Yeah, Paul, some/a lot of people think that universities/colleges/grad. schools/professionals/the mainstream media, etc. have some of the “smartest” people in the U.S. and world working for them – And this is true in some ways, but not in other ways – Wifi industries make billions of dollars every year selling billions of humans wifi products yearly – These multi-billion-dollar industries pay “professionals” in universities, grad. schools, mainstream media, etc. millions of dollars to claim that wifi “cannot hurt people and/or animals” in their “scientific” “studies”, when it is very obvious that many humans (and other animals/organisms) have been physically injured (or worse) by wifi products for several+ years now (including wifi cell towers) – Wifi smart meters are some of the most dangerous wifi products still being forced on millions of people worldwide – I don't know when or if there will be an anti-wifi-smart-meter U.S. and global “sea change” that could possibly outlaw those evil little blinking, pulsing buggers (along with other wifi products), but only time will tell

I don't remember exactly when the Smart-Meter was installed into our home over a year ago, However since the installation of the “Smart Meter” My Family Members, and I have experienced Multiple Health Problems, and can only think that it is related to the Smart Meter.

Within a Couple of months after the Smart Meter was installed I started Experience Anxiety/Panic Disorder, I went to see Multiple Doctors and was diagnosed with Panic Disorder. I also Experience other symptoms on the list like Body pain, but the worst symptom I have had was Anxiety. Oh and I forgot Sleep Problems too.

My Mother which is a Diabetic is also now experience Respiratory Problems, Multiple Urinary Infections, Arthritis Pains, Trouble Breathing, Anxiety, Sleep Disorder.

We both have also had the ringing in the ear thing for me it is very rare but sometimes.

Over the Last 2 months though I have not had as much problems with Anxiety not sure why I was put on Medication but Didn't take it because of the side effects on the meds itself, although the only thing I can think of when this all started is the "Smart Meter" which was installed in my house, I have no problem with Smart Meters, myself, but seeing all the complaints, and no scientific to prove these can't effect our health is the problem, I would rather pay an additional \$5 a month for someone to come out and read my old meter than to remotely monitor a meter with an automated API and risk health problems, or other concerns.

The Panic Disorder was so bad at one time that it could have been life threatening to myself, and others because of this.

I believe that we should have the right to Go back to the Old Analog Meters without any problem to determine if this is the actual cause, I have grown up around Computers myself for over 10 year's exposure to Radiation from Multiple PC monitors, Microwaves, Wireless WI-FI from my modem never had any problem but the Smart Meter maybe causing us health problems and we would like a way to rule this out.

Not sure how to go about asking to go back to a Analog Meter though as I am in Texas, and I read the AEP Site they say we have to be connected to the Smart Meters.

Now I am no expert but I do believe the Smart Meter could very well cause health problems, perhaps it has many factors on a persons Life, and how they live, and proper research should have been done before making the meter have to be installed in everyone's House. I understand the Need for Digital Meters because this is the Digital Age, however I feel there are more safe ways to read a meter like through the Power Line itself rather than having every home broadcast Wide WI-FI signals out of the persons property that could cause health problems, or constantly broadcasting information over wide distances.

I would very much like the ability to OPT-Out and Determine if this is the cause to our family's Health Problems.

[November 14, 2013 at 9:49 pm](#)

All of us have been having too many headaches since the new meter was put in. Our daughter sleeps with the meter on the other side of her head. She wakes up with headaches and nausea. At first I thought it was my imagination. But last year she attended the school year out of our home. At one point I asked her when was the last time she had a headache, and she could not remember. This year she has returned and her headaches are back and getting worse. We are getting a analog meter put back on the house. I have a dull headache most of the time with sharp pains in my head. I hope the absence of the meter corrects the problem with all of us.

[December 14, 2013 at 10:47 pm](#)

I have had similar problems on and off for about a year. My head gets really tight and foggy and sometimes the pressure in my head gets so bad I feel like my head is going to explode. It gets really scary when this happens and wonder if I should go to the hospital, especially when it wont go away. I know this is due to my sinus's swelling. It also effects my eyes and vision when this happens. Along with these symptoms I get a really nervous and shaky feeling for some reason and get a drunk feeling in my head. I also get red rashes and burns on my face, disorientation, memory loss, and confusion. I did some research about these symptoms and have come to the conclusion that it could be electromagnetic sensitivity or electromagnetic poisoning. Just recently my fingers on my right hand started twitching and when I go someplace else it all starts to clear up after a few days.

This depresses me because I just got my Bachelors degree in graphic design and just started a career in this field and I cant seem to be on a computer for more then 10 minutes without my eyes and face burning and my head feeling like its going to pop. I have been given freelance assignments and job offers, but I don't think I'll be able to do it..... So I guess my career is down the drain.

This all started when I moved into my apartment a year and a half ago, I never had problems like this before. I could use a computer as much as I wanted and now suddenly I am so sick and foggy headed all the time. I have heard about living near cell phone towers and having smart meters can make you sick. I found out that there is a cell phone tower a couple a blocks away from me and I am suspicious that my apartment complex is using smart meters. I am moving in a couple of weeks and hopefully I will start feeling better after I do.

So about a week ago I ordered an EMF shielding tent to sleep in and it has been helping a lot but I do have to spend a considerable amount of time in it. If I spend too much time in my apartment without being in the tent I start getting really sick again. The tent makes me feel a lot better and I can sleep really good and it makes the symptoms go away, even the twitching in my fingers.

221.

**admin** says:

[December 15, 2013 at 10:50 am](#)

Once you move- hopefully a good distance (at least 1/2 mile or more) away from cell towers and hopefully away from smart meters, consider reducing your overall electrical exposure. Most helpful is turning off the electricity at the breaker box- but every home/situation is different. Also I have found using a MAC notebook on battery, on a grounding pad, with an extended keyboard and wired mouse really helps ALOT. More ideas here: <http://emfsafetynetwork.org/safety-precautions/>  
Thanks for sharing your experience with a faraday tent. Sandi

**James Ginn** says:

[December 25, 2013 at 10:43 am](#)

This is absolutely amazing. I just happened to catch Joyce Riley's show on the radio this morning and they were talking about smart meters. And then it dawned on me. I have been having trouble sleeping for several weeks with an interrupted sleep which is totally foreign to me as I usually sleep like a log. Also I have noticed that I get these little pangs of nausea every so often that last but a few seconds and appear randomly throughout the day. I have been unable to account for such symptoms as I have never experienced anything like this before and have always been very healthy and fit.

And yes it now makes sense since these symptoms have been going on only for a few weeks and that is about how long the new smart meter from Hydro Quebec has been installed.

When doing a web search I came across this site and I thank you for all the info. Its good to see someone is on the case.

I'm a born again bi-directional transmitter,  
Covertly sensitive & weak.  
No matter how much damage I cause  
I inherit the earth, not the meek.

It's never ever my own fault  
No matter what I do.  
I'm uninsurable, nosy, risky, greedy,  
Yet they're all easy to subdue.

I'm illegal – I arc & corrode wires.  
I'm feared ...yet they imbue  
Me with powers far beyond what  
Any digital device can do.

When I sneak on to home wiring  
Homeowners just cry & shriek.  
They seem helpless and act hopeless.  
A laughing stock for any geek.

I can set home wires on fire  
Faster than one can strike a match.  
I operate remotely,  
Using stealth to data snatch  
And latch on to every move they make,  
For privacy to dispatch.

Luckily they don't catch on  
I possess a unique streak.  
I tend to succumb instantly to  
Certain magnetic techniques.  
A few rotations around my sides  
Make my mother board just freak.

My much touted "power"  
Is actually just a sham.  
Most worry about stopping me,  
And fear my tamper tell all cam.  
They really just do not get  
How vulnerable I am.

The flighty think I'm almighty  
They're just so dead easy to scam.  
Good thing they've never figured out  
How simple I am to jamb.

I had been given a notice in mail a couple months ago that a service tech was to come out and put in a smart meter ! I immediately called them to let them know I wanted to opt out. I told them I didn't want one installed die to my rights to say no ! I started also having insonomia bleeding of nose. Headache etc I received my bill today looked at it and it was almost twice as high as last December and I didn't even put up Christmas lites this year due to the closeness of the holidays. So wow I called nevada energy and asked them why is my bill so high. They said well it was about the same last year I said no its almost twice as much I live alone and she said well after we installed the smart meter the energy has been about the same !!! I asked what you put in a smart meter you jumped my gate ? You entered my property without my permission broke my gate to enter ? Ill file a trespassing charge now because that is called breaking and entering she told me they have to have access to their equipment !!! They never had the right to enter more did they have to because they could just look over fence to get meter readings. So if I'm out of line someone please call me. 775-843-7685

228. **admin** says:

[January 8, 2014 at 3:19 pm](#)

Outrageous. contact this NV group: <http://www.trueemfsolutions.com/contact/>  
I doubt you can get them on a trespassing charge. However document your experience by making a declaration.  
You should be able to call the utility and opt out. Or tell them you never consented to having a transmitter on your home and tell them to restore the analog meter at no additional charge. Good luck.

229. **Polly** says:

[January 13, 2014 at 3:55 pm](#)

Shortly after my SM was installed I started having severe itching in my ears. It feels like bugs crawling inside. I never had headaches until the meter was installed. This has been going on for almost 2 years now. In the past 3 months I had 2 double ear infections. I never go to the Dr., but had to go to Urgent Care for the infections. I told the Dr. it felt like bugs crawling inside my ear and he couldn't explain what was going on. He asked me what a Smart Meter is??? My electric Co. won't change the meter and if they did, I am afraid my neighbors meters would affect me as

well. I am miserable. My son is also suffering from the RF. His ears are bleeding and he has pains shooting thru his head. This is so cruel. What are we suppose to do. Pack up and leave our home and live in the woods. That's what I am about to do. We are being tortured.

[January 20, 2014 at 9:56 pm](#)

I am wondering if people with mercury amalgam fillings are more sensitive to smart meters, in general. If you have mercury amalgams, you could join the frequent-dose-chelation group in Yahoo, and post your story. <http://health.groups.yahoo.com/group/frequent-dose-chelation/> If you can not get away from a smart meter, try shielding, especially your sleeping area. You can buy cheap aluminum mylar "emergency" blankets to provide some shielding. Website <http://www.createhealthyhomes.com> has useful information.

231. [how to get rid of tinnitus](#) says:

[January 21, 2014 at 7:17 pm](#)

As opposed to adults, the elderly are much more vulnerable when it comes to developing tinnitus symptoms. Apart from their age, the body systems of the elderly (primarily their senses) are already vulnerable to degenerating.

Chances are they already have an altered smell and taste, probably have hearing difficulties, or probably have vision problems.

232. [Paul Vonharnish](#) says:

[February 1, 2014 at 8:27 am](#)

To all those complaining here, and the other 5 billion who are being intentionally snuffed by electromagnetic radiation devices: Get a weapon. Learn how to use it. When they come onto your PRIVATE property to install their death machines, open fire. If you think governments will ever protect you from these thugs and their snuff machines, you are brain dead already. Smart meters and smart devices in general, have only one purpose, which is to kill off the "worthless eaters". Fight back with every weapon you can lay your hands on.

233. [charlie](#) says:

[February 6, 2014 at 9:45 pm](#)

Yes, radio waves do effect amalgams. In WW2 the radar personell had to replace theirs every couple of months. mercury is also loosened when you visit the MRI.

I am trying to think of possible solutions to this radiowave problem, i sympathise with all of you (i too am severely sensitive to a specific type of radio wave that i dont often come accross... mobile

phones do not effect me much and i dont have smart meters in my area). Im not a professional with radiowaves but have a little electronics experience.

We know that microwaves heat water. Therefore water absorbs microwaves. Install few fish tanks into the room you cannot use. (No fish please). Build a strong wooden structure to hold them (see next about risks of metal bolts). Although i feel it may not work that well. Adding salt should cause the wave to conduct through (bad).

Next is antannas. There is an invention called “chaff”, this confuses radar when the bits of foil are dropped from a plane, because the foil is cut to a specific length (half the wavelength travelling at the speed of light) to retransmit the signal. You will find something similar encased in a plastic lump sticker on shop items, when they pass through the sensors, the red lights turn on and the alarm sounds. We are told the meter signals are 2.45Ghz and 900Mhz. therefore the chaff for 2.45G is 5.9014cm (2.323 inch) long and 900Mhz is 16.65cm (6.557 inch) long. If you have any metal object in your house that are these lengths or a multiple thereof, you should trim so they do not become emitters. I first heard of chaff when someone said you can use it as a passive WiFi extender. In the video about the YAGI antanna, bars of about this length are added to focus the RF energy.

<http://www.youtube.com/watch?v=lsIHtCUSfN4> (about the YAGI antanna and the dipole antanna), the video is slightly broken.

In order to absorb some of this energy, one of the simplest things you can build is a dipole antanna, which is not unlike the chaff.

diple antannas consist of two wires end to end, between them is the load. The load can be a small torch light bulb (if you want to see it, and want to replace the bulb when it wears out). You can buy little blinky things for your mobile too, but these dont absorb much energy. The total length of the two wires are the same figures mentioned earlier. you can zig-zag the wires if you need to fit it into a confined space like your meter box (not sure about coiling, like onto a pen shell, maybe). the 900Mhz is seemingly on the 2G mobile phone band, and 2.450Ghz is about halfway between WiFi channels 6 and 11 (You can tell me if your meter is transmitting on both frequencies by installing both sizes). I dont think you should copy the YAGI antanna, having the elements which are designed to focus what comes from the transmitter. simply make a bunch with bulbs on each one.

My questions:

\*I dont know what sort of load is best, if you make it a short circuit, you will only get a reflector, in fact you can find a radio receiver by the little bit of signal it does reflect. More than likely this has something to do with the laws of thermodynamics.

\*And i dont know if you can deviate from the design slightly: should you have a number of half lengths in parallel with a singular load?

\*should you install multiple units oriented in each axis, X,Y,Z?

\*should you vary the lengths a bit? perhaps +/- 1%

Finally, let me tell of something i did when i was younger on the school bus, which should help everyone:

I brought a little radio with me on the bus and sat near the bus driver. I found that if i tuned my

radio near the station of the bus's radio, the bus's radio would fade. From memory, it was slightly off frequency, rather than right on the station, which i thought was odd.

Summary:

Use the dipole antenna in the meter box. you can probably use a resistor (an electronic component) to replace the bulb, but check with a second unit with a bulb that the resistor is not adding to the length (it shouldn't), and should respond the same when brought together as if you had a bulb on it (two bulbs needed for the experiment). Conduct the experiment at night if the bulbs do not light. A camera without an IR filter can see heat before you can and also make sure that the bulb was not destroyed. It may best to have something near your body also, since we know that it can drain all the radio waves in a small vicinity around it. If you hear noises, instead of the dipole antenna, try the chaff, it may actually mute any hum completely. One person here wrote the noise they hear is associated with the trains, so it's seemingly an instantaneous measurement of the electromagnetic noise you are in (and you should be able to detect if it is better or worse). Why the chaff? The thinking is the laws of thermodynamics, for every action there is an equal and opposite reaction. Because i had my radio near the bus, it was sending out a signal to cancel the waves being received by the bus. Even in the video link, the reflecting element of the YAGI mutes the signal. The chaff, being a short circuit, completely mutes anything nearby because of its ability to retransmit the signal.

Well i hope this helps someone, even for the development for proper shields... enjoy... and if you are in a building with heaps of meters enjoy your personal sun bath! (although there may be negative ramifications for "sabotage").

Other melatonin research trails involve blue light before bed (look that one up).

234. [charlie](#) says:

[February 7, 2014 at 3:25 am](#)

Following on from the previous message.

If you intend to use LEDs instead of a lamp, ensure that you use two in parallel and facing opposite directions, because a single LED has a finite reverse voltage, two LEDs clamp the voltage low. Even with this precaution, they can be cooked much easier from too much power. I suggest greater wattage heatsinked ones but still no guarantees.

an alternate link to the previous video shows the making of the lamp antenna:

<http://makezine.com/2010/02/03/seeing-radio-waves-with-a-light-bul/>

here is a link about another handmade dipole antenna including the simple formula:

<http://antirez.com/news/46>

The WIFI function of the meter is likely to control in-house things (for example Google's 'smart thermostat'), therefore both transponders would be active. And perhaps is the motivation for charging people 9% more for their power for keeping their old meter.

Some recent computer processors (yes, CPUs) come with a 3G transponder for security (anti-theft) and possible remote activated system updates (since Jan 2011, although not all of them, and I'm still not sure if you can trust the CPUs that are "fine"). The public is only aware of Intel products, AMD is not known. I am not sure when it gets used.

Finally, about fires: For all we know, these house burnings are deliberate – that is, remote controlled. If you had a firecracker attached to your house, what would you do to protect your investment if it were to ignite? But when I read about these, there isn't any information about the current going through them at the time. If excessive and prolonged then sure it might burn (it may even be the fault of the installer), if all you have is a fridge running then it could be more sinister, because these things are supposed to be rated for high current (the conductors are supposed to be large), and with a singular bad connection, the large conductors should heatsink the heat.

You can tell a very bad connection by doing this. Measure the AC voltage using an RMS meter designed for mains AC (cheap meters have a warning to not use on mains and are not RMS), then have your wife cook. Measure the voltage again and that would be your voltage drop. If your cooktop has 600W elements that would be  $600W/110VRMS=5.45A$ . You see a 16VRMS drop then 87W is being lost somewhere (and assuming power factor = 1). If you are in a rural area far from anyone, by yourself on your own power pole transformer then this will not work as well unless you have a number of other loads occurring in the building. Better is access to the Grid side (because the transformer windings have a finite resistance). If it burns after your test (which found perhaps only a 5W loss) then it may not be good news for anyone.

If it uses a solid state relay for disconnecting you then that's an additional problem, the voltage will drop from being turned "on" will consume 1-2% of the energy intended for the load (SSRs have a 1.1-1.6V drop, in addition to a resistance that increases with heat, in other words, the possibility of thermal runaway). Some sources recommend "semiconductor" fuses to protect SSRs in the event of a load short circuit. If you have the normal filament type of fuse (rather than circuit breakers) used with older meters, then it's of little surprise the meter burned out instead of the fuse. Therefore a possible reason for the fires is previously the fuses only get warm. Upgrade to circuit breakers. If the conductors were poorly connected to the SSR then there is an increased possibility of a fire. I don't think a bad power factor would contribute to a fire (provided there is not much other load) but may (likely) contribute to your bill (not sure if it would be called your "peak power consumption").

"SCR-output devices can be expected to fail short at high temperature, while MOSFET-output devices can be expected to fail open." Here, "short" means the load remains powered. The latter can fail part conducting (can heat further).

SSRs are said to produce EMI but I assume this only occurs when switching, because I can't find anything.

237. **Mark** says:

[March 23, 2014 at 8:04 am](#)

Moved to South Carolina from the UK in late 2011 and rented an apartment in a nice complex. I do not know if smart meters are installed but I suspect they may be. Moreover, every apartment, and there are about 300 of varying sizes, have wireless internet access. There’s a cell tower that I can see from my living room window. The local airport is about 3-4 miles distant but the aircraft noise isn’t that bad.

I considered myself to be a pretty healthy person. I watch what I eat and drink and all that good stuff. I’m able to work from home a few days a week but I’ve been avoiding that. I started to develop problems with my concentration and became easily fatigued. My sleep is frequently disturbed and I’m getting vague aches and pains all over my body. I have started to feel quite lethargic and have lost interest in things that I formerly found pleasurable. It is quite categorically not depression for when I leave the building for any length of time, the symptoms markedly recede and I feel much better.

I’m moving away next month to a more rural environment which I hope will be beneficial but the only thing that I attribute my symptoms to is exposure to massive doses of EMF.

238. **admin** says:

[March 23, 2014 at 1:31 pm](#)

Some buildings are “sick” with EMF’s from bad wiring. It may be electrical fields, and magnetic fields in addition to wireless. You might consider getting a Trifield meter and a cornet RF meter and measure any new possible place, before you move.

239. **Debbie** says:

[April 8, 2014 at 8:49 pm](#)

Do you want to defeat the smart meter without vandalizing the box ! It will drive the utility company nuts. As they will not be able to read the box anymore. Not will you get hit with pulsed radiation....Wrap it in foil. Yes ordinary kitchen foil. You are effectively building a faraday cage which shall block all electric magnetic radiation emission.

Another solution is a metal trash can. But everyone has foil, it is cheap and does not damage the meter.

I would not recommend this for electrical boxes unless you are very careful. But gas, it works perfectly.

If they will not remove it, wrap it up... Goodbye problem. From your local computer engineer...

See:

<http://www.thesurvivalistblog.net/build-your-own-faraday-cage-heres-how/>

Smart meters, two of them, were recently installed on the rear of my daughter’s home in Michigan. My grandson started having grand mal seizures, we believe as a result. He had been living at another location with no problems but as soon as he moved in to where he is now, he started having grand mal seizures. My daughter, his mother, is having daily debilitating headaches, as well. She is paying to have to pay to have the smart meters replaced with analog. Another problem is, the next door neighbor’s smart meter is facing my daughter’s home right where my grandson’s bedroom is, maybe twenty feet away if not closer!! He was getting pulsed with three meters, simultaneously, one for gas the other for electric!! I’m sure the whole neighborhood is alive pulsating with these waves. He will have to move. His life is in danger from having the grand mal seizures. He stopped breathing with one of them and unresponsive another recent time, each time going to the ER and even staying in the hospital for a couple of days. The medication destroys the liver. This is a horrible situation!!

