill Schutte.

Illinois AG Lisa Madigan wrote in June 2012, “The utilities have shown no evidence of billions of dollars in benefits to consumers from these new meters, but they have shown they know how to profit. I think the only real question is: How dumb do they think we are?”

Moratoriums are being called on the grid due to

- Cost billing overcharges and reliability – the expense of the grid, which is anticipated at almost \$200 billion dollars worldwide, must be paid for by the ratepayers.
- Health issues – over 5,000 studies are documenting the health hazards associated with electromagnetic fields.
- Interference with other devices, especially deep brain stimulators for Parkinson's patients and pacemakers.
- Privacy spy meters, electronic privacy information centers – consumption patterns can be sold to interested industries such as appliance manufacturers by the for-profit utilities.
- Security – The smart meter grid being aggressively installed despite the fact that the system is not secure.
- Fire hazards – Reports of smart meter fires and explosions and lack of compatibility with ground fault interrupters.<sup>7</sup>

The strategy of providing economic stimulus funding, bypassing pre-market safety testing, passing legislation that limits liability and enforces consumption, and ignoring subsequent health issues has created windfall profits in certain sectors, but it has not resurrected the economy.

Compact fluorescent bulbs exemplify the added risks of both artificial frequencies and mercury vapors. Will Davis identified the practice of using toxic waste in manufacturing in his book *The War on Bugs*. He explains how industrialists in the last 100 years took toxic waste from coke manufacturing and packaged it as insecticide and fertilizer, avoiding disposal fees and reaping massive profits. Dr. Klinghardt explains the interaction between mercury and frequency-emitting CFLs, as well as health hazards resulting from smart meters and cordless phones, in [TakeBackYourPower](http://TakeBackYourPower) film footage. Legislating the use of CFLs is an example of technology-fueled economics over-running human health concerns, masquerading as a green initiative.

Humanity's Challenge: The Winter Solstice of 2012

The United States allocated \$4.5 billion in funding from the American Recovery and Re-investment Act to the Department of Energy to modernize the electric grid. New electric meters are intended to eventually give customers the ability to lower their electricity usage by responding to financial incentives to shift their energy use to off-peak hours. In New England, peak hours scheduled for a higher price structure are from 7:00 am to 11:00 pm; off-peak hours are 11:00 pm to 7:00 am and weekends and holidays.

Citizens will pay projected investment revenues resulting from the smart grid project to for-profit corporations.

Central Maine Power was awarded \$95,858,307, and the total project value is \$191,716,614.8

Analysts anticipate that U.S. “revenues will grow to \$9.6 billion in 2015 due to metering infrastructure, distribution automation, home area networks, and smart utility enterprise”.<sup>9</sup>

The fundamental flaw of the new smart meter grid is that it directs humanity's relationship with power and energy

away from a skillful partnership with the rhythms of nature, to fluctuating price points set by for-profit utilities. By manipulating pricing based on time of use, consumers are being influenced to run their appliances and charge their electric cars in the middle of the night. By spreading the demand for power to non-prime time, consumers are being told that additional power plants will not need to be constructed. Americans are being unwittingly forced to participate in the rapid build out of a power grid based on faulty values of man-over-nature, man-over-time, and man-over-man beliefs. And, the primary targets of this aggression will be women and children, due to their heightened vulnerability to EMF.

This misguided strategy is the culmination of a core denial of the rhythms of exertion and rest and the intelligent relationship between the radiation of the sun, the magnetism of the moon, and Earth's gravitational field. The recovery of a working relationship with these patterns is the only foundation for a true ecological sustainable life.

We are living the closing chapter in a history of de-evolutionary choices, or we have reached the crucial turning point where the light of dawning consciousness turns humanity back sustains all of the electromagnetic frequencies within the human energy field and all of nature in a rhythmic dance.

As the wheel turns from the Year of the Dragon to the Year of the Snake, unknown to most westerners, the Spleen energy field will move into prominence, followed by the Heart. These organ systems cannot tolerate the assault of artificial EMFs that their yang predecessors have been fighting in the last two years.

When tsunamis are created, initially the sea withdraws, exposing only sand for as far as the eye can see. Then the massive tumultuous wave crashes to shore. History will record the energetic tsunami in 2012 in one of two ways. We will unleash the largest wave of destructive technology ever known to mankind, or we will withdraw our energies from the consumer-driven model fueled in part by lack of recognition of the essence of time. Nelson Mandela wrote, "Sometimes it falls upon a generation to be great." To be alive at the turning point of realignment of human endeavor is an opportunity for individuals everywhere to participate in the emergence of the group soul. The time is now. For this new world we pray.

<http://stopsmartmeters.org.uk/www-scribd-comdoc79928679the-who-iarc-listing-of-rfr-as-a-possible-human-carcinogen/>

Email from Dr Robert Baan, the principal author of the 2011 IARC Monograph on the **carcinogenicity of radiofrequency radiation, in which he interprets the 2B classification of RFR as applicable to all form of RFR exposures, including Smart Meters and Wi-Fi:**

*Subject:* **EMF Class 2B Classification**

*Dear Dr Hudson,*

*Thank you for your message, which was forwarded to me, and to which I would like to respond as follows. The IARC Working Group classified “Radiofrequency Electromagnetic Fields” (RF-EMF) as possibly carcinogenic to humans (Group 2B). The information that formed the main basis for this evaluation was found in epidemiological studies on cell-phone use, where a slightly increased risk for glioma (a malignant form of brain cancer) and acoustic neuroma (a non-cancerous type) was reported among heavy users. There were some indications of increased cancer among radar-maintenance workers(occupational exposure), but no reliable data from studies among, e.g., people living close to base-station antennas, radio/TV towers, etc (environmental exposure). Although the key information came from mobile telephone use, the Working Group considered that the three types of exposure entail basically the same type of radiation, and decided to make an overall evaluation on RF-EMF, covering the whole radiofrequency region of the electromagnetic spectrum. In support of this, information from studies with experimental animals showed that effects on cancer incidence and cancer latency were seen with exposures to different frequencies within the RF region. So the classification 2B, possibly carcinogenic, holds for all types of radiation within the radio frequency part of the electromagnetic spectrum, including the radiation emitted by base-station antennas, radio/TV towers, radar, **Wi-Fi, smart meters**, etc. An important point is the radiation level. The exposure from cellular phones (personal exposure) is substantially higher and much more focused (usually on the brain) than exposures from radio/tv towers, antennas, or Wi-Fi. I hope this is useful. Thank you for your interest in our work.*

*Sincerely yours,*

*Robert A Baan PhD The IARC Monographs IARC, Lyon, FRANCE*

# Smart Meter Dangers, Who Knew and Did Not Sound The Alarm?

written by [Nancy Thorner](#) April 20, 2016

## [Nancy Thorner](#)

Nancy Thorner is a musician and patriot who writes regularly for Illinois Review, and occasionally for The Heartland Institute's Freedom Pub blog.

Commonwealth Edison (ComEd) is pushing for the deployment of 4,000,000 smart meters despite the fact that government agencies and the military have known for decades that Radio Frequency/microwaves can cause serious health effects.

[This information is not new](#); it is just being brought to the forefront as a health crisis is emerging in Illinois. ComEd is using the Energy Infrastructure Modernization Act, also known as the “smart grid modernization bill” (written by ComEd lobbyists), and the Illinois Commerce Commission’s interpretation of that bill, as justification for installing millions of wireless smart meters.

The RF/microwave emissions from smart meters are listed by the World Health Organization’s International Agency for Research on Cancer ‘IARC’ as a Class 2B Carcinogen. That makes this the first time in history a known carcinogen has been **mandated** on **ALL** homes, schools, and government buildings.

Barrier Trower, a retired British Secret Service Microwave Weapons specialist, states:

“The paradox is how Radio Frequency/microwave radiation can be used as a weapon to cause impairment, illness and death; and at the same time be used as a communications instrument [such as in smart meters].”

[Trower continues](#), “By 1971 we knew everything that needed to be known.”

“A 1976 document summarizing U.S. Defense Intelligence research **lists all of the health hazards caused by wireless devices and concludes: This should be kept secret to preserve industrial profit.**”

Jerry Flynn, is a retired Canadian Armed Forces captain with specialized training and 22 years of experience in Electronic Warfare and Signals Intelligence. Flynn has worked with U.S. and NATO armies in this specialized capacity. [He writes](#):

“[The U.S. military has known for decades](#) that the RF/microwave frequencies most harmful to man are those within the band 900 MHz to 5 GHz. These frequencies penetrate all organs of the body, thus putting all human organ systems at risk. **Smart meters emit these precise frequencies which, when combined with certain pulsed modulation characteristics and power densities, are most harmful to the brain, central nervous system, immune system, and can cause cancers.** This is precisely why these frequencies are used in Microwave weapons of war.”

ComEd smart meters contain two transmitters emitting high-intensity pulsed signals every few seconds in two frequencies within the “most harmful” range mentioned by Flynn. One frequency is 900 MHz used for the wireless network that relays data from the smart meter on one house to the smart meter on another house and then on to a collector which sends the data to ComEd. The second frequency, 2.45 GHz, is used for appliances inside the house to transmit data to the smart meter.

Although [ComEd claims](#) that data is only transmitted six times a day, what they neglect to mention is that smart meters also [emit high-intensity RF/microwave pulses](#) each time they perform network management functions. According to California court documents, a single smart meter can emit these pulses on average 10,000 to 190,000 a day. [The number of pulses](#) depends on where in the mesh network the smart meter is located and how often it is relaying data from other neighbors’ meters.

It is these around-the-clock, high-intensity pulses within the frequency range “most harmful” to humans that make smart meters so damaging. Consider 4,000,000 ComEd smart meters blanketing Illinois with billions of pulses in these frequencies being emitted every day, forever.

### **Basis for FCC guidelines: Health or Profits?**

The Federal Communication Commission (FCC) knew decades ago, for according to Gittleman, “back in the 1950’s there were growing concerns as to the dangers of these low-level microwaves, so the U.S. military had sought safety limits.”

The [current FCC](#) safety limits are based on thermal exposure alone. The FCC guidelines are ten times more lenient than what the Environmental Protection Agency (EPA) would have permitted to protect the general population from the health hazards of RF/microwave radiation.

In the late 1980’s, the EPA radiation division, staffed with practicing biologists and epidemiologists, decided on a safe limit for human exposure. Before the announcement was made, industry intervened, federal funding for that division of the EPA was cut, and the FCC was given the task of setting the RF/microwave guidelines for the public. The FCC, made up of bureaucrats and engineers, had no experience or training in setting “health related” guidelines. Therefore, from the beginning, FCC guidelines were set at a limit that was too lenient to protect the general population.

### **Government agencies respond to the FCC guidelines**

- **Environmental Protection Agency (EPA), 1990:** [“FCC exposure standards are seriously flawed.”](#) In fact, 40 EPA scientists released a 393-page report titled, “An Evaluation of the Potential Carcinogenicity of Electromagnetic Fields (EMF’s)”, which proposed classifying EMF’s as a “probable” carcinogen and Radio Frequency and microwave radiation as a “possible” carcinogen.
- **Food and Drug Administration (FDA), 1993:** [“FCC rules do not address the issue of long-term chronic exposure](#) to Radio Frequency fields. Data strongly suggests that RF/microwaves can accelerate the development of cancer.”
- **National Institute for Occupational Safety and Health (NIOSH)—a division of the Center for Disease Control (CDC), 1994:** [“FCC’s standard is inadequate](#) because it is only based on adverse health effects caused by body tissue heating (which means thermal).”
- **U.S. Consumer Affairs Commission, 1999:** [“Current thermal guidelines associated with Electromagnetic Radiation \(EMR\) are irrelevant.](#) Cancer and Alzheimer’s are associated with non-thermal EMR effects.”
- **Environmental Protection Agency, 2002:** [“FCC’s current Radio Frequency/microwave exposure guidelines are thermally based,](#) and do not apply to chronic, non-thermal exposure situations.” Norbert Hankin, Director, Radiation Protection Division

### **Medical and legal groups respond to the FCC guidelines**

Today there are more than [900 health and environmentally conscious groups](#) sending comments to the FCC as part of the agency’s reassessment of the guidelines. **The [American Academy of Pediatrics](#)**, with headquarters in Illinois, is one of these concerned medical organizations. **[The Academy of Environmental Medicine](#)**, along with **the [American Academy of Justice](#)** (formerly the Association of Trial Lawyers of America), are two more such groups. All of these organizations are concerned with saving the environment and preserving public health from the government approved harmful levels of microwave radiation.

ComEd touts compliance with FCC standards to assure the public that smart meters are safe. However, FCC exposure guidelines are irrelevant since the limit set is for thermal exposure. ComEd smart meters subject the public to chronic non-thermal exposure.

### **[Which authorities knew](#) or should have known of RF/microwave harm?**

**The U.S. military and intelligence agencies:** As early as the 1950’s, the military and intelligence agencies were aware of the health effects from RF/microwaves. From 1,000 classified studies, it was apparent that even low-level RF/microwaves [could create bio-effects that could be used to disrupt the enemy in covert](#), or battlefield operations. RF/microwaves could be utilized to create confusion, slow reaction time, create nausea, and shock adversaries in the field.

**NASA:** [This space agency has been studying the health effects for years](#) to facilitate protection from electromagnetic radiation for astronauts traveling in space.

**Government Health Departments:** These departments are charged with protecting public health and have a responsibility to keep up on studies. At this time, there are [thousands of peer-reviewed studies showing adverse biological and health effects](#).

**The Department of Energy:** It is the duty of this agency to investigate negative health effects before launching such an expansive national project. No health data was considered before deployment of billions of smart meters in wireless networks.

**The World Health Organization:** In 2011 the International Agency for Research on Cancer ‘IARC’ categorized [Radio Frequency emissions from all wireless devices as a Class 2B Carcinogen](#). ComEd’s wireless smart meters fall into this category. Although the IARC classification has been known for five years, the deployment of 4,000,000 ComEd smart meters is still being mandated.

**The Telecom executives:** Two decades ago Dr. George Carlo, who was in charge of the Wireless Technology Research (WTR) project in 1993 informed the Telecom executives. He reported the results of the research which revealed an [alarming increase in tumors](#) and many other health related problems.

**Lloyd’s of London:** This well-known insurance underwriter now specifically “[excludes liability coverage for claims](#) directly or indirectly resulting from electromagnetic radiation and illnesses caused by continuous, long-term, (non-thermal) radiation exposure.” ComEd’s wireless smart meters will inflict continuous, long-term, (non-thermal) radiation exposure on all life forms.

**Utilities, such as ComEd:** Utilities have been charged with providing safe delivery of electricity. Clearly, there has been no investigation into the safety of incorporating into the electric grid a product utilizing this dangerous technology.

### **What scientists recognize about “the emerging public health crisis”**

The [International EMF Scientist Appeal](#) has been signed by 190 scientists from 39 nations. These scientists have collectively published over 2,000 peer-reviewed papers on the biological or health effects of non-thermal radiation and are calling upon the United Nations, World Health Organization, and UN member states to:

1. Address the emerging public health crisis related to wireless devices, wireless utility meters [smart meters] and wireless infrastructure.
2. Urge that UN Environmental Program initiate an assessment of current exposure standards [in order] to substantially lower human exposures to non-thermal radiation.
3. Take a planetary view of potential for harm that EMF pollution presents to biology—the evolution, health, well-being and very survival of all living organisms worldwide.

### **Illinois politicians and members of the General Assembly: What do they know?**

Members of the General Assembly, who voted to pass the smart grid modernization bill, (after “ComEd’s lobbyists were able to muscle the bill through”, [according to the Illinois Attorney General](#)), and/or voted to [override Governor Quinn’s veto](#), might want to take another look at the health threat being inflicted on ComEd customers. [Why would any political leader knowingly permit their constituents to be forced to live](#) with a meter on their homes that emits a known Class 2B Carcinogen?

**With a mandate in place and no permanent opt-out option available, residents are powerless to protect their families.** In order for justice to prevail, consumer choice has to be restored, and a permanent opt-out option granted to ComEd customers.

### **They knew, they did not tell us, where do we go from here?**

Flynn’s summary on smart meter dangers:

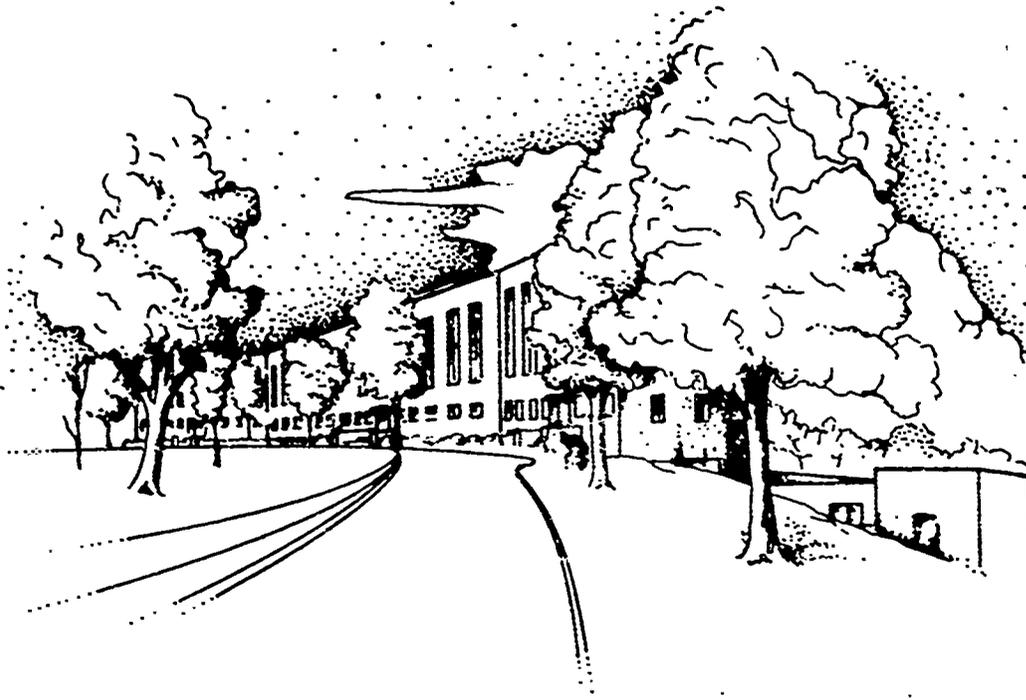

“Pulsed non-thermal radiation, which is emitted by smart meters, is far more damaging at the body’s cellular level to all life forms than any other technology ever devised by man. Militaries of the world have known for more than 50 years that RF/microwaves are the perfect weapon. Today, democratic governments are knowingly and callously authorizing untested (for safety) smart meters to operate (emitting pulsed non-thermal radiation) at the most lethal frequencies known to man.”

## ABSTRACT

More than 2000 references on the biological responses to radio frequency and microwave radiation, published up to June 1971, are included in the bibliography.\* Particular attention has been paid to the effects on man of non-ionizing radiation at these frequencies. The citations are arranged alphabetically by author, and contain as much information as possible so as to assure effective retrieval of the original documents. An outline of the effects which have been attributed to radio frequency and microwave radiation is also part of the report.

\*Three supplementary listings bring the number of citations to more than 2300.

13. ABSTRACT

More than 2300 references on the biological responses to radio frequency and microwave radiation, published up to April 1972, are included in this bibliography of the world literature. Particular attention has been paid to the effects on man of non-ionizing radiation at these frequencies. The citations are arranged alphabetically by author, and contain as much information as possible so as to assure effective retrieval of the original documents. Soviet and East European literature is included in detail. An outline of the effects which have been attributed to radio frequency and microwave radiation is included as Chapter 1. The revised report (which supersedes DDC report AD#734391) is updated with the inclusion of three supplementary listings, and has incorporated many corrections and additions to the original 2100 citations.

## Foreword

It is the hope of the author that this bibliography will provide guidance to the diffuse and conflicting literature on the biological responses to electromagnetic radiation at radio- and microwave-frequencies, with particular reference to the effects of concern to man. Such guidance is needed in the formulation and appraisal of criteria and limits of human exposure to "non-ionizing" radiation, and in the planning and conduct of future research.

The original plans were to categorize and key the literature citations to the "outline of biological and clinical effects" (Chapter 1). This proved to be a much more difficult and time-consuming task than anticipated, and was actually completed only for about 400 papers. Thus, the letter-number combinations given in square brackets for some of the "A" through "C" citations refer to the outline. [NV] indicates the citation was "not verified".

The standard format used throughout the bibliography is: author, (date), journal, volume, (issue): page, "title". The authors are alphabetized, and in chronological order. Multiple authors are also alphabetically ordered according to the second, third, etc., author. Inclusive pagination is given where possible, as is the original language of the citation. Report accession and translation numbers (some of which are cited in Appendix A), and alternate sources are listed when known. The title of books is underlined. When the title of the report was not available (or not given), a short (one line) description of the paper is listed whenever possible. Reports in which the name of the author was not given are listed chronologically using the format, "title", reference, source, (date). In many cases the citation was obtained from secondary (and tertiary) sources. For this reason it was impossible to put every citation into a consistent format.

In a few cases, papers have been cited which were presented at symposia or meetings devoted to the present topic, even when the report title suggests that it does not pertain directly to the topic. This has been done to show the wide range of items considered relevant (at least at the time of the meeting, and by the organizing chairman) in past years. An example is "electroanesthesia".

A few citations of marginal and/or peripheral relationship have also been included so that the reader may judge the applicability to his individual research needs. Examples are reports dealing with the biological effects of static and alternating magnetic fields, experimental techniques using radio frequency and microwave radiation (e.g., electron spin resonance, and nuclear magnetic resonance spectroscopy), and microwave exposure limits, regulations, and standards.

References for a few limited-distribution government reports are available upon request.

The author welcomes information which will correct errors and omissions (both of which no doubt exist). Copies of new papers would be greatly appreciated, and would encourage updating and revising the bibliography periodically.

#### ACKNOWLEDGMENTS

The assistance and support received during the preparation of this bibliography have been considerable, and I am happy to acknowledge my indebtedness and gratitude. Drs. John Keesey and Dennis Heffner, former and present Heads of the Biophysics Division, and Dr. Seymour Friess, Director of the Environmental Biosciences Department of the Naval Medical Research Institute, permitted me the opportunity to work on the bibliography, and offered frequent encouragement.

Acknowledgment is also due to many friends and associates for their helpful suggestions, comments, and loans and/or gifts of reports or other material, which have been invaluable in the course of the work. Mr. Glenn Heimer of the Naval Ship Engineering Center contributed an extensive collection of government reports and documents, many of which had not previously been cited in the open literature.

Special help in tracing and in the acquisition of relevant papers has been received from the librarians and staff members of the NMRI library: Mrs. Thelma Robinson, Mrs. Ernestine Gendleman, Mrs. Eleanor Capps, and Miss Deborah Grove. Their diligence and resourcefulness in tracing and obtaining copies of a large number of papers and reports, often in spite of incomplete and/or inaccurate citations given in other sources, enabled me to include many relevant items in the bibliography.

Mr. Christopher Dodge of the Scientific and Technical Center, Department of the Navy, provided much of the Soviet Bloc literature, linguistic and other technical assistance, and in addition offered valuable comments and encouragement throughout the preparation of this report. Especially noteworthy were the corrections and improvements suggested by Chris following his reading of the entire manuscript.

Helpful also in locating some of the Soviet literature was Mr. E. S. Serebrennikov, of the Science and Technology Division, The Library of Congress.

Credit is due Mrs. Anna Woke (of this Institute) for translating many of the German papers; to Dr. Emilio Weiss, who translated from the Italian, and to Mrs. Edith Pugh who typed many "first drafts"; also to Mrs. Rhoda Glaser for her help in many aspects of the work.

Mrs. Fannie Epstein deserves special mention for her outstanding editorial assistance, and especially for the heroic typing, organization, and checking of the entire report.

The Outline of Reported Biological Phenomena ('Effects') and Clinical Manifestations Attributed to Microwave and Radio-Frequency Radiation, is patterned after that given by R. Murray, et al., in an article entitled, "How safe are microwaves", which appeared in Non-Ionizing Radiation 1(1):7-8 (1969). Some of the "effects" were listed in the report by S. F. Cleary and W. T. Ham, Jr., entitled, "Considerations in the evaluation of the biological effects on exposure to microwave radiation", (Background document, Part I, 1969, for the Task Force on Research Planning in Environmental Health, Subtask Force on Physical Factors in the Environment). The discussion and suggestions offered by Byron McLees, Edward Finch, Lewis Gershman, and Christopher Dodge relating to the Outline are also gratefully acknowledged.

Preparation of the bibliography was supported by the Bureau of Medicine and Surgery, Department of the Navy, under work unit MF12.524. 015-0094B.

## CHAPTER 1

### Reported Biological Phenomena ("Effects") and Some Clinical Manifestations Attributed to Microwave and Radio-Frequency Radiation (See Note)

#### A. Heating of Organs\* (Applications: Diathermy, Electrosurgery, Electrocoagulation, Electrodesiccation, Electrotomy)

1. Whole Body (temperature regulation defects), Hyperpyrexia
  2. Skin
  3. Bone and Bone Marrow
  4. (a) Lens of Eye (cataractous lesions - due to the avascular nature of the lens which prevents adequate heat dissipation.)  
(b) Corneal damage also possible at extremely high frequencies.
  5. Genitalia (tubular degeneration of testicles)
  6. Brain
  7. Sinuses
  8. Metal Implants (burns near hip pins, etc.)
- The effects are generally reversible except for 4a.

#### B. Changes in Physiologic Function

1. Striated Muscle Contraction
2. Alteration of Diameter of Blood Vessels (increased vascular elasticity), Dilation
3. Changes in the Oxidative Processes in Tissues and Organs
4. Liver Enlargement
5. Altered Sensitivity to Drug Stimuli
6. Decreased Spermatogenesis (decreased fertility, to sterility)
7. Altered Sex Ratio of Births (more girls!)
8. Altered Menstrual Activity
9. Altered Fetal Development
10. Decreased Lactation in Nursing Mothers
11. Reduction in Diuresis ( $\text{Ca}^+$  excretion, via urine output)
12. Altered Renal Function (decreased filtration by tubules)
13. Changes in Conditioned Reflexes
14. Decreased Electrical Resistance of Skin
15. Changes in the Structure of Skin Receptors of the (a) Nerve, and (b) Blood-Carrying Systems
16. Altered Blood Flow Rate

---

\* It is also reported that low levels of irradiation produce a cooling effect - "hypercompensation".

Note: These effects are listed without comment or endorsement since the literature abounds with conflicting reports. In some cases the basis for reporting an "effect" was a single or a non-statistical observation which may have been drawn from a poorly conceived (and poorly executed) experiment.

17. Alterations in the Biocurrents (EEG?) of the Cerebral Cortex (in animals)
18. Changes in the Rate of Clearance of Tagged Ions from Tissue
19. Reversible Structural Changes in the Cerebral Cortex and the Diencephalon
20. Electrocardiographic (EKG) Changes
21. Alterations in Sensitivity to Light, Sound, and Olfactory Stimuli
22. Functional (a) and Pathological (b) Changes in the Eyes:  
(a) decrease in size of blind spot, altered color recognition, changes in intraocular pressure, lacrimation, trembling of eyelids; (b) lens opacity and coagulation, altered tissue respiration, and altered reduction-oxidation processes
23. Myocardial Necrosis
24. Hemorrhage in Lungs, Liver, Gut, and Brain
25. Generalized Degeneration of all Body Tissue
26. Loss of Anatomical Parts
27. Death
28. Dehydration
29. Altered Rate of Calcification of Certain Tissue

} At Fatal Levels  
} of Radiation

#### C. Central Nervous System Effects

1. Headaches
2. Insomnia
3. Restlessness (Awake and During Sleep)
4. Electroencephalographic (EEG) Changes
5. Cranial Nerve Disorders
6. Pyramidal Tract Lesions
7. Conditioned Reflex Disorders
8. Vagomimetic Action of the Heart; Sympathomimetic Action
9. Seizures, Convulsions

#### D. Autonomic Nervous System Effects

1. Neuro-vegetative Disorders (e.g., alteration of heart rhythm)
2. Fatigue
3. Structural Alterations in the Synapses of the Vagus Nerve
4. Stimulation of Parasympathetic Nervous System (Bradycardia), and Inhibition of the Sympathetic Nervous System

#### E. Peripheral Nervous System Effects

Effects on Locomotor Nerves

F. Psychological Disorders ("Human Behavioral Studies") - the so-called "Psychophysiologic (and Psychosomatic) Responses"

1. Neurasthenia - (general "bad" feeling)
2. Depression
3. Impotence
4. Anxiety
5. Lack of Concentration
6. Hypochondria
7. Dizziness
8. Hallucinations
9. Sleepiness
10. Insomnia
11. Increased Irritability
12. Decreased Appetite
13. Loss of Memory
14. Scalp Sensations
15. Increased Fatigability
16. Chest Pain
17. Tremor of the Hands

G. Behavioral Changes (Animal Studies)

Reflexive, Operant, Avoidance, and Discrimination Behaviors

ii. Blood Disorders

(V = in vivo)  
(v = in vitro)

Changes in:

1. Blood and Bone Marrow
2. Phagocytic (polymorphs) and Bactericidal functions of blood (v)
3. Hemolysis rate (increase), (a shortened lifespan of cells)
4. Sedimentation rate (increase), (due to changes in serum protein levels or amount of fibrinogen. (?)
5. Number of Erythrocytes (decrease), also number of lymphocytes
6. Blood Glucose Concentration (increase)
7. Blood Histamine Content
8. Cholesterol and Lipids
9. Gamma (also  $\alpha$  and  $\beta$ ) Globulin, and Total Protein Concentration
10. Number of Eosinophils
11. Albumin/Globulin Ratio (decrease)
12. Hemopoiesis (rate of formation of blood corpuscles)
13. Leukopenia (increase in number of white cells), and Leukocytosis
14. Erythrocytosis

I. Vascular Disorders

1. Thrombosis
2. Hypertension

## J. Enzyme and Other Biochemical Changes

### Changes in activity of:

1. Cholinesterase (V,v)
2. Phosphatase (v)
3. Transaminase (v)
4. Amylase (v)
5. Carboxydismutase
  
6. Protein Denaturation
7. Toxin, Fungus, and Virus Inactivation (at high radiation dose levels), Bacteriostatic Effect
8. Tissue Cultures Killed
9. Alteration in Rate of Cell Division
10. Increased Concentration of RNA in Lymphocytes, and Decreased Concentration in Brain, Liver, and Spleen
11. Changes in Pyruvic Acid, Lactic Acid, and Creatinine Excretions
12. Change in Concentration of Glycogen in Liver (Hyperglycemia)
13. Alteration in Concentration of 17- Ketosteroids in Urine

## K. Metabolic Disorders

1. Glycosuria (sugar in urine; related with blood sugar?)
2. Increase in Urinary Phenol (derivatives? DOPA?)
3. Alteration of Rate of Metabolic Enzymatic Processes
4. Altered Carbohydrate Metabolism

## L. Gastro-Intestinal Disorders

1. Anorexia (loss of appetite)
2. Epigastric Pain
3. Constipation
4. Altered Secretion of Stomach "Digestive Juices"

## M. Endocrine Gland Changes

1. Altered Pituitary Function
2. Hyperthyroidism
3. Thyroid Enlargement
4. Increased Uptake of Radioactive Iodine by Thyroid Gland
5. Altered Adrenal Cortex Activity
6. Decreased Corticosteroids in Blood
7. Decreased Glucocorticoidal Activity
8. Hypogonadism (usually decreased testosterone production)

## N. Histological Changes

1. Changes in Tubular Epithelium of Testicles
2. Cross Changes

O. Genetic and Chromosomal Changes

1. Chromosome Aberrations (e.g., linear shortening, pseudochiasm, diploid structures, amitotic division, bridging, "sticky" chromosomes, irregularities in chromosomal envelope)
2. Mutations
3. Mongolism
4. Somatic Alterations (changes in cell not involving nucleus or chromosomes, cellular transformation)
5. Neoplastic Diseases (e.g., tumors)

P. Pearl Chain Effect (Intracellular orientation of subcellular particles, and orientation of cellular and other (non-biologic) particles)

Also, orientation of animals, birds, and fish in electromagnetic fields

Q. Miscellaneous Effects

1. Sparking between dental fillings
2. Peculiar metallic taste in mouth
3. Changes in Optical Activity of Colloidal Solutions
4. Treatment for Syphilis, Poliomyelitis, Skin Diseases
5. Loss of Hair
6. Brittleness of Hair
7. Sensations of Buzzing Vibrations, Pulsations, and Tickling About the Head and Ears
8. Copious Perspiration, Salivation, and Protrusion of Tongue
9. Changes in the Operation of Implanted Cardiac Pacemakers
10. Changes in Circadian Rhythms

# Symptoms after Exposure to Smart Meter Radiation

People from coast to coast in the USA, and from one side of the world to the other, are becoming ill after exposure to the radiofrequency radiation emitted by Wireless Smart Meters. Attached are the results of two surveys of the symptoms being reported.

The first survey comes from the United States and includes 318 adults, from 28 states from California to New York, and addresses wireless utility meters that are principally Wireless Smart Meters. The second survey comes from the other side of the world, Victoria, Australia, and includes 92 adults and children, and addresses Wireless Smart Meters exclusively. Altogether, 410 adults and children are included. Both surveys report new or worsened symptoms after the installation of wireless utility meters in a given individual's environment.

The attached two graphs show the percentage of individuals in each survey who experienced each symptom. The two surveys group the symptoms into somewhat different clusters, but these clusters are similar enough to enable comparison between the surveys. Of the top seven clusters of symptoms in both surveys, six clusters are similar in both description and order of occurrence: (1) sleep disruption; (2) headaches; (3) ringing or buzzing in the ears; (4) fatigue; (5) loss of concentration, memory, and learning ability; and (6) disorientation, dizziness, and loss of balance. Most individuals in the surveys developed multiple symptoms.

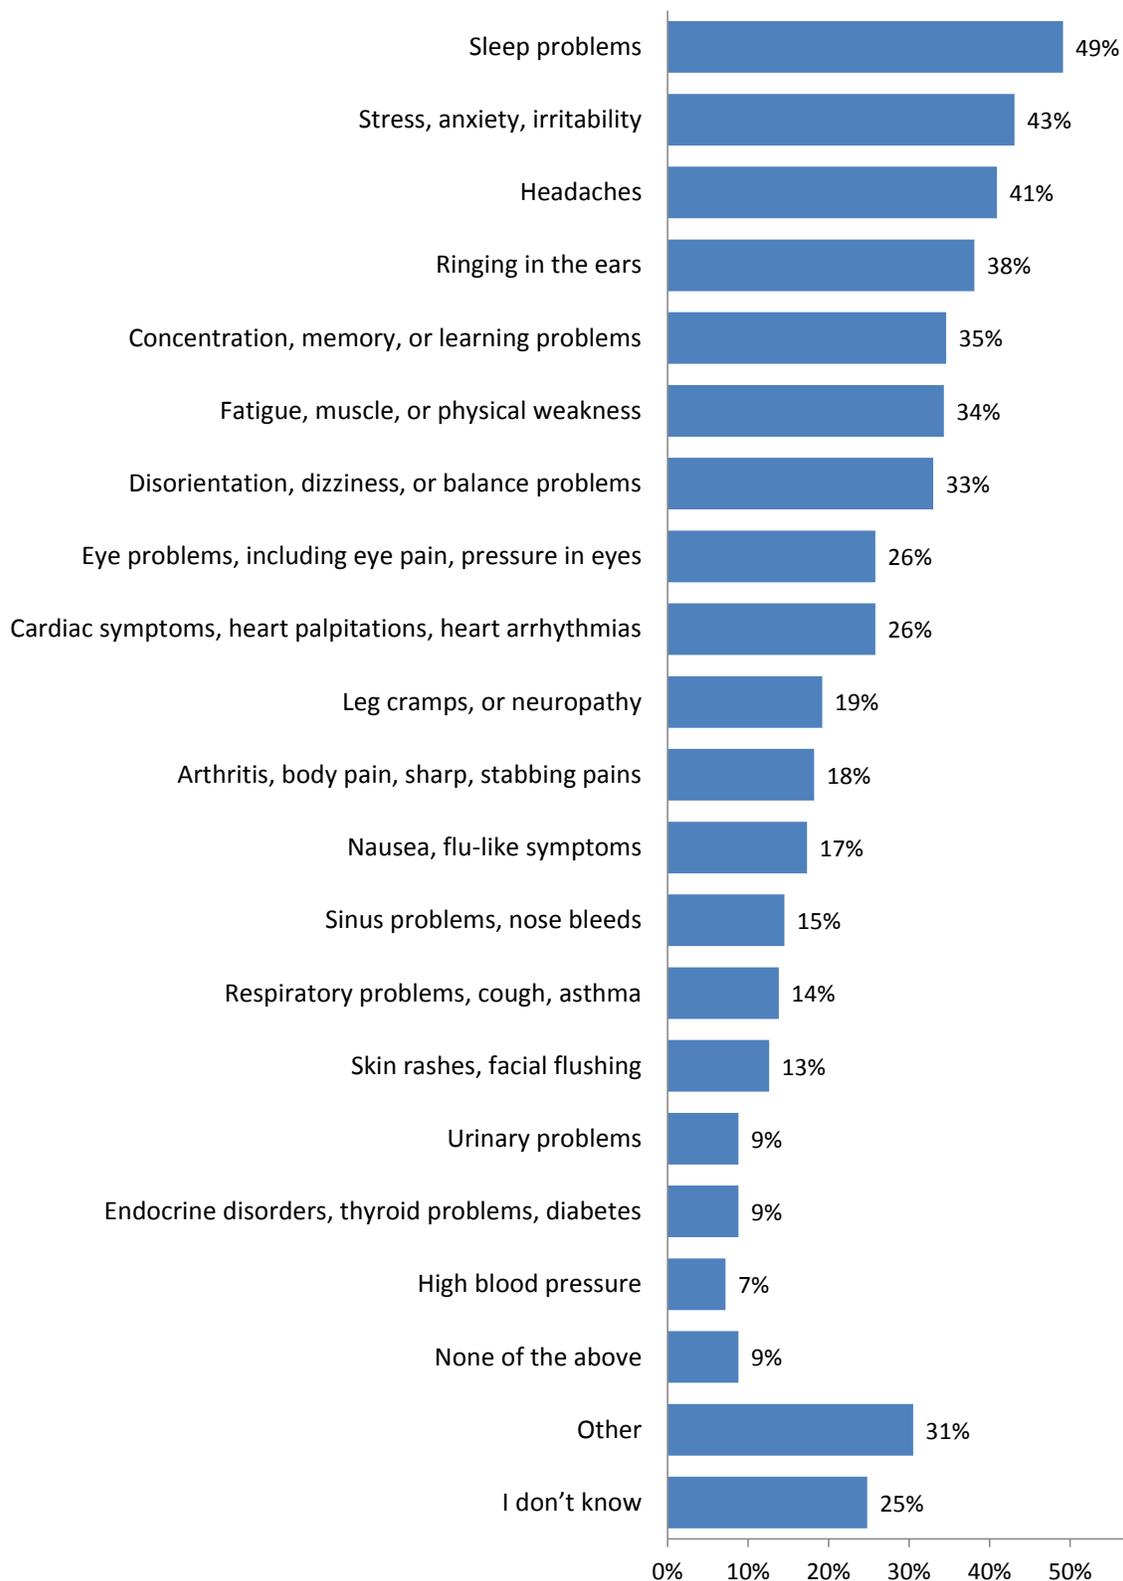

The surveys do not tell us how likely a given individual is to become symptomatic after exposure to the radiation from Wireless Smart Meters. But the surveys do tell us which symptoms a person who does become symptomatic is most likely to experience. The many symptoms found reflect the many body systems that are disrupted by such radiation.

A symptom, of course, is something that can be sensed by an individual, and thus can serve as a warning. Unfortunately, many health effects caused by radiofrequency radiation have no early symptoms and thus give no warning. These health effects become evident only after significant harm has been done. Examples are DNA damage, cancer, and reproduction effects.

During his Government career, he worked for the Executive Office of the President, the National Science Foundation, and the National Institute of Standards and Technology.

# New or Worsened Symptoms Reported by 318 Individuals after Exposure to Wireless Utility Meters in the USA<sup>1</sup>

<sup>1</sup> Ed Halteman, Ph.D., statistics, Final Results Summary: Wireless Utility Meter Safety Impacts Survey, September 13, 2011, p. 22 (<http://emfsafetynetwork.org/wp-content/uploads/2011/09/Wireless-Utility-Meter-Safety-Impacts-Survey-Results-Final.pdf>). 97 percent of respondents to full survey were in the USA, from 28 states with most in California (78 percent) and New York (16 percent).

# Executive Summary by Ed Halteman, Ph.D.

## Wireless Utility Meter Safety Impacts

### OBJECTIVES

- To investigate reported public health and safety complaints about wireless utility meters.
- To evaluate the impacts on health and safety due to wireless utility meters.
- To determine whether further study is warranted.

### METHODS

- Survey was designed by the EMF Safety Network (Network).
- The survey was circulated online through various social media outlets including Network's email list, Facebook, and the California EMF Safety Coalition (a discussion group).
- The survey was also posted on Network's website: [www.emfsafetynetwork.org](http://www.emfsafetynetwork.org) where visitors were invited to take the survey.
- 443 responses were received from 7/13/2011 through 9/2/2011. *(318 of the 443 answered the health questions that formed the basis for the bar chart on symptoms. RMPowell)*
- Network commissioned Survey Design and Analysis (SDA) to provide this report of the survey findings.

### RESPONDENT MAKEUP

- 93% are over 40 years old and 43% are over 60 years old.
- 73% are women.
- 78% are from California.
- 68% have Pacific Gas and Electric (PG&E) as their utility provider.
- 49% are EMF Sensitive.
- 41% have had a new wireless meter installed in their home; of these . . .
  - 56% have had it installed for at least six months
  - 89% have electric meters, 53% gas meters and 10% water meters
  - 35% saw an increase in their utility bill
  - 26% have experienced some type of interference
  - 8% experienced burned out appliances or damaged electronics including TV, stereo, computer, refrigerator and other.
- 76% indicated they have wireless utility meters installed in their neighborhood, town or city.
  - 44% near their home
  - 36% in town

### TOP HEALTH ISSUES SINCE NEW METERS INSTALLED

- Sleep problems (mentioned by 49%)
- Stress, anxiety and irritability (43%)
- Headaches (40%) *(Intentionally listed at 41% on symptoms bar graph, rounded up from 40.9%. RMPowell)*
- Ringing in the ears (38%)
- Heart problems (26%)

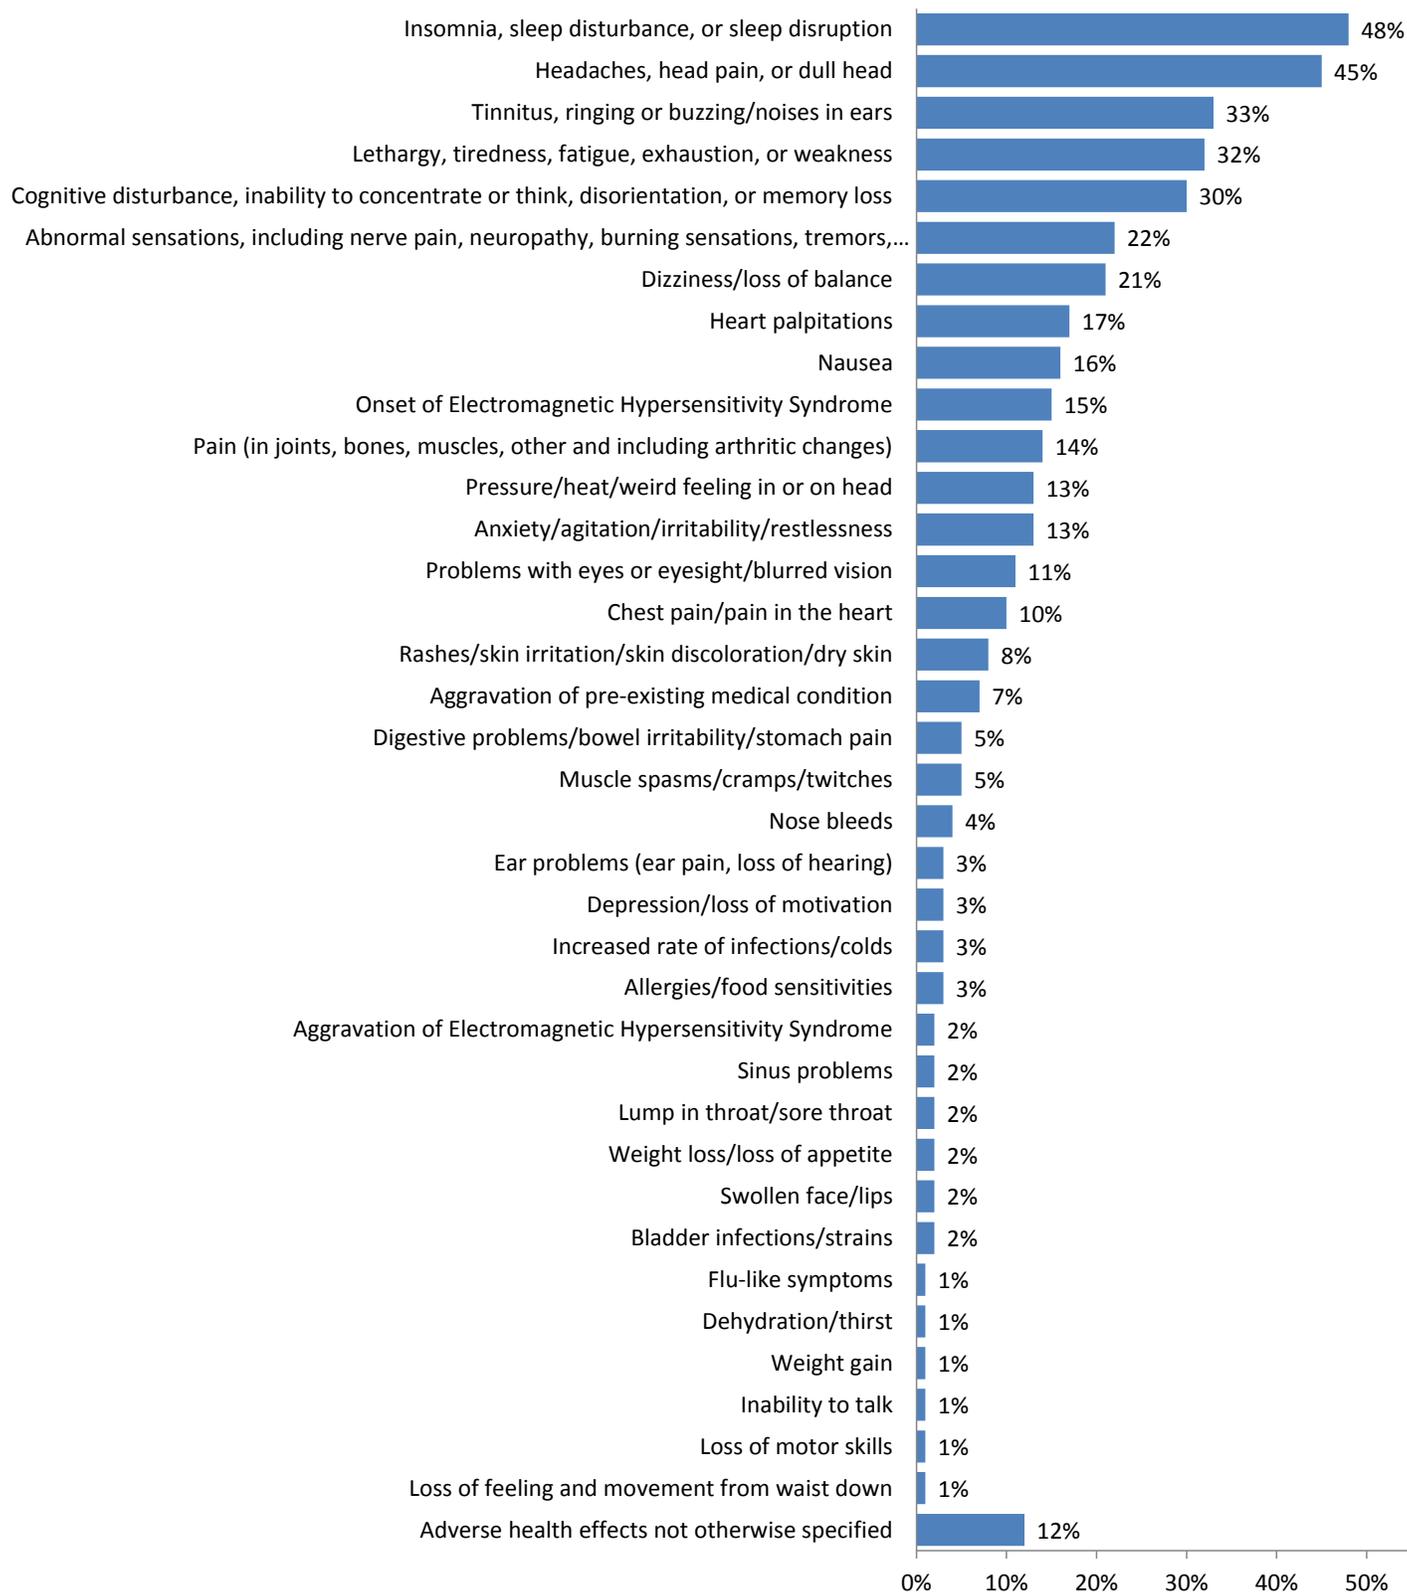

### UTILITY and PUBLIC UTILITY COMMISSION INTERACTIONS *(Title inserted by RMPowell.)*

- 40% (111 people) of those having wireless meters in their homes or community have complained to their utility provider.
  - 96% of these people were either "Unsatisfied" or "Very Unsatisfied" with the handling of their complaint.
- 32% (88 people) complained to the utilities commission.
  - 96% of these people were either "Unsatisfied" or "Very Unsatisfied" with the handling of their complaint
- 94% of respondents want to retain or restore their analog meters and 92% of these respondents do not think they should have to pay any additional money.

### STATISTICAL TESTING SHOWS THE TOP HEALTH SYMPTOMS ARE POSITIVELY ASSOCIATED WITH

- EMF Sensitivity
- Wireless meters installed in the home

# New or Worsened Symptoms Reported by 92 Individuals after Exposure to Wireless Smart Meters in Australia<sup>1</sup>

<sup>1</sup> Federica Lamech, MBBS, Self-Reporting of Symptom Development from Exposure to Radiofrequency Fields of Wireless Smart Meters in Victoria, Australia: A Case Series. *Alternative Therapies*, Nov/Dec 2014, Vol. 20, No. 6, pages 28-38. NIH PMID 25478801 (<http://www.alternative-therapies.com> and <http://www.ncbi.nlm.nih.gov/pubmed/25478801>).

Altern Ther Health Med. 2014 Nov-Dec;20(6):28-39.

### **Self-reporting of symptom development from exposure to radiofrequency fields of wireless smart meters in Victoria, Australia: a case series.**

Lamech F.

Abstract

#### **CONTEXT:**

In 2006, the government in the state of Victoria, Australia, mandated the rollout of smart meters in Victoria, which effectively removed a whole population's ability to avoid exposure to human-made high-frequency nonionizing radiation. This issue appears to constitute an unprecedented public health challenge for Victoria. By August 2013, 142 people had reported adverse health effects from wireless smart meters by submitting information on an Australian public Web site using its health and legal registers.

#### **OBJECTIVE:**

The study evaluated the information in the registers to determine the types of symptoms that Victorian residents were developing from exposure to wireless smart meters.

#### **DESIGN:**

In this case series, the registers' managers eliminated those cases that did not clearly identify the people providing information by name, surname, postal address, and/or e-mail to make sure that they were genuine registrants. Then they obtained consent from participants to have their deidentified data used to compile the data for the case series. The author later removed any individual from outside of Victoria.

#### **PARTICIPANTS:**

The study included 92 residents of Victoria, Australia.

#### **OUTCOME MEASURES:**

The author used her medical experience and judgment to group symptoms into clinically relevant clusters (eg, pain in the head was grouped with headache, tinnitus was grouped with ringing in the ears). The author stayed quite close to the wording used in the original entries. She then calculated total numbers and percentages for each symptom cluster. Percentages were rounded to the nearest whole number.

#### **RESULTS:**

The most frequently reported symptoms from exposure to smart meters were (1) insomnia, (2) headaches, (3) tinnitus, (4) fatigue, (5) cognitive disturbances, (6) dysesthesias (abnormal sensation), and (7) dizziness. The effects of these symptoms on people's lives were significant.

#### **CONCLUSIONS:**

Review of some key studies, both recent and old (1971), reveals that the participants' symptoms were the same as those reported by people exposed to radiofrequency fields emitted by devices other than smart meters. Interestingly, the vast majority of Victorian cases did not state that they had been sufferers of electromagnetic hypersensitivity syndrome (EHS) prior to exposure to the wireless meters, which points to the possibility that smart meters may have unique characteristics that lower people's threshold for symptom development.

# **Actual or potential effects of ELF and RF/MW radiation on enhancing violence and homicide, and accelerating aging of human, animal or plant cells.**

Dr Neil Cherry  
Lincoln University  
New Zealand

17/6/98, revised 30/8/02

## **Abstract:**

The brain is a very sensitive Bioelectromagnetic organ and through classical resonance processes can be halted and damage of external electromagnetic fields and radiation. This review will explore the possibility that this could result in violence enhanced rates of homicide. The evidence that electromagnetic fields and radiation electromagnetic are genotoxic means that exposure to any electromagnetic fields and radiation will enhance cell death (Apoptosis). The natural ageing process involves oxygenated free radicals from the breathing process causing enhanced rates DNA damage, cancer and cell death. Exposure to electromagnetic fields and radiation also reduces melatonin which limits a body's ability to scavenge the free radicals and therefore contributes to enhanced Apoptosis and cancer rates. Melatonin is also necessary for a healthy immune system. Reduced melatonin is also associated depression and suicide and therefore is likely to be associated with violence of homicide. Since electromagnetic radiation damages the DNA and reduces melatonin it is scientifically logical that it also enhances many of the natural aging process in people, animals and plants. These conclusions are strongly supported by robust evidence that natural weather related effects are caused by natural electromagnetic fields and radiation with extremely small intensities. Therefore it is logical and proven that humanly generated fields and radiation at intensities from a thousand to many billion times higher, also significantly enhance a wide range of adverse health effects, including cancer, heart disease, sleep disturbance, depression, suicide, anger, rage, violence, homicide, neurological disease and mortality.

## **1. Introduction:**

### **1.1 Brief:**

This report was commissioned by Bruce Ratcliff on behalf of Ratcliff Company Inc. in a letter dated 30 March 1998, with the following brief:

"We would like to know more about any possible relationship between microwave radiation as given off from relay towers and cell phones and premature, rapid ageing of humans, animals and/or plants. Please see page 22 in Firstenberg report on plants.

We recently had three news events which startled the public here in the U.S. They are listed as follows:

1. One where two apparently normal 11 and 13 year old boys shot and killed 4 people and wounded many others apparently with no known cause.

2. A mother in San Francisco smothered and killed her 3 babies. She was on medication which may have been a factor.
3. In another case in San Francisco, a student brought a gun to school and fired off a round.

What is the known and/or classified research relating microwave radiation to irritability, anger and violence?"

### 1.2 Context:

Levels of anger and violence in society are serious causes for concern. Well understood relationships between adult behaviour, parenting approaches, media, and movies and anger and violence, along with stress and frustration which can lead to rage such as road rage, and particularly the roles of alcohol and drugs, are associated with the development of lower self control, and more anger, rage and violence. This makes the social and environmental factors difficult to isolate.

This is not to say that environmental factors such as exposure to toxic substances in the environment should be ignored because of the difficulties involved. Rather, if there is evidence of potential or actual involvement of environmental toxins in enhancing the risk of anger, rage and violence, then it is vital that this be identified and addressed in order to develop strategies to reduce or minimize that particular risk factor. A toxic substance which is ubiquitous throughout a city, state or the whole country, would be of particular concern because of the vast number of people exposed to this enhanced risk.

The subject of this investigation is electromagnetic radiation in the radiofrequency and microwave (RF/MW) part of the electromagnetic radiation (EMR) and the ELF parts of the spectrum. This consideration is extremely important because humanly sourced EMR is ubiquitous and exposure levels are rising exponentially and at a rate which outstrips biological adaptation.

### 1.3 Biological Context:

For too long the RF/MW debate has been dominated by physics and physical concepts and arguments. These have been primarily revolved around exploration of the heating effects of RF/MW and determining "safe" levels of exposure which will avoid dangerous levels of tissue heating.

Many EMR researchers have noted the folly and error of this, e.g. Adey (1981), Frey (1994), and Goldsmith (1994). Human, animal and plant cells are bio-electro-chemical structures which interact in many ways including physically, chemically, biochemically and bioelectrically. Adey (1979) expresses this concern forcibly and scathingly:

**"Faced with the overwhelming complexity of the brain as a tissue and an organ of the mind, physical scientists and medical researchers alike have all too often retreated shamelessly into classicisms and the argots of their respective trades. Too many physicists and engineers cling desperately to thermal models as the alpha and omega of bioeffects from non-ionizing radiofrequency fields, shunning the exquisite beauty of long-range molecular**

interactions and resonant processes in biological macromolecules. In like fashion, medical physiologists, challenged by phenomena I have discussed here, have turned away and fixed their eyes in a glassy stare on the comparative crudity of ionic equilibria as the be-all and end-all of excitatory processes as described in the massive ionic exchanges of Hodgkin-Huxley models.

True science can never be a popularity contest. The time has surely come when we should place these scholasticisms of another age in a proper context, counting ourselves thrice blessed at the prospect that through the use of non-ionizing radiofrequency radiation as a research tool, the intrinsic organization of the brain tissue, the subtleties of neuroendocrine phenomena and the broad sweep of immunological interactions may at least be understood in terms of transductive coupling at the molecular level.”

#### 1.4 Summary of the Resolution from the European Parliament, 1992:

The European Parliament, after a series of hearings on the matter of EMR health effects expressed grave concern (Resolution B3-0280/92):

“Thus in the frequency range 100 kHz to 300 GHz, 50 years ago it was scarcely possible to measure 10 pW/cm<sup>2</sup> on the ground in our countries. Today, depending on the location, values one million to one thousand million times higher are recorded because of the explosion of telecommunications.”

and the following clauses:

- A. having regard to the significant increase, in the environment, of power density of non-ionizing electromagnetic radiation in the various frequency ranges, associated with technological development over the last few decades,
- B. having regard to the precautionary principle included in Article 130r of the Treaty establishing the European Community and the ALARA principle (a-slow-as-reasonably-achievable), according to which it is necessary, in this case to minimize exposure to electromagnetic radiation,
- C. whereas such radiation interacts with matter by non-thermal mechanisms and whereas, as regards radiofrequencies and microwaves, these are therefore added to the purely thermal interaction mechanisms,
- D. whereas, according to an increasing number of epidemiological and experimental studies, even slight exposure to non-ionizing electromagnetic fields increases the risks of cancer, can be accompanied by nervous disorders and disruption of the circadian rhythms and seems capable of affecting developing organisms,
- E. whereas the results of many *in vivo* and *in vitro* studies show increasing clearly the interaction mechanisms underlying such disorders and illnesses, centred mainly in cell membrane, lead to disruption of melatonin secretions, ornithine

**decarboxylase activity and T-lymphocyte efficacy, testifying to the probable role of non-ionizing radiation in promoting cancer,**

**F. whereas synergy phenomena must be expected between non-ionizing radiation and other physical agents, ...**

In clause D the European Parliament (E.P.) agree that electromagnetic fields affect the nervous system by nervous disorders and disrupts the circadian rhythms, such as sleep disruption leading to chronic fatigue syndrome, Altpeter et al. (1995). These also have a relation to behaviour, stress and advanced aging effects.

**1.5 This Report's Approach:**

This review takes a number of innovative approaches that are scientifically sound. The biological processes caused by genotoxic, melatonin reducing, cellular calcium ion altering and gap junction altering substances are described and the evidence that EMF/EMR does all these things is presented. Melatonin related behaviour function, including irritability, anger, rage, violence, homicide and crime are correlated with weather and Solar/Geomagnetic Activity. The biophysical mechanism provides plausible scientific links, the natural environment correlations provide evidence of human reactions and links to extremely weak EMR signals to a wide range of human reactions. Occupational and residential studies are limited in availability and scope but they confirm a reasonable number of the symptoms to support and confirm the soundly based hypothesis which is centered on the extremely bioelectrical sensitivity of the brain, electrical interference of electric functions in the brain, heart and cells by external EMF/EMR signals, with genotoxic, melatonin reduction and calcium ion alteration.

Altered neurological function and behaviour related to the electrobiochemistry of the brain and evidence of changed behaviour. The links to the melatonin effects and the calcium ion mechanisms are through accelerated cell death and cancer in all body organs including the brain, and to the very serious problem of impaired sleep. Impaired sleep has a serious effect on immediate health and well-being, with lethargy, confusion, and chronic fatigue. Chronic sleep impairment, especially with loss of REM sleep efficiency, leads to memory and learning impairment, depression and risk of suicide. Depression is also linked to lung cancer because chronically depressed people are more prone to smoking. Evidence of induced sleep disruption is strongly indicative of a melatonin reduction mechanism in humans. Evidence is strong for EMR and EMF induced melatonin reduction in animals and observational evidence for this in humans is growing.

Some basic principles need to be understood and applied appropriately to study and interpret data in Environmental Health:

1) **The Straw Principle:** There is a classical saying about "The straw that breaks a camel's back". In assessing potentially cumulative environmental factors we need to identify whether a correlation of a symptom with an environmental factor is adding a "straw" or a "log". It is possible sometimes to identify a straw which is closely related to a log because in effect the log is a million straws tied together. On the other hand the straw or twig might be quite different from the log or a bunch of different twigs, and be working in a synergistic way with many different factors.

2) **The Ubiquitous Principle:** Some substances may only be found in special circumstances such as occupational situations. Other substances may expose the whole population in their homes and workplaces and can sometimes even expose them when they are in school, carrying out recreation and holiday travel. An invisible, silent, tasteless, odorless toxic substance that the vast majority of the population are unaware of, can be causing a high proportion of existing health effects.

3) **The Absence of a no-exposed reference group principle:** It is very important when evaluating the effects of a ubiquitous substance that there is no non-exposed reference group. It is necessary for a case-control or cohort epidemiological study to compare the sickness or mortality rate of a non-exposed group with the rates of sickness or mortality in a group specifically exposed to a potential disease agent, not confused by any confounders. Two possible ways of correcting for this factor are a) using a dose response relationship to identify the exposure rate, b) using a historically earlier general population disease rate for a period which is known not to have exposure to the currently studied ubiquitous substance.

In the first case the interpretation of the dose-response gradient must consider the effect of the ubiquitous agent on it because the gradient is dependent on the reference group disease rate. In the second case the careful consideration of any other historical or ubiquitous factors must be considered.

### 1.6 The links between ELF and EMR effects:

Induced electric fields alter the electric field and the charge characteristics at the cell membrane. Biological effects are primarily related to time varying induced fields since our biology has developed in the environment of the earth's static electric and magnetic fields. Induction of electric fields in tissue at the cellular level varies with the intensity and the nature of the environmental field. Typical endogenous EM fields, with ELF modulation, induce fields in the order of  $10^{-1}$  to  $10^{-7}$  V/cm in the pericellular fluid (fluid surrounding the cell). RF/MW fields penetrate the organ or body much more effectively than the ELF fields.

For example, when chick brains were exposed to an applied 56 V/m field ( $832 \mu\text{W}/\text{cm}^2$ ):

- An ELF field 1-32 Hz, induced a tissue gradient of  $10^{-7}$  V/cm.
- An RF field, 147 MHz, ELF modulated, produced a tissue gradient of  $10^{-1}$  V/cm.

Both of these signals significantly changed the calcium ion efflux from the chick brain tissue, Bawin and Adey (1976).

Thus the RF/MW field with a little over a million times higher frequency, produced a cellular tissue gradient 1 million times higher than the ELF field of the same external field strength. This shows the highly penetrative nature of RF/MW fields compared to ELF fields. Since the energy flux relates to the square of the electric field gradient strength, the energy and the electric field gradient imparted to the cell tissue by ELF modulated RF/MW radiation is many orders of magnitude higher than the same external strength of ELF field. This it is highly likely that effects which are found for exposures to ELF fields will be more likely to also be found in association with RF/MW exposure. For example, several studies have found depression and psychovegetative effects when living near high voltage powerlines. The Schwarzenburg Study, Altpeter et al. (1995), Altpeter (1998), found a causal

disturbance to sleep in association with extremely low mean exposures to a short-wave radio transmitter. Chronic sleep disturbance can lead to chronic fatigue and depression. The health study of the staff and families at the U.S. Embassy in Moscow, Lilienfeld (1978), associated depression, irritability, memory loss and difficulty in concentration with extremely low level exposures to a pulsed microwave, radar signal.

### **1.7 Setting the scene by a veteran researcher, Professor W Ross Adey:**

Adey, W.R., 1988a: "The cellular microenvironment and signaling through cell membranes". *Prog. Clin. Biol. Res.*, 257:81-106.

**"The structural and functional aspects of communication between cells have been reviewed, with emphasis on the cell membrane in detection and transductive coupling of oscillating electromagnetic fields in the peri-cellular environment. Imposed fields are powerful and highly specific tools in manipulation of the sequence of events in membrane transductive coupling. They have revealed nonlinear and non-equilibrium aspects of these interactions. In cerebral tissue, extra-cellular fields orders of magnitude weaker than the membrane potential can modulate cell firing patterns, entrain EEG rhythms, alter neurotransmitter release and modulate behavioral states.**

**These sensitivities have also been widely detected in non-neural tissues. It is therefore proposed that an intrinsic communication system between cells based on these weak electromagnetic influences may be a general biological property. A three-step model of transductive coupling is presented. First, a highly cooperative modification of calcium binding occurs in the plane of the membrane surface following a focal event at a receptor site. This "amplifying" stage releases substantially more energy than in the initial events.**

**Cerebral extracellular conductance changes accompanying physiological responses may arise in perineuronal fluid with a substantial macromolecular content and calcium ions may modulate perineuronal conductivity. In the second stage, coupling occurs along transmembrane helical proteins and may be mediated by solitons.**

**The third stage couples transmembrane signals to the cytoskeleton and to intracellular enzyme systems, including membrane-bound adenylate cyclase and the protein kinase system of intracellular messengers. Activation of these intracellular systems is calcium-dependent."**

Adey, W.R., 1988b: "Cell membranes: the electromagnetic environment and cancer promotion". *Neurochem. Res.*, 13(7):671-677.

**"Use of weak electromagnetic fields to study the sequence and energetics of events that couple humoral stimuli from surface receptor sites to the cell interior has identified cell membranes as a primary site of interaction with these low frequency fields. Field modulation of cell surface chemical events indicates a major amplification of initial weak triggers associated with binding of hormones, antibodies and neurotransmitters to their specific binding sites.**

**Calcium ions play a key role in this stimulus amplification, probably through highly cooperative alterations in binding to surface glycoproteins, with spreading waves of altered calcium binding across the membrane surface. Protein particles spanning the cell membrane form pathways for signaling and energy transfer.**

**Fields millions of times weaker than the membrane potential gradient of  $10^5$  V/cm modulate cell responses to surface stimulating molecules. The evidence supports nonlinear, non-equilibrium processes at critical steps in trans-membrane signal coupling. Powerful cancer-promoting phorbol esters act at cell membranes to stimulate ornithine decarboxylase which is essential for cell growth and DNA synthesis. This response is enhanced by weak microwave fields, also acting at cell membranes."**

Dr Adey summarizes the EMR/EMF interactional effects at the cell membrane, demonstrating the great deal of knowledge about this subject which scientific research has already revealed, this includes the cell membrane as the primary interactional site, calcium ions and ODC as key compounds, and very low level effects which are amplified to produce brain function, behavioural and health risk changes.

### **1.8 Outline of This Report:**

This report presents information about the natural weather-related electromagnetic fields and their biological and health effects, how the background artificial EMR/EMF levels have increased, especially over the 20<sup>th</sup> century, and is continuing. It will outline and document the genotoxic and melatonin mechanisms, and the cellular effects of calcium ions. It will give evidence that shows that EMR/EMF can alter these in people and animals, as well as effects in plants in relation to calcium ions and tree ring growth. It will then outline the evidence of effects in the neurological functions of the brain and in behavioural studies of animals. Then the epidemiological evidence of effects in humans will be summarized to lead to the conclusion that there is very strong evidence of serious adverse effects of EMR and EMF on the physical health and emotional and psychological wellbeing of people, as well as deleterious effects on plants and animals.

**An important evidence principle applied here is that a dose-response relationship is indicative of a causal link.**

## **2. The natural and humanly changed EMR/EMF environment:**

Extremely small natural electromagnetic signals are causally associated with plant, animal and human biological and health effects. Therefore Human Biometeorology strongly challenges that basis and appropriateness of human health protection standards for artificial EMF/EMR fields and radiation.

### **2.1 The electromagnetic environment changes with the weather:**

The primary natural electromagnetic signal that has biological links is the Schumann Resonance a signal. This is a global radio signal generated by lightning from tropical thunderstorms and radiating around the world in the resonance cavity between the lowest layer of the ionosphere of the earth. Local weather systems also have associated ELF modulated RF fields. Anticyclones and depression are characterized by very different

natural background of ELF modulated RF fields. Eichmeier and Buger (1969) measured the EMR/EMF characteristics of weather system. They summarize their measurements as:

Cyclone: 10-100 kHz, 30-100 Hz, > 100 mV/m, (RF Exposure ~ 0.0027  $\mu\text{W}/\text{cm}^2$ )

Anticyclone: 10 kHz, 1-3 Hz, < 10 mV/m, (RF Exposure ~ 0.0000027  $\mu\text{W}/\text{cm}^2$ )

They were investigating biological effects found with weather conditions, including altered liver function. Importantly Eichmeier and Buger found that under in controlled laboratory conditions the RF cyclonic-like conditions mouse liver respiration rates were 42 % higher than anticyclonic RF conditions, a highly statistically significant effect ( $p < 0.001$ ). Thus the stronger natural RF field strengths in cyclones is associated with significantly altered liver respiration.

The cyclone is generally much more electrically active because of the convective and thunderstorm activity and precipitation formation. Precipitation formation separates charge, rain and hail becoming negatively charged and cloud droplet positively charged. The positively charged ionosphere creates a static field formed between it and negatively charged earth, called the fair weather field. During rain events, negatively charged rain falling from the cloud to the ground, reduces the vertical gradient of the local electric field. During vigorous thunderstorms the strong negative charge at the base of the cloud induces attraction of positive ions on the surface features, reversing the ground level field.

The ELF modulation of cyclones (depressions) is in the 30-100Hz range, covering the upper frequency range of the daytime EEG rhythms. The anticyclone has modulation in the 1-3Hz range, the nocturnal Delta EEG rhythm. Cyclones are cloudy with less sunshine and higher RF intensities around  $3\text{nW}/\text{cm}^2$ . Both factors are associated with reduced melatonin/serotonin diurnal cycle amplitudes. The local anticyclonic RF field is about  $2.7\text{pW}/\text{cm}^2$ , which is nearly 30 times higher than the global Schumann Resonance signal  $0.1\text{pW}/\text{cm}^2$ .

The effects of the hot dry foehn winds were first identified in Europe. They are associated with depression and suicide in areas near European Alps. In Los Angeles the Santa Ana winds are associated with enhanced homicide, Miller (1968), summarized by Maunder (1970). Miller reports an indicative correlation between the days with Santa Ana winds and homicide in Los Angeles from a 2-year data-set. He observed that in the strongest Santa Ana conditions there was initially a fall in homicide rate (-0.8, -0.7) followed by a rise in homicide rate over 5 days reaching a significant peak on day 2 (+1.0, +3.6, +0.8, +0.2). Weather conditions significantly alter the fair weather fields, Reiter (1992), Figure 1.