241. **Heather** says:

[April 23, 2014 at 3:21 pm](#)

Thank God I finally figured this out.

For the last 2 years I have been trying to figure out what's wrong with me. I was living in Los Angeles and Ojai. In LA, I felt fine. When in Ojai, I woke up all night, headaches, brain explosions in my sleep, (very scary and had never knew those existed) balance problems, facial flushing, depression, confusion, hard time finding words when talking, etc. After 8 doctors, MRI's, blood tests, getting tokd I could have cancer, etc., my neighbor helped me figure it all out. Reading these posts confirms it. It was this horrible Smart Meter.

The Smart Meter was removed 4 days ago. Already feeling better. Not back to normal yet but headaches went away right away, facial redness all better right away, eye sight no longer blurry, no numb hands when waking up. No pain in elbows. Sleeping well again.

There's is something that needs to be done about these Smart Meters. Most people have no clue how bad they are for us. I'm thankful for all of these posts. I hope something will be done for those people in states that won't take out these meters.

242. **Lynelle** says:

[April 25, 2014 at 1:03 am](#)

I have a solution!!!! (read on...)

I was relieved to see I am not the only one with these strange symptoms. I can't believe how many posts are on here. It's phenomenal!

I just happened to see a post about Smart Meters on Facebook last week (Apr 13, 2014)—a youtube video called “\* DANGER\* Smart meters being installed by global utilities....UN Agenda 21 \* DANGER\*” and another called “The Dark Side of Smart Meters.” VERY enlightening! I went down stairs from my 2nd story home office, and checked the meter on our house to see if it was one of these Smart Meters. It's located just under my home-office desk outside the garage wall. It was. Didn't think anything more about it.

I had talked to a M.D. at urgent care a few weeks earlier because of frequent and recurrent arrhythmia, palpitations and chest pains. I didn't connect the extreme DIZZINESS, balance problems, malaise, trouble forming words, fatigue, pain behind my eyes, irritability, endocrine problems, learning problems, and head pain to the heart problems, however. It was a week after viewing the videos, that I sat down at my computer and within 10 minutes began getting that dizzy feeling again...and exhaustion. I had woken up that morning feeling energetic and motivated—ready to tackle the office and the world! But that all got flushed when I sat at my desk to begin work—and felt awful in short order. It was then I had a lightbulb moment.

I searched for that youtube video and after re-viewing the video, called the electrical co and learned they would change it out for a mere \$10, but then would also FINE ME \$5/mo for not having it. What?!? So I wrote letters and also called the California Public Utilities Commission and was directed to a Smart Meter Hotline...where all I could do was leave a message. My complaint was that I was NOT going to pay a FINE for NOT having something I never gave

permission to install anyway! It's been on my home since Dec 5, 2011.

I talked it over with a couple friends. One found a DIY solution on youtube. <http://youtu.be/CwzeMOH-Jl4> “DIY Smart Meter Shield: light-duty, temporary, portable” I told my husband about it, and we decided to try it. The ready made covers are \$100-200, and besides, I wanted something RIGHT AWAY! So we went to Lowe’s that night, got the materials covered the wall behind the meter inside the garage and I crafted a cover for it and slipped it on before bed. In the morning, I felt so much better! And I felt great all day for the first time in years. My husband said, “I like this new woman I’m married to!” Why? Because I am now witty, bubbly, energetic, productive, even tempered and rested.

We also ordered a tri-meter to test the change in output. I plan to go to all the neighbors and alert them to this hazard. I will MAKE the little covers for them and offer them at a reasonable cost, just to reduce the EMF’s surrounding me from these hazardous little radiation producing body-roasters.

Lynelle –

Though shields will reduce exposure, they won’t eliminate it. People have had symptoms return over time. Your symptoms are very serious, and symptoms tend to increase with increased exposure. For instance, if you have wireless internet in the house or use cell phones, you are increasing your exposure, and may notice symptoms you didn’t have before when using them. This is in addition to the continued Smart Meter radiation.

Take Back Your Power <http://www.takebackyourpower.net> is a great movie with information on the many problems with Smart Meters, including electrical fire danger, surveillance aspects, and the risks of hacking. Inviting your neighbors for a movie night, many may decide to give the utility company an ultimatum to remove the Smart Meters or you will replace them yourselves.

Jerry Day has these videos, one talks about removing and replacing Smart Meters and he has forms to send to the utility company.

<http://emfsafetynetwork.org/?p=6562>

What I would do is hire one or two companies to come out and read the radiation levels in several different areas of your home. If you want to start cheap, I found this...

<http://www.lessemf.com/rf.html> But what you have to remember is that the goal here is to bring the utility company into litigation, and once you have proof from a company that knows how to measure radiation, any lawyer should take your case pro-bono, after all your under attack. You will have to find out exactly what time your meters upload data cause what I'm reading is they only do it for 90 seconds between 3-4 am in the morning. For such a short time of radiation, it would have to be a whopper to be affecting people the way that I'm reading on here. It's to my understanding these meters only upload data once a day.

The only thing I have ever suffered from was cell radiation back about 2000. It was my first cell phone and I started to have problems with my eyes twitching. I lived in a rural area which means my cell would be automatically switched to max output to hold contact with the tower. The eye problem persisted and eventually got worse, and I went to an eye doctor and they told me they would give me a steroid shot in the eye, and I said screw that. Soon I developed heart attack symptoms, I would double over, hard to breath, and rush to the window trying to get fresh air. I thought it was carbon monoxide and bought testers that proved me wrong. In a weird stroke of luck I had stopped using the phone for two weeks, and soon realized that all the symptoms went away. Weeks later my wife needed a cell so we could move to Spokane and look for property, and I warned her what it did to me. She hooked it up, and used it for a few days and her eyes started to twitch like mine had.

Keep in mind that cell output is suppose to be the same as those wireless meters, the problem with a cell is your holding it right up to your head. Depending on how far away you are from a meter, the power would drop exponentially.

Call the utility company and ask them what time yours uploads data. Get a professional to verify what parts of your home is getting hit the hardest and how hard. Do some research to try to compare the results to say a CAT scan, or an MRI, or an X-ray. If you can establish it's severe enough in comparison, you probably have a case. I don't think the judge would like to hear that your being exposed to the equivellant of an X-RAY every day. And if he tries to down play it, ask him if he would volunteer to having an X-RAY every day for the total amount of time you have been exposed.

Most smart meters are transmitting at least a couple times a minute, and even can transmit 2-3 X a second.(and more as the appliances join in)

**Snowy** says:

[May 24, 2014 at 5:48 pm](#)

I know a couple who feel that they literally saved their own lives, attest that they reclaimed the full use of their minds because of the installation of a very high quality industry grade whole house suppressor. They had it installed either between the meter and the service panel or right in the service panel, not sure which, but it was one with emf filters built in too, and LED lights to let them know about any power surges, its status, etc

Apparently these suppressors get rid of not only electrical transients from incorrect wiring but wireless induced total harmonic distortions and noise which is making so many so ill. I know they had to ascertain that the one they had installed was well grounded.

Has anyone else out there had success with use of any industry grade, emf filter enabled, whole house suppressor? I don't mean the regular hardware store variety which apparently can give a false sense of assurance since you are usually unaware when or if they fail.

I refer to the really top end skookum kind which industry uses to prevent damage to electronics, one that saves LED displays, wiring, and inflated bills, installed to save a ton of money. Anyone?

I mean the kind which smooths out the artificial "smart" sine wave and eliminates those wretched transients emitted by every aspect of every node in the entire wireless grid and especially the harmonics and transients emitted by the smart "meter"'s SMPS?

Worth researching, wouldn't it be? If the claims from industry are what they seem to be claiming, world wide, then if I understand this, the good suppressors are designed to filter everything from lightning to the smallest frequencies.

I know they are not cheap.

Also this type of suppressor has full replacement warranty and is said to protect against frequency graphing and activity data analysis and capture (privacy)- as well as frequency interference with bioelectrical human and animal systems (health)- as well as to save money (over billing, gouging)

The smart meter is a nightmare! my bill is terribly and I have many many health problems that I've never had in my life! I want it removed, it is killing me and my pet! OG&E has not replied.... I believe my bill is triple what it should be

249. **[Darragh McCurragh](#)** says:

[July 8, 2014 at 11:01 am](#)

What is difficult to understand is why these "smart" meters need to give off any undue radiation (except the 50 or 60 Hertz "buzz" that comes with the electricity as such). The "smart" is not about sending WiFi or microwave signals to "outer space" continuously. Even if a smart meter were to be read from outside the building to save time and be independent of people being at home when they are read (although they should transmit this information through other channels anyhow), then they need not radiate continuously but only once a meter reader approaches the building and sends an activation signal, after which it would send out a data packet and switch its sender off again.

250. **george anderson** says:

[July 8, 2014 at 10:18 pm](#)

I tried to delay this for as long as I could. The meter went in today and I am in fear for my life. I am already feeling the symptoms that so many of you describe. We all need to flood the lines and call your congressman and bitch like hell every day.

251. **Hans** says:

[August 6, 2014 at 3:09 am](#)

Easy way to TEST if you're susceptible to all this WiFi stuff:

– VACATION on an UNINHABITED island, a large forrest or somewhere high-up in the mountains. (As long as there's nothing there).

Vacationing in true nature for a few weeks will let you easily find out if you got sick/have symotoms from the 'WiFi BEFORE' and 'AFTER'.

You'll be sure to notice a clear difference.

Pluck the day,  
Hans

252. **Randy** says:

I am electrically sensitive and have been very concerned about smart meters as well. I found out this week though that my symptoms are not from my smart meter but from the COLLECTOR routers around my city. They are mounted on utility poles every mile or so. When I drive by or am exposed to the radiation from these COLLECTOR devices I get immediate symptoms which last for hours. I was then paranoid my smart meter was making me feel sick. I wanted people to know that the smart meter is just part of the whole system your electrical utility is using and there are other parts which are probably worse than the smart meter itself. So find out where the collectors are located and do your best to avoid them.

[November 1, 2014 at 10:10 am](#)

I got a golf ball size tumor on my leg right where it sits next to my computer tower. I also found out that the 8 SMART METERS on the other side of my wall ARE WIRED right under my desk creating another big surge of EMF. Double whammy for me. i had it cut off 2 weeks ago and it was malignant Melanoma. I got a EMF detector and got very HIGH in the danger zone, readings where the meters are wired. I have a friend who cant walk anymore so I went to see whats up and when i knocked on her door there was 9 SMART meters on the wall next to the door. just inside where she sits all day, very high readings and she puts her feet on the floor where its wired. She is in BAD shape

What you cant see CAN definitely HARM you

255. **TeeShark** says:

[November 12, 2014 at 2:26 pm](#)

Man you guys are a few sandwiches short of a picnic! I hate the utility companies and will usually back any fight against the thieves but I cannot get behind this hair brain idea. How many of the people claiming health problems are just looking for a lawsuit so they can sit on their fat @ss? How many of you own more then 2 cats (in general... Multi cat owners tend areto be eccentric or in lala land. If these meters suddenly started causing you problems then why did your problems not start when wifi and cell phones became common place. Walk/Ride down the road with a smart phone and see how many wifi networks you walk/ridr through. Besides you can beech all you want... The utility companies employ the best of the best lawyers just to deal with you nuts on a regular basis.

256. **Margaretha Tierney** says:

[November 23, 2014 at 4:21 am](#)

I had a smart meter installed under protest on my bedroom wall. Two weeks later I felt terrible, my head felt so strange. I had to go overseas and the feeling left me. On my return, the second night in that room and the awful head feeling came back. I changed bedrooms and it was gone. Then went overseas for three months, no problems. On return slept in that room and second night strange sick feeling back. Slept in another room. Went overseas and on my first night at a motel this awful strange feeling came back with waves going through me. It lasted while away and continued on my return for months. Some said I had parasites, but no evidence of them. Every six weeks, the feeling would be back for two weeks and then go again. Felt good for a few months. Two weeks ago it was back with a vengeance, waves through my body at night, palpitations and my right leg would not walk properly. The doctor was concerned about a stroke. Since then have felt terrible for two weeks, but last week good again. Interesting that every Monday I am terrible for exercise class, but

right all week. What happens Sunday night that is different? Am told every tenth house has a 'mother meter' that acts on behalf of the other nine houses. Don't know what it does differently. Until I can get total protection of all radiation in my house, I believe the symptoms will continue and perhaps get worse. Looking into the best and cheapest protection at present.

[December 25, 2014 at 11:57 am](#)

was driving through millburn new jersey residential area in september 2013 and I felt my head pounding to the point I thought i was going to die. I also saw white PSE&G trucks around and think they were putting in smart gas meters around there. The emf rf shielded coat I wore next time and the headband did not work to stop the effects the next time I went so now I go another route when traveling through milburn the shopping center area does not have these meters installed, yet. Hope they won't put them there. see stop smartmeters new jersey blog <http://theevolutionofosiris.wordpress.com/2013/03/11/stop-smart-meters-in-new-jersey/> for more. smart meters are so much more dangerous than cell phones and cannot be shielded because it's a web and it all communicates with your appliances which will all eventually be smart, and every smart meter communicates with each other, so it's like there is no escape from this earthly hell.

262. [theevolutionofosiris](#) says:

[December 25, 2014 at 12:13 pm](#)

People talk about how they did not give the electrical company permission to install them. I think these people are all acting like children. The moment you signed up for electricity, you gave them permission to do whatever they wanted, and you don't have permission to touch their property, that's why they sometimes bring police to help them install the meters and prevent you from interfering. If you want to have electricity without smart meters, find another utility, form your own utility, or turn off power in your home and use solar panels. Stop trying to write your utility and convince them not to do it. They are taking orders from higher ups the powers that be, and they are not going to listen to your demands. What you need is not a grassroots organization that tries to lobby congress but one that takes matters into its own hands and forms its own community supported power. This is all part of Agenda 21 and it is world wide so wake up people wake up. Ted Gunderson was talking about it in the 1990s.

263. [theevolutionofosiris](#) says:

[December 25, 2014 at 1:38 pm](#)

People do not realize that everything is controlled and leading to world government, so they cant contact their congressmen and expect it to do anything. Unless they are already good friends with someone on the inside who can help, then there is no reason to do that. What they need to do is realize that Take Back Your Power is controlled opposition. They give you great information, but a horrible solution that wont work. Such as trying to legally fight utilities, unless your judge is a patriot, it wont happen, many judges are bought off for agenda21 and even the fair ones will rule that the smart meter is the property of the electric utility company and home owners who entered

into contract with them do not have the right to mess with them. So I saw people protecting their homes inside them with emf shielding, if that works, good for them, eventually appliances that do not emit emf will be phased out and companies will only be making ones that do, and then in order to get safe appliances, we would need inventors who know what they are doing to compete with the evil appliance companies. I know I had an energy star freezer and it emit very high emf that bothered me and I was sitting 8 feet away, but an old Westinghouse refrigerator does not bother me, not even if I put my head up against it. So again to reiterate, there are three solutions, not proposed by the movie which is controlled opp, always looking to protesting your government to fix your problem when thhe government is in bed with them too. You need to form your own government on your block, start there, and get families together to say no. One family in a sea of families who don't care wont work. It was their evil idea to creat the nuclear family competition, families are strong if they work together, but separate, they are weak. Form your own electric utility, install solar panels on your block, put your minds together to find some other way to get power. As an entire block, get the next block, get the whole town to march to city hall and demand change, remove the people there from power if they refuse. This must be done locally. A few angry parents at a town council meeting will get ignored. Again you cannot stop them from installing it by putting a note or lock on their property. If you cant do any of this, move to a town that is not moving forward with agenda21 and bide your time.

[January 9, 2015 at 9:51 pm](#)

Live in an art deco apartment block of 8 where we had a switchboard upgrade mid 2014. Now, in October and then January blood tests have detected raised lymphocyte and B cell levels. The haematologist says I have a 1-2% chance of developing leukaemia. I know leukaemia is connected with radiation and so i started to look around my home. Nine smart metres are in a galvanised iron box 2.6 metres from my bedroom window. Inside a brick wall, there are switchboards for four of the units – all busily emitting radiation and even closer than the smart metres. Of course, I have all the usual things in my bedroom to add to my toxic exposure – mobile phone, wireless VOIP phone that runs on a modem, a laptop, two lights, a fan and a fan heater. I'm moving into the back bedroom away from the smart metres and keeping laptop, mobile etc in the lounge room. So scary. Technology is developing so rapidly, it's mathematically impossible to mitigate the new hazards that change brings.

Wireless Wake-Up Call

<http://tedxberkeley.org>

I have to say this: I would like to but so far I just do not understand any kind of first response to the smart meter when it takes the form of passive masochism as a reaction to a threat of this size, rather than, for instance, being someone motivated to locate inner resolve and access the determination to solve this problem – now. Smart meters are not an insurmountable threat. They are just plastic computers with no ground wires and no suppressors. They turn YOU into the ground, you and all your loved ones and appliances. NO ground wire is how the smart grid makes money. And sickens you slowly while it potentially kills you.

Is this unconscionable?

Of course.

Is there any point to being indignant but not doing anything to solve this home invasion?

Of course not.

Anyone who is a parent is duty bound to not let their own children suffer.

Any pet lover should be motivated not to let this continue.

I especially do not understand what seems like almost an epidemic of passivity. Way too many humans are acting like pushovers, seemed overwhelmed by this assault on our bodies, our private properties, our minds, our lives and our private homes.

Aren't you angry enough to get even?

FIGHT BACK.

It is all perfectly legal.

Take back your lives.

How?

Use what is available, what has already been used by industry for decades, what is used by anyone electrically and electronically cognizant, a perfectly legal way to sabotage the node of the smart grid on the side of your home and which can be used to regain peace, quiet, sleep, health.

Nearly everyone has a home computer, right?

Are its wireless features shut off, blue tooth, off, airplane mode on?

Nearly everyone has wifi, right? Is it a hard wired modem?

I can only hope that those affected by smart meters already have all the other forms of domestic wireless shut off? And hopefully do not use cell phones or worse still, portable home phones?

Are those who are angry about smart meters part of the problem or part of the solution?

Are they at very least already hard wired in their homes?

Are they already practicing safe tech in their lives, cars, anywhere possible?

Have they got an Electromog monitor to use to monitor sources of rf and radar and microwave harm inside the home or to show others at the office?

Do those who have demonized the smart meter as if it is all powerful happen to recall that any computer is extremely vulnerable to interference, to failures, to glitches, as well as unable to overcome total suppression of its wireless features?

Well, all a smart meter is is a computer.

And a very vulnerable, cheap one, at that.

It is SO dead easy to stop these frequencies.

Unless you think for some reason that you deserve to suffer?

Get active, make friends with your neighbour. He and./or she will listen to how to do this, too, once you tell him or her that this will drop the cost of his and/or her utility bills.

Just appeal to self interest, it works every time.

Imagine if a whole neighbourhood- and then the next one, and the next one, spread the word around that there is a solution to smart meter invasion.

Imagine the impact exponentially, if area after area were to all decide to stop suffering, and get even by suppressing the frequencies in the privacy of their own homes.

What if the entire area all ordered, bought and had installed in their circuit box (sharing two 15 amp circuits is fine, these things do not carry any juice), the right kind of purposefully designed smart meter suppressor, which already exists and is perfectly legal to own and use.

Then the Wide Area Network single harmonic distortion that is damaging everyone would cease inside the home.

The smart meter over billing would cease, because the pulses and surges would cease inside each home.

The privacy would return because the frequency graphing would be inaccessible, because the fire starting, privacy robbing, health damaging, hackable pulses and surges would cease inside your home.

Instead, for some reason, while complaints have increased exponentially, the smart meter has become mythologized into being impossible to overcome, as if it were a giant invader, a monster, which simply is not true. It is a cheap device, easily neutralized, legally.

I am trying to appeal here to any residual sense of initiative of the majority to counter this system, to undermine, legally sabotage and otherwise practice self defence against this radar system.

I want to locate the the “don’t get mad, just get even” response one would expect when everyone has been invaded to this degree, in every possible way.

For some reason, faced with an invasion every bit as real as any other, it seems as if far too many people are using learned helplessness to “comply”, to “submit” , to allow themselves to be harmed, damaged, robbed, invaded, homes burned down, and each one is getting picked off, one at a time.

Why continue with endless appeals to “higher authorities” to “do something about this”?

Authorities? Almost all of them are the same authorities who initiated the global smart grid in the first place, it is a top down initiative, and your life and privacy and safety do not matter.

But? Surely these things do matter to you, right?

Well then stop the smart meter and smart grid frequencies from at least entering your home.

And shut off the power to all bedrooms.

Do you really want to be divided and ruled?

Why? Particularly when it is so easy to undermine a smart meter?

Just get a specialized device, a sine wave tracking frequency attenuator (no not an ordinary household lightning suppressor), a sine tamer.

Get an industrial grade sine wave tamer that is also a suppressor used by industry everywhere to save a ton of money on wireless induced premature failure or burn out, etc.

A sine tamer (sine wave tamer) is what will address this smart meter invasion and is even able to neutralize wireless frequencies piggy backing onto your household wiring system (unless you live right beside a cell tower, maybe not then).

Anyway, that is what will make a major difference to the quality of your lives and recover your health so that you can make level headed decision to walk away from a system that is so corrupt it has in place plans to hack you into the dark and cold, on purpose, for a very very long time, possibly years.