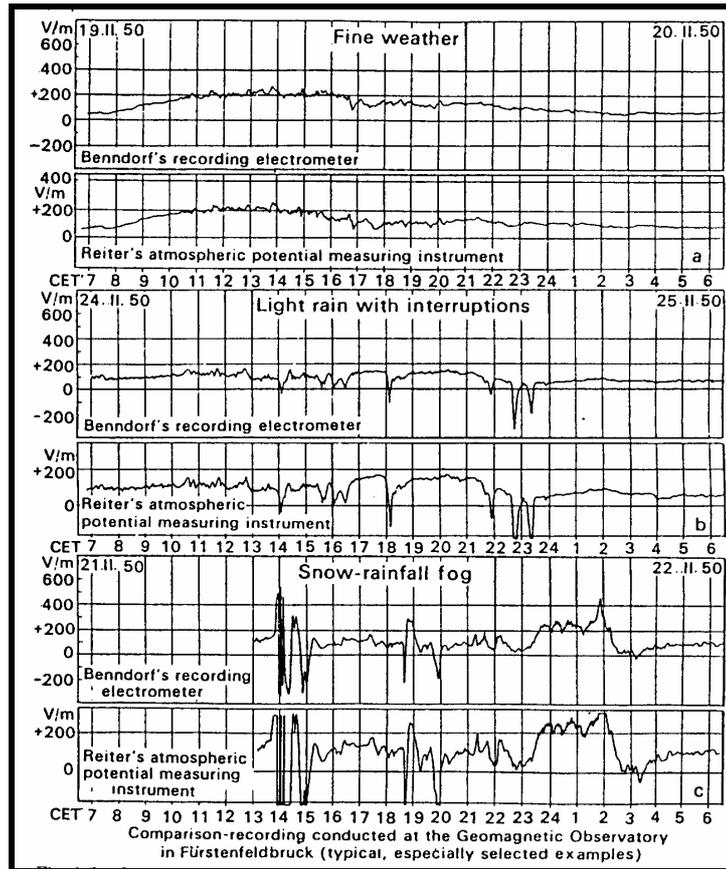

Figure 1: Electric field measurements for a range of weather conditions: (a) Fair weather field, (b), Light Rain with interruptions and (c) Snow/Rainfall and Fog, Reiter (1992).

In Canterbury, New Zealand our own research has shown some similar physical symptoms as those reported in Israel, Europe and America, associated with reduced melatonin. In our survey we found the same symptoms in people living inland and those living along the coast. The challenge was to identify the mechanism of how the people along the coast were affected by the hot dry winds that the people in the Inland were living in and experiencing, but along the coast the hot wind flowed over the sea breeze in the coastal zone and the people were in the cooler, high humidity marine air. It is well established that the hot, dry winds have much higher air ion content, enhancing the strength of the fair weather fields. The hot dry wind is very turbulent producing oscillating ELF electric fields which are associated with reduced melatonin. Therefore both the coastal and the inland living people with in the enhanced ELF electric fields and both experienced the symptoms associated with reduced melatonin.

Solar radiation from the high energy part of the solar spectrum, is absorbed high in the atmosphere, producing ionized atoms and molecules and free electrons. Because free electrons are more easily lost to space, this region, called the Ionosphere, has a net positive charge relative to the earth. This forms a static electric field which varies in strength from day to night, with season and with the presence of thunderstorms. The fair weather field is around 130V/m but can increase to 10kV/m beneath and within thunderstorms.

These ELF and RF signals are superimposed on the time varying static electric field some examples of which are given in Figure 1. The fair weather E field varies quite smoothly from about 20 V/m early in the morning to around 200 V/m during the afternoon. Light rain (b),

shows a nearly constant hourly mean value around 100 V/m, with reductions in E at times of rain, even becoming negative in heavier showers. During heavier precipitation the E-field is much more variable around a mean of about 100 V/m.

## 2.2 Pre-20th Century ambient exposures to ELF-UHF were extremely low:

Naturally occurring static electric and magnetic field strengths must not be confused with the strength of time varying EMR and EMF. Terrestrial biology has evolved in the long standing magnetic field of the earth and the static electric field produced between the ionosphere and the earth. The earth's static magnetic field varies with latitude, Figure 2, and year by year as the field rotates around the poles.

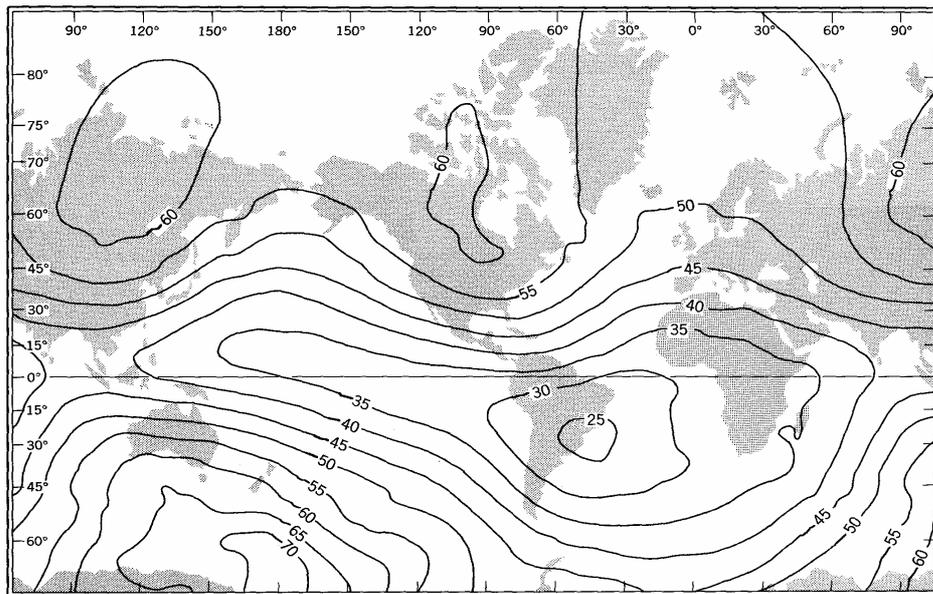

Figure 2: The earth's static magnetic field intensity in microTesla ( $\mu\text{T}$ ) for a given year, 1955.

The terrestrial magnetic field has a diurnal variation because of the distortion produced by the Solar Wind, Figure 3, and the effect of the sun.

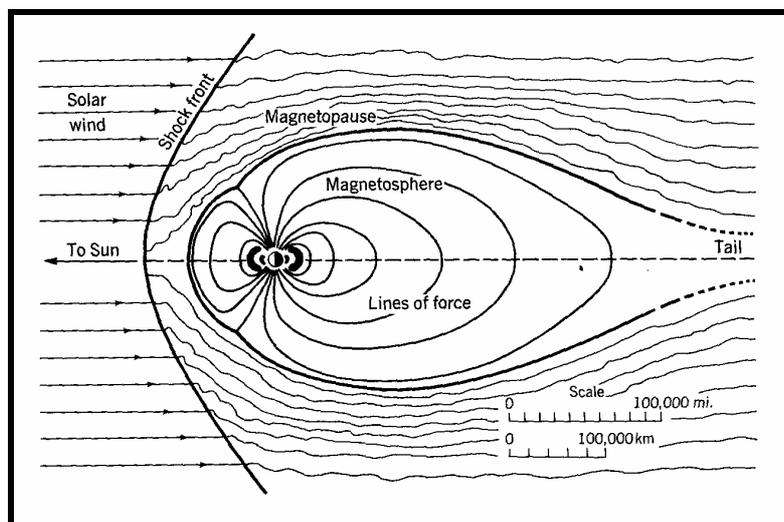

Figure 3: The earth's magnetosphere showing the effect of the solar wind which extends the lee-side magnetic field out into a "tail" region, Strahler (1963).

There are also annual solar and lunar cycles, 11-year sunspot cycles and other periodicities which create periodicities in the earth's magnetic and electric fields. An example of the diurnal magnetic field variation is seen in Figure 4.

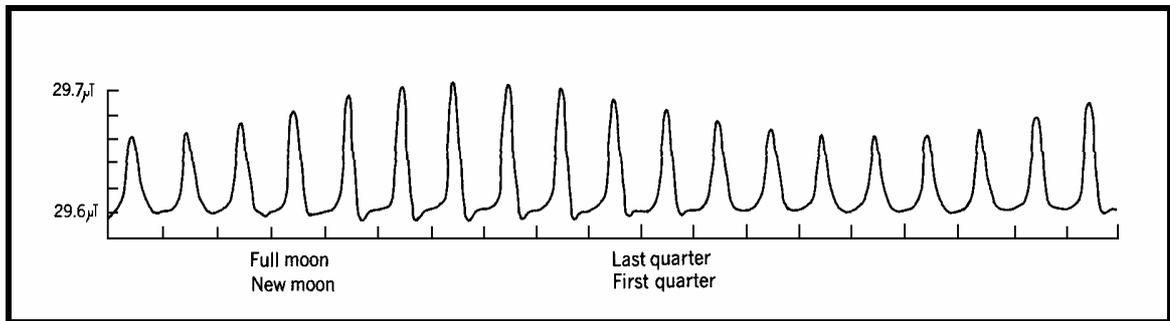

Figure 4: Daily magnetic intensity of the earth's field observed at Huancayo, Peru, throughout part of a month, showing also the moon's effect, Strahler (1963).

The natural sources of the natural radiation are galactic, solar and terrestrial. Detectable components of extraterrestrial sources at radio and microwave frequencies are extremely weak, around  $10^{-20}$  W/m<sup>2</sup>/Hz from a typical radio star. Even the sun cannot be considered a strong source of energy in the non-ionizing spectral region, making ancient ambient levels so low that the possibility of bioeffects is negligible, Adey (1981).

At 10 Hz the components of the solar flux do not exceed 0.001 V/m, with expected tissue gradients of around  $10^{-9}$  V/cm. A 10 Hz signal has a wavelength of 30,000 km making the head an extremely small fraction of the wavelength at EEG frequencies and incapable of significant radiation at these frequencies.

Terrestrial sources, primarily the Schumann Resonance Oscillations, have an amplitude around 0.0002 V/m/Hz. Schumann Resonance Oscillations originate from the radiation from lightning primarily in the tropics, the electric field radiation of which is ducted and resonates in the "electrical cavity" created between the ionosphere and the earth. The fundamental frequency is 7.8 Hz, with harmonics at 14.1, 20.3, 26.4 and 32.5 Hz. Assuming each resonant peak is associated with a 1 Hz bandwidth this results in a 0.001 V/m ELF field strength, or the same order as the solar 10 Hz flux. A combine signal of around 0.002 -0.003 V/m will produce tissue gradients in the order of  $2-3 \times 10^{-9}$  V/cm. The SR signal is in the range 0.1 to 0.25pW/cm<sup>2</sup>.

### **Human Detection of Schumann Resonances for Neurological and Cardiac Synchronization:**

Resonant absorption occurs when there is a frequency match. Figure 5 shows the typical human EEG spectrum and Figure 6 shows the typical daytime Schumann Resonance Spectrum.

Note the strong similarities between the natural E-field ELF variations and the ELF rhythms of the mammalian brain, Figure 7, not just the frequency range but also the diurnal pattern. Below evidence is given that these fields do in fact interact and alter human reaction times for example. Cherry (2002) shows that there is very strong and highly robust evidence that the SR signal is the biophysical mechanism linking Solar/ Geomagnetic Activity to human health effects related to reduced melatonin, including cancer, cardiac, reproductive and neurological health effects and mortality.

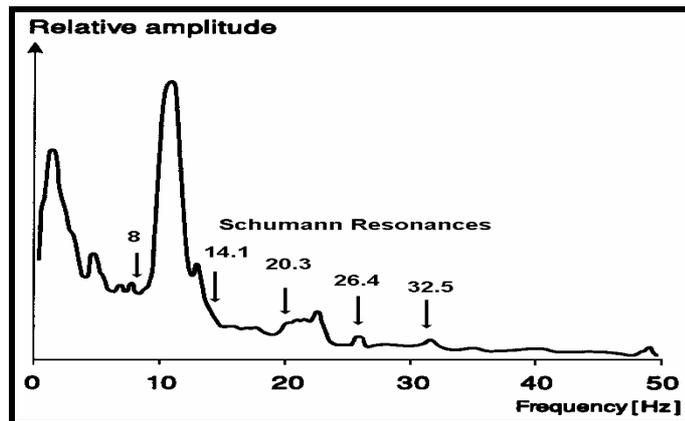

Figure 5: A typical EEG spectrum, with the Schumann Resonance peaks superimposed.

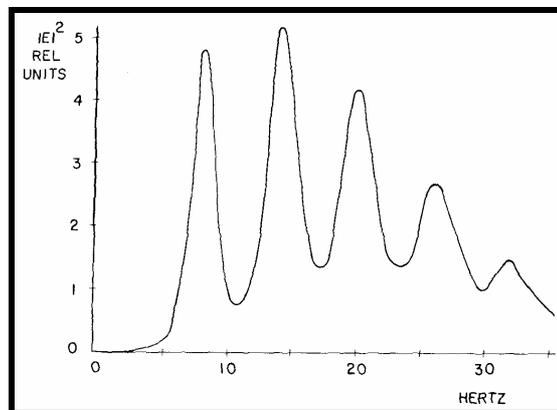

Figure 6: A Daytime Schumann Resonance Spectrum, Polk (1982).

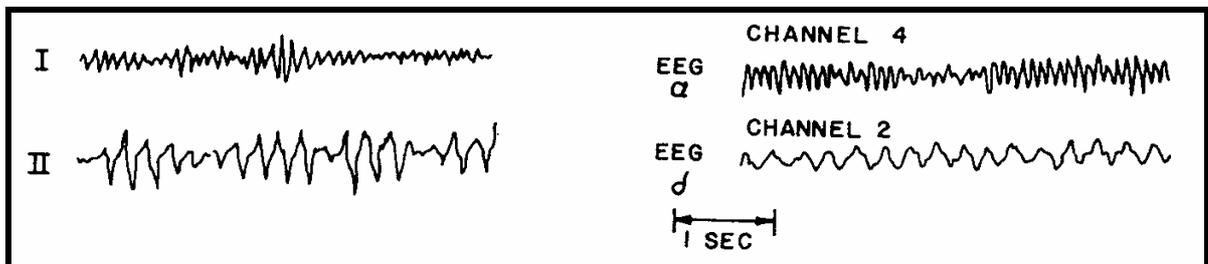

Figure 7: Electric fields from I, the Schumann-Resonance, II, Local fields of about 3 Hz and the  $\alpha$  (10 Hz) and  $\delta$  (3 Hz) human EEG channels, König (1974).

The frequency range of the Schumann Resonances and the human EEG overlap and some peaks coincide, showing the probability of resonant absorption and the likelihood of interaction. Both the high frequency peaks and the diurnal frequency shifts, high during the day and low at night, match between the two spectra. The 3Hz local field signal is very similar to the nocturnal SR signal.

It was proven, but not well known, that human brains detect, use and react to natural low frequency signals, the Schumann Resonances, König (1974). König (1974) reports on the results of an experiment carried out at the Munich Transport Exhibition of 1953, Figure 8. About 49,500 people were recorded in a visual reaction time experiment. Their reaction times were extremely highly correlated with the intensity of the Schumann Resonance signals.

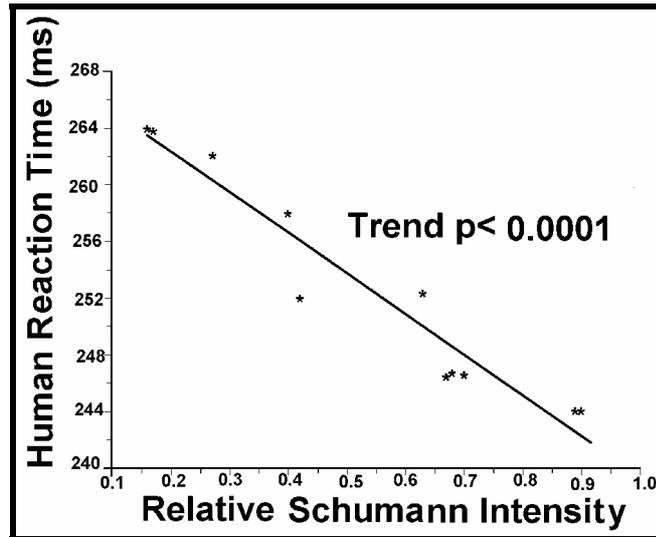

Figure 8: Human reaction times are causally correlated with natural variations in the Schumann Resonance Intensity, Konig (1974). The mean Schumann intensity (Relative Schumann Intensity =0.5) is 0.65mV/m or 0.1pW/cm<sup>2</sup>. The range is 0.2 to 1.2 mV/m (0.01 to 0.4pW/cm<sup>2</sup>).

The Schumann Resonances are global signals that radiate from tropical thunderstorms. They propagate around the world within the cavity created by the earth and the ionosphere. The intensity and spectrum of the Schumann Resonances vary markedly from day to night and with solar activity. At night both the EEG and the Schumann Resonances are dominated by very low frequencies (<5 Hz). With the coincidence of the frequency ranges, some of the high frequency peaks and the diurnal variation of the EEG and Schumann Resonances, it is biologically plausible that there is a resonant interaction between, and EEG reaction to the changing Schumann Resonance signals.

This biological plausibility is significantly strengthened by the observation that mammal brains contain and use phase-locked loop circuitry to detect and react to incoming ELF signals, Ahissar et al. (1997). Hence our brains contain a highly efficient, tuned FM receiver, Motluk (1997).

This result was confirmed by laboratory experiments that showed that 10 Hz signals significantly and consistently increase the reaction speed and 3 Hz signals slowed them down, Konig (1974). These results were independently confirmed by Hamer (1966, 1969). Hamer observed that human reaction times were significantly altered at exposure levels down to 4mV/m, 4.2 pW/cm<sup>2</sup>. This is approaching the level of the Schumann Resonance signal, which averages about 0.08mV/m, 0.1pW/cm<sup>2</sup>.

These experiments give substantial proof that extremely small natural and artificial ELF signals interact significantly with human brains. The signal level of this interaction is 2,000,000,000 times below the ICNIRP ELF guideline. This guideline is based on avoiding acute shocks and not on avoiding proven neurological effects. The maintenance of the standard is obtained by ignoring or rejecting any and all evidence that contradicts it.

Independently Wever (1974), at the Max Planck Institute, showed that by shielding people from the Schumann Resonances the average day length in isolation experiments is significantly longer than simple sunlight isolation, p<0.001. More significantly 30 % of

subjects in the Faraday Cage shielded room desynchronized,  $p < 0.001$ . This was corrected at will by the observers applying a small 10 Hz signal, Figure 9.

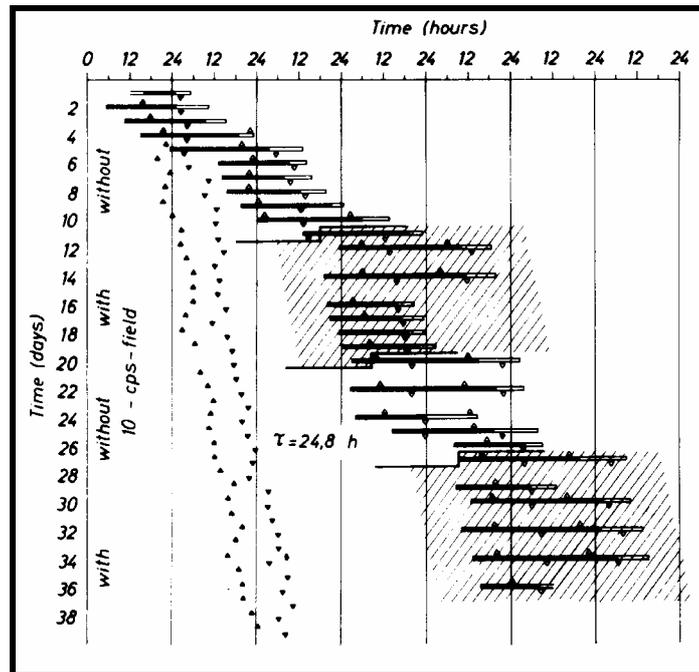

Figure 9: Free running circadian rhythm of a subject living under strict isolation from environmental time cues. The shaded period involve the secret application of 10 Hz pulsed signal with a peak-to-peak voltage of 2.5 V/m, corresponding to an rms voltage of 0.88V/m ( $S = 0.2\mu\text{W}/\text{cm}^2$ ).

**Wever concludes that these experiments “provide strong proof that electromagnetic fields in the ELF range influence human circadian rhythms, and therefore human beings”.**

Together Konig and Wever prove that human brains detect and react to the Schumann Resonance (SR) signal. This signal has a mean field strength of 0.08V/m,  $S = 0.1\text{pW}/\text{cm}^2$ . This is followed up and strongly confirmed by Cherry (2002), which also identified the melatonin mechanism and the human health effects.

This gives a very strong basis for this paradigm shift that recognizes the exquisite sensitivity of the human brain and its regulation and synchronization by these very weak naturally occurring, globally available, ELF signals. The paradigm shift is also based a classical public health approach setting standards based on epidemiology and strong evidence that electromagnetic fields and radiation is a genotoxic carcinogen.

Considering the SR signal, there is independent confirmation. In measuring the melatonin levels in electrical workers in the United States, Dr James Burch and his team at the Colorado State University, Fort Collins, found that ELF fields significantly reduce melatonin, as does cellphone use. Having removed the ELF and cellphone effects there was a residual variation in the data. This was dose-response related to Geomagnetic Activity, Figure 10.

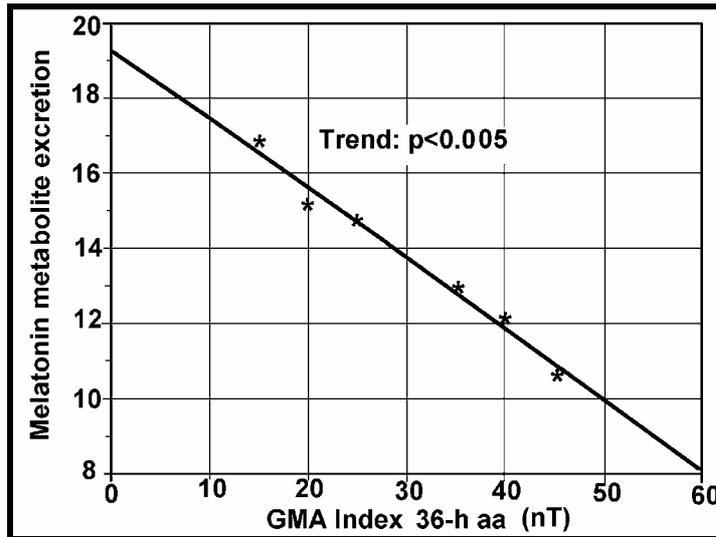

Figure 10: A dose-response reduction in human melatonin associated with increased geomagnetic activity, Burch et al. (1999).

An increase in GMA increases the nocturnal intensity of the Schumann Resonance signal that decreases the melatonin production in a causal manner (highly significant dose-response). Hence our brain's ability to detect and respond to the exquisitely minute signal of the Schumann Resonances results in changes in GMA causing physiological changes in human beings through the reduction in melatonin. A reduction in melatonin is associated with a very wide range of illnesses and diseases, including cancer, neurological, cardiac and reproductive health effects.

Cherry 2002 shows that the Schumann Resonance related health effects, operating through the melatonin mechanism, causes a homeostatic variation of cancer, cardiac, reproductive and neurological health effects in human populations. For example in relation to neurological effects, enhanced SR signal strength from enhanced S/GMA has been strongly correlated with:

Memory and attention deficit, aviation accidents, desynchronisation of the Alpha EEG rhythm, suppression of cortical activity, sensory deprivation (hearing and seeing), aggression, epileptic fits, convulsive seizures, dizziness, mental hospital admissions, suicide, migraine attacks, isolated sleep paralysis and multiple sclerosis incidence.

Lower levels of S/GMA are associated with increased levels of anxiety, vivid dreaming, crime, suicide, sports injuries, fatal work injuries, alcoholism and a psychiatric hospital admission rates.

Since the mechanism which causes these effects is a natural global radio electromagnetic signal with a mean field intensity of  $0.1\text{pW}/\text{cm}^2$  field strength of about  $1\text{pT}$ , it was predicted and confirmed in Cherry (2002) that similar effects would be found from electrical workers. The confirmation was given by multiple occupational epidemiological studies. Not all the identified effects have been found, but this is because not all effects have been investigated. However, the biological plausibility of altered melatonin related effects, produced by residential and occupational exposure to ELF and RF fields are producing all of the identified and many other health and biologically related effects.

### 2.3 The RF levels in U.S. cities in 1980:

The E.P.A. noted the extremely low levels of public RF exposure “50 years ago” was around  $10 \text{ pW/cm}^2$ , from a small number of radio stations. A survey of U.S. cities published in 1980, Tell and Mantiply (1980), found the mean urban public exposure was  $0.005 \text{ } \mu\text{W/cm}^2$ , or  $5 \text{ nW/cm}^2$ , with a median of  $6 \text{ nW/cm}^2$ , 600 times higher than 50 years earlier. At that time 0.59 % of the urban population of the U.S. was exposed to  $1 \text{ } \mu\text{W/cm}^2$  or more. This represents about a million people in 1980 exposed to more than 100,000 times more RF radiation than 50 years earlier. Figure 11 shows the frequency distribution of sampled exposures in U.S. cities in 1980.

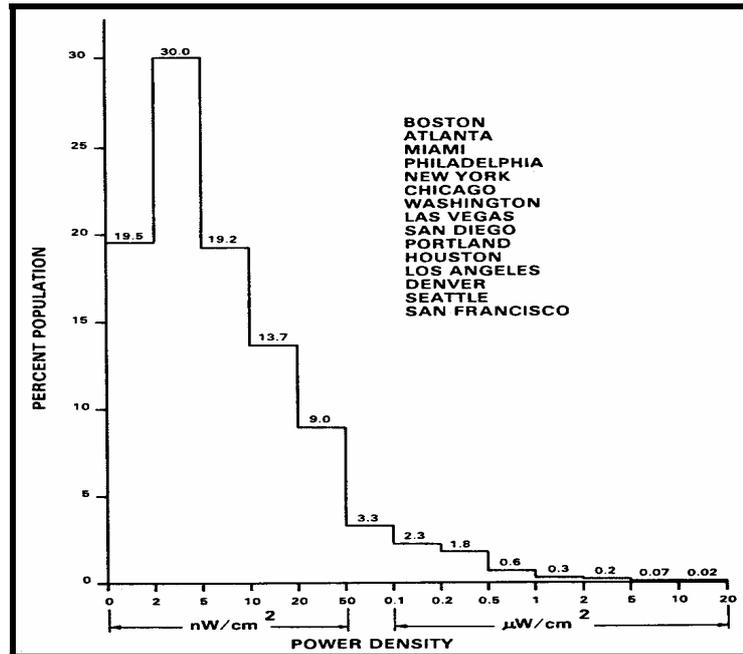

Figure 11: Frequency distribution of population exposures to RF radiation in 15 U.S. cities, Tell and Mantiply (1980).

With the explosion in the number of radio and TV stations, radio telephone networks, cordless phone and cell phones, the mean population exposures in the 21<sup>st</sup> Century will be 10-100 times higher than in 1980. Hence, compared with 50 years ago, the median public exposure levels to RF/MW radiation are generally 6,000 to 60,000 times higher now. For those living near transmission towers or the users of cell phones, the increase of the peak exposure is in the order of 1 million higher. Even the lowest of these, 6,000, is very concerning. If this was a visible or odorous substance, its presence and effects would be very evident and a grave cause for concern. Because RF/MW radiation is odorless, invisible, colorless and tasteless, its presence is virtually ignored and its effects are extremely hard for most people to conceive. Like many invisible toxic chemicals, RF/MW radiation is shown by many independent studies, including at isothermal and very low exposure levels, to be genotoxic. This puts the situation in a very different context if we ask the question,

**“Has a 6,000-fold or more increase in exposure level of people to genotoxic RF/MW had any potential effect or actual on individuals or populations of people ?”**

**Compare this with the public reaction to the question:**

**“Would you be concerned about, and urge the government to deal with your family being exposed to 6,000 times higher dioxin levels than people on Norfolk Island?”**

A genotoxic substance causes cellular DNA damage resulting in enhanced rates of cell death, mutation and cancer. If a substance is genotoxic, it causes cancer, cardiac, reproductive and neurological health effects and mortality. All of these health effects have shown rising rates in developed countries, over the past century, especially since the second World War.

### **3. The Melatonin Biological Mechanism:**

Melatonin reduction has many serious consequences including increased cancer risk for every organ in the body, increased risk of spontaneous miscarriage, impaired immunocompetence, impaired learning, memory, sleep, and enhanced incidence of anger, rage, depression and suicide. Hence when epidemiological studies identify statistically significant associations with any of these symptoms and EMR or EMF, then a melatonin mechanism is a plausible biological mechanism and that study adds to the weight of evidence that EMR and EMF alters melatonin in humans. Direct measurements of human melatonin in situations of EMR/EMF exposure are few in number but some have found reductions.

#### **3.1 The Pineal Gland:**

Melatonin is produced, primarily at night, by the pineal gland. The pineal gland is a cone shaped, pea sized body residing near the centre of the brain, Figure 12.

Light received by our eyes is the primary control source for melatonin. When it is light melatonin production is blocked. At night this blocking effect is removed. Then Tryptophan is converted to serotonin which is then converted to Melatonin at a rate controlled by an enzyme NAT (N-acetyltransferase) which has been activated or limited through protein synthesis from amino acids controlled by cyclic AMP, Figure 12.

Tryptophan, an amino acid from the blood, is converted to the hormone melatonin, which is quickly released into the capillaries of the gland. The enzymes which catalyze the conversion of serotonin to melatonin include N-acetyltransferase (NAT) and hydroxyindole-O-methyltransferase (HIOMT).

The pineal gland produces melatonin at night since the nerve endings which end in the pineal gland release the neurotransmitter norepinephrine (NE) which interacts with the b- and a-adrenergic receptors on the cell membrane; these interactions initiate the processes which control melatonin production. ATP, adenosine triphosphate; PVN paraventricular nuclei; SCN, suprachiasmatic nuclei; SCG, superior cervical ganglia. The melatonin easily passes through the cell wall into the blood stream to be dispersed throughout the body. The pineal gland is located near the centre of the brain. It is an endocrine organ which produces most of the melatonin which is found in the blood, Figure 13.

Because of its action in removing free radicals, melatonin is probably the most efficient natural cell protection and oncostatic agent in our bodies. Every night, our pineal produces large quantities of melatonin which flood almost every cell in our body, cleaning out the free radicals and assisting cell division to take place with undamaged DNA. As we age our nocturnal peak melatonin production falls markedly, making elderly people much more prone to cancer. To test the cancer protecting properties of melatonin, Tan et al. (1993), injected rats with a chemical carcinogen, safrole. Safrole normally damages DNA because it induces the production of large numbers of free radicals. Rats injected with Safrole were found to have extensive DNA damage after 24 h. When melatonin was also injected, the DNA damage was reduced by 99 %. Since damaged DNA can undergo mutation it may result in the growth of a tumour. Thus melatonin is clearly a potent cellular protector against cancer initiation.

### 3.3 Effects of melatonin:

There is evidence of the change of melatonin and serotonin that is linked to depression, anger and rage. As melatonin is a very high free radical scavenger, and free radicals are known to damage DNA. Hence reduced melatonin can lead to cancer or damaged cells which are then programmed to die (apoptosis). Lai and Singh (1997) showed that microwaves increased the single and double-strand DNA breakage in living rats brains. They also showed that the breakage did not occur if either melatonin or a chemical free radicals scavenger (PBN) were infused. They noted that PBN has been shown to protect cells from free radical-induced apoptosis. Hence melatonin has the same oncostatic protection action and reduced melatonin reduces such protection leading to enhanced cancer risk and apoptosis. Lai and Singh (1997) conclude:

**“Since cumulated DNA strand breaks in brain cells can lead to neurodegenerative diseases and cancer and excess free radicals in cells has been suggested to be the cause of human diseases, data in this study could have important implications of the health effects.”**

Free radicals have an important role in aging processes (Reiter (1995)). Aging has been ascribed to accumulated oxidative damage to body tissues, Forster et al. (1996) and Sohal and Weindruch (1996), and involvement of free radicals in neurodegenerative diseases, such as Alzheimer's, Huntington's and Parkinson's, has also been suggested, Borlongan et al. (1996) and Owen et al. (1996). Hence there is evidence that RF/MW can cause serious health problems, such as cancer which can lead to earlier death, and neurodegenerative diseases which are associated with aging.

Once apoptosis begins, cell death occurs within hours through the inter-nucleosomal digestion of the genomic DNA. In most cell systems apoptosis is part of the cell protection system by killing damaged cells so they don't become cancer cells, for example. In brain cells, which have no regeneration, enhanced apoptosis leads to neurodegenerative diseases.

Pineal and serum melatonin concentration drops during the day and rises overnight, Figure 14. This shows the great differences in nocturnal melatonin levels between individuals. Similar variations can be seen for the same people on different nights, reflecting widely differing sleep quality.

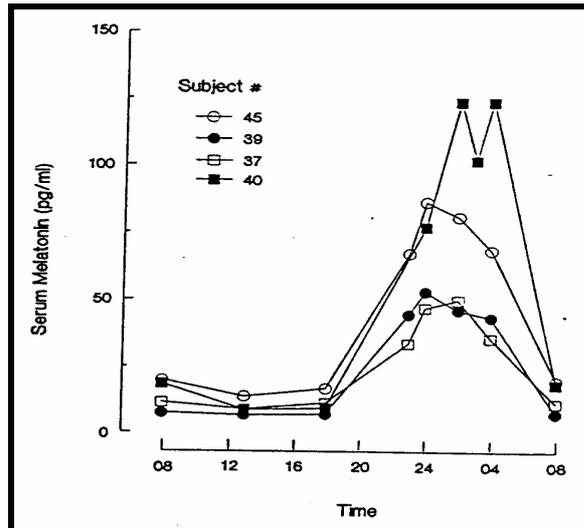

Figure 14: Blood melatonin levels for 4 healthy adult males over a 24 h period, Reiter (1994).

A natural part of aging is the reduced natural levels of melatonin which leads to increasing rates of cell damage, cancer and aging. Melatonin levels peak in childhood around 8 to 10 years and thence declines, Figure 15.

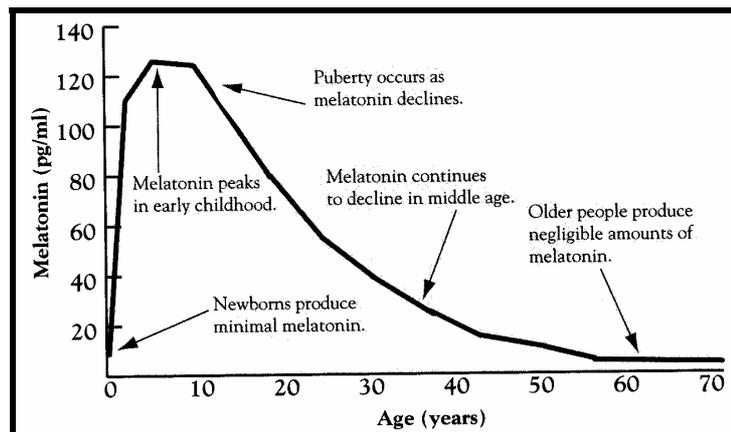

Figure 15: Peak night time melatonin varies throughout life span, Reiter and Robinson (1995).

### 3.4 Melatonin has a role in the immune system:

Melatonin is also linked to the immune system, with enhanced levels of melatonin protects and enhances the immune system. This happens through protecting lymphocytes from chromosome damage, Vijayalaxmi et al. (1995), and stimulating the T-cells, Maestroni et al. (1995), Figure 16.

### 3.5 Melatonin plays many roles:

High night-time melatonin is associated with healthy sleep, memory and learning. Thus the high nocturnal melatonin assists with physical health through good sleep and scavenging free radicals from cells throughout our bodies so that the cells divide and reproduce with healthier, less damaged DNA and chromosomes. Melatonin is critical to our DNA and cell repair systems and the next level of repair and protection system, our immune system.

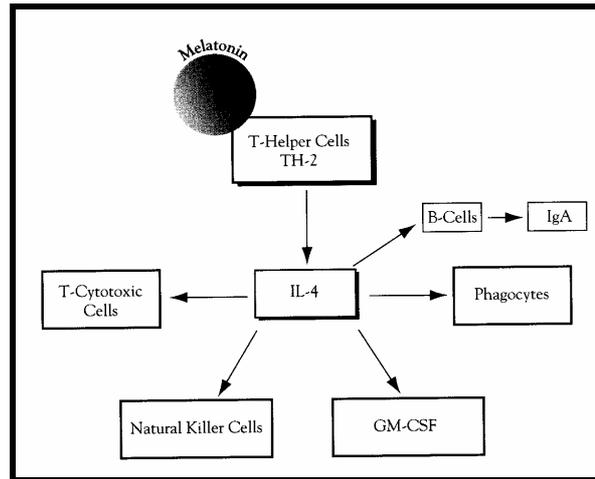

Figure 16: Melatonin stimulates T-helper cells, cited in Reiter and Robinson (1995).

Therefore any evidence that EMR can reduce melatonin, affects our sleep, memory or learning, impair our immune system and enhance apoptosis, has clear links to serious health and advanced aging problems. Reiter and Robinson (1995), identifying the following diseases that are associated with reduced melatonin “Arthritis, diabetes, heart disease, cancer Alzheimer’s Disease and Parkinson’s Disease”. In other sections they identify sleep disturbance that results in chronic fatigue, sudden infant death syndrome (SIDS), manic depression and suicide, Schizophrenia, chronic pain, seasonal affective disorder (SAD), alcoholism, and enhanced ageing. The key roles of melatonin in DNA and chromosome protection through free radical scavenging come together in the uterus where Sandyk (1992) notes that after genetic factors are taken into account, the next most important factors in the risk of spontaneous abortion are melatonin reduction and chromosome aberrations.

### 3.6 Melatonin production is inter-linked to intracellular calcium ions:

Melatonin production is interlinked with intracellular calcium ions through the fundamental role of calcium ions in all human cells, including the cells making up the pineal gland, the pinealocytes. The cyclic AMP and calcium ion dependent signal transduction processes are both involved in the regulation of melatonin production from serotonin within the pineal gland during dark periods, Figure 17.

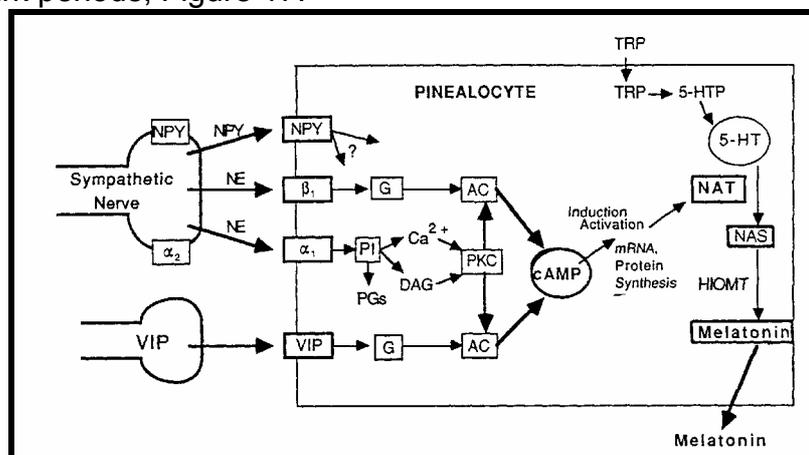

Figure 17: A schematic of the receptors and second messengers underlying the neural control of melatonin production, through which calcium ions mediate the cAMP through the protein kinase C (PKC) and thence the adenylyl cyclase (AC), Krause and Dubocoviich (1990).

### 3.7 EMR and EMF effects on the Melatonin Mechanism:

On the macro-scale, human and animal circadian rhythms are driven by the day/night cycle with a phase-lock synchronization provided by environmental ELF fields ( $E < 0.3 \text{ pW/cm}^2$ ). A fundamental physiological aspect of the circadian rhythm involves the pineal gland and the secretion of a neurohormone called melatonin. Light falling on the eye's retina produces signals which are biochemically amplified around a million times, to stimulate the pineal gland to reduce its melatonin output.

Four independent laboratories, Battelle PNL (Wilson), U.C. Riverside (Luben) and the U.S. EPA (Blackman), Lawrence Livermore Laboratory (Liburdy) have shown that 60 Hz modulated magnetic fields in the 1 to 12 mG range, almost completely negate the oncostatic effect of melatonin in human breast cancer cells, with a dose-response relationship. Wilson et al. (1986) showed significant reductions in pineal melatonin in living rats when they were chronically exposed to 60 Hz modulated electric field at 1.7-1.9 kV/m for 20 h per day, for 30 days, Figure 18.

Welker et al. (1983) studied a range of magnetic field configuration exposures on a group of Sprague-Dawley rats in relation to altered on pineal serotonin-N-acetyltransferase (NAT) activity and melatonin. Experimental inversion of the horizontal component of the natural magnetic field, performed at night-time, led to a significant decrease of both parameters investigated. During day-time, this effect was less conspicuous.

During night-time, inversion of the horizontal component is followed by a reduced pineal secretory activity for about 2 h. After 24 h exposure to the inverted horizontal component, return to the natural condition was followed by a renewed clear depression of pineal NAT activity and melatonin content, indicating that the main stimulus is not the inverted magnetic field itself but rather its change. Changing the inclination of the local magnetic field from 63 degrees to 58 degrees, 68 degrees or 78 degrees, respectively also decreased the secretory activity of the rat pineal gland.

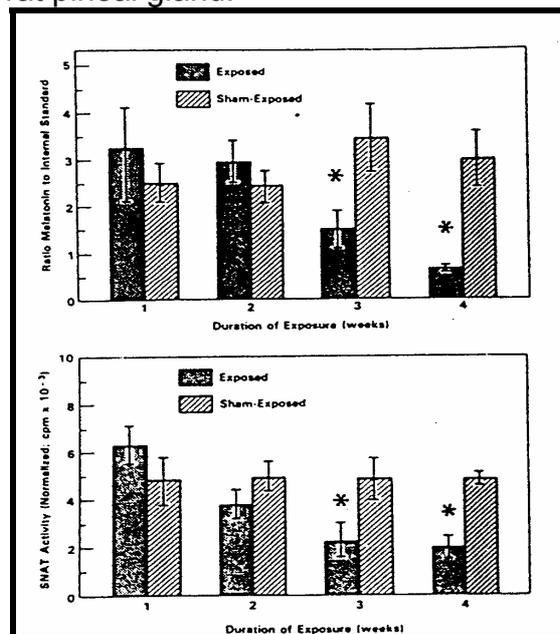

Figure 18: Pineal melatonin (top) and NAT activity (bottom) in groups of rats exposed to a modulated electric field for 1 to 4 weeks. The glands of the animals were collected at night.

In the sham-exposed animals the pineal melatonin and NAT levels were always high. However, after both 3 and 4 weeks of exposure to the electric field, both parameters were depressed ( $p < 0.001$ ).

Hence for rodents, whose cells in many ways behave as human cells, there is direct evidence that chronic electric field exposure over periods of weeks results in reduced pineal melatonin production, Figure 18, and increased serotonin production, Figure 19.

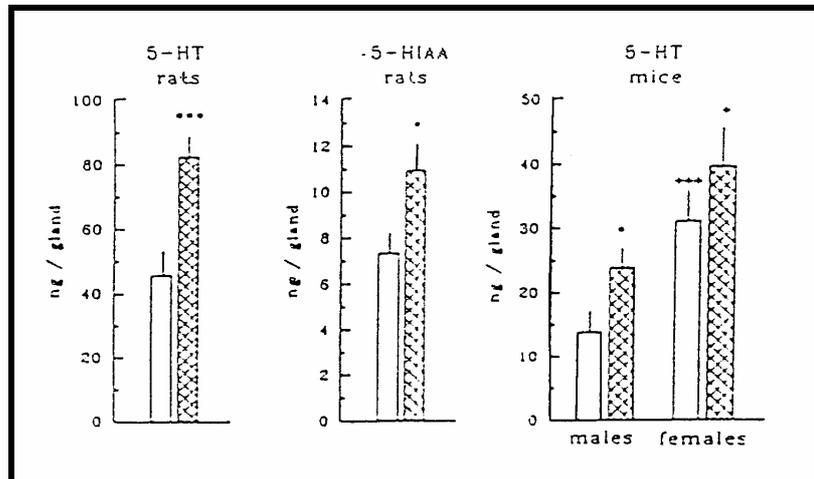

Figure 19: Pineal serotonin (5-HT) and 5-hydroxyindole acetic acid (5-HIAA) levels in rats and mice (cross-hatched bars) with and without (clear bars) exposure to pulsed static MF at night.

A highly statistically significant levels. Lerchl et al. (1988) samples for serotonin and its derivatives by periodically inverting the magnetic field at night.

In Figure 19, both 5-HT and 5-HIAA levels increased as a result of the exposure; these changes are consistent with a reduced melatonin production. \*  $p < 0.05$  and \*\*\*  $p < 0.001$  vs control; +++  $p < 0.05$  control male mice, from Lerchl et al. (1990). Thus it is shown that time varying electric and magnetic fields decrease the melatonin and increase the serotonin and NAT in rodents.

The review paper by Professor Russell Reiter (Reiter (1994)), was prompted by a number of epidemiological studies in which an increased incidence of cancer was reported in individuals living or working in an environment of higher than normal artificial electromagnetic fields. He concludes:

**“Reduction of melatonin at night, by any means, increases cell’s vulnerability to alteration by carcinogenic agents. Thus, if in fact artificial electromagnetic field exposure increases the incidence of cancer in humans, a plausible mechanism could involve a reduction in melatonin which is a consequence of such exposures.”**

He also notes:

**“Epidemiologists should look for other possible changes, including psychological depression, fatigue, sleep inefficiency, chronic feelings of jet lag, endocrine disturbances and other symptoms; all these may result from a chronically low melatonin rhythm.”**

Altpeter et al. (1995) [p 94] noted “a trend suggesting that an increased urine melatonin level is associated with the high probability of sleeping well during the night (OR = 0.903, 95% CI: 0.688; 1.455).”

A recent paper produced for the U.S. RAPID program, Burch et al (1997), reported statistically significant reductions of melatonin in a sample of 142 male electric utility workers. Those who reported occasional to frequent cell phone use had significantly lower melatonin secretion than those reporting no or infrequent cell phone use ( $p = 0.04$ ). After adjusting for age, light exposure and month of participation this association weakened slightly to  $p=0.05$ , whereas those with stable 60 Hz exposure and cell phone use the reduction was significant,  $p=0.03$ . They also concluded that “among cell phone users, there was a progressive decrease of mean 6-OHMS/cr (melatonin metabolite) concentrations in response to temporally stable magnetic field exposures. The results suggest that occupational cellular telephone use may be associated with reduced daytime melatonin production.”

Another study, Sait et al. (1997) concluded that in sensitive individuals there was a highly significant melatonin reduction,  $p= 0.005$ , with an average delay of 55 minutes ( $p<0.001$ ,  $n=11$ ), when exposed to an on/off 50 Hz magnetic field. Their nocturnal peak was reduced by 9 %, but this was not statistically significant. They found that a square wave form was more effective in reducing melatonin than a sinusoidal waveform and they concluded that for an effect to occur the magnetic field exposure had to precede the nocturnal rise in melatonin.

Hence there is direct evidence of melatonin reductions in people exposed to EMF and EMR, but that it varies considerably from person to person, that some people are much more responsive (sensitive) than others and that timing of the exposures is also a factor.

Thus in large exposed populations there are those whose melatonin will be reduced by combinations of EMF and EMR exposure and they are at increased risk of all the above identified health effects. The multiple independent studies showing a causal relationship are summarized below.

### **3.8 EMF/EMR Reduces Melatonin in Animals:**

Light-at-night and electromagnetic radiation, are proven to reduce melatonin and hence pose significant adverse health effects. The evidence for EMR is summarized here. Rosen, Barber and Lyle (1998) state that seven different laboratories have reported suppression of nighttime rise in pineal melatonin production in laboratory animals. They show that a 50  $\mu$ T, 60 Hz field with a 0.06 $\mu$ T DC field, over 10 experiments, averages a 46% reduction in melatonin production from pinealocytes. Yaga et al. (1993) showed that rat pineal response to ELF pulsed magnetic fields varied significantly during the light- dark-cycle. They found that the rate-limiting enzyme in melatonin synthesis, N-acetyltransferase (NAT) activity showed that magnetic field exposure significantly suppressed NAT during the mid- to late dark phase.

Stark et al. (1997) observed a significant increase in salivary melatonin in a group of 5 cows when the short-wave radio transmitter at Schwarzenberg, Switzerland, was turned off for three days, compared to 5 cows that had much lower RF exposure. Hence there are now at

least ten independent observations of melatonin reduction in animals from ELF and RF exposure.

### **3.9 EMF/EMR Reduces Melatonin in People**

Seventeen studies from show that ELF and RF/MW exposure reduces melatonin and enhances serotonin in people. Evidence that EMR reduced melatonin in human beings commenced with Wang (1989) who found that workers who were more highly exposed to RF/MW had a dose-response increase in serotonin, and hence indicates a dose-response reduction in melatonin. Sixteen studies have observed significant EMR associated melatonin reduction in humans. They involve a wide range of exposure situations.

This includes 16.7 Hz fields, Pfluger et al. (1996); 50/60 Hz fields, Wilson et al. (1990), Graham et al. (1994), Wood et al. (1998), Karasek et al. (1998), Burch et al. (1997, 1998, 1999a, 2000), Juutilainen et al. (2000) and Graham et al. (2000); combination of 60 Hz fields and cell phone use, Burch et al. (1997, 1999a); VDTs ELF/RF exposures, Arnetz et al. (1996), and a combination of occupational 60Hz exposure and increased geomagnetic activity around 30nT, Burch et al. (1999b). Two recent studies recorded significant melatonin reduction in women in EMF residential exposure situations, Davis et al. (2002) and Levallois et al. (2002).

### **3.10 Health effect consequences of reduced melatonin:**

Melatonin reduction is a plausible and identified mechanism for epidemiological studies associating depression with living near power lines, Beale et al. (1997) [with a linear dose-response relationship] and Verkasalo et al. (1997) [RR= 4.7, 95% CI: 1.70-13.3, for severe depression in people living within 100 m of high voltage power lines]; for suicide in association with proximity to power lines, and suicide in electrical industries. The staff of the U.S. embassy in Moscow were studied in relation to their being chronically exposed to very low exposure to a radar which was aimed at a part of the embassy. They showed elevated cancer levels, Goldsmith (1995, 1998), and statistically significant elevation in the following symptoms: Depression ( $p=0.004$ ), Irritability ( $p=0.009$ ), Difficulty on Concentrating ( $p=0.001$ ) and memory loss ( $p=0.008$ ) [Table 6.31, Lilienfeld (1978)].

Zyss et al. (1997) noted that “Numerous reports suggest a relationship between the increased incidence of depressive and neurotic symptoms in humans and the exposure to extremely low frequency electromagnetic field (EMF) at the place of residence.” They studied 70 exposed persons (35 male, 35 female) and compared them to a control group of 37. the exposed group were residents of a suburb of Cracow, Poland, living in the vicinity of two 400 V powerlines. The stated: “Our investigation showed the increased psychopathological values in all clinical tests. The difference between the group exposed to EMF and the control population was statistically significant.”

Verkasalo et al. (1997) stated that electromagnetic fields have been suggested to contribute to the risk of depression by causing pineal dysfunction. Some epidemiologic studies have supported this possibility but have generally reported crude methods of exposure assessment and nonsystematic evaluation of depression. Using two available nationwide data sets, the authors identified from the Finnish Twin Cohort Study 12,063 persons who had answered the 21-item Beck Depression Inventory of self-rated depressive symptoms in 1990. The personal 20-year histories of exposure (i.e., distance and calculated annual average magnetic fields) before 1990 to overhead 110- to 400-kv power lines were obtained

from the Finnish Transmission Line Cohort Study. The adjusted mean Beck Depression Inventory scores did not differ by exposure, providing some assurance that proximity to high-voltage transmission lines is not associated with changes within the common range of depressive symptoms. However, the risk of severe depression was increased 4.7-fold (95% CI: 1.70-13.3) among subjects living within 100 m of a high-voltage power line. This finding was based on small numbers. The authors recommend that attempts be made to strive for a better understanding of the exposure characteristics in relation to the onset and course of depression.

Beale et al. (1997) studied 540 adults living near transmission lines completed neuropsychological tests in major domains of memory and attentional functioning, mental health rating scales and other questionnaires. Magnetic field measurements were taken in each room occupied for at least one hour per day to provide an estimate of total-time-integrated exposure. The data were subjected to joint multivariate multiple regression analysis to test for a linear relation between field exposure and dependent variables, while controlling for effects of possible confounders. Performance on most memory and attention measures was unrelated to exposure, but significant linear dose-response relationships were found between exposure and some psychological and mental health variables. In particular, higher time-integrated exposure was associated with poorer coding-test performance and more adverse psychiatric symptomatology. These associations were found to be independent of participants' beliefs about effects of electromagnetic fields.

Bonhomme-Faivre et al. (1998) studied a small group (13) of exposed workers matched to 13 controls and found that those exposed to 50 Hz in the mean range of 0.2  $\mu$ T-6.6  $\mu$ T had “significant increase in degree of certain neurovegetative disorders (i.e., physical fatigue, psychical asthenia, lipothymia, decreased libido, melancholy, depressive tendency, and irritability). In addition, the population experienced a significant fall in total lymphocytes and CD4, CD3, and CD2 lymphocytes, as well as a rise in NK cells. Leukopenia and neutropenia were also observed in two persons chronically exposed to doses of 1.2-6.6 microT. The disorders disappeared when exposure stopped, and they reappeared on re-exposure.”

#### **4. Intracellular Calcium ions:**

As with melatonin, calcium ions are ubiquitous throughout our cells and our bodies. Calcium has been identified as a very important factor of many cellular processes. Morphological changes, cytoskeletal damage, cell death and cytolysis followed the elevation of cytosolic free-calcium levels. Calcium ions are very important for cell homeostasis, in fact, they control many functions of a variety of cellular responses, including secretion, cell proliferation and apoptosis, Mattana et al. (1997).

##### **4.1 Roles of intracellular calcium ions:**

“Even a rather small change in intracellular calcium can exert profound changes in cellular activity. In synaptic terminals of neurons, for example, calcium induces release of neurotransmitter molecules.” Berridge (1985) (p148): Hence any externally induced changes in the concentrations of intracellular calcium ions can have many far reaching consequences for the health and well-being of cells, organs and people.

**Table 1: Calcium ions play many roles in processes within cells, including:**

- As a second messenger in cell regulation signal transduction.
- In a signal transduction process component inter-linked to the cyclic AMP process.
- In the development and activation of the immune system, proliferation of lymphocytes and a variety of other components of immune response.
- In the degranulation and superoxide generation of neutrophils in the immune system.
- In Cell proliferation promotion at key parts of the cell cycle.
- In timing the initiation of DNA synthesis in the cell cycle.
- In Apoptosis (programmed cell death).
- In setting a preference for either apoptosis or proliferation of a damaged cell.
- In Transcription of proto-oncogenes (Genes which produce cancer).
- As a regulator of the opening and closing of the gap junction.

#### 4.2 Calcium ions as cellular messengers:

Calcium ion ( $\text{Ca}^{2+}$ ) functions as a ubiquitous intracellular messenger, Alberts et al. (1994). The first evidence that  $\text{Ca}^{2+}$  functions as an intracellular mediator came from an experiment in 1947, showing that the intracellular injection of a small amount of  $\text{Ca}^{2+}$  causes a skeletal muscle cell to contract. In recent years it has become clear that  $\text{Ca}^{2+}$  also acts as an intracellular messenger in a wide variety of cellular responses, including secretion and cell proliferation. Two pathways of signaling have been well defined, one used mainly by electrically active (excitable) cells and the other by almost all eucaryotic cells.

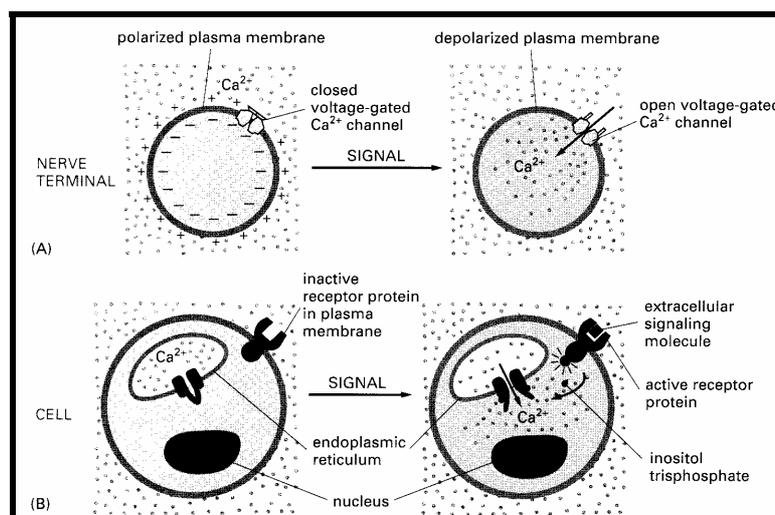

Figure 20: In (A)  $\text{Ca}^{2+}$  enters a nerve terminal from the extracellular fluid through voltage-gated  $\text{Ca}^{2+}$  channels when the nerve terminal is depolarized by an action potential. In (B) the binding of an extracellular signaling molecule to a cell-surface receptor generates inositol trisphosphate, which stimulates the release of calcium from the ER, Alberts et al. (1994).

The first of these pathways has been primarily described in nerve cells, in which depolarization of the plasma membrane causes an influx of  $\text{Ca}^{2+}$  into the nerve terminal, initiating the secretion of neurotransmitter; the  $\text{Ca}^{2+}$  enters through voltage-gated  $\text{Ca}^{2+}$  channels that open when the plasma membrane of the nerve terminal is depolarized by an invading action potential. In the second, ubiquitous pathway the binding of extracellular signaling molecules to the cell-surface receptors causes the release of  $\text{Ca}^{2+}$  from the endoplasmic reticulum (ER), Figure 20.

Calmodulin is a ubiquitous intracellular  $\text{Ca}^{2+}$  receptor. Calmodulin is a  $\text{Ca}^{2+}$  binding protein which is found in all eucaryotic cells that have been examined. A typical cell contains more than  $10^7$  molecules of calmodulin, which constitutes as much as 1 % of the total protein mass of the cell. Calmodulin functions as a multipurpose intracellular  $\text{Ca}^{2+}$  receptor, mediating many  $\text{Ca}^{2+}$  regulated processes. It is a highly conserved, single polypeptide chain of about 150 amino acids, with four high-affinity  $\text{Ca}^{2+}$ -binding sites, and its undergoes a conformational change when it binds to  $\text{Ca}^{2+}$ .

#### 4.3 Calcium ion and cAMP pathways are interlinked:

The cyclic AMP and  $\text{Ca}^{2+}$  intracellular signaling pathways interact at several levels in the hierarchy of cellular control. Firstly, cytosolic  $\text{Ca}^{2+}$  and cyclic AMP levels can influence each other. For example, some forms of enzymes that break down and make cyclic AMP are regulated by  $\text{Ca}^{2+}$ -calmodulin complexes. Also enzymes directly regulated by  $\text{Ca}^{2+}$  and cyclic AMP can influence each other, Alberts et al. (1994). In association with diacylglycerol release, calcium can activate protein Kinase-C dependent signal transduction pathways, thus modifying gene transcription, Clutton (1997). Thus induced alteration of intracellular calcium concentrations, disrupting the homeostasis of the cell, has serious consequences for the health and future development of the cell.

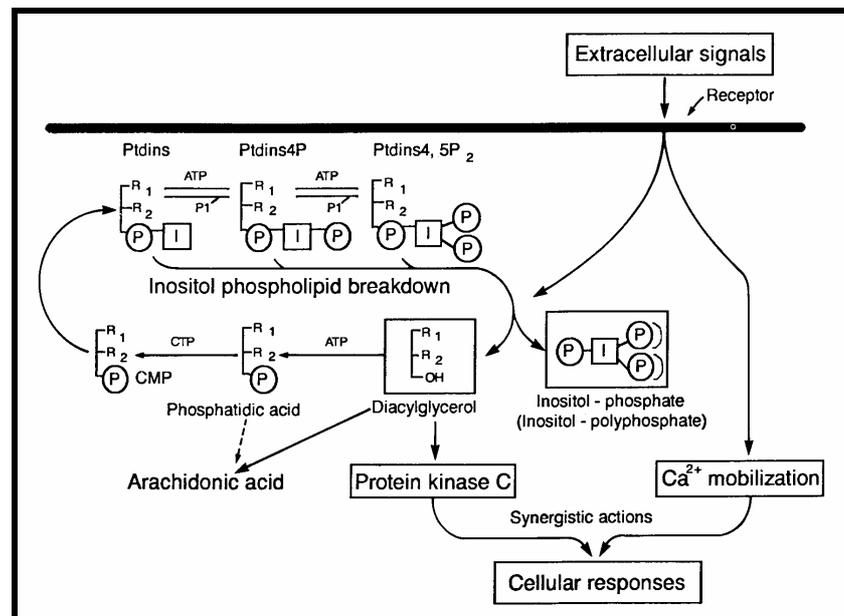

Figure 21: Illustrating the role of protein kinase C and calcium ions in signal transduction and cell responses to tumor promoters, Adey (1990).

Also, calcium ions, in partnership with cyclic AMP, control the proliferation of non-tumorigenic cells in vitro and in vivo. While it does not seem to be involved in the

proliferative activation of cells such as hepatocytes (in vivo) or small lymphocytes (in vitro), it does control two later stages of prereplicative (G1) development. It must be one of the very many regulatory and permissive factors affecting early prereplicative development, because severe calcium deprivation reversibly arrests some types of cell early in the G1 phase of their growth-division cycle in vitro, Whitfield et al. (1979).

However, calcium more specifically and much more often regulates a later (mid or late G1) stage of prereplicative development. Thus, regardless of its severity or the type of cell, calcium deprivation in vitro or in vivo reversibly stops proliferative development at that part of the G1 phase in which the cellular cyclic AMP content transiently rises and the synthesis of the four deoxyribonucleotides begins. The evidence points to calcium and the cyclic AMP surge being co-generators of the signal committing the cell to DNA synthesis.

The evidence is best explained so far by the cyclic AMP surge causing a surge of calcium ions which combine with molecules of the multi-purpose, calcium-dependent, regulator protein calmodulin (CDR) somewhere between the cell surface and the cytosol. The resulting Ca-calmodulin complexes then stimulate many different (and possibly membrane-associated) enzymes such as protein kinases, one of which produces the DNA-synthetic initiator, Whitfield et al. (1979).

#### 4.4 Calcium ions and gap junction communication:

Gap junctions are protein structures which link adjacent cells and provide a channel for the passing of small messenger molecules of 1000 daltons or less. The gap junction can open and close to control the flow. The opening and closing is regulated by the pH and calcium ion concentration. High  $\text{Ca}^{2+}$  shuts the gap junction while low  $\text{Ca}^{2+}$  open the gap junction, p 960 Alberts et al. (1994). Thus calcium ions play another key role in maintaining or interrupting the communication mechanisms for maintaining the health of cells because gap junctions are used to sense differences between cells and to initiate corrections in regulatory behaviour as necessary.

Both cAMP and calcium ions flow through gap junctions. A lowering of the intracellular calcium ion concentration has the effect of closing the gap junction and restricting this regulatory function.

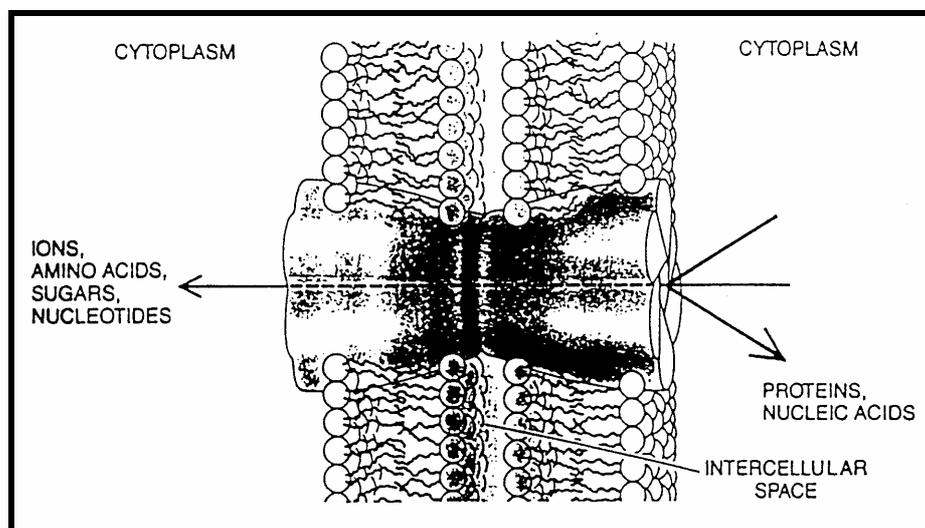

Figure 22: Schematic diagram of a gap junction between two cells.

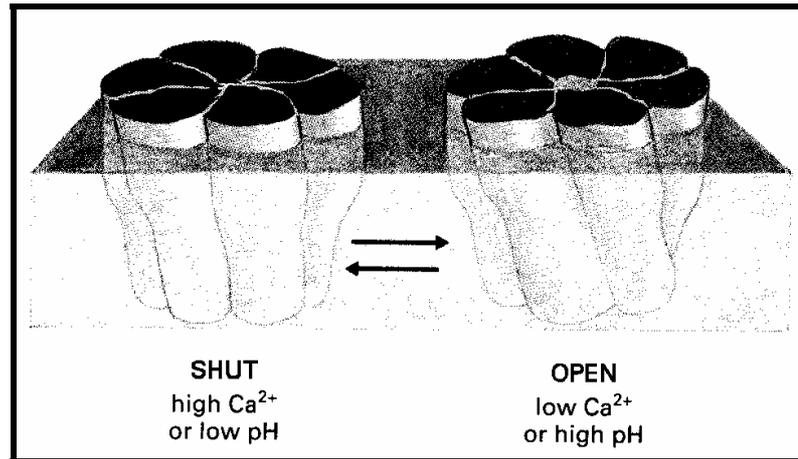

Figure 23: A small rotation triggered by high calcium ions or low pH causes the gap junction to close.

#### 4.5 Calcium ions and the immune system:

Grinstein and Klip (1989) state that:

**“It is now widely accepted that calcium plays a central role in the development of the immune system response. An elevation of  $\text{Ca}^{2+}$  (calcium ions) is a nearly universal feature associated with activation of cells of the immune system. Many responses normally elicited by physiological stimuli can be mimicked by simply elevating  $\text{Ca}^{2+}$  (calcium ions) by means of exogenous ionophores. These latter agents, which selectively increase the permeability of the membrane to divalent cations, such as  $\text{Ca}^{2+}$  (calcium ions), have been reported to induce degranulation and superoxide generation of neutrophils, proliferation of lymphocytes and a variety of other components of immune response.”**

#### 4.6 Calcium ions and cell proliferation:

Calcium ions ( $\text{Ca}^{2+}$ ) have been identified as mediators of proliferative and morphogenetic processes in many eukaryotic cells. Rodriguez-del Valle and Rodriguez-Medina (1993)

Durham and Walton (1982) outline the role of  $\text{Ca}^{2+}$  in cell proliferation.

**“Several lines of evidence suggest that  $\text{Ca}^{2+}$  ions control cell proliferation:  $\text{Ca}^{2+}$  entry into cytoplasm acts as a general mitogen; serum and serum-replacements induce  $\text{Ca}^{2+}$  influx; the  $\text{Ca}^{2+}$  concentrations in growth media required to support the proliferation of normal cells are much higher than those required for cancer cells; serum and growth factors reduce the  $\text{Ca}^{2+}$  requirements of normal cells; tumour promoters alter  $\text{Ca}^{2+}$  fluxes via a mechanism used principally by growth factors. Minor supporting evidence includes the effects of various drugs and viruses, and the behaviour of tumour cell mitochondria and intercellular junctions. It is still not possible to decide exactly where and when inside cells the critical effect of  $\text{Ca}^{2+}$  on proliferation occurs. Carried to its logical conclusion, present evidence suggests that an overridden or bypassed  $\text{Ca}^{2+}$  control process may be the key, common determinant of unrestrained proliferation in cancer cells.”**

Earlier work of Whitfield et al. (1979) revealed that altered intracellular calcium concentrations affected the cell cycle at particular points, producing different effects depending on the stage of the cell cycle.

**“Calcium, in partnership with cyclic AMP, controls the proliferation of non-tumorigenic cells in vitro and in vivo. Calcium must be one of the very many regulatory and permissive factors affecting early prereplicative development, because severe calcium deprivation reversibly arrests some types of cell early in the G1 phase of their growth-division cycle in vitro. However, calcium more specifically and much more often regulates a later (mid or late G1) stage of prereplicative development. Thus, regardless of its severity or the type of cell, calcium deprivation in vitro or in vivo reversibly stops proliferative development at that part of the G1 phase in which the cellular cyclic AMP content transiently rises and the synthesis of the four deoxyribonucleotides begins. The evidence points to calcium and the cyclic AMP surge being co-generators of the signal committing the cell to DNA synthesis.”**

This indicates that induced calcium ion efflux from a cell during the G1 phase of the cell cycle will reversibly stop the proliferation (stop or slow the cell cycle). Thus calcium ion efflux is expected to be associated with a slowing of the cell proliferation rate.  $\text{Ca}^{2+}$  also plays a key role in initiating the DNA synthesis.

#### **4.7 Calcium ions and apoptosis:**

A damaged cell can be programmed to die. This process is called “apoptosis”. Severe cell damage is caused by reactive oxygen species (ROS), which includes hydroxyl radical, hydrogen peroxide, superoxide etc.. After damage, if cellular balance is not restored, a number of pathological processes are elicited. Predominant processes resulting from oxidative stress include oxidative lipid degeneration, the loss of intracellular calcium homeostasis and alteration of metabolic pathways. All of these processes, including altered cellular calcium concentrations, have been recorded as apoptosis models. For example, calcium-dependent endonuclease activation is believed to initiate chromatin fragmentation frequently observed in apoptotic cells, Lemasters et al. (1987) and Orrenius et al. (1989).

#### **4.8 Intracellular calcium concentration alters the damaged cell’s futures:**

Balcer-Kubiczek (1994) links intracellular calcium levels to the future of damaged cells between becoming neoplastic (cancer) or dying by apoptosis. This is demonstrated by the way that the cancer promoter TPA, in low concentrations, “has been shown to switch the effect of calcium elevation from cell death to cell proliferation, probably by the activation of protein kinase C.” and “TPA leads to the maintenance of malignant phenotype by blocking apoptosis, thus allowing potentially transformed cells to survive and to develop transformational damage.”

Cytolysis is the process of dissolution or destruction of cells. Morphological changes, cytoskeletal damage, cell death and cytolysis followed the elevation of cytosolic free-calcium levels. Calcium ions are very important for cell homeostasis, in fact, they control the functions of a variety of cellular responses, including secretion, cell proliferation and apoptosis, Mattana et al. (1997). Hence reductions of intracellular calcium ions has a very important effect. Lower than normal intracellular calcium concentrations fail to activate the

protein kinase C which is necessary for apoptosis to take place. Hence damaged cells survive and proliferate with their transformed genetic damaged or changed material.

## 5. The role of EMR and EMF on Calcium ions:

### 5.1 ELF fields and calcium ion effects in the immune system:

Electromagnetic fields, through their effect on calcium ions, play a vital role in the immune system, Walleczek (1992). Walleczek (1992) quotes research relating to the role of calcium, sodium and potassium ions, including research showing that EMF could alter the activity of the membrane incorporated  $\text{Ca}^{2+}$ -ATPase responsible for pumping  $\text{Ca}^{2+}$  out of the cell (calcium ion efflux).

In addition, data from two laboratories demonstrate that ELF fields alter the activity of another membrane ion pump,  $\text{Na}^+/\text{K}^+$ -ATPase with current densities as low as  $50\mu\text{A}/\text{cm}^2$  and estimated, by the authors, to also have an effect at  $1\mu\text{A}/\text{cm}^2$ . At  $50\mu\text{A}/\text{cm}^2$ ,  $J = 0.5 \text{ A}/\text{m}^2$ ;  $E=2.5 \text{ V}/\text{m}$ , assuming  $\sigma=0.2 \text{ S}/\text{m}$ . Hence  $S= 1.7 \mu\text{W}/\text{cm}^2$  and  $\text{SAR} = 0.00063 \text{ W}/\text{kg}$ . If the extrapolation to  $1\mu\text{A}/\text{cm}^2$  is confirmed then the EMR effects will be occurring at  $1/2500^{\text{th}}$  of the S and SAR levels estimated here.

This demonstrates the extremely low induced currents, SARs and energy densities which are associated with EMR induced changes in ion pumping and calcium, sodium and potassium efflux at the cellular level.