No we don't sell them. We just have one, and sleep and live well, in our hard wired home. We bought and had installed a sine tamer, because we were and are single minded about overcoming this issue and we were determined not to become irreversibly chronically disabled with EHS.

Health is wealth.

Protect it or lose it.

We had an electrician take about 15 minutes to install that sine tamer which has a 25 year warranty.

And that, as they say, was the end of that problem in our home.

We even had our house given a base line reading beforehand, read by a bau biologist, both before and then again after.

Sine wave tracking frequency attenuators are out there, not hard to find one designed to stop a smart meter from the harm and hazard it was intended to cause.

You just need the ones designed for weak emfs with variable clamping, and electronic detection of the slightest pulse or surge.

Best part is the keep you safe if and when you go off grid, which should be your very next stop since this grid is not going to remain reliable or affordable or insurable.

Stop suffering, please?

TAKE BACK YOUR POWER, as Josh Del Sol entitled his smart meter movie.

Get a Sine Tamer or equivalent.

Surely this will be the best investment you will ever make for getting back your home and protecting your loved ones, your private property, your own inviolate sanctuary.

Just do it, it is soooooo worth it.

Question (thought!)of the day on this one!

The smart meters are inter-grading signals with Nano medical implants and brain tooth /gum cell phone communication implants and this is what is attacking people and we are being mind hacked or electrical harassment targeting and possibly system attacked from hackers around the world!

The electrical grid is all screwed up and is crossing electrical signals( Not intentionally!) into internal body implants and we a feeling the ground electric the same way cows do from electrical runoff!

We are in North Kingstown, Rhode Island, USA. We also hear high pitch noise for the past many years. We complained to many authorities about it and there were no help or not even a response from them. What is this all about? From our analysis, it may very well be coming from low orbiting weather satellites as the noise becomes more prevalent whenever there is an impending storm or inclement weather. Even otherwise, we hear this high pitch noise at a low tonal strength or volume, especially, at night causing sleep deprivation. We were able to record this noise using a software and it is not something we hear out of nothing or inside the ear. Some class mates of our daughter who live in this town mentioned to her that they also hear high pitch noise. In essence, the entire community may be helpless in resolving the high pitch noise. What is more irritable about this noise nuisance is that it causes sleep deprivation.

Is there any federal agency we could contact to complain about this noise disturbance as this is a nuisance not only to us but also the people living in the community.

If we can't anticipate help from federal agencies to stop this nuisance, how do we stop it with some method? We used tin foil in our bedroom and it stopped for some time but it became ineffective after sometime. We then used tin foil and Mylar type insulators and it stopped for some time. It is not effective any longer. This is why I searched Google to find some help to stop this high pitch noise nuisance from now on and came across this site. We may say that our privacy is also compromised by these abusers of the satellite mounted sonar radars. This must STOP.

[August 25, 2016 at 1:27 am](#)

I assume these complaints are about American smart meters?

272. **admin** says:

[August 25, 2016 at 6:56 am](#)

Most are, but complaints have come from Aus, Canada, UK also.

273. [holiam inderin](#) says:

[September 8, 2016 at 2:55 am](#)

waw, Live in an art deco apartment block of 8 where we had a switchboard upgrade mid 2014. Now, in October and then January blood tests have detected raised lymphocyte and B cell levels. The haematologist says I have a 1-2% chance of developing leukaemia. I know leukaemia is connected with radiation and so i started to look around my home. Nine smart metres are in a galvanised iron box 2.6 metres from my bedroom window. Inside a brick wall, there are switchboards for four of the units – all busily emitting radiation and even closer than the smart metres. Of course, I have all the usual things in my bedroom to add to my toxic exposure – mobile phone, wireless VOIP phone that runs on a modem, a laptop, two lights, a fan and a fan heater. I'm moving into the back bedroom away from the smart metres and keeping laptop, mobile etc in the lounge room. So scary.

Technology is developing so rapidly, it's mathematically impossible to mitigate the new hazards that change brings.

# Many Are Claiming Health Problems Caused by Smart Meters

October 12, 2011

A broad consortium of government agencies, environmental groups, and utilities and their industry organizations is touting the benefits of a "smart grid." Generally, this is conceived as an extensive revamp of the electrical system to make it more efficient and reliable, less polluting, and less expensive. Proponents of the smart grid envision it as having many benefits to both electric utilities and their customers — and see its costs largely as the dollar costs of building infrastructure.

- [US Dept. of Energy, Smart Grid](#); [Henry Kenchington](#), Deputy Assistant Secretary, Research and Development, Office of Electricity Delivery and Energy Reliability, 202-586-1878.

One component of the smart grid is smart meters, which operate as part of electric, gas, or water systems, and transmit meter readings to the utility many times a day, often via radio waves but sometimes via hard-wiring. This allows utilities to save money since meter readers are no longer needed. It also gives utilities frequent input on how much demand there is on their system at any one time, allowing them to fine tune their operations, use various tools (such as demand-based pricing) to equalize demand throughout the day and reduce peak loads, and plan for future supply needs.

The concepts sound good to many people, but serious flaws are becoming apparent as utilities rapidly install smart meters across the country, according to a rising chorus of critics. They are concerned about privacy (since they say utilities can interpolate many behavioral aspects of building occupants via the detailed reporting of utility use), security (since any utility's system could be hacked), and accuracy (with reports of very inaccurate readings from a small percentage of meters). Each of these issues warrants investigation and coverage.

Another major issue is possible human health impacts from smart meters. That is the focus of the remainder of this Tip.

## SMART METER HEALTH IMPACTS?

The health impacts of smart meters is a difficult topic, due in large part to the scarcity of pertinent science. As a result, some of your coverage will need to focus on the unknowns, rather than the knowns.

But the numerous allegations of health damage from people in the US and around the globe, the common threads in the descriptions of health damage (often appearing to involve the neurological, immune, and/or endocrine systems), and the evidence from thousands of published studies that address a wide range of electrical, magnetic field, and radio-frequency impacts, suggest this could be a major public health issue that warrants coverage.

The main questions are: with no smart meter-specific evidence of safety regarding a wide range of possible health impacts, should utilities be allowed to force smart meters on people? Should the meters be proven safe before they are installed — or should the "precautionary principle" be reversed, as it often is with US law regarding chemical pollution? In other words, is it acceptable to allow utilities to install these meters, then require people to prove they are being harmed? And in this case, with many government agencies and major environmental groups supporting smart meters, who will be the watchdogs?

Regarding the science, there appears to be virtually none specifically addressing smart meters, based on a search of [PubMed](#) using the term "smart meter." PubMed is the repository for the vast majority of the world's health-related research in the past half-century or so.

Looking beyond smart meter-specific research, there have been many studies of the electromagnetic spectrum involving cell phones and other electrical devices. You can find these on PubMed using search terms such as "radiowave," "cell phone," or "electromagnetic field." You may want to narrow your search to radiowave frequencies of 902-928 MHz, the band in which smart meters tend to operate, just above that of cell phones. Or you can scan more than 5,000 studies inventoried by an advocacy group:

- [Prove-It Initiative, Studies.](#)

However, the great majority of this research has focused only on thermal effects and cancer. Thermal effects (think of cooking meat in a microwave oven) are the health endpoint addressed by current FCC guidelines for wireless emissions. There has been relatively little research on health concerns such as damage to the immune, neurological, endocrine, cardiovascular, pulmonary, and other physiological or biological systems.

Another key issue is that the vast majority of the research has been conducted either in vitro, on animals, or on healthy humans. There has been almost no research on people with underlying health disorders, even though it's widely accepted that the body's defense systems in such people tend to be impaired. With about half the US population suffering from one or more chronic disorders, that's a large pool of people who could plausibly be more vulnerable to forces such as wireless emissions.

- CDC, ["Chronic Diseases and Health Promotion."](#)

One ongoing study that is attempting to investigate effects beyond thermal and cancer endpoints, at least for cell phones, is being led by Michael Wyde, a toxicologist with the National Institute of Environmental Health Sciences. His study is scheduled to be completed in 2014.

- [Michael Wyde](#), 919-316-4640.

## **CLAIMS AND COUNTERCLAIMS**

Given the existing evidence, the Council of Europe (an advisory body to the European Parliament that has been tasked with promoting democracy and protecting human rights and the rule of law) issued a resolution in May 2011 expressing numerous concerns about possible harm from various electromagnetic emissions, and generally recommending a cautious approach, saying "there could be extremely high health and economic costs if early warnings are neglected," similar to what happened with asbestos, leaded gasoline, and tobacco. The Council also said current international standards "have serious limitations."

- Council of Europe, [Resolution 1815, "The Potential Dangers of Electromagnetic Fields and Their Effect on the Environment."](#)

The EPA agreed in 2002 with the Council's caveat about existing standards, saying frequently-made claims that the FCC guidelines provide protection against a wide range of possible health effects from wireless emissions are unjustified.

- EPA, [July 16, 2002, letter from Norbert Hankin](#) (no longer listed with the agency), Center for Science and Risk Assessment, Radiation Protection Division, to Janet Newton, the EMR Network.

Nonetheless, many utility officials and others addressing this issue today are making just those kinds of claims, and saying smart meters pose no risk.

- ["Radio-Frequency Exposure Levels from Smart Meters: A Case Study of One Model,"](#) February 2011, by the Electric Power Research Institute.
- ["An Investigation of Radiofrequency Fields Associated with the Itron Smart Meter,"](#) December 2010, by the Electric Power Research Institute.
- ["No Health Threat from Smart Meters,"](#) 2010 (fourth quarter), by the Utilities Telecom Council.
- ["Health Impacts of Radio Frequency Exposure from Smart Meters,"](#) California Council on Science and Technology, April 2011.
- ["A Discussion of Smart Meters and RF Exposure Issues,"](#) Edison Electric Institute, Association of Electric Illuminating Companies, and Utilities Telecom Council, March 2011.

In addition to the dearth of research on nonthermal or noncancer effects, there is little or no research addressing the fact that smart meters are connected to a building's electrical system, and could interact with it in a variety of ways. That condition makes existing research on cell phones inapplicable, since cell phones have no such connection. In addition, smart meter critics say some manufacturers acknowledge their smart meter emits almost constantly for function, security, and operational reasons; this is in contrast to the claim by many utilities that the meters operate for only a very brief time, such as a fraction of a second once each hour, when transmitting a reading to the utility. Long-term, 24/7 emissions seldom, if ever, are studied in wireless emission research.

## **METER INDUSTRY**

A few of the many meter manufacturers you might consider contacting to check on this angle are listed below, along with their newly-formed national organization. Or ask the utilities you are covering which manufacturer(s) they are using or considering.

- [Landis+Gyr](#) (acquired in May 2011 by Toshiba).
- [Tantulus.](#)
- Silver Spring: [Realizing the Promise of Advanced Metering](#) and [Whitepapers.](#)
- [Smart Meter Manufacturers Association of America.](#)

## **HYPERSENSITIVITY IN SOME?**

Another issue that distinguishes smart meters from cell phones, wireless computers, microwave ovens, and similar devices is that users of the latter typically have a choice whether to use them; with

many utilities forcing customers to have a smart meter installed, no one served by that utility has a choice.

The number of people who are vulnerable to emissions from smart meters and other electrical devices — who are typically described as having electrical hypersensitivity — likely is small. A limited number of studies suggest the numbers may be 1.5-5% of the general population.

- Wikipedia: [Electromagnetic Hypersensitivity, Prevalence.](#)

Based on decades of anecdotal accounts, health problems can show up within seconds of exposure in some people, or in months in others. With the longer time frames, most people, and their doctors, will have a very difficult time making the connection between their health problems and a wireless device. That difficulty is illustrated in the following media article, and in some of the accounts inventoried at the second URL below:

- ["Study Lends Some Credence to Wifi Claims,"](#) SantaCruz.com, Jul 13, 2011, by Alastair Bland.
- EMF Safety Network, [Smart Meter Health Complaints.](#)

One prominent person who has discussed her pronounced, rapid-onset electrical hypersensitivity, long before the advent of smart meters, is Gro Harlem Brundtland, former prime minister of Norway and director-general of the World Health Organization.

- [Interview with Gro Harlem Brundtland,](#) translation of cover story in Norwegian newspaper *Dagbladet*, by Aud Dalsegg, March 9, 2002.

In many cases, people with known or suspected electrical hypersensitivities are knowledgeable and proactive enough to ask their utility to allow them to opt out of having a smart meter. For people who are unknowingly electrically hypersensitive, and in whom symptoms may not show up for months, they likely won't know enough to ask to opt out, and may suffer severe consequences. Until much more science is available — pinning down the specific electrical forces that may be doing the damage, the types of damage that are possible, and the traits of people who are vulnerable — current efforts to mitigate problems will be based on guesses.

## **UTILITIES FACE QUESTIONS**

As utilities increasingly are being forced to respond to customer concerns about smart meters, they have numerous issues they may be considering:

Given there is no mandate from the federal government requiring utilities to install smart meters, do utilities want to go this route?

If they do, should they conduct more research, in order to protect their customers, and themselves from future lawsuits?

There are many smart meter manufacturers. Are any of their systems safer than others? Can they prove it?

Even though there is little research on the potential health effects of hard-wired smart meters, and there are some indications this option may also be harmful to people with electrical hypersensitivity,

should utilities consider this option instead of wireless smart meters (which appear to be the dominant system being selected by utilities)?

Should utilities allow any customers to opt out? If not, are they willing to accept legal liability for any short- or long-term health problems that may occur? If they do allow opt outs, under what circumstances (for instance, do they need proof of health vulnerability, or is concern about possible health effects sufficient grounds)? Are utilities justified in charging such customers extra, or is this an anticipated expense that should be shared by all customers? Is there a way to minimize any additional expenses, such as allowing customers to self-report their monthly readings (with random checks by the utility), or charging a customer a flat monthly amount, based on historical usage, and reading the meter once a year and adjusting the final bill each year accordingly? What percentage of people can utilities allow to opt out, and still have a functional, more-efficient system?

Should utilities comply with the Institute of Medicine's report released June 21, 2011, recommending that all levels of federal government consider the health impacts of their actions — even when those actions don't seem to have a direct health component — since utilities are playing a quasi-governmental role and making decisions that affect a significant number of people?

- "For the Public's Health: Revitalizing Law and Policy to Meet New Challenges," Institute of Medicine, June 2011. [Release](#) (with link to the report).

The US Dept. of Health and Human Services has kept a very low profile regarding the health concerns being raised by critics of smart meters. It may be worthwhile to ask DHHS officials what efforts they may be making, in light of the IOM recommendations. A possible starting point is:

- [Howard Koh](#), Assistant Secretary for Health, 202-690-7694.

## STATES AND MUNICIPALITIES

As noted above, there is no federal mandate to install smart meters. After reviewing currently available information, PNM, a major New Mexico utility, says it won't be installing smart meters for at least 5 years, saying they aren't cost-effective.

Other utilities are allowing, or have been forced to allow, customers to opt out, under certain circumstances, and with varying cost structures. Examples include:

- Central Maine Power: [MPUC Decides Smart Meter Investigation](#), May 17, 2011, and [Skelton, Taintor & Abbott Wins Landmark Smart Meter Case](#), May 25, 2011.
- In Colorado, Xcel Energy, Black Hills Energy, and Poudre Valley REA have allowed opt outs on a case-by-case basis.
- For Xcel's experimental program in Boulder, the Colorado Public Utilities Commission is recommending a voluntary opt-in program, which is just the opposite of a mandatory participation program that allows no opt out.
- Arizona Public Service is discussing whether and how to allow opt outs.

Some states are taking an active role. In California, the state is requiring Pacific Gas & Electric to revisit its proposed opt out policy, after vehement reaction against the initial proposal.

- California Public Utilities Commission, ["PG&E Smart Meter Opt-Out Proposal"](#); Sept. 14, 2011, ["Workshop on Smart Meter Opt-Out Options."](#)

- In Arizona, the [Arizona Corporation Commission](#) (whose duties include oversight over public utilities) held a workshop Sept. 8, 2011, and is considering how to proceed. Arizona Corporation Commission.
- In Illinois, governor Pat Quinn vetoed in September 2011 legislation that would have authorized a smart grid. Instead, he favors other ways of modernizing the state's grid. His veto might be overridden by the state legislature later this year. ["Illinois Governor Vetoes Smart Grid Legislation,"](#) EnergyBoom, Sept. 13, 2011, by Joseph Baker.

Cities and counties also are responding to the concerns of their constituents, even though they may have no legal authority to force a utility to comply, since that power often is vested in a state utility agency. For instance, in California, 36 cities, 10 counties, and one tribal jurisdiction that are home to nearly 2.7 million people have expressed some level of opposition to installation of smart meters.

- Stop Smart Meters, ["CA Local Governments on Board."](#)

When you're exploring the politics of who has the authority to make decisions on this issue, a few points to keep in mind are:

- Utilities generally have a monopoly in any given location, and customers usually don't have any other provider to choose from.
- There usually is some type of state utility commission that has legal oversight over a utility. However, in some states, such as Colorado, the utility commission has no power over utilities such as member-owned cooperatives. One of the reasons state legislators exempted member-owned cooperatives from oversight was because they assumed members could have any problems addressed through the directors, who are elected. But there have been a number of cases where directors were unresponsive or didn't provide independent oversight. The net result may be an unregulated monopoly.

## ADVOCACY GROUPS

There are many advocacy groups, with various levels of sophistication and representing a wide range of geographic areas. In addition to ones referred to above, others you might consider as sources include:

- [Arizonans for Safer Utility Infrastructure.](#)
- [The Utility Reform Network.](#)
- [Electromagnetic Health.](#)
- [Smart Meter Dangers](#), a project of [Center for Electrosmog Prevention.](#)

Dozens of advocacy groups met Oct. 5-6, 2011, in Washington, D.C. The speakers and sponsors of this conference are possible sources for your coverage.

- [Wireless Safety Summit.](#)

## IN THE NEWS

One example of media coverage of the smart grid issue that provides an overview of many political, economic, historical, health, and technological aspects is:

- ["The Problems with Smart Grids,"](#) originally in CounterPunch, March 18, 2011, by B. Blake Levitt and Chellis Glendinning.

For many other examples of media coverage of the smart grid and smart meters, search:

- [Environmental Health News.](#)

As indicated by the discussion above about Gro Harlem Brundtland, smart meters are just one of the latest electrical devices of concern to people with electrical hypersensitivity. Though these concerns have been expressed for decades, there is little data documenting whether the number of people being affected may be increasing with the rapid expansion in the number of wireless devices and the geographic areas affected. This and many other aspects of electrical hypersensitivity are fodder for additional media coverage, and some of the sources noted above may be helpful.

One related angle is that the U.S. Supreme Court has been pondering whether to hear a class action case (technically known as multidistrict litigation) involving cell phones. The case involves a suit against 19 defendants, primarily cell phone manufacturers and telecommunications companies. The suit is being led by the Public Citizen Litigation Group's Allison Zieve.

- ["Cellphone Study Raises Profile on Safety Lawsuits,"](#) Reuters, June 1, 2011, by Dan Levine.

Any Supreme Court decision might influence the FCC, which has considered whether to eliminate the current telephone landline system and have everyone use wireless or wired broadband. If that strategy is adopted, and wireless is the dominant system, that could seriously impair the ability of people with electrical hypersensitivity to communicate.

# Leukemia, Brain Tumors, and Exposure to Extremely Low Frequency Electromagnetic Fields in Swiss Railway Employees

C. E. Minder and D. H. Pfluger

Railway engineers provide excellent opportunities for studying the relation between exposure to extremely low frequency magnetic fields and leukemia or brain tumors. In a cohort study of Swiss railway personnel with  $2.7 \times 10^5$  person-years of follow-up (1972–1993), the authors compared occupations with high average exposures (line engineers: 25.9  $\mu\text{T}$ ) to those with medium and low exposures (station masters: 1  $\mu\text{T}$ ). The mortality rate ratio for leukemia was 2.4 (95% confidence interval (CI): 1.0, 6.1) among line engineers (reference category: station masters). The mortality rate ratio for brain tumors was 1.0 (95% CI: 0.2, 4.6) among line engineers and 5.1 (95% CI: 1.2, 21.2) among shunting yard engineers (compared with station masters). Two exposure characteristics were evaluated: cumulative exposure in  $\mu\text{T}$ -years and years spent under exposure to magnetic fields of  $\geq 10$   $\mu\text{T}$ . There was a significant increase in leukemia mortality of 0.9% (95% CI: 0.2, 1.7) per  $\mu\text{T}$ -year of cumulative exposure to extremely low frequency magnetic fields. The increase by years spent under exposure of  $\geq 10$   $\mu\text{T}$  was even stronger: 62% per year (95% CI: 15, 129). Brain cancer risk did not show a dose-response relation. This study contributes to the evidence for a link between heavy exposure to extremely low frequency magnetic fields and leukemia. Its strengths include reliable measurements and reliable historical reconstruction of exposures. *Am J Epidemiol* 2001;153:825–35.

brain neoplasms; electromagnetic fields; environmental monitoring; leukemia; occupational exposure

**Editor's note:** An invited commentary on this article appears on page 836, and the authors' response appears on page 839.