Walleczek and Budinger (1992) report that:

**“To date, at least 10 different laboratories, including our own, have reported ELF magnetic influences on lymphoid cells, and stimulatory as well as inhibitory effects on parameters related to calcium metabolism or RNA- and DNA-synthesis have been observed.”**

They also state that:

**“A plausible magnetic interaction mechanism based on radical pair recombination reactions which are linked to cellular signal transduction and application processes has been proposed (Grundler et al. (1992)). Magnetic field intensities similar to the intensities used in most experiments (e.g. 1-30 mT) are known from magnetochemistry to be able to influence *non-thermally* the kinetics and product yields from radical pair reactions *in vitro*, Steiner et al. (1989). The underlying reaction scheme is well known and is described by the radical pair mechanism.**

**For this mechanism to be applicable to the data reported here, a pathway by which magnetically-sensitive radical-dependent processes could influence mitogen-induced lymphocyte  $\text{Ca}^{2+}$  signaling must be postulated. There is new evidence that such pathways exist.**

**For example, Con A-induced  $\text{Ca}^{2+}$  uptake in rat thymic lymphocytes has been shown to depend on the generation of reactive oxygen radical species. There is also evidence from inhibition studies that cytochrome P-450 activity may be**

involved in  $\text{Ca}^{2+}$  uptake regulation in rat thymic lymphocytes, Alvarez et al. (1992), and it is known that P-450 function proceeds via radical pair recombination steps, Hollenberg (1992). Thus it is plausible to investigate if externally applied magnetic fields may interfere with radical pair reactions and as a consequence, may alter lymphocyte  $\text{Ca}^{2+}$  regulation.”

Calcium ion influx has been shown to play a role in the transcript levels of proto-oncogenes c-myc and c-fos which alters in the presence of electromagnetic fields, Karabakhtsian et al. (1994). (Proto-oncogenes: altered genes which become carcinogenic.) Lin et al. (1994) identified a specific part of the c-myc promoter which is responsive to electric and magnetic fields. Phillips (1993) exposed T-lymphoblastoid cells to 60 Hz magnetic field and found alterations to the transcription of genes encoding for c-fos, c-jun, c-myc and protein Kinase-C.

Modulated electric and magnetic fields alter key genetic characteristics and therefore are mutagenic. This is further confirmed with studies showing EMR/EMF exposure is associated with chromosome aberrations and DNA damage, e.g. Vijayalaxmi et al. (1997) and Lai and Singh (1997). Lindstrom et al. (1995) replicated and extended the research of Walleczek (1992), using the T-cell line (lymphocytes) for human leukaemia cells, and show that oscillating low-level magnetic fields produce the same calcium ion reaction as does an antibody. They show that weak magnetic fields initiate calcium ion oscillations with a threshold flux density of  $40 \mu\text{T}$ , a plateau at  $150 \mu\text{T}$  and a frequency range from 5 to 100 Hz, with a fairly broad peak at 50 Hz. Galvanovskis et al. (1996) report significant 30% reductions in the calcium ion oscillation amplitude in human leukaemia T-cells when exposed to 50 Hz magnetic fields. The key role of modulation frequency in the alteration of calcium ions was recognized early.

## 5.2 Calcium ion efflux and modulation frequency

The very early research on brain cells efflux and influx of calcium ions using external ELF frequency fields in the same range of EEG frequencies was carried out by Dr Ross Adey and his research team, e.g. Figure 24a.

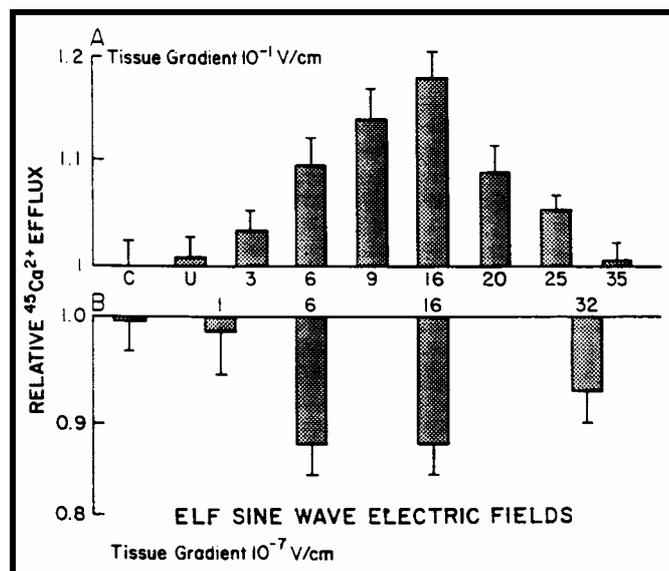

Figure 24a: ELF induced calcium ion efflux in chick brain cells from (A) an ELF modulated 147 MHz signal and (B) an ELF signal, Adey (1988).

Table 2 shows a concentration on using a modulation frequency of 16 Hz which was identified early to be an ELF frequency associated with strong calcium ion efflux compared with frequencies near it. A leading researcher in this area, Dr Carl Blackman of the U.S.E.P.A. has shown that research has identified modulation frequencies which significantly alter calcium ion efflux out to 510 Hz, Figure 24b.

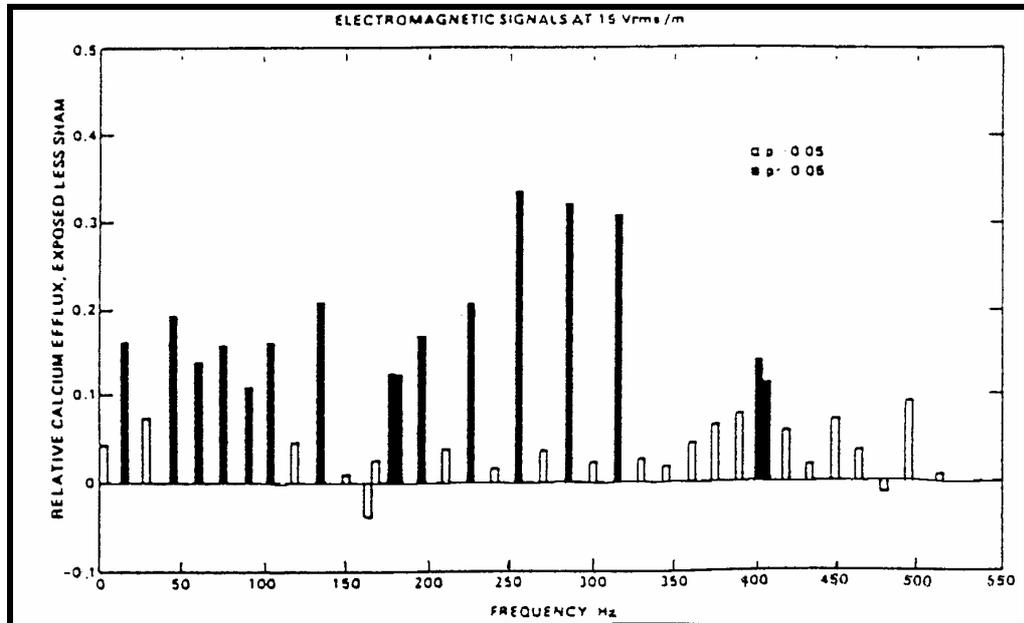

Figure 24b: The effect of 15 V/m electromagnetic fields on the efflux of calcium ions from chicken brain tissue as a function of modulation frequency. The relative efflux is the difference between exposed and unexposed samples. The data from 1 to 120 Hz are taken from Blackman et al. (1985). Blackman et al. (1988).

Their research further shows the involvement of polypeptide molecules, specifically poly-L-lysine, which the authors postulate may explain the intracellular calcium ion EMR effects on cell membrane surfaces, through the polylysine causing strong deformations on the cell surface which could trigger the release of stored calcium cations from intracellular pools, thus starting the oscillations.

Through replicating and extending the experiments of other laboratories, Dr Carl Blackman and his team at the U.S. Environmental Protection Agency have become the world leaders in calcium ion efflux research. That is why he was well qualified to review the research results and conclude, Blackman (1990) that

**"Taken together, the evidence overwhelmingly indicates that electric and magnetic fields can alter normal calcium ion homeostasis and lead to changes in the response of biological systems to their environment".**

There is extremely strong evidence that both ELF and ELF modulated RF/MW radiation causes calcium ion efflux from cells which significantly alters the intracellular calcium concentrations, reducing the efficacy of lymphocytes in the immune system, participating in the alteration of transformation of pineal serotonin to melatonin and altering the damaged cells likelihood of becoming neoplastic or dying by apoptosis.

### 5.3 The melatonin - calcium ion efflux link:

The interdependence of cyclic AMP and calcium ions is outlined in section 3.3 above. The following outlines an hypothesis for modulated RF/MW effects on melatonin.

Since it has been shown:

- That ELF electric fields do reduce melatonin production in living rats brains; Wilson et al. (1986).
- That RF/MW signals produce tissue level electric fields about a million times higher than imposed ELF signals, Adey (1981).
- That RF/MW signals are resonantly absorbed at the cell membrane, Liu and Cleary (1995).
- That altering the electric and thermal fields on the surface of the cell membrane change the binding characteristics of  $H^+$  and  $Ca^{2+}$  ions on the outer surface of the membrane, Adey (1990).
- That modulated RF/MW has been shown to induce significant calcium ion efflux from cells, Table 2 above.
- That it known that the cyclic AMP signal transduction pathway and the Calcium ion signal transduction pathway interact, Alberts et al. (1994).
- That in the pinealocyte cell the cAMP pathway is involved in regulating the transformation of serotonin to melatonin.

The calcium ion mediated responses to neurotransmitters on the membrane of the pineal cells has been discussed by Wilson et al. (1989) in relation to ELF induced melatonin reduction. Thus it is highly probable that pinealocytes exposed to modulated RF/MW will experience an outflow of calcium ions, a reduction of the cAMP signal transduction activity and a reduction in the production of melatonin. This is a highly plausible mechanism to explain why RF/MW can reduce pineal melatonin production with consequent the adverse health effects.

**Table 2: Summary of Studies concerning Calcium ion efflux and ELF Modulation of RF.**

Effects	Species	RF (MHz)	Mod <sup>n</sup> (Hz)	Intensity (mW/cm <sup>2</sup> )	Time (min)	SAR (W/kg)	Reference
<u>Altered calcium-ion efflux in brain tissue in vitro:</u>							
Frequency specificity	Chicken	147	6-20	1-2	20	0.002*	Bawin et al.(1975)
influence of pH and lanthanum	Chicken	450	16	0.75	20	0.0035	Bawin et al.(1978)
frequency and intensity specificity	Chicken	147	16	0.83	20	0.0014	Blackman et al.(1979)
intensity specificity and sample spacing	Chicken	147	9,16	0.083	20	0.0014	Blackman et al.(1980a)

## 6. Neurological Effects of RF radiation:

### 6.1 introduction to RF and Neurological functions of the brain:

Dr Henry Lai summarizes this research in Lai (1994). His opening statement is:

#### “INTRODUCTION

Many reports in the literature have suggested the effect of exposure to radiofrequency electromagnetic radiation (RFR) (10 kHz-300,000 MHz) on the functions of the nervous system. Such effects are of great concern to researchers in bioelectromagnetics, since the nervous system co-ordinates and controls an organism's responses to the environment through autonomic and voluntary muscular movements and neurohumoral functions. As it was suggested in the early stages of bioelectromagnetics research, behavioral changes could be the most sensitive effects of RFR exposure. At the summary of session B of the proceedings of an international symposium held in Warsaw, Poland, in 1973, it was stated that "The reaction of the central nervous system to microwaves may serve as an early indicator of disturbances in regulatory functions of many systems" [Czerski et al., 1974].

Studies on the effects of RFR on the nervous system involve many aspects: morphology, electrophysiology, neurochemistry, neuropsychopharmacology, and psychology. An obvious effect of RFR on an organism is an increase in temperature in the tissue, which will trigger physiological and behavioral thermal regulatory responses. These responses involve neural activities both in the central and peripheral nervous systems. The effects of RFR on thermoregulation have been extensively studied and reviewed in the literature [Adair, 1983; Stern, 1980]. The topic of thermoregulation will not be reviewed in this chapter. Since this paper deals mainly with the effects of RFR on the central nervous system, the effect on neuroendocrine functions also will not be reviewed here. It is, however, an important area of research since disturbances in neuroendocrine functions are related to stress, alteration of immunological responses and tumor development [Cotman et al. (1987), Dunn (1989), Plotnikoff et al. (1991)]. “

Dr Lai's review reports several thermal effects, e.g. Baranski (1972) reported edema and heat lesions in the brain of guinea pigs exposed to a single 3 h session to 3000 MHz RFR at a power density of 25 mW/cm<sup>2</sup> (SAR 3.75 W/kg). After repeated exposure to a lower level, myelin degeneration and glia cell proliferation were reported for guinea pigs (3.5 mW/cm<sup>2</sup>, SAR 0.53 W/kg) and rabbits (5 mW/cm<sup>2</sup>, SAR 0.75 W/kg). Pulsed RFR produced more pronounced effects than continuous-wave radiation at the same power density. These second set of experiments are athermal and produce an athermal effect.

### 6.2 Blood Brain Barrier:

Frey (1975) reports increases in the permeability of the microwave exposed blood-brain barrier (BBB). For example a 30 minute exposure to 1200 MHz RFR (2.4 mW/cm<sup>2</sup>, SAR 1.0 W/kg) as fluorescent dye was found to have crossed the BBB and was found mainly in the lateral and third ventricles of the brain. Other researchers found BBB changes only with

high exposures, e.g. Merrett et al. (1978). Dr Lai concludes: "It was apparent that in the majority of cases a high intensity RFR is required to alter the permeability of the BBB."

### 6.3 Evoked Potential:

Changes in the Evoked potential have been detected. For example, Taylor and Ashleman (1975) found that when the spinal cord was irradiated with a continuous wave 2450 MHz RFR at an incident power of 7.5 W, decreases in latency and amplitude of the reflex response were observed during exposure (3 min) and responses returned to normal immediately after exposure. They also reported that raising the temperature of the spinal cord produced electrophysiological effects similar to those of RFR.

### 6.4 Calcium ion balance in brain cells:

One of the most repeated effects of ELF modulated RF/MW is the calcium ion efflux from brain cells and muscle cells. Bawin et al. (1976) summarize some of the effects known up to that time. They are:

- Weak extracellular voltage gradients (1-5 mV/mm) have been shown to significantly affect the excitability or firing thresholds of the spinal neurons of cats.
- Nelson (1966) pointed out that the complex structural organization of brain tissues, as seen in the cerebrum, should be highly favorable for multiple electric field interactions, both in the intricate rate of overlapping dendritic trees and between macromolecules on the extracellular space and the glycoproteins of the out cell membrane.
- Weak pulsed electric currents (2-5 mV/mm, 200 pulses/sec) applied across the cat cortex were able to trigger the release of previously bound radioactive calcium ( $^{45}\text{Ca}^{2+}$ ).
- Intracranial injection of  $\text{Ca}^{2+}$  or  $\text{Mg}^{2+}$  in chronically implanted neonatal chicks resulted in an almost immediate synchronization of the hyperstriatal EEG, accompanied by behavioural depression, Bawin et al. (1984). During successive testing days, the animals appeared to recover behaviorally but never showed any sustained EEG arousal. By contrast animals treated with sodium chloride recovered completely within the first hour after injection.

Because of the high sensitivity of the chick forebrain to small perturbations of the extracellular divalent cations, this was chosen for investigating in vitro, possible interactions of weak voltage gradients induced by VHF radiation and ionic movements in cerebral tissue. The experiment showed that weak VHF fields (147 MHz, 1 mW/cm<sup>2</sup>), amplitude modulated at brain wave frequencies (6 Hz and 16 Hz) are able to increase the calcium efflux from the isolated brain of the neonatal chick. This result has been repeated by totally independent laboratories, and extended to a wide range of modulation frequencies up to 510 Hz, Blackman et al. (1988), and down to extremely low exposures. These include 10  $\mu\text{W}/\text{cm}^2$  (SAR=0.0075W/kg), Shandala et al.(1979) and an SAR of 0.00015 W/kg (S = 0.5  $\mu\text{W}/\text{cm}^2$ ), Schwartz et al. (1990).

Hence Calcium ion efflux is shown to alter mammal EEG and behaviour.

## 6.5 EEG alteration by EMR:

Professor Adey, and others, have been able to show that imposed oscillating electromagnetic fields can produce significant and repeatable changes in the behaviour of advanced mammals (cats and monkeys) in the laboratory, Adey et al. (1979). They used 450 MHz microwave signal at  $0.8 \text{ mW/cm}^2$ , modulated at 10 Hz, which produced an EEG level voltage gradient in the cat's brain of  $0.1 \text{ V/cm}$  and no detectable heating.

### 6.5.1 Altered Circadian Rhythm with extremely low exposure to RF and ELF:

Wever (1974) showed changes in human subjects isolated from environmental stimuli including ELF fields, which resulted in altered circadian rhythms which were corrected by applying a 10 Hz,  $2.5 \text{ V/m}$  field, which produces about  $10^{-7} \text{ V/cm}$  in tissue. The experiment was repeated using birds, with similar results, of lengthened circadian rhythms.

**“RF fields that are sinusoidally amplitude modulated at ELF frequencies produce a wide range of biological interactions. Induced electric gradients can be substantially higher than those produced by simple ELF electric fields, and at levels of 10-100 mV/cm, are the same range as intrinsic oscillations generated biologically, such as the electroencephalogram (EEG).”, Adey (1990)**

How does the brain cells sense these EMR fields ? The cell membrane outer surface is charged and the alpha-helix glycoprotein stands outside ends are highly charged. Calcium and hydrogen ions interact with the strands and its receptors, which is the first and most sensitive transductive coupling in brain tissue.

## 6.6 Neurotransmitters are altered by microwaves:

Many studies have shown significant efflux of calcium ions from cells exposed to ELF modulated RF and ELF fields. Since calcium ions ( $\text{Ca}^{2+}$ ) are known to stimulate specific glutamate binding to the synaptic membrane it is of value to determine whether modulated RF/MW alters glutamate binding.

An efflux has been recorded for the amino acid neurotransmitter gamma-aminobutyric acid (GABA), Kolomytkin et al. (1994), in association with microwaves modulated at 16 Hz. This is very significant since GABA and glutamateric synapses make up about 60 % of the CNS and calcium ions appear to hold the key to every aspect of cell-surface transduction, Adey (1979). Kolomytkin et al. (1994) showed that at 915 MHz microwave signal, modulated at 16 Hz, altered the binding of 3H-glutamate and 3H-muscimol in rats brains, at power densities below  $50 \text{ } \mu\text{W/cm}^2$ , which are statistically significantly different from controls to below  $10 \text{ } \mu\text{W/cm}^2$ , Figure 25.

Kolomytkin et al. (1994) link these changes to  $\text{Ca}^{2+}$  ions which have been shown to stimulate specific glutamate binding to synaptic membranes due to the activation of a calcium-dependent protease and resulting proteolysis (splitting into fragments) of cytoskeletal proteins. Since it is shown that modulated microwaves increase the glutamate uptake by synaptomes, Kolomytkin et al. pose the question as to whether microwaves directly affect the synaptosomes or does their sensitivity require some other brain system ? They determined that it was the synaptosomes which were sensitive to the microwaves. They then investigated whether it was a simple heating effect.

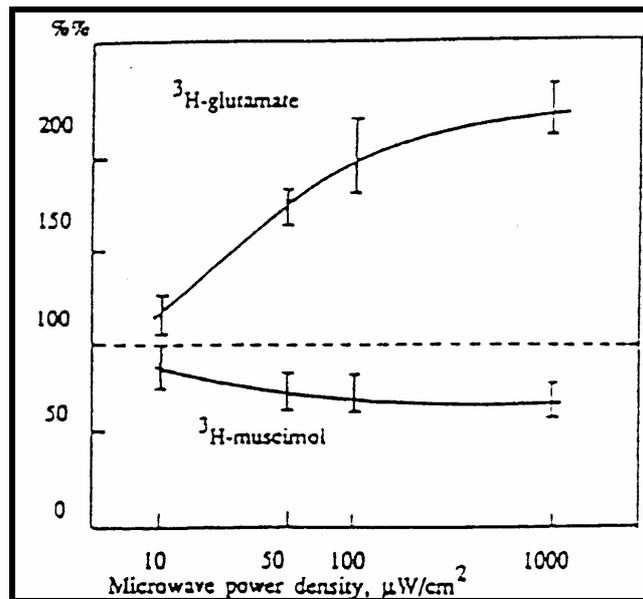

Figure 25: Altered the binding of  $^3\text{H}$ -glutamate and  $^3\text{H}$ -muscimol in rats brains versus microwave power density (915 MHz, modulated at 16 Hz), Kolomytkin et al. (1994).

Heating the samples to produce the same mean SAR did not produce the result. Hence they proposed the mechanism of localized microheating at the cell membrane. This membrane heating in the presence of microwaves has been demonstrated now by Liu and Cleary (1996). However, heating alone at the cell membrane level is unlikely to be the cause of the trends shown in Figure 20 since they follow a systematic change down to below  $10 \mu\text{W}/\text{cm}^2$ .

Kolomytkin et al. (1994) conclude that:

**“Our findings can be directly related to and complement the findings of Frey and Wesler (1990) and Kavakiers and Ossenkopp (1992). Frey found that dopamine and opiate systems of the brain were influenced by exposure to low intensity electromagnetic fields. Kavaliers has shown that electromagnetic fields can influence the functioning of multiple endogenous opoid systems and that the effects depend on the modulation of the field. Considering the great importance of GABA and glutamatergic systems in both normal and pathological brain processes, the finding of low intensity microwaves on these receptor systems is of significance.”**

This conclusion, which shows the findings of three independent studies, conforms to the requests of sceptics to show replication. Replication has been carried out and the effects are confirmed.

## 6.7 The Electroencephalograph (EEG) evidence from animals

The Electroencephalograph (EEG) provides a non-invasive means of monitoring the electrical activity of the brain.

Three studies show arousal in anesthetized rabbits with chronic athermal RFR exposure, Baranski and Edelwejn (1974) ( $7 \text{ mW}/\text{cm}^2$ , 200 h), Goldstein and Sisko (1974) (5 min,

9300 MHz, 0.7-2.8 mW/cm<sup>2</sup> ), and Servante et al. (1975) (rats, 10 days, 3000 MHz, 500-600 pps, 5 mW/cm<sup>2</sup> ).

Dumanskiy and Shandala (1974) and their colleagues reported altered conditioned reflex in rabbits and rats chronically exposed to extremely low levels of VHF and microwave fields. They used either 50 MHz or 2.5 GHz CW fields or 10 GHz 1  $\mu$ s pulses at 1,000 or 20 Hz, with 10-12h daily exposure with 50 MHz and 8 h with microwave fields. They found statistically significant effects with field intensities between 1.9 and 2.0  $\mu$ W/cm<sup>2</sup>.

In each experiment the animals were irradiated for 120 days, with a 60 day follow-up. For the first 10 days the animals were "somewhat excited" and reacted to the onset of exposure. Thereafter responses to conditioned stimuli has a longer latency, with weaker responses to positive stimuli and more numerous missed responses, leading to "pathologic stagnation and inertia".

Shandala et al. (1979) found statistically significant changes in the EEG and brain biochemistry of rats and rabbits exposed to 2.375 GHz microwaves at 10, 50 and 500  $\mu$ W/cm<sup>2</sup>, for 7 hours/day over 30 days. The 10 $\mu$ W/cm<sup>2</sup> and 50 $\mu$ W/cm<sup>2</sup> initially stimulate brain activity, while 500 $\mu$ W/cm<sup>2</sup> causes suppression as seen from the increase in slow, high amplitude  $\Delta$ -waves. After 1 month of exposure to a power density of 10 $\mu$ W/cm<sup>2</sup> (for 7hr/day, i.e. averaging 2.9 $\mu$ W/cm<sup>2</sup>) a reliable ( $p < 0.05$ ) increase was observed in the alpha-rhythm in the sensory-motor and visual cortex due to a suppression of the slow EEG components.

Clifford et al. (1989), in an effort to duplicate research carried out in the Soviet Union. The U.S. group found significantly less Na<sup>+</sup>, K<sup>+</sup> and ATPase activity in microwave exposed animals compared to sham exposed animals. Both groups found incidences of statistically significant effects in the power spectrum analysis of EEG frequency, but not at the same frequency.

These interactions included entrainment of brain EEG rhythms at the same frequencies as the ELF components of the imposed fields, conditioned EEG responses to imposed fields, and modulation of brain and behavioural states, Bawin et al (1973); and in non-nervous tissues, strong effects on cell membrane functions, including modulation of intercellular communication through gap junctions mechanisms, Fletcher et al. (1986), reduction of cell mediated cytolytic immune responses, Lyle et al. (1983), and mediation of intracellular enzymes that are markers of signals arising at cell membranes and couple to the cell interior, Byus et al. (1984, 1988).

Vorobyov et al. (1997) studied short-term alterations of EEG in mice exposed to ELF fields carried on a 945 MHz microwave carrier with exposures in the range 100 to 200  $\mu$ W/cm<sup>2</sup>. They found an induced asymmetry in the EEG on each side of the brain of an ongoing EEG power decrease in the 1.5-3 Hz range in the left hemisphere and a power increase in the 10-14 Hz and 20-30 Hz ranges in the right hemisphere. Significant elevations of EEG asymmetry in the 10-14 Hz range were observed after the first 20 s after five onsets of the microwave field, when averaged spectra were obtained for every 10 s. In their conclusions they comment that :

**"One of the possible key links in this effect can be calcium ion exchange in brain tissue (Adey (1981)). Indeed it was found that the intracellular**

**calmodulin level was changed by modulated microwave fields, Katkov et al. (1992), This change, as is known, can cause the change in receptor sensitivity to mediators, because in neural tissues both the transmitter-receptor mechanism and the second messenger are  $Ca^{2+}$  dependent."**

Many studies show that RF/MW exposure at athermal levels alters the EEG in animals. This is, that brain function relating to thinking and mood, altering the various bands of the EEG spectrum. With so many effects found in the higher mammals, this suggests that human brain activity and function might also be altered by EMR exposure, especially in the microwave range and with the signal contain ELF modulation which might find some way to resonantly interact with the brains EEG signals and alter them.

Lai et al. (1989) studied the acute effect of  $1 \text{ mW/cm}^2$ , SAR= 0.6 W/kg, 2450 MHz radiation exposed rats for 20 to 45 min. in terms of spatial learning and memory function using a radial arm maze. The exposed rats made significantly more errors than sham exposed rats.

Adey (1991) goes a considerable way towards describing the mechanisms which underlie these changes in the brains of higher animals, including people. Dendritic cells in the brain, high levels of entrainment of ELF signals from RF/MW ELF modulated radiation, associated with changes in calcium ion concentrations and altered release and binding of neurohormones and neurotransmitters, such as GABA, serotonin and melatonin, have all been described and linked to EMR exposure.

Adey (1981) states that there is **"unequivocal experimental evidence that fields from ELF to UHF (10 Hz -450 MHz) interact directly with brain tissue"**. Some of the evidence for this is summarised in Table 3.

Table 3: Identified tissue level electric field gradients to which living species are responsive, Adey (1992).

Organism	Function	Tissue Gradient	Imposed Field
Sharks and rays	Navigation and predation	$10^{-8} \text{ V/cm}$	DC to 10 Hz
Birds	Navigation	$10^{-7} \text{ V/cm}$	0.3 G
Birds	Circadian rhythms	$10^{-7} \text{ V/cm}$	10 Hz, 2.5 V/m
Monkeys	Subjective time estimations	$10^{-7} \text{ V/cm}$	7 Hz, 10 V/m
Man	Circadian rhythms	$10^{-7} \text{ V/cm}$	10 Hz, 2.5 V/m
<u>Comparison with Intrinsic Cell and tissue Neurochemical Gradients</u>			
	Membrane Potential	$10^5 \text{ V/cm}$	
	Synaptic Potential	$10^3 \text{ V/cm}$	
	Electroencephalogram	$10^{-1} \text{ V/cm}$	

ELF fields in the order of  $10^{-7} \text{ V/cm}$  are used in orientation, navigation and prey attack in marine vertebrates, in bird navigation and in mammalian biorhythms. Similar ELF fields modify calcium binding in cat and chick cerebral tissue. At higher tissue gradients around

0.1 V/cm induced by RF fields with low-frequency modulation, there are alterations in “spontaneous” ELF fields potentials in EEG wave trains evoked as conditional responses, and in the release of calcium from cerebral tissue.

Dr Adey remarks that **“a striking feature of some of these observed interactions with weak radio-frequency (RF) fields is their relationship to the modulation frequencies in the ELF range and not to the radio carrier frequency.”**

This clearly demonstrates an athermal effect, an effect which is related to the modulation frequency and not to the intensity or frequency of the RF carrier. This data shows that biological systems involving the brain are sensitive to and reactive to induced field tissue gradients at far lower levels than assumed limitations imposed by the Membrane Potential and the Synaptic Potential, and well below field strengths associated with the EEG.

Just because effects are found in animals some claim that it does not necessarily apply to people. Cells and organs of mammals are highly similar to the cells of human beings, who are also mammals. Many toxic substances are tested on animals and the results are applied to people. In the case of EMR the reluctance to apply results shown in animal experiments to people as often related to a strong desire not to agree that there affects from commercially and militarily important technology. When it comes to the question of public health, these sectorial interests should not prevail. However, a strong reason why they should not prevail is also that the effects have also been found in people.

## **7. EMR induced EEG changes in humans:**

Are these effects found in humans? Two papers known to the author show EMR alteration of the human EEG. The first, Von Klitzing (1995) shows dominantly EEG delta to alpha rhythm change when exposed to GSM signal. The second shows sleep and EEG change with GSM phone exposure.

### **7.1 Human EEG delta to alpha when GSM exposed:**

Von Klitzing (1995) shows the same result, alpha enhancement and slow wave suppression in human subjects exposed to a GSM cell-phone like signal with an SAR of 0.001 W/kg ( $S = 0.7\mu\text{W}/\text{cm}^2$ ), (from Eq. 8 using  $\sigma=0.77$  S/m) and a pulse frequency of 217 Hz. The power spectrum of one of the subjects is shown in Figure 26. Von Klitzing’s paper presents an example of the 45 experiments from 17 students tested. Around 70 % of the students showed significant alteration in their EEG at these very low exposure levels.

The human subjects react much more quickly than the rat and rabbit subjects. Not all human being show this sensitivity. The author underwent the exposure and EEG test and showed no significant difference between the exposure and unexposed periods. He therefore joins the 30 % who show no effects.

### **7.2 Cell phone signal alters sleep EEG:**

Healthy people sleeping with a digital GSM cell phone on next to the bed, exposing their heads to about  $50\mu\text{W}/\text{cm}^2$  while their brain EEG was being monitored, Mann and Roschke (1996). This revealed a statistically significant disruption of alpha EEG frequency range and REM sleep. REM sleep decreased from 17.07 % to 13.91 %, which is significant at

$p < 0.05$ . In addition subjects went to sleep faster, a hypnotic effect also reported by Reite et al. (1994) who used a signal of 27.12 MHz modulated at 42.7 Hz.

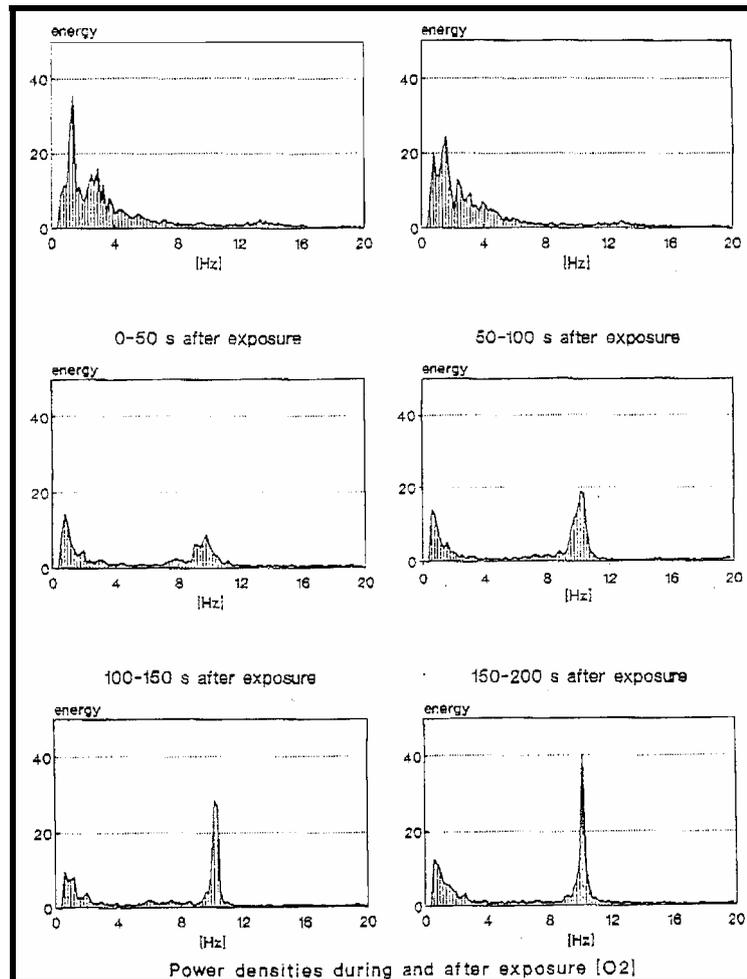

Figure 26: Human Alpha-EEG (O2-position) is altered by pulsed electromagnetic fields following first exposure, Von Klitzing (1995).

Mann and Roschke (1996) exposed 14 healthy, non-smoking, non-drinking, 21-34 year old male volunteers to 900 MHz, pulsed at 217 Hz with a pulse width of 580  $\mu\text{s}$ , digital GSM signal with a resultant average power density at the head of 50  $\mu\text{W}/\text{cm}^2$ . They concluded that:

**“Besides a hypnotic effect with shortening of sleep onset latency, a REM suppressive effect with reduction of duration and percentage of REM sleep was found. Moreover, spectral analysis revealed quantitative alterations of the EEG signal during REM sleep with an increased spectral power density. Knowing the relevance of REM sleep for adequate information processing in the brain, especially concerning the mnemonic functions [Memory functions] and learning processes, the results emphasize the necessity to carry out further investigations on the action of this type of electromagnetic fields and the human organism.”**

The results are summarized in Figure 27.

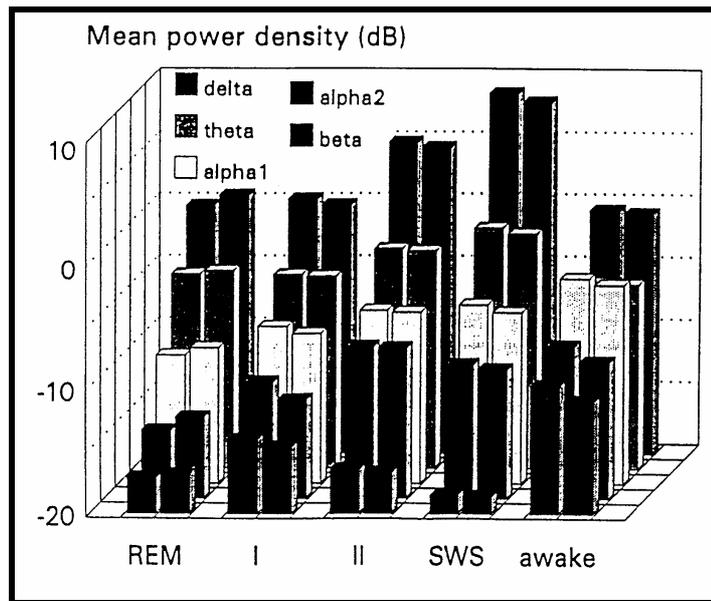

Figure 27: Mean power density (dB) of the averages of different sleep stages in 12 subjects averaged, left columns without field and right columns with GSM digital field of  $50 \mu\text{W}/\text{cm}^2$ .

Reite et al. (1994) also found an hypnotic effect when a 27.12 MHz signal, modulated at 42.7 Hz as applied over a 15 min. period. Exposed subjects reached a deeper state of sleep than sham exposed subjects.

The GSM exposed subjects also reported having fewer “bad dreams”. This is consistent with reduced melatonin. Post sleep subjective surveys found non-significant changes with GSM exposure such as reduced sleep quality, number of wakings. Post waking increased calmness and alertness, along side decreased concentration and increased anxiety. These latter two are frequently associated with increased daytime serotonin. The authors relate REM sleep impairment to memory and learning processes. Recently large numbers of cell phone users have been reporting headache, loss of concentration and memory impairment. This is consistent with these results.

Hence human studies, as with the animal studies above, shows that EMR from pulsed microwaves, including a cell phone signal, induces alterations in the human EEG in awake people, Von Klitzing (1995) and in sleeping people, Mann and Roschke (1996). Earlier German observations found that extremely low levels of EMR altered the reaction times and circadian rhythms of people. This suggests that there could be memory, and learning impairment in humans exposed to low level EMR.

## 8. Studies showing learning difficulties with EMR exposure:

Sound REM sleep is necessary for learning, memory and wellbeing. Any studies associating learning difficulties with EMR exposure would strengthen this association and the evidence of likely melatonin reduction and sleep disruption.

Three published papers or reports identify such effects:

- Chiang et al. (1989) found that visual reaction time, a measure of the function of the visual receptor and the central nervous system, varied with microwave exposure of children up to  $4 \mu\text{W}/\text{cm}^2$ . Children exposed to over  $10 \mu\text{W}/\text{cm}^2$  had lower scores in the

memory function test. They concluded “the data indicate that chronic exposure to EMFs are associated with significant changes in some physiological parameters.”

- Altpeter et al. (1995) showed a statistically significant delay in promotion from primary to secondary school in the more highly exposed school compared to a low exposure school, OR= 0.63, 95% CI: 0.43-0.85,  $p < 0.005$ . This involved short-wave radio exposure. The daily mean exposures in the highly exposed group were in the range 0.031 to  $9.1 \mu\text{W}/\text{cm}^2$ , median  $0.1 \mu\text{W}/\text{cm}^2$  and mean  $0.24 \mu\text{W}/\text{cm}^2$ .
- Kolodynski and Kolodynska (1996) investigated the effects of a RLS radar in Latvia, radiating at 154-162 MHz and pulsed at 24.4 Hz, on the performance of school children living several km in front of the radar compared to children living behind the radar. They concluded that “Motor function, memory and attention significantly differed between exposed and control groups. Children living in front of the RLS had less developed memory and attention, their reaction time was slower and their neuromuscular apparatus endurance was decreased.” Assuming that the closest child lived 2km in front of the radar, the maximum mean measured exposure is in the  $0.16 \mu\text{W}/\text{cm}^2$ .

Hence there is evidence from a wide range of RF/MW frequencies, at public exposure levels of around  $0.1 \mu\text{W}/\text{cm}^2$  and less, of learning, memory, sleep and physical performance of children; sleep disruption, aches, pains and chronic fatigue in adults. All of these symptoms are consistent with the hypothesis that RF/MW reduces nocturnal melatonin with consequent psychological and physical impairment.

## **9. Human Reactions to Atmospheric EMR/EMF changes:**

Thus the German work in the 1960's and 1970's established that naturally occurring EMR and EMF at extremely low levels influenced and altered sleep, circadian rhythm and reaction times. Later German work showed the cell phone and cellphone-like signals alter the human EEG and interfere with REM sleep. Impairment of REM sleep is associated with memory and learning difficulties. The Swiss research (Schwarzenburg Study) found a causal relationship between sleep disturbance and subsequent chronic fatigue, and short-wave radio exposures at extremely low mean levels.

### **9.1 Conclusions - EEG, Learning and EMR:**

These recent studies show unequivocal evidence that low level modulated and pulsed RF/MW signals, including GSM digital signals, alter the human EEG and affect the state of sleep in ways which interfere with information processing and learning. This confirms a neurological basis for the observed impairment of children's learning in Switzerland, Latvia and China.

Hence, far from being isolated examples, as this report brings together multiple studies showing adverse alterations of human EEG, learning, memory, reaction times, sleep efficiency in humans which has also been demonstrated in animals. In rabbits, Dumanskiy and Shandala (1974) and Shandala et al. (1979); and in cats, Bawin et al. (1973). Studies on altered reaction times and circadian rhythms in humans and animals are linked to EEG changes, Adey (1981).

These alterations are consistent with the calcium ion and melatonin effects, both of which also point to increased risks of cancer.

## 10. Cancer results from EMR/EMF

Evidence here shows that RF/MW and ELF are carcinogenic at the cellular level, increase tumours in animals with chronic exposure and increase the incidence of cancer in human populations. Leukaemia and brain tumor are commonly associated with EMR, but cancers of almost all organs have been associated.

### 10.1 The cell membrane is the primary site of many EMR interactions:

Adey (1990) reviewed the evidence for nonlinear cell membrane transductive coupling and concluded:

“We have reviewed event that couple chemical stimuli from the cell surface receptor sites to the interior. Weak imposed electromagnetic fields with low-frequency components (typically in the spectrum below 100 Hz) have proved unique tools in identifying the sequence and energetics in these events. Cell membranes are primary sites of interactions with these fields. recent observations have opened doors to new concepts of communication between cells as they whisper together across barriers of cell membranes. regulation of cell surface chemical events indicates a major amplification of initial weak triggers associated with binding of hormones, antibodies and neurotransmitters to their specific binding sites. Calcium ions play a key role in this stimulus amplification. The evidence supports nonlinear, nonequilibrium processes at critical steps in transmembrane coupling.”

“Communication between cells through gap junctions is also sensitive to low-frequency electromagnetic fields at athermal intensities. We hypothesize that cancer promotion may involve dysfunctions at cell membranes, disrupting inward and outward signal streams.”

“There is evidence that these fields may participate in the promotion phase of carcinogenesis by at least two mechanisms: through effects on immune responses and by direct effects on mechanisms regulating cell growth.”

### 10.2 Cancer and Cell Death are closely linked at the cellular level:

The cellular processes which have the potential to lead to cancer (neoplastic transformation) and to cell death (apoptosis) are very tightly related in terms of the factors which regulate cell growth and development. Apoptosis (programmed cell death) is a pathway of cell death characterized by internucleosomal digestion of the genomic DNA, Balcer-Kubiczek (1994). Neoplastic transformation involves the alteration of the genomic DNA, particularly involving certain genes which appear to suppress programmed cell death; these include the *bcl-2* oncogene, over-expression of *c-myc*, *c-ras*, *c-fos* and *c-jun*, ornithine decarboxylase (ODC) genes or reproduction of the wild-type *p53* tumor suppresser gene. DNA fragmentation can be induced in mammalian cells by a wide variety of stimuli, including cytotoxic, carcinogenic and anticarcinogenic agents. Among other factors, it can be overcome by an elevation of intracellular calcium. It can also be overcome by phorbol esters with tumor-promoting activity, such as TPA (12-O-tetradecanoyl-phorbol-13-acetate).

Low concentrations of TPA have been shown to switch the effect of calcium elevation from cell death to cell proliferation, Kizaki et al. (1989), probably by activation of protein kinase C, McConkey et al. (1988). Hence the calcium ion concentrations inside the cell are a central factor in influencing whether the damaged cell dies by Apoptosis or survives with altered

genetic structure which enhances cell proliferation and hence is neoplastic and potentially tumor forming.

One of the strongest and most repeated effects seen in brains, hearts and muscles of exposure to ELF and RF/MW with ELF modulations, is calcium ion efflux, e.g. Blackman et al. (1981), Adey et al. (1982), and Schwartz et al. (1990). Hence the many experiments which have found statistically significant efflux of calcium ions from cells in EMR exposed organs, which couples with the cellular understanding of the role of calcium in influencing the future of a damaged cell, whether it dies or survives to potentially produce a tumor, provides a clear mechanism for the role of low intensity EMR in promoting cell death and cancer. In most organs the desired outcome is enhancing cell death since damaged cell are removed this way. However, in the brain accelerated cell death is associated with neurodegenerative illnesses and premature senility.

Lai and Singh (1997) found increased DNA damage and enhanced cell death in the brains of living rats exposed to low level pulsed microwaves.

Balcer-Kubiczek (1994) states “In 1985 we published the first evidence of EMF carcinogenesis at the cellular level.”, referring to Balcer-Kubiczek and Harrison (1985). They used the standard cell line C3H/10T1/2 samples exposed to 2.45 GHz microwaves for 24 hours, then treated with 0.1 mg/ml of the cancer promoter TPA. One set of samples had no TPA, the remained had the TPA treatment and a range of microwave exposures for SARs of 0.1, 1.0 and 4.4 W/kg, Figure 28.

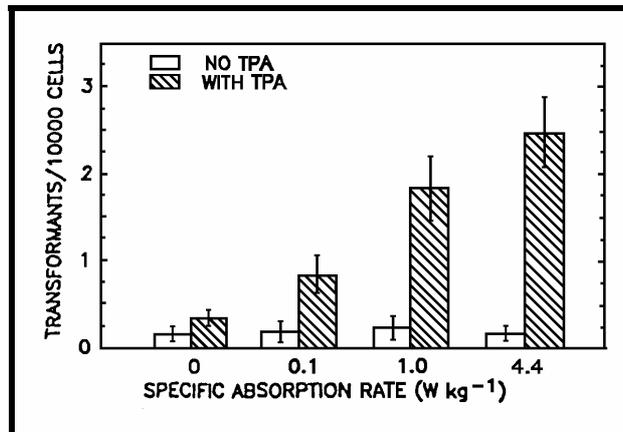

Figure 28: Dose-response relationship for the induction of neoplastic transformation in C3H/10T1/2 cells by a 24 hr exposure to 2.45 GHz microwaves modulated at 120 Hz, with and without post exposure treatment with TPA for 8 weeks, after Balcer-Kubiczek and Harrison (1985).

Balcer-Kubiczek (1994) states that “Our dose response data in terms of SAR for neoplastic effects provides evidence that the effect on tumor induction and development observed in a mouse skin model may operate at the cell level.”

The authors state that these results, and those of Szmigielski et al. (1982), are that **“2.45 GHz microwaves and 60-Hz magnetic fields, seem to act as an initiator or carcinogen, rather than as a promoter of malignant transformation.”**

Since genetic damage can lead to cancer, miscarriage, birth defects and health problem is future generations, evidence of DNA breakage and chromosome aberrations is crucial.

The first identified chromosome aberration study of non-thermal pulsed RF exposure was Heller and Teixeira-Pinto (1959). They concluded that the effects mimicked ionizing radiation and c-mitotic chemicals. More recently it has been shown that extremely significant DNA strand breakage was caused by cell phone radiation exposure to human cells,  $p < 0.0001$ , at a very low SAR level  $0.0024 \text{ W/kg}$ , Phillips et al. (1998). This followed pioneer work on direct DNA strand breakage observations using the Comet Assay by Lai and Singh (1995, 1996, 1997a,b,c).

Sagripani and Swicord (1986) showed that non-thermal levels of microwave exposure can produce single and double-strand DNA breaks in *E. coli* in solution.

Garaj-Vrhovac et al. (1991) showed that cultured V79 Chinese Hamster fibroblast cell exposed to continuous wave (CW) 7.7 GHz microwaves at power density of  $0.5 \text{ mW/cm}^2$  for 15, 30 and 60 min., kept at a constant temperature, produced a significantly high frequency of specific chromosome aberrations such as dicentric and ring chromosomes in irradiated cells. The dose-response relationships were significant at  $p < 0.01$ . They also observed increased cell Apoptosis.

Garaj-Vrhovac et al. (1992) exposed whole human blood samples to the same exposure regime. With the addition of power densities of 10 and  $30 \text{ mW/cm}^2$ . The number of chromosome aberrations increased from 1.5 % in controls to 2.7 to 7.2 % at the rising power densities. There was a statistically significant dose response with  $p < 0.05$  for total aberrations,  $p < 0.001$  for Acentric and  $p < 0.0001$  for micronuclei.

Nordenson et al. (1994) reported that their recent studies have shown a significant increase in the frequency of chromosomal aberrations in human amniotic cells after exposure to a sinusoidal 50 Hz,  $30 \mu\text{T}$  (rms) magnetic field. To evaluate further interactions between chromosomes and electromagnetic fields, they analyzed the effects of intermittent exposure. Amniotic cells were exposed for 72 h to a 50 Hz,  $30 \mu\text{T}$  (rms) magnetic field in a 15 s on and 15 s off fashion.

Eight experiments with cells from different fetuses were performed. The results show a 4% mean frequency of aberrations among exposed cells compared to 2% in sham-exposed cells. The difference is statistically significant, with  $P < 0.05$  both excluding and including gaps. In another series of eight experiments, the cells were exposed in the same way but with the field on for 2 s and off for 20 s. Also in these experiments a similar increase in the frequency of chromosomal aberrations was seen, but only when the analysis included gaps. Continuous exposure for 72 h to  $300 \mu\text{T}$ , 50 Hz, did not increase the frequency of chromosomal aberrations.

By 2002 I have identified over 20 studies showing that ELF exposures are genotoxic and over 50 studies showing that RF/MW are genotoxic, many at low exposure or isothermal levels showing that the mechanism is not thermal nor electric shocks with high induced currents as assumed originally by western scientists.

### **10.3 In vivo animal experiment results:**

Lai and Singh (1997a) used a highly sensitive microgel electrophoresis, COMET assay technique to identify single strand DNA breaks, Figure 27, and double strand DNA breaks,

Figure 28, from 2hr exposure to 0.1 mT and 0.25 mT 60 Hz magnetic fields in living rat brains.

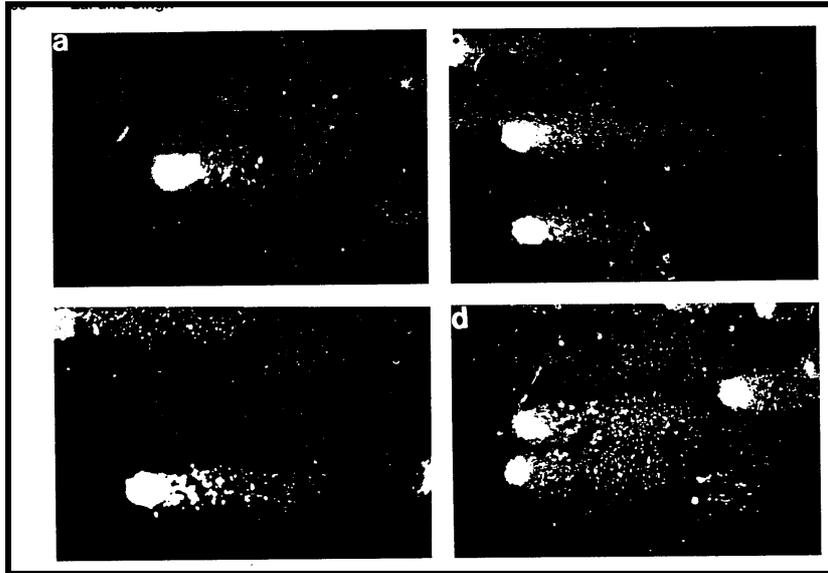

Figure 29: Photographs of single-strand DNA migration pattern of individual brain cells from rats exposed to (a) a bucking condition (0.1mT), magnetic fields of (b) 0.1 mT, (c) a 0.25 mT and (d) 0.5 mT. (x 400).

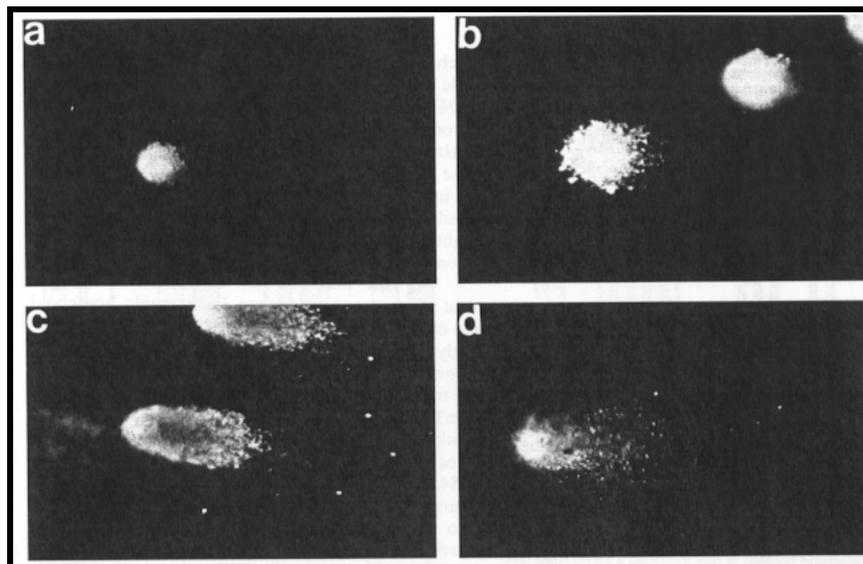

Figure 30: Photographs (expanded x 400) of double-strand DNA migration pattern of individual brain cells from rats exposed to (a) a bucking condition (0.1mT), magnetic fields of (b) 0.1 mT, (c) a 0.25 mT and (d) 0.5 mT.

Lai and Singh (1997a) conclude:

**“Because DNA strand breaks may affect cellular functions, lead to carcinogenicity and cell death, and be related to the onset of degenerative diseases, our data may have important implications for possible health effects of exposure to 60 Hz magnetic fields.”**

Lai and Singh (1997b) investigated the effect of melatonin and a spin trap compound (PBN) both of which scavenge free radicals. They found that rats injected with melatonin or PBN

before ELF field exposure and 2 hours after exposure. Both of these treatments blocked the magnetic field induced DNA single- and double-strand breaks.

Lai and Singh (1997b) conclude:

**“Since melatonin and PBN are efficient free radical scavengers, these data suggest that free radicals may play a role in magnetic field-induced DNA damage.”**

Lai and Singh further state that both melatonin and PBN can have other actions on cells in the brain that can prevent DNA damage therefore further support for their hypothesis can be obtained by studying whether other free radical scavenging compounds also block the effect of magnetic fields.

Timchenko and Ianchevskaia (1995) concluded that an electromagnetic field (EMF) at a frequency of 24 or 14 MHz and intensity of 400 or 200 V/m, increases numbers of hepatocytes from rats with chromosomal aberrations 1.4-1.5-fold.

#### **10.4 Human studies of chromosome aberrations with EMR exposure:**

Ciccone et al. (1993) conducted a case control study of 50 acute myeloid leukemias (AML), 17 chronic myeloid leukemias (CML), 19 myelodysplastic syndromes (MDS), and 246 controls. The chromosome aberrations were recorded according to the International System for Human Cytogenetic Nomenclature. Chromosome aberrations were not associated with chemical exposures (OR = 1.0), but a non-statistically significant excess was noted in association with electromagnetic fields (OR = 2.1).

Valjus et al. (1993) sampled for chromosomal aberrations, sister chromatid exchanges (SCEs), replication indices and micronuclei in peripheral blood lymphocytes among 27 nonsmoking power linesmen with considerable long-term exposure to 50-Hz EM fields, and among 27 nonsmoking telephone linesmen serving as a reference group, pairwise matched with the exposed workers for age and geographical region. Blood samples from the two groups were collected, cultured and analyzed in parallel. No differences between the groups were observed on analysis of SCEs, replication indices or micronuclei. However, the mean rate of lymphocytes with chromatid-type breaks was higher among the power linesmen (0.96% gaps excluded, 1.41% gaps included) than among the reference group (0.44% and 0.70%, respectively). The excess of aberrant cells was concentrated among those power linesmen who had worked earlier in their life. Although the interpretation is somewhat complicated by the confounding effect of previous smoking, these results suggest that exposure to 50-Hz EM fields is associated with a slight increase in chromatid breaks.

Skyberg et al. (1993) studied 13 high-voltage laboratory employees and 20 referents participated in a cross-sectional, matched-pairs study of cytogenetic damage. During cable testing the workers were exposed to static, alternating, or pulsed electric and magnetic fields. The alternating magnetic field levels of 50 Hz were 5-10  $\mu$ T, occasionally much higher. Chromosome aberrations, sister chromatid exchanges, and aneuploidy were studied in peripheral blood lymphocytes. Among seven smoking laboratory employees the mean number of chromosome breaks/200 cells was 2.3, as compared with 0.7 for the job-matched referents. The comparable figures for inhibited cultures were 12.0 versus 6.0. No increase was detected in nonsmokers with either method. The results support, to some

extent, the hypothesis of an increased risk of genotoxic effects among high-voltage laboratory workers, particularly a synergistic effect with smoking.

Garson et al. (1991) studied 38 Australia Telecom radio-linesmen who had been exposed to RF EMR in their work and compared the chromosome damage in lymphocytes compared 38 non-exposed clerical staff. A very detailed assay of chromatid and chromosome gaps and breaks and other aberrations was carried out. Most categories showed a small but statistically insignificant increase in chromosome aberrations, with the sum of aberrations of 2.55% for linemen and 2.18% for controls (RR= 1.17, 95%CI: 0.9-1.6).

For Chromatid Gaps RR=1.2 (0.7-2.1); Chromosome Gaps: RR = 1.5 (0.6-3.5); and Chromosome Breaks (without outlier) 1.4 (0.8-2.3). Adjusting for confounding from recent X-rays and for smoking both produced a small increase in Rate Ratio. The absence of adjusting for coffee drinking is a limitation. Such an adjustment would be likely to favour reduction in the incidence among clerical workers, further increasing the Rate Ratio. The incidence of total chromosome aberrations among the controls does appear rather high.

Is chromosome damage in people evidence of an increased risk of cancer. Hagmar et al. (1994) trichotomize CA into the low (1-33%ile), medium (34-66%ile) and high (67-100%ile). The threshold for low CA is typically 1.0% but in the range 0.5 to 1.5 %, while medium is typically 1.0 to 2.0 %, and high >2 %, but may use a threshold between medium and high of 3 %. They concluded that there was a statistically significant linear trend (P=0.0009) in chromosome aberration strata with regards to subsequent cancer risk.

In addition to Hagmar et al. (1994), other studies finding increased subsequent cancer from earlier measured chromosome aberrations include Nordenson, et al. (1984), Nuzzo and Stefanini (1989), Sorsa et al. (1990), Brogger et al. (1990), Sorsa et al. (1992) and Bonassi et al. (1995).

Taking the typical classification the Australia Telecom study as both exposed and control groups in the high category. If the control group was in the "low" category  $\leq 1\%$ , then the Rate Ratio for the clerical staff would be 2.2 and for the linemen 2.6, both of which are significant ( $p < 0.01$ ) and, according to Hagmar et al. (1994), both have increased cancer risk.

There are multiple studies and hence strong evidence that RF/MW exposure increases chromosome aberrations in humans with a subsequent increase in cancer risk.

Garaj-Vrhovac and Fucic (1993) provide another important aspect to this data. Many factors cause chromosome aberration and repairs are being carried out all the time. The cancer risk occurs because not all chromosomes are repaired and mutated cells persist and tumors grow from them. The pulsed microwave exposure of a group of radar station personnel offered the opportunity to study the recovery rate of chromosome aberrations for 30 days after exposure was ceased. Hence this study gives more evidence that RF breaks chromosomes in humans, and shows the rate of recovery through repair. The most affected person is shown in Figure 31.

The recovery rate is very close to linear and the chromosome damage falls to 10% of the original damage in 28.6 weeks, dropping from 33% to 3.5% after 30 weeks, with a tendency for the repair rate to slow suggesting a more exponential recovery rate. For this person the typical daily recovery rate was 0.14% /day.

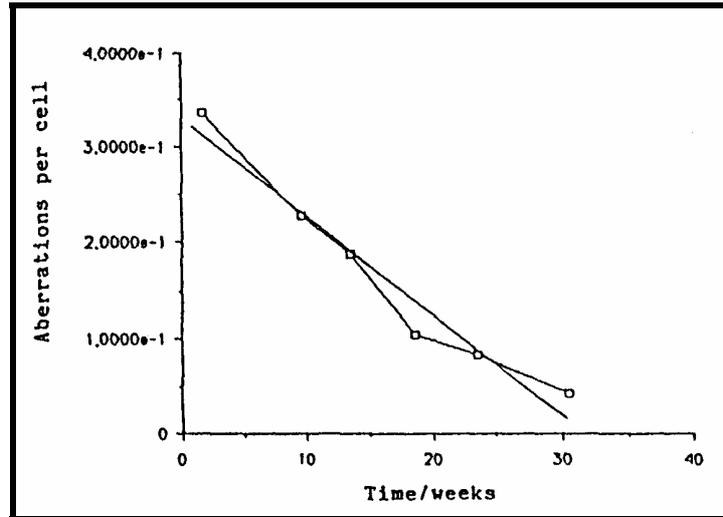

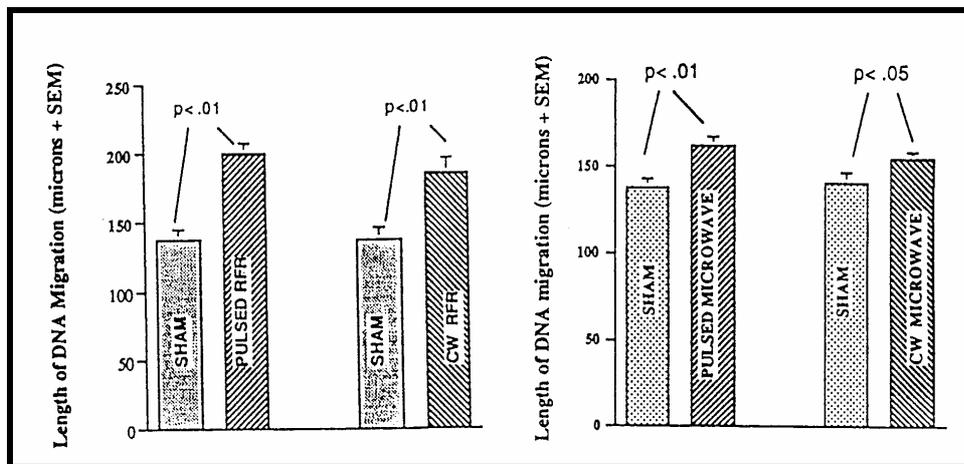

Figure 31: The time-dependent decrease in the number of chromosome aberrations for the subject with extremely high numbers of chromosome impairments,  $y = 0.318 - 0.010x$ ,  $R = 0.98$ .

For two others with lower damaged chromosome rates it was 0.08 and 0.03%/day. Hence daily repair rates are low, suggesting continuing exposure can easily lead to a build up of chromosome damage and an increased risk of cancer.

### 10.5 DNA breakage associated with RF/MW exposure:

Sarkar et al. (1994) found significant modification of the DNA from mouse cells from brain and testes exposed to  $1 \text{ mW/cm}^2$  2.45 GHz microwaves for 2 hr/day for 120, 150 and 200 days.

Lai and Singh (1995) exposed living rats brains to a single 2 h exposure to microwaves at 2.45 GHz, pulsed at 500 pps, at SARs of 0, 0.6 and 1.2 W/kg. They found significant dose-response relationships for single strand DNA breaks in an assay carried out 4 hours after exposure for both the hippocampus and the rest of the brain

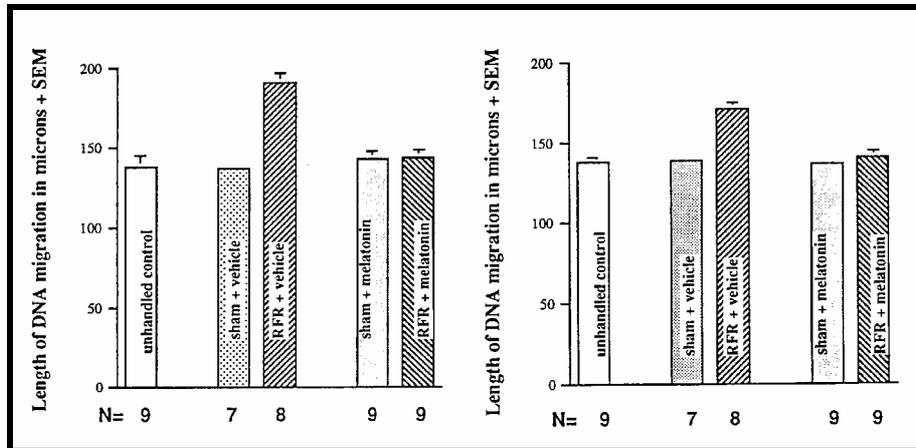

(a) Single strand breaks

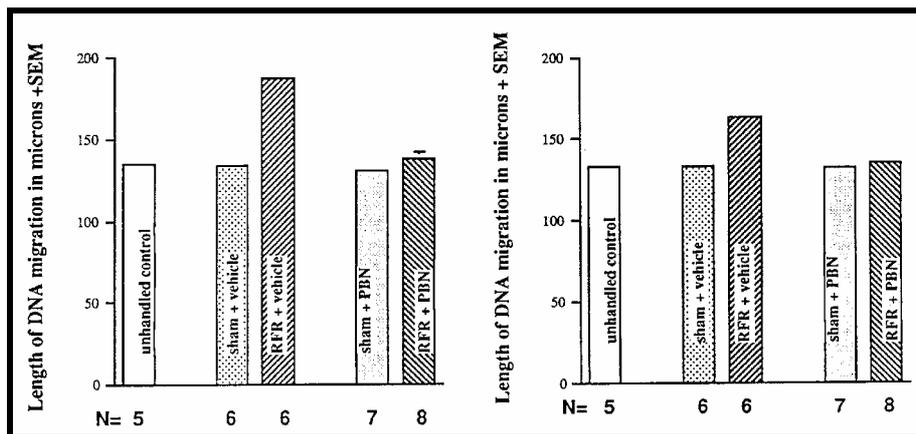

(b) Double strand Breaks

Figure 32: DNA breakage in rat brains (SAR = 1.2 W/kg), Lai and Singh (1996).

A second analysis involved assaying the whole brain and continuous wave microwaves at 2.45 GHz and 1.2 W/kg. This showed a statistically significant increase in single-strand DNA breaks between sham and exposed ( $p < 0.01$ ) but no significant difference between assays at 0 h and 4 h after exposure.

(a) Single strand DNA breakage. (b) Double-strand DNA breakage.  
Figure 33: Effect of melatonin on RF/MW induced DNA breakage, Lai and Singh (1997c).

(a) Single strand DNA breakage. (b) Double-strand DNA breakage.  
Figure 34: Effect of PBN (spin-trap compound) on RF/MW induced DNA breakage, Lai and Singh (1997c).

Lai and Singh (1996) repeated the experiment of Lai and Singh (1995) and extended the analysis to include and assay of double-strand DNA breaks and included both pulsed (500 pps) and continuous microwaves at 2.45 GHz. The exposed condition was  $2\text{mW/cm}^2$  (SAR = 1.2 W/kg). Statistically significant single-strand DNA breaks were found for both the CW and pulsed signals ( $p < 0.01$ ), and for double-strand DNA breaks (pulsed  $p < 0.01$  and CW  $p < 0.05$ ). This data was not available for the MacIntyre Case.

Their most recent work, Lai and Singh (1997c), shows that in the exposed rats brains there is enhancement of free radicals and the acceleration of cell death (apoptosis), which is eliminated by melatonin. It is not yet known whether this is caused by the MW radiation influencing the pineal gland or the retina of the eyes, to reduce melatonin production and hence enhance free radical numbers, or whether the MW radiation produces free radicals locally in the brain.

The implications of this study are very important. The authors, Lai and Singh (1997c),

conclude:

**“Data from the present experiment confirm our previous find in a [Lai and Singh, 1995, 1996] that acute RFR exposure causes an increase in DNA single- and double-strand breaks in brain cells of the rat. In addition, we have found that the effect can be blocked by treating the animals with melatonin or PBN. Since a common property of melatonin and spin-trap compounds is that they are efficient free radical scavengers [Carney and Floyd, 1991; Carney et al., 1991; Floyd, 1991; Lafon-Cazal et al., 1993 a,b; Lai et al., 1986; Oliver et al., 1990; Reiter et al., 1995; Sen et al., 1994; Zhao et al., 1994], these data suggest that free radicals may play a role in the RFR-induced DNA single- and double-strand breaks observed in brain cells of the rat. Consistent with this hypothesis is the fact that free radicals can cause damage to DNA and other macromolecules in cells. Particularly, oxygen free radicals have been shown to cause DNA strand breaks [McCord and Fridovich, 1978]. In addition, a study has implicated free radicals as the cause of some of the biological effects observed after exposure to RFR. Phelan et al. [1992] reported that RFR can interact with melanin containing cells and lead to changes in membrane fluidity consistent with a free radical effect.**

**If free radicals are involved in the RFR-induced DNA strand breaks in brain cells, results from the present study could have an important implication on the health effects of RFR exposure. Involvement of free radicals in human diseases, such as cancer and atherosclerosis, have been suggested. Free radicals also play an important role in aging processes [Reiter, 1995]. Aging has been ascribed to accumulated oxidative damage to body tissues [Forster et al., 1996; Sohal and Weindruch, 1996, and involvement of free radicals in neurodegenerative diseases, such as Alzheimer's, Huntington's, and Parkinson's, has also been suggested [Borlongan et al., 1996; Owen et al., 1996]. Furthermore, the effect of free radicals can depend on the nutritional status of an individual, e.g., availability of dietary antioxidants [Aruoma, 1994], consumption of ethanol [Kurose et al., 1996], and dietary restriction [Wachsman, 1996]. Various life conditions, such as psychological stress [Haque et al., 1994] and strenuous physical exercise [Clarkson, 1995], have been shown to increase oxidative stress and enhance the effect of free radicals in the body. Thus, one can speculate that some individuals may be more susceptible to the effects of RFR exposure.**

**However, it must be pointed out that both melatonin and PBN can have other actions on cells in the brain that can decrease DNA damage. Further support for our hypothesis can be obtained by studying whether other compounds with free radical scavenging properties can similarly block the effect of RFR, and by measurement of other free radical-related cellular effects, such as oxidative molecular damages in lipids, protein, and DNA.”**

This is also relevant to the study carried out by Adey et al. (1996) in which rats exposed to cellphone-like signals had 30 % fewer tumours than controls and the tumours were statistically significantly smaller. These results were reported to the 1996 BEMS conference in Victoria BC. Dr Singh raised the question with Dr Adey, of the possibility of cell death as an explanation for the result. Dr Adey agreed that this was possible, but stated that it

needed to be tested. Garaj-Vrhovac et al. (1991) and Lai and Singh (1997c) have found that result.

It has been shown that a sub-thermal dose of microwaves (0.6 W/kg and 1.2 W/kg) can enhance DNA breakage and accelerate the cell death (apoptosis) in living brains, through the increased production of free radicals. This is associated with a reduction in melatonin. With enhanced rate of cell death tumour cells can die at a faster rate than they grow, producing fewer and smaller tumours.

All of these above experiments were carried out without the use of cancer initiators nor co-carcinogens. They involve the direct application of RF/MW radiation to a sample or an animal and the observation of chromosome breakage, DNA breakage, tumours, free radicals and cell death. Hence they confirm the proposal of Reiter (1994) in section 4.1, that EMR would be both an initiator and promoter of cancer, in his case through melatonin reduction, in this case through direct observation of DNA damage which might involve melatonin reduction since free radicals are observed to be enhanced.

## **10.6 Conclusions on Mutagenic effects of EMR:**

DNA damage is shown by Chromosome Aberrations, Micronuclei Formation, DNA strand breakage, enhanced oncogene activity, neoplastic cell transformation. DNA damage has been found under non-thermal exposure to EMR in many independent studies. ELF and ELF modulated RF have been associated with chromosome aberration and micronuclei formation in cells and in exposed workers. Microwaves have been shown to produce DNA damage in living rats brains. Hence EMR is implicated in increasing cancer rates in exposed populations, Hagmar et al. (1994).

Increased cancer incidence can come about by the direct effect of a DNA damaging carcinogen or by the synergistic effect of co-carcinogens. The co-carcinogenic effect and cancer promotional effect of EMR has been widely suggested and demonstrated through a number of experiments, e.g. Adey (1992b), Byus et al. (1988). Direct effects (in the absence of a cancer initiator) include chromosome aberrations and DNA breakage which is most likely to be the result of the enhanced presence of free radicals in the RF/MW field. The role of melatonin is important here. Direct effects are likely to involve higher mean power densities than co-carcinogenic effects. In Lai and Singh (1995) the inter-animal variability is very small giving a small standard deviation for each exposure group. Even so a linear the dose-response relationship is statistically significant for the "rest of the brain" assayed 4 h after exposure ceased. This suggests that the smallest detectable increase in DNA breakage would be associated, with this small sample size, with an SAR of  $<0.2 \text{ W/kg}$ ,  $\sigma = 1.7$ ,  $S < 62 \mu\text{W/cm}^2$ .

Many early studies showing that microwaves caused chromosome aberrations assumed that the mechanism was the heat effects. We now know from many multiple independent published studies that DNA damage occurs at non-thermal and isothermal exposure levels. The lowest reported DNA damage from cellphone radiation ( $p < 0.0001$ ) was provided by Phillips et al. (1998). Two SAR exposures were in the range  $0.0024 \text{ W/kg}$  to  $0.026 \text{ W/kg}$ . These are equivalent to  $1.2$  to  $13 \mu\text{W/cm}^2$  for microwaves at  $813$  to  $837 \text{ MHz}$  and human brain tissues. This study also showed significant ( $p < 0.0001$ ) DNA repair rates in these human brain cells. We now know that induce DNA repairs is caused by DNA damage and brain cancer cells have very strong repair mechanisms because they cannot be

regenerated and it's a vital organ. The time exposure reaction of brain cells to cellphone radiation caused DNA damage is shown by the data in Figure 2 of Malyapa et al. (1997).