Several papers (1–3) reviewing residential and occupational epidemiologic studies of cancer risks and exposure to extremely low frequency (ELF) magnetic fields have concluded that there is a weak association between exposure to electromagnetic fields and leukemia and brain tumors. Several occupational epidemiologic studies have explored the relation between ELF magnetic field exposure and leukemia or brain tumors (4–10), with contradictory findings. Kheifets et al. (2) have investigated the causes of discrepancies in studies of brain cancer and have suggested many possible reasons for these discrepancies. However, it is evident that one of the principal challenges of studies of the health effects of ELF magnetic fields is exposure assessment, since historical measurements are usually lacking (11,

12). High-quality work in this area has been conducted by Feychting and Ahlbom (13) for residential exposure and by Savitz and Loomis (8) for occupational exposures.

In Switzerland, the study of railway workers offers an excellent possibility for investigating the health effects of ELF magnetic fields. Exposures of railway engineers can be measured and extrapolated accurately, since the position of a train's driver is fixed and electromagnetic characteristics stay the same over the lifetime of an engine, thus permitting reliable extrapolation. In addition, the Swiss railways have extensive, mostly electronic records on their employees, which allows cohort studies. An earlier study showed excess mortality from malignancies of the hematopoietic and lymphatic systems for engineers as compared with workers in metal construction and engineering and technical personnel (14). Subsequently, measurements of ELF magnetic fields in Swiss railway engines were made, showing magnetic field strengths in the 3–6,000  $\mu\text{T}$  range at the workplaces of railway engineers (15).

The purpose of the present study was to use better methodology to reassess whether, for Swiss railway engineers, exposure to electromagnetic fields is associated with an increased risk for leukemia or brain tumors. In particular, we wanted to investigate the following two hypotheses (adapted from the original project funding proposal from 1991, with slightly changed wording):

1. *Occupational hypothesis.* Among four groups of railway employees—line engineers, shunting yard engi-

neers, train attendants, and station masters (defined more precisely below)—the groups with higher exposures to ELF magnetic fields experience higher mortality from leukemia and brain tumors than those with lower exposures.

2. *Dose-response hypothesis.* Independent of job description, there is a dose-response relation between leukemia and brain cancer mortality and cumulative exposure to ELF magnetic fields and time spent exposed to ELF magnetic fields of  $\geq 10 \mu\text{T}$ .

## MATERIALS AND METHODS

### Cohort

The cohort was established using Swiss Federal Railways personnel and pension records. The cohort comprised all male persons recorded as actively employed or retired and alive in the microfiche copies of personnel or pension records from 1972, 1974, and 1978 or in the computer tapes of the Federal Railways Personnel and Pension Department between 1980 and 1993. Only members of four job categories—line engineer, shunting yard engineer, train attendant, and station master—were considered.

### Vital status and cause of death

Mortality follow-up covered the period between January 1, 1972, and December 31, 1993. Probabilistic record linkage (16, 17) was used to determine the vital status and mortality endpoints of cohort members by linking personnel or pension records to (anonymous) death certificates. Linkage variables used were date of birth, date of death, place of residence, occupation, marital status, and duration of marriage if married. Prior to linking, knowledge of the vital status of cohort members was completed by searching union journals and noting all deaths in the four study job categories. The computerized records of death certificates were then matched by name and date of birth to personnel or pension records. Only deaths with complete agreement regarding dates of birth and death on the personnel or pension record and the death certificate and with an odds ratio for correct linkage (vs. linkage due to random agreement) exceeding 1,024 were accepted. Finally, the vital status of all 123 linked cases with a cause of death of leukemia, other hematopoietic or lymphatic neoplasm, or brain tumor were manually verified against archived pension records. The data sources (personnel records, pension records, and death certificates) and linkage variables used did not differ between occupations.

### Outcomes

The main mortality outcomes were leukemia (*International Classification of Diseases*, Eighth Revision (ICD-8), codes 204–207; 37 cases) and brain tumors (ICD-8 code 191; 23 cases) (18). In addition, we analyzed deaths from any cause, all cancer deaths, and lung cancer deaths (ICD-8 code 162) for validation purposes. Table 1 gives the

numbers of deaths in each category, including leukemia subtypes.

### Work situation

Swiss railway employees work 8-hour days, 5 days per week. Line engineers and train attendants are on rotating shift work, beginning with the late shift at 4:00 p.m. and moving forward 1 hour each day until they are on the early shift, beginning around 4:00 a.m. After each cycle of shift work, they are off work for 3–4 days. Line engineers are the drivers of all scheduled trains. Mostly, they drive large and powerful engines. Each line engineer drives several different engines daily, with a changing composition of engines over time. Shunting yard engineers drive smaller engines around the shunting yards, setting up train compositions. They also switch between engines. Train attendants accompany passenger trains, checking tickets and assisting travelers. Station masters are responsible for train traffic within a station perimeter. They work partly in an office and partly on the station platforms.

Employment data with beginning and ending dates, duration, and job category were available for all cohort members. We assigned each person to the job category last mentioned. With few exceptions, this corresponded to the job held the longest, since there was limited switching between job categories. However, younger line engineers often worked in shunting yards (M. Gerber, Motive Power Construction Division, personal communication, 2001).

### Assessment of magnetic field exposure

Swiss trains run on 16 $\frac{2}{3}$ -Hz alternating current. For our measurements, we used a device developed by Bramur, Inc. (Lee, Massachusetts). Tests conducted at the technical laboratory of Swisscom (Berne, Switzerland) confirmed that it was reliable for recording magnetic flux density in the frequency range between 0 Hz and 100 Hz. Measurements of root mean square field strength were taken at 10-second intervals and stored in a battery-powered computer. Figure 1 shows the readings from one driving cycle. The raw readings were processed to extract mean exposure, as well as the time fraction with field strength at or above 10  $\mu\text{T}$ . This fraction is a simple measure of exposure dynamics.

*Exposure assessment for line and shunting yard engineers.* For measurements of exposure in the driver's seat of the engine, three measuring heads were mounted on a wooden stand just behind the driver at the level of his head, thorax, and feet without the use of metal parts. For each major type of engine that had been used in Switzerland since 1905, measurement series covering complete driving cycles (starting, acceleration phase, driving phase, braking, and stopping) lasting from 20 minutes to 4 hours were taken. For the most numerous engines, the impact of the kind of train (freight train, normal train, or fast train) and the particular route taken on the magnitude of the magnetic fields was examined. The variability within a specific type of engine was found to be moderate (coefficients of variation of mean exposure per time unit calculated from one driving cycle did not exceed 26 percent).

**TABLE 1. Numbers of workers exposed to extremely low frequency electromagnetic fields and numbers of deaths, by cause and occupation, Swiss railway cohort, 1972–1993**

	Occupation				
	Line engineer	Shunting yard engineer	Train attendant	Station master	Total cohort
No. exposed	6,879	1,314	5,720	4,157	18,070
No. of deaths, by cause					
All causes (000–999)*	1,152	244	1,315	868	3,579
All cancers (140–209 and 225)	388	88	391	256	1,123
Lung cancer (162)	77	20	88	58	243
Malignancies of the hematopoietic and lymphatic systems (200–209)	40	11	26	21	98
Leukemias (204–207)	19	3	9	6	37
Chronic lymphatic leukemia (204.1)	7	1	2	6	16
Chronic myeloid leukemia (205.1)	6	0	2	0	8
Acute lymphatic leukemia (204.0)	0	0	1	0	1
Acute myeloid leukemia (205.0)	3	2	3	0	8
Other (204.9, 205.9, 206, and 207)†	3	0	1	0	4
Brain tumors (191)	4	5	11	3	23

\* Numbers in parentheses, *International Classification of Diseases*, Eighth Revision (18), code(s).

† Monocytic leukemia and further nonspecifically coded diagnoses in the death registry.

For modified engines in which exposure was not measured, the measurements of the corresponding main type of engine were used.

*Calculation of historical exposure.* Swiss line engineers switch engines several times daily, and over time they drive a changing mix of engines. We obtained the numbers of engines

**FIGURE 1.** Graphic representation of exposure levels measured at 10-second intervals during one driving cycle in a line engine, Swiss railway cohort, 1972–1993. Solid line: head; dotted line: thorax; dashed line: feet.

in service every 5 years from 1905 to 1995 and estimated the ELF magnetic field load for each 5-year calendar period by calculating weighted averages of engine-specific exposures. A similar approach was used to estimate the historical exposure of shunting yard engineers, including an average of 36 percent steam-powered engines (1905–1965) and later diesel-electric engines (1954–1995). We assumed that steam-powered and diesel-electric engines gave zero exposures (diesel-electric engines being direct-current engines).

For independent validation of the historical exposure reconstruction, we assembled the engine sequences of the daily service tours of 52 line and 14 shunting yard engineers for several weeks in 1993 (19).

**Exposure assessment for train attendants and station masters.** Train attendants and station masters do not work at the same location for extended periods of time. Therefore, spot measurements lasting for 2–30 minutes were taken at their most frequent places of work (train attendants: various positions within the coaches; station masters: platform and office). Exposure was then estimated as a time-weighted average of location-specific field strengths. The weights were estimated in close collaboration with railway authorities, taking into account the fractions of air-conditioned and electrically powered coaches.

**Calculation of historical exposure.** For train attendants and station masters, only recent measurements were available. Historical exposures were linearly interpolated between 0  $\mu\text{T}$  for 1900 and the exposure level of 1993.

### Data analysis

Data were analyzed using SAS (20) and Stata (21). Record linkage was carried out using probabilistic linkage with the LinkPro subroutine package (17). For cohort analysis, we used Clayton's algorithm as described by Breslow and Day (22), with 5-year age groups/5-year periods/exposure categories as units of analysis. The cumulative exposures were classified into three categories: 0–4.99  $\mu\text{T}$ -years, 5.00–74.99  $\mu\text{T}$ -years, and  $\geq 75$   $\mu\text{T}$ -years. We determined these cutoffs from the empirical frequency distribution of cumulative exposure to obtain an approximately equal distribution of person-years across the exposure categories. Similarly, the time fractions of each year spent under ELF magnetic field exposures of  $\geq 10$   $\mu\text{T}$  were cumulated over life. These were

aggregated into the following groups:  $\leq 0.099$  years, 0.100–0.499 years, and  $\geq 0.50$  years (feet:  $\leq 0.199$  years, 0.2–0.499 years, and  $\geq 0.5$  years).

To estimate mortality rate ratios and their 95 percent confidence intervals, we carried out Poisson regressions using number of deaths from leukemia or brain cancer per unit of analysis (see above) as the dependent variable and 5-year age group, 10-year calendar period, and job or exposure category as the independent variables. For estimation of the dose-response curves, we classified exposures into five classes by subdividing the lowest class and the middle class. The number of person-years at risk was included as an offset in the models. We carried out trend analyses using weighted regression with mortality rate ratios as dependent variables and job-related exposures as independent variables.

## RESULTS

Basic information on the cohort is presented in tables 1 and 2. There were 18,070 cohort members and 270,155 person-years of mortality follow-up.

### Information on linkage

Manual mortality follow-up in union periodicals yielded 1,729 records—8.2 percent of all engineers and 10.7 percent of all train attendants and station masters. Restricting linkage to those links in which dates of birth and death agreed resulted in the loss of 147 (4.1 percent) potentially linkable deaths. Manual checking of 121 linked cancer deaths resulted in our finding one person who was still alive; i.e., one incorrect link was discovered.

Each cohort member was assigned the job he held when he left the cohort. Job changes were not frequent. Fifteen percent of shunting yard engineers were promoted to the position of line engineer. Fewer than 2 percent of line engineers changed to shunting yard engineer, and none became train attendants or station masters. Fewer than 2 percent of station masters and train attendants changed their job category.

### Accuracy of exposure information

Treating the engine mix driven by each line engineer as a random sample of all engines available at the time, the coef-

† Differs from sum because of rounding imprecision.

ficient of variation of the cumulative occupational exposure reconstruction was estimated at 18 percent for the head, 25 percent for the thorax, and 40 percent for the feet. For shunting yard engineers, the coefficient of variation of the reconstructed estimate of cumulative exposure was estimated to be 26 percent regardless of body location. Estimates of cumulative exposure obtained by reconstructing average exposure using the daily work plans of 52 line engineers and 14 shunting yard engineers over a 2-week period were within 10 percent of the historical reconstruction estimates described above. For station masters, the coefficient of variation of the reconstruction was approximately 40 percent. For train attendants, the coefficient varied from 25 percent at the head and thorax levels to 60 percent at the feet.

Table 3 shows the exposure characteristics of the four occupations for the years 1930, 1960, and 1990. There was a fairly steady increase in the estimated exposure levels.

To assess the quality of endpoints, we checked mortality outcomes against cancer registry data. Not all of Switzerland is covered by cancer registries. For deceased cohort members with a diagnosis of malignancy on their death certificates who had lived in an area covered by a cancer registry, we verified the diagnosis against the corresponding cancer registry entry. This applied to 11 out of 37 cases of leukemia and 12 out of 23 cases of brain tumor. For two of 12 brain tumors on death certificates, the three-digit ICD-8 diagnosis was misspecified. Of the 11 leukemias on death certificates, all were classified as leukemias in the cancer registry files.

### Study hypotheses

To assess the occupational hypothesis (see Introduction), we calculated mortality rate ratios for five causes of death and three job categories—line engineers, shunting yard engineers, and train attendants—each compared with station masters (table 4). No differences between occupations were apparent for all-cause mortality or lung cancer mortality. However, there appeared to be differences in leukemia mortality between engineers on the one hand and train attendants and station masters on the other, although statistical significance was not attained. Risk of brain tumor mortality appeared to be elevated for shunting yard engineers and train attendants, but only the shunting yard engineers' risk relative to that of station masters was significant.

The association between occupational leukemia mortality rate ratios from table 4 and mean exposures from table 3 for these occupations in 1930 proved to be significant ( $p$  for trend = 0.04), as did the associations for the years 1960 ( $p$  = 0.03) and 1990 ( $p$  = 0.03). The associations between occupational leukemia risks and the fractions of time members of these occupations spent under magnetic fields  $\geq 10$   $\mu$ T in strength were also significant ( $p$ 's for trend < 0.05 for 1930, 1960, and 1990). None of the analogous associations of exposure and brain tumor mortality risk were significant. Thus, the occupational hypothesis was confirmed for leukemia and refuted for brain tumors.

To assess the dose-response hypothesis (see Introduction), we estimated a dose-response curve by including all occupations together in a Poisson regression with number of

\* Percentage of working time spent under exposures of  $\geq 10$   $\mu$ T.

leukemia (or brain tumor) deaths as the dependent variable, offset person-years at risk (22, p. 137), and the independent variables age group, calendar period, and exposure category. The results are shown in table 5 for various measures of exposure. For leukemia, there was an excess risk in the highest exposure category regardless of the way exposure was assessed. This excess attained significance for time spent under ELF magnetic fields  $\geq 10$   $\mu$ T at the thorax level; it did not reach significance at the other body sites or for mean exposure. For brain tumors, no consistent increase in risk with dose was visible, regardless of the measure used. However, the lowest category seemed to have a lower risk—significantly so for time spent under ELF magnetic fields  $\geq 10$   $\mu$ T at the level of the feet.

On the basis of the fairly steady increase in leukemia mortality risk by exposure seen in table 5, we carried out Poisson regression analyses using exposure as a continuous linear covariable, thus obtaining a more powerful analysis. These results are presented in table 6. With every measure of exposure, a significant increase in the mortality rate ratio with exposure was obtained; the largest and most significant effect estimates were for years under ELF magnetic fields  $\geq 10$   $\mu$ T at the head and thorax levels. The analyses of table 6 confirm the dose-response hypothesis for leukemia. We conducted a sensitivity analysis incorporating both job classification and exposure for the leukemia deaths. While both the effects of job classification and the effect of exposure became insignificant, the estimate of percentage increase in leukemia mortality per  $\mu$ T-year of cumulative thorax exposure increased from 0.94 percent to 1.46 percent (95 percent CI: -1.15, 4.1).

Engineers were not involved in the cleaning and maintenance of railway engines. Cleaners in use during the study period were phosphatic and sulfuric acids and, later, formic acid. Benzene was never used as a cleaning fluid (P. Lauber, Cleaning Services, personal communication, 2001). Polychlorinated biphenyls were never used in Swiss Railways transformers (M. Gerber, Motive Power Construction Division, personal communication, 2001). Line

and shunting yard engineers receive periodic medical check-ups, including chest radiographs. These could lead to, at most, 0.3 cases of leukemia over the whole lifetime of our cohort (estimate of the Swiss Workers' Accident Insurance Fund, December 13, 1989). In an unpublished survey of 378 railway employees carried out in 1994, we found that station masters and line engineers had the smallest fractions of smokers (8 percent and 12 percent, respectively), while shunting yard engineers and train attendants smoked more frequently (38 percent and 29 percent, respectively).

## DISCUSSION

### Findings

The results of the present study demonstrated a dose-response relation between leukemia mortality and occupational exposure to 16-Hz magnetic fields. The picture of this excess mortality was consistent: It occurred in the highly exposed occupational groups, as well as in persons with high exposures. Even within each occupation, more highly exposed persons were at higher risk, although this relation was no longer significant. A dose-response relation was observable using different measures of exposure: cumulative exposure at the thorax level as well as cumulative time spent under exposures  $\geq 10 \mu\text{T}$  at the head, thorax, and feet. There was a statistically stronger and more significant association of leukemia risk with length of exposure to ELF magnetic fields at levels of  $\geq 10 \mu\text{T}$  than with cumulative exposure at the thorax level. This could indicate that the dynamics of the exposure process play a more important role than has been suspected so far. An important health effect of exposure dynamics would provide an explanation for the inconsistent results found in occupational and residential studies of the health effects of ELF magnetic fields.

Brain tumors seemed to aggregate in the occupations of shunting yard engineer and train attendant. These two occupational groups may have a common exposure that causes brain tumors. However, it is unlikely that electromagnetic fields are solely responsible for this finding. We did not find a dose-response relation between exposure to ELF magnetic fields and risk of brain tumor mortality. Speculatively, the results shown in table 5 could be interpreted to mean that risk of brain tumor mortality exhibits a threshold with respect to ELF magnetic field exposure. We found elevated brain tumor rates for occupations that in other studies had been found to entail exposure to the highest electric fields: shunting yard engineers and train attendants. Hence, our results fit in with Guénel et al.'s (23) conclusion that brain

cancer risk relates more to electric field exposure than to magnetic field exposure. However, Guénel et al.'s findings were not confirmed by Miller et al. (24).

### Limitations

In this study, there was potential for exposure bias from several sources. Measurements were done in different ways for the four occupational groups. The effect of this was probably minor, since the largest potential for bias was with the occupations of generally low exposure: These were measured least precisely. Historical extrapolation could be based on erroneous judgment about past exposures, either over- or underestimating exposures. It is hard to assess the possible effect of this, except that the relative order of occupations with respect to exposure would probably be preserved. In view of the above discussion, the nonassessment of electric field exposure must be considered a weakness.

### Ascertainment of death

Probabilistic record linkage poses the problem of false positives (false links) and false negatives (missed links). With the restrictive strategy we used, the numbers of deaths and causes linked to the wrong person were certainly small. From the manual verification of cancer deaths, in which we found one person still alive among 122 deaths checked, we estimate it to have been less than 1 percent. On the other hand, we probably missed some deaths, which reduced the power of our study as well as the size of the estimated effects of ELF magnetic fields. The number of deaths missed was probably less than 4 percent, since most of these deaths would have been found among the 147 additional deaths linked when less restrictive linkage rules were applied. We can discern no reason why these losses should have differed according to occupation. Ascertainment of causes of death such as leukemia and (especially) brain cancer may be subject to errors. A validation study showed that the quality of cause-of-death data was good for leukemia and fairly good for brain tumors (see Materials and Methods section).

### Exposure assessment

We had employment data, including duration and type of activity, for all members of our cohort. All of the major engines that had ever been in use were measured repeatedly so that exposure could be assessed precisely, and extrapolation was fairly straightforward. Taken together, this means that in the present study, accurate exposure assessment was possible for the highly exposed group. For the less exposed groups of station masters and train attendants, the relative accuracy is lower. Because newer electric and electronic equipment, most notably air conditioning in coaches (since 1964) and computers in station offices (since 1985), was introduced rather recently, the linear historical interpolation used probably led to an overestimate of the historical expo-

sure of these groups, decreasing any estimate of the effects of ELF magnetic fields. However, for these occupations as well, the absolute level of exposure was determined fairly accurately ( $\pm 1 \mu\text{T}\cdot\text{years}$ ).

The data logging at 10-second intervals permitted us to quantify and investigate the health effects of length of time spent under magnetic fields of  $\geq 10 \mu\text{T}$ , in addition to the more customary cumulative exposure. In a crude way, this measure describes the dynamics of the exposure process. We neglected leisure time and home exposures, because we judged them to be negligible in comparison with occupational exposures.

### Confounder assessment

From the information obtained about the substances used for cleaning and maintenance, there seems to be no reason to suspect any confounding effect. A substudy showed that line engineers smoked less than either shunting yard engineers or train attendants. Line engineers, working mostly alone in their driver's stands, tend to have fewer contacts with other people than workers in the other occupations investigated. Both of these characteristics reduce the exposure of line engineers to two suspected (but not well established) causes of leukemia.

### Comparison with literature

Comparison of our study with other occupational or residential studies in the literature is complicated somewhat by the fact that most other studies were concerned with the effects of 50- or 60-Hz alternating current on health, while in our study, 16 $\frac{2}{3}$  Hz was the frequency assessed. It is instructive to compare our study with three other studies (7, 25, 26) of railway personnel exposed to 16 $\frac{2}{3}$ -Hz ELF magnetic fields. Table 7 provides a comparison with these studies.

The similarities between these studies with respect to both the occupational risk profiles for leukemia and brain tumors and the exposure situation are remarkable. Swiss and Swedish railway engineers show substantially elevated risks of leukemia, which is also observed among Norwegian tram drivers. This supports the notion of the importance of dynamic exposure aspects. Swiss shunting yard engineers and train attendants, Swedish conductors, and Norwegian track walkers have elevated brain tumor risks, which suggests a risk of continuous long term exposure to electric and magnetic fields. However, several major distinctions should be borne in mind: first, the lower exposures of Swedish railway employees compared with Swiss (there were no exposures given for the Norwegian railway workers) and, second, differences in reference groups. Both factors could be expected to lead to a reduction in risk among the Swedish workers relative to the Swiss workers. Third, there are differences in study sizes, as well as in distribution of diagnoses: The Swiss study had more power to detect effects on leukemia in engineers, while the Swedish one had more power for brain tumors. Fourth, the ratio of the number of cases of leukemia to the number of cases of brain tumors ranged from nearly 5 in Swiss line engineers to 0.4 in Swedish conductors.

We are aware of two occupational studies besides this one that permit the estimation of a dose-response relation (4, 10). Table 8 summarizes the findings of these studies. There is no statistical disagreement between the findings of the present study and those of Floderus et al. (4), but there is statistical disagreement with the findings of Tynes et al. (10). However, the latter study reported results on exposure that are difficult to reconcile with each other: A yearly average exposure of 20  $\mu\text{T}$  (10, p. 647) would necessitate 95 years of exposure for accumulation of 1,900  $\mu\text{T}\cdot\text{years}$ , which is the border between the highest and second highest exposure categories in Tynes et al.'s table 3 (10, p. 650).

Several factors lead us to believe that the accuracy of our assessment of line and shunting yard engineers' exposure in the present study was quite good. First, line and shunting yard engineers spend a large fraction of their working time in the same, fixed location, which permits accurate assessment of exposure. Thus, daily workplace exposures could be measured exactly as they had occurred over the past 50 years, using the same engines and measuring at the driver's position. Second, reconstruction of group exposures relied on these measurements and on historical records of numbers of engines in use. We know of no other study in which similar features could be exploited to obtain accurate exposure assessment. Assessment of train attendants' and station masters' exposure was less accurate, since only recent exposure situations could be measured for these occupations.

The findings of the present study do not result from data-dredging, because we evaluated two hypotheses formulated a priori (see Introduction).

The frequency of 16 $\frac{2}{3}$  Hz has some special interest in view of findings on a frequency-dependent calcium efflux from cells at the frequency of 15 Hz and multiples thereof (27). Another mechanism of cancer promotion being discussed is based on melatonin, since melatonin appears to be involved in modulation of the immune system (28) and has oncostatic properties (29). In a related study, the melatonin metabolism of locomotive engineers was investigated (19). This study showed a suppression effect after onset of exposure which could not be explained by the shift work. Comparable findings were reported by Burch et al. (30). Thus, a possible pathway of leukemia causation is a disturbance of melatonin metabolism.

### Conclusions

This study contributes to the evidence that exposure to ELF magnetic fields in high dosages over prolonged time promotes or generates leukemia. The best estimate of the dose-mortality relation is an increase of approximately 1 percent per  $\mu\text{T}\cdot\text{year}$  of cumulative thorax exposure. On a methodological level, this study reinforces the impression that accurate assessment of electromagnetic field exposure through historical reconstruction is crucial. With the moderate size of the risks involved and the rarity of leukemia and brain tumors, even moderate exposure misclassification will invariably lead to insignificant results.

What are the consequences of this study and similar studies with respect to prevention? We believe that moni-

## LETTER TO THE EDITOR

**Extremely low frequency (ELF) electromagnetic fields and leukaemia in children**

Sir – In your issue of November 1989, which contained our article on low frequency electromagnetic fields and leukaemia (Coleman *et al.*, 1989), your Guest Editorial by Dr R.A. Cartwright addressed the same topic. While welcoming the importance you attach to this research, we were surprised at Dr Cartwright's suggestion that current evidence points to a risk of leukaemia from ELF fields that is 'minute [and] verging on the point of non-existence'. While this may be a reasonable view of the evidence in adults, the evidence about leukaemia in children gives some cause for concern.

The results of all the epidemiological studies on ELF fields in the home and leukaemia risk in children are summarised in Table I, which gives the relative risk estimates (RR) for high field homes compared to low field homes. The definition of high and low magnetic field varied between studies. Four of the six studies show an increased risk, although the risks are small, the highest being the two-fold risk found in the original study by Wertheimer and Leeper (1979). A crude pooling of the studies subsequent to the first is consistent with Dr Cartwright's interpretation that there is little evidence of any risk. However, the methodology of the early studies was strongly criticised (Coleman & Beral, 1988), and two recent studies of leukaemia (Savitz *et al.*, 1988; Coleman *et al.*, 1989), both carefully designed to avoid bias, gave closely similar results in children, both of which approached formal statistical significance. Crudely pooling the results of these two studies gives a risk estimate (RR) of 1.5 (95% CI 0.9–2.3).

As discussed in our paper, the true magnitude of any risk is likely to have been underestimated in epidemiological studies performed to date, because of the inherent difficulties in assessing the intensity of ELF fields in the home over the period relevant to leukaemogenesis (Savitz *et al.*, 1989). The uncertainties in the exposure estimates will tend to dilute the estimated risk considerably.

The statistical power of studies is limited by the relative rarity of high-field homes. The range of magnetic fields in homes is wide (Kaune *et al.*, 1987; Maddock, 1987), but most homes fall at the low end of the range, in the region of 100nT (1 mG), with relatively few above 200–300nT, as shown by the small numbers in the 'High Field' category in Table I. This is particularly true in the UK where electricity distribution is predominantly in underground cables.

Further epidemiological studies are required in order to establish whether such low intensity, low-frequency fields are associated with leukaemia. The epidemiological evidence needs to be particularly strong as there is no clear biological evidence of a mechanism. ELF fields undoubtedly affect biological systems (Byus *et al.*, 1987; Ahlbom *et al.*, 1987) but have not been shown to produce mutagenesis or chromosomal damage. Future work needs to focus on highly exposed groups: there are at least 12,000 houses in the UK close to high-tension powerlines; the young residents of these and adjacent homes might provide a suitable population for study in the UK. Such a study is in progress in the Nordic countries (A. Ahlbom, personal communication). Further, four new independent studies are under way or about to begin: one international, and one each in Canada, USA, and Sweden. These large, well-designed studies should provide an improved estimate of the size of any risk.

Yours etc.,

J. Bell

## I. KEY SCIENTIFIC EVIDENCE

Exposure to electromagnetic fields (EMF) has been linked to a variety of adverse health outcomes. The health endpoints that have been reported to be associated with ELF and/or RF include childhood leukemia, adult brain tumors, childhood brain tumors, genotoxic effects (DNA damage and micronucleation), neurological effects and neurodegenerative disease, immune system dysregulation, allergic and inflammatory responses, breast cancer in men and women, miscarriage and some cardiovascular effects.

Effects are not specifically segregated for ELF or RF, since many overlapping exposures occur in daily life; and because this is an artificial division based on frequencies as defined in physics that has little bearing on the biological effects. Both ELF and RF, for example have been shown to cause cells to generate stress proteins, a universal sign of distress in plant, animal and human cells.

The number of people exposed to elevated levels of EMF has been estimated in various studies, and there is general agreement among them. In the United States, few people have chronic or prolonged exposures over 4 mG (0.4  $\mu$ T) (Kheifets et al, 2005b). Section 20 has information on average residential and occupational ELF levels. The highest exposure category in most all studies is  $\geq 4$  mG ( $\geq 0.4$   $\mu$ T). Many people have daily exposures to ELF in various ways, some of them up to several hundred milligauss for short periods of time, but relatively few people with the exception of some occupational workers habitually experience ELF exposures greater than 1-2 mG (0.2 – 0.3  $\mu$ T - App. 20-A).

The exposure of children to EMF has not been studied extensively; in fact, the FCC standards for exposure to radiofrequency radiation are based on the height, weight and stature of a 6-foot tall man, not scaled to children or adults of smaller stature. They do not take into account the unique susceptibility of growing children to exposures (SCENIHR, 2007; Jarosinska and Gee, 2007), nor are there studies of particular relevance to children.

Differences in exposure patterns between infants, children and adults; 2) special susceptibilities of infants and children to the effects of EMF; and 3) interactions between chemical contaminants

and EMF are lacking; as are studies on chronic exposure for both children and adults. There is reason to believe that children may be more susceptible to the effects of EMF exposure since they are growing, their rate of cellular activity and division is more rapid, and they may be more at risk for DNA damage and subsequent cancers. Growth and development of the central nervous system is still occurring well into the teenage years so that neurological changes may be of great importance to normal development, cognition, learning, and behavior. Prenatal exposure to EMF have been identified as possible risk factor for childhood leukemia. Children are largely unable to remove themselves from exposures to harmful substances in their environments. Their exposure is involuntary.

Like second-hand smoke, EMF is a complex mixture, where different frequencies, intensities, durations of exposure(s), modulation, waveform and other factors is known to produce variable effects. Many years of scientific study has produced substantial evidence that EMF may be considered to be both carcinogenic and neurotoxic. The weight of evidence is discussed in this report, including epidemiological evidence and studies on laboratory animals.

Relative risk estimates associated with some of these endpoints are small and the disease is fairly rare (for childhood leukemia, for example), For other diseases, the risk estimates are small but the diseases are common and EMF exposures at levels associated with increased risks are widespread and chronic so the overall public health impacts may be very large.

## **A. Weight of Evidence Assessment and Criteria for Causality**

A weight-of-evidence approach has been used to describe the body of evidence between health endpoints and exposure to electromagnetic fields (ELF and RF).

The number and quality of epidemiological studies, as well as other sources of data on biological plausibility are considered in making scientific and public health policy judgments. Methodological issues that were considered in the review of the epidemiological literature include 1) quality of exposure assessment. 2) sample size of the study, which detects the power to detect an effect, 3) extent to which the analysis or design takes into account potential

confounders or other risk factors, 4) selection bias, 5) the potential for bias in determining exposure. Assessment of the epidemiological literature is consistent with guidelines from Hill (1971), Rothman and Greenland (1998) and the Surgeon General's Reports on Smoking (US DHHS, 2004), and California Air Resources Board (2005). Factors that were considered in reaching conclusions about the weight of evidence overall included strength of the association, consistency of association, temporality, biological plausibility, dose-response and issues with non-linear dose-response, specificity and experimental evidence.

There is a relatively large amount of human epidemiological information with real world exposures, including data from occupational studies. There is less animal data in most cases, except for the genotoxicity studies. Human epidemiological evidence has been given the greatest weight in making judgments about weight-of-evidence, where the results across high quality studies give relatively consistent positive results. Meta-analyses of childhood leukemia, adult leukemia, adult brain tumors, childhood brain tumors, male and female breast cancer and Alzheimer's disease were relied upon in assessing the overall strength of epidemiological study results. Sections 5 – 15 provide analysis of the relevant scientific studies that are key evidence in making public health policy recommendations with respect to exposure to electromagnetic fields (both ELF and RF).

## **B. Summary of Evidence**

### **1. Childhood Leukemia**

Several meta-analyses have been conducted to assess risks of childhood leukemia from exposure to ELF. The results of these studies that combine or pool results of many individual studies (including studies that report both effects and no effects) consistently report increased risks.

#### **Meta-Analysis: Studies of Childhood Leukemia and EMF**

Greenland et al., (2000) reported a significantly elevated risk of 1.68 [95% CI 1.23-2.31] based on pooled results from 12 studies using a time-weighted average of exposure greater than 3 mG (0.3  $\mu$ T). This is a 68% increased risk of childhood leukemia.

Ahlbom et al., (2000) reported a doubling of risk based on a meta-analysis of nine (9) studies. The results reported an elevated risk of 2.0 [95% CI 1.27-3.13] for EMF exposures equal to or greater than 4 mG (0.4  $\mu$ T) as compared to less than 1 mG (0.1  $\mu$ T)

### **Other Relevant Evidence**

In 2002, the International Agency for Cancer Research (IARC) designated EMF as a “possible human carcinogen” or Group 2B Carcinogen based on consistent epidemiological evidence. The exposure levels at which increased risks of childhood leukemia are reported in individual studies range from above 1.4 mG or 0.14  $\mu$ T (Green et al., 1999) for younger children to age six (6) to 4 mG (0.4  $\mu$ T). Many individual studies with cutpoints of 2 mG or 3 mG (0.2-0.3  $\mu$ T) report increased risks. Plausible biological mechanisms exist that may reasonably account for a causal relationship between EMF exposure and childhood leukemia.

### **Recurrence of Childhood Leukemia and Poorer Survival Rates with Continued EMF Exposure**

Foliart reported more than a four-fold (450% increased risk) of adverse outcome (poorer survival rate) for children with acute lymphoblastic leukemia (ALL) who were recovering in EMF environments of 3 mG (0.3  $\mu$ T) and above (OR 4.5, CI 1.5-13.8). Svendsen reported a poorer survival rate of children with acute lymphoblastic leukemia (ALL) in children exposed to 2 mG (0.2  $\mu$ T) and above. These children were three times more likely (300% increased risk) to die than children recovering in fields of less than 1 mG (OR 3.0, CI 0.9-8). Children recovering in EMF environments between 1- 2 mG (0.1-0.2  $\mu$ T) also had poorer survival rates, where the increased risk was 280% (OR 2.8, CI 1.2-6.2).

### **Higher Lifetime Cancer Risks with Childhood EMF Exposure**

Lowenthal (2007) reported that children raised for the first five years in home environments exposed to EMF within 300 meters of a high voltage power line have a five-fold (a 500 percent increased risk) of developing some kinds of cancers sometime in later life. For children from newborn to 15 years of age; it is a three-fold risk of developing cancer later in life (Lowenthal et al., 2007). There is suggestive evidence for a link between adult leukemia and EMF exposure.

### **Attributable Risk**

Wartenberg estimates that 8% to 11% of childhood leukemia cases may be related to ELF exposure. This translates into an additional 175 to 240 cases of childhood leukemia based on 2200 US cases per year. The worldwide total of annual childhood leukemias is estimated to be 49,000, giving an estimate of nearly 4000 to 5400 cases per year. Other researchers have estimated higher numbers that could reach to 80% of all cases (Milham, 2001).

## 2. Childhood Brain Tumors

### Childhood Brain Tumors

There is suggestive evidence that other childhood cancers may be related to EMF exposure. The meta-analysis by Wartenberg et al., (1998) reported increased risks for childhood brain tumors. Risks are quite similar whether based on calculated EMF fields (OR = 1.4, 95% CI = 0.8 – 2.3] or based on measured EMF fields (OR = 1.4, 95% CI = 0.8 – 2.4).

## 3. Adult Brain Tumors

### Brain Tumors in Electrical Workers and in Electrical Occupations (Meta-analysis)

A significant excess risk for adult brain tumors in electrical workers and those adults with occupational EMF exposure was reported (Kheifets et al., 1995). This is about the same size risk for lung cancer and second hand smoke (US DHHS, 2006). A total of 29 studies with populations from 12 countries were included in this meta-analysis. The relative risk was reported as 1.16 (CI = 1.08 – 1.24) or a 16% increased risk for all brain tumors. For gliomas, the risk estimate was reported to be 1.39 (1.07 – 1.82) or a 39% increased risk for those in electrical occupations. A second meta-analysis published by Kheifets et al., ((2001) added results of 9 new studies published after 1995. It reported a new pooled estimate (OR = 1.16, 1.08 – 1.01) that showed little change in the risk estimate overall from 1995.

## 4. Brain Tumors and Acoustic Neuromas in Cell Phone and Cordless Phone Users (Meta-Analysis)

### Glioma and Acoustic Neuroma

Hardell et al., (2007) reported in a meta-analysis statistically significant increased risk for glioma with exposure of 10 years or greater in persons using cell phones. Risks were estimated to be 1.2 (0.8 – 1.9) for all use; but when ipsilateral use was assessed (mainly on same side of head) it increased the risk of glioma to 2.0 (1.2 – 3.4) for 10 years and greater use.

For acoustic neuromas, Hardell et al., (2007) reported the increased risk with 10 years or more of exposure to a cell phone at 1.3 (0.6 – 2.8) but this risk increased to 2.4 (1.1 – 5.3) with ipsilateral use (mainly on the same side of the head). There is a consistent pattern of increased risk for brain tumors (glioma) and acoustic neuromas at 10 years and greater exposure to cell phones.

The meta-analysis by Lakhola et al., (2006) reported that brain tumor risk was 1.3 (0.99 – 1.9) for ipsilateral use of a cell phone, but no data was given for exposures at 10 years or greater (all exposures were of shorter duration).

The meta-analysis by Kan et al., (2007) reported “no overall risk” but found elevated risk of brain tumors (RR = 1.25, CI 1.01 – 1.54)  $\geq$  10 years, reinforcing the findings of other pooled

estimates of risk. No estimates of increased risk with ipsilateral use were provided, which would have likely increased reported risks.

## 5. Neurodegenerative Diseases

### Alzheimer's Disease and ALS

Evidence for a relationship between exposure and the neurodegenerative diseases, Alzheimer's and amyotrophic lateral sclerosis (ALS), is strong and relatively consistent. While not every publication shows a statistically significant relationship between exposure and disease, ORs of 2.3 (95% CI = 1.0-5.1 in Qio et al., 2004), of 2.3 (95% CI = 1.6-3.3 in Feychting et al., 2003) and of 4.0 (95% CI = 1.4-11.7 in Hakansson et al., 2003) for Alzheimer's Disease.

Hakansson et al., report more than a doubling of risk for ALS 2.2 (95% CI = 1.0-4.7).

Savitz et al., (1998) reports more than a tripling of risk for ALS (3.1, CI = 1.0 – 9.8).

## 6. Breast Cancer (Men and Women)

A meta-analysis by Erren (2001) on EMF and breast cancer reported pooled relative risks based on studies of both men and women. A total of 38 publications were reviewed; there were 23 studies on men; 25 studies on women; and 10 studies on both men and women. The pooled relative risk for women exposed to EMF was 1.12 (CI 1.09 – 1.15) or a 12% increased risk, Erren observed that variations between the contributing results are not easily attributable to chance ( $P = 0.0365$ ). For men and breast cancer, he reported a fairly homogeneous increased risk (a pooled relative risk of 1.37 [CI 1.11 – 1.71]).

This analysis is well conducted. The results were stratified according to measured or assumed intensity of exposure to EMF; and the estimate of risk for the most heavily exposed group was extracted. Independent estimates of RRs were grouped according to gender, type of study (case-control and cohort), country where the study was conducted and method used to assess exposure. Pooled estimates of RRs and their 95% confidence intervals (CI) referring to various combinations of these factors were calculated according to appropriate statistical methods (Greenland, 1987). Misclassification possibilities were thoroughly assessed, and whether the results were sole endpoints or there were multiple endpoints in each study did not affect the RRs.

Erren qualifies his findings by discussing that latencies for cancers can be 20 to 30 years, Further, he notes that studies of total EMF exposures from both home, travel and workplace are rarely available, and these EMF sources are ubiquitous. Both could result in underestimation of risks. Another way in which risks might be masked is by variations in age of study participants. Forssen and colleagues (2000) reported no increased RRs for breast cancer in women of all ages

when they combined residential and occupational EMF exposures (RR = 0.9, CI 0.3 – 2.7). However, when risks for the women younger than 50 years of age were separated out and calculated, the RR increased to 7.3 (CI 0.7 – 78.3) although with wide confidence intervals based on only four cases. Erren notes

*“When possibly relevant exposures to EMF in the whole environment are assessed only partially, errors in the categorization of exposure status are likely to occur. If such misclassification is random and thus similar in subgroups being compared (nondifferential), then the error will tend to introduce bias towards the null. Substantial random misclassification of exposures would then tend to generate spurious reports of ‘little or no effect’. Note for example that estimates of smoking-associated lung cancer risks in the early 1950’s could have been seriously distorted if exposure assessment had not considered smoking either at work or at home.”*

*“Collectively, the data are consistent with the idea that exposures to EMF, as defined, are associated with some increase in breast cancer risks, albeit the excess risk is small.”* Erren (2001)

## **7. Combined Effects of Toxic Agents and ELF**

### **ELF and Toxic Chemical Exposures**

There is also the issue of what weight to give the evidence for synergistic effects of toxic chemical exposure and EMF exposure. Juuilainen et al., (2006) reported that the combined effects of toxic agents and ELF magnetic fields together enhances damage as compared to the toxic exposure alone. In a meta-analysis of 65 studies; overall results showed 91% of the *in vivo* studies and 68% of the *in vitro* studies had worse outcomes (were positive for changes indicating synergistic damage) with ELF exposure in combination with toxic agents. The percentage of the 65 studies with positive effects was highest when the EMF exposure preceded the other exposure. The radical pair mechanism (oxidative damage due to free radicals) is cited as a good candidate to explain these results. Reconsideration of exposure limits for ELF is warranted based on this evidence.