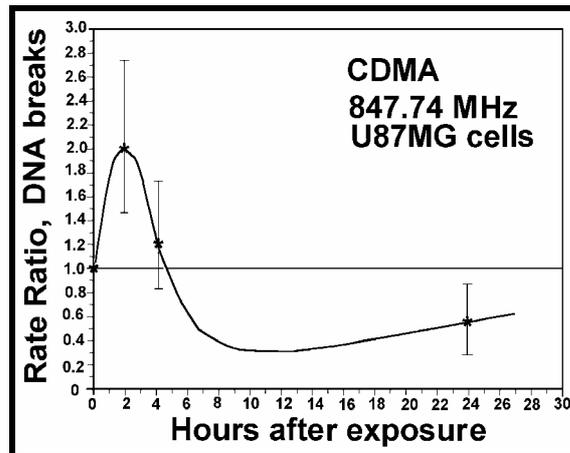

Figure 34a: DNA strand breakage Risk Ratio and 95% CI for the frequency distribution in Figure 2 Normalized Comet Moment of Malyapa et al. (1997).

Figure 34a clarifies the understating of the relationship of microwaves induced DNA damage with DNA repair.

## 11. Long-term Animal Studies:

A small number of long-term animal studies involving RF/MW exposure have been carried out, largely because of their extreme difficulty and very high cost. Balode (1996)

### 11.1 University of California, Berkeley:

Professor Charles Susskind and Dr Susan Prausnitz, Dept of Electrical Engineering, UC Berkeley carried out the first reported long term study for the US Air Force, Prausnitz and Susskind (1962). They exposed male Swiss albino mice to 9.27 GHz microwaves, pulsed with a 2  $\mu$ s pulse at 500 Hz, 4.5 minutes per day, 5 days per week for 59 weeks with an exposure level of 0.10W/cm<sup>2</sup>. This amounts to a mean weekly exposure of 223 $\mu$ W/cm<sup>2</sup>.

Detailed autopsies were carried out on 60 irradiated and 40 control mice who died during the experiment. Two adverse effects were more severe in the exposed compared to the control animals.

- (1) Testicular degeneration (sterility, atrophy with no sperm) occurred in 40 % (23/57) of the exposed animals and 8.1 % (3/37) of the control animals.
- (2) Cancer of the white cells or leukemia was seen in 35 % (21/60) of the exposed animals compared to 10 % (4/40) of the controls. This condition was described as monocytic or lymphatic organ tumours or myeloid leukaemia in the circulating blood.

At the 16-month interim kill, one month after exposure ceased, 30 % (6/20) of the exposed group had leukemia compared to 10 % (1/10) of the controls.

At the final kill at 19-months, 4 months after cessation of exposure testicular atrophy was seen in 21% (14/67) of the exposed group and 5 % (1/19) of the control group, and

testicular weights were lower for the exposed group. At this stage leukosis was the same in both groups at 18 % (12/67) for the exposed group and 21 % (4/19) for the control group.

This gives an overall rate for testicular degeneration of 29.8% (39/124) for the exposed group and 7.1% (4/56) for the control group, giving a Rate Ratio of RR=4.2 . For leukosis the incidence was 26.5 % (39/147) for the exposed mice and 13.0% (9/69) for the control mice, RR = 2.04 .

Cairnie et al. (1980) exposed mice to microwaves at power density of 50 mW/cm<sup>2</sup>. They found that the absorbance in the abdomen area of the liver was 11 times greater than the testes, and while the abdomen temperature was increased the testicular temperature was not. This suggest that the 100mW/cm<sup>2</sup> exposure testicular degeneration could have been the genotoxic effect of microwaves rather than the temperature rise.

Leukosis (the initiation of leukaemia) requires damaged DNA and chromosome aberrations which are transferred from cell to cell through mutation. The same mechanism could cause testicular degeneration. An accumulated cellular level damage mechanism is not necessarily related to the intensity but can relate to total dose in relation to rates of repair. Hence the averaging of weekly exposure is a meaningful adverse effect related level. Actual public exposure levels of 0.2μW/cm<sup>2</sup> and less saw childhood leukaemia incidence and death rate rises at similar exposure levels (2.74 for mortality) in the North Sydney Study.

## 11.2 University of Washington Case Study:

Establishment of a potential adverse human health effect can be obtained from a suitably designed and executed animal experiment. Such an experiment was carried out at the University of Washington by Professor Arthur Guy and his associates, funded by the United State Air Force, Chou et al. (1992).

**Table 4: Crude incidence of neoplastic lesions (Tumours)**

Site/Type	Crude Tumor Incidence			
	Control		Exposed	
Adrenal Cortex	12/85	14.1 %	12/76	15.8 %
Adrenal medulla	1/73	1.4 %	7/67	10.4 %
Thyroid	9/85	10.6 %	12/76	15.8 %
Liver	1/85	1.2 %	3/76	3.9%
Pituitary	21/85	24.7 %	19/75	25.3 %
Testes	0/85	0 %	2/76	2.6 %
Epididymis	0/85	0 %	1/76	1.3 %
Pancreas	2/85	2.4 %	2/76	2.6 %
Urinary bladder	0/85	0 %	2/76	2.6 %
Stomach	4/85	4.7 %	4/76	5.3 %
Duodenum	0/85	0 %	1/76	1.3 %
Lymph node	0/85	0%	1/76	1.3 %
Soft Tissues, Thorax	0/85	0 %	2/76	2.6 %
Mesentery	0/85	0 %	2/76	2.6 %
Lymphosarcoma	3/85	3.5 %	4/76	5.3 %
Total	53/85	62.4 %	63/75	84.0%
	(RR=1.35, 95%CI: 1.11-1.63,p=0.0022)			

The exposed a large group of rats to pulsed radar-like microwaves, 2,450 MHz, pulsed at 800 pps, 10  $\mu$ s pulse, at <0.4 W/kg, the human exposure level allowable under the ANSI standard. These rats were compared to a similar group who were sham exposed. Guy found a total of 18 malignancies in the 100 exposed rats compared to 5 in the 100 sham exposed rats, a ratio of RR=3.6 (1.34-9.70), in particular there were 9 endocrine tumours in the exposed group compared to 2 (ratio RR=4.5 (1.0-20.8)) in the control group. On the other hand, the EPA review team worked with the original University of Washington research team, and undertook further detailed statistical analysis of their results and showed “a statistically significant elevation in the incidence of carcinomas at all sites combined.”

The experiment ran for 25 months with some mice being sacrificed and analyzed at 13 months. Their initial reports concluded no effects except a significant increase in the number of benign adrenal tumours. At 13 months the exposed group had a significantly larger number of B- and T-cells than do controls, but no difference was seen at the end of 25 months. This suggests the immune system was initially disrupted, but over a 2 year period it adapted to the exposure situation. Disturbance of the immune system is also consistent with the developing cancer and tumours growth.

These results were worrying to EPA researchers. Dr Robert McGaughy asked Dr Lawrence Kunz, the pathologist on the University of Washington study, for copies of the survival and histopathologic findings. Dr McGaughy was able to show that three statistical tests showed a statistically significant increase in carcinomas ( $P < 0.05$ ) but no statistically significant increase in sarcomas. These results are listed in Table 13.

The EPA team argue that while most chemical carcinogens affect only one or a few tissues, the distribution of the EM field as a “toxic agent” is more uniform than a “typical” chemical agent, and therefore an “all sites” approach is justified..

McGaughy et al. (1990) point to the more ubiquitous action of melatonin as an example, since,

**“Nocturnal pineal melatonin activity is known to be inhibited by ELF electric fields (Wilson et al 1986) and that the pineal gland function is closely coupled to the function of other glands. Melatonin is known to inhibit tumour growth-enhancing hormones like prolactin and estrogen. The postulate has been made that when the blood melatonin concentration decreases because of the action of EM fields on the pineal gland, a tumour growth inhibitor has been reduce or effectively removed, thereby causing a stimulation of tumour growth.**

**Although only breast and prostate tumours have been discussed in this connection, the same regulation by melatonin might hold for other hormonally-regulated endocrine organs as well.”**

<p><b>The Guy et al. (1985) study, along with other supporting material, led to the recommendation that the US EPA classify RF/MW as a possible human carcinogen (Class C).</b></p>
---

The data presented in this report indicate the progressively strengthening evidence of carcinogenicity and other adverse health effects from chronic non-thermal exposure to RF/MW radiation which raise the evidence to classify RF/MW radiation as a highly probable (Class B1) carcinogen.

Note: All you need in New Zealand Law is evidence of a potential irreversible adverse environmental effect to decline this application and to recommend the identification of a site in a less sensitive receiving environment, or a potential adverse effect to require mitigation or remediation.

### 11.3 Polish Study:

Szmigielski et al. (1982) measured the effects of 2.45 GHz microwave radiation at 5, 10 and/or 15 mW/cm<sup>2</sup>, 2h /day, 6 times/week exposure (average weekly exposure 360, 520 and 1,100 μW/cm<sup>2</sup>), mice able to maintain core temperature under both exposures, specifically investigating lung cancer, breast cancer and skin cancer. Figure 32 shows the result of initiating skin tumours using 3,4 benzo-alpha-pyrene (BP) and assessing the cancer promoting effect of microwaves.

Cancer development started 2 months earlier for the MW exposed mice and reached the 50 % point for the population after 137 days compared to 305 days. Hence MW significantly accelerated the growth and proliferation of skin cancer tumours.

Figure 33 shows the results of planting lung cancer (sarcoma) cells and then exposing the mice to 5 and 15 mW/cm<sup>2</sup> MW radiation. The 5 mW/cm<sup>2</sup> exposure produced an enhancement of lung cancer modules at 2.5 times more than controls after 3 months, but at a similar level to the effect of an over-crowding stress factor. The 15 mW/cm<sup>2</sup> exposure produced about 5.5 times more lung cancer nodules.

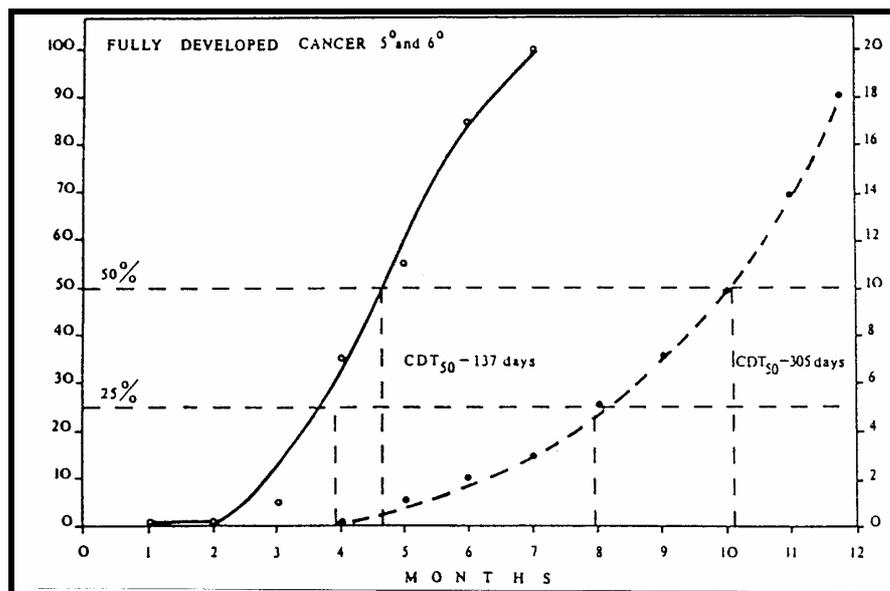

Figure 35: Growth curves of BP-induced skin tumour in mice exposed daily to 10 mW/cm<sup>2</sup> of 2.45 GHz microwave radiation for the whole period of tumour growth. CDT<sub>50</sub> refers to the cancer development time when 50 % of the animals have tumours.

A parallel experiment for breast cancer for control, overcrowding stress, 5 and 15 mW/cm<sup>2</sup> MW exposure, the 50 % development points were 322, 255, 261 and 219 days, respectively. These show a similar relationship to the results in Figure 26 for lung cancer, except that the stress and 5 mW/cm<sup>2</sup> effects are reversed.

These results show statistically significant increases in numbers and rates of development of chemically initiated skin, lung and breast tumours when exposed to low level microwaves, with a significant dose response relationship in each case.

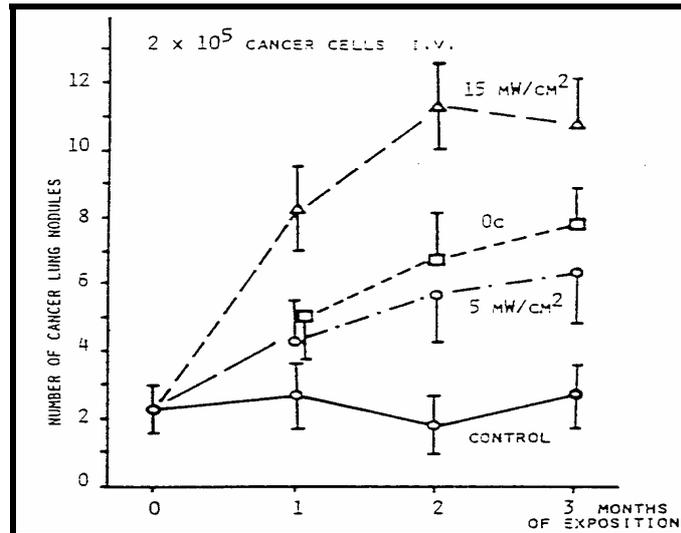

Figure 36: The number of lung tumours (following intravenous injection of  $2 \times 10^5$  viable sarcoma cells) in mice exposed during 1, 2 and 3 months to 2.45 GHz microwaves (2h daily) at 5 or 15 mW/cm<sup>2</sup>. Oc refers to mice treated with nonspecific stress of over crowding.

#### 11.4 Duke University Medical Center:

Eight week old female mice were exposed to 2.45 GHz microwaves at power densities of 5 to 15 mW/cm<sup>2</sup> for 30 min./day over periods between 1 and 17 days, Huang and Mold (1980). Daily mean exposures were about 100 to 300  $\mu$ W/cm<sup>2</sup>, and exposure conditions were essentially isothermal. The results showed, (a) A sustained activation of tissue macrophages resulting in suppression of lymphocyte responsiveness, and (b) a gradual but temporary stimulation directed to the lymphocytes.

Macrophage activation may have caused the early depression of lymphocyte responsiveness. The suppression is later overridden by the cumulative direct stimulation of lymphocytes by microwaves. Prolonged exposures is suggested to eventually result in depressed function in much the same as seen in rheumatoid arthritis which occurs from chronic immune stimulation.

They also conclude that 2.45 GHz microwaves affect the hematopoietic colony-forming abilities through altering the growth of both erythroid and myeloid cells. This is direct evidence of the ability of sub-thermal microwaves to cause chronic immuno-suppression.

### 11.5 Jawaharlal Nehru University Study:

Ray and Behari (1990) exposed young albino rats of both sexes to 7.5 GHz microwaves, pulsed at 1000 kHz and at a power of  $600 \mu\text{W}/\text{cm}^2$ , for 3 hr /day, averaging  $75\mu\text{W}/\text{cm}^2$ .

Microwave exposed rats ate and drank less and thus showed smaller weight gain. Leukocyte count increased by 35 % in the exposed animals along with a 2-fold increase in eosinophils, and Spleen, Kidney, Brain and Ovaries were significantly smaller.

### 11.6 Royal Adelaide Hospital Project:

Repacholi et al. (1997) exposed genetically engineered mice to a cell phone signal for 1 hr/day. This was an Australian industry funded study to allay public fears of cell phone health effects was carried out by a team led by Dr Michael Repacholi at the Royal Adelaide Hospital. In an ABC Four Corners documentary Dr Repacholi describes this study:

**“We tried to get the most sensitive model of mouse that we could find that would get lymphoma and then see if we exposed them to radio frequency field, whether we could promote that cancer above its normal incidence.”**

Mice are often used to test toxins, chemicals and radiation effects because of the strong similarity of their cells to human cells. A search of Medline shows that since 1993 over 21100 cancer studies have used mice and 621 used tumorigenic mice.

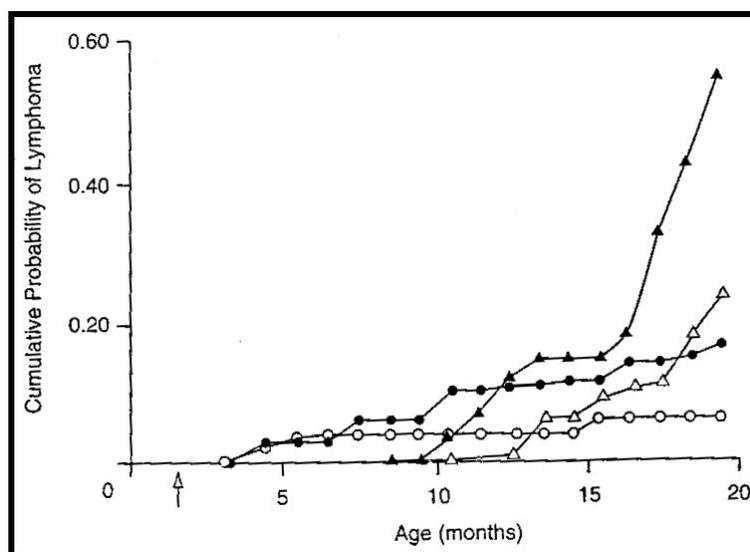

Figure 37: Rate of lymphomas increase in control and exposed groups of mice, Repacholi et al. (1997). The vertical arrow shows when the exposure began.

Their 200 genetically engineered mice normally had 22 % of them to get lymphomas in their immune system, including B-cells. About half of the mice were exposed to a moderate level of cell phone radiation for 1 hour per day for 18 months. The other half were treated the same way but not exposed. At the end of the study 43 % of the exposed mice had lymphomas. The overall Odds ratio was 2.4,  $p=0.006$ , 95% CI=1.3-4.5. This is a highly significant results in which the cell phone radiation more than doubled the cancer rate from a 1 hour per day exposure. Mean exposure range was measured as 0.13 to 1.4 W/kg.

Hence the mean daily exposure was 0.005 to 0.058 W/kg, averaging 0.03 W/kg. This is somewhat below the ICNIRP Guideline of 0.08 W/kg and clearly non-thermal.

### 11.7 Greek Mouse Fertility Study (1997)

Because of health concerns among residents living in the vicinity of an RF transmission tower in Greece, groups of mice were placed at various locations in relation to the tower, Magras and Xenos (1997). The mice fertility over several generations was monitored and related to the RF exposure. Figure 38 shows the fertility rate of the two exposed groups. Where group A the “Low” exposure group ( $0.168 \mu\text{W}/\text{cm}^2$ ) became infertile after 5 generations and B the “High” exposure group  $1.053 \mu\text{W}/\text{cm}^2$ , became infertile after only 3 generations. This is a highly significant result because so few multi-generation studies have been done and the effects of this study occur at extremely low levels and the effect is total infertility.

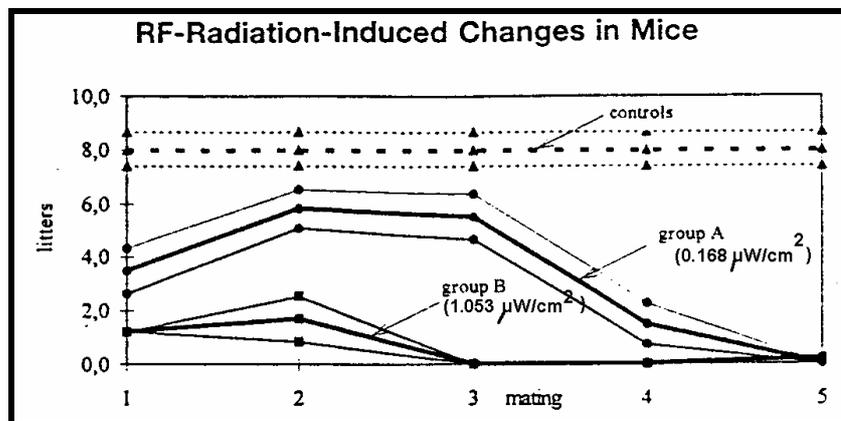

Figure 38: Reproductive rates in two groups of mice exposed to extremely low intensity radio signals, showing a dose response in the time taken to achieve full infertility of 3 matings for  $1.053 \mu\text{W}/\text{cm}^2$  and 5 matings for  $0.168 \mu\text{W}/\text{cm}^2$ .

### 11.8 University of Texas mice study

Vijayalaxmi et al. (1997) was designed to test whether microwaves were genotoxic by assaying the presence of micronuclei in peripheral blood and bone marrow of cancer-prone mice. Their threshold test was if there was a significant increase of micronuclei then microwaves were genotoxic. Their initial results had major errors and when they were corrected they did find significant increases of micronuclei in both blood ( $p < 0.02$ ) and bone marrow ( $p < 0.025$ ). In addition, 12 exposed mice had tumors compared to 8 mice in the control group, OR = 1.5. Therefore their results show that microwaves are genotoxic because they significantly enhance micronuclei formation and increase the tumour rate.

### 11.9 Summary and Conclusions about long-term animal experiments:

Animal experiments confirm that in mice pulsed RF/MW radiation is able to initiate statistically significantly more malignant tumours in many body organs at exposure levels assumed to be non-thermal and safe ( $0.4 \text{ W}/\text{kg}$ ), McGaughy (1990), and in the presence of a chemical cancer initiator to drastically increase the rate of development of lung, breast and skin cancer, Szmigielski et al. (1982), showing the strong co-promotional effects of microwave exposure. Prausnitz and Susskind (1962) found increased in testicular degeneration and increases in leukaemia at Rate Ratios from, chronic exposure to a short daily acute exposure to microwaves. Chou et al. (1992) found that radar microwaves more

than tripled the overall tumour rate in rats. Repacholi et al. (1997) shows that cellphone radiation enhances B-cell tumours in genetically engineered mice. Vijayalaxmi et al. (1997) show a similar result but also found significant increases in micronuclei formation in the microwave exposed mice. These are consistent with the research summarized above on the direct mutagenic effects of RF/MW radiation and the research showing alteration of signal transduction, cell communication which influence the cellular level growth regulation and can lead to cell proliferation and thence to tumour formation and cancer.

Magras and Xenos (1997) showed that mice became totally infertile with exposure to extremely low levels of radiofrequency radiation. This shows the strong value of multi-generational studies which are almost entirely lacking and almost impossible for epidemiology to carry out in relationship to human exposure to RF/MW. Human generations are over 2 decades long and hence a 5 generational study requires over 100 years of known exposure to RF/MW which is impossible at this time because the technology is too new.

With the very close parallel effects of mouse and rat studies and human studies, the results of chronic and multigenerational rodent studies must serve as a direct most probable indicator of effects on people. For example, Vijayalaxmi et al. (1997) show significant increases in chromosome breakage in the blood and bone marrow of cancer-prone mice chronically exposed to 2.45 GHz RF radiation, along with a 50 % increase in mammary tumors in the exposed vs sham exposed mice. Goldsmith (1995) reports enhanced chromosome damage and increased incidence of tumors in the Civil Service population of the U.S. Embassy in Moscow after they had been chronically exposed to a radar signal for varying but very low mean exposures less than  $0.1\mu\text{W}/\text{cm}^2$  (the mean range 1 to  $2.4\mu\text{W}/\text{cm}^2$  as measured on the outside of the walls).

Non-thermal microwaves also caused significant impairment of the immune system functioning. This was recently found in people in association with powerlines (Beale et al (1997)), and recall that powerlines emit RF radiation as well as ELF fields.

#### **11.10 Plant effects:**

The first published chromosome aberration study was for pulsed radiofrequency radiation and showed that in an isothermal situation the genotoxic effect of radiofrequency radiation mimicked ionizing radiation and C-mitotic chemicals. The subject of the exposure was garlic roots. Four of the Latvian studies published in 1996 refer to EMR effects on plants which were exposed to a radar RF pulsed signal. Balodis et al. (1996) measured a significant reduction ( $p < 0.01$ ) in relative additional increment tree ring growth over 20 years of exposure. Figure 35 shows the incremental tree ring growth at 4 km from the radar. Figure 36 shows the measured exposures with distance giving a mean of about 0.1 V/m which corresponds to  $0.003\mu\text{W}/\text{cm}^2$ .

Selga and Selga (1996) found significant cell structure changes in this exposure, including alterations of the Golgi apparatus switched to functions from synthesis of predecessors of cell walls to formation and export of resin predecessors and other cell stressors. These lead to accelerated resin production and promoted senescence of the pine trees.

Magone (1996) studied fast growing plants, *Spirodela polyrhiza* (L.) Schleiden. Generally, the vegetative reproduction rate was accelerated in the first 20 days after the end of exposure. Exposure of plants beginning formation lowered the vegetative growth rate.

Eighty-eight-hour exposure caused the appearance of some abnormal individuals after 30 days of growth. At 55 days growth, various morphological and developmental abnormalities appeared in 6-10 daughter plants from 10 exposed mother plants, compared to 0.1 plants per 10 in the control plants. Plants developed completely to daughter fronds under exposure from the electromagnetic field had a shorter life-span (67 days compared to 87 days in the control) and fewer daughters (8 compared to 10 in the controls).

Schmutz et al. (1996) studies young spruce and beech trees exposed to 2450 MHz for 3.5 years at a range of exposures from  $0.7 \mu\text{W}/\text{cm}^2$  to  $300 \text{ W}/\text{m}^2$ , depending on the location. A negative relationship existed for foliar concentrations of the calcium and sulfur in the beech and the exposure during the first 2 years.

Hence the Skrunda studies on plants show similar effects to those on human beings including stress symptoms, changes in calcium, growth reduction and reproductive changes consistent with chromosome damage. Adverse biological effects are found with exposures down to  $0.003 \mu\text{W}/\text{cm}^2$ .

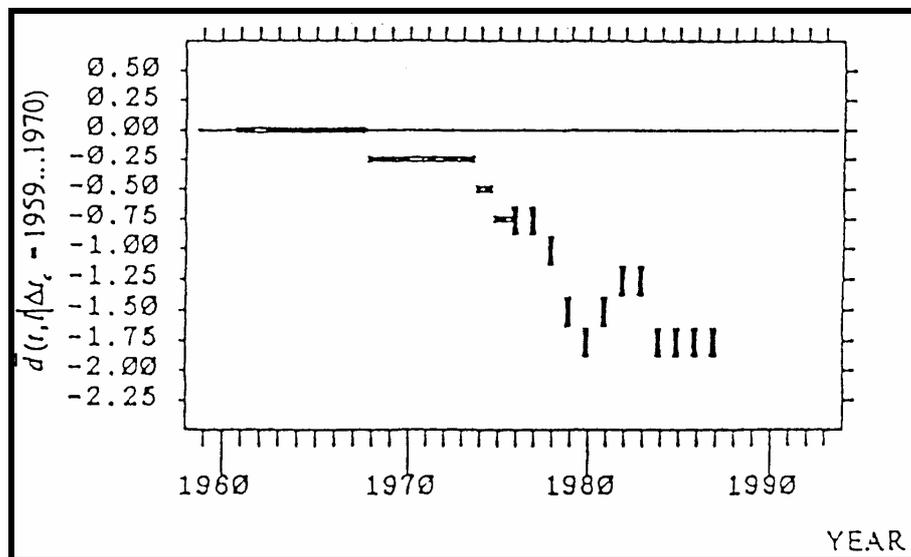

Figure 39: Reductions in annual incremental tree rings growth with  $0.003 \mu\text{W}/\text{cm}^2$  exposure to a pulsed radar signal. Balodis et al. (1996).

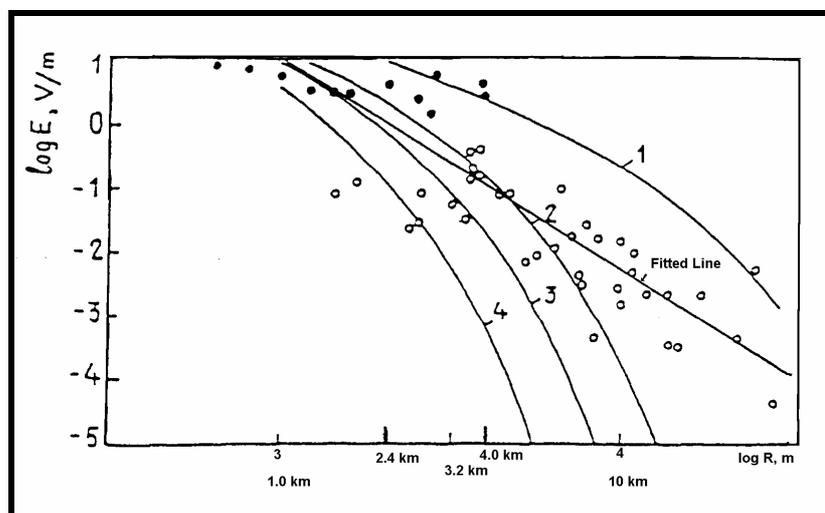

Figure 40: Measured exposure with distance from the Skrunda Radar.

## 12 Human health studies:

### 12.1 Reproductive

#### 12.1.1 Summary of Epidemiological Studies:

During the 1980's and early 90's there were three studies of the reproductive outcomes of physiotherapists (Physical Therapists) who were occupationally exposed to short-wave and infrequently to microwave, radiation during diathermy.

Kallen et al. (1982), in Sweden, used a survey of therapists recalling pregnancy outcomes and work place equipment use during pregnancy, involving 33 cases. None who reported pregnancy outcomes reported exposure to microwaves. They found increased congenital malformations, low birth weight, still birth and death within the first 7 days after birth in association with short-wave diathermy.

Taskinen et al. (1990) in Finland, with 204 cases, found increased spontaneous abortion with short-wave and microwave use (electric therapies  $>5$ /week OR=2.0, CI: 1.0-3.9, n=17 ; shortwaves  $\geq 5$ h/week, OR= 1.6, CI: 0.9-2.7, n= 30; Microwaves, OR= 1.8, CI: 0.8-4.1, n=13), but stronger associations with ultrasound and heavy lifting (Ultrasound  $\geq 20$ /week, OR= 3.4, CI: 1.2-9.0, n=9 . Heavy lifting,  $> 10$  kg or patient transfers  $\geq 50$  times/week, OR=3.5, IC: 1.1-9.0, n=11). Odds ratios increased for pregnancies  $> 10$  weeks: electric therapies OR=2.2, shortwaves 2.5, Microwaves 2.4, ultrasound 3.4 and heavy lifting 6.7 .

They conclude "Physical exertion during early pregnancy seems to be a risk factor for spontaneous abortion. The findings raise suspicion of potential harmful effect of shortwaves and ultrasound on the pregnancy, but no firm conclusion can be drawn on the bases of these results alone." However, this study adds weight when grouped with other studies.

Larsen et al. (1991), studying pregnant physiotherapist's, identified 54 cases and 146 spontaneous abortion cases from Denmark, found a significant increase in malformations, still birth, low birth weight, cot death and prematurely when working with short-wave diathermy.

Taken together, the three Scandinavian studies show adverse changes in pregnancy outcomes associated with short-wave RF, including spontaneous abortion later in the pregnancy, fetal malformations, still birth, low birth weight, cot death and prematurely.

The only study to find effects with microwaves was Taskinen et al. (1990), and then an association with later pregnancy spontaneous abortion.

A further Finnish study on spontaneous abortion in association with the use of VDUs, Lindbohm et al. (1992), found a non-statistically significant elevated risk miscarriage of 10% with all VDU usage, but for those exposed to  $\geq 0.9 \mu\text{T}$ , the odds ratio was 3.4 (95% CI: 1.4-8.6) when compared to rates in workers exposed to  $< 0.4 \mu\text{T}$ . They investigated confounders such as ergonomic factors and mental workload but these change the odds ratio very little. An exposure assessment found a significant dose-response relationship.

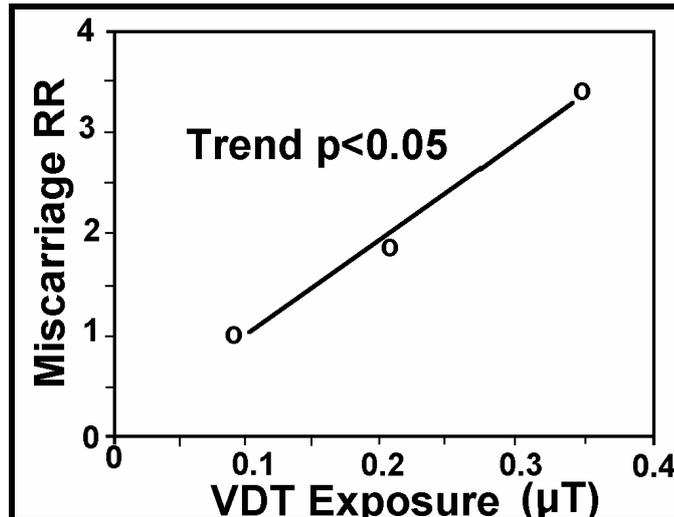

Figure 41: ELF/RF/MW exposure from VDT usage increases miscarriage in a dose-response manner, Lindbohm et al. (1992).

American studies include Vaughan et al. (1984) who found significantly increased risk of fetal death for last pregnancy for therapists, RR=2.0, CI: 1.5-2.5, n=169, and for electronic technicians, RR= 1.5, CI:1.2-2.0, n=202.

The most significant study was carried out by Ouellet-Hellstrom and Stewart (1993) who investigated early spontaneous miscarriage among U.S. Physical Therapists who had used short-wave (27 MHz) or microwave (915 MHz and 2.45 GHz) for diathermy. The sample involved 1753 case pregnancies (miscarriages) and 1753 matched controls. Exposed cases were women who had been exposed to EMR in the 6 months prior to the first trimester or during the first trimester of the pregnancy. They found statistically significantly increased early spontaneous abortions in the first trimester for those using microwave diathermy, OR= 1.28, CI: 1.02-1.59, the odds ratio increasing with exposure (trend  $p < 0.005$ ) giving a statistically significant dose-response relationship, the odds ratio in the highest exposure group being OR= 1.59, CI: 0.99-2.55 .

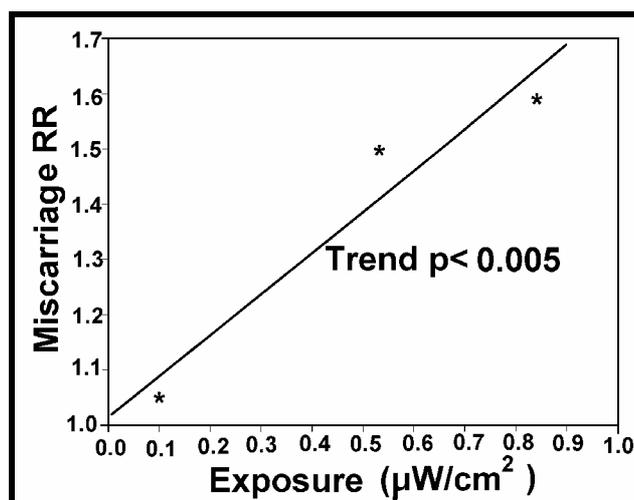

Figure 41a: Microwave exposure associated miscarriage for pregnant physiotherapists, Ouellet-Hellstrom and Stewart (1993).

For those for whom this was the first miscarriage, the association with microwave exposure gave OR= 1.26, CI: 1.00- 1.59, the dose response trend had  $p < 0.01$  and the highest

exposure group had OR= 1.55, CI:0.92-2.61 . Short-wave exposure showed some positive odds ratios but none were statistically significant.

This study shows a very strong relationship between microwave exposure and early miscarriage, with a dose-response relationship, backed by several other studies, and evidence of melatonin reduction and chromosome aberrations, showing a causal relationship between RF/microwave exposures and miscarriage and congenital malformation.

Taken with the Scandinavian studies, the pattern emerges of late pregnancy miscarriage and fetal damage in association with short-wave exposure and early miscarriage in associate with microwave exposure.

A subsequently exchange of correspondence related to this study challenges those who dismiss an athermal mechanism, such as chromosome aberration or melatonin reduction which are known miscarriage risk factors, Sandyk et al. (1992). Hocking and Joyner (1995) show that microwaves produce very small SARs with the uterus, Figure 42.

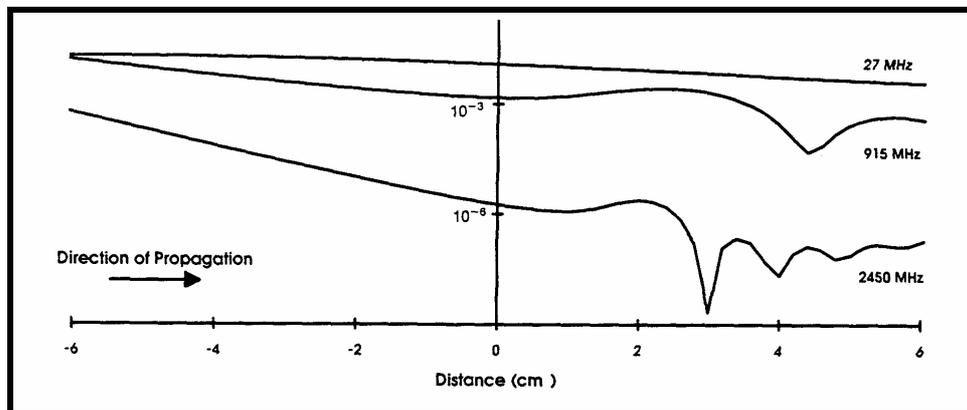

Figure 42: Specific absorption rate (SAR) profile across the uterus for a small woman exposed to  $1 \text{ mW/cm}^2$ , from Hocking and Joyner (1995).

Their table 2 shows maximum SARs in the uterus for the conditions in Figure 38 for short-wave (27.12 MHz) of  $0.209 \text{ W/kg}$ , for microwave (915MHz) of  $0.023 \text{ W/kg}$  and for microwave (2.45GHz) of  $0.000027 \text{ W/kg}$ . With a heating rate of  $0.0045 \times \text{SAR } ^\circ\text{C/min.}$ , Gandhi (1990) and a maximum exposure time per treatment of 5 minutes, the heating of the fetus will be  $0.005$ ,  $0.0005$  and  $0.0000006^\circ\text{C}$ , respectively. Not even the short-wave exposure can produce a detectable heating effect in the uterus environment. The purpose of providing this data was for Hocking and Joyner, employees at that time of Telstra, the Australian telecommunications company, to argue that microwaves cannot be associated with miscarriage because there is no heating. Ouelette-Hellstrom and Stewart correctly reply that the association with microwaves cannot be changed but the explanation (thermal mechanism) can be.

### 12.1.2 Biologically Plausible Mechanism:

Electromagnetically reduced melatonin could be related to spontaneous abortion. According to Sandyk et al. (1992):

**“The causes of spontaneous abortion can be divided into two main categories: those arising from chromosomal anomalies and those arising**

**from abnormalities in the intrauterine environment. In the following communication, we propose that deficient pineal melatonin functions in early pregnancy may be causally related to the development of spontaneous abortions in cases where chromosomal anomalies or structural abnormalities of the uterus have been excluded.”**

Microwaves are shown to be associated with DNA breakage in rats brains, Lai and Singh (1995, 1996) and to cause chromosome aberrations in living humans blood, Garaj-Vrhovac and Fucic (1993), and hence can produce the first cause of spontaneous abortion. Reduced melatonin allows greater concentrations of free radicals to exist. These damage the DNA and chromosomes, leading to a similar mechanism for miscarriage of the deformed fetus.

Therefore, thermal shock and cumulative buildup of thermal lesions is implausible and cumulative cell damage, including melatonin mediated free radical chromosome damage is a highly plausible mechanism.

### **12.1.3 The microwave dose associated with the risk:**

Given the SAR information and the dose-response relationship, it is appropriate to estimate the risk of spontaneous miscarriage in terms of monthly mean exposure.

The quoted mean exposure is 80 - 1200  $\mu\text{W}/\text{cm}^2$ . Assuming a conservatively long estimate of 2 minutes exposure per treatment, 1 treatment per month averages out to the range 0.004 to 0.056  $\mu\text{W}/\text{cm}^2$ , mean 0.03  $\mu\text{W}/\text{cm}^2$ . With 10 treatments per month from 0.04 to 0.56  $\mu\text{W}/\text{cm}^2$ , mean 0.3  $\mu\text{W}/\text{cm}^2$ ; and 20 treatments per month 0.08 to 1.11  $\mu\text{W}/\text{cm}^2$ , mean 0.6  $\mu\text{W}/\text{cm}^2$ . The lowest limit is very difficult to estimate with reliability but the mean level of the middle band is 0.3  $\mu\text{W}/\text{cm}^2$ . This suggests that a 20 to 50% increase in miscarriage occurred with a mean monthly microwave exposure of somewhat less than 0.3  $\mu\text{W}/\text{cm}^2$ . The dose-response relationships in Figures 41 and 41a points to a zero safe level. RF/Microwaves are genotoxic. A genotoxic substance has no safe threshold.

When applying the ubiquitous substance principle and the no non-exposure principle, along with two recently published that is showing that enhanced miscarriage rates are associated with residential power frequency fields, this confirms the conclusions above, Li et al. (2002) and Lee et al. (2002).

### **12.1.4 Relevance to mobile phone base stations:**

The fact that this level of microwave exposure is found near base stations and that there are currently no documented reports of increased incidence of miscarriage occurring near cell sites is not surprising nor a proof that the hypothesis advanced here is wrong. It simply results from the fact that miscarriage is not reported and no statistics are being collected for the general population. Each pregnant woman can only miscarriage once per child, with a several month wait until the next pregnancy. Each spontaneous miscarriage is isolated and does not form a pattern. Many causes are possible. Very few miscarriages are investigated, unless it becomes an issue from a cluster pattern and then a medical or environmental cause is sought. Initially few pregnant women lived near mobile phone base stations. However with the unrestricted sighting policy advocated by the companies and accepted by almost all states and councils, this is changing significantly month by month.

Increased incidence of miscarriage is potentially occurring right now and until it is scientifically assessed, we will not be able to rule out the scientifically indicated probability. The studies presented here give ample grounds for requiring the sighting of cell sites far enough away from residences to avoid an increase in risk of miscarriage.

## **12.2 Cancer**

### **12.2.1 WHO review team's results:**

The World Health Organization (WHO) has reviewed the EMR health research, including studies on cancer published up to about 1992 and published the review report "Environmental Health Criteria 137: Electromagnetic fields (300 Hz to 200 GHz)", Ed. Dr M.H. Repacholi (1993). The team selected 6 cancer related studies, 3 of which the authors conclude no effects, one "radar-exposed populations near air force bases" which has contradictory conclusions and two which do show increases in cancer risk, Figure 39. Given these conclusions on face value their chapter conclusion (8.2.5 in the box) of "no clear evidence of detrimental health effects" appears to be justified. However, two of the four "no effects" studies, Robinette et al. (1980) and Lilienfeld et al.(1978) have been closely studied and followed up by Professor John Goldsmith, Goldsmith (1995, 1998) who concludes that they both show increases in cancer risk. Given this analysis, of the six studies quoted, 5 actually do show increased risks of cancer. Below 24 studies are summarized showing EMR is associated with increased cancer

### **12.2.2 Brief Overview of Epidemiology and RF/MW association with cancer:**

There are many other studies which have found statistically significant increases in adverse health effects, including cancer. It is not that there is no evidence, nor even limited evidence of adverse effects. There is a large body of evidence, only part of which is reviewed here. There are sound scientific reasons for including studies involving ELF high voltage exposures (not reviewed here however), because of the similarity of cellular interactions and because high voltage are a localized source of RF radiation primarily in the 3 to 30 MHz range, which is why you hear a buzz on your car radio as you drive under a powerline.

The following give a brief summary of some of the published studies showing statistically significant increases of cancer from exposure to RF/MW on people.

A major study of radar and radio exposed U.S. Navy personnel, summarized as having no reported effects, includes data which shows statistically significant increases cancer between a group assessed as high exposure compared to a group assessed as low exposure, e.g. All death (RR=1.79 (1.52-2.12)), Accidental Death (RR=2.20 (1.72-2.82)), All Diseases (RR=1.55 (1.19-2.01)), Malignant tumours (RR=1.66 (1.06-2.60)), and Lymphatic and Hematopoietic cancer (RR=2.66 (1.02-4.81)). There was also statistically increased risks of a host of illness including, Musculoskeletal, Organs of Sense, Systematic conditions, Respiratory, Cardiovascular and digestive illness, Skin, Endocrine, Neurological and Mental conditions, Robinette et al. (1980).

<i>EHC 137: Electromagnetic fields</i>			<i>Human responses</i>		
<b>Table 31. Morbidity and mortality studies</b>			<b>Table 31 (continued)</b>		
Exposure conditions	Effect on exposed group	Reference	Exposure conditions	Effect on exposed group	Reference
Radar (pulsed), two groups: (i) <2 (ii) >2 up to 80 W/m <sup>2</sup> , for 1-10 years	No difference in health status between 841 adult males in groups (i) and (ii)	Czerski et al. (1974b); Siekierzynski et al. (1974a,b)	27 MHz shortwave diathermy (questionnaire to 3004 physiotherapists)	Association between heart disease and work with shortwave therapy (number of treatments/week)	Hamburger et al. (1983)
Radar (pulsed), <50 W/m <sup>2</sup> (<0.2 W/kg), for 5-10 years	No effects in clinical evaluations in comparisons between 322 radar workers and 220 non-radar workers; however, more neurasthenic symptoms in exposed group	Djordjevic et al. (1979)	Work at 27 MHz plastic sealers (70% of measurements at the head and hands >300 V/m)	Upper limb paraesthesia and eye irritation noted among 30 exposed workers compared with 11 partially exposed and 22 unexposed workers	Bini et al. (1986)
0.2-5 GHz (pulsed), approx. 10 W/m <sup>2</sup> , 0.05 W/kg (max). Occasional exposure to 1 kW/m <sup>2</sup>	No effect on mortality in male military personnel followed for over 20 years, exposed for 2 years on average (over 40 000 personnel)	Robinette & Silverman (1977); Robinette et al. (1980)	Military personnel exposed to RF/MW fields <2 W/m <sup>2</sup> with daily incidental (minutes) exposures of 2-10 W/m <sup>2</sup> (some times even 100-200 W/m <sup>2</sup> )	Increased risk of cancer morbidity in a retrospective cohort study of military personnel (study group size not given)	Szmigielski et al. (1988)
Males: 2.56-4.1 GHz (CW), 0.05 W/m <sup>2</sup> (max), 0.0002 W/kg (max); Females: 0.8-9.5 GHz (CW), 0.018 W/m <sup>2</sup> (max), 0.0007 W/kg (max), for 0.5-4 years average exposure	No effect on life span or cause of death of 1800 employees and 3000 dependents of US Embassy personnel	Lilienfeld et al. (1978)	51 male/62 female operators of plastic welding machines (27 MHz, 50% of welders exceeded 250 W/m <sup>2</sup> ) 23 female controls (sewing machine operators)	Increase rates of paraesthesia in hands, neurasthenia, and eye complaints; diminished 2-point discrimination ability	Kolmodin-Hedman et al. (1988)
Long-term microwave exposure of military personnel (interviews)	Higher frequency of microwave exposure in 14 polycythaemia cases than in 17 age-matched controls	Friedman (1981)	Amateur radio operators	Deaths from all causes less than expected from national rates; increased risk of leukaemia	Milham (1985)
Radar-exposed populations near air force bases	Increased cancer mortality compared with population-matched controls. No increase in cancer mortality compared with population-matched controls	Lester & Moore (1982); Lester (1985); Polson & Merritt (1985)	1.3-10 GHz, 0.1 to 10- $\mu$ s pulses, RF exposure of radar mechanics often exceeded 10 W/m <sup>2</sup>	No differences in neurological symptoms and findings between 17 exposed and 12 controls; increased protein band in CSF in the exposed group	Nilsson et al. (1989)
Children exposed to various air pollutants and RF	Duration and severity of tonsillitis increased	Shandala & Zvinjatskovsky (1988)			

**8.2.5 Conclusions**

In summary, the epidemiological and comparative clinical studies do not provide clear evidence of detrimental health effects in humans from exposure to RF fields. Some occupational groups, such as exposed physiotherapists and industrial workers, should be studied further. The question of whether RF might act as a carcinogen should be further evaluated in epidemiological studies.

Occupational exposure to RF will be at higher levels than that encountered by the general population, and, thus, there is less likelihood of health effects in the general population as a whole.

Figure 43: Table 31 from WHO (1993) showing the review team's selection of studies on EMR and morbidity and mortality and their summary of the study's conclusions, and, in the box on the bottom right hand side, the review teams conclusions on this set of studies and the reproductive studies.

You will note that the WHO review, WHO (1993) refers to Robinette et al.(1980) as showing no effects. Similarly for Lilienfeld et al. (1978). The data contained in these papers and reports indicate otherwise, Goldsmith (1995, 1997). The following is a summary of the cancer based studies published over the past two decades.

- Cancer incidence in the vicinity of Wichita, Kansas was found to be higher on ridges which were exposed to radar transmissions than those residents who lived in the valleys, Lester and Moore (1982 a). Residents were potentially exposed to two radars, one radar and no radars with relative cancer incidences of 470, 429 and 303 per 100,000 (1.55: 1.42: 1.00), trend  $p=0.03$ . The association persisted through adjustments for age, sex, race and socio-economic factors.

- Lester and Moore (1982b) found significantly higher cancer rates in U.S. counties with Air Force bases compared to those without Air Force bases, which they related to prolonged environmental exposure to RF/MW from radar.
- Polson and Merritt (1985) criticized the analysis of Lester and Moore (1982b), pointing out weaknesses in their use of the data, such as a city could be in a country with no Air Force Base but be closer to a base in another country than a city in that county. Having made corrections for this, Lester and Moore (1985) found strengthened associations between cities and air force bases, with higher incidences of cancer related to radar transmissions.
- Lin et al. (1985) studied 951 cases of brain tumors among white male residents of Maryland during the period 1969-1982. Fifty cases of glioma and astrocytoma were observed among electrical workers exposed to EMR compared to an expected number of 18, i.e. an risk ratio of 2.8. While their exposure was mainly to ELF fields it shows the common link over a wide range of frequencies.
- Increased risk of leukaemia amongst amateur radio operators (Milham, 1985).
- In 1985 an unusual number of children with leukaemia were identified living in the vicinity of broadcasting facilities (OR = 3.4: CI=0.70 -16.41), Maskarinec et al. (1993).
- De Guire et al. (1987) report increased malignant melanoma of the skin in workers in a telecommunication industry, affecting only men, SIR = 2.7 CI : 1.31-5.02).
- Thomas et al. (1987) report a 10-fold increase in astrocytic brain tumor among electronics and repair workers employed for 20 years or more. Some risk was due to solvents, put at a factor of 2, placing RF/MW contribution at a factor of 5.
- Milham (1988) studied 67,829 amateur radio operators in Washington State and California. He concludes "The all-cause standardized mortality ratio (SMR) was 71 but a statistically significant increased mortality was seen for cancers of the other lymphatic tissues (SMR = 162), a rubric which includes multiple myeloma and non-Hodgkin's lymphomas. The all leukemia SMR was slightly but not significantly elevated (SMR = 124). However, mortality due to acute myeloid leukemia was significantly elevated (SMR = 176).
- Szmigielski et al. (1988) studied polish military personnel exposed to microwave radiation and reported that cancer morbidity was three times higher in the exposed group than the control group.
- Electrical workers in Los Angeles County have a 4.3-fold increased risk of certain brain tumors (Preston-Martin et al. 1989).
- An increased incidence of malignant brain tumors has been reported in children of fathers exposed to electromagnetic fields and electronic solvents (Johnson and Spitz, 1989).
- Hayes et al.(1990) report an Odds ratio for all testicular cancer of 3.1 (CI: 1.4-6.9) for a small sample of workers who were occupationally exposed to RF/MW radiation.

- U.S. Navy electrician's mates have an excess risk of leukaemia, RR=2.4 (1.0-5.0), Garland et al. (1990)
- Savitz and Chen (1990) show significant increased risk of childhood cancer (Neuroblastoma (OR=11.8\*), Brain Tumour (OR=2.7\*) and CNS tumors (OR=1.7)) associated with parents who work in electrical and electronic industries.
- Increased risk for all brain tumours (RR=2.9 (1.2-5.9)) and glioblastomas (RR=3.4 (1.1-8.0)) for assemblers, and repairmen in the radio and TV industry, Tornqvist et al. (1991)
- Goldsmith (1995) reports an up-dated analysis of the US embassy in Moscow which does show a significant elevated risk of a wide range of adult cancers, and including childhood leukaemia, after years of microwave irradiation, exposed to average levels of radar produced microwaves of long-term average indoor exposure of 0.2 to 0.5  $\mu\text{W}/\text{cm}^2$ , daily peaks between 5 and 18  $\mu\text{W}/\text{cm}^2$  on the outside walls.
- Increased risk of female breast cancer with exposure to radiofrequency EMF, RR=1.15 (1.1-1.2), Cantor et al. (1995).
- Hocking and Gordon (1996) found a 2.74-fold increase in childhood leukaemia death within 4 km of three TV and FM radio transmission masts in North Sydney between 1972 and 1990. Mean direct exposures were measured in the range 0.1 to 1  $\mu\text{W}/\text{cm}^2$ . Mean personal exposures are in the range 0.002 to 0.02  $\mu\text{W}/\text{cm}^2$ .
- Polish Military personnel (1971-85) exposed to above average radar and radio sourced RF/MW show large increases in leukaemia (Lymphoma: RR=5.8 (2.11-9.74); Chronic lymphocytic: RR=3.7 (1.45-5.18); Acute Lymphoblastic: RR=5.8 (1.22-18.16); Chronic myelocytic: RR=13.9 (6.72-22.12); Acute myeloblastic: RR=8.6 (3.54-13.67) and Total: RR=6.31 (3.12-14.32). Also show statistically significant associations for cancer of the esophagus and stomach, colorectal, skin (including melanomas), CNS and brain. (Szmigielski , 1996)
- U.S. Air Force personnel showed increased incidence of brain tumour with exposure to ELF (RR=1.28 (0.95-1.74)), and RF/MW (RR=1.39 (1.01-1.90)).
- Dolk et al. (1997 a, b) found small but significant increases in adult leukaemia, which decreases with distance from the transmitter, associated with 21 highly powerful Regional FM and TV transmission towers in the United Kingdom. The 20 site study shows adult leukaemia incidence following the typical exposure pattern as it varies with radial distance, i.e. low near the tower, peaking between 1.5 and 3 km and then decreasing with distance. This is a strong dose-response result.

The Sutton Coldfield result, Dolk et al. (1997a), differs from the 20 site result because of five people with leukaemia who live near the tower. These 5 people are a classic cancer cluster. Clustering of cancer has been used as a confounding factor to dismiss the association with a toxin. In this case the cluster is kept in the sample to weaken the result through inconsistency with the 20 site study. If the cluster, which has a highly probable chance of being random, is removed, then the Sutton Coldfield result is fully

consistent with the 20 site result when the exposure and population patterns are appropriately considered, Cherry (2001).

- Szmigielski (1998), a conference paper reported in microwave news, concludes that the data suggests that cancers “develop faster, with a shorter latency period” in servicemen with occupational RF/MW exposures. He also found a dose-response relationship with cancer rate against maximum microwave exposure.

Number of Men	Peak Exposure Range $\mu\text{W}/\text{cm}^2$	Cancer Rate Ratio
1900	100-200	1.69
1320	200-600	1.57
350	600-1000	4.62
280	1000-	4.93

The morbidity rate for hematological and lymphatic cancers was 5.33 times greater than unexposed servicemen, also a highly significant result. (MWN Jan/Feb, 1998 p10)

- Michelozzi, et al (2002) showed that chronic residential RF exposure of people living in the vicinity of the Vatican radio towers, outside Rome, show a significant dose-response increase in adult and childhood leukaemia.

### 12.2.3 Cancer studies conclusion:

A genotoxic substance causes cancer. There is extremely strong evidence that RF/microwave radiation is genotoxic. There is also overwhelming direct evidence that RF/MW radiation is carcinogenic, raising the incidence of cancer in exposed military, occupational and residential populations. Many dose-response relationships, even at residential exposure levels give substantial evidence of a causal link between of cancer and chronic RF/MW exposure. Cancer of many organs is found and is expected since RF/MW exposure is a whole body exposure. Most commonly found cancers are leukaemia and brain tumors.

Evidence that RF/MW causes cancer is also evidence of shortening life and accelerating aging, as cancer is a strong result of aging. In a toxic substances also enhance the apoptosis rate. This is also a basic mechanism for advancing the ageing range.

### 13. Conclusions:

Scientific studies at the cellular level, whole animal level and involving human populations, shows compelling and comprehensive evidence that RF/MW exposure down to very low residential exposure levels, levels which are a minute fraction of present “safety standards”, results in altered brain function, sleep disruption, depression, chronic fatigue, headache, impaired memory and learning, adverse reproductive outcomes including miscarriage, still birth, cot death, prematurely and birth deformities. Many other adverse health effects have been found, predominantly cancer of many organs, especially brain cancer, leukaemia, breast cancer and testicular cancer. Studies have also found that RF/MW exposed parents have more children with CNS cancers and other health defects. These effects are consistent with genetic damage caused by RF/MW. Many scientific studies have found chromosome aberrations and DNA damage with RF/MW exposure, the first being published in 1959. Three primary biological mechanisms are linked to these effects, genotoxicity, altered cellular calcium ions and melatonin reduction. With melatonin reduction there is

usually a rise in serotonin which is associated with awakesness, alertness, anxious, anger, rage and violence depending on the serotonin level, the person and the circumstances. Most of these and many other neurological and health effects are associated with geomagnetic activity, through the Schumann Resonance signal mechanism which alters the human melatonin levels. It strongly supports a causal connection between the extremely low intensity natural electronic signals and the thousands to billions of times higher humanly generated electromagnetic signals, and the listed health effects.

**Hence there is strong evidence that ELF and RF/MW is associated with accelerated aging (enhanced cell death and cancer) and moods, depression, suicide, anger, rage and violence, primarily through genotoxic damage, alteration of cellular calcium ions and the melatonin/serotonin balance.**

Wireless radiation threatens birds, bees, and butterflies

# Smart Meter Health Complaints

All around the world people are reporting wireless radiation is affecting their health. We've collected many smart meter health complaints and posted them here. Utilities claim smart meters are safe, and compare them to cell phones. However cell phones, cell towers, wi-fi and other wireless devices can also affect your health! Reducing your EMF exposure can benefit your overall health and wellness. [Learn more about how to reduce EMF's](#), and sign up for monthly email updates to [stay informed!](#)

**The World Health Organization (WHO) classifies wireless radiation as a 2B carcinogen, based on studies linking cell phone radiation to brain tumors!**

## List of symptoms:

- Sleep problems (insomnia, difficulty falling asleep, night waking, nightmares)
- Stress, agitation, anxiety, irritability
- Headaches, sharp pain or pressure in the head
- Ringing in the ears, ear pain, high pitched ringing
- Concentration, memory or learning problems
- Fatigue, muscle or physical weakness
- Disorientation, dizziness, or balance problems
- Eye problems, including eye pain, pressure in the eyes,
- Cardiac symptoms, heart palpitations, heart arrhythmias, chest pain
- Leg cramps, or neuropathy
- Arthritis, body pain, sharp, stabbing pains
- Nausea, flu-like symptoms
- Sinus problems, nose bleeds
- Respiratory problems, cough, asthma
- Skin rashes, facial flushing
- Urinary problems
- Endocrine disorders, thyroid problems, diabetes
- High blood pressure
- Changes in menstrual cycle
- Hyperactivity or changes in children's behavior
- Seizures
- Recurrence of cancer

## Complaints:

---

I have been a cynic towards people who worry about smart meters for a couple years, even was an early adopter nearly 5 years ago. The last year I have been experiencing a chronic sore throat that my doctors can't explain, my kids are developing learning disabilities, among other strange health issues. The more I read, the more I'm concerned about the microwave radiation they give off.

---

---

2/2014 The first ones installed on the side of my apartment building were just steps away from my apartment. I had lived in this apartment for 5 years with no problems. Suddenly I started having terrible problems sleeping. I tried everything I could think of and finally went to my doctor who gave me sleeping

pills. For over a year I needed a pill every night, sometimes a half worked, but only for a few hours and soon I would be using the second half.

On Thursday, 4 days ago, newer and stronger meters we put in to replace the ones installed a little over a year ago. Now I cannot sleep, even with the sleeping pill and I am feeling so fatigued and muddle-brained that I can barely think straight and even have trouble standing up straight. I have literally done nothing since they have been put in and feel achy all over and disoriented, slightly dizzy.

Since I am in a rental, I am going to have to try to move, probably to another state, because I do not feel that California is going to do anything good on this matter to protect my health.

But I want you to know that in my opinion, making all of our technology communicable with wireless technology is going to bite us in the rear **BIG TIME** one day and we will be totally unprepared!

The reason? **THIS IS A TWO WAY COMMUNICATIONS SYSTEM THAT IS OPEN IN THE MOST OPEN WAY POSSIBLE ON OUR PLANET – THROUGH THE AIR!**

I am a systems engineer so I know very well how technology works. I am also an avid science fiction reader and I cannot even count on both hands the number of books I have read with scenarios where Earth is taken over and completely defenseless against invaders because we have WiFi'd **ALL OF OUR EXISTENCE ON EARTH!**

Anybody who knows anything about technology and physics knows this truth. **ANY** electrical signal retriever can catch these wireless messages floating through the air. This **ANYONE** is, say, **ANYONE WITH A CELL PHONE!**

In many of these science fiction stories, those using wireless technologies, (most were begun for **POPULATION SURVEILLANCE!**) were completely defenseless!

Think about it. And while you are at it take a look at the amount of equipment and hardware the US military forces are rushing to implement on every truck, tank, plane, bomb, etc., etc., **EVERYTHING** and **ANYTHING** can be made wirelessly communicate-able. –W.R. CA

---

8/13/2013 Hello, I live in an upstairs apartment, in Turlock, CA. I have been feeling sick since they installed 16 smart meters on a panel 6 feet away from my building. I have developed respiratory problems and insomnia and anxiety and pressure in my head. They have checked me for physical problems and Dr. says there is nothing wrong with me and they keep prescribing me anxiety meds to help me sleep at night that are messing with my heart and my head.

In a desperate attempt to figure out what is wrong with me, I came across a website that revealed a possibility that I may be exposed to the smart meter radiation. My husband has also developed asthma, coughing, bloody nose headaches.

Since then I have left my home and have been getting sicker because I cannot find anyone that believes me. Can you please help me find out how to even test for the exposure in my body?

If I stay away from the meters are my symptoms reversible mainly the insomnia and the anxiety. I have never experienced such a thing before. I am exhausted and I cannot find a doctor to help me. Most doctors are oblivious to what I am suggesting.

---

8/2013 I've been doing my own research for 8 months now, and have definitely concluded that Smart Meters are causing this horrible humming noise in my home. It is ruining my life and is violating my rights as a human being. I noticed it in the rental house I was living in for 7 months. I went to my parent's house to see if I heard it there and sure enough I did. I finally moved to the country in Sonoma County and it's horrible here too. Each place has Smart Meters. It's not like a normal sound from a refrigerator, etc. It's a low frequency humming sound that actually hurts my ears. I can't get to sleep and have had to run a fan or some noise to try to drown it out. But, since it vibrates in my ear, that is hard to do. I've gone online and millions are complaining of this humming noise. This is INSANE! If you do the research, you will find out how harmful these meters are. What are they going to do to our children, who are sleeping in the rooms where they are connected? PGE lied to us, sneaked into our homes to put these in, have not done proper testing, and are causing health problems to millions. Some counties in CA have banned them and I really hope it continues. I will have to ask my landlord if he is willing to opt out, and I will pay whatever to get peace again. This is torture. And yes, there are electrosensitive people out there for the person who said there aren't. Ignorance! Cell phones even hurt my ears. They have even linked heavy cell phone usage to brain tumors. Wake up everyone! It's time to stand up to this bullshit.

---

2013 We had a Smart Meter installed on our home. I got sick and two weeks ago had a mini-stroke. We took the meter off our home after sending Central Hudson (our utility company) several sets of documents – detailing my illness and then my hospitalization – and they did nothing and did not even respond to our requests. After my stroke, we ordered an analog meter online and replaced their radiating meter. We video taped it and sent their meter back to them with a letter, along with all the other correspondence we had sent (return receipt and notarized).

The following Monday the electric company came to our home, with no notice nor explanation, and physically, right in front of me, cut our electric lines with a huge pair of clippers! — New York

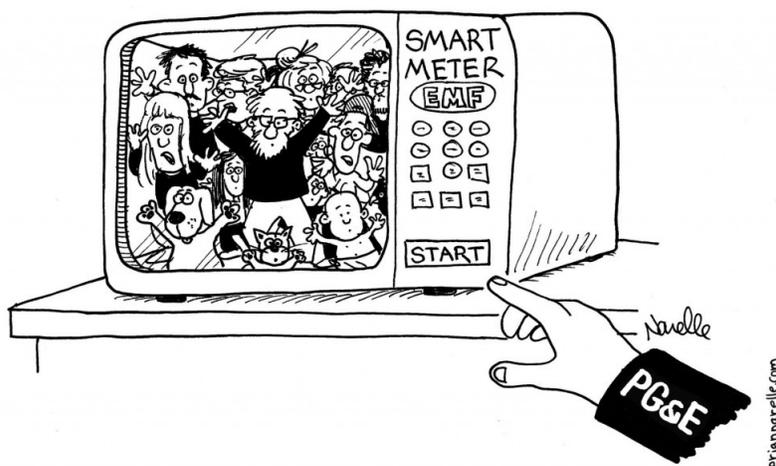

---

5/2013 My family recently moved into a new home which has 4 smart meters, we had wifi also initially. I began feeling ill: symptoms included a sensation of electricity coursing through my body, headaches, my blood pressure soared, the sensation of my brain feeling like it was being squeezed, and a sensation of burning on my skin and eyes. I could not find relief anywhere in my home. The symptoms of my three sons are less than my own and more vague: headache, "feeling sick upon waking", feeling a jolt type feeling sometimes.

I have purchased an RF meter but, even after much reading, still don't understand the subject very well. I do know that my meter indicated that there are strong fields all over my home and very strong pulse points in four corners of my home from the smart meters. There is literally no place in my house that does not show high RF levels. I can't escape from this feeling anywhere in my home and I even experience it where ever wifi is being used and even just near people using cell phones and near cell towers.

The effects that I feel from this exposure take a long to to subside even when I go to my father in laws where the meter shows no high levels of RF. I feel much, much better there but still have burning sensations on a much lower level. I have only been away from my home for about 12 hours now and can feel the symptoms greatly reduced.

I am afraid I am being caused permanent damage and most importantly that my young sons may be receiving damage from this exposure. They are only 7,7 (twins), and 10 years old. I am turning to you all for help because I am certain that I will not receive much help from the authorities. My own family cannot understand what is happening to me and to, I fear, my children. I am not crazy or imagining my symptoms. I hold a MA in Social Work, have a BA in psychology, have been employed in a professional setting for many years prior to the birth of my children. – Anon, Indiana, U.S.

---

4/29/2013 I am a 31 year old Female and I reside in Plantation, FL. I would say I started to notice major health concerns since the FPL Smart meter was put beside our bedroom window and it did me in. It gradually kept giving me headaches. Also, I have permanent retainers from wearing braces, behind my bottom and top teeth. Anytime a wi-fi or cell signal passes me I get a metal taste in my mouth. My Smart Meter peak occurred when I was in a deep sleep around 6:00am and was awoken to massive pressure in my head. It felt like my brain was on fire and it wanted to explode all at the same time. I woke up frantically screaming . I was holding my head and I had my husband scared. I hurried out of the bedroom still holding my head.

We were up all morning trying to figure out what it was. I felt as if my brain had burned. I knew it was from the Smart Meter because I was feeling it a little more each day. I called to have the Smart meter removed. For the rest of the week I felt the left side of my head and face numb. I couldn't speak properly or concentrate. Since then I have not been the same. I have a very difficult time concentrating. The newest thing that is occurring is that I feel my skin burning. I feel the top of my head burning as well.

Since the whole Smart meter incident we have removed our home wi-fi and we put our cell phones on airplane mode. What is killing me though is that our entire community not only has Smart Meters but our association just made a deal with AT&T and every house has U-verse. Each house has a wireless modem which transmits wi-fi and television. Even though we had our wi-fi turned off from the modem we also had the company run all the cable lines through the attic to the rooms for television. Our houses are so close together that our house gets both of our neighbors signals from each side.

---

2013/ I am the proud parent of six, of the six children we have four children who are under the age of six. In July of last year the LADWP placed on our home a RF meter, the RF meter was placed on the back of our home which is directly located about 25 to 30 feet away from the LADWP power pole that is located on our property. In July of last year our children started to exhibit health symptoms and health signs that alarmed myself and my husband. The children began to have fevers out of no where, essentially their bodies were boiling and their fevers would go from 101 to 104 and sometimes to 105. My husband is a Clinical Partner at Cedar Sinai Hospital in the ICU so he is versed in the area of taking care of patients in extreme health decline, but he was not prepared to handle the weekly and monthly bouts that our smaller children began to have. Our children also began to have problems with the inability to control their bodily fluids, our five year old began peeing and pooping herself, our four year began to display the same problems, soon many of the smaller children were all displaying these symptoms and concerns. The children became depressed, and essentially we began to realize that our children were not the children who we cared for prior to the RF meter being placed on our property. We were the only family in our area to have this new meter so we do not have a frame of reference in our community to measure the health side effects against. Please help us, we are good honest people who have suffered for the past few months trying to put the pieces of this puzzle together.

[Admin's note: *The mother wrote that after the Smart Meter was removed in January the children's symptoms "diminished greatly, they no longer get high fevers, or suffer from loss of their bodily function."* Meanwhile LADWP has terminated their power.]

---

[West Kelowna man claims Smart Meters are killing him](#) "...an Okanagan man claims the meters may be interfering with an important medical device – his pacemaker. Jerry Smith, 70, of West Kelowna is partially paralyzed as a result of the 10 strokes he's had since last August...."

---

---

I am an engineer. I have used technology my entire adult life – cell phones, smart phones, wi-fi, laptops, you name it. I really enjoyed all of this and had no issues or fears related to technology.

Then, when a bank of smart meters were put next to our apartment, both my wife and I starting experiencing headaches, insomnia, heart palpitations and tinnitus. Within a couple weeks, I could no longer use a cell phone without the same symptoms. Within a month I could feel the microwave radiation from cell towers. I have had to completely change my life because of this. Jeromy [[Testimony Jeromy submitted to the CPUC](#)]

---

“Is there a list of safe communities with no smart meters? Our whole family is being sickened by the smart meters around us and we need to find a place to live quickly.”

“We are just miserable here. We can’t sleep at night, are dizzy, have headaches, ear pain, and more. We also own our home so it is not easy to just pick up and get away from the smart meters.” CA. 2013

---

---

### **Sick with palpitations, chest pain, insomnia, dizziness...**

I managed to have smart meter installation delayed at my house, but suddenly became sick overnight with palpitations, chest pain, insomnia, dizziness, inability to concentrate and memory loss and fainting spells. AFTER becoming sick I found out that the day I became suddenly sick was the day the smart meter roll-out was completed in my area and the smart meters were remotely turned on from base.

I can no longer drive, I can’t work (I’m a doctor), I have to go and sleep at my mother in law’s place (there are no smart meters there yet).

My life is completely ruined and the energy companies and members of Victorian Parliament completely ignore me. Two doctors have confirmed my disability is entirely due to my sensitivity to smart meters’ radio transmission and I am 100% sure of that as I can always tell accurately if I am in a smart metered area or not.

We are now planning to move to South Australia to survive. What is happening in Victoria is a complete breakdown of democracy and an affront to social justice of enormous proportions and implications.

What if this is happening to an old lady living alone? Where can she go? We are all morally obliged to speak up and do something about it, if not for ourselves, for the vulnerable amongst us that, if affected, could not do anything about it. Posted on [Stop Smart Meters Australia](#)

---

I had no idea that a smart meter would pose a hazard to my health when I agreed to let them install one on my home. Shortly after the smart meter was installed my health took a terrible downturn. I began having heart palpitations, trouble sleeping, unexplained anxiety attacks, dizzy spells, nausea and fatigue. I have been battling anxiety for months and I had no idea why. I've never had these types of symptoms plague me like this before. Then I found out that so many others have had the same reactions to smart meters in their homes and neighborhoods. Smart meters need to be outlawed and all of them must be removed at once. There are enough toxins in our food and the environment without this happening too. I hope I am able to get mine removed, but from what I've read Southern California Edison isn't cooperating. H .M. Orange CA

---

Since the new Smart Meter has been installed my wife has had a ringing in her ears. The only time she has this is in our home. Outside of the house she does not have the problem. J. F. Sacramento CA

---

I was not asked permission to have the Smart Meter installed. In fact, when your representative/installer came to my door informing me he would be installing the meter, I specifically told him that I did not want it installed. He told me that I didn't have a choice in the matter.