## **II. FALLACIES AND ANSWERS IN THE DEBATE OVER EMF EVIDENCE**

There are several arguments (false, in our view) that have been presented by those who minimize the strength of the relationship between exposure to both 50-60Hz ELF and RF EMFs. These are as follows:

**A. “Only a small number of children are affected.”**

This argument is not correct because we do not know precisely how many children are affected. In 1988 Carpenter and Ahlbom attempted to answer this question based on the results of the New York State Powerlines Project and the results of the study of Savitz et al. (1988), and concluded that if the magnetic fields homes in the US were similar to those in Denver, Colorado fully 10 to 15% of US childhood leukemia (about 1,000 cases) could be associated with residential magnetic field exposure. They then concluded that exposure to magnetic fields from non-residential sources (particularly appliances) must be at least equal in magnitude, and that if so these two sources of exposure would account for 20-35% of childhood leukemia.

There have been several meta-analyses of the childhood leukemia data (Wartenberg, 1998; Greenland et al., 2000; Ahlbom et al., 2000). All have concluded that there is a significant association between residential exposure to magnetic fields and elevated risk of leukemia in children. Greenland et al. (2000) performed a meta-analysis of 15 studies of magnetic field or wire code investigations of childhood leukemia, and calculated the attributable fraction of cases of childhood leukemia from residential magnetic field exposure in the US was 3%. Ahlbom et al. (2000) conducted a different meta-analysis that concluded there was a significant 2-fold elevation of risk at exposure levels of 4 mG (0.4  $\mu$ T) or greater. Kheifets et al. (2006) attempted to calculate the attributable fraction of worldwide childhood leukemia due to EMFs, based on the meta-analyses of Ahlbom et al. (2000) and Greenland et al., (2000). They concluded that the attributable fraction of leukemia was between <1% to 4%. The recent WHO Environmental Health Criteria ELF Monograph #238 (2007) states “(A)ssuming that the association is causal, the number of cases of childhood leukaemia worldwide that might be attributable to exposure can be estimated to range from 100 to 2,400 cases per year. However this represents 0.2 to 4.9% of the total annual incidence of leukaemia cases, estimated to be 49,000 worldwide in 2000. Thus, in a global context, the impact on public health, if any, would be limited and uncertain.”

These reports are important, in that they show consistency in there being a clearly elevated risk of leukemia in children with EMF exposure from power line fields in homes. These meta-analyses lead to the conclusion, reflected in the WHO report, that there is an association between childhood cancer and exposure to elevated magnetic fields in homes. We strongly disagree, however, with the overall conclusion that these calculations indicate that the fraction of childhood leukemia attributable to EMFs is so small as to not have serious public health implications.

There are several reasons why the WHO ELF Environmental Health Criteria Monograph conclusion is not justified. These studies all considered either only measured magnetic fields in homes or wire codes from power lines, ignoring exposure from appliances, wireless devices and all exposures outside of the home. Thus these metrics do not come close to accounting for any individual’s cumulative exposure to EMFs. If residential magnetic fields cause cancer, then those from other sources will add to the risk. The failure to measure total EMF exposure would tend to obscure the relationship and lead to

gross underestimation of the true relationship between exposure and disease. While the evidence for a relationship between exposure and childhood leukemia may be considered to be definitive at exposure levels of 3 or 4 mG (0.3 or 0.4  $\mu$ T) or higher; there is evidence from some (but not all) of the other studies for an elevated risk at levels not greater than 2 mG (0.2  $\mu$ T) (Savitz et al., 1988; Green, 1999). There is absolutely no evidence that exposures at lower levels are “safe”, since persons with these exposures are usually the “control” group. Therefore this WHO statement fails to acknowledge the true magnitude of the problem, even when considering only childhood leukemia. The global attributable risk of childhood leukemia as a result of exposure to EMFs must be significantly greater than that calculated from consideration of only residential 50/60 Hz magnetic fields in studies where there is no unexposed control.

As detailed in other chapters in this report (Chapter 10), there is some evidence for a relationship between EMF exposure and brain cancers in children. We have almost no understanding of the mechanisms behind the development of brain cancers, and any cancer in a child is a tragedy. While evidence for a relationship between EMF exposure and childhood brain cancer is not as strong as for leukemia, it is of concern and deserves more study. Of even greater concern, given the clear evidence for elevated risk of childhood leukemia upon exposure to 50/60 Hz EMFs, is the relative lack of a comparable body of information on the effects of radiofrequency EMFs on the health of children. A recent study of South Korean children (1,928 with leukemia, 956 with brain cancer and 3,082 controls) living near to AM radio transmitters reports an OR of 2.15 (95% CI = 1.19-2.11) for risk of leukemia in children living within 2 km of the nearest AM transmitter as compared to those living more than 20 km from it (Ha et al., 2007). No relation was found for brain cancer. This study is consistent with the hypothesis that radiofrequency EMFs have similar effects to 50/60 Hz EMFs, but more study is needed. Since radiofrequency EMFs have higher energy than do power line frequencies, one might expect that they would be even more likely to cause disease. The enormous and very recent increase in use of cell phones by children is particularly worrisome. However there is little information at present on the long-term consequences of cell phone use, especially by children.

## **B. “There is insufficient evidence that adult diseases are secondary to EMF exposure.”**

It is correct that the level of evidence definitively proving an association between exposure to EMFs and various adult diseases is less strong than the relationship with childhood leukemia. However there are multiple studies which show statistically significant relationships between occupational exposure and leukemia in adults (see Chapter 11), in spite of major limitations in the exposure assessment. A very recent study by Lowenthal et al. (2007) investigated leukemia in adults in relation to residence near to high-voltage power lines. While they found elevated risk in all adults living near to the high voltage power lines, they found an OR of 3.23 (95% CI = 1.26-8.29) for individuals who spent the first 15 years of life within 300 m of the power line. This study provides support for two important conclusions: adult leukemia is also associated with

EMF exposure, and exposure during childhood increases risk of adult disease. Thus protecting children from exposure should be a priority.

The evidence for a relationship between exposure and breast cancer is relatively strong in men (Erren, 2001), and some (by no means all) studies show female breast cancer also to be elevated with increased exposure (see Chapter 12). Brain tumors and acoustic neuromas are more common in exposed persons (see Chapter 10). There is less published evidence on other cancers, but Charles et al. (2003) report that workers in the highest 10% category for EMF exposure were twice as likely to die of prostate cancer as those exposed at lower levels (OR 2.02, 95% CI = 1.34-3.04). Villeneuve et al. (2000) report statistically significant elevations of non-Hodgkin's lymphoma in electric utility workers in relation to EMF exposure, while Tynes et al. (2003) report elevated rates of malignant melanoma in persons living near to high voltage power lines. While these observations need replication, they suggest a relationship between exposure and cancer in adults beyond leukemia.

Evidence for a relationship between exposure and the neurodegenerative diseases, Alzheimer's and amyotrophic lateral sclerosis (ALS), is strong and relatively consistent (see Chapter 12). While not every publication shows a statistically significant relationship between exposure and disease, ORs of 2.3 (95% CI = 1.0-5.1 in Qio et al., 2004), of 2.3 (95% CI = 1.6-3.3 in Feychting et al., 2003) and of 4.0 (95% CI = 1.4-11.7 in Hakansson et al., 2003) for Alzheimer's Disease, and of 3.1 (95% CI = 1.0-9.8 in Savitz et al., 1998) and 2.2 (95% CI = 1.0-4.7 in Hakansson et al., 2003) for ALS cannot be simply ignored.

In total the scientific evidence for adult disease associated with EMF exposure, given all of the difficulties in exposure assessment, is sufficiently strong that preventive steps are appropriate, even if not all reports have shown exactly the same positive relationship. While there are many possible sources of false positive results in epidemiological studies, there are even more possible reasons for false negative results, depending on sample size, exposure assessment and a variety of other confounders. It is inappropriate to discount the positive studies just because not every investigation shows a positive result. While further research is needed, with better exposure assessment and control of confounders; the evidence for a relationship between EMF exposure and adult cancers and neurodegenerative diseases is sufficiently strong at present to merit preventive actions to reduce EMF exposure.

### **C. "The risk is low."**

This argument is incorrect because at present it is not possible to determine the magnitude of the risk. Clearly as far as EMFs are concerned there is no unexposed population. Therefore one can only compare groups with different levels of exposure. We can perhaps say with confidence that the elevated risk of leukemia from residential exposure of children to magnetic fields is "low" (meaning ORs in the range of 2-4), but this does not consider the child's exposure to appliances, exposure in automobiles and at

daycare or school, exposures in playgrounds and at all of the other places that a child spends time. Even if the risk to one individual is low, the societal impact when everyone is exposed may be very significant.

In addition the exposure assessment is grossly inadequate, even in the best of studies. Most reports deal only with either characterization of the fields within residences or with job titles in occupational settings. Some studies attempt to quantitate other sources of exposure, such as frequency of cell phone usage or use of other appliances, but these studies almost always do not consider residential exposure from power lines. In no investigation has it been possible to follow the exposures of a large number of people over a number of years with accurate monitoring of total exposure to EMFs. This would of course be almost impossible to do for the very good reason that as a person moves through his or her environment the exposures vary from place to place and from moment to moment. However to truly and objectively determine the risk of exposure to EMFs it is essential to consider residential, occupational (or school) and recreational exposures to the full range of the electromagnetic spectrum, including appliances and wireless devices. This has not been accomplished in any study, and without such information it is not possible to determine the overall magnitude of the risk. It is possible, indeed likely, that upon consideration of both childhood and adult diseases that the risk is not low.

#### **D. “There is no animal evidence”.**

It is correct that there is no adequate animal model system that reproducibly demonstrates the development of cancer in response to exposure to EMFs at the various frequencies of concern. McCann et al. (1997) reviewed the animal studies, and while they found most to be negative there were several that showed suggestive positive results. They also clearly identified issues that need to be improved in further animal carcinogenesis investigations. However Kheifets et al. (2005a) in a policy review noted that “even consistent negative toxicological data cannot completely overcome consistent epidemiological studies. First, a good animal model for childhood leukemia has been lacking. Second, particularly for ELF, the complex exposures that humans encounter on a daily basis and a lack of understanding of the biologically relevant exposure calls into question the relevance of exposures applied in toxicology. Another limitation of toxicologic studies is that animals cannot be exposed to fields that are orders of magnitude more powerful than those encountered by humans, decreasing their power to detect small risks.” Further, they conclude that “(A)lthough the body of evidence is always considered as a whole, based on the weight of evidence approach and incorporating different lines of scientific enquiry, epidemiologic evidence, as most relevant, is given the greatest weight.”

One positive animal study is that by Rapacholi et al. (1997), who demonstrated that lymphoma-prone transgenic mice developed significantly more lymphoma after exposure to 900 MHz fields (lymphoma being the animal equivalent of human leukemia) than did unexposed animals. More striking is the report from Denver, Colorado using the wire-code characterization originally developed by Wertheimer and Leeper (1979) showing

that pet dogs living in homes characterized as having high or very high wire codes, as compared to those with low or very low wire codes or buried power lines, showed a OR of 1.8 (95% CI = 0.9-3.4) for development of lymphoma after adjustment for potential confounders, whereas dogs that lived in homes with very high wire codes had an OR of 6.8 (95% CI = 1.6-28.5) (Reif et al., 1995). This study is impressive because the exposure of the dogs reflects the environment in which exposure has been associated with elevated risk of human cancer in two independent investigations (Wertheimer and Leeper, 1979; Savitz et al., 1988).

It is curious that in many legal situations the courts are reluctant to accept only evidence that substance X causes cancer in animals without corresponding evidence in humans. In the case of EMFs we have strong evidence that EMFs cause cancer in human, but much less evidence from animal models. The US Supreme Court, in the case of *Daubert vs. Merrell Dow Pharmaceuticals*, effectively ruled that animal studies were not relevant to human health, and that the only admissible evidence must be from human epidemiological studies! While this is certainly not a justifiable conclusion, the situation with regards to EMF health effects is that we have strong evidence for human cancer from epidemiological studies, but do not have good evidence for cancer in experimental animals. But it is humans that we should be concerned about, not the laboratory rats.

#### **E. “We do not know a mechanism.”**

We do not know the mechanism of cancer in general, although we know a lot about cancer. It came as a major surprise to most scientists when Lichtenstein et al., (2000) reported that genetic factors play a minor role in causing most types of cancer, since it was commonly assumed that genetics was the major cause. However Lichtenstein et al. concluded from their study of identical twins that environmental factors were the initiating event in the great majority of cancers. This does not, of course, mean that genetic susceptibility to environmental contaminants is unimportant, but only that genetic factors alone do not result in cancer. We know mechanisms of action for some carcinogenic substances, but for most cancers we know neither the environmental trigger nor the mechanism of action. So there is no reason to negate the evidence that EMFs cause cancer just because we do not know a single mechanism to explain it's mode of action.

We do not know the mechanism or cause for development of Alzheimer's Disease or ALS. We do know that both are more common in individuals in certain occupations, and that exposure to certain metals appears to be associated with increased risk (Kamel et al., 2002; Shcherbatykh and Carpenter, 2007). In the case of Alzheimer's Disease there are abnormalities of amyloid  $\beta$  and tau protein (Goedert and Spillantini, 2006), but very limited understanding of why or how they form. Neither the association with metals nor the presence of abnormal proteins constitutes a mechanism for cause of disease. So rather than discounting the relationship between EMF exposure and neurodegenerative diseases we should be using this information as a tool to better understand the etiology of these diseases.

There is clear evidence from animal and cell culture studies that ELF and RFR have biological effects. Furthermore, these effects occur at intensities commonly experienced by humans. We know a number of ways in which EMFs alter cell physiology and function, as detailed in various chapters in this report. EMFs affect gene transcription (Chapter 5 and 6), cause the synthesis of stress proteins (Chapter 7) and cause breakage of DNA, probably through generation of reactive oxygen species (Chapter 6 and 9 - Lai and Singh, 2004). Any one of these actions might be responsible for the carcinogenic and neurodegenerative actions of EMFs. However, as with many environmental agents, it would be a mistake to assume that there is only one target or mechanism of action. It is unlikely, for example, that the effects on the nervous system and behavior are secondary to exactly the same cellular targets and actions that lead to cancer. It is likely that there are multiple mechanisms of action leading to disease. But the lack of complete understanding of basic mechanisms does not alter the importance of the relationships.

## **F. Vested Interests: How They Shape the Public Health Debate**

There is no question but that global implementation of the safety standards proposed in this report has the potential to not only be very expensive but also could be disruptive of life and economy as we know it if implemented abruptly and without careful planning. Action must be a balance of risk to cost to benefit. However, “deny and deploy” strategies by industry should not be rewarded in future risk assessment calculations. For example, if significant economic investments in the roll-out of risky technologies persist beyond the time that there is reasonable suspicion of risk available to all who look, then such costs should not be borne by ratepayers (in the case of new powerlines) or by compensating industry for bad corporate choices. Such investments in the deployment of new sources of exposure for ELF and RF should not count toward the balance sheet when regulatory agencies perform risk assessments. Mistakes may be made, but industry should make mid-course corrections to inform and protect the public, rather than deny effects pending “proof”. Whether the costs of remedial action are worth the societal benefits is a formula that should reward precautionary behavior. Prudent corporate policies should be expected to address and avoid future risks and liabilities. Otherwise, there is no market incentive to produce safe (and safer) products.

The deployment of new technologies is running ahead of any reasonable estimation of possible health impacts and estimates of probabilities, let alone a solid assessment of risk. However what has been missing with regard to EMF has been an acknowledgement of the risk that is demonstrated by the scientific studies. As discussed in earlier sections, in this case there is clear evidence of risk, although the magnitude of the risk is uncertain, and the magnitude of doing nothing on the health effects cost to society is similarly uncertain. This situation is very similar to our history of dealing with the hazards of smoking decades ago, where the power of the industry to influence governments and even conflicts of interest within the public health community delayed action for more than a generation, with consequent loss of life and enormous extra health care costs to society.

Just because a problem is difficult to solve is not a reason to deny that a problem exists. In fact solutions to difficult issues usually can't be expected until the issues are known and creative thinking is brought to bear to find a solution.

The most contentious issue regarding public and occupational exposures to ELF and RF involves the resolute adherence to existing ICNIRP and IEEE standards by many countries, in the face of growing scientific evidence of health risks at far lower levels. Furthermore there is widespread belief that governments are ignoring this evidence. There are two obvious factors that work against governments taking action to set exposure guidelines based on current scientific evidence of risk. These are: 1) contemporary societies are very dependent upon electricity usage and RF communications, and anything that restricts current and future usage potentially has serious economic consequences and 2) the electric power and communications industries have enormous political clout and even provide support for a significant fraction of what research is done on EMF. This results in legislation that protects the status quo and scientific publications whose conclusions are not always based on only the observations of the research. It hinders wise public health policy actions and implementation of prevention strategies because of the huge financial investments already made in these technologies.

In 1989, in an editorial for Science Magazine, Philip H. Abelson called for more research into low-frequency electromagnetic fields. At that time, he confirmed that a US Office of Technology Assessment (OTA) study had determined that “*(o)verall, the evidence is too weak to allow firm conclusions either way*” but a policy of prudent avoidance strategy was suggested, Abelson defined this as “*to systematically look for strategies which can keep people out of 60 Hz fields*”. Both policy actions were developed in the midst of scientific uncertainty, but rising concern for possible health impacts to the public. At that time, with high level of unknowns, the appropriate level of policy action was prudent avoidance or precautionary action. Nearly two decades later, the level of action warranted is higher – based on many new scientific publications confirming risks may exist – and justifying prevention or preventative action.

### III. EMF EXPOSURE AND PRUDENT PUBLIC HEALTH PLANNING

- *The scientific evidence is sufficient to warrant regulatory action for ELF; and it is substantial enough to warrant preventative actions for RF.*
- *The standard of evidence for judging the emerging scientific evidence necessary to take action should be proportionate to the impacts on health and well-being*
- *The exposures are widespread.*
- *Widely accepted standards for judging the science are used in this assessment.*

Public exposure to electromagnetic radiation (power-line frequencies, radiofrequency and microwave) is growing exponentially worldwide. There is a rapid increase in electrification in developing countries, even in rural areas. Most members of society now have and use cordless phones, cellular phones, and pagers. In addition, most populations are also exposed to antennas in communities designed to transmit wireless RF signals. Some developing countries have even given up running land lines because of expense and the easy access to cell phones. Long-term and cumulative exposure to such massively increased RF has no precedent in human history. Furthermore, the most pronounced change is for children, who now routinely spend hours each day on the cell phone. Everyone is exposed to a greater or lesser extent. No one can avoid exposure, since even if they live on a mountain-top without electricity there will likely be exposure to communication-frequency RF exposure. Vulnerable populations (pregnant women, very young children, elderly persons, the poor) are exposed to the same degree as the general population. Therefore it is imperative to consider ways in which to evaluate risk and reduce exposure. Good public health policy requires preventative action proportionate to the potential risk of harm and the public health consequence of taking no action.

## IV. RECOMMENDED ACTIONS

### A. Defining new exposure standards for ELF

This chapter concludes that new ELF limits are warranted based on a public health analysis of the overall existing scientific evidence. The public health view is that new ELF limits are needed now. They should reflect environmental levels of ELF that have been demonstrated to increase risk for childhood leukemia, and possibly other cancers and neurological diseases. ELF limits should be set below those exposure levels that have been linked in childhood leukemia studies to increased risk of disease, plus an additional safety factor. It is no longer acceptable to build new power lines and electrical facilities that place people in ELF environments that have been determined to be risky. These levels are in the 2 to 4 milligauss\* (mG) range (0.2 – 0.4  $\mu$ T), not in the 10s of mG or 100s of mG. The existing ICNIRP limit is 1000 mG (100  $\mu$ T) and 904 mG (90.4  $\mu$ T) in the US for ELF is outdated and based on faulty assumptions. These limits are can no longer be said to be protective of public health and they should be replaced. A safety buffer or safety factor should also be applied to a new, biologically-based ELF limit, and the conventional approach is to add a safety factor lower than the risk level.

While new ELF limits are being developed and implemented, a reasonable approach would be a 1 mG (0.1  $\mu$ T) planning limit for habitable space adjacent to all new or upgraded power lines and a 2 mG (0.2  $\mu$ T) limit for all other new construction. It is also recommended for that a 1 mG (0.1  $\mu$ T) limit be established for existing habitable space for children and/or women who are pregnant (because of the possible link between childhood leukemia and *in utero* exposure to ELF). This recommendation is based on the assumption that a higher burden of protection is required for children who cannot protect themselves, and who are at risk for childhood leukemia at rates that are traditionally high enough to trigger regulatory action. This situation in particular warrants extending the 1 mG (0.1  $\mu$ T) limit to existing occupied space. "Establish" in this case probably means formal public advisories from relevant health agencies. While it is not realistic to reconstruct all existing electrical distribution systems, in the short term; steps to reduce exposure from these existing systems need to be initiated, especially in places where children spend time, and should be encouraged. These limits should reflect the exposures that are commonly associated with increased risk of child hood leukemia (in the 2 to 5 mG (0.2 to 0.5  $\mu$ T) range for all children, and over 1.4 mG (0.14  $\mu$ T) for children age 6 and younger). Nearly all of the occupational studies for adult cancers and neurological diseases report their highest exposure category is

4 mG (0.4  $\mu$ T) and above, so that new ELF limits should target the exposure ranges of interest, and not necessarily higher ranges.

Avoiding chronic ELF exposure in schools, homes and the workplace above levels associated with increased risk of disease will also avoid most of the possible bioactive parameters of ELF discussed in the relevant literature.