I am plagued with various health issues because of the Smart Meters, such as insomnia, constant headaches, blurred vision and ringing in my ears, and other various aches and pains. I understand that others are suffering from various health issues throughout the state and country as well. I do not want this device on my home or in my neighborhood. I want the old analog meter re-installed. I also do not want the new digital meter installed. I specifically want the old analog back which worked just fine. I want this Smart Meter removed now! A.S. Bakersfield CA

---

For the past year, I have been suffering health effects due to the installation of a Smart Meter at my home and the other homes in my neighborhood. I have experienced migraines, disrupted sleep, and electronic sensitivity so that I was unable to use a computer or my cellphone without immediate nausea and headache. I feel constant low-level anxiety when in my house which "magically" goes away every single time we have a power outage. My husband has developed migraines, disrupted sleep, and tinnitus. I am concerned for the long term health consequences on us and on my daughter who is almost 3.

I have called PG&E and they refuse to remove the Smart Meter from my house. Other electricians say that they cannot replace the meter with an analog variety because it would be illegal. This product is making me sick, and even with the money to pay for it, I am not allowed to have it removed.

I would like to see Smart Meters pulled from the market until thorough testing is done and they can be proved safe. It is the responsibility of our government to protect public health from polluting corporations. Charging for the right to "opt-out" is criminal because it subjects the poor to poisonous health effects, and also because people will still receive exposure from their neighbors' properties, especially in urban population-dense environments.

PG&E cannot be relied upon to treat us fairly—my health just does not figure into their bottom line. Sometimes we need people with power to stand up for us.

---

---

I have been suffering since the installation of 3 meters in my complex (of 12 units) and from larger multi-unit complexes on both sides of where I live. This means that the radiation coming off all of these meters encroach on me, even though I have opted out and do not have one...Each day I awake with my head buzzing. I now have fatigue and headaches, nausea unexplained and nosebleeds at the oddest times for no other reason. I have lost so many days of working (I work from home) and now there is no place to go. Our entire county, once a pristine, safe and desirable place to call home is now a sea of massive radiation from the thousands of smart meters now installed.

---

We didn't even know the meter was there when we moved in the house late April, 2011. We'd been feeling strong and well. Suddenly our health started deteriorating rapidly. It was until end of May that I saw the meter and red flags went off. I have been avoiding all types of radiation since the 80's due to poor health...and here it was now permanently attached to my bedroom wall!! We had no place to go. Complaints and pleas to the utility companies were absolutely fruitless. We have removed it ourself.

---

I have been suffering horrible migraine headaches since a SmartMeter was installed on my home in the fall of 2010. The meter was installed without my permission. When the installer arrived unannounced, I happened to be home. I told him I did not want a Smartmeter. He responded by telling me I had no choice and walked right in my gate and installed it.

It took almost a year of 15-18 debilitating migraine level headaches before the cause was discovered. I saw doctors and had blood tests, MRI's CT scans, took migraine medications all with no relief. I kept a headache journal as recommended by headache specialists at UCSF and found no connection to headache development and diet, activity, etc. Looking at every variable possible, it was finally discovered that when I am around Smartmeters, I get headaches. When I am not, I don't get headaches.

I am a high school teacher and was able to go visit my Mom in a neighborhood that has no Smartmeters when school let out in June of 2011. For my 9 day visit with my mother, I had no headaches. When I returned home, the headaches resumed on my first day back. The Smartmeter was then suspected. I shielded the SM with simple aluminum shielding, and the migraine headache significantly reduced to a normal headache. When I remove the shield the intense migraines come back; replace the shield, they go away. The shielding is not 100% blockage. I need this meter completely off my home!!

I cannot walk my dog in my own neighborhood. All the buzz from my neighbors meters make me dizzy and don't help my headaches!! I feel trapped. There aren't many places to escape the horrible effects of

these meters because they are everywhere. I love my job and I love where I live, but I feel I am being forced to leave. I cannot believe this is happening in this country!

The longer I am exposed to this SmartMeter, the more sensitive I am becoming. My doctor says I have developed electrical sensitivity. I am miserable and there are some days I wish someone would just shoot me. These SmartMeters and the technology they use have turned me from a happy and productive member of society, into a desperate and miserable person. Please help!!!!!!!!!!

---

I have been severely harmed by the installation of two smart meters on my family's home where I reside with my elderly parents and nephew.

I was forced to go to the emergency room only three hours after the two meters were installed on our home (one for gas and one for electric) from severe nausea, heart palpitations and a severe headache.

After several days, with the help of several highly trained medical doctors and a PA at my personal doctor's office, I finally found a medication that allowed me to stay home and assisted me in not having to continue to visit hospital services.

However, though the nausea was lessened by the medication they gave me, which by the way is what they give to people who have radiation poisoning, its side effects were too severe (mild to severe constipation and cramping leading to the need for more medical treatments) to continue for more than a few weeks. I was lucky enough to find an Accupuncturist who helped with these symptoms so at least I can now manage my pain.

I also suffered severe headaches (one meter was right outside my room, only two feet from my bed) and I was forced to move from a private room in front of the family house into the back of the house where the pain is much less.

Now I live my life in our family's den, always intruded upon by the need for my parents and other family members who reside here to work in the same area. I have lost all my privacy and I still suffer headaches every day now. I fear my health is also deteriorating as I keep getting colds. I have had one every month since the smart meters were installed. Even in the warm weather. My immune system is being affected negatively.

My only hold on my sanity is my friends and loving mother. Otherwise I would have given up on living months ago. I hold on though I doubt I can withstand a flu or other immune compromised illness. My final act is to stop smart meters here on this planet, if at all feasible.

As I already have fibromyalgia and acid reflux, this is probably the final nail in the coffin for my health. Please stop all smart meter installations and try to get all the ones already installed off people's homes and residences and businesses. I can't hardly go anywhere now without an instant migraine from the fact they are installed everywhere. I hate to think what they are doing to everyone's health in my community. It makes me ill thinking how it is harming our children and elderly right now.

---

A man who identified himself as working for PG&E, came to my door stating that he was here to install a Smart Meter on my home. I said, "No! Please don't do that. I don't want a Smart Meter." I watched him walk out of our gated yard. But he had not left. Moments later, he entered our gated yard again and I heard pounding at the side of my home, where the 4 meters for our townhouse are located. I called out to him, and he came to the front door and told me that he was installing 3 Smart Meters for my neighbors—on MY HOUSE! I said, "No, please don't do that this is my home." He stated that he had his orders and he was installing them. He left a card on my door with a number to call. He did not work for PG&E but a private company—PG&E may have an easement to my property, but his company does not—I believe he was trespassing when I denied access. I begged him to stop—telling him repeatedly that I was not well, and I was not giving my permission for Smart Meters to be installed on my home. He stated, It is my job, & went to the side of my house. I called the number he had given, spoke with a PG&E rep and the connection was lost. I called back and spoke to another rep, who stated that I wasn't on the "list" and that he would place me on it. I explained why I was calling, then he had to speak to his supervisor. He came back and said, "Well I can tell you this, once they are installed, they aren't coming off!" I explained that I could hear the pounding at that moment and that they were in the process of installation and still could be stopped. I was told that nothing could be done.

Since the installation, my heart has been in fibrolation daily & my heart rate & blood pressure are elevated. Our granddaughter's bed in her room is on the same wall as the Smart Meters. She has suddenly developed insomnia & is doing poorly in school. Recently, staying at a hotel she had no trouble sleeping through the nights.

Since installation, our high-speed internet connection has slowed, been interrupted often, dialing out we have static on the phone lines, similar to taking a cordless phone too near a microwave oven in use. Even our Wii reception has been slower & multiple interupts during each episode of Netflix—not interrupted prior, all since the installation.

---

My family has suffered since moving to this house (our old house did not have a smart meter). We have trouble sleeping. Headaches. Our son experiences nosebleeds and attention problems. My Mother feels that her health has declined in many aspects since the installation of her meter (she lives next door). We all have noticed our immune systems are weaker. The biggest complaint is difficulty sleeping.

---

When the SmartMeters were put in my neighborhood, I and others had sleep problems. We did not know that the SMeters were installed on the neighbors' homes as we did not have any SMeters. I have had to sleep in a heavily shielded area to get more than a couple of hours of sleep. I have also had pain in my sinuses and pressure in my face, and increased bleeding episodes.

I do not want an SMeter of any kind. An injury 6 years ago left me hypersensitive to the electromagnetic fields these and other devices emit. I had a lot of pain when appliances with switching power supplies were plugged in (like my computer). A doctor suggested I buy filters for this. That worked.

Please help me and others. I have since looked into the research. This hypersensitivity is caused by over-exposure. Wireless and the high frequencies produced by switching power supplies affects many people. There are 1000's of red flags in the research. Please help stop this criminal use of compulsory technology.

---

Within 5 hours of having a smart meter installed on my apartment building I developed a severe band-like headache. I did not know what a smart meter was when the man with the hard hat knocked on my door to tell me that my power would be turned off for about 10 minutes. I thought nothing of it. The headache persisted through the night and was unresponsive to medication. The next morning I also experienced nausea and began to think that I was coming down with the flu. However, when I left my apartment and went to another city (no meters) my symptoms cleared up. I was perplexed when they returned that evening after I returned home. This pattern continued for the next 3 days: headaches, nausea, some heart palpitations, and feelings of irritability and confusion — all of which resolved when I left Burbank and went into LA City. After 5 days I could no longer tolerate the symptoms and left my home of 23 years, to live out of my car and sleep in the homes of friends and family to avoid the unbearable health issues.

I am disabled and, try as I might, I have been unable to find subsidized housing in an area that is free of meters. I am exhausted and despair at what my future holds. I have told Burbank Water and Power about my problems. A board member told me to move out of Burbank. I contacted the CPUC and was told that they have no jurisdiction over my utility company and was instructed to contact my City Council. I have spoken several times at City Council meetings but the council members are relying on the information provided to them by the CPUC, the California Council of Science and Technology, and Burbank Water and Power. It is the most of vicious of circles. There is no remedy. There is no advocacy.

Several of my neighbors are experiencing similar symptoms, complaining of insomnia, headaches, difficulty concentrating. The mesh network and the meters are a scourge, depriving us of our human rights and our civil rights.

---

I am writing to file a complaint against PG&E and CPUC due to the health hazards of installing a Smart Meter in our home without our consent. When we first discovered its installation in May of 2010, my husband called PG&E with the request to have it removed, and they refused. On July 31, 2010, I went into the living room, about 6 feet from the wall that holds the Smart Meters, and felt a sudden zap of energy that instantly had my chest and throat aching, sending my already delicate health into immune collapse. It took several days before the aching in my chest, and the intense fatigue and brain fog that accompanied it, abated. We hired an electrician to come to our home with his radiofrequency radiation meter, to determine the frequency and strength of the Smart Meter radiation in our home. At the time of his reading on Wednesday, August 4th, the meter was pulsing about 3 times a minute, and inside the house the radiation from the Smart Meter was definitely high in the living room.

This kind of radiation is not good for anyone's health, and as someone with chronic health issues and immune dysfunction, to have a Smart Meter in our home is completely unacceptable. I am writing to

request that the Smart Meters at our home be removed immediately, and that action is taken to remove these meters from our area.

---

We had requested by phone that the smart meter not be installed at our residence. A couple of weeks or so after that, we noticed that our old analog meter was gone and a smart meter had been installed.

---

Within 1 hour of having our smart meter installed my wife started getting heart palpitations, headaches, brain fog and trouble sleeping. I have had brain fog and trouble sleeping. When we leave our home for a day then our systems return back to normal. We went to visit our family away from our home for 2 days to celebrate Thanksgiving and again felt much better. When we returned so did the problems.

We have our own business and have to work out of our home. It seems that America was a country of freedom of choice and not a country where things can be shoved down our throats and when we ask for reasonable changes we are turned down. We should have the choice of what goes on our house that is reasonable and safe to our health.

If you are normal or of normal health than a smart meter may not effect you but to the percentage of people that have medical issues please do not discriminate or destroy their ability to function normally or lose productivity.

---

I find it deeply troubling that the utility did not offer me the option of a new meter. Things like this should ALWAYS be opt-in only. I am also deeply concerned about the health effects of the meters. This should be among the top priorities for our legislators, as exposure to electro magnetic radiation impacts children and the ill the most, but will also make healthy people ill. Meanwhile, doctors are not properly trained to diagnose or treat related illness.

---

Within a month or 2 of installation of my EvilMeter, aka SmartMeter, I noticed for the first time in my life that my heart was skipping beats. It occurred only in the front part of my house. After a few days I remembered the EvilMeter, and checked to see where it was located. It was on the outside of my living room wall, only 1-2 feet from my sofa, where I often used to sit. I tried taking my pulse many places, and my pulse was normal everywhere except in the front part of my house. My irregular heartbeat was worst when near the EvilMeter.

Over the months since then, I have tried to stay out of the front part of my house. But my kitchen, TV, phone and computer are there, so I couldn't completely avoid it. I did spend as much time as I could in my bedroom, e.g., eating most of my meals there, not watching TV, bringing my computer into my bedroom to work on it, etc.

However, a month or two ago I noticed that my skipped heartbeats were getting worse — my heart would only beat 2-3 times, then skip a beat, beat 2-3 times, then skip a beat, etc. That would go on for hours. This was much worse than at first, when it would go back to normal within a short time of going into my bedroom or leaving the house.

So I went to an MD, who diagnosed me with PVC (premature ventricular contraction). It may cause me to have a stroke, a heart attack, or eventually heart failure. I think that is extremely Evil.

Please make PG&E (and other utilities who may be doing the same thing) stop installing EvilMeters, and make them leave the analog meters in place. And please make the utilities replace all installed EvilMeters with analog meters.

---

I am a retired school teacher who has served California well over the years. I am ill from the smart meters (two of them, one gas, one electric) on my property – one at each end of my home. The electric smart meter, the worst of the two, is located on my bedroom wall, right by the headboard of the bed. My head was less than a foot, about 8 inches or less, from the smart meter for six months, as I slept and read in bed, sitting up. I had no idea that the electric meter on my property was causing emissions, including high bursts of radiation, 24/7. I have had my home tested and there is also “dirty electricity” from emissions on the wiring in the bedroom. I developed numerous symptoms, including very shrill (painful) ringing in my ears, severe headaches, skin cancer, dizziness, nausea, sensitivity to rf radiation and more, all following the exposure to the smart meters. Finally my doctor told me about the dangers of smart meters and diagnosed me with radiation illness. I moved out of the bedroom, along with my husband. I now sleep (for the past year) in the living room (very uncomfortably) and he sleeps in another bedroom. The living room is far enough away to lower the headaches, the other bedroom is not. I cannot use 1/3 of my home and property now, due to the smart meters. Getting anywhere near the electric meter, especially, inside or outside, produces extreme illness that lasts for three or four days.

I wrote and called SDG&E and the CPUC many times. Neither one was helpful. They both incorrectly insisted that it was mandatory to have these horrible meters on my property. I wrote and called all elected officials. They have ignored me... This is the worst thing I have ever experienced or seen. America will be destroyed by these multinational companies and the politicians who cater to them, if we don't take action to stop the smart grid.

---

I would like to have the SmartMeter removed from my home immediately. I was not asked permission prior to the SmartMeter device being installed on my home. My family was never consulted about the program, or even notified in advance of installation. I hereby demand that the SmartMeter device be removed from the premises.

Since the installation, I have had headaches, nausea, dizziness, confusion and memory loss. I now understand that there are health concerns related to the wireless network that the SmartMeters use, and I do not want this device on my home or in my neighborhood. My old analog meter worked just fine, and I do not want to risk the health of my family with this SmartMeter.

---

I live in Encinitas and the Smart Meter was installed in my home without even asking or considering the Health issues for myself and those living here. This is so outrageous and plain inconsiderate. I feel very resentful to the SDg&E! I have felt more tiredness, stress and agitation since they were installed and I want them out of my home. Did no one do any research on the effects on Health before considering installing these on our homes. I cannot believe the ignorance of such an act!

---

I have had headaches and progressive MS symptoms since the smart meter was installed. My MS symptoms now have progressed to feelings of numbness in my hands, burning sensations in my left arm, weakness in my left arm and a sense of confusion and memory loss intermittently from week to week. I want these poisonous contraptions OFF my house ASAP!

---

Since about a month after the meter was installed on my home, I began experiencing hives all over my body and near constant ringing in my ears which gets very loud at times. Both symptoms disappeared immediately months later when I was able to leave my home for more than a day. They returned within 24 hours when I returned to my home.

When the installer came to change out my analogue meter which was working perfectly, I followed him out to the side of my house and told him I objected strongly to the meters because of the problems I'd been hearing about inaccurate readings. I had not heard about the health concerns at that point. My objections were ignored so the meter was installed. As stated above, my symptoms began about a month later and have continued non stop since...except when I was able to leave my home for more than 24 hours.

Two and a half years ago, I had major surgery for cancer. It was removed and my follow up treatment worked. I was feeling very well just before the smartmeter was installed. When the hives and ear ringing began, my feelings of well being totally disappeared. My MD is VERY concerned and believes as I do that the Smartmeter is a threat to my health.

---

In the past year, without my consent, a smart meter was installed on my property. Between the time of installation and this writing, I have developed tinnitus—a constant, faint, ringing in my ears that negatively affects my sleep and my overall quality of life. I had no idea why I developed this condition (I have suffered no head injury or severe illness this past year) until I learned today that tinnitus has been associated with the emanations from these smart meters. My wife then attempted to contact PG&E and local electricians regarding the replacement of the smart meter with an analog meter. She was informed by the local electricians that it was illegal for them to remove the smart meter from our property. She was informed by PG&E that they would not remove the smart meter. This situation is intolerable. The idea that a private company is somehow entitled to place a device on my home that is harmful to me and to my family flies in the face of my understanding of property rights in this state and in this country. I would ask

that you give rapid consideration to a method by which homeowners can opt out of having a smart meter. The longer this goes on, the greater the harm that will be suffered by the populace and the greater the damages that will ultimately be recovered against PG&E in the numerous lawsuits that will inevitably result. I own and operate a civil litigation law firm in Los Gatos (Abronson Law Offices). I have previously received inquiries regarding legal action against PG&E. Given my personal experience, I will be taking these more seriously in the future. I and numerous others in my community will also be watching to see how quickly and successfully this issue is addressed in considering how to vote in the next election.

---

I have called to have my smart meter removed 11/30/11 This was installed Jan. 12 2008. Since then I have experienced sleepless nights, anxiety, ringing in the ears and headaches, my children have as well.

When I called to have the smart meter removed I was informed that I will be charged to go back to the analog and will not longer be able to use the Time of Use plan (which I have been a part of before the smart meter...this is a cost saving program as to when the peak and off peak hours are for usage) Their reasoning is that a technician will have to come out monthly to read meter. So I am curious why my NEW monthly tehnician fee who will come out to read my meter will not be able to do the exact same service I had prior to the having the smart meter installed!

---

I have lived in my home in Santa Cruz for over 30 years. This last summer I was away for 5 weeks, when I returned to my home in mid September I began having sleepless nights. I would awake about midnight with my heart racing and be unable to go back to sleep at all. After a week of this I went to visit a friend and slept perfect at her house, that has no smart meter. When I returned the same sleeplessness happened. It finally dawned on me to check the meter which is on the outside wall of my bedroom. The smart meter had been installed against my opt out wishes.

I called PG&E and they have refused to take it off and gave me misinformation on the phone saying that the meter was not even working yet. When I pressed the representative about this, he changed his story. I need this meter off, I am missing work and my health is suffering from lack of sleep.

---

Since the SmartMeters have been installed on the condo building where I live, I started suffering from heart palpitations.

I happens especially during the night awakening me and keeping me awake, without being able to fall asleep again.

I also started suffering from Hypothyroidism, a problem I never had in my life until now (I am 41).

This is an intolerable decay in environmental quality. Since now, I have conducted a very healthy life style, rarely have I got sick form common things such as colds and flu.

How is that eating only organic foods, not smoking, having low stress level got me into an autoimmune disease?

---

Since Smart Meter has been installed, I am suffering from heart palpitations, unusually dry skin, and insomnia for months. My pregnant wife has had chronic headaches for months. I usually keep abreast of health dangers that most people are unaware of, but somehow I missed this one. I was personally violated when my Kafkaesque utilites company, PG&E, came and did this to me without informing me. They come and threaten my health and the health of my family like this. It's an outrage but most folks, as usual, are still asleep to it. I had to spend 200 bucks on EMF shielding fabric for our bedroom, as the accursed "Smart" meter is directly opposite our bed. I've written, I've called, and as I fully expected, PG&E doesn't give a damn about my family.

---

I would like to have my smart meter removed from my home immediately. I never gave my permission to install a smart meter on my home. One day a company representative showed up at my door and said he needed to replace my meter. I did not realize that it was going to be a totally different meter than what I already had. I was not given any information about the smart meter at all. I demand it be removed immediately!

Since the smart meter was installed i have been suffering from debilitating headaches. On some days it is so bad that I cannot function at all. I have also been having severe difficulty with sleeping. After doing research on my on I found out that there are considerable health concerns involved with smart meters. The problems that I have been having are among those health concerns. I demand that my smart meter be removed from my home immediately.

I have called my utility company, Georgia Power, and informed them of these problems and requested by old meter back. I was told that those meter were being phased out and I would not be able to get it back. I was told that I was going to have to deal with the smart meter. They were sorry that I was having problems but there was nothing that could be done. This is not satisfactory! My health and the health of my family are very important. I demand that my smart meter be removed immediately!

---

Since the installation of this new meter, we have both been experiencing ear ringing, headaches, problem sleeping. we would very much like to have our older type meter reinstalled. we don't believe all this to be just a coincidence, because of the timing of it all.

---

Moved into my apartment complex back in November of 2010. The Smart Meter was already installed for our apartment.

Ten out of twenty apartments here have smart meters installed. Our apartment is about 90 ft. away from all of them, yet I still have not had a regular nights sleep since I have moved here. The past year has been pretty painful for me. On average I would normally wake up once through out the entire night. Now its 5-6 times a night if I can even fall asleep!

I don't use wifi unless I have guests over. I keep my cell on speaker away from my head at all times and out of my room at night. obviously I am highly sensitive to electric fields. Not to mention my young indoor cats used to be very active and out in the open of the living room at all times. Here, they hide behind the couch or in the closet as if they are nearly always disturbed=(

The only change in our lives has been the SMART METERS. If all smart meters in my complex are not removed with in the next 3 months, I will have no choice but to move once my lease is up. It will have to be somewhere where they don't allow them. Im sure I will be pushed into backwoods because all of this.

---

Since the installation, I have had bad headaches, and buzzing in my head as well as feeling of my inside is being cooked at night when I try to go to sleep. I have changed my bedroom twice, and now I am sleeping and living in my kitchen where it is the furthest from the SmartMeter. When I go to bed, I turn off the Main Switch to the house over night so that I can sleep. This constant switching on and off the power is making my husband crazy too. He cannot go to sleep until I go to sleep because I need the power off entirely in the house.

I have called my utility company, PG&E, multiple times about getting the SmartMeter removed, and they have told me they will not remove it. They told me there would be an opt out option in the future, but we cannot wait for finalization the opt out program. I do not feel it is fair that I have to suffer when I did not want the SmartMeter on my home in the first place. I am certain that the SmartMeter is causing other health issues for myself and my family because ever since the installation of the SmartMeters, I not only cannot sleep well but my back and leg hurts all the time. I do not want to wait remove this SmartMeter. I would like it removed now!

---

I learned of the dangers of 'Smart' meters shortly after it was installed on my home. Since this time, I have experienced a loud ringing in my ears when I am at home, and my toddler, whose bed is about 15 feet from the 'Smart' meter, has not yet slept a full night in our home since the new meter was installed. He sleeps fine at his grandparents house. He sleeps fine when we are staying elsewhere. He is generally awake and crying every 2-4 hours when we are at home.

Also, the month after my "Smart" meter was installed, my electricity bill almost doubled. This was even after we put our home electronics on a power strip so that we could completely power everything down. We also have gas appliances, so when SCE told me that we were 'probably running our dryer more than usual', they were quite mistaken.

I am also very concerned about fires, as my house was built in 1913 and, while the wiring has been updated since then, there are still some areas of the house that may not have been. After hearing about the

'cause' of fires in some peoples' homes (that their wiring was not up to code), I am concerned that I will also be a victim of this fraud claim.

Had I been informed of the issues surrounding 'smart' meters, I would not have allowed one on my home, near my family.

---

Since moving into this partial basement apartment 2.5 years ago, I noticed an increase in my resistance to environmental sensitivities. I have always lived with cats, and upon moving in here I developed allergy symptoms (sneezing, wheezing and itchy eyes). I also found that whenever I needed to work at my desk, I became extremely lethargic within minutes of sitting down. Soon I discovered information about the negative affects SmartMeters can have on people sensitive to electro-magnetic frequencies. The next time I was doing laundry (which is located in a room directly on the other side of the wall of my living room and desk) I noticed 4 SmartMeters. Four! They are located in a row about 7 – 9 meters away from where I sit at my desk, or couch!

I'd like to mention here that I only found out about the issues surrounding SmartMeters in the last couple of months. Up until now I have spent thousands of dollars in doctors visits, allergy testing and different remedies, diet changes and medication to help get back to health.

So when I saw these SMs ticking away at such a close distance, I went to the internet to figure out a quick-fix barrier to use until I can get these meters switched out to the analogue meters. I discovered that a decent barrier is tin foil and I have since covered the meters with the foil. I noticed an improvement immediately. I have not had allergy symptoms for the past month, and I am able to sustain normal focus while working at my desk. I do not think this is any coincidence.

It is my desire that the KW Hydro company replace these Smart Meters with the analogue meters as soon as possible.

---

This afternoon, my doorbell rang. A very large, intimidating man was standing there, and informed me that he was going to turn my power off for 20 seconds to install a new Smart Meter on my house. I had never heard of a Smart Meter, and told him I didn't want it. He said it was required by the power company. I wanted more time to research it, so I told him to opt us out until I was able to make a more informed decision. He said there was no opt out option and that we had no choice in the matter. He said he would leave a pamphlet on the door and then proceeded to change the box regardless of my objections. I then called the power company and they refused to do anything about it. I am very upset because we were never told about the smart meter, or that there was a delay option. We certainly would have called had we known!

---

Being around Smart Meters gives me nausea, headaches and heart palpitations within minutes. Fortunately my neighborhood has not been completely installed with the meters yet. I no longer can go for walks

around town because I can feel the stabbing of the electrical impulses. Same when driving through neighborhoods where they have been installed. Please stop the madness. I notice DDT and lead are now banned in this country. Since the wireless industry has been totally unregulated so far, it seems that it will just be a matter of time before the health impacts become too great to be ignored any more. I see no reason not to be able to keep the analog meter. PG&E can save money by leaving it there! Meter reading is already included in our rates as is the rollout of the Smart Meters.

---

Since the smart meter was installed on my home I have been plagued by Tinnitus, very loud and consider staying in my home toxic. I also have leg twitching and my whole body convulses like I am shocked. This is torture. I find when I am away from my home the Tinnitus subsides to none at all.

Overall I feel my health is downgrading, also having heart palpitations. I am considering taking this meter off of my home since phone calls to the utility company don't bring them out to replace it with the analog meter. I am also considering a class action suit. This is unconscionable with this device being imposed and infliction of its microwave propagation upon us. My ability to think degraded and I am trying to focus above the noise in my head. My rights to enjoy the quiet peace and privacy of my home has been invaded and violated. I will be contacting attorneys.

The actions of the CPUC, SCE and lack of prompt redress is criminal. None of Californians or Americans should have to withstand this.

---

I would like to have the SmartMeter removed from my home immediately. I was not asked permission prior to the SmartMeter device being installed on my home. I was never consulted about the program. I hereby demand it's removal.

Since the installation, I have had headaches, problems sleeping and humming in my ears. I now understand that there are health concerns related to the wireless network that the SmartMeters use, and I do not want this device on my home or in my neighborhood. My old analog meter worked just fine, and I do not want to risk the health of my family with this SmartMeter.

---

I am requesting the immediate removal of the Smart Meter at my home. I am having severe health issues: headaches, nervousness, inability to sleep, a lowering of my immune system so that I am frequently sick with head colds and cough.

I have called several times and have sent a letter from my Doctor to PG&E with absolutely no response. My telephone conversations were met with no understanding that my request to remove the Smart Meter was valid and important. I was given the PG&E policy line by rote, and my complaint duly set aside.

---

I am writing to request for a zero cost Opt-Out Smart Meter Program. I would like the smart meter to be removed from my home immediately as possible and replaced with an analog meter. All data shows the only benefit for these meters is to PGE. To date PGE is unresponsive as to why my bill is outrageously high when it is only myself and my wife in our home. There is no care, concern or response as to what health effects we might be suffering. To date we are experiencing short term memory issues, sleeplessness issues, headaches.

We did not authorize this meter and were never consulted or given a choice to have it. We are extremely conservative in our power use. I am extremely concerned about the health effects of the smart meter and what they might be doing to us both and our neighbors. It is a travesty that the CPUC could appoint themselves approvers of the PGE smart meter rollout without any actual health, economic studies and actually mandate them without actual legislation homeowner approval. This is a non-legislated private corporate/government deal. I thought that could not happen, but here we are today.

There is actually ZERO PROOF that smart meters are benefiting households or the energy grid regardless of the sales and marketing pitch. There is however considerable research and anecdotal data in the form of studies and many reports demonstrating ill health effects, extreme RF radiation levels and effects, and alleged fraud on the part of PGE – and NO ONE IS BEING HELD TO ACCOUNT! The CPUC is now widely considered a corrupt committee.

Official action is needed now to allow a no cost opt-out program. The meters costs have been illegally passed on to the unwitting consumer with out our consent and PGE consumer billing costs are skyrocketing when the promise was savings! Please hold all accountable for foisting these “smart meters” on the public at our expense without public permission. Restore faith in the rule of law in California. Please act now start with a Zero Cost Opt-Out Program for all Californians.

---

We were never informed a new meter would be installed, we don't even know when it was installed, we just happened to notice it had been changed sometime in the last year. Also in the last year, I have been suffering from debilitating headaches, which have been diagnosed as “Primary Stabbing Headaches” I suffer from these headaches on a daily basis now.

We request that the meter be replaced with the original analog meter.

---

Florida Power and Light notified us by mail in early September 2011 concerning a change in our electrical metering. They stated that they had completed installation an electrical smart meter on our residence.

Since that period of time my family has noticed an abnormal increase in health related issues. These health issues include non-restful sleep periods, fatigue, nausea, headaches, unexplained stomach discomfort, ringing in the ears, etc. Health professionals have been contacted, but no explanation for the abnormal issues have been found.

We have contacted Florida Power and Light to request the removal and replacement of the digital electrical meter, with a conventional analog electrical meter. Up to this point, we have had little response from FPL.

---

My wife has a lifetime history of seizures. She is extremely sensitive to electrical and magnetic fields. Just sitting in front of a computer for too long causes her to have pre-seizure symptoms. For this reason we do not use portable phones and other RF technology. Now PG&E has forced these powerful RF Smart Meters on our neighbors and my wife's seizure symptoms increased almost immediately. So far PG&E has not installed these dangerous devices on our house because we have a locked gate... We are also well aware of the large volume of research that makes it clear exposure to these meters and other RF devices causes cancer. It seems to us that PG&E is determined to kill everyone with these lethal, cancer causing devices.

---

Since a mass "deployment" of Smart Meters in my neighborhood, unbeknownst to my neighbors, our family has suffered health issues. I personally have begun to have ringing in my ears. My daughter has also suffered health issues. I am also concerned because I am aware that this "deployment" was done against the will of my neighbors and without prior notification of the health, invasion of privacy issues.

---

I had my smart meter removed because I was experiencing dizziness, headaches and was unable to sleep and a constant ringing, humming in my ears especially at night. to resolve the problem I had my old analog meter reinstalled. which cost me money plus the opt out fee.... Blackmail... Because I live in a park of about 200 or more homes and because of the high frequency volume, I am still having symptoms to the meters, because most in the park have the smartmeters. I am experiencing headaches on a daily bases and I can not tell you when I've had a good nights sleep. and the constant humming, I am constantly up through out the night... just as if I was plugged in... my health care provider is aware of my conditions and is concerned as well..I was not aware that there were side affects to these meters, but my body is telling me different. when I called and told CMP they minimized it and said it was no different then a cell phone I don't believe it for a moment. I have NEVER had this experience with my cell phone. and I have never had problems with falling to sleep and staying asleep.

---

My complaint is about my neighbor's Smart Meters as well as about the Smart Meter equipment that was installed on the utility poles along the road in my area. My sleep and the general health of my immune system have increasingly deteriorated over the past two years or so since the amount of Smart Meters and Smart Meter equipment has gradually, but steadily, increased in my area. I have spent thousands in medical bills to try and figure out my health problems, but physicians have been unable to find a diagnosis and are left trying to alleviate the symptoms. My doctor agrees that I am adversely affected by radiofrequency, but does not feel qualified to test for this factor.

Communities need to establish safe zones where people can live free from excessive radiofrequency from Smart Meters (and other sources as well). I am forced to try to locate such an area and then move there as the only way to escape the daily assault from PG&E's Smart Meters. Harming citizens in this way is criminal and should be illegal. The fact that the World Health Organization has now classified radiofrequency as a Class 2B Carcinogen clearly illustrates the far-reaching health effects of microwave radiofrequency radiation from Smart Meters. And scientific research has demonstrated that radiofrequency radiation causes many adverse biological effects on the human body long before cancer is induced.

---

I was sitting in my home office when a PG&E employee installed a "SmartMeter" upon my house without knocking on my door first. He did it very quickly and was gone because I went outside when the electricity went out and there was a hugh hammer sound. There I found a notice of what was done.

This is my situation. I moved to the country surrounded by forest several years ago due to extreme sensitivity to electric-magnetic pollution , radiation, and other health issues such as chemical sensitivity. You can imagine how violated I must feel to have this "SmartMeter" installed against my will. The stress of this was tremendous, and as of yet I can not get it removed. I try to just put it out of my mind however, my physical body is experiencing rapid heart beat and head-ache. I realize that Wi-Fi is in the world now but please let my home remain my sanctuary for healing.

I can document my health challenges and their worsening due to the installation of "SmartMeter" on my home.

I will continue to pursue the removal of this health hazard device until it is removed.

---

I live in an apartment building with seven units. When I heard about smart meters I called PG&E and was put on the delayed list. This did not make me very happy because I didn't want one period. Our meters are in a location about 40 feet from my apartment and right next to the building. When I went down recently to look, some of the meters already had smart meters on them. Even though three of us don't, we are still getting the EMF's from the others. I am 74 years old and have lived in this location for more than 20 years. I have been getting headaches lately and I believe it is due to the smart meters. I don't want one and I don't think it's right for us apartment dwellers to be subjected to the smart meters that you installed outside our building next to my meter.

---

Since the smart meter was installed on my home (without choice, just DONE) I have been having ringing in my ears, fatigue and my husband gets severe headaches. The meter is installed outside the wall of the family room where we watch tv and where I'm sitting now at my computer. It's 12 feet away.

I now have called SDGE about getting the SmartMeter removed, and they have told me they will not remove it. One lady told me it was California Law that I have it on my house.

I do not feel it is fair that I am required to wait up to a year to have my SmartMeter removed when I did not want the SmartMeter on my home in the first place. I am also concerned that the SmartMeter may be causing sleep problems and other health issues for myself and my family. I do not want to wait months to remove this SmartMeter. I would like it removed now!

---

Two Smart Meters were installed at our house – gas meter directly behind our kitchen sink – less than 1 foot away, and electric meter – 3 feet from our kitchen/dining room table. I began to develop a host of health problems following this: Intense Tinnitus, trembling, confusion, dizziness and bad abdominal pains, loss of appetite, moodiness and tremendous sleeping problems. I also began to drop things and break out in hives. This has never happen to me before. I am a very healthy, active person. I spent a lot of time in the kitchen cooking, which I love to do – not realizing what was going on. I knew that I felt much better when I left the house, though was still foggy and out of it when I was around the neighborhood. Our house is approx. 18 feet from our neighbors on one side, and 15 feet from the other side. I can feel all these meters. I talked to my Dr. to see what was going on and had bloodwork done. My liver enzymes were elevated – 2x their normal rate – something caused by toxicity. I became scared. When I called PG&E to complain, they spoke to me in a condescending way saying ” Do you own a microwave? It’s no different than a microwave. As long as you are 6ft away from it/them, it’s no problem”. This is a complete lie. They are extremely powerful. We bought a meter and measured it and it goes to extremely high levels of RF in spikes every few seconds, and is transmitting 24 hours a day. I called again and was told there was nothing they could or would do for me. This is when I joined the Stop Smart Meter organization and realized that I was not alone. I have worked in the wireless industry in the past and know that corporateions lie (the manufacturers, the utility, etc. to save money and hide the lack of actual research that has been done. I have seen it firsthand.)

I was getting so sick, we fled to Santa Cruz for a few months – before they were installed there – and I felt fine. All my symptoms went away. PG&E then announced they were going to bulldoze into Santa Cruz county, even though there was a moratorium on the meters until further research was done. What an outrage! We finally left CA and are now living in the midwest where there are no meters. This was extremely upsetting and stressful for both my husband and myself.

---

In mid-October 2011 because of noise from neighbors in the back bedroom, I moved my mattress to the front room of my house. That room is directly over our electric smart meter and our gas smart meter. I couldn’t sleep. Usually I do meditation every night, and sleep easily, but now I cannot do this. I just cannot sleep, night after night. No peace in my heart. I feel my heart jumping for several seconds in a row.

I have no energy. I usually exercise and do stretching. I have exercises I do for my back that I learned from physical therapy, but I cant do them. My ear has noise in it. Its like the noise of my neighbors TV thru the wall, but it is in my ear. I have perfect hearing. Its like a low whishing sound. Since then, I also lost weight for no reason10 pounds. I have nausea and have lost my appetite.

I called the doctor on Oct. 26, and he gave me 100 Lorazepam (2/d) pills and 15 sleeping pills (zolpidem, just before bed).

I took the Lorazepam, everyday but I stopped after a few days. It wasn't helping me to sleep. The sleeping pills did help me to sleep. But I can't take it every night, I am not supposed to according to the information with the pills [effect wears off in 2 wks].

It's about 1 1/2 months now. I am afraid I will have a heart attack or a stroke. I am a sensitive person. I did not know anything about smart meters, I didn't know when they put them in. I called now to find out. PG&E says I am now on a waiting list to have the radio turned off in the smart meter, but they cannot say how long that will be.

---

I have NEVER had headaches in my life but now find myself with one everytime I spend time in the room next to where my smart meter was installed. I want this thing out and my old meter returned.

---

One day I got a notice in the mail that "Smart Meters" were being deployed in my neighborhood in Long Beach whether I liked it or not. I found it interesting that they use a military term to describe this intervention. Since the meter was installed I have had problems with my heart racing for no apparent reason while I am in bed. The meter is on the other side of my bedroom wall. I am in my 60s and everyone I have talked to at Southern California Edison claims the meters are not the problem and no more dangerous than a cell phone. However the phone I can shut off. It has even affected my pets. I have two old dogs and two young cats. Since the meter installation I have noticed that they are panting more and at times seem to have trouble breathing. I do not believe these meters have been studied long enough as to long term effects on humans or animals. I would really like my analog back and have no desire to watch the meter on my computer to see how much energy I'm using. I have no air conditioner; dish washer; clothes washer or dryer. Nor do I have central heating, extra refrigerators or freezers. I use a power strip for my computer and shut it off when not in use. I don't need this big brother utility dictating my energy use. It is an invasion of privacy and it puts meter readers out of work. Higher unemployment rates in this state are NOT needed.

---

I am a health practitioner concerned about the effects of Smart Meters I have seen in my patients. Many previously healthy people are having symptoms dating from the installation of their Smart Meters or shortly thereafter. Some patients already health-compromised, have gotten worse since their Smart Meters were installed. Some are affected more than others. Some have become disabled from their symptoms.

I feel strongly that installation of Smart Meters with their potential health hazards is a violation of the personal rights and freedom of myself and others.

I have refused a Smart Meter and want the right to continue to do so to protect my health.

---

On October 22nd of 2011, my life changed forever. I was sitting writing a letter to my daughter, and I began to get stinging, shooting pains in my jaw and ear area, my sinuses starting filling up and my head felt like it was full of paint. That night I was unable to sleep because of a very alarming case of acute tinnitus, unlike anything I had ever experienced before, and chest pains. The next night I was awakened from a dead sleep at 1:30 in the morning with vacuum-cleaner like tinnitus and an alternating two-tone noise that sounded like notes from an electric keyboard. It was so loud that I opened the window to see if it was coming from outside. I had to put on street clothes and walk away from our apartment in search of relief. A couple of blocks away, the tinnitus diminished greatly. When I came back I had to lie on the couch in the living room and turn on the TV and heater to help mitigate the white noise in my head to try to sleep. Staying asleep was another battle. This nightmare went on for a couple of more nights.

I stayed away from the apartment during the day, and it was patently obvious that the symptoms abated away from the 11 “Smart” meters installed in our building a couple of months prior. As I already had fibromyalgia, missing deep sleep cycles affected my health all day long. My ten year old son and I had to start finding different places to sleep. I soon began to realize that some of the symptoms he had been having disappeared away from the apartment – chest pains so alarming I had to take him to a pediatric cardiologist, “stinging” headaches, and bouts of fatigue.

My son and I have now been homeless since early December, when I was finally able to get us all the way out of our apartment in spite of debilitating symptoms, including head aches, diarrhea, nausea, hand numbness, chest pains, neck pains, and extremely upsetting cognitive impairment. We are having to move into a van and are currently searching for a place to park/live where we can remain relatively healthy – at least functional. I have had to cut down on the hours I can work, and usually have to work under very difficult conditions, in terms of symptoms. There is utterly no mystery here in terms of causation – most symptoms diminish the further away my son and I get from electro-smog sources. After a big exposure, though, it takes some time to recover to the usual level (of discomfort!)

The CPUC has allowed PG&E to ruin my son’s and my health, and that of many, many others, and we have had no recourse but to take the brunt of it with no official help – even doctors at this point are generally ignorant of the EHS phenomenon (in this country). So where’s the accountability? This travesty is indefensible and unconscionable. PG&E needs to stop this madness immediately, and the CPUC needs to make them stop. And we victims of this outrageous breach of public trust need to be compensated.  
Anon, CA.

---

For over a year my parents have been waiting to have their smart meter replaced with an analog meter for health reasons. PGE has been unresponsive and neglected my parents health and their request to have the smart meter removed.

As soon as the smart meter was put onto my sisters home last year, her family began experiencing ringing in their ears, headaches and malfunctioning of electrical devices such as their cell phones, laptop and baby monitor. PGE refused to take off their smart meter. They had to move out of the city because of the health problems they experienced once the smart meter was installed.

During the year that my parents have been living with smart meters their health has deteriorated. In the past year my mother has lost much of her ability to speak clearly and walk without assistance. My father, who was diagnosed with Parkinsons Disease approximately fifteen years ago, yet had improved after a new Deep Brain Stimulation (DBS) procedure in 2009, has also experienced increased problems with balance and speech.

We are concerned that the two smartmeters on their residence are interfering with the functioning of his DBS implant, a pacemaker-like device that sends electric signals into his brain to stimulate dopamine production. The device's use manual warns against exposure to EMF and RF radiation. We called the engineer hotline for the company that manufactures the DBS device, Medtronic, and the staff recommended having the smartmeter removed. We have learned that no studies have been conducted concerning the risk of a smartmeter affecting the health of a person with a DBS. We notified PGE, however they ignored our request to have the smartmeter replaced with an analog meter.

PGE is obligated to comply with the federal Fair Housing Act and the Americans with Disabilities Act, and the California Unruh Civil Rights Act, as well as other state and federal laws, mandating that you make changes to rules, policies, or practices, or services that may be necessary to allow a person with a disability the equal opportunity to use and enjoy a dwelling. Please be advised that my father and mother, are deemed disabled by the Social Security Administration and, therefore, are people with a handicap under the relevant anti-discrimination laws. This letter places you on notice of our need and request for a reasonable accommodation in the form of immediate re-installing analog meters on his dwelling. (Anon Family, Alameda County CA)

---

I am doing all the research I can to fight the Northwestern Energy Co's illegal installation of a smart reader. Since the installation took place in March, 2011, my 14 year old cat has developed a bad eye infection and is now going blind in one eye. Rabbits I recently purchased and put in my barn due to cold weather have given birth to still born or highly deformed litters (the barn is much closer to the smart reader than my house)

One of my goats had twins, one was normal, the other about 1/3 the size of a normal kid and died within 3 days despite being bottle fed (mother rejected her) .

My mother suffers from seizures and immediately started having bad ones after the installation of the smart meter. She is 93 and has recently moved into my house. I am 65 and have had a lot of joint pain since the installation, the ring finger of my left hand started becoming paralyzed during the night in the spring—sometimes it takes several hours in the morning for me to be able to flex my hand and use it properly. Prior to the installation, I had no problems with that hand. Sudden fatigue is becoming a problem as are severe sleep disturbances.

Sincerely, Eunice Farmilant Plains MT

PS. I also wanted to add that my land line causes my dog a lot of distress—even after removing my cordless phone.. As soon as the phone rings and I begin talking, she starts barking and runs to the door to be let out. I experience a high pitch ringing which is intermittent. I did buy a radio frequency meter and

took readings off the digital meter. The exact same signals are given out by my laptop computer while it is on. The signals only stop after the computer is turned off at the surge protector.

I get the same readings from my land line and the television—so it is apparent the frequencies are being carried by both the electrical wiring in the house and the telephone. I have to turn off the television also at the surge controller to stop the frequencies....so now both the computer and television are on for only limited times during the day. I am also going to use a speaker phone so I do not have to hold the receiver near my ear/head.

Part of the problem may be due to the proximity of the meter which sits in front of the electric box in my yard being mounted on the same 6 x 6 post as my telephone connection and my satellite receiver for the television. I wonder if other people have encountered this problem?

The only way I can sleep (nothing is plugged into any electric outlets in the bedroom where I sleep) lately is by taking melatonin.

My bedroom is approximately 40 feet from the digital meter which is free standing. I have procured several microwave ovens and plan to mount the doors from them to both the front and back of the meter as I have read they have an embedded screen which blocks radiation. I am also in the process of buying various forms of screening and grounding devices.

---

I am writing in regards to Smart Meters that I have to deal with on a daily basis. Over the past 6-7 months I have recently developed Tinnitus, Migraines and Blurred sensitive vision. The only change in my life has been the SMART METERS. I have to sit within about a 6-10 ft radius of a smart meter at my work and My neighborhood has been flooded with them. I have called Pg&e but of course they say nothing can be done. At this point I am just looking for help on how to approach this matter. A.M.C Santa Cruz

---

I do not have a SmartMeter on my house and most of my neighbors don't. But as the meters have increased nearby the ringing in our ears is near constant here and sometimes intolerable. Sleeping can be difficult, I have suffered unexplained hair loss, my appetite has gone down and my digestion has suddenly gotten more difficult. Further, I have suddenly become lackluster about things and other health issues have spiked. I feel better now when I am away from home but it is getting increasingly difficult to find places where I can not feel restless or spacey. R.H. Santa Cruz

---

I was switched on to a Smart Meter without my consent. ( a notice was sent out only) Since that time, I've had issues with severe anxiety, depression, sleeplessness, headaches, buzzing and ringing in my ears...I couldn't account as to why I was feeling this way, until I finally read about the smart meters and what they are doing to some of the population....I called my utility co.(salt river project in az.) and asked to speak to a supervisor about this matter. He (Ben Celleck) said that they don't cause these problems and that it's SRP's property and they will deem what they will use. I told him "I'm the customer and I pay SRP for the

service and they should use what I request, not the other way around!”.....I kept insisting to have it changed out and stating it was my right as a customer to have this request..but he keep telling me...”No, they will not change out the meter, but we will come out and check it for any leakage of power.”.....”I said I’m very sensitive with the EMF that it produces and is causing my health problems.” I said. ” I don’t want SRP to just come out and check it, I just want it to be replaced with the analog meter not the smart meter”.....He kept to his same story....”We will not replace with the analog”.....When I got back home (11/2/11) from work, I had received a notice from SRP that they had been out there to inspect my meter and stated they had found nothing wrong with my meter. D.M. Arizona

---

Since the smart meters were installed, I have difficulty breathing, have headaches which I never had, sleep problems, balance problems, physical weakness, nausea, anxiety, depression, and worsening of health conditions. I would like the analog meter back so I can feel normal again. D.D. Santa Cruz

---

I am having serious health issues since the meter was installed. And, not prior. My home has become toxic. I want this meter removed immediately. I can not wait. This is an emergency. Either the utility company comes out immediately and takes it off or I will resort to other measures. This is oppressive tyranny and an assault to my mental and physical well being. M.C. Riverside CA

---

My family and I have been experiencing negative health effects since the smart meter was installed. I have had ringing in my ears and my son has not slept a whole night since the meter was installed. He sleeps fine at his daycare (analog meter) and he sleeps all night at his grandparent’s house (also analog meter).

I would like permission to have my analog meter replaced at no cost to me or my family. L.S. Los Angeles CA

---

Ever since the Smart Meter has been installed in my house I have suffered insomnia, constant headaches and am forced to listen to the sound of electrical humming outside my bedroom. Do not ignore the fact that some people are more sensitive to electricity than others. L.M. Santa Cruz

---

In May of 2010 they installed a RF Smart Meter. Between then and June 2011, I had made four trips to an ER for heart palpitations, tinnitus, extreme fatigue with mental confusion and inability to sleep. On top of being able to accomplish damn little due to the symptoms, the electric bills topped \$200 per month when we didn’t add an appliance or use more of what we had.

In each ambulance ride, the symptoms went away after 30 minutes out of this Smart Meter Neighborhood. Then the symptoms returned within a day.

June 2011, I demanded they remove the smart meter because I was being over-charged. They replaced the RF Smart Meter with a hardwired digital Smart Meter in an attempt to placate me. And I am still being overcharged. The symptoms are a little less severe, but they still exist and are very hard to accommodate in any capacity. Especially the headaches that I've never had until a Smart Meter was installed. John N., New Mexico \_\_\_\_\_

My name is Donald Newsom. I have an account with PG&E in my home. My desk is on the other side of the wall from the smart meter.

I am 42 and in excellent health. However, since this was put on our home without any permission I have had severe headaches and my right eye is twitching now uncontrollably. This doesn't happen when I am away from my home (although now the problems are severe enough they are becoming constant). I believe it's the smart meter. I have phoned them twice to have someone remove it but they will not.

On 10/18/2011 I called PG&E and they transferred me to Angel in Sacramento with the Smart Meter Department. I told Angel that my eye is twitching badly and that my headaches are getting severe. He took my information down and said he'd have someone get in touch with me. I told him I tried this once before, where PG&E said they would have a supervisor call me back, but when they did call 5 days later they hung up immediately after I picked up the receiver – which was 2 rings in. I saw it was PG&E via my caller ID. They did not call back. Thus, Angel told me he would have someone get in touch with me over the next week. I hope so... as I am now demanding this be removed.

I would like to have this smart meter removed. I have 3 adults living here and 4 children all under 13 years of age. PG&E did not allow us to opt out and put the meter on our home while we were away. It seemed to us very sneaky. How can a company put something on my home that may harm me and my children, and then not remove it when I tell them the harm it is now causing? I am hoping someone needs to come out and remove this from our home and put back the old style meter, or turns off the transmitter I am so sensitive to.

My body is now feeling very sick, I have headaches constantly and my eye may need surgery to stop the twitching. Further, we work where we live and home school our kids ... so we are getting much exposure to the RF Transmissions and would like it to stop.

How can we accomplish this?

Donald Newsom, Butte County CA

---

I have very disturbing symptoms after living for a year and a half sandwiched between 30 gas smart meters on one side and 30 electric smart meters on the other side. I also have wi-fi router and wi-fi radio which are probably part of the problem.

I am toasted by inability to sleep more than 4-5 hours and even those hours occur randomly so as to say my sleep patterns schedules are all out of whack. I have intermitant vertigo. I think I am getting cooked by meters in my location because I get unexplainable, VERY uncomfortable sweats that come upon me out of

nowhere feeling like I am being heated up from the inside out, they make me feel very unbalanced and really mad as I usually evacuate my apt and go outside before I take a shower to try to feel good. My facial skin also has dried and aged and wrinkled beyond recognition. Most replies to my inquiries say I must move from this apt a.s.a.p. That is not an easy job.

Where am I going to be safe?

NO wi-fi recommended or maybe wi-fi will invade another neighborhood after I relocate there. Also getting away from the stupid smart meters they are everywhere here now. I know moving off the grid and living with solar power is ideal but that is not likely at this time. I cannot really start living in my car and spend my time at the park or whatever others report such as staying away from their homes as much as possible. MS. Humboldt County

---

Edison installed a new smart meter yesterday. I did not sleep last night. There is something going on in my head and body. I have ringing in my ears at a very high pitch. Like a dog whistle or crystal in some electronic device whistling. It is creating some sort of electric waves from my ear area to my body that is very uncomfortable. It is making me sick. It is like a chill but not quit. I am having a hard time describing it.

I called Edison right away and they tell me there is nothing they can do for me. But they say things like we care and have a nice day while I tell them I am being harmed as we speak. The people at the Edison company are not trained in electromagnetic radiation or electronics and challenge me that I am not having the reaction that I am having. I begged them to remove the meter and it is still whistling away in my head. No concern to Edison that it is killing me. It makes it hard to think. My brain is slowly shutting down.

It is a real wake up call to me since I have worked in the electronic field (Research and development for Hughes aircraft, Semens etc.) I know about EMF and have heard of these things happening but it was always on an intellectual level since I had no personal reaction in the past. At least not like this. Now I know! It is real bad and I am considering getting an ice chest and just turning off the electricity to the house but this produces many other problems I don't know how to get around. I want to change to another electric company but Edison says you can't do that now. What can I do. I can't take this for very long.

Is there a class action suit against the smart meter yet? Allan B., So. CA

---

I have had severe headaches since a Smart Meter was installed on my house. When I leave to visit my Mom in a place where there are no Smart Meters, my headaches subside. As soon as I come home, the headaches return. I have been getting 15 – 18 severe headaches per month for approximately a year now. The days the headache is not severe, it is still present. This is severely affecting the quality of my life and my ability to work. I am barely hanging in there. I don't know how much more I can take.

When the subcontractor working for PG&E came to install the meter, I told him I did not want one. He said I had no choice in the matter and installed the meter anyway.

Despite my health complaints, PG&E will not comply with my request to remove the meter. My request to purchase my own analog meter, have it installed by an electrician, and return their meter to them was also denied.

I cannot believe this is happening in this country!! This is absolutely criminal!!

Lisa Miller, Novato CA

---

This is becoming such a critical issue all over the globe, including my soon-to-be “former home” of 23 years: the city of Burbank, CA. I am being forced to leave the city that I have loved living in, where I have friends and family and community ties. The place that I thought of as a safe and friendly haven.

I began to experience severe health affects within 5 hours of the installation of 4 GE Trilliant smart meters on my small apartment complex on 7/28/2011. Headaches, nausea, insomnia, feelings of agitation and irritability, and difficulty concentrating have made it necessary for me to leave my home. My symptoms resolve within about 30 minutes going to a meterless area. I have been living out of my car since 8/2/2011, stopping in the evenings at the homes of people who are able to let me sleep for the night. My life has been turned upside down. I knew nothing of smart meters until the onset of my symptoms, but I do know for sure that the effects are real. Five out five residents who were polled in my complex (out of 6 total residents who live here full time) have shared that they are having similar physical symptoms. A woman in the building next door has reported that she is unable to sleep in her bedroom. She didn't know she had a bank of 8 meters installed in the basement directly below her bedroom.

I have sought remedy through contacting Burbank Water and Power. Initially I was told it would be too expensive to restore my analog meter by Ron Davis, Chairman of BWP. Another board member suggested I just move out of Burbank. In a bizarre twist, I received a phone call from BWP a month after I spoke about the problem offering me a new refrigerator (free) to replace my “old” refrigerator. This is peculiar, given that my refrigerator is only one year old. I then received another call from BWP suggesting that I might have a problem with a carbon monoxide leak. Given that my carbon monoxide meter reads zero and given that I feel ill in other people's homes in Burbank, I hardly think that this is feasible. BWP employees have suggested that I am reacting to my neighbors' WIFI. While this may be true, I have lived quite comfortably with my neighbors' WIFI until the day the meters were installed. They also suggested that I might be having a problem with the new paint in my apartment (it's a year old) or the new carpet (it's 15 years old). Other helpful suggestions included the idea that something new is in bloom and/or there might be some construction going on around me.

I contacted Judge Yip-Kikugawa, telling her of my plight. I received a terse message back from one of her assistants stating that the CPUC has “zero authority” over BWP and a suggestion that I present my complaints to my City Council. I took the suggestion and tearfully told the Mayor of Burbank and the Council at a meeting in early August. The response was underwhelming, save for that of Dr. David Gordon. After public comments were made, Ron Davis was allowed to take the floor for several minutes, during which he stated that the meters are “safer than safe” and that BWP is working with each concerned citizen to resolve their issues. I do not feel that BWP's effort with me come close to solving my problem. I am losing my home and they are offering me a new refrigerator.

I am desperately saddened by the situation and am seeking a place to go that is not too far distant from my elderly mother and from the community I have lived in all my life...

This must be STOPPED. Civil rights, human rights, and the future of the planet could very well turn on this issue. Dramatic? Yes! True? Absolutely. SG, Burbank CA

---

Since PG&E put in their 'smartmeter' (oxymoron), I wake up with a headache every day and I am always tired no matter how much sleep I get. I have been depressed, lethargic and forgetful. I have so much trouble thinking clearly, it interferes with my daily functioning. I have gone to several doctors about the symptoms, but nothing has helped. I didn't realize how much the meter had been affecting me until I went away for a vacation and all of my 'illnesses' were gone. Now that I am home, all of my "symptoms" are back. On top of everything, SMUD came out to try to install one of the meters, too. I told them I didn't want one. As the men were leaving, I heard one of them say, "She is going to get one anyway." This is absolutely criminal!

Michelle, Sacramento

---

From Dec 2010 to April 2011 four 'smart meters' were installed within 20 feet of our bed. Since that time we've experienced headaches, ringing in the ears, heart palpitations and insomnia, ONLY when we sleep in our bed in this house. We've had SDG&E out on several occasions and have requested to opt-out of the 'smart meters' and return to analog. The SDG&E reps say that there is NO alternative to the 'smart meters'! Also our city block's main grid 'smart meter' is located in front of our home, so short of moving, we don't know what to do! Friends in Northern Calif. tell us that PG&E offers an 'opt out' program for their customers. Plus many cities there have chosen not to have 'smart meters' at all. Why can't SDG&E give us that same option in Southern Calif?

At least with cell phones, microwave ovens and computers, we have the choice to buy them or not, and when to turn them off. What about all the families with small children who live in apartments or condos with hundreds of 'smart meters' in banks of adjoining bedroom walls? We should all have a choice with our metering system, especially since so many are having health issues with the 'smart meters', and the long term effects of microwave exposure are still unknown.

Not long ago we were told that high tension power lines were safe, but over time statistics have shown that the incidence of several types of illnesses, including cancer, is much higher for people living beneath those wires. We can all only hope that you, (our California Public Utilities Commission) will step in and create a state wide free opt-out program soon, or maybe this is something to be put on the ballot and let the residents of California decide for ourselves? Vicki, San Diego

---

Submitted on [2011/09/01 at 9:03 am](#)

I live in Perris CA in an apartment complex that also has swap the old analog meters for smart meters. The meters are directly outside of my bedroom wall. Eversince these smart meters were installed every night while trying to sleep I can hear this buzzing, humming sound that gives me horrible migraine headaches n heart palpitations. I wake up feeling tired, nauseas and not well rested whatsoever due to all the disturbance this smart meter brings upon not only myself but also my little four year old daughter that sleeps with me every night. I know that these smart meters are a big health risk because of all the symptoms my daughter and I have been experiencing since they were installed. I really wish that this issue can be seriously investigated because I know that I'am not the only person experiencing the same issues and our electric company should be held accountable. I hope this matter gets resolved quickly before people become more seriously ill. We need our old analog meters back!!!!

Thanks,  
Julie Reynoso

---

I currently have a 4 bedroom house that I can only use two bedrooms of due to the radiation being emitted from your smart meters. My daughter had the classic symptoms from having slept in the room adjacent to the meter for 9 months before I realized that her problems coincided with the installation of the meters. I have had the radiation levels measured in her room and she was getting dosed with high levels of MW radiation every couple of minutes all night long for nine months. I need my home to be a safe haven, my daughter needs her room back, give me the option to protect my family from microwave radiation. [electrosmog21 on youtube](#). Paul, CA

---

“My health has been effected since my neighborhood had smart meters installed. I have trouble sleeping, often only sleeping a couple of hours each night. I feel this is a giant experiment on the population.”  
Anon.

---

An open letter to SDG&E, Smart Meter Complaint Department

I have made three prior telephone requests advising SDGE of the serious side effects concerning my health since the installation of the smart meter device at my home. Three different individuals came out to my house on three separate occasions, all armed with the same propaganda, the same zero concern for my health or the safety of my home.

I was told, “I don’t know. You are the only one that has complained.” (A false statement.) I was also told, “The smart meter is not causing any problems to your home.” (Another false statement.)

I am a 49-year-old woman and I have never before experienced any of these problems in either this home, or any other home that I have lived in, prior to the smart meter installation.

I came home one day after work, and they had just finished installing my smart meter. I did not think anything of it. I had received a notice a few weeks prior, indicating that a smart meter was going to be installed.

That same evening I awoke between 2:00 and 3:00 in the morning, with ringing in my ears, dizziness, tingling at the upper part of my head that turned into a headache and then nausea. There was also a horrible feeling of uneasiness that I had never experienced before and that prevents me from going back to sleep at night — every night.

One of my dogs awoke at the same time, wandering the hallways whining and crying. This dog refuses to sleep inside at night now, as the pulsed radiation also makes him sick. This dog had slept at the foot of my bed since the day I brought him home until the night the smart meter was installed. I have numerous friends and family who will testify to this, if called to do so.

The same scenario occurs whenever I sleep in my home, a home that I worked six or seven days a week for most of my life to be able to afford, and now you, the utility company, is FORCING PULSED RADIATION where I live and sleep, which if you do your homework and read the numerous articles that have been published by scientists who were not paid off by a utility company, you will see that radiation causes cancer and I will not stand for a cancer causing device to be attached to my home.

I was gone for two weeks on two occasions over the summer, and I sleep fine whenever I am away from my home. I was in Peru for two weeks without these problems and also in Alaska, where I had no trouble sleeping, no trouble concentrating, no dizziness, no ringing in my ears, no tingling at the upper part of my head that turned into headaches.

I also have noticed a strange humming and buzzing in my home around the appliances, coming from the computer, and around all the intercom panels in my home. I've had three people out from SDGE and they all heard the humming and buzzing and told me to turn the intercom down all the way and then I would not hear it.

I asked them, "How do you explain this? This humming and buzzing was not ever here before the smart meter installation? My kitchen appliances never hummed and buzzed before the smart meter installation." I told them, "I don't think my house is safe. This is not normal."

And I just got the blank stare, the "I don't know what to tell you," and the "No, I cannot remove the smart meter." I begged them to return my house and home which I loved back to normal, to please, please remove the smart meter and install the old analog meter that worked just fine and that I never had a problem with. The blank stare and the, "No, I cannot do that," was the only answer I could get out of these people.

I asked one of the gentlemen what his job was at SDGE, as it appeared he had no training as an electrician and was not capable of answering any of my questions. He told me, "Well, my job is to handle questions from people like you." I then replied, "I thought you said I was the only one that complained." Of course, he quickly departed after that. We all know that if he had told me anything different, he would have lost his job.

I want the same remedy that Northern Californians have received. I pay my utility bills just like they do and I want to be treated with the same remedy that [they] received: IMMEDIATE REMOVAL OF MY SMART METER AND REMOVAL OF SMART METERS SURROUNDING MY HOME.

How can the utility commission and the utility companies treat Southern Californians who are being made sick by smart meters any different than customers in Northern California? They cannot. This is a formal request for removal of the smart meter illegally attached to my home and to the homes around me.

Copies of this letter are going out to as many people, organizations, and government agencies as I can send it to, so you can't drop this one in the trash and say you never got my letter.

Sincerely,

Richard and Diane XXXXXXXXXXXXX

---

The following letter was sent to the CPUC judge overseeing the 'Smart' Meter proceeding:

Your Honor,

I am writing from the city of Burbank, in Southern California. On July 28, 2011 Burbank Water and Power, the municipal utility company that "serves" my home city, installed a bank of four GE/Trilliant smart meters on the side of the small fourplex in which I live.

Approximately four hours after the installation was complete I developed a band-like headache that was unresponsive to medication. The next morning I awoke with the headache and slight nausea. I thought I might be coming down with the flu. However, after I was away from my apartment, I noticed that these symptoms resolved — only to return when I was back in my apartment for about 4 hours. This pattern continued for the next three days. I began to have trouble sleeping and difficulty concentrating. I also experienced some transient heart palpitations.

Prior to this I knew nothing about smart meters and had no idea that they could impact human health. I am devastated by these developments.

My current residence has been a haven for me — until the meters went in. In an almost nightmarish scenario the place that I call home is now off-limits for me. This is particularly problematic because I am disabled and rely upon Section 8 rental subsidies in order to survive. I cannot move within my home city because every building is slated to receive the meters by the end of 2011.

I have spent the past 22 days living out of my car, finding shelter at various friends' homes in the evening. The temperatures in Southern California have been in the high 90s and over. I am exhausted, frightened, and do not know where to turn.

I have spoken to the board of BWP at a public meeting. The best they could come up with is the suggestion that I move into another city. This is problematic because the closest city to me is Los Angeles.

To transfer my housing voucher to Los Angeles is a Sisyphean task. The housing authority in Los Angeles (HACLA) is a poorly-run, huge bureaucracy that has been known to cause tenants to lose their housing vouchers through mismanagement. I have called five different telephone numbers to try to get some guidelines about transferring — all to no avail. Meanwhile I struggle to keep my health and my life together. I take anti-seizure medication and my medication schedule has been disrupted by the random and brutal way I am living right now.

This is so very wrong. I have been displaced from my home of 23 years due to the installation of the meters. To be sure, I am currently in the minority of people who are known as electrosensitive but I do not believe that I should not be subjected to the suffering and losses that are my current reality. If I were physically challenged and needed a wheelchair would I be thrown out of my home? I think not — there are laws that protect against this. Why, then, should I be denied the fundamental right of a home — a home that I have been healthy and happy in until the meters were foisted upon me?

Where can I go? My 84-year-old mother lives 10 minutes from me and I believe that it is my duty and right to remain close to her in the event that she needs to call upon me for assistance. As a disabled woman (I've had four brain surgeries), life is difficult enough without being displaced by a technology that I have neither asked for nor consented to. I consider myself to be a resourceful and strong person, but I am feeling overwhelmed by what I am facing: illness and homelessness. I am college-educated and have a middle-class background but even this does not equip me to deal with my current challenges caused directly by the smart meters.

I believe that the utility companies have relied upon poorly-designed studies conducted by organizations (CCST and EPRI) that have ties to the communications industry, the utility companies, and that have financial interests in the smart grid infrastructure. I do not think that a thoroughgoing study into health consequences has been performed by either of these entities. The non-thermal effects of non-ionizing radiation (especially pulsed RF) has NOT been studied by these so-called “impartial” organizations. I think it is an outrageous and tragic turn of events that is affecting me and many other people. I have heard three of my neighbors (young people with no history of electrosensitivity) complain of headaches and insomnia since the meters were installed — and they weren't even aware that they had received them! I am absolutely sure I am not alone in my suffering.

Your Honor, I ask you to take into account my situation when you consider what is being perpetrated upon the citizens of California. This cannot continue. I may be collateral damage — it's too late for me. But, please, think about the population and countless numbers of people who are having their lives upset and threatened by these dangerous devices.

I am not a believer in conspiracy theories, but I do believe what my body is telling me. This is real, this is true, and it should not be allowed to continue.

Thank you for consideration.

Sincerely,

Ms. Shane Gregory, Burbank, CA

---

from: July 26, 2010

Dear Barbara Boxer:

I'm currently living in a corner of my house the size of a single bed surrounded by aluminum foil. This blocks the Wi-Fi from my neighbors' houses and ambient EMF.

The Wi-Fi fields and other EMF make me sick. I've spent the last eight months extremely ill and spend much of my days in state parks where there is no Wi-Fi or electricity. I've had to stop working.

There have been nights at 10:30 pm, when I've been driving around, looking for a place I could sleep with no Wi-Fi, and there was no place to go. If Smart Meters are not stopped, there'll be no place for me to be.

European countries have standards for health for EMF safety. America does not. I may be a canary in a gold mine but I'm an early warning sign for everybody else.

All our bodies are delicate, organic bioelectrical systems and not made to be constantly bathed in the electrical frequencies that Wi-Fi and Smart Meters put out. It's so toxic, and this needs to be addressed so that I can come out from behind the foil screen. There's been no place to turn. Society has had nothing to offer me in terms of help.

This is an urgent and life-threatening issue. Please act on behalf of the well-being of your constituents.

Sincerely, J

One year later, Aug. 19, 2011: Recently I tried to spend the night in a neighborhood that had Smart Meters, in a home that was on the delay list and did not have one. After 8 hours, I was so ill I had to drive out of there at 2:30 in the morning. If I had stayed for another 10 hours, I would have been vomiting and convulsing. An opt-out plan is not a viable solution for health concerns. Smart Meters should not be put in until the health issues are resolved. J

---

### Driven Out by Power Line (PLC) Signals

Jack (not his real name) has been sensitive to wireless transmitters for well over a decade. For that reason he stays away from the cities. He and his girlfriend spend their winters in Arizona, and the summers in eastern Washington State.

In the spring of 2011, they traveled to their rented house in eastern Washington. When he arrived, he could immediately feel something had changed. It was as if a cell tower had been erected nearby, but he could not find one. It was unlikely to be the neighbors, since they lived on a large lot and he could still feel it when he drove some distance away. It seemed to be everywhere. Jack's girlfriend stayed in the house while Jack drove back down to Arizona.

After asking around, they found out that the local utility had swapped out all of the electrical meters over the winter. The new smart meters communicate with the utility's computers by sending signals through the power line back to the substation. This is called power line communication (PLC) and is mostly used in rural areas.

The specific system used is called TWACS. This system works by transmitting pulses 120 times a second. Each pulse contains a brief signal of higher frequencies. Since all meters share a common wire, only one meter in the area can transmit at a time. Each household meter can transmit for only a few minutes each day, or even only once for several days.

The pulses travel for many miles and back feed into all houses on the grid. It makes no difference whether it is the meter on one's own house that transmits, or one on another house. There is a constant stream of pulses on all wires throughout the house. The household wiring, as well as the power lines along the streets, are all turned into unintentional antennas. The signal is not very powerful, but the antennas are huge and everywhere.

Jack came back up to eastern Washington a month later, but he had to camp in the back yard. The pulses bother him even fifty feet (15 meters) from the house, with the power line 150 feet (50 meters) on the other side of the house.

The house is rented. The couple decided not to bother complaining to the landlord and the utility company. Even if they got the old meter back it would not help. There is no way to stop the pulses coming from the outside. Instead, the couple will soon move away to an area without his menace. [Anon.]

---

My name is Diane Nagby and I and my pets are also a victim of the Smart Meter. Dizziness, ringing in my ears, insomnia, nausea, rapid heart beat. I had none of these problems prior to the installation of the Smart Meter. I came home from work and they had just finished installing the Smart Meter. That very night my animals started acting agitated. There is a constant feeling of uneasiness in my household now and at night a loud buzzing/humming noise takes place, which was never present prior to the installation of the Smart Meter. It is just plain old common sense that should tell us any amount of radiation in our household is NOT going to be good for us. A friend of mine that lives in Upland, California experienced a stroke just days after her Smart Meter was installed. How many people have to die, have their homes burned down (because the Smart Meter has been proven to be a fire hazard in some houses), get sick, watch their animals suffer, as I have, before we stand up and say ENOUGH is ENOUGH.

---

Until moving to the current rental I did not have the problems I am getting. I work from home and did not get constant exposure to a Smart Meter, as I did not permit one to be installed on my own property, and then after it was sold I lived in an apartment building that refused the installation of Smart Meters.

Frankly when the electrical shocks in my body began at random I didn't connect the dots to a smart Meter issue. When my vision, recently corrected with a new eye glass prescription began to not focus at random times I didn't connect it to Smart Meters. Even without my glasses at random times I am unable to clear

my vision, as if I just woke from a very deep sleep and am still groggy or am drugged...nope, no drugs either.

The foginess and random electrical shocks go away when I am away from this house. I just learned this morning that there is a 'stupid' meter installed on my bedroom wall. I say stupid because proper studies were not done to assure the safety of the equipment...made where...China! and we know how safety conscious that is.

My body is very sensitive to electrical fields, and I demand that CA which normally is so environmentally conscious, take responsibility for these meters and put a stop to them. Make the electric companies and their investors swallow the cost and not allowed to pass it on to customers. We didn't ask for this fake improvement. Carol Church, Placer County CA

---

On Dec. 31st, 2010, approx. 22 smart meters were installed in our building. They are directly under our apartment. On Jan. 26, 2011, my husband, while sleeping, suffered a tonic clonic seizure. All tests came out ok. But he is now on seizure medication. However, I notice that his hands twitch at night when he is asleep. Then more slowly, I began to feel a buzz in my feet that went up my legs and then twitching developed. Never in my life have I had this sensation. While I am away and at work during the day, it goes away and I don't have these symptoms. Also while in our apartment, especially the bedroom, I get ringing in my ears which I never before have had here. I used to be able to completely relax in my bedroom but now always feel like I'm laying in an electric magnetic field .

I was awakened at 3:30 am this morning because of the tingling in my left foot and leg was so strong also I had a racing heart. This is a feeling of something from the outside coming in. When I get up and walk around a little it seems to be a little better but laying down in the bedroom causes the feeling to return.

Also in the bedroom I experience the brain fog and can hardly complete a sentence. It's a very strange sensation. I have none of this at work — only at home and especially in my bedroom. I know we need to move. M. Dawson, Marin County, CA

---

“This is a health issue,” Pauline HOLETON said. “I’m sensitive to electromagnetic fields. I got a smart meter put on my house in November and got it taken out in January. I told them I would take a chainsaw and rip it off if they didn’t come out and get it. I now have the old analog meter.” [Michigan News story](#)

---

After having a smart meter installed on our home, with out any one ever asking if we wanted one or not, I have terrible headaches every single day. I was never the type who got them. But now it's a constant. And incidentally every time I'm away from my home for a few hours they go away. More importantly my husband has developed a tumor on the side of his head, on his temple. Upon the Dr. ordering the CT scan they also found a cyst in the posterior portion of his brain. I also fear for my toddler because her room is closest to the smart meter. What effects will or does it have on her? This has to stop. Does body

remember the issues with people and PG&E near Bakersfield and Kettleman City? How many people suffered at PG&E's hands. They are not a forthright company! I will do everything I can to get this meter removed from my home. Wish me luck. ~ Placer County, Ca.

---

I am so sick & dying from the smart meters. I was sick before I moved here & became way worse. Several hospital trips and two hospital stays. One in oncology & 1 in trauma dept. I have mercury poisoning from having a lot of silver MERCURY dental fillings (nightmare story) & have had more than my share of radiation for a life time starting 30 years ago when I had Hodgkins disease & then all the years after from EMF exposure. So I could not wait to get out of last building where I fought Sac. city council to stop 6 cell tower panels being put on roof but lost that battle.

I learned there were 8 smart meters on my bedroom wall & 20 across the sidewalk plus right out my door is the spa & pool- we knew why I was throwing up blood, heard surging & ringing noises & literally felt & feel like I am being electrocuted. This is the most horrifying nightmare journey I could ever imagined.

I fight for my life literally everyday. I am on section 8 for the 1st time & only get SSI which is being cut again. I was told from apt. complex & SHRA that I need a doctors note to be able to move & to get out of here but cannot find a doctor who is educated on this & your regular doctors think your crazy. My lease is up & out of retaliation they want me to pay \$150 more to live in this place that is killing me.

I am very sick, sad and very ticked off. If someone can tell me who could write me or give me something saying the PGE meters made me really sick & are killing me ...Where do people go to get diagnosed & I have no car & no where to run or hide but I wish someone was doing my story of my journey for years now but especially now in case I die I wanted people to be educated on what I have had to learn the hard way full circle 1st hand so they do not have to get sick & die & not know the truth of their illnesses & or death and just handed a pill or poison or cut on unnecessarily...I have no EMF protection yet since I am so poor. Belva, Sacramento CA

---

I have recently moved to a place with a smart meter.

Since I have moved I have experienced, headaches, agitation, dizziness, upset, acid reflux, and ringing at certain periods. I am sure it is the smart meter. I am not sleeping well and do not feel refreshed, the headaches are constant when in or near the home, but gone immediately upon my leaving.

I work outside on ranches in rural areas. When I am in these areas I do not experience these side effects. I want this device removed from the side of my home and any within my neighborhood as well. They are not UL approved, they are known to be dangerous and this is illegal and a crime, I will do everything in my power to educate people about this and to stop the installation of these torture devices. D.Holden. CA

---

I suffer from EMF sensitivity and although my husband and I were able to prevent PG&E from installing a smart meter (oxymoron) at our home, we are already feeling the ill effects from our neighbors' "SM" which was installed within 10 feet of our house. My husband and I are both having intermittent heart palpitations and I am suffering from nausea and have intermittent headaches and eye lid spasms that are only on the right side of my head (which happens to be where most of my implanted metal is, including my titanium jaw). I have attached an image to help you understand. I feel so violated, especially when I KNOW they (EMFs) are dangerous. My husband and I have taken every measure we can to at least have a home that we feel can be a sanctuary, and have taken every measure short of installing a faraday cage throughout our house. We have no WIFI in our house, nor do we have cell phones or cordless phones and I have never even owned a microwave oven. We have Stetzer filters on the outlets in every room and we sleep with all electronics unplugged. It is bad enough that I can't go to many public places without physically suffering from unhealthy levels of EMF enhanced by negative ramifications from WIFI. Peer-reviewed science exists warning of the dangers of SMs, yet PG&E continues to sell the story that serves them. Their short-sighted and greedy "fix" to their past blunders will have long term ramifications that will cripple our already suffering medical system. I'm at a loss, perhaps the masses are ingesting so much fluoride from the toxic water Marin Municipal gives us that the world of WALL-E is closer than we think... "say it ain't so..."

Caroline Kim Jonsson, San Anselmo, CA

---

I am EMF sensitive, use to live under cell phone tower, had to run away from it. Now the worse nightmare had come true again, the smart meter just right out side and in our living space, in the front, on the back yard and everywhere around us. Try to escape but don't know where to go, My vertigo is getting worse everyday, not even mention that awful nausea, leg cramp and so on. I work in a commercial kitchen because it is lined with mental walls, I swear to God, every time the radiation come through the wire and lights, it felt like a radiation chamber, we are being slowly cooked, I know people do not want to face it, it is inconvenience truth, but who know among my co-workers many of them whom had prior health concern is now been told need surgery and such, make me wonder how they going to recover from our radiated home, those female co-worker having more emotional break-down and don't know why, can we make a connection here! Or we are going to pay a huge price for it. Robert Bucher, Sonoma

---

The smart meter was installed in my neighborhood about a week ago, after it was installed my dogs started going crazy. I have not had a good night sleep since. I tried to figure out anything that could be causing their change in behavior, but the only thing different was the smart meter. They act just like they do when there is a thunder storm or fireworks going off. They are constantly jumping up and down on me acting very nervous and never lying at rest. They act like they hear something and it is very upsetting to them. Can this be possible? Any other complaints from dog owners? PG&E left a flyer saying it has not been activated as of yet??? Would that make a difference to the high frequency? Any help would be appreciated and I will do all I can to help stop this process. M.R. Sonoma County

PS. I realized that I also had a problem with my garage door opener. I had my garage open on two different occasions...I was very alarmed and upset because my side door is always opened for the dogs. I

heard a loud roar and I couldn't figure out what it was and upon opening the back door, I saw my garage door was up.....lucky my dogs didn't get out.....I didn't even think of the smart meter until now. This happened twice. I had to unplug it. I now believe the coffee pot was crackling from the electric outlet and not on.....I can't be sure of the coffee pot because I can't remember if I saw the green light on or not...but to be awakened in the middle of the night to popping sounds was very unusual.

*ADMIN note: This person's meter was removed the very next day after they called PG&E. This is unusual, the majority of people who have complaints are unable to get them removed.*

---

I have been living with a smart meter for only 3 weeks and have been suffering nausea, anxiety, depression and a low grade head ache. Prior to moving into a smart meter vicinity I had none of these symptoms. Smart meters emit pulsed microwave radiation which has been found by numerous studies to be health damaging. I want my smart meter removed but have been told by P G and E that I have no choice in this. I will continue protesting until my meter is removed and the longer I have to wait the more I will spread the word about P G and Es invasion of my privacy, installation of a health damaging device and refusal to remove it. I.W. Menlo Park CA

---

I cannot explain nor rationalize what I have experienced in the past few months since PG&E installed a smart meter at my residence. Since February 2012 I have had experienced the following: My Labrador Retriever had a case of old dog vestibular "vertigo", both my Schipperkes have been diagnosed with diabetes, one now has Cushing's disease, I myself spent a day in the emergency room with vertigo and almost 3 weeks not being able to work due to the vertigo " I still have symptoms" and now one of my dogs has an unexplained infection? I have been a licensed electrical contractor since 2004 and have been in the trades since 1993, I have never heard of anything like this nor would I believe a silly device on a pole 15' from my home could cause such effects. It's just, could it cause them? I do not see that the device at my home is UL Listed? Has it been tested? I called PG&E and asked to have it removed they said that there would be a fee to remove it and that the power I used from that day on would be charged at the highest rate? How can that be? Why have the PUC if they do not regulate the utility companies? M. F. Sonoma County

---

I have been experiencing ringing in my ears at home for the last 5-6 days. I read an article last night about these smart meters causing tinnitus and I realized the ringing began the same time the meter was installed. I did a test today and while I was gone from my home for a few hours I did not have the ringing, yet after I was home for 1 hour my ears began to ring. How do we protect ourselves from this? No one asked if we wanted it, and If I can no longer deal with this problems where am I supposed to go if they are being erected all over the state of Ca? Maybe one by itself is not a problem, but think of how many neighbors you have all around you. That amount of EMF's have got to become problematic. J.B.

---

I have been trying to figure out why my daughter and I have had such intense headaches and now I know. I want my Smart Meter removed. I am the owner of this home and I should have the right to have or not have a unit that puts out so much radiation. I do not and have not ever had wireless internet or any wireless in my home and yet I have it stuck to my wall without knowing it. I'm very electrically sensitive. Since having it installed I have had very intense headaches that nothing helps as well as heart palpitations.

I called PG&E today to ask that it be removed and they refused. I also filed a complaint with the CPUC today. We'll see what happens. E.B. Stockton CA

---

While my landlord and housemate and I have temporarily succeeded in preventing PG&E from removing our analog electric meter in favor of a wireless smart meter, my next door neighbor's landlord thought it would be a fabulous idea to have one installed. This happened about a year back prior to the massive deployment now underway.

Soon after the install, I began experiencing piercingly loud high-frequency ringing in my ears and noticeable cognitive impairment. I've also become unusually tired whether working at my home office desk, reading, or doing virtually any activity in this house, regardless of having had enough sleep. At first I thought these three symptoms were due to increased doses of Warfarin (generic version of Coumadin), a blood thinner I must take which precisely regulates blood viscosity to support optimum functionality of a mechanical mitral valve embedded in my heart. But, after Judy clued me in on the many dangers of smart meters and told me of the symptoms, I put two and two together and deduced the problems are most likely as a result of the smart meter on my neighbor's home approximately 25-feet from my living quarters. She has also experienced cognitive impairment since she moved in. Unfortunately for her and her five-year-old son, the meter is outside the wall to the living room area. A. P., Los Osos, CA

---

I have been disabled by electrosensitivity for about 5 years, but not to RF, just to ELF (power lines, motors, etc — magnetic fields). But since June of 2010 the area I have been in was thoroughly smart metered, so they have been all around me but not on the house I spend the most time in because we put up No Smart Meter signs. On one side of our house is a parking lot, and on the other was an abandoned house, which is now almost completely remodeled, and this is where the electric smart meter was installed, two weeks ago, just 10 feet away across the driveway, facing our home.

I had some hope that I might be able to "live with" a smart meter — after all, so many people are seemingly unaffected. However, when I went to move the trash bins (which sit about 10 feet from it), the first thing I noticed was a headache and stiff neck, and a building up of an awful feeling that included nausea and dizziness.

As the days went on, I noticed that it was hard to breathe well, like there was a weight on my chest, and tightness in my chest. I also noticed my heartbeat felt different. There was a feeling of panic, wanting to flee but nowhere to go. The nausea/dizzy feeling remained low-level, with some disorientation and balance problems, flu like symptoms. There were pains to the head that came on like strokes of pain from a whip, being laid deep into my brain.

The smart meter seems to be transmitting two different qualities. One is a widespread field that attacks and drains you, and the other is the head pain that comes in sporadic waves and builds up along with a stiff neck and contributes to the draining effect. The pain I believe is from the pulses, which are completely unpredictable and can come several times a minute or there might be 20 minutes with none. The general field has a distinct character of its own, a very NASTY and aggressive character, that creates a sensation so bad that the effect over time is as if there are microscopic teeth constantly gnawing away at you. It is as if, at the most minute level, the cells of your body are being attacked. You become exhausted — you feel like you are under constant siege. The best description I could think of is that when you get away from it and are able to catch your breath and assess how you feel, it is like you have been taking a constant beating at the cellular level. You feel debilitated.

I have a piece of very effective shielding cloth and that is really the only thing that made it possible for me to be in the house at all. I have one square-meter of this, which I folded over into a triangle and wore as a head-wrap. I contemplate getting enough of this shielding fabric to make a burka and/or drape over a small tent for a refuge.

So I wanted to try to describe what it is like, the “smart meter air”: the air is filled with a kind of jangling, a very, very fine but nasty kind of shredding, grinding dissonance.

A.C Alameda County

---

A year ago I developed trigeminal neuralgia along with dizziness and weakness. Now I have peripheral neuropathy which includes burning, tingling and numbness. After reading the article in the LA Times about Smart Meters I called SCE to find out when they installed them here. They said May of 2010, a year ago, which coincides with my neuropathy. There are 8 condo’s utilities up against my bedroom wall. There are 8 more in the building close to my only other outside wall. I live in 500 sq. ft. There is no place to get away from being zapped. Please help. A.F. Orange County

---

About a month after PG&E installed the smartmeters, my husband and I both started getting headaches, some so severe that sometimes I was getting blurred vision. We both had very loud piercing sounds in our ears. Finally my husband said it sounds like a telephone poll or something buzzing outside all night long.

Last Easter, my sister offered to let us stay with her at the Horse Ranch for 2 weeks. First day the headaches went away, and that loud piercing sound in our ears went away overnight. Our sleep went back to normal. The entire time there, we both felt so refreshed from 3 months of agony.

Not less than 2 days after we came back, it all started up again. Now I was nervous and my heart also started racing all of a sudden at times. From what all heard, it almost resembled an anxiety attack! Just that weekend at the PG&E office was people gathered about the smartmeters. I was curious and decided to listen in.

Well, I was shocked! I just remembered that our smartmeters had been in for 4 months, and two of them were outside our bedroom wall. We immediately decided to switch the bedroom with the living room. In fact, sometimes if my husband leaves the bedroom door open, the whole house becomes infected with that piercing hiss and a pain at the back of your head. We looked for another apartment without a smartmeter, and found one in Santa Cruz. Since then, the only small hiss I heard of the marvelous ocean waves instead of that nagging piercing sounds. How on this precious earth can something so monstrous be allowed to continue????? Posted by Ruth on EMF Safety Network

---

I'm already electrically sensitive. I immediately feel very sick when I try to use a cell phone (and have for years). I feel dizzy in a home that has WiFi and also in banks, airports and places with a lot of radiation. Given this, I do not want (and will vehemently fight the installation of) a smartmeter. My 34 yr old daughter became immediately ill right after a smartmeter was installed on the house she was living in. Her symptoms were all the ones I've read about – strange headaches, pain in the ears, dizziness, heart stress and insomnia. She had to move from this house after a few months as she just couldn't sleep! I cannot express strongly enough how criminal it feels to me that the CPUC has mandated 24/7 radiation into my home without my approval and without proper research on long term health effects. Why should I have to prove that EMF is harmful to me? The CPUC should have to prove that it's not harmful. I have never seen such violation of our civil liberties and rights!!!! I demand that I have the right to keep my present analog meter with no additional cost! J. S. Lake County

---

I am going to take on PG&E starting tomorrow for damaging my health due to the installation of 4 smart meters right outside my bedroom window, and since then my health has been continuously deteriorating. I have insomnia, nightmares, headaches like an ice pick is being jammed in my head, fogginess, blurred vision (and getting worse by the week), tinnitus, and heart palpitations, all of which never existed until the installation of the 4 smart meters last Summer, and gradually getting worse. I moved my bedroom into the living room, of which reduced the effects by half, but that's not good enough when something that is killing you is still in your home! All of my symptoms are documented by my physician, but he said they are vague and cannot be evidenced as produced by smartmeters. I was a trained Naturopathic Doctor and absolutely know my own body, and every time I leave the house for extended periods of time, all the symptoms miraculously vanish! It has been a 5 month ordeal calling countless times, PG&E, the Smart Meter reps, both of which tell me there is nothing I can do since they claim they cannot remove the smartmeters... PERIOD! In retaliation, last month I gave them a decision to remove the smart meters in 10 days or I would remove them myself. A man called me from the Smart meter office and said the moment I remove even one of the meters, the police will be called and I will be put to jail. So, the only decision they gave me was to sit at home and die. Seriously... I think I have only a few months to live if they leave these meters outside my bedroom window. I spoke to 2 supervisors from Smart Meter company and both told me there is nothing they can do, and that there was going to be a public hearing about other complaints, but don't know when, said it's going to be a while... and couldn't give me any date as to when I can expect a public hearing on the matter. Both confirmed to me on the phone that there is no reported adverse affects due to the smartmeters, and started trying to convince my body on how safe they are! However, because I know all too well here, one supervisor recommended that if I'm not happy where I live that I should just move out! I can't afford to move out, and why would I want to if I'm very

happy here apart from the damaging health due to the meters. This weekend I have finally had enough! I decided to take PG&E to court in a lawsuit. I am in process of locating the attorney as I write this. I am going tomorrow into the office of PG&E and giving them 10 days to remove the smart meters so it will be recorded on my account since jail or death is my only option at this point! So, my constitutional right to health is being outright violated by ELF Wave poisoning with Big Brother in complete control as someone who is slowly torturing and murdering me! PLEASE HELP, in any way you can, and QUICKLY! Please help do something about this before I am murdered by the PG&E company! I feel like my brain is exploding in my head and it's getting worse by the day!

A.S. Sonoma County

---

I have read in horror the testimonials on this website. My SM was installed at the end of October 2010. Since that time I have developed tinnitus, which is incredibly irritating, bordering on painful. The head of my bed was located on the opposite side of the wall on which the SM is located. I have moved my bed to the other side of the room, but I'm scared to death that it will get worse and that I will experience other symptoms, such as cardiac arrhythmia's, which would be a disaster as there is a history of an inherited disease, Hypertrophhic Cardiomyopathy, in my family and my sister died of Sudden Cardiac Arrest last year, a common cause of death when you have this disease. I called PG&E in panic, but they are all inculcated with the corporate line that there is no research to support the claims of health problems. If this is true, why are so many of the people writing these testimonials talking about developing tinnitus? Where is the point organization that can fight this monster? Margery Entwisle Mill Valley, CA

---

Smart Meters were installed in my neighborhood on April 15, 2011. Since then I have had constant ringing in my ears. Smart Meters violate my constitutional right to be safe and secure in my home, 4th Amendment. Smart Meters violate my privacy and my health. This is a KILLER and you know it. S.B. Orange County CA

---

I've had the Smart Meter installed in my home several years ago. I am now wondering if the Smart Meter was the cause of my sudden onset chronic headaches and dizziness, vertigo, that has left me about 25% functional to this day. G.T. Sacramento

---

I am VERY ill from the Smart Meters! And I am just putting together all the ways this equipment is ruining my health. This needs to stop NOW! W.T. San Mateo County

---

I am (was) a very healthy individual, and have all the past medical information to prove it. In the last year I have been suffering illness that I feel is directly related to the Smart Meter on my home. The

electromagnetic currents are so strong I can feel them and hear them in my home. I now wake with headaches, I have dizzy spells, I'm getting skin rashes and more. I have repeatedly placed complaints with the CPUC and PG&E, to no avail. I have no alternative but to move to a house outside of the PG &E territory. Removing my meter alone won't solve the problem. My house is at the hub, the terminal, for the neighborhood distribution and the adjacent neighbor's meters are on my side of their houses, putting me in direct line of current for three homes. I want these things removed so I can resume my life, which is on hold. C.L. Yolo County

---

As an older adult who has been treated with radiation for lymphoma I am opposed to "smart" meters. I also cannot afford an expensive opt out plan. In fact I believe it is discriminatory to impose such fees on people who have legitimate health concerns. B.R. Marin County

---

Since December I have been experiencing a terrible condition called Tinnitus. I hear sound in my head 24/7 which at times has left me unable to work or sleep and coincides with the installation of new smart meters on my home. Tinnitus is something I would never wish on anyone, it can drive one crazy. It has affected my work and my life. I want my life back. I demand more research done on health impacts of smart meters before installing them on anyone else's home! H.K. Alameda

---

Yes, I got big headaches, depress, and weak every night until early morning on my bed near smart meter. I can't think straight out because of smart meter. I don't feel like to eat because of sick every day. I went to Los Angeles, CA for visiting my sister and feel clear up my mind and restore my health but I have to go back to my home and come back to sick again. Donna Avent, Taft, CA (Kern County)

---

Though I never was electrically sensitive before, an extreme exposure to Electro Magnetic Frequencies (EMFs) from just one of PG&E's digital SmartMeters, (from 10/31/09 to 3/3/10), left me as an electrically sensitive person. Along the way, the experience of dealing with PG&E to take the SmartMeter out was truly creepy. Now, a year after the SmartMeter was removed, 30% of the symptoms still rule my life.

Here is the sequence of events: In early December 2009, I began experiencing nights of fitful sleeplessness. I soon had less and less energy in the day time. I began having localized headaches and worried why I was constantly a bit dizzy. In January the dizziness became worse and I began feeling very oddly 'spaced out'. I began having strange strong cramps in my legs at night that woke me up. My eyes were constantly extremely itchy and incredibly light sensitive, often with strong pains in my right eye. My normal mild tinnitus was far far worse. Also my familiar chest pressure and pains were far more pronounced and far more often. I had no idea these things were related. At first I just felt guilty I had allowed myself to get so out-of-shape that I could not find a solution to the horrible insomnia. By January I had such serious memory problems I often could not remember what I was doing from one minute to the next. I would find myself standing still, staring into space, and vaguely realizing that something must be

wrong with me. By February, when speaking, hard as I tried, I could not remember the most common words, and was spelling words phonetically. Also, the stutter I had as a child began to return.

By the end of February I realized I was becoming more and more dizzy as the days went by. One day I was so dizzy, I literally could not walk and was actually staggering. Also, by then, I frequently saw in the mirror that my face was Bright Bright Red. And since I had no feeling of being hot, I finally knew something was really very wrong and that the cause was not insomnia. But I had absolutely no idea what the cause could be. It is only because of two purely chance incidents that I discovered the cause was just one SmartMeter seven feet below my bed.

In January and again in February a friend using my garage as a theater rehearsal space, twice came upstairs to the apartment to tell me that as a person who rarely got headaches, he could not figure out why lately whenever he was in the garage he would get horrific headaches. But, as it turns out, he had been sitting and standing about ten feet from the SmartMeter.

Through this whole experience, there were two ambulance trips to the emergency room for racing heart. Both times at the onset I was in no stress whatever. When the pills that are supposed to slow the heart rate down did not work, I had no choice but to call an ambulance. Both times, at the hospital, my heart checked out just fine. The first time was before the SmartMeter was taken out. The second ambulance trip to the ER was one morning 6 weeks after the SmartMeter was taken out. I had been sitting for a few hours at my desk 25 feet from a power pole. This was the day I realized that even though the SmartMeter had been taken out, it had left me as an electrically sensitive person and I could no longer use that office or enjoy that roof garden as I had for the past 30 years.

For this whole past year since the SmartMeter was taken out, I have had to completely interrupt my cultural-exchange business and personal life to only focus on finding ways to shield myself from EMFs. Every day is a fight. It is serious stress. I am on constant overwhelm. Lately the symptoms are worse again. The strange leg muscle cramps are waking me up again at night. In this past year I have lost half of my hair. The tinnitus is worse and worse in just the last few weeks. There are fewer and fewer places I can go, out of the house, to avoid EMFs that do not make the Tinnitus worse. I worry a lot about cancer and the health of my neighbor's children. And I know there is no where to escape to. Maya Cain, SF CA

---

I have developed nodules on my thyroid , dizzy spells, difficulty swallowing, and petite seizures, since the smart meters were put in. I have never in my life had anything like this, and I am so upset. I have always been in good health. I am looking for some help, on how to save my life.L. M. Pacifica CA

---

Since the December 4, 2010 installation of PGE Smart Meter in my apartment building, I have been a Smart Meter refugee. December 30th I fled my apartment with severe symptoms and only the clothes on my back to Marin General ER. After 3 months, even though I have been with friends (11 moves), I am now homeless. To date, I have exhausted: the landlord, Legal Aid, Fair Housing, District Attorney, Sacramento, trying to get an atty, Marin Housing Authority, many, many of my doctors, Jared Huffman/Supervisor's office, Health Dept., Environmental Dept., and still cannot get any help. I have

forwarded the recent March CPUC document with “opt-out option” to my landlord, and she still does not think there is a “problem” on the property. Cannot move out b/c of symptoms when on property, cannot pay 3 months rent to transition out, and exhausted and depressed from this battle w/o any disability rights protecting me.

Like many with the symptoms, I am on my last and giving up... exhausted from trying to get help, afraid of my health, depressed, crying all the time, difficult to work, cannot get the proper sleep...I Don't know how much more I can tolerate w/o major support. All I want is my life back. ZEENA QUINN, Marin

---

This past year I have become electro-sensitive due to the many wireless communication bands in the air. I cannot even go into coffee shops anymore without getting ‘burned’, a feeling of intense sunburn. This is one of the many symptoms I now suffer. Recently, my wife has been getting intense headaches for no apparent reason. I myself have recently suffered symptoms of a heart attack. I had to go through extensive testing that hit hard financially. We just discovered that the smart meter had been installed here without our permission, which coincided with our physical problems. We are so upset about this that we are now considering legal options, at the very least to cover the cost of our medical expenses .KB, San Mateo County

---

I woke up this morning to a SMUD employee knocking on my door letting me know they were installing smart meters in the neighborhood he replaced my old meter and went on his way. After he left I noticed my scalp tingling and it just wouldn't stop the unit was place on my wall outside my Kitchen I was sitting in the living room most of the morning. Not only did my scalp tingle but I felt a little dizzy. I left and went on a bike ride and felt fine as soon as I got back I felt dizzy again and my scalp started tingling again. These were both abnormal I never feel dizzy and my scalp rarely tingles. I called SMUD and asked them to take the meter off the guy still has the old equipment and is right down the street I passed by him on my way back from the bike ride through much resistance they agreed to call him and have him put back in the old meter. Within minutes after him leaving with the old meter installed again my head stopped tingling and I no longer felt dizzy. This is proof enough for me there's something wrong with those things. If there is any way I can help in signing some sort of petition or something I will. Please let me know this is a complete home invasion where can you go to relax and feel comfortable if you can't go home to do that. S.L. Sacramento CA

---

About two months ago, after sitting in my living room for several hours, I took my pulse; it was wildly irregular, skipping a beat every 3-7 beats. My pulse had never done that before. I then took my pulse in a number of places inside and away from my house. My living room is basically the only place my pulse skips beats. The irregularities occasionally occurred in a milder form in the dining room, which is at one end of the living room. When my daughter was visiting, we sat in the living room for 20 or 30 minutes, then took our pulses. Both our pulses skipped a beat after 10 to 11 beats. Why was my heart pumping irregularly only in my living room? At some point I remembered that a SmartMeter had been installed a few months earlier on the outside of my living room wall, directly behind my sofa. From what I have

read, an irregular heartbeat can be dangerous. I told PG&E about my experience, but they refused to remove my SmartMeter, so now I don't go in my living room. A.H. Monterey County

---

The following letter is from a prominent doctor in Napa:

"I have a patient who is being injured from the SmartMeter. She has a history of Cardiomyopathy from infection and was doing well until the SmartMeter went in last fall. She is now back in Atrial Fibrillation and needs meds she does not tolerate well. It is all a result of the extra EMF. I will send you copies of articles about how EMF effects patient's heart rate. Is there are special complaint form I could send off to the SmartMeter company that you use? I was going to dictate something for my patient and reference the EMF and heart rate issue".

---

They installed our Smart Meter about 3 months ago and I have been extremely sick from the day it was installed. My husband who never has headaches, now has one 24 hrs. a day. I have been extremely sensitive to RF/EMF since 2005 when a neighbor had 2 Sprint cell towers installed next door and we were forced to sell and move.

We are trying to move now, but you have put Smart Meters on every house that might work for me. How come you don't have a contingency plan for RF sensitive people? You have made my life a living hell and won't even give me an option to have my old meter reinstalled even with a Drs. note saying how sick I am. J.M. Riverside

---

**URGENT!! HEART CONDITION- SMART METERS MUST BE REMOVED IMMEDIATELY!!!** A bank of Smart Meters, that emit radiation 24 hours a day, were installed on the wall of my home, and I have been severely affected with heart palpitations, non-stop ringing in the ears, shortness of breath, insomnia, and sleep interruption, and more. I posted signs not to install smart meters, which is a legal action, but PGE/Wellington Energy illegally trespassed and ignored the signs.

I have a heart condition, and am EMF sensitive, and yet despite many very futile calls to PG &E, they have not removed the meters, nor have they replaced them with the non-wireless analog meters that have worked perfectly for decades. I have been an excellent ratepayer for decades, I am low-income and cannot afford to move. This is unjust discrimination, and gross negligence not to allow an "opt-out" of any kind. And even worse, with PG & E being fully aware that I have a heart condition, they have added more smart meters on the wall of my home, and they are threatening to add double the meters to my home in the next days, or weeks. How can a utility demand that our health, and the health of our families, and pets be exposed to 24 hour radiation, with no ability to say "NO"? Anon, Sonoma

---

For the past few months, I've been having more problems than ever, including difficulty sleeping, fatigue, headaches, and a level of 'brain fog' that I have never experienced previously. I did not correlate this to

SmartMeters, because I had heard that our unincorporated Sleepy Hollow area of Marin was going to be among the last areas to get SmartMeters installed. Recently, I called the PG&E hotline to be placed on their Do Not Install list, which the courteous rep did. I then went outside to look at my meter, which I had NOT done since August. To my shock, a Smartmeter had ALREADY been installed. \*\*\* (No notice was given after the fact, either.)

I called PG&E back, and another rep told me, "It's not hooked up." I called back again, got another rep who told me, "Oh yes it is. It's been hooked up for months!\*\*\*\*I don't know why the other rep said it wasn't." He also told me it 'only transmits in the dead of night for about 40 seconds.' Both reps confirmed that our conversation was being recorded. I would suggest to anyone who calls the PG&E hotline to record the conversation themselves as well. I wish I had!

\*\*\* My health issues correlate directly with the date that the SmartMeter was installed on my property.

I pointed out to him that this contradicted PG&E's rationale for continuous monitoring. Then I hung up. I have since spoken with several neighbors, who also received PG&E's 'notice to install' two weeks ago, yet they, too, discovered that SmartMeters were ALREADY installed on their property. That's either incompetence in coordinating installation scheduling and mailings, or intentional deception. Steven Halpern, Marin County

---

I am extremely sensitive to EMF and RF signals since 2005 when a neighbor had 2 cell towers installed about 400' from our home. We moved from that house and I got better as long as I am not in any contact with any signals. Then we got our SM installed about 9 weeks ago and I have been extremely ill every since. My husband has sent letters to all of SCE management and the CPUC and they all ignored us. He finally got an SCE EMF engineer to reply back and they sent out 2 EMF "specialists" to measure the signals twice, and both times they said our SM meter was OK. My husband has his own meter and showed the specialists that the meter is showing dangerous spiking every 15 seconds. SCE's meter did not show the spikes. My husband got the make and model number of their meters and talked to the company that makes them... apparently the meters they use only average the signals and the 15 second spikes do not show up, so of course they are telling every body that complains they are within the "approved" range. My husband also measured their cell phones and the smart meter signals were about 5 times stronger than their cell phones. We have covered our meter with Heavy duty aluminum foil and a thick metal bucket. We have also lined our garage with it. It does cut our signal a little, but we still have all the other neighbor's signals blasting towards our house. The SM's use a repeater signal that sends the signals from one meter to the next.. they constantly "talk" to each other all day long and send data the same way. It's so bad in our neighborhood that I can't take our dog out for walks anymore. I feel it as soon as I walk out the front door.  
Jana, anon

---

Two weeks ago they installed smart meters on our row of townhouses. A few days later I felt dizzy; this changed to heart beat very strong – occasional racing – and now ringing in ears and pressure in chest as well. Dizziness subsided but have been waking up at 4 am and can't

t get back to sleep. There are also about 20 meters about 75 feet from my house; i look at them in a line of sight.

I seem to have been way more affected when they actually installed them in our block of 7 townhomes even though i am slightly further away from this meter box collection. it's like it comes in through the wires.

Those other ones were installed in Nov. or Oct. and i remember feeling nausea and more migraines from those. A few times a day we get this awful screeching too. I have been in a panic wondering where I can move? if it's gov't mandated then does it matter if we complain?

I also heard that PGandE could have installed all kinds of meters like cabled ones instead.

I never knew anything about smart meters until it happened to me. where can we go to escape, this is so scary. Anon

---

I have six smart meters right outside my bedroom and kitchen since they were put in i have been having headache's ringing in my ears and nausea. i know it's due to the radiation but it's hard to get people to believe me is there any help out there? i would welcome any advice or if anyone is going thru this please contact me. my together we could fight pg&e and have these things removed before they cause permante damage to me & my children or to anyone else.... Daniel G, unknown

---

Smart meters were installed at my house about a year ago and soon after I experienced ringing/buzzing in my ears that keeps me awake at night. I thought my clock radio was on so turned everything off (including computer, vcr...etc) but still heard the noise. Remembered the smart meter install and now see many other people with the same symptoms. More recently my ears have a burning sensation. Is there any way to block the transmission into the house? I feel like the inside of my head is hot. Thank you for the site. How can this experiment be legal? E. C. CA

---

Since I had the SmartMeter placed on my home (master bedroom wall by headboard of my bed) by SDG&E about 3-4 months ago, I have developed increasingly severe reactions to EMF (electromagnetic fields). I have constant ringing in my ears, getting louder and very distracting; headache, sinus pain, feeling of heaviness in chest, disorientation, mental confusion, difficulty concentrating and with calculation and driving, nausea, and very hard to use computer, phones, etc. Can't sleep well, insomnia, though improved with change of bedroom. My doctor wrote a letter demanding under the ADA that SDG&E remove the SmartMeter, the reply was that SM's don't impact health, and that my doctor is wrong that the ADA covers this, and they essentially refuse to remove the SM. Needless to say, I am shocked, horrified, and will take further steps. This is an example of Big Brother in our lives worse than anything I have seen in America in 60 years. They can harm and kill us legally now, in our own country. S.B. San Diego

---

Since the “smart” meter installation I’ve been suffering from headaches, losing sleep, and hearing high pitched ringing from time to time. I’ve already called PG&E to complain and requested they remove the meters...they said someone from their “smart” meter escalation department will be contacting me soon. Would appreciate any suggestions or advice you may have on how to get them off my home. I am very sensitive to RF signals. (Two weeks later...) PG&E is still refusing to remove my “smart” meter even though It makes me ill. I will be forced to sell my home and move if wireless smart aren’t removed from my home and neighborhood. PG&E may have an easement to put a meter on my home...but a meter on my home that shoots RF in to my home and in to me, my partner and my child’s bodies? As a Realtor it seems to me like that should be overstepping the limits of their easement. M.H. Humboldt County CA

---

“One month ago I moved into a house that has a smart meter installed on the same side of the house as my bedroom. I have been having sleep problems including insomnia, nightmares and restless sleep. I am epileptic and sleep deprivation is very dangerous for me. I have also been experiencing unexplained anxiety and irritability. I live in Oakland. I’m also having strange interference on my phone line.”

(Update) ” I have now been living with a smart meter for nearly 4 months. My sleep has deteriorated. I often only get 4-5 hours which is a serious threat to my health as an epileptic. My request to have the meter removed has been denied. I cannot afford to move, and anywhere I move to in this area will likely have the same problems. Past seizures have caused me to suffer brain injuries, and many neurologists believe that seizures cause permanent damage to the brain. PG&E is putting me at risk of major injury and even death, since seizures can be fatal”

.A.L.M. Alameda County CA

---

I am disabled from a spinal injury and neurological damage from a severe case of Encephalitis. I moved into a small apt attached to my Mother’s house three months ago. Both my mother and her husband are also disabled. We all have serious health problems. They were not aware a smart meter was installed a year ago, right behind my bedroom wall. Everyone in the house has been having similar issues since it was installed, exhaustion, stomach issues, ear aches, ringing the ears, dizziness and skin issues. My health issues are complicated already and I cannot move again. I want to know what I can do to get this thing removed. Nobody asked, they just did it. I have signed petitions, I have written letters. What else can I do? My Mom has had 22 surgeries, Cancer, RSD, Interstitial Cystitis and much more. Just the fear that it may be adding to our health problems is unhealthy. She grew up under power poles and has always believed that played a role in her health issues. Although she knows now, I was afraid to even tell her it was there.

I believe we as humans have not had time to adapt to the barge EMF from such devices and we need choices and a voice in the decision processes when it comes to technology such as Smart Meters. There are also privacy and other issues at play here that make me very much against Smart Meters.

T.R. Aptos CA

---

“I have been in the ER overnight three times this week, with unexplained sickness. I have had a CT Scan of the brain, Stress Test, CTA, EKGs, Ultra Sounds, Blood work and still no definite answer. We recently had a Smart Meter installed and these symptoms began about a week after: Extreme Stress, diagnosed TIAs, dizziness, headaches, nausea and fainting. I mentioned this to a doctor and he suggested that the Smart Meters may have something to do with it because the hospital has had quite a rise in illness of this kind reporting to the ER. “J.W. (anon)

---

My family lives very simply, we do not own a tv, do not have a computer in our home or microwave and do not use cell phones at home, we keep them in the car for emergency only. We also watch our energy usage and do not keep appliances plugged in. Within days after our smart meter was installed I experienced a very painful miscarriage. After the miscarriage I started experiencing mysterious pain throughout my body that could not be explained. My two children who are diagnosed autistic regressed in their autism after much work with behavioral therapy and other interventions. I sadly watched my father’s health decline since last fall he became very fatigued and weak and unexpectedly passed away in October 2010 of a heart arrhythmia. I believe the smart meter played a role in his health because he was very healthy until it was installed on their house last fall. T.M. Anon

---

I was unaware that a smart meter has been on our home for over 18 months, until I called to be on the delay list only to be told that I had a smart meter installed in 2009. I never got a knock on the door or a notice of installation, but during that time I had a series of strange health issues including a pressure in my ears for which I went to two doctors, irritability, insomnia, and general nervousness and extreme debilitating fatigue. I am not saying my health was perfect before, but I never had the consistent excitement which I thought was overdose of computer use, even when I used my computer at home for work sometimes 10 hours a day. Now, I hear a buzzing and feel hyper and we have discontinued our use of wireless internet and installed a land phone line so we minimize use of our cell phones as well. We no longer have wireless Internet, but so many of our neighbors do, that we feel like we live in a hyper anxious space. We are moving soon because I survived cancer, I want to stay healthy, and I feel better away from these wireless smart meters and other forms of EMF and RF. We moved to a neighborhood in a forest in West Marin that didn’t have Smart Meters. Less than a week after we closed on our home, the Wellington truck was at the bottom of my driveway, installing smart meters on this rural road in the forest trailhead. We did not get a smart meter because I put us on the delay list for this home, and told the installer not to install. I also had a No Smart Meter Sign. M. G-K Marin County CA

---

” My husband has brain cancer attributed to the radiation from his cell phone. Shortly after installation of the smart meters on our home I was diagnosed with hypothyroidism. I never had the symptoms prior to the installation of the smart meters- fatigue, depression, joint pain, heart racing, and weight gain. I also suffer from atypical trigeminal neuralgia- a very painful nerve disease in the face that causes electrical jolts within my face and head. It worsened with the smart meters.

Denise Alexander of PG&E did have my meters removed when I notified her of my husband's illness. I never mentioned my problems as his alone are reason enough to not be subjected involuntarily to the very thing that is killing him. Shortly after the removal of the meters I received a hand signed letter from Mr. Devereaux that the meters will be going back on. I just received a recorded call from PG&E stated they will be here to put them back on within 30 days. I cannot and will not allow this to happen." E. M. Contra Costa County CA

---

"I purchased a condo in Rocklin CA. I have probably 20 smart meters in the room next to my bedroom (the electrical room wall). My 2 daughters and I all have headaches and there is a buzzing sound. One of my daughters is constantly fatigued. How do I prove that the smart meters are causing these symptoms?" D.O. Rocklin, CA

---

"I have been having headaches, heart palpitations, horrible ringing in my ears, dizziness and some nausea, and a burning of my facial skin for 8 months, since PG&E installed a Smart Meter at my house. These symptoms began gradually in the first weeks after the Smart Meter was installed and have increased in intensity over the months. For the two weeks I was in New Zealand in October, the problems lessened or disappeared completely . Home again and it all started again. I want this Smart Meter taken off of my home. I am sick because of it!!!" L.H. Sonoma County

---

Smart Meter destroying my sleep. Since the Smart Meter was put in my home, I have not had been able to sleep through the night. The Smart meter was installed just a foot from the head of our bed (on the outside of our bedroom wall). Before it was installed, I could easily sleep through the night. Bill Beckham Fresno, CA

---

We recently had our smart meters installed, three of which our on our wall, for the three units on our lot. I have a super healthy routine and was drastically improving my health and wellness. I am Vegan, non smoker, non drinker, I record all of my food intake, exercise avidly and slept regularly from 10 pm until 7am. I began to get unexplainable huge rashes on my face. My doctor freaked out and couldn't believe the photos and ordered labs immediately, he was sure I had Lupus or Rheumaty Arthritis. He sent me to a Rheumatologist ASAP, It then started with the aches and pains, the super dry lips and a loud squealing in my right ear. Even my teeth hurt. Then the buzzing sound intermittently mixes with the high pitch squealing noise in my ear, followed by extreme exhaustion or fatigue in random parts of the day or evening, to where I couldn't even stand. The headaches make me feel like I want to die. I can't sleep until 5 or 6 am and pop back up at 7 am. I am nauseas, and my ear in is extreme pain. I have feelings as if the ground or furniture is moving or being bumped. I get dizzy and have problems orientating myself when I go from standing to sitting or vice versa. My 1200 calorie diet that I record every meal has turned into a 300 calorie diet because I'm too sick to eat. I am having to drink meal replacements because the more I

cook in the kitchen the worse I get. My husband complained of feeling sick, back pain, headaches and an electric-like pulse or shock-like feeling that darts up his body through his brain. When it happens he jumps. It has happened three times now. The downstairs neighbor moved because of her sudden onset of symptoms that began at the same time. Our DVD player now cannot reach a signal on the TV (says no signal) despite the player actually being a part of the TV, all in one piece. My eyes burn and weep full of tears with a mental cloud I can't shake. My stomach turns upside down it feels and I feel a burning sensation on parts of my body. I have missed about 80% of my work schedule and am rapidly deteriorating. I just kept saying, "something is wrong with the air." I didn't know what exactly I meant, it was just a feeling I had. Then someone else said the same thing out of the blue. Then the other evening, I couldn't walk. I was crying profusely from the pain and symptoms. Everyday its worse....I am going to request mine be removed but the neighbors still have them, still posing a threat since they're everywhere around us. ...These meters not only quadrupled our electric bill but also my health that I've worked so hard to achieve came to a complete halt, the same exact day as the meters were installed and everyday since then. ... This isn't fair. I don't want a smart meter. We weren't surveyed or asked. We never got informed until the knock on the door saying "SDGE, were here to install your smart meter." Then we were handed a little piece of paper which didn't disclose much. Now we have a super high electric bill that is way to much for our tiny two bedroom beach apartment and a super ill husband and wife who were otherwise healthy and active until the day of the meter installation. Amy Evans San Diego CA 28 yrs old

---

Last year I lived in Livermore CA. The meters were changed in Livermore last year. It wasn't until I just saw a news story where I have now put 2 and 2 together. Starting in Oct. 09 I have been experiencing terrible ringing in the ears. A hi-pitch hissing/buzzing noise. It's been driving me crazy. I have been to so many doctors since trying to find out what is causing this terrible problem. Doctors cannot find anything wrong. But what I have noticed is this, when I have traveled away from the city to the mountain such as to go camping, the hissing and buzzing go away. But as soon as I get back home the noise starts back up again. NR Tracy CA

---

I live in San Diego in a small apartment building with 3 apartments. SDGE installed 3 Smart Meters on 9/29/10 and I have been sick as a dog ever since, even to the point of missing work. The Meters are located below my apartment, just below my bathroom wall (I am on the second floor). Using my Entech Meter I tested the outlet in my bathroom and the signal was so distorted I could pick up a radio signal! My Gauss Meter also picked up Hot Spots that never existed before.

I suffered from severe joint pains on the day it was installed to the point where I couldn't move my wrist without agonizing pain. I have been in pain ever since and also got a very bad cold. I also developed an odd problem called Phantosmia, in which you can smell something that isn't there (in my case cigarette smoke which I am allergic to). I am EMF sensitive but I have never felt as ill as I do now. I was completely functioning before, whereas after these Meters were installed I just feel awful all the time. S.G. San Diego CA

---

Last week our power company in NE Arizona put a new digital meter on our house. The meter was supposed to remain in a silent mode and not transmit unless someone sent a signal to it from the highway to activate it and get the reading.

Over the next 6 hours I gradually got very sick from the meter. The symptoms were a vise grip headache, nervousness, horrible brain fog (after 3 days I was unable to complete a sentence), total insomnia, stomach rolling and nausea. The meter seemed to run in on the current and I began to have reactions to my electric stove and other electrical appliances that I had not been bothered by before.

After a couple of plea's from my husband, the power company made a decision to return our meter to analog. I had immediate relief in some symptoms, but others took several hours to go away. Due to a weekend and Monday holiday, it took a week to get the meter removed. I was so sick by then I was worried it would leave me highly sensitive to emf's. After 24 hours I seemed to be ok, however. These meters are not safe! Anonymous in Arizona

---

In July 2010, SDG&E installed Smart Meters in my condo complex. I own a townhouse that is situated in clusters: 8 units per cluster. Therefore 16 Smart Meters were installed in the utilites shed outside my kitchen/bedroom walls, ten feet away.

I began having symptoms of head burning and pressure on my chest within a few days. As time progressed the symtoms worsened. I had severe burning in my head and headaches of a new type. I starting having palpitations, arrythmias and flutter. I called SDG& E. Three people including an engineer and the director of the Smart Meter program came to my home, spent an hour talking and photgraphing the meters. They took no measurements of the radiation, though they said they would on the phone. The next day SDG&E informed me that they would not be replacing the meters with the analogue meters. They assured me that they are concerned about people's health.

By six weeks in, my cardiac symptoms were so severe and erratic that I had to move out. I rented an apartment, which turned out to be unsafe as well. The Smart Meters are everywhere. With the intensification of my symptoms, I have become EMF/RF sensitive and now have the above problems around cell towers, Wi-Fi and other sources, accompanied by skin rashes and burning.

I am being evaluated by a cardiologist. I have always had a strong, healthy heart, even told so by doctors. The cardiologist has sent me for an evaluation by a neurologist as well.

Five people have reported symptoms in my home: My father has experienced headaches and visual migraines. My mother reported having pressure on the upper part of her chest and palpitations. One neighbor exposed to these 16 cluster meters is experiencing headaches and chest tightness. Another neighbor has difficulty opening her eyes in the mornings after 8 hours by the meters. Her ophthalmologist could find no explanation. She said she uses her fingers to open her lids. All of the above symptoms have occurred since the smart meter installations. The symptoms are worsening for everyone.

I am running scared living this nightmare. I don't know where to live and fear for my well-being. I already have a prior immune disability and I thought I would be legally protected by the ADA. I don't know

where it is safe for me to live. In addition, the financial impact of this disaster compounds. I pay my monthly mortgage and rented a place, which due to symptoms, I cannot stay in. I am not sure that I can rent or sell my condo in good conscience. I am seeking medical care including treatments not covered by any insurance. My out of pocket costs continue to grow.

R.H., San Diego CA

---

We live in Berkeley and recently had a smart meter installed without our knowledge. Since that time, my husband and I have been having increasingly painful headaches around our ears, along with other symptoms. My father, who has Parkinson's and a Deep Brain Stimulator with two leads, also lives with us. I also have a two year old and a five month old. My two year old is no longer sleeping well and is waking up all night. We strongly feel that the smart meter is unhealthy for our family and want to get it removed. (Anon, Alameda County CA)

---

Since the meters were installed, I am experiencing continuous severe ringing in my ears in my home, which does not happen when I am at work in Marin in an area where the smart meter have not been installed. Family members are also experiencing headaches and one family member, who did not know the smart meters had been installed was working unloading boxes for 1/2 an hour about 5 or 6 feet form the meters. He became very dizzy, had very rapid heart beat and lost consciousness and fell. We are very concerned about the short term and long term effect of the smart meters. We are in the process of trying to move to Fairfax hoping they will be able to keep the smart meters out. As PG&E has refused to move them we were forced into selling our house. This seems extremely unfair. (Anon. SF Bay Area)

---

" I am chemically and electrically sensitive but have gotten much better. I am finding that since they installed our smart meter, I am getting unexplained exzema and rash. I have tried to heal leaky gut and all the things you do to stop it and am still struggling with it. I know that I can't use a cell phone unless it's on speaker phone, and then only a second. I get very ill with continued wi fi exposure. I wanted to ask you if you know how much radiation these smart meters are putting out. I am really pissed about this, I rent and don't own so I feel stuck. " (Anon, Alameda County)

---

After the installation, I started hearing high-pitched frequencies that lasted about 20 seconds...

I called PG&E and told the lady there about hearing high-pitched noises in my house. It's not coming from a specific appliance but rather I'd hear it for 20 seconds or so (kind of like those hearing tests when we were kids) and then it would go away. I heard it in the kitchen, the dining room, and my bedroom. The PG&E rep had never heard of anything like this and forwarded me to the Smartmeter Division. (Anon, Berkeley CA)

This meter was eventually removed.

---

Since the new meter start-up a few weeks ago ... Family members' new or exacerbated symptoms have coincided with the meter start-up. Myself, I hear ... high-pitched buzzing now within our house, absent before. I often go to the clock to check the timing of the microwave hearing, and it most often corresponds exactly to the minutes when our microwave meter picked up the signal, so I have no doubt about the source of this brain penetration. I know of another EHS-er who apparently has a urinary bladder reflex activated by the meters. Note that the frequency range is long known to be among the best for brain penetration. (Anon, Canada)

---

If you are wondering why you have a nagging headache, insomnia, fatigue, etc.—start doing your research on PG&E's Smart Meters... I have a relay Node on the telephone pole in front of my house [installed May 2010] and the 4 people who now live here have the subject symptoms.

---

Gas meter installation was installed in our property on 3/18. The Smart Meter was causing us headaches, achy/watery eyes and loss of sleep; effectively blocking out half of our house. We called PG&E on 3/19 and meter was removed on 3/20. However, because of neighborhood deployment of Smart Meters, we are getting constant light headaches since then, even after the removal of the meters from our property. .. We consider this unnecessary bombardment with radiation an invasion of privacy, disturbance of domestic peace, and potentially a health hazard.

At the initial call on 3/19, PG&E agreed on the removal of the meter, which occurred on 3/20. On 3/27 we received a letter notifying us (again), of a pending Smart Meter install. We called PG&E on the same day, where we were informed that Smart Meter installation is eventually unavoidable per PUC mandate. They also mentioned that research was done and proved that Smart Meter did not cause problems. In our mind, this research should be void and not provide sufficient proof, since we are a living proof that Smart Meter is causing us problems.

I should add that I've been also been sensitive to other devices, such as bluetooth headsets and WiFi. We don't have WiFi at home, and no bluetooth, of course. In the case of WiFi or similar, I consider this as voluntary exposure. In the case of the SmartMeters, it is non-voluntary exposure. Even if I wanted to, I couldn't go outside and turn off the meter. .. Putting corporate greed on top of public health is an outrageous disregard for society. (G.K. Santa Clara County CA)

---

I choose not to have a cell phone, computer, or use other wireless devices in my home. I'm not interested in having "smart" appliances there either. I avoid exposure to cell phone towers and public places that are "hot spots" for wireless use. This is because I experience headaches, a sensation of pressure in my head, increased heart rate, a sensation of dizziness, and other disturbing symptoms when I am around wireless

frequency emissions. Regardless of what others may think, the symptoms are experienced by me, and I DO NOT want to have any wireless devices ON my home, where I cannot get away from them. I have owned this home for 25 years, and plan to stay there. I demand an opt-out option, and refuse to have a Smart Meter on my home.

---

My husband has had an intense electrical/EMF sensitivity for the past 10 years. It has obviously had a great impact on our family. He had to quit his job a few years ago because of the work environment, and as new cell antennas and towers have gone up, we've often worried that we'd have to move. So far, we've managed to be able to stay in the Bay Area where we've lived our entire lives.

Installation of Smart meters began on our block two days ago. We declined, as did many people on our block, but our immediate neighbors both accepted (one of them did so only because he felt it was inevitable even though he was opposed). Since installation, our baby monitor (that we keep in a remote corner of the house) regularly becomes staticy to the point of not functioning, so clearly the microwave radiation is interfering. My husband has developed the same symptoms that he feels when he is near things like cell towers and speed limit monitors (intense pressure in his head and a headache, and agitation), symptoms he feels before he even sees the offending source. And I've been feeling nauseous and agitated with tension in my head, which honestly could very well be from anxiety.

We need to convince PG and E that we can never have a Smart meter installed on our property. And, we NEED to have our neighbors go back to the old kind of meter if we are to be able to stay living here. (Anon, Alameda County CA)

---

..What is happening in America is happening in my state of Queensland.

We had solar panels put onto the roof of our home, and then the power company came along and installed smart metres in our mains power box. There are three mains power boxes, so therefore there are three smart metres transmitting 24/7. My health has deteriorated so much, that I feel that I can't last.

Our state government has just gone ahead and made it mandatory even though the first state to install them, Victoria, is now finding real serious problems.

All I know is that we have 120 units in our complex, which means in a four acre block we have 120 smart metres. I have also found that the radiation from these smart metres are also being piggybacked into our home via the electrical wiring and causing further torment. (Australia)

---

She came home the other day and instantly became very sick: Migraine, heart palpitations, dizziness, depression, nausea, vomiting, intense thirst, parched lips, neuropathy, teeth pressure and buzzing, etc. Her husband had recently done some electric work on the house and went out to check to see if he wired something the wrong way. He came back in and reported that a Smart Meter had been installed by PGE.

She called PGE and reported her symptoms, demanded they remove it, and replace w old meter, which they did. She's feeling better after the removal and replacement of old meter." (Anon, SF CA)

---

"I highly suspect the smart meters as being the cause behind my sudden menstrual irregularity...In early December, a guy knocks on our door saying they're putting a new meter on our home and they're turning off the power – Meanwhile starting in December – I had been having more headaches and difficulty staying on the computer for very long because of them – I thinking to myself, "what is causing this???"

A light bulb goes on finally – I make the connection, it all makes sense now – meters = headaches?

About the time I figure out what is causing the headaches is about the time my period decides to make it's second appearance this month. ...Then I start monitoring my blood pressure for whatever reason, only to find that it has gone up – from usually 125/82 to now reading 148/95" (Anon, Kern County CA)

---

I was just told today by my PG&E reader that there would be a "smart meter" installed on each gas and each electric unit, totaling 14 for my yard! For some reason I was under the impression that there would be one meter for the grouping. That was bad enough but fourteen is absolutely terrifying.

Has there been any comment or discussion on the additional hazards of so many units in one place? My bedroom is about 10 feet from the units. Do I have any recourse at all, that you know of, due to these special circumstances? My next door neighbor, on one side, is already coping with a seizure disorder, I have Lyme disease and there are health issues on the other side of my unit as well. Are there any attorneys around who are taking on this issue? (Anon, Sonoma County CA)

---

I have severe Electrical Hypersensitivity (EHS). I also have severe Multiple Chemical Sensitivities. I have been essentially homeless and searching for housing for 3 years. I was doing ok in my temporary spots in Marin, where Smart Meters had not yet been installed. I had to move to Berkeley, because I could not find another temporary place in Marin, and I've been here for 4 months. My electrosmog sensitivity has gotten worse here, and I was finally clued in to the Smart Meter issue. There are 2 Smart Meters 10 feet from my current bed (for this property) and 1 Smart Meter 30 feet from my bed (for the property next door

I am trying to move out of the East Bay, because the Smart Meters seem to be most fully installed here...

I'm very frightened, for my housing situation, because it was already so difficult to find safe-enough housing, with my chemical and electrical sensitivities, but now the Smart Meters make it feel nearly impossible. I went all the way to Petaluma yesterday, by bus (I don't own a car), and I found a chemically safe-enough rental, but that neighborhood already has Smart Meters installed on every house. The houses are much smaller and closer together, than in Berkeley, so I think the radiation per house is higher there. I was very discouraged to discover this. (S.B., SF bay area CA)

---

A woman, who requested to remain anonymous, called today and let me know she was able to have her Smart Meter removed. She called the PG&E Smart Meter line and told them it was urgent, and insisted they remove it. She also had a prescription letter from her doctor stating that she should not have a smart meter now or in the future. PG&E removed it. (Web Admin)

---

On January 15th PG&E installed the new Smart Meter on our home in Aptos.

I was not home at the time and had no idea it was installed.

I arrived home from a great workout at the gym feeling like the peak of health.

As soon as I got back home I started to feel horrible and had no idea why.

The first thing I noticed was the worst pressure in my head and ears ever.

Then my heart started to beat really fast and then my brain felt wired.

Within 15 minutes I started to get really dizzy, nauseous and weak.

Within 20 minutes my whole body began to ache like nothing I had ever experienced before.

When I got on my computer my whole face and hands started to burn and hurt.

My husband arrived home 30 minutes later and asked how I was and I said the worst ever.

He then said he was going to check the work out the electrician did and saw PG&E installed The new Smart Meters.

I then called PG&E in a panic since i was feeling so awful and filed a complaint and asked them to take it off right away since it was making me so sick.

Santa Cruz is not scheduled until July to get these Meters.

We left and went out of town and I felt better in 30 minutes.

When we arrived home Sunday I felt horrible again and could not sleep that night. I called PG&E first thing Monday morning and pleaded to have it taken off right away since I felt so sick form it all.

Monday night at 8pm a PG&E installer came and took it off and put an old meter back on. Within 15-20 minutes I felt 90% better.

I have been electrical sensitive now for 4 years and these form of radiation was the worst that I ever felt in my life. T.D. Santa Cruz County CA

---

“I have lived in my home in San Leandro since November 2003, and have had two smart meters on my home (1 on gas, 1 on electric meters) since October 2008; and they are throughout my neighborhood since about that same time. I/we are now surrounded by a mesh network of pulsing extremely low emf (ELEMf). In May 2010, I had the signals measured by a local technician who had also checked my home in spring 2008 for possible EMF exposure that I suspected was causing me symptoms of vertigo and anxiety. I can provide a detailed report of his recent measurements showing the pulsing measurements and ranges of EMFs. Contrary to what PG&E has told me that these meters emit below the acceptable tolerable range of exposure, it’s the pulsing ELEMf that can interact with our body’s pulsing ELEMf and interfere with cellular communication. I believe I am having ill affects due to this technology being used, and have been seeking medical attention for symptoms of vertigo, the sound of my blood pulsing through my ears all the time while I’

m at home, hyper-arousal/ADHD leading to inability to focus or relax, interrupted sleep, pressure in my head between my ears, increased headaches; and less frequently, heart-racing anxiety, nausea, and shakes. I take really good care of myself, and do not believe that this noticeable decline in my health is due to me getting older.

I truly feel like I am in a microwave and slowly being cooked. Even my previously healthy houseplants have either died or have big brown spots, like burns. These strange effects have been occurring now for over a year, and it’s finally beginning to make sense.”

A.C. Bay area, CA

---

I personally experienced a smartmeter when PGE installed one on my neighbor’s home 25 ft away on May 7th, 2010. I did not expect to notice anything from one gas meter at that distance. However, I felt increasingly bad as the days wore on, with palpitations, irregular heartbeat, headaches, slight dizziness/weakness, emotional distress, anxiety and inner agitation, especially when on that side of our house. When I would leave to go for a walk out in the country, my headache would go away and I would feel better overall, but symptoms would come back upon return home.

I began to wonder if that one smartmeter could possibly be causing my symptoms, and even asked my neighbor if they had recently purchased any new electronic equipment (I wondered if it might be a DECT phone), but she said no.

Finally, in desperation, on May 22nd, I put a metal wheelbarrow over the meter (I had heard that metal stops much of the radio frequency (RF) radiation). My symptoms began to subside, and I was feeling better on May 23rd and 24th.

On May 24th, I was gone much of the day. Upon return home in the evening, I was feeling fine, and then worked for 2 hours in my office on that side of the house. All of the previously mentioned symptoms reappeared, and I was feeling despondent, even crying, as I went to bed. The next morning I learned that my neighbors had removed the wheelbarrow the day before while I had been gone, because PG&E had finally agreed to come out and deactivate the RF transmitter. That morning, May 25, 2010, a PG&E technician disabled the radio transmitter on the gas meter. I gradually began feeling better since then, although my heartbeat is still quite irregular much of the time. I am no longer getting headaches at home, and do not feel the emotional distress, dizziness or weakness.

I should mention that I am constantly exposed to some level of RF, since I live within 800 or 900 feet of the Sebastopol downtown cell tower, and can pick up 4 or 5 wifi signals in my home. Plus numerous nearby neighbors have "smart"phones or cellphones. We no longer have wireless of any kind in our home (since January 2010). Nor do we have fluorescent light bulbs or a microwave oven. I keep a cellphone in my car, switched OFF, and use it once or twice a month on speaker-phone for extremely brief intervals. I avoid places with lots of cellphones. None of these previous exposures prepared me for the onslaught of the smartmeter operating 24/7 next door, and I was very surprised at it's strength.

For this reason I know that I cannot live in a neighborhood with smartmeters, whether or not they let me "opt out". I am obviously more sensitive to RF radiation than most, but I am sure many others will be similarly affected. And many will have symptoms caused by the meters that they don't understand or correlate to the meters. N.H. Sonoma County

---

In about late September I began to notice I was having some odd symptoms, including the following:

\*Agitation\*Memory loss\*Inability to concentrate\*Nervousness\*Inability to get my work done,\*Interrupted sleep, I felt as if I were becoming unhinged.

During the time between September and earlier this month my husband and son seemed agitated too. My husband's blood pressure rose and he had to begin taking blood pressure medication. He was also experiencing sleep disruptions.

On February 25th and 26th there was a huge snowstorm here. During the storm I spent many hours in my living room, near my fireplace, about five feet away from the electric meter, which is installed outside my living room window. My right ear was facing the meter. My husband was traveling and my son was not at home for the same length of time that I was. The electricity went on and off several times during those two days. At one point I heard a piercing sound along with pressure in my ears. Along with the symptoms I had previously experienced, I began to develop worse symptoms, including the following: \*Heart palpitations,\*A buzzing-pulsing sound, especially in my right ear,\*Agitation,\*Interrupted sleep with nightmares of being attacked,\*Accelerated heartbeat. I was afraid that I would have a heart attack.

The symptoms would lessen when I went outside. It seemed that there was something wrong inside my home, perhaps with the electricity. Through research and talking to electricians, I began to realize that my symptoms might be traceable to something relating to the meters. They were the only recently installed appliances in our home with radio frequencies.

After many desperate phone calls to Con Edison, it removed the digital meters, but only after I presented a note from my doctor, upon which Con Edison insisted. In place of the electric meter Con Edison installed another electric, digital meter that it assured me emitted NO radio frequency...

Con Edison also told me that I would need in the future to provide it with meter readings. Con Edison told me that both my doctor and I would be receiving a follow up communication from its health department, which we never did.

Whether the people at Con Edison lied or did not know what they were talking about is a question that needs to be answered. This meter also had a radio frequency ... I realized this when my symptoms got worse. I was truly afraid that I would have a heart attack. I became terrified in my own home and could not find a comfortable place to sleep, because the buzzing pulsing sound in my ear was so disturbing. Before all of this started I was a healthy 51 year old.

Again, after making many more calls to Con Edison, on March 4 they removed that meter from my house and replaced it with an analog meter (this is the same type of meter Con Edison had initially removed in June 2009).

My immediate responses were so remarkable that I recorded them. \*Tingling in arms,\* Legs felt very heavy, \*The buzzing-pulsing became quieter.\* I felt as if my body was weighted down with exhaustion. Within hours I began feeling better. The loud buzzing-pulsing sound quieted down and my thoughts were less scrambled.

But my difficulties continued. In our home we have lived with wireless appliances, cell phones and fluorescent light bulbs for at least three years, and to my knowledge they have never been a problem for me. Now I cannot be near any of these things because I get a buzzing in my ears and my heart starts to race. The only possible cause for this change is that Con Edison placed meters emitting radio frequencies on and in my home in June.

Since Con Edison removed the digital meters and replaced them with an analog meter I am feeling better, but some of the symptoms have not gone away completely.

When I asked the Con Edison "Meter Relations" department (212-460-4111) if I could see a copy of the test results for human exposure to the frequencies in the meters, I was told that I must obtain a subpoena to acquire that information.

Con Edison also told me that the FCC had approved the meters. When I called the FCC, I was told that it does not address human health issues, but only with regulating frequencies, and the person with whom I was speaking hung up on me....

This could be a very dangerous situation. These meters are being used across New York State and the country. People might become sick from them and not know what is happening to them.

I am requesting that the meter replacement program be stopped immediately and that home owners be given the right to opt-out of receiving these meters if they do not want them, until further testing is done to

learn the effects of the frequencies they emit, especially in combination with other frequencies to which we are already being exposed.

Thank you.

Michele Hertz

New York

---

I am Toril Jelter, a board certified pediatrician specializing in medical and environmental aspects of autism related illness. I have health concerns regarding the unbridled roll out of wireless technologies without adequate health studies before hand. Dear FDA/FCC, I request a moratorium on the Smart Meter roll out ASAP until a proper assessment of health effects has been conducted. Here are a few patient stories for your review: A 2 year old child can't sleep at night. He screams inconsolably for hours. When the mother takes the child away from the SF Bay area to a remote area with poor cell phone reception the child sleeps well every night and naps as a normal 2 year old would during the day. A 40 year old man with MS & EHS (multiple sclerosis and electrohypersensitivity) requests no Smart Meter. His doctor writes a letter to support this request. It is granted BUT only temporarily! His 4 neighbors get a Smart Meter and he develops such severe ringing in the ears (tinnitus) that he is no longer able to sleep indoors. He discovers that the only way he can sleep is to sleep outdoors. (This could be explained by the cumulative effect of EMF in his home + the Smart Meters next door.) A 45 year old woman with MS has been stable for several years. After installment of a Smart Meter she goes down hill rapidly. Depression, flu-like symptoms and severe fatigue. Another woman with MS 50 years old improving. Gets a Smart Meter. Gets worse balance, worsening depression. Falls breaks 2 ribs and punctures a lung. A 10 year old child with high functioning autism gets a Smart Meter. His handwriting deteriorates. He seems more fatigued. He gets flu like symptoms frequently. Looses his appetite. Stops gaining weight. A 65 year old woman gets a Smart Meter, actually 4 at the head of her bed. (condo) She develops severe tinnitus, sleep disturbance, intermittent confusion, memory problems, heart palpitations and diabetes. PLEASE HAVE AT LEAST ONE PERSON READ AND UNDERSTAND

---

For anyone who wishes to fight the installation of a Smart Meter on their home for medical reasons, I would like to share my own successful experience. I live in the San Diego area –most of us in California live very close to our neighbors homes, and unfortunately there is nothing to date we can do to stop installation of their meters. However, nothing in The Telecommunications Act of 1996 prohibits us from complaining about health when installing a Smart Meter on our own homes. A “Smart Meter” is NOT a “wireless facility” [thus exempted from health concerns] and many of us will be/are being harmed by the unwelcome radiation in our homes. Do not let your electric company tell you otherwise. Tell them to very carefully read Section 704 of The Telecommunications Act of 1996 and ask how they would define a Smart Meter as a wireless facility – i.e. are cell phones wireless facilities? Of course not. It defies logic. But be prepared, because that excuse may be attempted by your electric company. SDG&E tried it –unsuccessfully. Bottom Line: You do have a right to complain about health concerns, but be prepared to offer solid proof by way of a physician's documentation.

When I heard SDG&E was going to install Smart Meters in Rancho Santa Fe, CA I did the following to prevent installation of a Smart Meter on my home.:1) I called and followed-up in writing with SDG&E corporate office,informing them that I had a heart condition that could be adversely affected by RF radiation. Anyone who is known to be electro-sensitive should have the same rights as those of us who have heart-related issues.

2) I got a letter from my cardiologist explaining that RF radiation has been known to alter heart rhythms. (But first I had to educate my cardiologist as to what a Smart Meter is and does. I am attaching two documents I took to my cardiologist.)

\* Int Arch Occup Environ Health. 1997 ;70 (1):9-21 9258703

<<http://lib.bioinfo.pl/pmid:9258703>> Exposure to extremely-low-frequency electromagnetic fields and radiofrequency radiation: cardiovascular effects in humans. [My paper] <<http://lib.bioinfo.pl/auth:Jauchem.JR>> J R Jauchem

\* The 2002 letter from Norbert Hankin of the US Environmental Protection Agency to Janet New of (then) The EMR Network [she is now head of the EMR Policy Institute]. [My paper]Norbert Hankin’s revealing letter indicates standards set by the US government in 1996 do not apply to non-thermal effects of RF radiation. In other words, we are not living in a world of protection; the non-thermal effects of RF radiation were not taken into account when the regulations were established. “Safety standards” were never set. “Safety” is a false assumption.

3) I made an appointment to see Gunnar Heuser, MD, PhD., in the Los Angeles area. Dr. Heuser has long specialized in neuro-toxicology and is widely recognized as an one of the top medical experts in this arena. Dr. Heuser can objectively test a patient to document electro-sensitivity, and if they are found to be electro-sensitive, he can write a medial report that can unequivocally state one’ s health may be harmed by exposure to RF

radiation from a Smart Meter. I fell into this electro-sensitive category,  
as have many others. Dr. Heuser is seeing more and more patients adversely  
affected by Smart Meters. He can be reached at: (310) 500-0041. Dr. Heuser's address:  
P. O. Box 2730, Agoura Hills, CA 91376.

4) I then sent letters from my cardiologist and Dr. Heuser to SDG&E's  
corporate office. I told them they could not place a Smart Meter on my home  
due to health concerns. Additionally, I stated I would hold SDG&E legally  
responsible if my health was further impaired by a Smart Meter.

5) The result? SDG&E did not install a Smart Meter on my home.

Susan Foster

Rancho Santa Fe CA

January 4, 2010

Ms. Susan Crane

Director, Meter to Bill Process

We Energies

231 W. Michigan Street

Milwaukee, WI 53203

[susan.crane@we-energies.com](mailto:susan.crane@we-energies.com)

Dear Ms. Crane:

My patients, Shivani Arjuna and her husband Dan Small, have asked me to write to you with regard to  
how Shivani is affected by exposure to communication frequencies and "dirty electricity"

frequencies. They are deeply concerned that placement of one of We Energies' new, radio-broadcasting  
meters on their property would be harmful to their health, especially to Shivani's. I share their concern.