It is not prudent public health policy to wait any longer to adopt new public safety limits for ELF. These limits should reflect the exposures that are commonly associated with increased risk of childhood leukemia (in the 2 to 5 mG (0.2-0.5  $\mu$ T) range for all children, and over 1.4 mG (0.14  $\mu$ T) for children age 6 and younger). Avoiding chronic ELF exposure in schools, homes and the workplace above levels associated with increased risk of disease will also avoid most of the possible bioactive parameters of ELF discussed in the relevant literature.

## **B. Defining preventative actions for reduction in RF exposures**

Given the scientific evidence at hand, the rapid deployment of new wireless technologies that chronically expose people to pulsed RF at levels reported to cause bioeffects, which in turn, could reasonably be presumed to lead to serious health impacts, is a public health concern. A public health action level that implements preventative action now is warranted, based on the collective evidence. There is suggestive to strongly suggestive evidence that RF exposures may cause changes in cell membrane function, cell communication, metabolism, activation of proto-oncogenes and can trigger the production of stress proteins at exposure levels below current regulatory limits. Resulting effects can include DNA breaks and chromosome aberrations, cell death including death of brain neurons, increased free radical production, activation of the endogenous opioid system, cell stress and premature aging, changes in brain function including memory loss, retarded learning, performance impairment in children, headaches and fatigue, sleep disorders, neurodegenerative conditions, reduction in melatonin secretion and cancers (Chapters 5, 6, 7, 8, 9, 10, and 12).

As early as 2000, some experts in bioelectromagnetics promoted a  $0.1 \mu\text{W}/\text{cm}^2$  limit (which is 0.614 Volts per meter) for ambient outdoor exposure to pulsed RF, so generally in cities, the public would have adequate protection against involuntary exposure to pulsed radiofrequency (e.g., from cell towers, and other wireless technologies). The Salzburg Resolution of 2000 set a target of  $0.1 \mu\text{W}/\text{cm}^2$  (or 0.614 V/m) for public exposure to pulsed radiofrequency. Since then, there are many credible anecdotal reports of unwellness and illness in the vicinity of wireless transmitters (wireless voice and data communication antennas) at lower levels. Effects include sleep disruption, impairment of memory and concentration, fatigue, headache, skin disorders, visual symptoms (floaters), nausea, loss of appetite, tinnitus, and cardiac problems (racing heartbeat). There are some credible articles from researchers reporting that cell tower -level RF exposures (estimated to be between  $0.01$  and  $0.5 \mu\text{W}/\text{cm}^2$ ) produce ill-effects in populations living up to several hundred meters from wireless antenna sites,

This information now argues for thresholds or guidelines that are substantially below current FCC and ICNIPR standards for whole body exposure. Uncertainty about how low such standards might have to go to be prudent from a public health standpoint should not prevent reasonable efforts to respond to the information at hand. No lower limit for bioeffects and adverse health effects from RF has been established, so the possible health risks of wireless WLAN and WI-FI systems, for example, will require further research and no assertion of safety at any level of wireless exposure (chronic exposure) can be made at this time. The lower limit for reported human health effects has dropped 100-fold below the safety standard (for mobile phones and PDAs); 1000- to 10,000-fold for other wireless (cell towers at distance; WI-FI and WLAN devices). The entire basis for safety standards is called into question, and it is not unreasonable to question the safety of RF at any level.

A cautionary target level for pulsed RF exposures for ambient wireless that could be applied to RF sources from cell tower antennas, WI-FI, WI-MAX and other similar sources is proposed. The recommended cautionary target level is  $0.1 \mu\text{W}/\text{cm}^2$ \*\* (or 0.614 Volts per meter or V/m)\*\* for pulsed RF where these exposures affect the general public; this advisory is proportionate to the evidence and in accord with prudent public health policy. A precautionary limit of  $0.1 \mu\text{W}/\text{cm}^2$  should be adopted for outdoor, cumulative RF exposure. This reflects the current RF science and prudent public health response that would reasonably be set for pulsed RF (ambient) exposures where

people live, work and go to school. This level of RF is experienced as whole-body exposure, and can be a chronic exposure where there is wireless coverage present for voice and data transmission for cell phones, pagers and PDAs and other sources of radiofrequency radiation. An outdoor precautionary limit of 0.1  $\mu\text{W}/\text{cm}^2$  would mean an even lower exposure level inside buildings, perhaps as low as 0.01  $\mu\text{W}/\text{cm}^2$ . Some studies and many anecdotal reports on ill health have been reported at lower levels than this; however, for the present time, it could prevent some of the most disproportionate burdens placed on the public nearest to such installations. Although this RF target level does not preclude further rollout of WI-FI technologies, we also recommend that wired alternatives to WI-FI be implemented, particularly in schools and libraries so that children are not subjected to elevated RF levels until more is understood about possible health impacts. This recommendation should be seen as an interim precautionary limit that is intended to guide preventative actions; and more conservative limits may be needed in the future.

Broadcast facilities that chronically expose nearby residents to elevated RF levels from AM, FM and television antenna transmission are also of public health concern given the potential for very high RF exposures near these facilities (antenna farms). RF levels can be in the 10s to several 100's of  $\mu\text{W}/\text{cm}^2$  in residential areas within half a mile of some broadcast sites (for example, Lookout Mountain, Colorado and Awbrey Butte, Bend, Oregon). Like wireless communication facilities, RF emissions from broadcast facilities that are located in, or expose residential populations and schools to elevated levels of RF will very likely need to be re-evaluated for safety.

For emissions from wireless devices (cell phones, personal digital assistant or PDA devices, etc) there is enough evidence for increased risk of brain tumors and acoustic neuromas now to warrant intervention with respect to their use. Redesign of cell phones and PDAs could prevent direct head and eye exposure, for example, by designing new units so that they work only with a wired headset or on speakerphone mode.

These effects can reasonably be presumed to result in adverse health effects and disease with chronic and uncontrolled exposures, and children may be particularly vulnerable. The young are also largely unable to remove themselves from such environments. Second-hand radiation, like second-hand smoke is an issue of public health concern based on the evidence at hand.

## V. CONCLUSIONS

- We cannot afford “business as usual” any longer. It is time that planning for new power lines and for new homes, schools and other habitable spaces around them is done with routine provision for low-ELF environments . The business-as-usual deployment of new wireless technologies is likely to be risky and harder to change if society does not make some educated decisions about limits soon. Research must continue to define what levels of RF related to new wireless technologies are acceptable; but more research should not prevent or delay substantive changes today that might save money, lives and societal disruption tomorrow.
- New regulatory limits for ELF based on biologically relevant levels of ELF are warranted. ELF limits should be set below those exposure levels that have been linked in childhood leukemia studies to increased risk of disease, plus an additional safety factor. It is no longer acceptable to build new power lines and electrical facilities that place people in ELF environments that have been determined to be risky (at levels generally at 2 mG (0.2  $\mu$ T) and above).
- While new ELF limits are being developed and implemented, a reasonable approach would be a 1 mG (0.1  $\mu$ T) planning limit for habitable space adjacent to all new or upgraded power lines and a 2 mG (0.2  $\mu$ T) limit for all other new construction, It is also recommended for that a 1 mG (0.1  $\mu$ T) limit be established for existing habitable space for children and/or women who are pregnant . This recommendation is based on the assumption that a higher burden of protection is required for children who cannot protect themselves, and who are at risk for childhood leukemia at rates that are traditionally high enough to trigger regulatory action. This situation in particular warrants extending the 1 mG (0.1  $\mu$ T) limit to existing occupied space. "Establish" in this case probably means formal public advisories from relevant health agencies.
- While it is not realistic to reconstruct all existing electrical distributions systems, in the short term; steps to reduce exposure from these existing systems need to be initiated, especially in places where children spend time, and should be encouraged.

- A precautionary limit of 0.1 ( $\mu\text{W}/\text{cm}^2$  (which is also 0.614 Volts per meter) should be adopted for outdoor, cumulative RF exposure. This reflects the current RF science and prudent public health response that would reasonably be set for pulsed RF (ambient) exposures where people live, work and go to school. This level of RF is experienced as whole-body exposure, and can be a chronic exposure where there is wireless coverage present for voice and data transmission for cell phones, pagers and PDAs and other sources of radiofrequency radiation. Some studies and many anecdotal reports on ill health have been reported at lower levels than this; however, for the present time, it could prevent some of the most disproportionate burdens placed on the public nearest to such installations. Although this RF target level does not preclude further rollout of WI-FI technologies, we also recommend that wired alternatives to WI-FI be implemented, particularly in schools and libraries so that children are not subjected to elevated RF levels until more is understood about possible health impacts. This recommendation should be seen as an interim precautionary limit that is intended to guide preventative actions; and more conservative limits may be needed in the future.

## Media Blackout On Smart Meter Dangers

January 29, 2014 | By Professor James Tracy | [General Health](#), [Mainstream Media](#),

Major power utilities continue to deploy “smart” electrical meters on businesses and private residences throughout the United States and Canada. Yet those in North America and elsewhere remain in the dark on the negative health effects of such devices that systematically blast their homes with radio-frequency (RF) radiation on a minute-by-minute, round-the-clock basis.

In 2009 the Obama administration partnered with utilities by allocating \$3.4 billion in federal stimulus funds toward building a nationwide “smart grid,” where smart meters figure centrally.[1] The project is part of President Obama’s “Climate Action Plan” that under United Nations auspices seeks to reduce US carbon emissions 20% by the year 2020.[2]

There is more than ample research available that has associated negative health effects of RF radiation emitted by smart meters [3] for regulatory authorities to place restrictions on power utilities and compel them to abide by the precautionary principle. Such restrictions would require power providers to refrain from wide scale installation of smart meters until a sufficient body of scientific research demonstrating the safety of such devices has been produced and rigorously evaluated.

Yet in the US and elsewhere the imperative of having a “smart grid,” the prospect of a carbon trading scheme, lax (and in at least some cases corrupt) state and federal regulatory bodies, and the sheer power of the utilities combine to jeopardize the long term health of the entire population.

In a purportedly democratic society news outlets play a decisive role in such an impending health crisis. By failing to report on the dubious health research of smart meters and the fact that the public is being involuntarily subjected to such technology, news media are a key factor in the citizenry’s continued ignorance and inaction.

In May 2011 the World Health Organization’s International Agency for Research on Cancer categorized “radiofrequency electromagnetic fields as possibly carcinogenic to humans based on an increased risk for glioma, a malignant type of brain cancer, associated with wireless cellphone use.”[4] Despite this warning from a well-recognized source, the utilities stubbornly insist that all residences must be equipped with a smart meter issuing dangerous electropollution.

The Environmental Protection Agency (EPA) ceased studying the health effects of radiofrequency radiation when the Senate Appropriations Committee cut the department’s funding and forbade it from further research into the area.[5] Thereafter RF limits were codified as mere “guidelines” based on the EPA’s tentative findings and are presently overseen by the Federal Communications Commission (FCC).

These weakly enforced standards are predicated on the alleged “thermal effect” of RF to which the FCC subscribes. In other words, if the energy emitted from a wireless antenna or device is not powerful enough to heat the skin or flesh then no danger is posed to human health.[6]

To this day power utilities cling to this severely outmoded and unscientific standard when confronted with the formidable body of research linking RF to cancer, destruction of DNA, and other negative health effects. News media seldom question the FCC policy when it is cited by utilities and regulators alike to underline the supposed overall safety of smart meters.[7]

An electronic LexisNexis search of newspaper articles referencing “smart meters” appearing between May 31, 2011, the date WHO classified RF a Class 2B carcinogen, and June 19, 2014, yields close to 839 pieces published in English language papers. Yet for the same time span only one tenth of the sample (82 articles)

mentions “smart meters” and “carcinogen” or “carcinogenic” in the same report. Of these, 65 of the articles appeared in Canadian, and to a much lesser degree Australian or UK papers. Note that each sample includes guest editorials and letters to the editor penned by concerned citizens.

Using parameters from the date May 31, 2011, the date WHO declared RF a Class 2B carcinogen, to January 19, 2014, of 93 newspaper articles referencing “smart meter” and “World Health Organization,” 76 were published in Canadian, and to a much lesser degree UK, Australian, Malaysian or New Zealand outlets. As the above suggests, the extremely limited awareness especially in the US of the potential health consequences of exposure to the continual RF emitted by smart meters is primarily because the issue is being blacked out in the press. When such dangers are reported, they are tempered by the refrain of the FCC’s “thermal effect” policy, which in light of the abundant countervailing research amounts to disinformation. In December 2013 I contacted the reporter at the local metro-daily *Palm Beach Post* covering the state power utility, Florida Power and Light, and its smart meter policy to remind her of the bevy of public health and medical research documenting the likely consequences of sustained RF exposure. I also directed her to the WHO statement classifying RF as potentially carcinogenic.

To the *Post*’s credit a subsequent story highlighting Florida Power and Light’s “opt out” policy referenced the WHO statement. Yet the piece appeared deep in the business section of the paper, and the WHO warning was accompanied by the Florida Public Service Commission’s familiar rejoinder.

In 2011 the World Health Organization’s International Agency for Research on Cancer classified radio frequency electromagnetic fields such as those emitted by cellular phones, microwaves and smart meters as possibly carcinogenic to humans.

The PSC has said its authority does not extend to health issues related to meters. Smart meters are certified for compliance with radio frequency emission standards by the Federal Communications Commission, and the FCC has deemed that meters in compliance with the standards do not have adverse health impacts.[8]

While one or more hidden agendas likely exist to keep the public unaware of the health dangers associated with RF and smart meters (again, think carbon trading, in addition to the social control possibilities via energy rationing and surveillance soon to be realized through the “smart grid,”) a more immediate cause for such censorship is simply profit and continued media monopoly control of public opinion and discourse.

The telecommunications industry whose services are largely predicated on RF has recently exhibited the largest growth in advertising outlays, which are surely recognized in bottom line terms by the news and media industries.[9] With potential continued revenue growth on this scale, raising questions and relaying information that can safeguard public health and allow citizens to ask intelligent questions concerning the health of themselves and their loved ones simply constitutes poor business practice.

## ABSTRACT

More than 2000 references on the biological responses to radio frequency and microwave radiation, published up to June 1971, are included in the bibliography.\* Particular attention has been paid to the effects on man of non-ionizing radiation at these frequencies. The citations are arranged alphabetically by author, and contain as much information as possible so as to assure effective retrieval of the original documents. An outline of the effects which have been attributed to radio frequency and microwave radiation is also part of the report.

\*Three supplementary listings bring the number of citations to more than 2300.

13. ABSTRACT

More than 2300 references on the biological responses to radio frequency and microwave radiation, published up to April 1972, are included in this bibliography of the world literature. Particular attention has been paid to the effects on man of non-ionizing radiation at these frequencies. The citations are arranged alphabetically by author, and contain as much information as possible so as to assure effective retrieval of the original documents. Soviet and East European literature is included in detail. An outline of the effects which have been attributed to radio frequency and microwave radiation is included as Chapter 1. The revised report (which supersedes DDC report AD#734391) is updated with the inclusion of three supplementary listings, and has incorporated many corrections and additions to the original 2100 citations.

## Foreword

It is the hope of the author that this bibliography will provide guidance to the diffuse and conflicting literature on the biological responses to electromagnetic radiation at radio- and microwave-frequencies, with particular reference to the effects of concern to man. Such guidance is needed in the formulation and appraisal of criteria and limits of human exposure to "non-ionizing" radiation, and in the planning and conduct of future research.

The original plans were to categorize and key the literature citations to the "outline of biological and clinical effects" (Chapter 1). This proved to be a much more difficult and time-consuming task than anticipated, and was actually completed only for about 400 papers. Thus, the letter-number combinations given in square brackets for some of the "A" through "C" citations refer to the outline. [NV] indicates the citation was "not verified".

The standard format used throughout the bibliography is: author, (date), journal, volume, (issue): page, "title". The authors are alphabetized, and in chronological order. Multiple authors are also alphabetically ordered according to the second, third, etc., author. Inclusive pagination is given where possible, as is the original language of the citation. Report accession and translation numbers (some of which are cited in Appendix A), and alternate sources are listed when known. The title of books is underlined. When the title of the report was not available (or not given), a short (one line) description of the paper is listed whenever possible. Reports in which the name of the author was not given are listed chronologically using the format, "title", reference, source, (date). In many cases the citation was obtained from secondary (and tertiary) sources. For this reason it was impossible to put every citation into a consistent format.

In a few cases, papers have been cited which were presented at symposia or meetings devoted to the present topic, even when the report title suggests that it does not pertain directly to the topic. This has been done to show the wide range of items considered relevant (at least at the time of the meeting, and by the organizing chairman) in past years. An example is "electroanesthesia".

A few citations of marginal and/or peripheral relationship have also been included so that the reader may judge the applicability to his individual research needs. Examples are reports dealing with the biological effects of static and alternating magnetic fields, experimental techniques using radio frequency and microwave radiation (e.g., electron spin resonance, and nuclear magnetic resonance spectroscopy), and microwave exposure limits, regulations, and standards.

References for a few limited-distribution government reports are available upon request.

The author welcomes information which will correct errors and omissions (both of which no doubt exist). Copies of new papers would be greatly appreciated, and would encourage updating and revising the bibliography periodically.

#### ACKNOWLEDGMENTS

The assistance and support received during the preparation of this bibliography have been considerable, and I am happy to acknowledge my indebtedness and gratitude. Drs. John Keesey and Dennis Heffner, former and present Heads of the Biophysics Division, and Dr. Seymour Friess, Director of the Environmental Biosciences Department of the Naval Medical Research Institute, permitted me the opportunity to work on the bibliography, and offered frequent encouragement.

Acknowledgment is also due to many friends and associates for their helpful suggestions, comments, and loans and/or gifts of reports or other material, which have been invaluable in the course of the work. Mr. Glenn Heimer of the Naval Ship Engineering Center contributed an extensive collection of government reports and documents, many of which had not previously been cited in the open literature.

Special help in tracing and in the acquisition of relevant papers has been received from the librarians and staff members of the NMRI library: Mrs. Thelma Robinson, Mrs. Ernestine Gendleman, Mrs. Eleanor Capps, and Miss Deborah Grove. Their diligence and resourcefulness in tracing and obtaining copies of a large number of papers and reports, often in spite of incomplete and/or inaccurate citations given in other sources, enabled me to include many relevant items in the bibliography.

Mr. Christopher Dodge of the Scientific and Technical Center, Department of the Navy, provided much of the Soviet Bloc literature, linguistic and other technical assistance, and in addition offered valuable comments and encouragement throughout the preparation of this report. Especially noteworthy were the corrections and improvements suggested by Chris following his reading of the entire manuscript.

Helpful also in locating some of the Soviet literature was Mr. E. S. Serebrennikov, of the Science and Technology Division, The Library of Congress.

Credit is due Mrs. Anna Woke (of this Institute) for translating many of the German papers; to Dr. Emilio Weiss, who translated from the Italian, and to Mrs. Edith Pugh who typed many "first drafts"; also to Mrs. Rhoda Glaser for her help in many aspects of the work.

Mrs. Fannie Epstein deserves special mention for her outstanding editorial assistance, and especially for the heroic typing, organization, and checking of the entire report.

The Outline of Reported Biological Phenomena ('Effects') and Clinical Manifestations Attributed to Microwave and Radio-Frequency Radiation, is patterned after that given by R. Murray, et al., in an article entitled, "How safe are microwaves", which appeared in Non-Ionizing Radiation 1(1):7-8 (1969). Some of the "effects" were listed in the report by S. F. Cleary and W. T. Ham, Jr., entitled, "Considerations in the evaluation of the biological effects on exposure to microwave radiation", (Background document, Part I, 1969, for the Task Force on Research Planning in Environmental Health, Subtask Force on Physical Factors in the Environment). The discussion and suggestions offered by Byron McLees, Edward Finch, Lewis Gershman, and Christopher Dodge relating to the Outline are also gratefully acknowledged.

Preparation of the bibliography was supported by the Bureau of Medicine and Surgery, Department of the Navy, under work unit MF12.524. 015-0094B.

## CHAPTER 1

### Reported Biological Phenomena ("Effects") and Some Clinical Manifestations Attributed to Microwave and Radio-Frequency Radiation (See Note)

#### A. Heating of Organs\* (Applications: Diathermy, Electrosurgery, Electro- coagulation, Electrodesiccation, Electrotomy)

1. Whole Body (temperature regulation defects), Hyperpyrexia
  2. Skin
  3. Bone and Bone Marrow
  4. (a) Lens of Eye (cataractous lesions - due to the avascular nature of the lens which prevents adequate heat dissipation.)  
(b) Corneal damage also possible at extremely high frequencies.
  5. Genitalia (tubular degeneration of testicles)
  6. Brain
  7. Sinuses
  8. Metal Implants (burns near hip pins, etc.)
- The effects are generally reversible except for 4a.

#### B. Changes in Physiologic Function

1. Striated Muscle Contraction
2. Alteration of Diameter of Blood Vessels (increased vascular elasticity), Dilation
3. Changes in the Oxidative Processes in Tissues and Organs
4. Liver Enlargement
5. Altered Sensitivity to Drug Stimuli
6. Decreased Spermatogenesis (decreased fertility, to sterility)
7. Altered Sex Ratio of Births (more girls!)
8. Altered Menstrual Activity
9. Altered Fetal Development
10. Decreased Lactation in Nursing Mothers
11. Reduction in Diuresis ( $\text{Ca}^+$  excretion, via urine output)
12. Altered Renal Function (decreased filtration by tubules)
13. Changes in Conditioned Reflexes
14. Decreased Electrical Resistance of Skin
15. Changes in the Structure of Skin Receptors of the (a) Nerve, and (b) Blood-Carrying Systems
16. Altered Blood Flow Rate

---

\* It is also reported that low levels of irradiation produce a cooling effect - "hypercompensation".