People who are aware of experiencing symptoms as soon as they are exposed to radio (RF) and microwave (MW) frequencies are currently termed “electrically hypersensitive,”

or EHS. Shivani is electrically hypersensitive. However, these individuals are by no means the only people actually being affected by such exposure, as ample, rigorous research done over a period of several decades shows chronic exposure causes health damage to people who note no immediate symptoms. Please see, for example, the bibliography of reported biological phenomena associated with radio-frequency and microwave radiation compiled by the US Navy Medical Research Institute in 1971, with over 2,000 references.,

at: [www.dtic.mil/cgibin/GetTRDoc?AD=AD750271&Location=U2&doc=GetTRDoc.pdf](http://www.dtic.mil/cgibin/GetTRDoc?AD=AD750271&Location=U2&doc=GetTRDoc.pdf). Also, please see the summary of EMF effects at: [www.icswebsite.com/emf/emfissues.html](http://www.icswebsite.com/emf/emfissues.html) with 62 more recent references.

The immense proliferation of wireless technologies in the past few years has given rise to health problems that cannot be successfully treated medically, as medicine cannot remove the underlying cause, the exposure to radiation.

Safety regulations of various nations vary widely regarding what level of exposure is supposedly safe. Unfortunately, most countries’ regulations are still based on the old, inaccurate assumption that non-ionizing radiation is not harmful unless it actually heats body tissues. The fact that a given technology adheres to the present standards is meaningless in terms of its actual biological effects. Even an EPA spokesperson has stated that present U.S. standards are not protecting citizens from harmful radiation. Research shows harmful effects at levels far below what is presently allowed.

Years of research also reveal a broad range of symptoms and diseases caused by RF exposure. This is hardly surprising, as the human body functions electrically from the cellular level on. Attached you will find a list of conditions caused by exposure to RF and therefore termed “radio wave sickness.”

There are probably more mechanisms underlying the damage done to health by manmade electromagnetic frequencies than we are presently aware of. (To date, the mechanism by which smoking tobacco causes cancer is unknown.)

However, here is brief information regarding a few known mechanisms:

- o It is established from multiple, independent studies that EMR from ELF to RF/MW reduces melatonin in animals and human beings. Melatonin is not only vital for healthy sleep, it is the most potent, naturally produced antioxidant that helps to protect cells from genetic damage that leads to cancer, neurological, cardiac and reproductive damage, illness and death.

- o Exposure to intensities and field strengths that are extremely low cause a biological effect called calcium ion efflux. Calcium ion alteration of cells by EMR is linked to neurological degeneration, to cancer and many other health effects. The heart is also an electromagnetic organ, with an electric pulse initiating a cascade of calcium ions that cause the cells in the heart to contract and produce a heartbeat. Exogenous electromagnetic signals can interfere with this regular, electrical pulse leading to heart disease and heart attack of the arrhythmic kind.

o Physiological changes that are bedrock indicators of allergic response and inflammatory conditions that are stimulated by EMF exposures include: overreaction of the immune system; morphological alterations of immune cells; profound increases in mast cells in the upper skin layers, increased degranulation of mast cells and larger size of mast cells in EHS individuals; presence of biological markers for inflammation that are sensitive to EMF exposure at non-thermal levels; changes in lymphocyte viability; decreased count of NK cells; decreased count of T-lymphocytes; negative effects on pregnancy (uteroplacental circulatory disturbances and placental dysfunction); suppressed or impaired immune function; and inflammatory responses that can result in cellular, tissue and organ damage if exposure occurs on a continuing basis over time. Mast cells are also found in the brain and heart, and this might account for some of the other symptoms commonly reported: headache, sensitivity to light, arrhythmias and other cardiac symptoms.

o Many studies have shown that RF/MW radiation and ELF fields cause increased DNA strand breakage and chromosome aberrations.

As was concluded by the authors of the Bioinitiative Report ([www.bioinitiative.org](http://www.bioinitiative.org)), it is unwise from a public health perspective to continue “business-as-usual,”

deploying new technologies that increase RF exposures, particularly involuntary exposures.

Any company or industry whose products or operational methodologies cause involuntary exposure to RF radiation would do well to become more informed about these and other effects of such exposure, both to protect the public and to protect themselves from future liability suits.

Though it is no longer possible in today’s world to completely avoid exposure to communications frequencies, EHS individuals such as Shivani, need to live in a personal environment as clear of RF/MW as possible. This is recognized in Sweden, where the government creates safe working and living spaces for such individuals. In the U.S., EHS individuals have to do what they can to create their own safe living spaces. Certainly, these safe havens, on their own property, should not be denied them.

I have been Shivani Arjuna’s physician since 2002 and have noted how her specific symptoms and overall health have corresponded directly to her exposure to RF/MW radiation. Initially, she was experiencing incapacitating and life-threatening symptoms related to such exposure. At present, she is able to remain free of RF/MW exposure-induced symptoms as long as she remains in the safe home space that she and her husband have gone to considerable effort and expense to create. That she remains EHS is clear from how she responds to exposures when not in that safe environment.

It is my opinion that the placement of an RF-broadcasting device connected to the wiring on this property would be extremely detrimental to Shivani’s health and that it must not be allowed.

Such a device connected to their wiring, whether at or away from their house, would cause RF to be broadcast from the wiring throughout their home. I suggest the alternative of asking them to take regular meter readings from their present meter and call or mail these to you, with a We Energies employee checking the meter annually or semi-annually to ensure accuracy.

I look forward to your response and hope you will agree to this solution to ensure that Shivani’s health be respected and protected.

Sincerely,

Roy D. Ozanne, MD, HMD

[November 4, 2010 at 11:49 pm](#)

This is so weird reading these comments. I just moved to Fairfield, CA from Oklahoma and have never heard of this smart meter. Ever since I moved here I noticed weird things happening in my chest. The tightness and palpitations that other people are talking about are exactly what I am experiencing too. It isn't real painful or anything but just worried me since I thought I may be having heart problems...at 25 years old! I've only been here a little over a month and definately noticed something weird way before I even heard about these smart meters or issues anyone was having. Being an electrical engineering major I see what PG&E is saying about it being a very small wattage and how it shouldn't affect anything but something about this new house I moved into is causing something to go on in my body. I Looked outside and I do have a smart meter attached to my house. I'm not really taking sides or anything on this debate of weather it's the smart meter or something else but I do know that there is something weird/different about California that seems to be affecting my health...I just hope it's not something permanent.

[December 17, 2010 at 6:46 pm](#)

Since I had the SmartMeter placed on my home (master bedroom wall by headboard of my bed) involuntarily by SDG&E about 3-4 months ago, I have developed increasingly severe reactions to EMF (electromagnetic fields). I have constant ringing in my ears, getting louder and very distracting; headache, sinus pain, feeling of heaviness in chest, disorientation, mental confusion, difficulty concentrating and with calculation and driving, nausea, and very hard to use computer, phones, etc. Can't sleep well, insomnia, though improved with change of bedroom. My doctor wrote a letter demanding under the ADA that SDG&E remove the SmartMeter, the reply was that SM's don't impact health, my doctor is wrong that the ADA covers this, and they essentially refuse to remove the SM. Needless to say, I am shocked, horrified, and will take further steps. This is an example of Big Brother in our lives worse than anything I have seen in America in 60 years. They can harm and kill us legally now, in our own country. This is an outrage.

3. **SG** says:

[December 28, 2010 at 9:45 pm](#)

SDGE just replied to my letter to them (Ted Reguly is the head of the Dumb Meter program) and they told me also that it was too bad and ADA does not apply. They said I should write a letter to CPUC if I feel like it. They are sending the same form letter to everyone. I would love to see a class action suit against these creeps.

Sent from Dr. Tobin Watkinson:

The government FCC PUC WHO etc have allowed technology with lots of money to influence the importance of caution when it comes to the health of those who have to live decisions. People are as different as grains of sand or snow flakes everyone is unique. Our chemistry our audition our speech our electronics. The human body is a series of electrochemical reactions which drive it's function. For anyone to think this organic battery of a body of ours can sit aside a strong (as compared to the body)artificial electrical field without effect or some perception even on a cellular level has a "short"between their ears. Our health and the health of everyone depends on our understanding of these basic physiological principles and progress that is not blinded by profit.

Each and every one of us is at risk and must speak out for our rights to have a voice when inappropriate choices are imposed upon us without our consent.

5. **Sandi** says:

[January 16, 2011 at 10:38 am](#)

Sent from Cynthia Perkins:

Open Letter to Southern California Edison and CPUC

On Thursday, January 6th, I called Southern California Edison to inform you I do not want a Smart Meter installed at my residence.

I am disabled with several health conditions that will be adversely affected by the installation of the Smart Meter.

I have very weak adrenal glands that don't produce enough Cortisol. The combination of EMF/RF in the Smart Meters is known to be very damaging to the adrenal glands. The stress from this type of exposure could push me into Addison's disease and possibly result in death.

I have chronic migraines, which could be magnified with the EMF/FM exposure.

I also have EMF sensitivity. EMF sensitivity is an illness caused by exposure to radiation that is discharged from a variety of sources like cell phones, microwaves, cell phone towers, etc. When I am exposed to certain levels of EMF, I experience migraines, heart palpitations, trembling,

weakness, hot flashes, increased pulse, pain in my gastrointestinal system, dizziness, inability to concentrate, impaired cognitive functioning and hyper-arousal. I do not even own a cell phone, because I'm incapable of using one.

When I called your office, I was met with hostility, confrontation, intimidation and a complete lack of regard for my position. I was told that I had no choice in the matter and if I do not comply my electricity will be shut off.

Therefore, if a Smart Meter is installed at my home, I will hold you, Corix and the CPUC legally responsible for any and all impairments in my health and consider the following possible charges:

#### Assault

I have informed you that installation of a Smart Meter will cause me bodily harm and puts my life at risk. If you install a Smart Meter, I will consider this assault and will file charges accordingly.

#### Manslaughter or Wrongful Death

If I die, then we're talking about manslaughter or wrongful death.

#### Medical Expenses

If you install a Smart Meter, I will hold you legally responsible for all medical expenses incurred by the Smart Meter to my health.

#### Trespassing

If you, Corix or anyone on your behalf comes on my property to install a Smart Meter, I will have you arrested for trespassing.

#### Invasion and Violation of Rights

Last, but not least. This entire procedure is unconstitutional. It is an invasion and violation of my rights. You should not have the right to bathe me with environmental toxins without my permission. You should not have the right to alter my home in any manner without my permission.

I am not willing to play Russian roulette with my life and you should not be permitted to do so either. As someone who lives with five disabling chronic health conditions, there is not room in my life for more suffering that may result from the Smart Meter. You should not have the right to violate and intrude upon what I must do to protect my health.

I should have the right to have electricity service without being forced to put my life and health in danger. I will take any and all measures available to me to be heard on this issue in my community and across the country including the media and the Internet.

For starters, I am using my website which gets more than 70,000 visitors a month, to broadcast all that transpires between me, the CPUC, Corix and Southern California Edison, including your threat to turn off my electricity and your hostile and lackadaisical attitude towards the concerns and rights of the citizens. I will also use Facebook and Twitter. You may want to take a look at the following page on my blog, which I will be updating throughout this process:

<http://www.holistichelp.net/blog/smart-meters-are-hazardous-to-your-health-and-violate-your-rights/>

I am in the process of contacting ABC news, CBS news, NBC news, all the local newspapers, the Internet Radio shows, legislators, City Council, President Obama and anyone else who is willing to listen about your lack of concern for our rights and the threat to turn off my electricity — a woman who is disabled with five chronic health conditions. The lack of electricity would leave me without heat in the middle of winter, not to mention the inability to cook etc.

So, once again, this letter is to inform you that I oppose the installation of a wireless SmartGrid meter at my home. I do not want to be exposed to the wireless radiofrequency/microwave radiation from the meter, the security and hacking risks, the potential fire hazard from the meter, or the electromagnetic interference with electronics and medical devices, the invasion of privacy – nor do I want any more cell antennas in my neighborhood.

I will not opt-in to the Southern California Edison Company program by installing power transmitters inside my home on my home appliances, to report energy usage to SCE. The California Public Utilities Commission should require SCE to conduct additional economic studies that take into account various percentages of people who will NOT join this program. SCE has stated that its current ‘base case’ requires compliance by the public in placing radiofrequency radiation transmitters inside their homes. SCE says the SmartGrid project will cost \$1.6 billion dollars of ratepayer money (for 5 million new wireless meters). This is a waste of ratepayer money if people decline to participate due to health and safety or trespass reasons.

Therefore, I am requesting that you do not shut off my electricity and continue to provide me service with the meter that is currently installed at my residence.

If you do not want to send out a meter reader to read my meter, I will be happy to take a picture of my meter every month and send it to you.

I repeat, I do not consent to the installation of a Smart Meter at the address listed below. Corix, or anyone acting on your behalf does not have my permission to install a Smart Meter at the address listed below.

I would appreciate hearing from you on this matter promptly, as deployment begins on January 18th in my neighborhood.

Sincerely,  
Cynthia Perkins, M.Ed.

It's unconscionable that so many stories are coming in and from everywhere and NOTHING is being done. It's like we've been invaded by creatures bent on destroying us. It's worse than any science fiction movie I can conjure. This has to stop. It has to stop now. This is genocide. They're going to reduce the population to a sick, confused mush puddle and then walk them off the cliff.

moving to CA and concerned about the smart meters. And since I had brain surgery a year ago I get really bad headaches. Worried the EMF's from the Smart meters will cause head aches

8. **Valerie** says:

[May 31, 2011 at 7:23 am](#)

I was wondering does anybody know if these devices have an effect on Patients with pacemakers or even effect the pacemaker itself? I hear that Australia is getting these so called smart meters & my husband has a Gaurdiant pacemaker with 3 leads & already suffers from Tinnitus without a smart meter & I have heart issues as well & our Electrical box is on the outside of our bedroom wall with our bedhead against this wall & cannot be placed any other way in the room due to the design of the room (built in wardrobes & ensuite & large window).

I live in a 472 sf small studio, there are 7 smart meters outside the wall of my bed. PG&E installed about a year ago, I recently am dying from the terrible headaches, woke up many times at night , with also very loud ring deep in my ear, consistently ring in my ear !!! I want to throw up all the time, very very tired, do not want to do anything, bad memory, I cannot believe I start to feel my heart is beating so heavy painful and just struggled to make it going. I went to see the doctor, I was told to move out of this room far away from smart meter as soon as possible. I contacted with PG&E, they told me that those killer smart meters are not going to be removed no matter what, PG&E is murder !!!! we need to do something about it in Government to get rid off this killer smart meter !!! I do not want smart meter damage my 6 years old child's brain or any part of our body, please stand up to protect our own life !!! I live in los Gatos, Santa Clara , Ca. thank you for reading and need help !!!

[June 15, 2011 at 2:17 pm](#)

I have been having increased symptoms over the past few years since a Smart Meter was installed. I did allow it but didn't know then about the health risks, and it's located just outside out bedroom window. I have tinnitus, heart palpitations, many aches and pains that I never had before. I keep going to the doctor's office spending money on trying to feel well, but to no avail. I wish I could find out if we can have it removed.

12. **S. G.** says:

[June 29, 2011 at 2:18 am](#)

Thank you. This has finally answered my questions. A smart meter was placed on our house April 25. I have been having chest pains, joint pains, rashes, horrible piercing headaches, nausea, very heavy menstrual cycles for two months, decreased mental capacity and increased sensitivity to emf's. I have been trying to get Florida Power and Light to help me figure out why I have been having surges on my gauss meter. I feel sorry for all of the Florida residents who are having symptoms and don't know why.

13. **Bill Beckham** says:

[July 2, 2011 at 1:38 am](#)

I live in Fresno, CA and ever since a Smartmeter was installed in our home, I have had trouble sleeping at night. Recently, even my wife has had trouble sleeping. The Smartmeter is installed on the wall outside of our bedroom and moving to a new room is not an option. PG&E says that they will change it back at a large cost and monthly fee.

14. **Robert Leverant** says:

[July 3, 2011 at 5:53 pm](#)

Reading these testimonies, amplify my concerns about smart meter installation on my house, my neighbor's house (which faces my house), and the houses on our street. It is unconscionable that by stealth and power tripping (pun intended) that PG& E can install these toxic devices & get away with mental, physical and emotional abuse of psyche and soma of their customers/citizens in California, U.S.A. I'm glad to see that in some instances, due to the timeliness and cogency of a complaint, that some smart meters were removed and the analogue meters reinstalled. This gives me hope.

15. **Holly Manion** says:

[July 3, 2011 at 6:00 pm](#)

Please, if possible move your bed away from the wall where the smart meters are installed. My friend, John, experienced ringing in his ears when the smart meter was installed on his house. He made a temporary shield for the RF radiation with HEAVY DUTY foil from the supermarket and a grounding wire. He now uses a more permanent solution which reduces the radiation from the smart meter. As a result the ringing in his ears is gone!

You then need to expose one end of the wire about two inches, and tape this to the wall. Here is the IMPORTANT part. The wire needs to be grounded. Run it out the window and attach to a water pipe coming out from the ground, or you will need to get a copper grounding pipe (at Home Depot). Attach the other end of the wire to this copper pipe (that is pounded as far as you can into the ground). This should reduce the majority of the EMF's coming into your home.

16. **John** says:

[July 15, 2011 at 7:29 pm](#)

I have read the symptoms, odd enough it was in 2009 that I have experienced vertigo, and balance problems when the Smart Meter came. With all these 'claims' like what I have, there must be some medical research to back it up as well proof. The EMF meter's on the Ghosthunter's show could detect some form of waves coming from the Meter's. Anythought to this?

17. **JAR** says:

[July 17, 2011 at 10:00 am](#)

It's a shame that reading all these complaints has the effect of summoning up the thought, "These people are nuts." Well, count me in, then.

Central Maine Power did not perform due diligence in alerting people that the meters were to be installed. When installation began in my neighborhood, two weeks ago, exactly two weeks ago, I began experiencing what I can only call a short-circuiting of synapses or something — spasms — which spread across my chest into my arms and legs. Szit szit szit — but intermittently throughout the day and night. These have now largely stopped, but my tinnitus is horrible, and I am not doing anything to exacerbate it.

I don't know whether these effects are due to the Smart Meter installation or not. Perhaps I am having sudden cardiac/neurological problems. But what if my symptoms ARE caused by the emfs? The doctor who I will see in a week, would not cotton, I am certain, to my even posing the question. He will say I am nuts.

I say – in the absence of any scientific evidence for my symptoms, one must consider alternative explanations; in this case – the Smart Meter installations.

Note that I had no idea the Smart Meters were being installed, so, at least, this is not a case of psychosomatic inducement of symptoms. Is there a physicist in the house?

PS The dog has been barking wildly – a completely new behavior for this normally plain ol' dog.

18. **JAR** says:

[July 17, 2011 at 10:03 am](#)

One more thing: my pulse rate, always in the upper range, around 90 bpm, has dropped like a stone. No, as yet known medical explanation for that either. Hate feeling like a nut.

19. **Donna Avent** says:

[July 19, 2011 at 12:26 am](#)

Smart meter make me dizzy and can't think straight. My mind lot of confuse because of radiation by smart meter. I did tell CPUC about restore analog but CPUC did not listen me many times.

20. **Mia Nony** says:

[July 22, 2011 at 11:13 pm](#)

Anyone else here know about Graham Stetzer filters? They are an antidote. They also sell the frequency reading meter which will read your induced electromagnetic levels in the home. The filters are used in the electric outlets in the house to clean up dirty electricity from the smart meter and otherwise. This also means the smart meter stops using your house wiring as a transmission antenna and stops using you as a transmission receiver.

As for physical well being, at least one antidote to ANY radiation exposure and for DNA repair is to take sea vegetables daily.

21. **Mia Nony** says:

[July 23, 2011 at 12:03 am](#)

All of these symptoms are very real. These frequencies slowly cook the human body. Literally. Hence the need to practice self protection daily.

The effect is called the "heat effect". Depolarization of nerve and muscle occur as a result.

In Canada it is illegal to allow any frequency to excite or stimulate body tissues. And yet Health

Canada ignores their own laws. In reality smart meters are illegal.

So is any wireless device or even the wired meters, since those have a special device called a Supply Mode Power Switch or SMPS which – wait for it – protects the meter from 240 high voltage but exposes the human inside the building to radically spiking high voltage in the process, up to 50,000 Giga hertz a spike.

The way I see it? If this is illegal in my country according to Canadian health laws, then if and when this comes to my home I intend to fully and completely wrap the meter in heavy aluminium turkey plates and to hold it in place with duct tape which suppresses the transmission which in turn converts the transmission of the meter from frequency into heat, just like any microwave oven does, and which in turn fries the meter.

I don't know how to use a chainsaw or I would use this but I do very much admire anyone who refuses to accept this illegal surveillance device. I feel exactly this way – or I would maybe use a sledge hammer. Same goes for the smart meter boosters on utility poles in the rural areas as target practice. Call this sedition but who is the illegal one in this picture? The utility corporations, that's who. All of them. All at the same time doing this to all of us all over the globe. Who thought that up? The united Nations, that's who. Fake green microwave pollution. FIGHT BACK!

22. **Mia Nony** says:

[July 23, 2011 at 2:01 am](#)

**TAKING BACK THE POWER FROM THE “POWER” UTILITY:**

We are all essentially junkies, electricity addicts. Think of the power utility as the drug dealer who is counting on us to not ever think of ways to reduce the amount of electricity we have turned on all over the house at any given moment. We seldom think of ways to wean off the use of this electricity nor even think how to pare down what we do use to absolute essentials as needed. Right now every circuit and every wire in the average home is “on”, whether it is needed or not. Every circuit is “live” or “active” for the sake of “convenience”. But at what price? When all circuits are left “live” this turns the whole house into one giant transmission antenna for the smart meter to co-opt. Start to think about how much of this circuitry is truly essential for one's daily use. An electricity free bedroom is a good place to start. Okay here are some ideas friends have shared with me.

1) **LINE THE INTERIOR SURFACE BEHIND THE Smart Meter** ...with a large sheet of anything protective which deflects on one side and is coated on the other interior side so that it does not deflect into the home as well, and choose the shield according to its ability to create back scatter and to reflect radiation, be it specially metal threaded fabric or be it the kind of leaded glass used by x-ray techs or be it a large sheet of lead, or nickel. You can buy and use specially designed carbon paint for the entire interior wall area and even the exterior wall area for at least several yards in all directions behind the meter. Or maybe cover the whole interior area with copper backed wallpaper. Some metals are more effective than others. Aluminium is okay but not as strong at deflection as is copper, for instance. (Although if you were to turn on a cell phone and then wrap it totally in aluminium foil it would eventually turn into heat and fry itself.).

There are also smart meter metal collars and box shields for sale on the net. Truth be told, I am not

sure how much they reduce emissions but I think the idea is to direct the frequency and to narrow its beam.

In any case the general idea is to accomplish the same thing with this purchase of a smart meter shield kit approach or with DIY for this: Wrap a snug metal collar or aluminium wrap around the entire circumference of the smart meter and then box it in on all sides except the face with what ever will deflect or suppress the frequencies, hopefully not toward anyone else's property. This is one approach for those who do not want to be liable for actual damage to the smart meter or who prefer not to wrap it up to suffocate the frequency and shut it down for good.

Whatever you use on the interior wall behind where the meter is installed, do some research on the best materials first.

Make it a VERY LARGE SHEET.

Smart meters have a large field. Visualize them as a giant lightbulb and visualize the field as the light from it.

Better yet also add EMF absorption material on the interior side of the lead or other metal sheet or carbon paint surface which you install on the interior wall shared by the meter. Or you might also try to obtain Carboshield from Germany which actually extinguishes radiation and is used to prevent espionage or hacking. .

Be careful not to operate EMF emission items indoors anywhere at all near the smart meter interior shielding material or that same shield, if it has no absorption layer on it, will tend to also reflect or enhance the emissions from items in your home. Remember all electricity has a field. Same goes for stainless steel appliances which bounce EMFs from other wireless devices in the home.

2) YOUR CIRCUIT BOX IS YOURS. Use this fact to your advantage.

Diagnose every circuit. Then turn off every single circuit that is not absolutely essential to your daily use. Fridge and freezer is all you really need except when cooking and one back up plan is to consider a propane outdoor two burner cookstove and or a BBQ with an oven area, for that. Switch to gas or wood heat where ever possible. Turn your hot water heater on only for a while in advance of when absolutely needed. Turn off all appliances including washer and dryer at the circuit box. Especially turn off any newer appliances which radiate 24/7 and which "talk" to the meter. For bathing try one hour max to heat the hot water tank for a shower, then turn it back off for the rest of the time, by using the HW tank like an on demand heater, and then leave it off at the circuit box the rest of the time. Turn off all bedroom circuits and use only LED battery operated "puck" lights everywhere possible. Filter any and all remaining live circuits with the Graham Stetzer filters to neutralize dirty electricity in any live circuits.

3) Notify the utility that you hereby refuse to allow any surveillance device or wiretapping device to be installed or to remain on your home. It is illegal to monitor your activities. Warn them that you know this.

Go to Youtube and put the name " Jerry Day" or" Smart Meters" into the Youtube search bar. Then listen to what this savvy electronics guy has to say, so straightforward and uplifting and practical advice. Then use the form letter he provides below the video and personalize it, add your account number and address and send it by registered mail with a certified arrangement and a double signature assurance of acceptance, making certain to send it to the head or CEO top management person of the utility company for your area.

[July 23, 2011 at 2:16 am](#)

Robert Baan a, Yann Grosse a, Béatrice Lauby-Secretan a, Fatiha El Ghissassi a, Véronique Bouvard a, Lamia Benbrahim-Tallaa a, Neela Guha a, Farhad Islami a, Laurent Galichet a, Kurt Straif a, on behalf of the WHO International Agency for Research on Cancer Monograph Working Group

In May, 2011, 30 scientists from 14 countries met at the International Agency for Research on Cancer (IARC) in Lyon, France, to assess the carcinogenicity of radiofrequency electromagnetic fields (RF-EMF). These assessments will be published as Volume 102 of the IARC Monographs.<sup>1</sup>

Human exposures to RF-EMF (frequency range 30 kHz—300 GHz) can occur from use of personal devices (eg, mobile telephones, cordless phones, Bluetooth, and amateur radios), from occupational sources (eg, high-frequency dielectric and induction heaters, and high-powered pulsed radars), and from environmental sources such as mobile-phone base stations, broadcast antennas, and medical applications. For workers, most exposure to RF-EMF comes from near-field sources, whereas the general population receives the highest exposure from transmitters close to the body, such as handheld devices like mobile telephones.

Exposure to high-power sources at work might involve higher cumulative RF energy deposited into the body than exposure to mobile phones, but the local energy deposited in the brain is generally less. Typical exposures to the brain from rooftop or tower-mounted mobile-phone base stations and from TV and radio stations are several orders of magnitude lower than those from global system for mobile communications (GSM) handsets. The average exposure from use of digital enhanced cordless telecommunications (DECT) phones is around five times lower than that measured for GSM phones, and third-generation (3G) phones emit, on average, about 100 times less RF energy than GSM phones, when signals are strong.

Similarly, the average output power of Bluetooth wireless hands-free kits is estimated to be around 100 times lower than that of mobile phones.

EMFs generated by RF sources couple with the body, resulting in induced electric and magnetic fields and associated currents inside tissues. The most important factors that determine the induced fields are the distance of the source from the body and the output power level.

Additionally, the efficiency of coupling and resulting field distribution inside the body strongly depend on the frequency, polarisation, and direction of wave incidence on the body, and anatomical features of the exposed person, including height, body-mass index, posture, and dielectric properties of the tissues.

Induced fields within the body are highly non-uniform, varying over several orders of magnitude, with local hotspots.

Holding a mobile phone to the ear to make a voice call can result in high specific RF energy absorption-rate (SAR) values in the brain, depending on the design and position of the phone and its antenna in relation to the head, how the phone is held, the anatomy of the head, and the quality of the link between the base station and phone.

When used by children, the average RF energy deposition is two times higher in the brain and up to ten times higher in the bone marrow of the skull, compared with mobile phone use by adults.<sup>2</sup> Use of hands-free kits lowers exposure to the brain to below 10% of the exposure from use at the ear, but it might increase exposure to other parts of the body.<sup>3</sup>

Epidemiological evidence for an association between RF-EMF and cancer comes from cohort, case-control, and time-trend studies. The populations in these studies were exposed to RF-EMF in occupational settings, from sources in the general environment, and from use of wireless (mobile and cordless) telephones, which is the most extensively studied exposure source. One cohort study<sup>4</sup> and five case-control studies<sup>5–9</sup> were judged by the Working Group to offer potentially useful information regarding associations between use of wireless phones and glioma.

The cohort study<sup>4</sup> included 257 cases of glioma among 420 095 subscribers to two Danish mobile phone companies between 1982 and 1995. Glioma incidence was near the national average for the subscribers. In this study, reliance on subscription to a mobile phone provider, as a surrogate for mobile phone use, could have resulted in considerable misclassification in exposure assessment.

Three early case-control studies<sup>5–7</sup> encompassed a period when mobile phone use was low, users typically had low cumulative exposures, time since first use of a mobile phone was short, and effect estimates were generally imprecise; the Working Group considered these studies less informative.

Time-trend analyses did not show an increased rate of brain tumours after the increase in mobile phone use. However, these studies have substantial limitations because most of the analyses examined trends until the early 2000s only. Such analyses are uninformative if excess risk only manifests more than a decade after phone use begins, or if phone use only affects a small proportion of cases—eg, the most heavily exposed, or a subset of brain tumours.

The INTERPHONE study,<sup>8</sup> a multicentre case-control study, is the largest investigation so far of mobile phone use and brain tumours, including glioma, acoustic neuroma, and meningioma. The pooled analysis included 2708 glioma cases and 2972 controls (participation rates 64% and 53%, respectively). Comparing those who ever used mobile phones with those who never did yielded an odds ratio (OR) of 0.81 (95% CI 0.70–0.94). In terms of cumulative call time, ORs were uniformly below or close to unity for all deciles of exposure except the highest decile (>1640 h of use), for which the OR for glioma was 1.40 (95% CI 1.03–1.89). There was suggestion of an increased risk for ipsilateral exposure (on the same side of the head as the tumour) and for tumours in the temporal lobe, where RF exposure is highest.

Associations between glioma and cumulative specific energy absorbed at the tumour location were examined in a subset of 553 cases that had estimated RF doses.<sup>10</sup> The OR for glioma increased

with increasing RF dose for exposures 7 years or more before diagnosis, whereas there was no association with estimated dose for exposures less than 7 years before diagnosis.

A Swedish research group did a pooled analysis of two very similar studies of associations between mobile and cordless phone use and glioma, acoustic neuroma, and meningioma.<sup>9</sup>

The analysis included 1148 glioma cases (ascertained 1997—2003) and 2438 controls, obtained through cancer and population registries, respectively. Self-administered mailed questionnaires were followed by telephone interviews to obtain information on the exposures and covariates of interest, including use of mobile and cordless phones (response rates 85% and 84%, respectively). Participants who had used a mobile phone for more than 1 year had an OR for glioma of 1.3 (95% CI 1.1—1.6). The OR increased with increasing time since first use and with total call time, reaching 3.2 (2.0—5.1) for more than 2000 h of use. Ipsilateral use of the mobile phone was associated with higher risk. Similar findings were reported for use of cordless phones.

Although both the INTERPHONE study and the Swedish pooled analysis are susceptible to bias—due to recall error and selection for participation—the Working Group concluded that the findings could not be dismissed as reflecting bias alone, and that a causal interpretation between mobile phone RF-EMF exposure and glioma is possible. A similar conclusion was drawn from these two studies for acoustic neuroma, although the case numbers were substantially smaller than for glioma. Additionally, a study from Japan<sup>11</sup> found some evidence of an increased risk for acoustic neuroma associated with ipsilateral mobile phone use.

For meningioma, parotid-gland tumours, leukaemia, lymphoma, and other tumour types, the Working Group found the available evidence insufficient to reach a conclusion on the potential association with mobile phone use.

Epidemiological studies of individuals with potential occupational exposure to RF-EMF have investigated brain tumours, leukaemia, lymphoma, and other types of malignancy including uveal melanoma, and cancers of the testis, breast, lung, and skin.

The Working Group noted that the studies had methodological limitations and the results were inconsistent. In reviewing studies that addressed the possible association between environmental exposure to RF-EMF and cancer, the Working Group found the available evidence insufficient for any conclusion.

The Working Group concluded that there is “limited evidence in humans” for the carcinogenicity of RF-EMF, based on positive associations between glioma and acoustic neuroma and exposure to RF-EMF from wireless phones.

A few members of the Working Group considered the current evidence in humans “inadequate”. In their opinion there was inconsistency between the two case-control studies and a lack of an exposure-response relationship in the INTERPHONE study results; no increase in rates of glioma or acoustic neuroma was seen in the Danish cohort study,<sup>4</sup> and up to now, reported time trends in incidence rates of glioma have not shown a parallel to temporal trends in mobile phone use.

The Working Group reviewed more than 40 studies that assessed the carcinogenicity of RF-EMF in rodents, including seven 2-year cancer bioassays. Exposures included 2450 MHz RF-EMF and various RF-EMF that simulated emissions from mobile phones. None of the chronic bioassays showed an increased incidence of any tumour type in tissues or organs of animals exposed to RF-EMF for 2 years. An increased total number of malignant tumours was found in RF-EMF-exposed animals in one of the seven chronic bioassays. Increased cancer incidence in exposed animals was noted in two of 12 studies with tumour-prone animals<sup>12, 13</sup> and in one of 18 studies using initiation-promotion protocols.<sup>14</sup> Four of six co-carcinogenesis studies showed increased cancer incidence after exposure to RF-EMF in combination with a known carcinogen; however, the predictive value of this type of study for human cancer is unknown. Overall, the Working Group concluded that there is “limited evidence” in experimental animals for the carcinogenicity of RF-EMF.

The Working Group also reviewed many studies with endpoints relevant to mechanisms of carcinogenesis, including genotoxicity, effects on immune function, gene and protein expression, cell signalling, oxidative stress, and apoptosis. Studies of the possible effects of RF-EMF on the blood-brain barrier and on a variety of effects in the brain were also considered. Although there was evidence of an effect of RF-EMF on some of these endpoints, the Working Group reached the overall conclusion that these results provided only weak mechanistic evidence relevant to RF-EMF-induced cancer in humans.

In view of the limited evidence in humans and in experimental animals, the Working Group classified RF-EMF as “possibly carcinogenic to humans” (Group 2B). This evaluation was supported by a large majority of Working Group members

Don't wait for local or state laws to protect you Head straight to the top.  
Smart meters are illegal.

Health Canada laws use Safety Code Six – (which, please note, is absolutely no different than the same Code used for all countries including the USA, as these are the international code standards of safety).

International Health Law, as well as the version for Canada in Safety Code Six law, states that any wireless device with incompatible frequencies capable of exciting human tissue and causing the “heat effect” are by ALL Health laws, Canadian ones and those everywhere, “to be avoided” Think about those implications legally!!  
Every single corporation connected with the manufacture and/or the installation of any wireless device is liable under the health laws of every democratic country.  
This means that smart meters are right now ILLEGAL, illegal according to every country's own health safety laws which state the same thing as Canadian law everywhere else.

Testimony has been given to our government by a man named Curtis Bennett to this effect.

I gather that it has been pointed out to the House of Commons in Ottawa, Canada in a Standing Committee that Health Canada has “omitted” by what they are politely calling an “error of omission” This means they have decided to disregard the law, and even since being notified officially Health Canada still has continued to overlook or ignore the link to causation from incompatible frequencies between biological beings and artificially generated EMFs. This is a key legal clause of their own laws and Health Canada has also as good as suspended the procedural use of the “weight of evidence” requirement in the study of incompatibility of frequencies between biological entities and wireless devices.

Note that Health Canada only did so for this sole issue of wireless devices.

This means this must be the same for the USA.

And that means that while everyone is busy trying to demand that local ordinances upheld, the reality is that each local governmental body is answerable to each state and each state may or may not be individually answerable to the Feds. So at the Federal level, at least in Canada, the reality is that smart meters are in total violation of Federal health laws.

Busted?

There is a lawsuit in process in the US based on the same fact, that Health Canada is in violation of its own Federally mandated laws which are no different than those of the USA regarding prohibition of any risk of excitation and stimulation and resulting heat effect on human tissues from frequency conflict between these devices and the human body which has a frequency of about 7 to 7.5 hertz and which has absolutely no EMF shielding. Even a simple coaxial cable has shielding!

We have NONE!

25. **Mike** says:

[July 27, 2011 at 11:23 pm](#)

“My friend, John, experienced ringing in his ears when the smart meter was installed on his house. He made a temporary shield for the RF radiation with HEAVY DUTY foil from the supermarket and a grounding wire. He now uses a more permanent solution which reduces the radiation from the smart meter. As a result the ringing in his ears is gone!”

Does he wear a tinfoil hat too?

[August 27, 2011 at 6:27 pm](#)

Reading these comments goes to show what a negligent society we live in. I moved to a small country town after being maimed by a Government run hospital. The house we moved into had a small phone tower about a mile up a hill behind us but that was it. Within a year they built a much larger tower next to the old one and now I get pulsing through my ears while my head is on the pillow at night also ringing and sometimes deafness. This all started when the new tower was built. Then after looking through a spotting scope used for photography I saw in the distance a new phone tower has been built high on top of a hill whose antenna points directly to the one near us. We are right in the middle. This is consistent with all these symptoms happening to both myself and my friend who lives with me. We intend to sell up and move away as soon as possible as these phone towers are making us sick.

I just wanted to add something for the benefit of people who might read these reports and dismiss them as complaints from the "tin-foil hat" – or nutso – people.

You will find the "tin-foil set" to include people of all ages, from the left, right and middle, from every walk of life – artists, musicians, teachers, administrators, farmers, veterinarians, etc. Traditional medicine is behind the curve on this growing health disaster, and lumps people into other categories, mental and physical. This is just another form of environmental illness, and in time, will be accepted as such. In the meantime, please be kind and respectful of people with the condition. They are isolated enough without being labelled as "tin-foil nuts."

Thanks.

[September 23, 2011 at 5:16 pm](#)

Think about it.....is this just part of a huge eugenics operation? They take things we all need, Food (GMOs), Water (fluoride and all kinds of other pollutants), Air (chemtrails) and elec power, then go about their attack. Not to mention vaccines or prescription drugs! Can you imagine what this country will look like after everyone has the meters and all the supporting antennas and relay stations are in place? Talk about Zombie world. The way the people from companies and utilities who are raking in the gov. money for doing this boondoggle are absolutely denying the health effects is CRIMINAL and murderous. THEY don't care! I wonder how many of THEM would sleep in a room that was near a bank of 4-100 meters? Yeah, sure. And I thought I was pushed over the edge with being saturated with aerosol spraying containing God knows what! Time for thousands of us to bring lawsuits (small claims courts) against the people who are responsible for forcing this on us. The makers of the meters, utilities, PUCs, and state or local legislators!!!

I am 50- one small three pound dog died. I have headaches, dizziness, palpitations,scarey heart pains, blood clots, abnormal periods, tingling and itching of the scalp, facial pain, I feel like something is squeezing my entire body in to . It is awful I have fibromyalgia and arthritis before the meter, But now, I have worse, I fight everyday. It is awful. My husband has a hard time at night while asleep, and my grandchildren when in my home have terrible problems, even get wild at times. I do not know what to say or do. I have contacted my local electric company. I ask you to join me in prayer to get something accomplished. And for God to call an advocate to our defense, a strong advocate if they do not listen to us. I pray that it does not take another country taking is over, through the super naturalist of God Jehovah to stop them. They are destroying our temples. God is against this , very much so and as a Christian we all know this to be true. Please pray that America does the right thing, quickly all over the nation. My electric company told me we do not have a smart meter it is hooked through the electrical line that it is not wireless, same difference. Same cause and affect, I assure you. Please pray . I am praying with you.

34. **Paula Fighting for our lives** says:

[September 28, 2011 at 12:17 pm](#)

35. **dale sheridan** says:

[October 7, 2011 at 7:38 pm](#)

I was just getting mad at the insane increases to my PGE bill when I started looking at this site. I have been having really weird health problems for about a year now. Dry mouth, buzzing in my head.

I don't think about sex any more and I was beginning to think it was because I'm getting a little old but now I am just about convinced it's the radiation coming from the meter. It is less than 10 feet from my bed. I sleep upstairs and the meter is right below my window.

I need to get away from this thing and determine if these symptoms go away.

This just makes complete sense now. I need to get a meter and start a lawsuit.

36. **Betty Gustafson (Health/Fitness Coach)** says:

[October 11, 2011 at 1:10 pm](#)

Ever since the Smart Meter was installed in my home in California, I have experienced major interruption of my sleep....waking up several times during the night with feelings of agitation and unable to go back to sleep right away – sometimes I lay there for an hour or more – and sometimes I am so restless that I have to just get up!! (even if it's in the middle of the night).

I also, frequently experience tingling sensations in my lower legs through-out the day and night along with pulsating “siren-like” noises in my ears.

I never experienced any of these problems BEFORE the Smart Meter was installed. I always considered myself very fit and healthy, and could always sleep through-out the night!!!

37. **E.B. Myers** says:

[October 14, 2011 at 11:32 am](#)

They installed a smart meter yesterday. The first day they came out we refused it and asked them to leave. Two men returned the next day with the main supervisor. He told me all the info on the internet about smart meters was just lies and hype. I still refused the meter. The super told me I had 10 seconds to decide to have the meter installed or have the power shut off. He told me if I did not give them access to the back yard( where the old meter was located) they would cut power off at the pole and I had about 10 seconds to decide.

Are they (power companies) allowed to use this kind of coercion to achieve their agenda? I still do not want this meter and am fighting to have it removed ASAP.

38. **admin** says:

[October 14, 2011 at 1:36 pm](#)

Which utility company did this? No they are not allowed to use coercion like this. Contact TURN or UCAN if you live in So CA. File a formal complaint with the CPUC.

39. **smartmeter statistic 2011** says:

[October 18, 2011 at 10:40 am](#)

They installed these meters 2 months ago at my house (cincinnati, Ohio) and since then i have felt like i'm always sick. When i visit my parents in the next town i felt fine until last week. They started changing to smartmeters in my parents neighborhood and now i am experiencing the symptoms at their house also. These smartmeters are dangerous.

40. **Aphool Imnaught** says:

[October 21, 2011 at 4:14 pm](#)

RF/microwave radiation mitigation shielding is essential to protect your DNA and to avoid rapid onset of cognitive impairment.

Repair of DNA is also essential. Protect and repair yourselves

41. **Aphool Imnaught** says:

[October 21, 2011 at 4:28 pm](#)

Stop suffering needlessly and take care of the damage to your bodies, and then prevent further damage.

Spirulina & chlorella repair DNA. Hiroshima survivors who took these two items never got cancer. Stick to recommended dose and at first start with less.

Keep proof of all utility bills as paid up.

Carbon sheets can and do absorb and neutralize radiation. Bubble wrap insulation is a product with this stuff between two layers of foil, is easy to staple to an entire wall and deflects radiation. Staple it to the entire interior wall where the meter is located. Then, since there is no anti foil law, wrap the meter itself up totally with the foil insulation, as well.

Then put on the kettle for tea and calmly wait for the utility rep to show up.

They will.

Ignore what they say.

As soon as they leave then rewrap the meter with this special foil. One place to see pictures of the right kind is at [insulation4less.com](http://insulation4less.com)

42. **Kara** says:

[October 24, 2011 at 1:55 pm](#)

PLEASE CALL THE PUBLIC UTILITIES COMMISSION OF CA 1-800-649-7570 AND VOICE YOUR CONCERN. Our smart meter was installed today and I just called Edison to have them remove it. They said they can't do that. Once the new meter is installed they get rid of the old one. Of course that's bs on their part. I called the 3rd party vendor and they said they give the old

meter back to Edison. So what I learned is that we all need to call the Public Utilities Commission of CA and voice your concern. Use your voice. They are going to make a decision soon about what to do for the people who don't want their Smart Meters PLEASE CALL 1-800-649-7570.

43. **Larry Dunmire** says:

[October 29, 2011 at 2:54 pm](#)

The more I read of these MANY comments, the more I have realized that I'm not the only one, such as what the reps at Southern California Edison have attempted to convince me of. I have experienced dry mouth and intense headaches at night, and a racing heart, too. I'm wondering if EMF's also have an effect on the teeth and gums, as I've experienced serious bone-loss and dental problems since the installation of the Smart Meter in August 2010 upon my apartment. Of course, there's the unbearable tinnitus and vertigo upon arising from bed in early a.m. around 3, 4 or 5 a.m. On my leg, I've experienced sores near to where my computer modem rests on the floor.... Come on everyone, let's UNITE and form a group, locate a willing lawyer and class action sue the electrical utility companies ..... what do you say?? I have written the 60 Minutes television show and suggested they do produce an expose on this serious problem!!!! All the best to all of the electrosensitives out there!!!!!! Peace & sleep!!!!!!!

44. **Barbara Pries** says:

[November 3, 2011 at 8:23 am](#)

Before I knew any of this info., a SCE man came around and said that meters were changing and I just said ok for him to install the new one. I have tried to get it taken away and get the old one back, SCE said they couldn't do that. I have called and emailed and have not received a response.

[November 4, 2011 at 6:35 pm](#)

I am so relieved to have found this site. Im here in Maine and our community just began installing the new meters. I had symptoms before I realized it was on my home as well as most of you. The symptoms seem to be changing or revolving and include, sleeplessness, anxiety, feeling of being "amped" up through my body, tingling in limbs, dry mouth, feeling sick to my stomach, but never vomitting, heat on my facial skin, twitches, headaches, twinges of pain randomly throughout my body.

I chose not to opt out...we did receive a notice fortunately, but I just couldn't have imagined this NIGHTMARE! It's been almost two weeks and I'm going to call CMP(our company provider) and complain to get my old meter back.

I feel so hopeless, defeated that smart meters will be all around me causing problems. I have increased sensitivity to wireless networks now...and well my job requires me to use a wireless laptop for hours daily...

People who don't know how bad this feels, just don't understand! ...and for those who are involved with the installation, it is all about \$\$\$\$. It always is.

I'm so sorry to those of you whose lives have been turned upside down in this unbelievable nightmare. How can we promote more awareness...? Fight this battle? People who don't feel the effects right now, are still experiencing radiation but...their bodies just aren't in tune with their experiences like ours are. It's a survival mechanism we have...like wildlife have...and there is

nowhere to run

47. **admin** says:

[November 11, 2011 at 2:17 pm](#)

I have been diagnose with a thyroid condition that I think is directly related to exposure to smartmeter ionized radiation. Here are the resources I have found informative.

<http://youtu.be/FLeCTaSG2-U>

and this article

[http://www.avaate.org/IMG/pdf/Tiroides\\_Pulse\\_modulated\\_900\\_MHz\\_radiation\\_induce\\_hypothyroidism\\_and\\_apoptosis.pdf](http://www.avaate.org/IMG/pdf/Tiroides_Pulse_modulated_900_MHz_radiation_induce_hypothyroidism_and_apoptosis.pdf)

Not sure what to do, PE&E will not remove the smart meter. My home office is 5 feet from my smart meter and I have been sick for a few months now.

52. **Lody Haroun** says:

[November 15, 2011 at 8:21 pm](#)

I have recently been staying at my brother in laws house for a few days a week. I recently found out that the smart meter was installed without his permission and that the energy company refused to change it back to the analogue meter. This afternoon a 'smart meter visitor' came around to check to see if it 'has an anetenna.. or not' I asked him to explain to me further as to what was going on and he proceeded to tell me that 'he cant tell me untill he finds out if there is an antenna or not'' because he was sent out to a few homes that have had 'missing antenna's or faults' The person refused to answer any further questions... except to justify the meters with the world wide use of mobile phones... which was just ridiculus. I told the gentleman that he needed to research these devices further as he is more exposed to smart meters. The man looked at me as if i was crazy. I can't understand why people cant put two and two together and realise the gov't never spends money for US to save, it only spends money for US to SPEND MORE and for THEIR

SAVINGS – whether they effect the health of the community or not. My brother in law has not been complaining about health effects, however im wondering if this is the case because there was an ‘antenna’ missing, or supposedly missing. I also asked if I was the only person asking him these question and no answer was given. Individuals need to speak up! In parts of Australia you can’t just change over your organisation as some energy providers dont use or accept smart meters and your current provider will refuse to change it back to analogue. The person also said that by Law as of next year every Australian household will have a smart meter... and it will be a choice between smart meter or NO ELECTRICITY. He claimed that the company would shut down electricity if a smart meter was refused. These are scare tactics – I say its killing us softly era – There is NO LONGER A CHOICE ... smart meter or no electricity. Im taking his INFORMATION seriously...

Since a Smart Meter was installed on our house two years ago the following health issues have transpired. My step father died of lung cancer, my mother has severe headaches, tightness and pain in her chest, my brother in-law has loud ringing in his ears, my sister has insomnia, and I have depression, weakness in hands and arms, constant aching in all my bones along with bouts of insomnia. We want this meter taken off our house and I will do everything possible to make this happen.

54. **nowifimeters** says:

[November 16, 2011 at 10:36 pm](#)

These meters and the LAN antennas they put on our buildings are dangerous. In time we will see. It’s the NWO’s agenda to track and treat us like slaves. We need a triage solution in the meantime, in response to the dangerous wifi meters being put near our homes and work places. I saw recently that tin foil placed over a smart meter lessened the RF.

We need to find a simple and cheap solution to help us survive until we can get away from the meters. Is this to put foil over every meter we see; is it to line our walls that separate us from the meters with some kind of shielding, like foil?

We always laughed at the “tin foil hat” people. But in reality, it may be a short term help. Please lets figure out what we can do to help ourselves in the short term. I recently purchased a meter so I can find out what the exposure is, now that the F\*ing PG&E secretly installed this.

55. **admin** says:

[November 17, 2011 at 8:40 am](#)

I appreciate your suggestion that we need to find a simple and cheap solution to this problem. If you put tin foil on the outside of the meter it will radiate stronger into the home. Shielding is tricky, not simple.

People can change out their own meters for analogs , but this is not cheap. A multi- approach is what we have done and we need to keep raising public awareness.

What do you think of bright colored stickers that say “RF bio- hazard” or something like that and sticking those on every meter you see?

56. **TAH** says:

[November 17, 2011 at 4:42 pm](#)

How can the horrible ill health effects of these “smart” meters be denied??? I suffer from the same exact problems as everyone else has stated here. I didn’t know what was wrong with me either, until I found out about these damn meters!! I am going to sue, sue and sue. I was told told that nothing was being done until some bill or ? gets ruled upon by ?? . What a load of BS! See you clowns in court!

57. **Rob** says:

[November 17, 2011 at 9:26 pm](#)

EMF is everywhere, cell towers, anything electrical battery powered or powered from a utility or a generator has EMF. RF is everywhere, it comes from satellites in space, radio and tv transmissions, once again cell phones, short wave radios, cordless anything, baby monitors.

Every car today produces more EMF than anything you have in your household and just think you are locked in that metal capsule that does not absorb it or allow it to dissipate into the environment. Yes, we don’t always have choices in what companies do to innovate. Though we do have the ability to be educated and change our lifestyles and environments to conform with our beliefs.

58.  **admin** says:

[November 19, 2011 at 1:14 pm](#)

Rob, your point that EMF’s are everywhere is a misconception in that there is more in some areas, less in others. Practicing prudent avoidance means to understand and avoid EMFS and learn how to reduce your exposures wherever possible. To suggest people move to the desserts of South America is derogatory and making fun of people who have become sick, so I removed it from your comment.

59.  [Charyl Zehfus](#) says:

[November 23, 2011 at 10:09 am](#)

Just an idea here about the person who PG&E responded to quickly to remove the smart meter: he or she said it was affecting other appliances, including garage door opener and coffee maker (besides their dogs' new strange behavior). THE LESSON HERE IS BE SURE AND TELL THEM ABOUT INTERFERENCE with THINGS in your home to get a response.

60. **Matt C** says:

[November 30, 2011 at 2:41 am](#)

We DO have a choice nomatter what they say. My choice is soon to junk their stupid "Smart" meters and refuse their service. I am going off grid by makin my own solar panels. It's not that hard. Look at countless YouTube videos for building your own D.I. Y. solar panels. An off grid system you build own and maintain is the only real smart answer to this game of harassment bullying denial ignorance and blame-shifting being played by the big electric utilities. Solar power is DC and DC power is both quieter, and safer for human beings in terms of direct contact and lower EMF and RFI emissions. Directly DC-based motors and appliances also are also generally more efficient because they lose no power like AC appliances do, due to having to invert alternate alternations of voltage (rectify Ac into pulsed DC) and smooth ripple from pulsing rectified peaks to try to achieve a more stable DC-like power supply necessary to operate sensitive electronics etc. Thus I recommend slowly room by room converting your appliances and other machines to accept straight DC input by bypassing their internal AC TO DC circuitry and merely transforming an input voltage to any wanted voltage using a Multi-tap transformer only from your solar DC-power battery storage array. If you aren't technically savy to convert power supplies, new directly DC powered gear can be found ready to order online from a variety of vendors on eBay and from other websites.

61. **admin** says:

[November 30, 2011 at 7:34 am](#)

Matt: you write: "converting your appliances and other machines to accept straight DC input by bypassing their internal AC TO DC circuitry and merely transforming an input voltage to any wanted voltage using a Multi-tap transformer only from your solar DC-power battery storage array. If you aren't technically savy to convert power supplies, new directly DC powered gear can be found ready to order online from a variety of vendors on eBay and from other websites."

Can you provide some links to websites that you found most helpful to understand how to do this?

My electric company hasn't put a smart meter on my house. I think I have one on my gas meter as the meter man does not come into my yard anymore. He just pulls up in his truck and gets the meter reading from there. I called them up and they said it is the same meter, but they just added something to it so they can read it from the street, do you think this is a smart meter?

63. **admin** says:

[November 30, 2011 at 1:07 pm](#)

If they read it from the street it's not like the new smart meters which require no meter readers and constantly transmitting. It may have an RF component, as it is being read from a distance.

64. **Robin Davis** says:

[December 3, 2011 at 5:52 am](#)

I have been reading posts about the smart meter and the affects on others. I too am experiencing ringing in my ears, headaches, fatigue and my husband gets unexplained headaches. The smart meter is mounted on the wall outside our family room and we sit in the room watching tv and me on the internet less than 12 feet from it on a nightly basis.

Tonight (Dec 2) the ringing in my ears got so bad I called SDGE about 6 p.m. and complained. The girls answering the phones sounded like they were reading scripts prepared for these calls. I was hysterical as the ringing increased. Finally through the tears and threatening to take a baseball bat to the meter and taking it off my home, SDGE had a representative call me and they changed out my meter with another newer smart meter. The ringing is still there but it got a bit quieter.

I couldn't sit in my own home without being uncomfortable. While talking to SDGE on the phone I had to flee my own home. I went to my husbands work in tears. The further I got from the house the quieter it got. We went back to the home and a technician met us there to install a new meter.

I want the meter off my home. After reading other posts, I am certain that this is what it is. I can't sit at my computer for extended lengths of time anymore without the ringing.

Does anyone know a law in California that says we have to have them? One of the ladies on the phone (I went through two and had to hang up on one and call back because she was so scripted it was like talking to a machine.) says it was California law that we had to have these smart meters.

I am ready to get a generator and get off the meter. If anyone would like to contact me and compare notes you can email me at rdavis5 at cox dot net and I'll give you my private email and we can exchange information. I am ready to become a local advocate for the removal of these meters.

Robin

p.s. The ringing is there right now but not screaming at me. I am taking Lipo-Flavanoid (just 24

hours now) that my doctor recommended and purchased it at Walmart. It seems to work when I'm not at home but even that doesn't help the ringing when at home.

65. **Kay** says:

[December 8, 2011 at 4:31 pm](#)

Does anyone have suggestions to help us counteract these side effects until the smart meters can be removed? We are experiencing interrupted sleep, headaches, nausea, and fatigue since our smart meter was installed Sept 2011. At night, we take a product called Quietude (from the health food store) to help us sleep; we take two tablets before bed. Also, we wear wristbands called Energy Factor Ionic Lifestyle. We have no affiliation with these companies selling these products, but we wanted to share what we're doing in case it can help others. Our toddler woke up every single night since the installation, so he now wears a wristband too. We have written & spoken out to everyone: Governor Brown, the Mayor & City Council, the homeowner's association, Channel 4 news, the EPA, SCE, the CPUC, and the President. SCE has a delay list now, but it was not enacted until AFTER the installation of our meter, and they will not let us have our analog back and thereby join this delay list. SCE suggested that we move out of our house if we feel unsafe. SCE also came to our townhouse to test the smart meters—we have a bank of ten—and they arrived with a useless MF detector, not an RF detector. Concurrently, we had independent testing done with a friend's RF detector, and the readings were off the charts. We need a class-action lawsuit if there is an attorney out there willing to help...

67. **Kay** says:

[December 8, 2011 at 6:13 pm](#)

I wish it were as easy as replacing our single meter (per the link you provided), but unfortunately there is a bank of ten meters on our house. This is why the current opt-out solutions being proposed will not help us—they are geared only towards those with single meters. The opt-out solution needs to accommodate those who have banks of meters on or near their residence.

68. **admin** says:

[December 8, 2011 at 6:26 pm](#)

I will reassert your point in the comment on the opt out. Banks should be removed.

[December 10, 2011 at 11:21 am](#)

i have just encountered and learned about all this, having had a gas smart meter installed two days ago and immediately experiencing ringing in the ears, slight nausea, and discomfort (my head feels weird and hot, with a “buzzing” feeling) – all of these symptoms I recognize as the similar to how I feel if I put a cell phone near my head. (I avoid this by using speakerphone and holding it away from my face.)

My meter is a gas meter with dials, but apparently, according to Entergy La, it transmits once a month. So that sounds like something not too bad. But why the constant symptoms every time I go in my bedroom? (Meter is below and to the right of my second floor bedroom, and faces a metal shed wall.)

I just ordered this, and hope it helps!

<http://www.earthcalm.com/products/scalar-home-protection-system/>

Also, I found this helpful info:

[http://www.eiwellspring.org/smartmeter/Smart\\_Meter\\_overview.htm](http://www.eiwellspring.org/smartmeter/Smart_Meter_overview.htm)

Good luck everyone! HH

I don't have a smart meter yet but will be forced by BC Hydro to get one in February 2012. I am terrified. Two years ago I got wireless internet in my house for the ipods, etc. I just loved all those wireless toys. After about 2 months I started having major health problems. First came the insomnia and I felt my whole body was vibrating in pulses. Then my feet hurt so bad I had trouble walking. The doctor's couldn't see anything wrong on the x-rays, so recommended to fuse the bones in my left foot. Then I got zigzag lightning flashes in my eyes that came every other day. The doctor said they were migraine auras without the headache. I never have had a migraine headache or aura before in my 57 years and no headaches without a cause (like a hangover). The worst was not being able to sleep and being exhausted. One night at 3am I was at my wit's end not having slept in 48 hours. No matter where I tried to sleep, my body felt pulsing vibrations. So I decided to unplug everything in my house. When I unplugged the wireless router the pulsing instantly stopped. This total calm was like a miracle and I found the problem...the wireless radiation. I replaced the wireless router with a regular router and installed shielded cables and plugged everything in. It took 2 months to recuperate and feel better. It's been a year and now I sleep like a log again, I cancelled the foot surgery, and no more migraine auras, none. I'm terrified now to have any wireless in or on my house. I don't want to be that sick ever again. I don't need tests, I know firsthand what made me sick since I was the Guinea pig. I pity the EMF sensitive babies and children in wireless homes. It was difficult for me to figure out what was going on, I thought I was going crazy from lack of sleep. I really didn't want the wireless to be the problem, but it was. Disappointing (I'm a Trekkie), but I want to live and be healthy.

So soon my home will be infiltrated by wireless radiation from smart meters. Then what? Do I wallpaper my home with aluminum foil to reflect the radiation ...to my neighbours? Will EMF sensitivity be defined as a disability as it is in Sweden? Will wireless health damage reduce the number of capable and healthy workers in the western world? Will countries without wireless saturation have healthy populations when the wireless nation's manpower resources are

dwindling?

The future looks interesting, bright for some nations, not so bright for others. Where do we fit in?

74. **Marilynn** says:

[January 3, 2012 at 11:08 pm](#)

I'd like to suggest that everyone posting here give their general location. I am near Willits, Mendocino County, California. The Smart[sic]Meters have been installed in my semi-rural neighborhood, but we don't have one because I posted a very strongly worded warning about violating federal and state trespassing and surveillance laws AND wrapped the analog meter with a bicycle cable and lock. They would have to destroy my property to replace the meter.

I DID NOT put my name on a delay list, because that just gives them permission to install the infernal thing AFTER everybody who is not on the delay list has theirs. I will NEVER consent to a Smart[sic]Meter and furthermore I will NOT pay them a damn cent for the "privilege" of keeping my original, functioning analog meter.

Re: health issues. Obviously there is nothing I can directly attribute to digital wireless meters because the nearest operational meter is some distance from my house. However, I have reason to believe that such a device in close proximity would trigger a reaction in me, as I have had the weird pulsing through my body (described by several people here) at times over the last few years, sometimes to the point of feeling like my head was going to implode. Was I in the path of an EMF transmitter of some kind? I have no way of telling, but since more than 60 of my 67 years was free of such a phenomenon, I can only attribute it to radiation of some sort. (I don't use a cell phone and my internet connection is not wireless.)

I do know people whose entire family started having headaches, insomnia, etc., after a Smart[sic]Meter was installed. Another thing I've noticed is the explosion of shingles (herpes zoster) cases over the last few years. Immuno-deficiency diseases are on the rise as well. Triggered by EMF radiation? Until we know for sure, the only wise course is to shelve these confounded devices until disinterested (read: not-for-profit) third party agencies can certify them as safe for all, especially babies and those in frail health.

75. **Christine** says:

[January 4, 2012 at 8:33 pm](#)

If a homeowner is sensitive to RF waves and has opted out of the smart meter installation, could they file suit against another neighbor for having a smart meter who didn't opt out? I was asked this while handing out fliers about smart meter awareness in Naperville IL.

76. **admin** says:

[January 5, 2012 at 12:10 pm](#)

I know of one case in the US where a neighbor sued a neighbor for Wi-Fi- but I am not sure where the case stands.

77. **esdsix** says:

[January 5, 2012 at 2:29 pm](#)

I think a lawsuit needs to be filed, maybe a class-action. Reason being... There's a smart meter located just below my kitchen window..I had no idea it was there, til recently. But, what I have noticed is anxiety, pain in my neck, and headaches. This usually happens while I'm at home. I just couldn't figure out what it was. I feel this smart meter that's been installed is taking a toll on my health. I am obviously sensitive to these EMF frequencies it emits.. I want it removed, it's not healthy. And it's obvious these power companies are covering it up with excuses. Not only that, considering it's a wireless device, it's a security risk to personal usage information. The data they are collecting is unnecessary and of risk to our health and security. These smart meter devices need to be recalled with no further use against the public. It's way out of hand.

These companies have shown nothing that proves the safety of anything. I've even seen dead bee's near the device, on the ground.

78. **Annie Gibbons** says:

[January 9, 2012 at 11:07 am](#)

I have electromagnetic hypersensitivity, have moved 5 times in three years because of thermal burns to my face and neck because of the proximity of cell mast, and increasing wifi use and ever increasing use of hotter devices polluting the air. Recently I had an upper denture put in because the titanium bridge in my upper pallet was acting like a transmitter making things really worse for me. After this was done I was better, however I have asked the spokespersons for both San Meguiel Power Co. in Montrose Co. Colo. and Holy Cross Electric Co Op. 's spokesperson in Eagle Co. Colo. to realize that smart meters have already been receiving bad reviews from others in the country, and for me these represent an unacceptable threat to my health, and I believe to all of us, especially children and the aged. Both spokespersons were very nice, and said maybe we could have this discussion later. I also sent a letter to the San Meguiel Power Co. board meeting on Dec.14 2011 which carefully explained these very serious concerns. I know that they received this letter. They have an opt out for \$25.00 a month, however if all the other buildings in a neighborhood have them with a router in each block, then the overall electro-smog will be so bad, as to cancel out the one opt out... although at least there is an opt out. Other folks in my area, just don't realize how serious this is. I know because I am suffering with this, and now know all the symptoms, which we are all already suffering with... ie... the five hour energy drink... and sleep meds increase in sales over the past 7 years, which is astronomical! As well as the huge increase in the sales of 24 hr. ant acids for younger and younger people, C-Pac masks for sleep apnea, and a sharp increase in asthma, thyroid problems, , un-diagnosable pain, and stiffness, heart palpitation, and last but not least brain cancers. Our Government has allowed these industries to proliferate and has passed regs. which no one voted on, and mandated these things both to supposedly make

us use energy more efficiently, and then also to line the pockets of those providers who are manipulating the market. It reminds me of how the American Indians were treated... and now it's us. No news channel has reported on this either, since as a people we are in love though advertizing with the notion that all these devices make our lives better, and more powerful. The Green Initiative (?) is at the root of the Smart meter push... the underlying belief is, if the use of electricity is so closely monitored, and controled, it will force people ot make green choices, and spur invention. However the way this is being done, isn't based on free market forces, but on forced control, and manipulation, which already has invited those on the inside to see hugh profits for themselves while absolveing themselves of the health conciquences.... since the rest of us, must be made to stop global warming because it's in all of our best interests, ie, we the people are too dumb to choose otherwise. This is the same sort of rationalization of power that led to the geneocides every where, and in our past too. The belief that green energy must be mandated is the basis of this. Whereas all true green energy initiatives in the past that were truly invented by the people of the United States have been brutally surpressed, because they would have made those corporations in control, loose control of the market, and that was not acceptable since our Government is directed by money, and no longer cares what it does to the people. I realize that all of us who know that electro-smog is reaching the tipping point, must come together in protest, since our singular voices have no value in this system.

79. **Annette Eckert** says:

[January 11, 2012 at 11:48 pm](#)

I have never had migraines until I moved to WI where they just started using smart meters before I moved here. The headaches have become debilitating to the point that I have become bedridden. I feel better when I get away from the constant high-pitched humming. My vision has deteriorated and I have had my Rx changed 8 times in the past year. What were occasionally annoying pains have become nagging frequent chronic pains, probably exacerbated by the poor quality of sleep from the EMFs and constant stress of exposure. I never put 2 & 2 together until recently, although I was aware of the high-pitched noise and the health risks of EMF exposure. This is a situation where we all need to unite and take action. Our future health is at risk, and we're getting sicker every day!

80. **Maria Crioula Preta** says:

[January 12, 2012 at 11:43 pm](#)

I never had a single health issue in my entire life. One day, PG&E cut my electricity for a few hours and when I went outside, the meter was installed. A week after that, I started having constant diarrhea. A week after that the migraine headaches came. I consulted with my doctor and he asked if I had been exposed to radiation! I called PG&E and they said it was not their fault. The somewhat sarcastic ((which I don't appreciate) attendant asked me "Ma'am, we emit less RF than your iPhone". Oh gosh, as if Apple would make a product that hurt me! Of course I have an iPhone, but I don't believe for a second that Apple's RF is harmful like PG&Es RF! Outraging! Months after that, I started vomiting early in the morning and having cravings! I again went to my doctor and he told me I was pregnant! Now, tell me, HOW? I don't have a boyfriend or lover! It

can only be the SmartMeter! This is an outrage! Now I have to support a child as a single moter and PG&E won't even help me!

81. **Bevy Armstrong** says:

[January 16, 2012 at 3:05 pm](#)

i have had my muscles stop working since the installation of the smart meter.i have had 2 surgeries on my right hand, need it on my left hand, the muscles blew in my left knee, i am very sore and tired all the time. my sleep patterns are messed up and i have constant ringing in my ears. my small dog has some of the same symptoms. he is only 2 and has muscle disorder, pain, skin issues, etc. my cats who are siblings suddenly act bizarre and mean. this can't all be coincidental.

82. **Mia Nony** says:

[January 18, 2012 at 12:48 am](#)

All of this suffering has one common denominator, it is a description of all of the symptoms of electrical induction and ammonia poisoning of the brain. SM enabled frequencies allow ammonia and other toxins to cross the blood brain barrier Amalgam teeth fillings make it happen faster. However, it helps to realize that the frequencies enabled by smart meters or SMs can be “foiled” (literally) and blocked. Interior meter wall must be shielded effectively. Many circuits should be shut off at the electrical panel when not in use for all but absolute essentials like a fridge. Surge protectors should also be used for all appliances and shut off whenever not in use. All live wiring inside the walls should have this flexible foil stapled to the walls, so the walls are lined with mylar insulation foil with bubble wrap spacing.

To block frequencies coming through exterior walls and windows they should be screened with aluminium screening.

The radiation itself can be suppressed with carbon paint (expensive) or carbon sheeting (much cheaper).

On the other hand: The fact is that so called “smart” electronics don't just CAUSE interference, they are also vulnerable to interference.

Fight fire with fire.

The goal should be to achieve total suppression of transmission immediately, not just shielding one's walls with aluminium screening from the frequencies from outdoors that take over one's house wiring but putting wire mesh all around the meter and on the interior side of the meter wall.

Next, go to <http://www.freedomtaker.com> and order an analog meter. Instructions for safe replacement come with the kit. So do legal instructions on how to give notice of “just cause” to the utility. Follow the steps for this and hire an electrician after the time line is up.

Essentially you follow the accompanying analog meter kit directions to the letter so that you cannot be held liable for removal of the SM.

You give the utility the correct notice of a deadline for them to remove the meter. When they don't, – and chances are they won't – you are now legally protected by having used due process and in a powerful position to have the SM removed yourself.

Now you return it to the utility, after you replace it with a \$50 analog meter.  
Then you secure the analog meter – lock it up but good. Some people build an entire room around them, come put steel bars in front of them, lots of creative ideas. Go to Google images and put in to the search bar Defend Your Analog Meter for inspiring pictures.  
It really is time to stop suffering needlessly, especially when electronic signals that cause pain and disability can be blocked, suppressed and stopped.  
Remember SM stands for Smart Meter, not SadoMasochism.  
Fight back.

I to have been having the same health problems as the people I have been reading about. Every since they installed the smart meter without my permission in September of 2110 I have been sick. I suffer with headaches, insomnia ringing in the ears. what makes in worse for me is that my meter is right behind my head, on the other side of the wall my bed is on. All night I hear this humming and buzzing sound in the wall, with a buzzing in my pillow. I have complain to PG%E over and over and all they say it is nothing they can do about . what really piss me off is the fact that I did not request this health robber, and I was not given the right to opt out. PG%E came to my home while I was at work and put this thing on my house. I call this a violation of my right to choose. I have not felt my self in over a year, not only that beware of the turbines windmills they also cause the same health problem. And they are being put up everywhere, it is called WIND TRUBINE SYNDROME it to makes you sick, I no, I have a smart meter on my house and a wind turbine 1/4 mile from my door with low frequency vibration. Sensitive people do not stand a change in this world full of greedy selfish people, we need to stand together we have a right to life in our home and not be sick.CLASS ACTION LAW SUITE IS IN ORDER.

84. **Dusty Lindsay** says:

[January 22, 2012 at 9:28 pm](#)

We do not have a smart meter yet here in our part of Australia, but they are coming. The only solution to the problem as I see it, is when the smart meters actually cost more to have than the analogue meters. I recon that day will come when some one has come up with a “hacking” system that we all can use that will cause the meters to fail. Is it possible? Well if a teenager can hack into the highest secured computer in the world, then a “smart meter repellent” is merely a brain storm away. So one of you computer geeks go out there and cause havoc to the morons that are causing sooooo much havoc to the unsuspecting electricity using public.

Dusty Lindsay  
Sydney Australia

The smart meter was installed and the symptoms started. After 10 months of headaches, insomnia, high blood sugar levels, tinnitus, memory loss, and feeling tired all the time SRP decided to let me opt out. It's been off for over a month and the symptoms vanished the day they removed it. If you are experiencing these symptoms don't delay getting the smart meter removed. It depletes the natural melatonin levels in your body and attacks your immune system due to not getting good sleep. I have found that since your neighbors have smeters you will get even better sleep if you turn the electricity off to your bedroom. You might want to have your bedroom tested for any other microwave radiation.

My smart meter was installed approximately 2 months ago. Since the installation (by the way I had no idea of the radiation risk when it was installed), I started experiencing headaches and could actually hear the throbbing in my head/ears like a heart beat. I had never experienced it before and had no idea why I was experiencing these symptoms until someone later told me it was probably the smart meter that was installed. Looking back at the time it was installed and when I started experiencing headaches, the connection is undeniable. When I am at work, the headache subsides and I no longer hear the throbbing in my ear. When I go back home it starts all over again! It is a nightmare. I've actually had thoughts of sleeping in my car away from my street. It is unfathomable that the CPUC and the EPA would allow these silent killers to be installed on our homes. Please, for the love of humanity, please remove these meters from our homes!

First I recommend that everyone purchase a Scalar Home EMF protection system. They are 300 dollars and plug into your outlet to ground you with the Earth. Read the google article "No more privacy smart meters are surveillance devices that" and watch David Icke on youtube "Behind the world events" to learn more what this is about. The smart readers pump your house with radiation and your cfl light bulbs. Your cfl lightbulbs and energy and radiation to your outlets and chipped appliances. "They" have total surveillance in your household and can do things like lower your heat,open your garage door,turn off your refrigerator etc.. "They" can also bombard your electrical brain with subliminal thoughts and do mind control experiments because you are bathed in this frequency grid which uses ELF waves. The same waves the brain works. Crazy place...

I can't believe what I'm reading! I was just saying the other day that my apartment was making me sick! Now I know what it is!! We had our meters switched out a few months ago also! I haven't been able to sleep and my ears are clogged constantly. I am sick and my husband is getting sicker...I thought I was coming down with pnuemonia! I keep looking out my window and opening up my door to find out where that sound is coming from! OMGoodness, it's the meters?! For goodness sake they need to do something about this! Thank you all so much, I thought it was me, but every time I'm away from my apartment I feel better!!!! I didn't have health problems before...OK change them back, I for one, knew the Duncan one's were better...ha ha, little Duncan humor...but this needs to stop! Put us back on the other PG&E!!! Don't you have enough problems with the leaking gas!!! REALLY! Alice Duncan, Citrus Heights

[March 4, 2012 at 10:09 am](#)

I live in the San Diego East County area. I came out of my house one day a little over a year ago due to hearing a strange noise and caught the man attaching a smart-meter to my home. I asked him what he was doing and told him to stop it, I told him I did not want a different meter on my house. He was working very quickly and made some comment about how letters had been sent out (I never received one) and that he had to put the meter on and then he drove away. It was very disturbing. I didn't know at that time what a "smart-meter" was or what the health ramifications would end up being.

I do know that since that time I have had unending tinnitus and ringing in my ears, that interrupts my sleep every night. In fact, I also hear it throughout the day when I'm home and before I go to sleep and dread laying down in my bed. I think the only reason I actually nod out for a few hours is from sheer exhaustion. Once I wake up around 3 hours later, I move to the living room, but even that place has become one of unending high-pitched ringing. My ears almost burn from it. In addition, I used to be very focused and energetic, with plans and goals. Now I frequently feel overwhelmed and almost "frozen", having lost the desire to do many of the things I used to greatly enjoy. I couldn't understand what happened to me until recently I started hearing about the smart meters and the EMFs and found this site. I am horrified to see that not only are my symptoms very similar to what others are experiencing, it is nearly impossible to get SDG&E to remove these meters. I'm also afraid because I have had much exposure to radiation starting in my teens due to extensive diagnostic xrays in my youth for scoliosis. Perhaps that is why I am so sensitive to these frequencies now. I also just figured out today that my neighbor's smart meter is 10 feet away from my bedroom wall, which explains why I can't sleep in there and feel so restless all night. It's a toxic zone! I have been feeling like my bedroom in particular has become a menacing environment to me every time I go to lay down, which I couldn't understand why I felt that way, and now today it all makes sense. I pay SDG&E over \$100 a month for their services. Why am I forced to have this equipment that is dangerous, that I don't want, and that can easily be replaced by something less harmful? Do we no longer have any rights at all??? We need to band together and fight for a solution.

99. **Julie Sunflower** says:

[March 4, 2012 at 9:57 pm](#)

I am SICK AND TIRED OF LISTENING to your frequencies of your smart meters that EVERY ONE HATES it is obviously a health issue I can't wait until you go down in many lawsuits over this negligence!

[March 5, 2012 at 1:17 am](#)

I also had the smart meter attached to my home without an "opt out" option that I was aware of. After receiving a horrendous electric bill, we requested a tech to check our meter to see if it was running accurately. The supervisor at the electric company told me we had used a lot of electricity over the weekend. We had family that visited us from out of state. Is this Big Brother??? When the tech arrived at our home to check the meter, he informed us that the electric company employees themselves had opted out of the new meter. Does that tell you something? He said there were

many complaints. Meantime, I've felt faint and jittery and didn't have a clue that my meter may be the culprit. I'm restless when sleeping and have had headaches which have all been recent. This is scandalous. I'm praying for a resolution.

101. **linda sass** says:

[March 10, 2012 at 8:04 pm](#)

I am not certain how much these meters affect us, but I know they are not good for the health at all. I also know that in our town are 180 something cell tower clusters, enabling cell phones to function all over our town. On one side of town the other day, I got sick just driving around them. I have electro sensitivity. I have tried everything on the market, and as of yet, I do not have an answer. I can tell you that I did put pet resonator protectors on the animals, after losing one

animal, and this helped them.

I remain in pain, they were having seizures, all the same kind, one died.

My house is no longer comfortable at all. I so long to have our home back.

I understand your fear, your pain, and I know that you are telling the truth.

People are developing all kinds of diseases and dying, some do not feel the effects and say we are crazy, yet they are being effected as well.

I pray for tis to end and for you and yours to be protected from this evil that surrounds us daily.

105. **Lisa** says:

[March 18, 2012 at 2:09 pm](#)

My neighbors got smart meters installed on Feb 28 or 29th as of March 1st I started getting sick. I started to get diarrhea, sev nausea, heart palitations and chest pains, trouble sleeping, earaches, sev constant migraines, confusion, weakness on left side and a seizer on 3/10/12 my husband could not get a pulse in my neck and called 911.

After the seizer on Sat the side effects from my neighbors smart meters got worse. My husband was calling me every 1/2hr during the day because he was terrified I would have a gm seizer which could kill me if I am alone.

I called multipal times Gov Scott of Florida, Rep Harrell, and have never recieved a call from them. I have other people calling my Rep Harrell daily and they also get no call back. I have called Senator Joe Negron no call back. The PSC is more concerned in protecting FPL then a florida resident it is very obvious specially when you get verbally attacked.

Rep Harrell, Gov Scott, Sen. Joe Negron are more concered covering for FPL (big biz) then protecting their constituents.

I have not had a seizer in 14 years and I was looking to get off my meds, yes 14 years NO zeizer.

FPL did remove the mart meter on one neighbors house as per their request (I spoke to them) I have called FPL many times and told them their damn meter is endangering my life after having a seizer and I was going to SUE them.

Hopefully the other smart meter on my other neighbors house is going to get removed.

[March 24, 2012 at 6:48 pm](#)

we have recently moved into a neighborhood in chesapeake virginia (dominion power supplied) with a friend and roommate. right next to our house is a panel with four of these "stupid meters" installed. before moving here me and my wife never had headaches and now constantly do. so does our room mate for the last three months, and has lived here for four years but he did not have headaches till a bit after the meters were installed. i have researched this subject for 3-days straight now on the internet and have found out once again the american political system has sold out the

health of its citizens for corporate profit, california excluded it seems (they are removing them and virginia is buying them). this goes right up to the obama administration who backed this 100%. well i for one have had enough of this “change”. in my opinion change is not good. our health is worth much more than corporate profits. we are going to start a petition to get these “stupid meters” removed.

I live in an apartment building with the smart meters somewhere in the basement, much farther than 6 feet away from me. However, I have experienced dizziness and disorientation, memory loss, and confusion since they were installed. Other symptoms are present as well, but only when I am in the basement of our building.

108. **John** says:

[April 3, 2012 at 4:28 pm](#)

For everyone suffering from the effects of smart meters, help may be on the way. Recently SC Edison installed a smart meter at my residence, which is also my business location, and in so doing shut the power off without notice and damaged our main computer. After taking SCE to court and having a crooked judge only award me the cost of the damage harddrive, but give us nothing for the labor costs to install the harddrive and reload all the computer software, I am pissed.

Being a defense contractor, we have designed RF shielding for sensitive military equipment, and I am so pissed off at SCE that we are now going to use our engineering talents to design a military grade RF shield to encapsulate smart meters. This will not be a home-brewed design like wrapping aluminum foil around the meter. Our design goal will be to stop 100% of the RF emissions from any smart meter. The “opt-out” programs Edison and the other utility companies are pushing will cost you \$200 – \$300 the first year and \$120 – \$200 every year thereafter. Our plan will be to sell these units at cost with a price goal for the shield to be around 25% of the first year cost and with no future year costs.

Of course these things do not happen overnight, so it will take us a couple of months to get a working design, test it, and figure at the production process. If you don't have to make an immediate decision to pay Edison or your utility company for their “opt-out” program, give us a chance to do this development effort. I, like most of you, am sick and tired of the arrogant attitude from Edison and all these utility companies. I want to make their lives as miserable as they have made ours. I will post again in a couple of weeks and give an update on our progress. Hopefully we will be successful and can put an end to everyone's suffering and Edison's arrogance.

I read with great interest today of your problems with Smart-Meters in the USA. I do not think, so far that we have them in England. However, we are in the middle of the digital changeover for TV's here in England. The reason I am going through relevant sites today, is to find out why since the changeover to HDTV, am I feeling so ill and my sight in particular feeling so bad. With analogue TV I had no such problems. As soon as I look at a digital TV my eyes feel strained and I am most uncomfortable. I have never worn glasses to watch TV but tried to watch for 2 hours the other night, with my driving glasses on. I felt extremely uncomfortable and on removing them and switching off was extremely disorientated and woozy. I felt depressed (never happened before) and not able to focus or concentrate; totally like a zombie. Since then I have not watched TV, only on analogue; no probs with that but the changeover was completed last night, so analogue has been switched off for good now. I do have fibromyalgia badly and a reduced immune system, due to severe allergies some years back, so can relate to so many of your comments on here but am wondering is there is a similar connection with digital TVs and the transmitted waves which are affecting me or if anyone known how I can watch TV again now we are stuck with digital. Some of the things I have read today on various net sites concern me greatly, particularly with relation to HAARP transmitters and HDTVs – see Control by the Sound of Silence and The energy effects of HDTV, which states that the brain cannot translate the signals with Digital waves as it can with Analogue. Or is anyone can direct me to the relevant sites which may answer my questions and my problem. Thank you.

110. **Holly** says:

[April 18, 2012 at 6:15 am](#)

I am having all of the symptoms that are being mentioned here especially insomnia. I am also sleep walking and screaming all through the night. No one is getting any sleep... This is the worst thing that could ever happen to us. Can it not be reversed? I can not get anyone at Georgia Power to switch my meter back to analog. I want my health back!!!!

111. **admin** says:

[April 18, 2012 at 8:58 am](#)

Smart meters will not be mandatory in UK. I do think the switch to digital TV signals was/is a problem, but am unaware of other sites addressing this particlur issue. Maybe another reader can comment?

112. **class action lawsuit** says:

[April 28, 2012 at 4:38 am](#)

Until recently, I lived in a large apartment complex. Shortly after conversion to smart meters I developed really distressing symptoms. I felt dizzy to the point where I couldn't function normally and spent a lot of time lying down. I also developed a high pitched humming/buzzing in my ears that seemed especially loud when I woke up in the morning. I didn't know we had even converted to smart meters since it's an apartment building versus a house and I had never even looked at my meter. Once I developed symptoms I researched online and came up with smart meters being a possible cause – a neighbor showed me a letter from PGE describing the timing of the conversion which was shortly before I developed my symptoms. I guess I missed the letter, not that it would have done me any good to protest. I went to look at my new smart meter after I started developing symptoms and oh my god, it was a huge bank of smartmeters not far from my unit (it's a really big complex). The worst part is I have since moved and my new duplex also has 2 smart meters not to mention the neighbors smart meters. The dizziness seems a bit improved but the humming/buzzing is getting steadily louder. Folks, we have a serious problem. First of all, it should be illegal for any industry to sponsor or quote scientific studies that they themselves have funded (purchased). Scientists are like any other people and just as susceptible to corruption from money as a politician. We have enough independent research that verifies the dangers of the type of radiation put out by smart meter's that PGE should not have been allowed to do this. If there is a class action lawsuit I'm signing up. I have documented the onset of my symptoms for the lawyers when it gets to that. Here's some links for you all including one report produced by a company that shows that radiation from a smart meter can increase to the point of fcc violations – the increase is related to increases of 1000% to 2000% re [http://emfsafetynetwork.org/?page\\_id=2292](http://emfsafetynetwork.org/?page_id=2292)

reflective factors. Here's the link...I hope you all READ IT!!!

[http://sagereports.com/smart-meter-rf/?page\\_id=212](http://sagereports.com/smart-meter-rf/?page_id=212)

Also, consider that the smart meters are on top of the already increased pollution from cell towers, radio towers FM and AM, ham radios, etc. If you want to check out the nearest antenna's and towers to your location use this website:

<http://www.antennasearch.com/default.asp>

Finally, here is a table from this same website that produced the smart meter report showing the serious and severe health consequences that have been shown in scientific studies due to radio frequency radiation.

[http://sagereports.com/smart-meter-rf/?page\\_id=404](http://sagereports.com/smart-meter-rf/?page_id=404)

Finally, don't forget that the smart meters have TWO antenna's, 900 MHz and 2.4 GHz. Do not spend a long time looking closely at your smart meter. It is bad for your eyes – and I mean literally. Seriously, I see PGE's future and in it are a lot of lawyers trying to fight all of us off. My recommendation to all of you is document now – when did your symptoms start appearing? Go to the doctor to get evaluated and have hard documentation. Note if your symptoms improve if you spend time away from the smart meters. Write down all of your symptoms. That way when we haul PGE's aXX to court you'll have a nice neat packet to hand over to the class action lawyers. Good luck until then everyone. I feel for you!!

113. **Phyllis Reed** says:

[April 28, 2012 at 9:24 am](#)

I have always been healthy. I started noticing that I was feeling dizzy, having intense head and body aches, inability to concentrate, and heart palpitations. I did not know how to explain this rapid deterioration in my health. My daughter came to visit and I was discussing this with her and really confused as to why this was happening. She went outside to find that my bed was literally 3 feet from the recently installed SmartMeter. She proceeded to call PG&E to complain about this and they said there was nothing they could do except place our name on a list. I am very disappointed since I was never informed of such a change. Why can they come over and add such a device without our permission? I would like to change back to an analog meter and hope we can do so in the near future.

114. **admin** says:

[April 29, 2012 at 10:31 am](#)

You absolutely can get rid of the smart meter. Call PG&E and tell them to remove it. 866-743-0263

116. **Dave Lynch** says:

[May 3, 2012 at 12:41 am](#)

Opting out of a Smart Meter has now become an extortion racket. Even if you can stand EMF radiation, there is a 4th Amendment Constitutional violation as these meters monitor your daily activity by the hour, without a warrant, and anyone can access your activities with enough computer chops. Your data may also be sold without you knowing about it.

I just received SMUD's \*Opt Out plan:

\* I will be charged a One Time Fee of \$127.00.

\* I will have an additional monthly fee of \$39.40 added to my SMUD Bill.

\* I have 13 days to respond, from today 5-2-12.

They are the only game in town, a monopoly, and I have no alternative. I refuse the meter for it's health issues and violations of privacy I am crushed with cost, Mafia style. Is this just? No, it will happen to you.

When will we all collectively say, enough is enough? Adding insult to injury, our legislators could care less. Personally, I am sick of it. How do we stop this insane criminal behavior?

This is my house, my investment. I have a right to privacy and be able to refuse this EMF device without extortion and I should have the right to be able to buy my utilities at a fair price without these Unconstitutional surveillance devices on my home.

117. **admin** says:

[May 3, 2012 at 7:44 am](#)

Have you seen this? <http://emfsafetynetwork.org/?p=7284>

[May 17, 2012 at 7:43 am](#)

The SoCal Edison Smart Meter has invaded my house since Aug. 2010 and turned my littl wooden home into an unbearable electrical or electronic "warzone!!!" The last couple of weeks have been

the worst, and eventhough I call Edison, they say there's "no harm done" from the "Smart" Meters, and I ask the representative how he/she knows, since I'm the one living in this terrible environment and experiencing the terrible effects of the meters !!!!

The Smart Meters upon the wall just outside my bedroom have made this warzone unbearable, and seem to be doing a number of other things to my home, as well, such as for some reason setting off my refrigerator to recycle incessantly and often .

For many nights now, I've been unable to sleep comfortably, or even at all, and I suffer from pitiful and continual heart palpitations at night and the non-stop inability to stop my mind's racing thoughts, and the buzzing and ringing in my ears and head continues continuously until I leave my apartment to "clear my head." Leaving the premises immediately clears my head and the symptoms disappear immediately upon leaving my "electrified" atmosphere !!!!

Other ailments include painful joints in my hands, (rings on fingers increase the pain), my hips and knee, and I feel that the meters affect our body's ability to keep or absorb calcium, with continued tooth/gum problems and difficulties.

I feel that the EMF and EMR's emitted by the Smart Meters and electrical invasion are also responsible for blister-like sores on my shins which appeared soon after the installation of the "Smart" Meters in 2010, and have continued to grow in number and discomfort. For months before I was able to discern that the meter was responsible, I slept quite near to the meters, and my head faced in the direction of the meters, probably five to six feet from the smart meters!!! Not a good idea, at all, i'll tell you. I also feel that the Smart Meter has affected my thyroid gland, as I experienced pains in my lower throat/neck area for months after the meters were installed, and I also lost sufficient amount of weight in that first year (probably as much as 30 pounds, and five inches around my waist!!).

The sleepless nights continue now and as SoCal Edison continues to promise the removal of these terrible, hateful things mounted without our permission upon the outside of our houses !!! These physical issues are just part of the many problems that the so-called "Smart Meters" bring with them into our lives, and there are a number of additional rights issues I've not discussed !!!!

SoCal Edison and the many other utility companies need to waken up to the many REAL harmful physical and mental effects and issues brought upon us by the installation of their "Smart" Meters upon our personal, private property, and again, without our permission or agreement!!!

This torture and torment is terrible, and very REAL, and not imagined. SoCal Edison and the other companies and their employees must be made fully aware of this and not to laugh at, mock, or question our credibility in this regards.

-LD (Newport Beach)

[May 21, 2012 at 10:56 am](#)

I've got an outside wall with five smart meters on it. Inside my house, I've got a large lead crystal bowl and artistic plate against the wall at the approximate place they are on the outside. I'm wondering if copper or aluminum plates would be better at blocking the emanations. The electric company would charge \$15 per month to reinstall the old meters – I'm not paying \$75 per month for other units' meters. I also wonder if the Stetzerizer filters would provide any benefits.

Just to piggyback on SOLUTIONS, not to discourage ranting, I have noticed that the “peak” of my head buzz comes just seconds before I hear the choo choo train (that's railroad for anyone under 40 yrs.) sounds its alarm. THIS IS CONSISTENT. In Georgia, the rails are abundant. We live only one-quarter mile from tracks. Anyone with an engineering degree and high mathematical ability should explain to us the probability that the radiation from wires overhead are and IS movement with trains. My guess is it's all connected. We live in a virtual field of buzzing from top to rails. With meters buzzing 24/7 the “pulse” continues. Have you noticed that?

I am trying to find a law firm, after over 2 years of being terrorized by infrasonic radio phenomenon and blasted by power surges through my wiring, I narrowed the cause down to Smart Meters. I believe these things are causing an epidemic and MUST be stopped and damages paid to us whom these shoddy/foreign made devices have made sick and disabled. Not to mention many firms and manufacturers have committed outright fraud trying to profit off people's ignorance.

Another sleepless night . . .

It's been over a year since Smart Meters were installed here. I'm quite familiar with most all of the symptoms described here – as well as the feeling of desperation. I continue looking for a new home after living in my apartment for 25 years. I think it would be good to establish a website for “Smart Meter Refugees” and people looking for others wanting to build a community without wireless technology.

[July 5, 2012 at 11:40 pm](#)

I'm a radio guy, and understand transmitting ok I think. My guess is these meters use a very small antenna, with a lot of wattage, to get the signal to their “base.” All they have to do is use the current from their lines. (Makes sense right!) I mean, if their is no repeaters or anything like that, it would have to mean they use a LOT of wattage then, since their is no other “magical way.” That is what scares me about these. Who knows, they could be using FM radio station strength wattage around your homes, and you could be getting rf causing all of this, on top of the emf. These freak me out. A GMRS radio doing 5 watts can't even go a mile practically. And since you can't see an antenna of any kind, it must be fm, and has an antenna inside of it coiled up. So think of the actual wattage these things could be doing. Just do the math. Man, if they don't have repeaters...heck whatever...GET RID OF THEM. I noticed a “change” too in the environments feel. Something isn't right...it's just like doing a remote at a radio station, and standing next to the vans antenna when transmitting. It's the same feeling!!!

Three months after a smart meter was installed on the house where I rent the master suite, I was diagnosed with severe depression and panic attacks. This came out of the blue. When I heard about the meter dangers, I went outside to see where the meter is, and it's ONE FOOT FROM MY HEAD when I'm in bed. There is nowhere to move the bed. When I'm on my cordless phone, it clicks and crackles so loudly I have to leave the room. I have ringing in my ears on and off. I have

lost 40 pounds from all the medications I've been given for the depression and panic attacks. As a 59-year-old woman working part time, I don't have the luxury of moving right now. This sucks.

129. **LC** says:

[July 14, 2012 at 11:56 pm](#)

We moved to Aptos (Calif.) in October of 2011 and are renting a place with three Smart Meters outside the house, near the garage. In April of 2012 I developed severe pain in my neck, hands, wrists, elbows, hips, lower back, and knees. It does not respond to pain medications at all. I was tested for rheumatoid arthritis, Lyme disease, Lupus—all came back negative. I'm a 55-yr-old woman who used to take brisk walks almost daily and now need to go at a much reduced pace over shorter distances with the aid of a walking stick. What is going on?

130. **Lorene** says:

[July 18, 2012 at 3:40 pm](#)

For two years I've had chest pains, heart palpitations, shortness of breath, sleep problems, anxiety, memory problems, have felt exhausted and weak, and I cannot even walk halfway up our stairs without my heart racing and being totally out of breath. I am not overweight. I work out daily. I eat decently. I'm in my early 40's. But my health is like that of an 85 year old smoker! I've been to my family doctor, a pulmonologist, a cardiologist and an allergist and no one could find anything wrong with me. I started having these problems for two years, out of the blue.

I started to research the health effects of RF radiation, and found out that smart meters are huge emitters of this type of radiation. We had two meters installed (against our wishes) two years ago. One is on our gas meter, which is near my office where I work all day and is on the wall of my 6 year old daughter's bedroom. The other meter is on the other side of the house for our electrical.

Basically I have now figured out that my symptoms started soon after the smart meters were installed on our house. My 6 year old daughter has also shown symptoms. She is losing her hair and has frequent nose bleeds, and cannot sleep at night. She also has frequent head aches. I thought that all her symptoms were from her allergies but when she started losing her hair I knew something was up.

Yesterday I put foil on her bedroom wall and floor behind where the meter is, and around the actual meter. Today I woke up for the first time in two years without feeling like absolute crap and my shortness of breath and heart issues are gone. So I think the foil diminished the amount of RF I was taking in each day, all day long. I am having my daughter sleep in another room for the time being, away from that dang thing.

I have asked PG&E to remove our meters and they are doing so. This is due in part to all the backlash they have received from people like those of you who posted to this site, and I'm very grateful for that. Of course they are going to charge us \$ 75 to remove those cancer cannisters. I plan to fight them. I am going to call our local news station to tell them about this and make a huge stink

about this BS. I think PG&E should be paying ME for all the health issues they've caused me and my family and the wasted money I have paid to doctors to figure out what was wrong with me.

[July 19, 2012 at 11:16 am](#)

I am woken up nightly by a strong surge and jolt. Then I feel small ripples through my body that start and stop for seconds at a time. This also occurs during the day. My sleep has been disturbed ever since the smart meters were put in. My energy is lower than it used to be and I am very irritable as a result. I can't think as clearly as I used to. But mainly if I am sleep deprived my body doesn't function well.

Not sure what the ultimate toll on body is from the Smart Meters but I am not happy about being used as an experiment.

132. **tim** says:

[July 20, 2012 at 9:55 am](#)

wow this something else. i mean i know all these symptoms can have other related causes but ever since they have installed smart meters in my condo complex a slew of the exact same things have been happening. we live up stairs but the people downstairs closer to the meters fight all the time. her daughter has chronic head aches, the kid is ALWAYS going wild. her mom had a seizure not so long ago. my step father has had random migranes he has been diagnosed with neuropathy and random chest pains. my mother cant get a full night sleep she continuously complains of naseau. i havent been able to get to sleep at a decent time of night to save my life, plus i have been having a hard time using the bathroom and a constant case of dermatitis and psoriasis. im not a stupid person i do know some what about the medical field im a pharmacy technician and i know a bit of what connections could be concerning exposure to EMF meters smart meters ect...

Wow!! So many sick ppl my heart goes out to you. My health issues started in 1999 from a cell phone, since then it has gog worst including WIFI routers, smart meters so Yes I to am sick from EMF like smart meters, WIFI, cell phones. All of you also need to remove the WIFI router from the home if you hv them, kthey are Evil for our health. What I hv found out is others including many family, friends and for sure the Government, power & gas companies give a rats ass about us and our health. My own grown childen hv turned against me saying well dad it dont affect us, yea as their father I hope they never do but as a person suffering from what I am, I hope everyone who is a doubter & hater gets it so they hv this same evil feeling of poor health. We did get the gas meter removed & working on the electric. I have found nutrition has healped me, Alive whole food energizer, miracle reds, spirulina, chlorella, saunas & drinking steam distilled water. I hope for a healthy resolve fof us all but am sure we will have to fight. I told the gas & electric co I will destroy their meters if not removed it took 2 days to make it happen. Bug we must be willing to do whatever to save our health after all if is our health we are talking about, the value of our life is all that matters and the issues with these items need to be brought into the light. Be blessed Charley

The best solution I have found to counter the side effects from a smart meter is to take the liver of a toad, bind it tight about my throat and stand naked by the full moon in a barrel of eels' eyes.

Doing this monthly ensures you will be committed indefinitely – thus solving your problems as you will be away from the demonic smart meter.

136. **Stuart** says:

[August 7, 2012 at 6:21 pm](#)

I had a meter installed yesterday. This morning I woke with really bad ringing in my ears. I've NEVER had ringing before. I was wondering if anyone else had experienced any ill effects after the meters were installed, so I checked online today – and found this website. I'm really not happy that we are being forced to have these meters installed. It's bad enough that we get slow cooked by mobile phone and internet signals – now I have a smart meter 1 foot off my bed head.

[August 17, 2012 at 7:49 am](#)

I am having ringing in my ears, dizzy spells, night sweating, can't sleep at night, cant think, stiff neck, stomached upset and feeling like I am a going to throw up, I want to sleep all day to feel better, bad mood all the time, forgetting things and I thought it was me. this started when they put a earth meter in 1985 on my house and got worse when they installed a smart meter may 12 2010, they refused to remove the earth meter in 1985 and have suffered from then until now and it continues, they finally removed the meter on aug 5 2012 and I felt a little better, but the feelings wont go away, I hear and feel it outside and still in my house, I have seen doctors for the symptoms and they give me drugs which don't help, I am very sensitive to wireless and never had a cell phone or anything wireless at my house, I do not use a microwave oven. I hear and feel it when I enter other places that have wireless, if I leave my house and go to the beach after an hour or so I start to feel better, but when I return to my house I start to feel sick again. I can hear and feel my neighbor's houses also.

They are charging me to remove and a monthly fee on something that is causing health problems, not because I just want it removed for no reason, I feel like this is wrong and don't feel I should pay for extra for this.

140. **Sondra Creed** says:

[August 26, 2012 at 9:32 pm](#)

A man appeared at my door and told me he was going to shut my electricity off for a minute and turn it back on, little did I know he was installing a Smart Meter. I have had major ringing in my ears, stabbing pains on the left side of my head and insomnia. I am ready to crawl out of my skin. I called SCE and was added to teh Opt Out program. I feel we need to start a class action to stop the installation and extortion of funds to keep our health safe from these Smart Meters. I do not feel good nor can I relax at home. I work in a busy Emergency Room and feel it is safer for me to be there than at home now. Our dogs are getting sick since we moved here one has lumps all over his skin the other one in his throat. They were perfectly healthy when we moved in. I feel totally violated with SCE being able to walk onto my property and install a device that has not been researched to benefit their needs and not the needs of the consumers who have to pay for them. Last night I was so frustrated I wrapped heavy duty aluminum foil around my head and slept that way. Today I double wrapped the entire cabinet with foil and covered the meter hoping that will stop the ringing in my ears. I've called and I've written to get this thing removed. We need to start

fighting for our rights and our health. I'm healthy, what right do they have robbing me of my good life??? I want it removed immediately.

141. **bryan nolen** says:

[August 28, 2012 at 3:40 pm](#)

If PGE wants to charge a customer to OP OUT because a serviceman needs to come to your house to read the meter, then they should also DISCOUNT the customer that same amount who is willing to have the meter installed because a serviceman DOES NOT have to come to your house. If PGE claims that these WIRELESS RADIO FREQUENCY METERS are safe to your health, then they should also agree to pay any customer's HEALTH expense and legal fees if they incur a HEALTH problem.

Well I am feeling a a little better but still hear it and feel it – also strange but my floor is vibrating now also! Its been almost a month with a spinning old meter, after filing a complaint with the PUC, edison Corp called and had a RF Engineer call me ( if you want to call them and get a reading there SCE california number is 800 200 4732 this is a free service they offer all SCE customers – I said I would think about it and havent called yet, ) and they are willing to do a RF EMF Survey on and around my house, my meter is also wrong, I use killawatt meters on everything in my home then add them up and the new meter is almost 100 KWH to much after 30 days, I am filing another complaint with the PUC when I get my bill!  
you must go to the PUC web site and file a complaint with what everyone is saying here and then you will get the ball rolling, DO NOT give up – keep filing complaints untill this is resolved! I will never roll over and kick my feet in the air and play dead!

I need help please. I live in Ohio and they just installed a smart meter. I told them I didn't want one, but they did it any ways. I am the only person that has one. We in the country and I feel like

they did this on purpose because my old meter was broken, when we moved in this house. How can I get this Smart Meter removed?

145. **George Shaver** says:

[September 22, 2012 at 12:41 pm](#)

I understand from SDG&E, my electric company, that smart meters was installed in my home in April 2011 or about a year and a half ago. I was not notified about the smart meter installation and was not able to avoid it's consequences. I can see now that the 12 smart meters installed on the wall of my bedroom has been the cause of the health disaster that has befallen me. Prior to the SDG&E installation, I was a post polio survivor and I used a cane for improved mobility. Now, a year and a half later, I'm confined to an electric wheelchair that I need 24/7 hours everyday. The only exception is when I am sleeping and when using the toilet. This disaster has befallen me because of the 12 Smart Meters that were installed on the outside wall of my bedroom.

My history of this issue began 6 years ago when I became sick from my cell phone. Because I was able to choose not to use a cell phone, I was able to avoid disasterous health consequences from exposure to RF Radiation. Unfortunately, I was not able to avoid these same microwaves that are radiating from 12 smart meters installed to the back side of the wall in my bedroom.

Can i persuade you to help me with my law suit?

We live in a two-level townhouse that we own in Langley BC within a 24 unit complex, and our situation is slightly different. In October 2011, we asked BC Hydro to be exempted from a smartmeter, and the strata council was aware of this. We never received any response from both of them at that time. In January 2012, while boondocking in Arizona, the then strata council president let BC Hydro enter the site and install smartmeters in two locations: thirteen in an electrical room next to our unit, and eleven somewhere else. There are in total 25 meters because one is for the common area streetlighting and the electric gate. But in the middle of these 13 smartmeters they did not touch our analog meter, as a "lone ranger". We returned home at the beginning of March and have been in poor health ever since, with insomnia, muscle pains and heart palpitations , which we never had before, so that we need to avoid our upstairs living room and our downstairs hallway on that side of the townhouse. We cannot really complain to BC Hydro – because they could counter that they allowed us (for now) to keep our analog meter. But we receive all the negative effects from the 13, within 2 metres of our private property! Our family physician just blurted out: "Well, then you have to move!" Where to? We are around 70 years old and have three married children and nine grandchildren close by.

151. **Tammy** says:

[October 21, 2012 at 3:25 pm](#)

I refused to let SCE's contractors come in to install the smart meter, but when I started feeling tired and irritable, and having ringing in my ears a lot more often and my hair started thinning tremendously I wondered why, thinking it must just be hormones. I went outside my house and sure enough, SCE's contractor had broken into my gate and trespassed to install it. I had been feeling this way since about mid August, but didn't notice it was in until a few weeks ago. After reading up on it, I'm thinking that all these recent changes in health has a lot to do with this stupid smart meter HOW do I get rid of the darn thing? I also have 4 kids, I don't want them exposed to the unnecessary transmissions several times a minute. Is there anything I can do?

152. **admin** says:

[October 21, 2012 at 4:21 pm](#)

Call SCE to remove it.

I travel a lot and have another residence (owned, where we are still fighting not to have smart meters installed). However, at our rented apartment in town (one of 13 in the low rise, older building) my work desk is located within 8 feet of the smart meters for the whole building, which were installed almost right below, earlier this summer. This is a brick building with wood interiors—with little or no insulation between floors and no metal screens, for sure. We were away for most of the summer (including when they were installed) and I was traveling out of town for much of September and part of October. However in the past few weeks I have spent much of my time at my desk and also sleeping within 20 feet of the smart meters. I have a history of good health. Recently, though, I have begun to have unbearable ringing in my ears and am frequently nauseous. I never had problems sleeping before but now wake after just a few hours. Working and concentration have become a real challenge ... I have lost my appetite and now have no interest in cooking, once a passion. We are long time residents of this building, with great neighbours, and have no desire to leave. I am planning to move my work space asap. As I'm travelling again soon it will be interesting to see how much or if the various symptoms subside ... I don't know what action we can take short of moving, although we may start by requesting the landlord to have the room screened in some way, which it is not right now.

I have been severely suffering the same effects as many of you for 10 months.

I do not know how I am going to be able to work.

We did put foil around the meter and on the inside wall the meter is against and it did help quite a bit, but not completely. We also grounded the emissions to the ground after putting up the foil.

Although it is not a solution as removing it is, you all might want to put foil up.

156. **Valerie Fearing** says:

I live in the state of Victoria in Australia. The Victorian State Government has tried to force smart meters into every household BY STEALTH and DECEPTION. I have refused installation and have locked up my meter box. When the installers came and left my place they then went up and down my street and managed to talk their way into installing smart meters in all the other houses including my next door neighbor's house. Two weeks after these installations I started waking up with the presence of a mild headache in my forehead. This was over 4 months ago in August of 2012 and this headache has remained with me ever since. It just doesn't go away. Sometimes it intensifies and becomes debilitating and sometimes it eases but it's presence is always there. I am now very easily irritated by trivial annoyances and tend to react in a hostile fashion. This forceful imposition of smart meters using this dangerous technology is sheer criminality. I previously had no history of head pain whatsoever and now every single time I wake out of sleep the first thing that I am aware of is the presence of pressure and pain in my forehead. Thinking of the problem just in terms of transmission signal strength could be a a deception. I think the problem involves many other factors than just the strength of the wireless communication signal. I think there is something particularly sinister in the physics of the smart meter transmissions, almost like a secret language that has a way of speaking to the brain. It would have to do with transmission fequencies, wave forms, harmonics etc etc and also the pulsing nature of the exposure with smart meters giving off short sharp but frequent bursts of wireless communications. I am not sure where any immediate relief is going to come from. People here are writing to the Victorian State Government expressing that they are having these health problems and pleading that the rollout of smart meters be stopped and the govt is sweeping all these people under the carpet. They just ridiculously hide behind and keep spilling out the same line that "the meters are safe they are within Australian

Standards”. The only thing this means is that if you are exposed to a smart meter for 6 minutes, you won’t be cooked. It’s totally irrelevant and it’s an insult to people’s intelligence. The people of the state of Victoria have been sold down the river by these criminals that happen to run their State Government.

Shortly after a Smart Meter was installed on our home, my mother and I began having problems. The meter was on mom’s bedroom wall so she started feeling ill right away. For FOUR MONTHS I took her to her doctor AT LEAST every other week. Mom became extremely lethargic. She suffered major muscle pain, dizziness, confusion and headaches. She was rarely able to get out of bed. Her doctor order blood work nearly every time we saw her. She had xrays and a CAT scan done. They could find nothing and insinuated she was ‘just old’. Before the Smart Meter my mother was a vibrant, active, 85 year old woman. I suffered headaches, sleepless ness, irritability and depression. Out of desperation I started searching the internet and thank goodness I found an article about the Smart Meter. Not really knowing if it WAS the meter but at my wits end, I called to have it removed. It took several phone calls, I had to pay \$75 and an additional monthly fee. When I ask about that I was told they must now employ someone to read the meter. OH MY GOSH!! They are going to have to give someone a job!! The man who came to replace it made derogatory remarks to me as well but, as soon as it was gone, mom and I started to feel beter. With in a week or so she was ALMOST her old self. I do believe she suffered permanent damage as she is NOT as vivacious as she was pre Smart Meter. This is WRONG. It is known that these meters cause damage. And to pay EXTRA to protect our health?? What is going on in this world.

For me, I think the “wake up call” has been loosing 2 pets to cancer & having one operated on for cancer in less than a year.

It was approximately 4 years ago when the meters were installed. Since then, there has been an issue with cancer (pets above) & my daughter & I have continued to suffer with numerous health issues.

I had heard that the meters cause problems, but didn't really start thinking about it until I lost my cat 2 weeks ago. It seemed more than odd that I'd have 3 pets with cancer in less than a year.

We have sleeping issues, severe headaches, eye & ear pressure, sinus issues, bloody noses, leg cramps, body aches which include skeletal aches, dizziness/vertigo, concentration issues, chest pains & pressure, etc. It makes me wonder what all my pets must be feeling like.

I want the meters banned & we definately shouldn't have to pay a fee to have an analog meter installed & a monthly fee to have it read. Why should we have to pay a fee to a utility company in order to maintain our health?

Shortly after our old analog meter was replaced with this "smart" bastard, my mother began acting...erratically. Forgetful, sick, even delusional at times. She was diagnosed shortly thereafter with dementia, possibly Alzheimer's. I've felt light on my feet at times and dizzy. I checked the

house for a defective furnace exhaust, gas leaks, etc. Found nothing. Everything points to this bastard new meter. For what it's worth, our house is 100% Wired as in we use landlines, wired dial-up Internet, no routers, Nothing.

I want this thing removed!

166. **Terry Maness** says:

[March 20, 2013 at 2:07 pm](#)

I have complained for three years about ringing in my ears. I over all had good health. No complaints except the normal colds. Well last year I had an CT, MRI done due to severe head issues "clogged as tho so full it's going to pop". I had fought our electric company over their NOT installing this smart meter, threats of this 75.00 fee and paying 10.00 extra a month for NOT having it. We do NOT have this meter on our property but well well well, our electric bill decided to triple since fighting them and our winning. But not my health. I find that neighbors have it and basically all over they have these things. So what now?????

167. **Terry Maness** says:

[March 20, 2013 at 2:12 pm](#)

Oh and yes the MRI shows I have spots on my brain. Never had any problems what so ever. To this day my ears are heck to live with, the head is constantly full and I am off balance at times. Just pray for help and others like myself.

168. **Mia Nony** says:

Those who forget history are doomed to repeat it.

At least those targeted by the Nazis for understood the policy to get rid of them – The only fatal error was that they thought that the term deportation meant relocation rather than elimination. But people who grew up in North America without overt fascism staring them in the face, without a culling policy openly on the books, without 42,500 death camps located everywhere in Europe, these people have no survival instincts and no ability to wrap their minds around just how far the eugenics gan is prepared to take this.

People who have known freedom assume that its price is NOT eternal vigilance. Few seem to recognize what is unfolding here, even when the jackboot is already at their .doorsteps and in their faces.

And that means that they will be far more successful this time, since your own home is now your own personal "relocation" destination, cheaper by the billions.

169. **Richard Cooper** says:

[April 6, 2013 at 10:03 am](#)

Since the smart meter was installed I have experienced heart palpitations, severe leg pains, headaches, UTI's, irritability and other symptoms associated with the meter. My wife has experienced severe anxiety, irritability, painful leg cramping that lasts for hours. Even my dog is experiencing anxiety and irritability and at certain times the dogs in the neighborhood seem to go collectively insane.

Can anyone tell me if there is a law firm engaged in a group lawsuit regarding these meters? This may be the only way to combat them since we are all aware that the PCU really has no interest in requiring their removal.

[April 16, 2013 at 11:18 pm](#)

Since moving into my new home, which has a smart meter, I have developed serious health problems. I built my house and was able to work 14 hours per day, 80 to 90 hours per week, with no problems. After moving in, I began to have serious burning and trembling of my feet and legs. Pain in both arms, numbness in both hands, more headaches and backaches than before, and nose bleeds. They have made my life miserable. I cannot walk any distance or ride a bike any distance without extreme pain, burning and trembling of my limbs.

I have had tests and my neurologist has no answers, and wants to send me to Stanford Medical Center for neuro-muscular tests. I am wondering if anyone has had similar problems, and if they went away when/if their smart meters were removed. PG & E has assured me that they have run numerous tests and found no link to health problems, and no radio waves emitted that are stronger than cell phones or computers.

But then they also said they found no link to cancer and birth defects, and Chromium 6 at Hinkley California either, until it was proven. We know that PG & E lies to the public. So, again, has

anyone found health problems to go away when/if smart meters were removed? If so, please contact me, as my life has become a bit of a living hell. Thanks.

172. **admin** says:

[April 17, 2013 at 10:43 am](#)

Get rid of the smart meters asap and **accept only the true analog**, *not a digital analog meter, not a radio off/out smart meter.*

YES absolutely people have restored their health by reducing their smart meter exposure. You may also have to look for other possible RF exposures in your home and neighborhood and eliminate what you can. Wi-fi routers, cordless DECT phones, use cell phones for emergencies..If there's a cell tower within 1500 feet it could be contributing also, as well as smart grid collectors and repeaters. Usually eliminating what's closest can make a big difference. Keep in touch.

**BTW, PG&E lies!**

173. **Madoce1@Yahoo.com** says:

[April 21, 2013 at 2:01 pm](#)

When a patient has an MRI exam the machine uses RF waves to spin the hydrogen atoms in the human body. These atoms give off a signal which is translated by the computer into an image of that portion of the body. Patients and technologists have reported adverse side effects of MRI systems. Patients have stated that they feel weak and disorientated after the exam. Technologists (including myself) have experienced hair falling out, short-term memory loss, disorientation, weakness and pain in parts of the body. I worked on MRI systems for 3 years and experienced all of the above. On a couple of occasions after finishing for the day and preparing to go home I have had difficulty locating my own car just 50 feet away from the machine. Finally realizing it was my car I got behind the wheel and then paused...trying to remember where it was I wanted to go. I finally switched from MRI back to CT scanning and within a month all symptoms abated and I was back to normal. Radio frequency (RF) waves do have a powerful effect on the body and mind.

After my smart meter was install I once again had similar problems and others as well. Last week I ihad to smart meter removed and an analog meter installed. his week my syptoms are far less sever and I look forward to complete recovery.

174. **Betty Dougia** says:

[May 2, 2013 at 8:07 pm](#)

you are getting sick from the electromagnetic field that the meters, and other devices omit. cops use what is call an electromagnetic impulse gun to do to the human body the same thing the smart meters do. get a gauss meter it will help you find the frequency and protect yourself from it. The American government is testing direct energy weapons on the citizen of this county to see what health effect it causes. google electromagnetic field you will learn a lot. I now have the sickness called environmental hyper sensitivity, caused from living in this field. the cops will target you and use their emp guns on you to make you sick if they do not like you or if you are fighting them in court. THE FCC SAID DO NOT CALL US WE DO NOT CARE IF YOU GET SICK AND DIE.

175. **Betty Dougia** says:

177. **Tekola Nisla** says:

[May 6, 2013 at 10:32 am](#)

Wired systems emit RF radiation unless properly shielded against this. Simply living near a power transfer station or wires will expose you to relatively strong EMF field. Also, utility companies transfer data over the power lines, between transfer stations and the regional grid control. This is called PLC or Power Line Communications. This is undoubtedly what PG&E is using to transfer data between utility AND the meters, especially in rural areas.

If any of them are interfering with appliances they are in violation of FCC rules and as such you can have the setup checked, fixed or removed as a communications interference.

As for the mesh-network. It's far more benign than any other digital transfer protocol, it's simple, it transmits in set bursts, just like a cellphone or WiFi but using far less complex modulation. It is called ZigBee, a common automation and hobby protocol found from your fridge to RC toys to domestic automation. Peak signal power is usually around 100mW. It's not intended for long ranges or high power transmissions. The transmitters switch on and off to communicate when to hibernate and save power. While on they transmit "continuously" just like any other radiodevice. Also this text has a fundamental misunderstanding between a pulse, a signal and frequency. The writer seems to confuse signal encoding, which all telecommunication devices do, from your

modem to my 150W radioamateur station, with communication bursts. The transmitter isn't going off for 2 milliseconds, it's just encoding data at that rate, continuously transmitting for however long it needs to communicate with other meters, your fridge, airconditioning, etc. that you might've connected to the smartgrid.

The data is encoded with either binary or quadratic phase shift keying, that is, the signal sine-wave carrier signal transmitting at 900Mhz / 2.4Ghz (the standard uses both) (900 times a second vs. 2400 times a second). With binary phase-shift keying the modulator shifts the phase of the sine-wave by 180 degrees to signify either a 0 or a 1. and QPSK has four phase-shifts 00, 01, 11, 10, having twice the data bandwidth.

All I see is unsubstantiated anecdotal evidence without sources, doctors reports or even an official diagnosis. Talk of PG&E – or it's subcontractors trespassing but nobody sticking to their rights and calling the comps and raising a case and incredible delusional paranoia over wireless systems.

Your paranoia is and unfounded fear mongering has lead to hypochondria and others to develop it as well.

And if you indeed are a verifiable case of RF sensitivity, please post source material. As of now there is no official diagnostic criterion for such a condition in either DSM-IV or ICD-10.

178. **Tekola Nisla** says:

[May 6, 2013 at 10:44 am](#)

“Mia Nony” also writes incorrect claims. A human body emits several different EM Frequencies. One of which is heat, or infrared, also we reflect light which also electromagnetic radiation. And usually we have some radioactivity as a result of natural background radiation in substances consumed and which form us. In addition, Canadians. You live on top of a uranium field. You have Radon hot spots, which are a very real and far more dangerous health risk than radio/microwave radiation which isn't ionizing.

Also, consider this, your brain emits enough EMF that you can actually perform a low-resolution cat-scan simply by attaching an antenna-array over your head and feeding the signal into a computer. That's your brains electrical impulses impinging upon an external sensor array being read using a simple receiver. “Absolutely no EMF”. With out EMF there would be no humans, there's a huge ball of fusion blasting this planet with energy with the whole EMF spectrum and it's the very reason there is any life at all. Man made signals are a camel fart in the desert compared to sun-storms.

179. **Nancy Chevreaux** says:

[May 7, 2013 at 8:37 pm](#)

I noticed a smart meter was installed at my house I own in Oroville, CA. It is strange because I have a locked gate. Someone must have jumped the fence to install this thing. I was not advised in advance or even asked if I agreed to it being installed. These power companies seem to be above the law. I know that if you are a tenant, a landlord must give 24 hours notice to enter your property. I am just confused...and now I am reading about all these side effects from the smart meter. My main concern is the entering of personal property without prior consent and not given a choice to opt out.

Nancy

Tekola Nisla, if 100s (most likely 1,000s or more) of people around the world are feeling and have felt (sometimes/often extremely) sick because of wifi smart meters, I think that's a huge problem(!) There should be wifi/wifi-smart-meter-free zones in every country so that people who are sensitive to wifi smart meters and other wifi can have a place to live and exist without wifi of any kind, the way life used to be back in the 20th century/1900s. Smart meter (and wifi) activists like Dafna Tachover, Liz Barris, Dr. Magda Havas, Dr. Barrie Trower, Dr. Henry Lai and numerous other people have said that wifi smart meters and wifi can seriously physically harm people and other organisms. This is real and has been going on for years. Wifi smart meters and wifi are nothing "like the sun" because wifi and wifi smart meters have only been around since the 2000s and 2010s I believe. "Modern," "current" and "trendy" does NOT necessarily mean "good" (and sometimes/often it's not). I pray that wifi/wifi smart meter sufferers are given a place to live without wifi (like there is apparently in Green Bank, West Virginia I've heard).

181. [MLC](#) says:

[May 16, 2013 at 8:18 am](#)

My name is Marguerite LaChance and I would like to tell everyone about the health problems I had after the so-called smart meter was installed on my house.

In May of 2011 the meter was placed on my house without my authorization and with no notice or warning of all the health hazards. Around that same time, I remember that I started feeling tired all the time, getting very dizzy, I started passing out and was having chest pains. I started getting very weak and needed a cane to walk around so I would not fall; but I fell, many times.

My Doctor started treating me for vertigo, with no results.

In March 2012 I passed out again and fell to the ground, because I was so weak and dizzy; the paramedics brought me to the hospital. I was in the ER for a day then transferred to the intensive care for a day, and then I was another day in patient care. They did all kinds of test and blood work but found nothing wrong, except that my heart rate was low; but attributed that to lack of oxygen. So they sent me home with oxygen bottles, which I had to use day and night, but it didn't help.

The chest pains were getting worse, no one knew why. I was in and out of the doctors' office as well as the hospital, having test after test and endless blood work. They could not find anything wrong; at this point the pain was going up to my neck and making my left arm numb.

Then my Dr. did some very intrusive test, and found no answers about what was wrong with me and finally suggested I go to see my cardiologist. They ran more tests and did more blood work but all they could tell me was, my heart did not cause the pain.

I felt like I was dying, but no one had any idea why. I had no life in me, dizzy, headaches, chest pains, weak, couldn't breath, and I needed oxygen all day long. Every living moment of my life was agony, I really though it was over for me, and there was no help.

At this point my son Robert started doing research on the Internet and discovered that other people were having the same health problems. Robert printed many articles for me to read that were written by professionals and Doctors all around the world. These articles are telling people about the problems other people are having from the smart meters.

My son called CMP and asked them to remove the meter and they did so with in two hours, after he told them I had a pacemaker. CMP told us it would cost us \$40 to put back the old meter, even though they took it for free in the first place. They also said, "we would have to pay an extra twelve dollars a month for that." I understand approximately half the state is not on smart meters and they are not paying an extra twelve dollars a month; for the old fashion, safe meters.

I am so very happy to say 3 days after that meter was gone, I stopped having chest pains, and within a week I didn't need the oxygen all the time. My energy started coming back to me and I was walking without the cane. After about a month, I started sleeping nights, no more headaches, no more chest pains, and no more dizziness or passing out falling to the ground. My life is pleasurable again, and I truly enjoy living, Thank the Lord.

I called CMP several times and spoke with at least six different people about all of the issues I experienced. Not one person at CMP seemed to care or even believe me. They are still making me pay extra to live free of the awful effects of their terrible new meter. But I would rather pay them their wrongful fees and live then save twelve dollars a month and die.

182. **Christine Justice** says:

[May 18, 2013 at 6:34 am](#)

I have been sensitive to mobile phones and wifi for a few years and did get a lot of headaches. But only hours after the new smart meters were installed I experienced severe temple pain in my right side and severe ear pain and teeth pain. I have been searching trying to find some kind of protection for me and my children. Does anyone have any suggestions?

183. **Veronica** says:

[May 21, 2013 at 11:35 am](#)

I just wanted to say to all those people who continually state that the smart meters/ARM's don't cause problems, you are lucky if it is not causing problems for you. Not everyone gets cancer, not everyone has heart attacks, not everyone develops kidney disease and not everyone gets electromagnetic sensitivity! Some do, some don't. It would be insane to say, "I didn't have a heart attack from eating poorly, so you couldn't have had a heart attack from eating poorly". There are diseases that affect only a small section of the population—but those people suffer nonetheless. Some in the medical community don't understand the medical problem because it is not taught in school yet. Not having a diagnosis name or the mechanism for the disease does not magically make the constellation of symptoms and the cause vanish. Diseases generally start without a name. There are plenty of Environmental Doctors who are aware of this illness. The people who are suffering from it do not have 3.5 billion dollars at their disposal to show the problem and cause. The industry has unlimited funds to cloud the issue, marginalize the sufferers, and influence legislation. I was told that this was a pilot program in my state of Indiana with opt out options by a representative. However, I have received no other calls or assistance though I have phoned and emailed everyone who is suppose to be representing me. I haven't received any assistance yet from the utilities or the government. Like everyone else, I am shocked by the way this is being handled and shocked by the customers inability to have any say in having a device that is causing so many health concerns and misery. I, myself have spent several thousand dollars on medical tests that simply cannot show that I am affected by the pulse that is emitted every 28-30 seconds from the THREE meters my home . I can only pray to God that we can all join together and hopefully have some leverage against these deadly meters.

184. **Mia Nony** says:

[June 2, 2013 at 12:18 pm](#)

I am at a loss as to why people are not doing something to help themselves. Do they feel they must suffer? ARE they too weak to act to save themselves? Are they not aware that there is only one direction this is going, toward death?

I have a neighbor who did not want a smart meter but who also did not want any conflict with the utility. That neighbour caved in to pressure – and now suffers ALL the classic symptoms of radiation poisoning. Radiation poisoning is not recognized by radiation illiterate doctors. That neighbor's beloved pets are constantly on edge ever since the smart meter was installed, completely altered and anxious.

Instead of prevention or remediation of radiation exposure, that neighbor is only a few months later now scheduled for a craniotomy to relieve skull pressure, blinding headaches, extreme spine pain.

The smart grid is no different than the perfect murder weapon, as no one, doctor or patient, seems able to make the link between radiation 24/7 and the myriad of symptoms of extreme suffering. The exception is those who remove themselves from exposure and notice that the symptoms abate. What I don't understand is this:

In every sense the smart grid is not one bit different than nuclear fall out. The cellular damage is identical, just slower to cause irreversible damage.

If a bomb had gone off, I am beginning to wonder just how many people would shield their homes

and hard shield their home wiring, – even then.

I have nothing but anger for the illegal torture and nothing but empathy for the growing suffering but still ..... unless one is a masochist, would most people, if still able, if doable, not want to STOP it by any means possible?

Unless chlorella and spirulina are taken after cutting out all sugar, as was done after Hiroshima for the survivors, the damage will accelerate.

Unless bentonite clay is taken to bind up the radiation poison in the body, disability will grow.

Unless radiation shielding is put in place until these criminals go to jail for genocide, people will go into sharp decline in ever greater numbers.

Unless people are prepared to use whatever they can afford to use, most importantly house wiring shielding, carbon paint, carbon sheets over meters after utility hours, radiation deflection window screening, double walled foil insulation, metal insect screening correctly applied, etc. (from lessemf.com or somewhere more affordable) .....unless shielding is used to protect oneself from one's own smart radiation emitting device and from the guaranteed irreversible damage caused by it and by all the other meters around one's home, (meaning get neighbors on side and all do shielding, which must be done correctly after ALL wireless is removed from the home), ..... OTHERWISE, this slow motion depopulation will not stop, not until most of the nation is disabled, diseased and dying.

185. **Mia Nony** says:

[June 4, 2013 at 3:59 pm](#)

The following protocol can noticeably ease radiation overload suffering. This is only for the meantime until shielding and removal can occur. However this is not a permanent solution to radiation poisoning, until the source is eliminated.

One of the natural antidotes to electromagnetic poisoning is correctly designed physics aware magnetics, (not the new age pendant type stuff)

These are military grade frequencies and they require a military blocker. Track down an RF choke or electromagnetic filter – the kind they talk about on eiwellspring.com

Depending on the type install the microwave filter or rf choke either at the electrical mast or at the electrical panel. The design must match microwaves to filter out smart frequencies. (poor pity everything biological in nature, with no way to find any shield from this microwave blanket) When researching this, be sure to locate and use military grade filtering.

Dr. Brian Clement, Hippocrates Institute has a protocol for treating EHS.

Incidentally this approach to radiation overload reduction often reverses cancer as well.

– Detox first, using gentle bentonite clay or french green clay.

– Stop intake of ALL sugar and ALL foods which rapidly convert to sugar in the body. Sugar acidifies the body and further predisposes it to microwave induced disease. One tsp of sugar depresses the immune system for 56 hours even without frequencies already doing so.

- Do not take any artificial sweeteners (poisonous) or any sugar substitutes, other than stevia and stevia only in very small amounts
- Eliminate all “white” foods, minimize fried food, shellfish, “hot to the tongue” foods from the diet. This includes dairy. Unsalted butter is fine. Greens are healing. rawfamily.com
- Get rid of excess fat
- Nori type seaweed is anti radiative and is protective of the thyroid
- Remove wheat from the diet due to mould

#### Eat Sea Vegetables

- Spirulina, warning only a minimal amount to begin with, 1/4 tsp. Do not take more than the maximum daily dose of 1 tsp. Only work up to this level slowly as excess will adversely effect bowels.
- OR
- Chlorella – slowly increase up to 30 tabs and then slowly to as high as 120 to 180 tabs in severe cases
- Infrared sauna – 30 to 60 minutes daily – (Sit 4” away from infrared source or radiation)
- Drink PURE water –(not reverse osmosis filtered water as the latter is drained of all essential minerals)  
Drink ½ ounce of clean water per pound of body weight (e.g. 160 pounds = 80 oz equals 10 cups of water per day)
- B vitamins – high quality brands only, such as New Chapter, or Vitamin Code or AOR
- Ionic minerals – Manganese, Magnesium, Phosphorus, Calcium
- Dulse seaweed – buy low salt variety or rinse out the salt
- Take very warm salt baths (use Dead Sea or common salt) for 20 to 30 minutes, best done before bed time. Add ¼ cup of powdered Ginger (least expensive if purchased in Indian markets)

---

Electrosensitivity symptoms can be eliminated in 60% of people and significantly reduced in the rest – Dr Brian Clement

[June 19, 2013 at 12:29 am](#)

I wonder about how autism (now “1 in 50” children has autism I believe, as of March 2013), cancers (I personally know of several/many people who have died of/had brain cancer, and one person I know died of eye cancer), disabilities and other physical/health problems are connected to wifi and wifi smart meters. I believe they are/can be connected, though most people seem to be “fine” with wifi smart meters/wifi, but at least some people are not. Human (and animal) health is about food, water, environment and genetics. Of course wifi smart meters and wifi aren’t the only things hurting human and animal health. It’s also unhealthy food, water, the environment other than wifi, genetics, etc. It’s so shocking that this is happening and not being stopped thus far. Mia gave some advice to try and help those suffering. That’s good, but ultimately, we need these wifi smart meters, wifi smart appliances and wifi to be outlawed. This is all 21st century stuff, like “Agenda 21” (21st century). Wifi/”wireless” itself has only been around for several years I think(?). I hope we see some national/global action taken against wifi smart meters, wifi smart collector meters, wifi smart appliances and other wifi.

[June 19, 2013 at 4:12 pm](#)

This attack on the people simply is part of the New World Order depopulation protocol.

- Wi-Fi/cellular telephony/”Smart Meters”
- hidden artificial sugars
- unlabeled GMOs
- water fluoridation
- sterilizing vaccines
- chemtrailing
- prohibition of Cannabis use
- excessive pesticide residues allowed in food
- Codex Alimentarius
- prime-time TV
- Corexit/Synthia mixed into the Gulf of Mexico
- Fukushima releases

@ Mia Nony – June 4, 2013 at 3:59 pm

**I too am an advocate of Bentonite clay for detox.  
However it only works to remove ionizing radiation,  
not the stuff coming from Wi-Fi/cell phones/”Smart Meters”.**

there doing this to destroy americans if its your health or your property! cell towers are part of it along with smart meters and chemtrails. any electric field that is generated in your home gives them access to spy on you. if its your vacuum cleaner or cloths dryer any electric motor that is on! sounds crazy right, ya, that's what I thought ! do you hear sounds from your walls, like pinging or the t.v. clicking when it's off, or strange noises ,I believe that's echo microwave radar working! I know all the symptom's ,the pain, fog, no energy etc! when your ears are ringing their power is on . I have to say this, it seems not many people are working but I see utility trucks digging up grass belts everywhere and installing fiber optic cable and cameras . new generators and high power transformers being installed in neighborhoods that have been around for 20-30 years why? this is war for the souls of men!

189. **Cathleen Bowen** says:

[July 5, 2013 at 4:42 am](#)

Hi,

I stumbled across these complaints whilst looking for something else. I have suffered many of these symptoms for several years. But the worst thing is that my mum who lives next door had tinnitus, pressure on her head, dizziness and heart palpitations. She passed away 3 months ago. The night she took ill she complained of her usual head pressure and of being more dizzy than usual. Because her doctor had assured us that nothing was wrong I gave her some paracetamol and put her to bed. She then started to scream – o my head it feels like its going to burst.

We called an ambulance – by the time she got to hospital she was in a coma – she had suffered a massive cerebral bleed. She died a week later niver having recovered.

The Electricity metre in her house was changed a few years ago and the house next door was renovated around the same time – probably around the time she first complained of her tinnitus and pressure.

I'd really like to know if this affected mum's health but here in Ireland you get laughed at for putting forward any of these theories.

We cant all be wrong though so keep up the good work.

190. **admin** says:

[July 5, 2013 at 2:21 pm](#)

Hi Cathleen,

I am going to send you an email privately. If you don't receive it please email me. Found this flyer on smart meters from Ireland, so there's resistance starting there.

I am so annoyed that this issue doesn't receive coverage by the "mainstream media" every single week (heck, every single day) – There are literally 100s or 1,000s (most likely many more) of people suffering from wifi smart meters in the U.S. and all around the world (and many/some have been for years), and the national media in the U.S. doesn't cover it? They've been talking about "the royal baby" and Anthony Weiner's, well, you know (Huma (his wife), you could do so much better – You deserve a husband that doesn't cheat on you ("sexting" or otherwise), just like Hilary Clinton did/does), but do they talk about the wifi smart meter health controversy as a (weekly) "top story" on national news in the U.S. and world? Not that I've seen(!) – Fibromyalgia seems fairly common these days, with body muscle pain and weakness/fatigue/hard to physically get out of bed often being main/possible symptoms, headaches, seizures (Lil Wayne, Rick Ross and Kelly Osbourne to name 3 famous examples in the past year or 2), brain bleeding/strokes (in the past year, Bruno Mars' mom died of it, Cathleen's mom (above, on Smart Meter Health complaints) died of it, a member of the band Mumford and Sons had surgery for it, country singer Randy Travis had surgery for it, etc.), autism affecting "1 in 50" children as of March 2013, cancers (including brain, eye, breast, etc.) apparently increasing, etc. – It feels like we are living in the twilight zone in many ways in late July 2013, like this is the new "normal" – Wifi smart meters (and other wifi) can, and have, physically injured and/or disabled (or worse) many people around this world – This is not OK and can no longer be ignored(!)

I cannot believe how they are forcing these things onto our homes when they have never been proven to be safe! I live in Chicago & ComEd is stating we will NOT have a choice and they are going to be installing these “smart meters” on all homes in our area in 2015. They say the radiation is nothing compared to a cell phone or microwave. We told them we don’t use cell phones & have never owned a microwave specifically because of the radiation. They don’t care. They are putting them on and I am terrified for my family’s health!

[August 9, 2013 at 10:45 am](#)

I had one installed in February. They said it’s not a smart meter but an RF meter (radio frequency) and my life has been hell ever since. It’s been increasingly affecting my sleep and the insomnia has been getting worse and worse over time to the point where maybe I get 3 hours now. I also have been getting headaches increasing in severity and frequency. Now my period has stopped coming and I’ve been irritable, edgy, and spinny. I wake up feeling hungover and sick. The DWP says they won’t remove it and is charging me \$30 to have someone come investigate. I was not warned about anything and also was told to get this meter because I had received a \$900 bill (I live alone) for the reason that they couldn’t get to my meter to read it and that’s why I needed a digital meter so my bills would be more accurate. My bills have gone up by over \$100 since they installed it. I used to live in a bigger house and had a much smaller bill prior to this. Something needs to be done!

We live a pretty enviromentally aware, progressive city. We eat organic food, and have flouride free water. And I forsee the next step of this progressiveness will l be decrease use of cell phones, cell phone towers, wi-fi and absolute elmination of smart meters. We have digital meters to check frequency pulsations in our home and in cars etc... while driving in a new digital car while talking on your cell phone is not safe. According to our field meter the waves register so high that the measurement is off the charts. I wonder if this is why it seem like every other person has cancer? Anyhow, PGE told us they will happily remove the meters for \$ 250.00 and the cost every month for a human being to come to our home to read the meter is I believe 52.00 .

San Fransisco basically has a choice if you want smart meters or the old meters The price remains the same. In Hawaii there are no cell phone zones on certain parts of the island to protect children from dangers of EMF waves, so awareness is increasing . See the way things are going anymore we would love to run off into the “Lost Horizon” and get lost in the countryside there .

197. **admin** says:

[August 13, 2013 at 6:11 am](#)

Did PG&E tell you the cost to opt out was \$250 and \$52 a month? If so, this is not true. It's 75 and 10 a month and less for low income. AND we are opposing these fees in a legal proceeding at the CPUC. Sandi

[September 3, 2013 at 11:47 pm](#)

it's september 3, 2013, and has anything changed in regards to the wifi smart meters around the u.s. and world? not that I can see – I still see several of them around my neighborhood and place of work every single day – you really would think that enough people have (loudly) complained (nationally and globally) about these things to get them outlawed, but no, not yet – all we can do is hope that there will be a great “sea change” in the near future and that people will really begin to realize and finally accept that wifi smart meters (and all other wifi) are (very). bad. for. human(and animal). health! this is not “rocket science” (far from it), and a “tipping point” appears to be coming in the near future, with all this wifi radiation pretty much everywhere every single day

I live in NZ in Auckland (boarding) with a friend who is an electrician. Some months ago they installed a new meter which no longer requires them to come into the house to check the reading. Old meter is still on the board.

Siunce then I notced sometimes at night I copuld hear this humming but no one else could, they thought I was making it up.

Lately I been getting headaches at night and for a long while now I do not sleep very well at all. Also I have noted my eyes have detorated really quickly where it is getting to the ppoint I have to waer them all the time. Before it was for reading only.

This is an old house so the meter board is in the hallway and seeing they no longer come into the house I am guessing what they installed is a smart meter. The board is also right outside my bedroom..

The brand on this meter is Elster Metrix and has a digital readout. Is someone able to confirm that this is a smart meter for me please.

The main tenant is not open to listening even though he is an electrician about these sorts of things as he is in this mode where the world powers would not do these things and he thinks I am a conspiracy theorist..Basical thinks I am making things up.

Is there anything I can do to protect myself while living here ?

Any assistance appreciated.

[September 21, 2013 at 9:03 am](#)

You can call the utility to ask if the meter is emitting RF, either wireless or what the industry calls unintentional radiation. You can try reducing other wireless devices already in the home to see if reducing your overall exposure helps. Be sure to complain to the utility, and whomever oversees utility safety. Shielding meters is tricky, and if the RF is in the wiring then the meter should be removed. Know you are not alone.

202. **Timm Slybo** says:

[September 29, 2013 at 1:23 am](#)

If its on your own property, You should make a “faraday cage” cover for the smart meter so that it is completely insulated and the RF signal cannot escape. Its not hard to do.!

203. **HAHA** says:

[October 3, 2013 at 5:22 pm](#)

Smart Meters are ruining my life. I have now been exposed to smart meters in both Indiana and Illinois and have become significantly ill during direct exposure. Having now had more prolonged exposure it takes more time to recover. When exposed, I am disoriented, dizzy, nausea, have significant brain fog and moodiness. I also have major headaches, tinnitus and am unable to sleep for more than 3-4 hours. I have recently discovered with prolonged exposure I have started to have significant chest pain and had to go to the ER to make sure I was having any cardiac event. I have incurred significant financial burden as I cannot live in my own home in Central IL and have been sleeping in my car or a hotel. I also have had to work partially in Northern Indiana but quickly discovered I could not live there due to the meter radiation. My \$500 rent per month in Valparaiso has not turned into a \$1500 rent in Chicago with a daily 3 hour commute and added \$200 train ticket. I still have major issues as my job in Valparaiso still exposes me to these meters during the day and I have had to adjust the amount and pattern of work that I do each day. But I may not be able to control my work load soon and don't know what I am going to do. My symptoms always start upon exposure and always decrease and eventually disappear when I remove myself from them. It is a very clear and definitive precipitant and it is degrading and dismissive when the electric companies tell me that there are no problems from them. Thus far I have been met with resistance and no opt out options.

[October 10, 2013 at 9:01 pm](#)

everyone gets health problem(s), sooner or later – not only is there wifi radiation from wifi smart meters, wifi, cell towers, etc., but I have also heard that the fukushima nuclear disaster from march 2011 could still be affecting the world with nuclear radiation more than 2 years later – I don't mean to be a "negative nelly", but if we can't control some things, we should at least try to control the things that we can actually control, like, oh I don't know, getting rid of wifi smart meters all over the u.s. and world and going back to non-wifi analog meters? who knows what the future will bring (it doesn't look too good now), but hopefully things will get better

210. **Selisha** says:

[October 20, 2013 at 10:02 pm](#)

Hi, my name is Selisha. (My mother suffers from EHS & has been homeless due to smart meters now for nearly 5 months.)

We wanted to ask if you could please add your voice & encourage others to add their voices to a potentially precedent-setting case developing against smart meters, starting here in San Diego with plans to spread out. An attorney is seriously interested in taking the EHS case on to stop all this ridiculous violation of EHS—an ADA-recognized disability. This attorney to my knowledge has never lost a trial & has a strong disgust for injustice, so if he takes the case, this is a good chance with far-reaching implications. He's a personal injury trial attorney who is very happy that EHS is accepted as an illness by the ADA, & he wants to help ordinary people harmed by others carelessness or intentional wrongdoing.

But the office needs as much information as possible (and they are happily delving into it all), particularly from experts, in their own words.

To go forward with a proceeding, Jayme (the daughter of the attorney, who is evaluating all the EHS evidence before it goes before her father) needs 3 things:

1. She needs to speak to EHS sufferers, & particularly hear about how smart meters have driven you or someone you know from a home or in some other way impeded the right to socialize or be at home. (Public settings included as well—stores, offices, transit—however smart meters & wireless has held you or someone you know captive.)
2. At least 1 medical expert in the who can unequivocally testify that smart meters themselves are dangerous and causing the damage claimed. (to corroborate EHS victims' claims) This is important to stem the almost certain tide of power company denial!
3. And another expert who can verify fair damage amounts (settlement amounts, etc).

The attorneys are trying to do this right, and the more people they have to help with these 3 things, the better & the quicker the process.

Please call her (the attorney's daughter)  
Her name is Jayme (619) 236-9696 Her Father's name is Sean Simpson

(Let her know Selisha told you about them)  
<http://www.simpson-moore.com/seansimpson>

Thanks, potentially this can help get a survey together & help more than just one state, but set precedents to stop this ridiculous violation of a valid ADA-recognized disability.

Thanks, please let me know you received this, & please send to ANYONE else who could be of help  
Selisha (858) 571-7181

Hi, this is Selisha. (Mom has EHS & has been homeless for 5 months due to smart meters forcibly installed on our apartment complex.) I'm writing to ask if you know where the newer findings are saying that cellphones & wifi are conclusively carcinogenic? I know before that WHO has said possibly they are carcinogenic, but I keep hearing & I remember coming across new findings saying conclusively & definitively that they are carcinogenic, not just "possibly" or "potentially." I need them for an upcoming submission but just couldn't locate them.

Please let me know or if you know someone who might be able to direct me to these papers...

Thanks so much, Selisha (858) 571-7181

214. **admin** says:

[November 7, 2013 at 2:35 pm](#)

The WHO classification is a 2B possible carcinogen- they have not changed that.

215. **Richard** says:

[November 7, 2013 at 9:56 pm](#)

Selisha (and admin) – Actually, the WHO classified RF radiation as a Class 2B Agent, which they define as possibly carcinogenic to humans... "This category is used for agents for which there is limited evidence of carcinogenicity in humans..."

>> That is what has not changed.

Anyone interested (Selisha?) in the WHO's work and conclusions should first familiarize themselves with the definitions laid out in their Preamble to all that RF work. REF: <http://monographs.iarc.fr/ENG/Preamble/CurrentPreamble.pdf>

I am unaware of any more recent studies or analysis of previous work that even comes close to "new findings saying conclusively & definitively that they are carcinogenic". If any such work exists, then PLEASE let us know.

216. **Paul H** says:

Richard is unaware of the mechanism involved with the slow destruction of mankind due to microwave (300MHz-300GHz) frequency radiation. It seems impossible for some to put pieces of a puzzle together. They are only capable of looking at the finished product.