Note: These effects are listed without comment or endorsement since the literature abounds with conflicting reports. In some cases the basis for reporting an "effect" was a single or a non-statistical observation which may have been drawn from a poorly conceived (and poorly executed) experiment.

17. Alterations in the Biocurrents (EEG?) of the Cerebral Cortex (in animals)
18. Changes in the Rate of Clearance of Tagged Ions from Tissue
19. Reversible Structural Changes in the Cerebral Cortex and the Diencephalon
20. Electrocardiographic (EKG) Changes
21. Alterations in Sensitivity to Light, Sound, and Olfactory Stimuli
22. Functional (a) and Pathological (b) Changes in the Eyes:  
(a) decrease in size of blind spot, altered color recognition, changes in intraocular pressure, lacrimation, trembling of eyelids; (b) lens opacity and coagulation, altered tissue respiration, and altered reduction-oxidation processes
23. Myocardial Necrosis
24. Hemorrhage in Lungs, Liver, Gut, and Brain
25. Generalized Degeneration of all Body Tissue
26. Loss of Anatomical Parts
27. Death
28. Dehydration
29. Altered Rate of Calcification of Certain Tissue

} At Fatal Levels  
of Radiation

#### C. Central Nervous System Effects

1. Headaches
2. Insomnia
3. Restlessness (Awake and During Sleep)
4. Electroencephalographic (EEG) Changes
5. Cranial Nerve Disorders
6. Pyramidal Tract Lesions
7. Conditioned Reflex Disorders
8. Vagomimetic Action of the Heart; Sympathomimetic Action
9. Seizures, Convulsions

#### D. Autonomic Nervous System Effects

1. Neuro-vegetative Disorders (e.g., alteration of heart rhythm)
2. Fatigue
3. Structural Alterations in the Synapses of the Vagus Nerve
4. Stimulation of Parasympathetic Nervous System (Bradycardia), and Inhibition of the Sympathetic Nervous System

#### E. Peripheral Nervous System Effects

Effects on Locomotor Nerves

F. Psychological Disorders ("Human Behavioral Studies") - the so-called "Psychophysiologic (and Psychosomatic) Responses"

1. Neurasthenia - (general "bad" feeling)
2. Depression
3. Impotence
4. Anxiety
5. Lack of Concentration
6. Hypochondria
7. Dizziness
8. Hallucinations
9. Sleepiness
10. Insomnia
11. Increased Irritability
12. Decreased Appetite
13. Loss of Memory
14. Scalp Sensations
15. Increased Fatigability
16. Chest Pain
17. Tremor of the Hands

G. Behavioral Changes (Animal Studies)

Reflexive, Operant, Avoidance, and Discrimination Behaviors

ii. Blood Disorders

(V = in vivo)  
(v = in vitro)

Changes in:

1. Blood and Bone Marrow
2. Phagocytic (polymorphs) and Bactericidal functions of blood (v)
3. Hemolysis rate (increase), (a shortened lifespan of cells)
4. Sedimentation rate (increase), (due to changes in serum protein levels or amount of fibrinogen. (?)
5. Number of Erythrocytes (decrease), also number of lymphocytes
6. Blood Glucose Concentration (increase)
7. Blood Histamine Content
8. Cholesterol and Lipids
9. Gamma (also  $\alpha$  and  $\beta$ ) Globulin, and Total Protein Concentration
10. Number of Eosinophils
11. Albumin/Globulin Ratio (decrease)
12. Hemopoiesis (rate of formation of blood corpuscles)
13. Leukopenia (increase in number of white cells), and Leukocytosis
14. Erythrocytosis

I. Vascular Disorders

1. Thrombosis
2. Hypertension

## J. Enzyme and Other Biochemical Changes

### Changes in activity of:

1. Cholinesterase (V,v)
2. Phosphatase (v)
3. Transaminase (v)
4. Amylase (v)
5. Carboxydismutase
  
6. Protein Denaturation
7. Toxin, Fungus, and Virus Inactivation (at high radiation dose levels), Bacteriostatic Effect
8. Tissue Cultures Killed
9. Alteration in Rate of Cell Division
10. Increased Concentration of RNA in Lymphocytes, and Decreased Concentration in Brain, Liver, and Spleen
11. Changes in Pyruvic Acid, Lactic Acid, and Creatinine Excretions
12. Change in Concentration of Glycogen in Liver (Hyperglycemia)
13. Alteration in Concentration of 17- Ketosteroids in Urine

## K. Metabolic Disorders

1. Glycosuria (sugar in urine; related with blood sugar?)
2. Increase in Urinary Phenol (derivatives? DOPA?)
3. Alteration of Rate of Metabolic Enzymatic Processes
4. Altered Carbohydrate Metabolism

## L. Gastro-Intestinal Disorders

1. Anorexia (loss of appetite)
2. Epigastric Pain
3. Constipation
4. Altered Secretion of Stomach "Digestive Juices"

## M. Endocrine Gland Changes

1. Altered Pituitary Function
2. Hyperthyroidism
3. Thyroid Enlargement
4. Increased Uptake of Radioactive Iodine by Thyroid Gland
5. Altered Adrenal Cortex Activity
6. Decreased Corticosteroids in Blood
7. Decreased Glucocorticoidal Activity
8. Hypogonadism (usually decreased testosterone production)

## N. Histological Changes

1. Changes in Tubular Epithelium of Testicles
2. Cross Changes

O. Genetic and Chromosomal Changes

1. Chromosome Aberrations (e.g., linear shortening, pseudochiasm, diploid structures, amitotic division, bridging, "sticky" chromosomes, irregularities in chromosomal envelope)
2. Mutations
3. Mongolism
4. Somatic Alterations (changes in cell not involving nucleus or chromosomes, cellular transformation)
5. Neoplastic Diseases (e.g., tumors)

P. Pearl Chain Effect (Intracellular orientation of subcellular particles, and orientation of cellular and other (non-biologic) particles)

Also, orientation of animals, birds, and fish in electromagnetic fields

Q. Miscellaneous Effects

1. Sparking between dental fillings
2. Peculiar metallic taste in mouth
3. Changes in Optical Activity of Colloidal Solutions
4. Treatment for Syphilis, Poliomyelitis, Skin Diseases
5. Loss of Hair
6. Brittleness of Hair
7. Sensations of Buzzing Vibrations, Pulsations, and Tickling About the Head and Ears
8. Copious Perspiration, Salivation, and Protrusion of Tongue
9. Changes in the Operation of Implanted Cardiac Pacemakers
10. Changes in Circadian Rhythms

# County of Santa Cruz

## COUNTY ADMINISTRATIVE OFFICE

701 OCEAN STREET, SUITE 520, SANTA CRUZ, CA 95060-4073

(831) 454-2100 FAX: (831) 454-3420 TDD: (831) 454-2123

SUSAN MAURIELLO, J.D., COUNTY ADMINISTRATIVE OFFICER

January 18, 2012

AGENDA: January 24, 2012

Board of Supervisors  
County of Santa Cruz  
701 Ocean Street  
Santa Cruz, California 95060

### SmartMeter Moratorium

Dear Members of the Board:

On December 13, 2011, your Board directed this office to return today with a report on issues associated with the current SmartMeter moratorium ordinance, and information on the possible extension of the moratorium for an additional year. Your Board also directed the Public Health Officer to return with an analysis of the research on the health effects of SmartMeters, and directed County Counsel to return with a report regarding the legality of a public utility refusing service to customers who are willing to pay for service and are willing to have an analog meter.

As your Board is aware, the California Public Utility Commission is considering PG&E's application for modification to PG&E's SmartMeter proposal to include an option for residential customers who do not wish to have a wireless SmartMeter. The item was scheduled on the January 12, 2012 agenda, but the commission anticipates that a vote on the proposal will not happen prior to February 1, 2012.

### Moratorium Ordinance

Your Board has heard significant amounts of testimony regarding SmartMeters and concerns about their possible impact on health, questions about their accuracy, their inability to recover real-time data, privacy concerns, and the lack of safety standards for chronic long-term exposure to electromagnetic frequency radiation. In addition, PG&E has not presented studies to support their primary justification that the SmartMeter program will encourage customers to more effectively manage their utilization of electricity.

Given the broad concern about SmartMeter technology and your Board's desire to go on record, this office and County Counsel believe that notwithstanding the enforcement challenges, that it is in the best interest of public health, safety, and welfare for your Board to adopt the attached ordinance (Attachment A) implementing a temporary moratorium on the installation of SmartMeters in or on any home, apartment, condominium or business within the unincorporated area of the County. The purpose of the moratorium is to allow additional time to educate the CPUC about these concerns and allow time for adequate study of the impacts resulting from the SmartMeter technology.

PG&E, asserting that local governments do not have jurisdiction on the installation of the meters, has ignored the previous Santa Cruz County ordinance as well as similar ordinances adopted in other jurisdictions. PG&E believes that only the California Public Utilities Commission (CPUC) has the authority to stop installation of the meters. Elected representatives, including the Board of Supervisors of Marin County, have acknowledged the limits of their ordinances to actually stop the installation of the meters. However, jurisdictions have adopted their ordinances with statements that such ordinances play an important role by informing the CPUC of significant community concerns.

#### Health Officer Report

The Public Health Officer's report is provided as Attachment B. The report discusses the health risks associated with SmartMeters, the scientific reports and actions the public might take to mitigate potential harm.

#### PG&E Shutoff Update

At the December 13, 2011, meeting, your Board questioned the PG&E representative about the utility company's decision to shut off power to the homes of residents who removed their SmartMeters. Subsequent to that meeting, PG&E restored power to those residences with the intent of charging them based on past electrical bills.

#### Petition

At your January 10, 2012 meeting, your Board was presented with a petition to the California Public Utilities Commission regarding PG&E SmartMeter Opt-out Application, (Petition A.11-03-014). The petition provides the opportunity for local elected officials to urge the Commission to continue Petition A.11-03-014 for further public hearings. The petition is provided as Attachment C. It is recommended that your Board direct the Chair to sign the petition on behalf of the Board and submit it to the PUC.

#### IT IS THEREFORE RECOMMENDED THAT YOUR BOARD:

- (1) Direct the Chair to send a letter to the PUC calling for independent testing and monitoring of SmartMeters in place to determine duty cycles and frequency, especially in the following circumstances
  - Where both gas and electric meters are located closely together
  - Where there is a bank of SmartMeters such as on a multi-family residential building or apartment building
  - Where there is a collector meter on a home that serves the home, plus as many as 5000 other residential units in the area
  - Where a SmartMeter on a home acts as a relay for other local neighborhood meters

- (2) Direct the Chair to send a letter to the PUC and PG&E allowing any Santa Cruz County resident to request removal of a previously installed SmartMeter and the replacement with an analog meter
- (3) Accept and file the report from the Public Health Officer
- (4) Direct the Chair to sign the petition to the California Public Utilities Commission on behalf of the Board urging the Commission to delay consideration of a preliminary decision on PG&E's SmartMeter application until further public hearing and input are completed, and
- (5) Adopt the attached ordinance imposing a temporary moratorium on the installation of SmartMeters within the unincorporated area of Santa Cruz County and direct the Clerk of the Board to place the ordinance on the February 7, 2012 agenda for final consideration.

Very truly yours,

SUSAN A. MAURIELLO  
County Administrative Officer

## ORDINANCE NO. \_\_\_\_\_

**AN UNCODIFIED ORDINANCE OF THE COUNTY OF SANTA CRUZ  
IMPOSING A TEMPORARY MORATORIUM ON THE INSTALLATION  
OF SMARTMETERS AND RELATED EQUIPMENT IN, ALONG,  
ACROSS, UPON, UNDER AND OVER THE PUBLIC STREETS AND  
OTHER PLACES WITHIN THE UNINCORPORATED AREA OF SANTA  
CRUZ COUNTY**

The Board of Supervisors of the County of Santa Cruz find as follows:

**WHEREAS**, the County of Santa Cruz (the “County”), through its police powers granted by Article XI of the California Constitution, retains broad discretion to legislate for public purposes and for the general welfare, including but not limited to matters of public health, safety and consumer protection; and

**WHEREAS**, the County of Santa Cruz has a franchise agreement with PG&E that has been in effect since 1955; and

**WHEREAS**, in addition, the County retains authority under Article XII, Section 8 of the Constitution to grant franchises for public utilities, and pursuant to California Public Utilities Code section 6203, “may in such a franchise impose such other and additional terms and conditions..., whether governmental or contractual in character, as in the judgment of the legislative body are to the public interest;” and

**WHEREAS**, Public Utilities Code section 2902 reserves the County’s right to supervise and regulate public utilities in matters affecting the health, convenience and safety of the general public, “such as the use and repair of public streets by any public utility, the location of the poles, wires, mains, or conduits of any public utility, on, under, or above any public streets, and the speed of common carriers operating within the limits of the municipal corporation;” and

**WHEREAS**, Pacific Gas & Electric Company (“PG&E”) is now installing SmartMeters in Central and Northern California and is installing these meters within the County of Santa Cruz; and

**WHEREAS**, concerns about the impact and accuracy of SmartMeters have been raised nationwide, leading the Maryland Public Service Commission to deny permission on June 21, 2010 for the deployment of SmartMeters in that state. The State of Hawaii Public Utility Commission also recently declined to adopt a smart grid system in that state. The CPUC currently has pending before it a petition from the City and County of San Francisco, and other municipalities, seeking to delay

the implementation of SmartMeters until the questions about their accuracy can be evaluated; and

**WHEREAS**, major problems and deficiencies with SmartMeters in California have been brought to the attention of the Board of Supervisors of the County of Santa Cruz, including PG&E's confirmation that SmartMeters have provided incorrect readings costing ratepayers untold thousands of dollars in overcharges and PG&E's records outlined "risks" and "issues" including an ongoing inability to recover real-time data because of faulty hardware originating with PG&E vendors; and

**WHEREAS**, the ebb and flow of gas and electricity into homes discloses detailed information about private details of daily life. Energy usage data, measured moment by moment, allows the reconstruction of a household's activities: when people wake up, when they come home, when they go on vacation, and even when they take a hot bath. SmartMeters represent a new form of technology that relays detailed hitherto confidential information reflecting the times and amounts of the use of electrical power without adequately protecting that data from being accessed by unauthorized persons or entities and as such pose an unreasonable intrusion of utility customers' privacy rights and security interests. Indeed, the fact that the CPUC has not established safeguards for privacy in its regulatory approvals may violate the principles set forth by the U.S. Supreme Court in *Kyllo v. United States* (2001), 533 U.S. 27; and

**WHEREAS**, significant health questions have been raised concerning the increased electromagnetic frequency radiation (EMF) emitted by the wireless technology in SmartMeters, which will be in every house, apartment and business, thereby adding additional human-made EMF to our environment around the clock to the already existing EMF from utility poles, individual meters and telephone poles; and

**WHEREAS**, FCC safety standards do not exist for chronic long-term exposure to EMF or from multiple sources, and reported adverse health effects from electromagnetic pollution include sleep disorders, irritability, short term memory loss, headaches, anxiety, nausea, DNA breaks, abnormal cell growth, cancer, premature aging, etc. Because of untested technology, international scientists, environmental agencies, advocacy groups and doctors are calling for the use of caution in wireless technologies; and

**WHEREAS**, the primary justification given for the SmartMeters program is the assertion that it will encourage customers to move some of their electricity usage from daytime to evening hours; however, PG&E has conducted no actual pilot projects to determine whether this assumption is in fact correct. Non-transmitting time-of-day meters are already available for customers who desire

them, and enhanced customer education is a viable non-technological alternative to encourage electricity use time shifting. Further, some engineers and energy conservation experts believe that the SmartMeters program--in totality--could well actually increase total electricity consumption and therefore the carbon footprint; and

**WHEREAS**, this Board of Supervisors sent a letter to the CPUC on September 15, 2010 expressing concern about reports that SmartMeter technology was interfering with the proper functioning of common household devices and requesting a response from the CPUC; and

**WHEREAS**, there has been no response by the CPUC to the letter sent by the Board of Supervisors; and

**WHEREAS**, because the potential risks to the health, safety and welfare of County residents are so great, the Board of Supervisors wishes to adopt a moratorium on the installation of SmartMeters and related equipment within the unincorporated area of the County of Santa Cruz. The moratorium period will allow the Council on Science and Technology and legislative process referenced above to be completed and for additional information to be collected and analyzed regarding potential problems with SmartMeters; and

**WHEREAS**, there is a current and immediate threat to public health, safety and welfare because, without this urgency ordinance, SmartMeters or supporting equipment will be installed or constructed or modified in the County without PG&E's complying with the CPUC process for consultation with the local jurisdiction, the County's Code requirements, and subjecting residents of Santa Cruz County to the privacy, security, health, accuracy and consumer fraud risks of the unproven SmartMeter technology; and

**WHEREAS**, the Board of Supervisors hereby finds that it can be seen with certainty that there is no possibility that the adoption and implementation of this Ordinance may have a significant effect on the environment. This Ordinance does not authorize construction or installation of any facilities and, in fact, imposes greater restrictions on such construction and installation in order to protect the public health, safety and general welfare. This Ordinance is therefore exempt from the environmental review requirements of the California Environmental Quality Act (CEQA) pursuant to Section 15061(b)(3) of Title 14 of the California Code of Regulations; and

**WHEREAS**, there is no feasible alternative to satisfactorily study the potential impact identified above as well or better with a less burdensome or restrictive effect than the adoption of this interim urgency moratorium ordinance; and

**WHEREAS**, based on the foregoing it is in the best interest of public health, safety and welfare to allow adequate study of the impacts resulting from the SmartMeter technology; therefore it is appropriate to adopt a temporary moratorium that would remain in effect from the date of its adoption until December 31, 2012, unless your Board acts to repeal it prior to that date.

**NOW, THEREFORE BE IT ORDAINED** by the Board of Supervisors of the County of Santa Cruz as follows:

### **SECTION I**

Moratorium. From and after the effective date of this Ordinance, no SmartMeter may be installed in or on any home, apartment, condominium or business of any type within the unincorporated area of the County of Santa Cruz, and no equipment related to SmartMeters may be installed in, on, under, or above any public street or public right of way within the unincorporated area of the County of Santa Cruz.

### **SECTION II**

Violations of the Moratorium may be charged as infractions or misdemeanors as set forth in Chapter 1.12 of the Santa Cruz County Code. In addition, violations may be deemed public nuisances, with enforcement by injunction or any other remedy authorized by law.

### **SECTION III**

This Board of Supervisors finds and determines that: (a) there is a current and immediate threat to the public peace, health, or safety; (b) the moratorium must be imposed in order to protect and preserve the public interest, health, safety, comfort and convenience and to preserve the public welfare; and (c) it is necessary to preserve the public health and safety of all residents or landowners adjacent to such uses as are affected by this interim ordinance as well as to protect all of the citizens of Santa Cruz County by preserving and improving the aesthetic and economic conditions of the County.

### **SECTION IV**

If any provision of this interim ordinance is held to be unconstitutional, it is the intent of the Board of Supervisors that such portions of such ordinance are severable from the remainder and the remainder is given full force and effect.

**SECTION V**

This interim ordinance is not subject to the California Environmental Quality Act (CEQA) pursuant to Section 15060(c) (2) – the activity will not result in a direct or reasonably foreseeable indirect physical change in the environment and Section 15060(c) (3) – the activity is not a project as defined in Section 15378 of the CEQA Guidelines, because it has no potential for resulting in physical change to the environment, directly or indirectly.

**SECTION VI**

This ordinance shall take effect on the 31<sup>st</sup> day after the date of final passage.

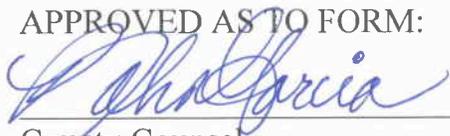

PASSED AND ADOPTED THIS \_\_\_\_\_ day of \_\_\_\_\_, 2012, by the Board of Supervisors of the County of Santa Cruz by the following vote:

- AYES: SUPERVISORS
- NOES: SUPERVISORS
- ABSENT: SUPERVISORS
- ABSTAIN: SUPERVISORS

\_\_\_\_\_  
Chairperson of the Board of Supervisors

Attest: \_\_\_\_\_  
Clerk of the Board

APPROVED AS TO FORM:

### Memorandum

Date: January 13, 2012  
 To: Santa Cruz County Board of Supervisors  
 From: Poki Stewart Namkung, M.D., M.P.H. *PON*  
 Health Officer  
 Subject: Health Risks Associated With SmartMeters

### Overview

On December 13, 2011, Santa Cruz County Board of Supervisors directed the Public Health Officer to return on January 24, 2012, with an analysis of the research on the health effects of SmartMeters.

### **Background**

In order to analyze the potential health risks associated with SmartMeters, the following questions should be asked:

- 1) What is the SmartMeter system and what is the potential radiation exposure from the system?
- 2) What scientific evidence exists about the potential health risks associated with SmartMeters?
- 3) Are there actions that the public might take to mitigate any potential harm from SmartMeters?

SmartMeters are a new type of electrical meter that will measure consumer energy usage and send the information back to the utility by a wireless signal in the form of pulsed frequencies within the 800 MHz to 2400MHz range, contained in the microwave portion of the electromagnetic spectrum. SmartMeters are considered part of 'smart grid' technology that includes: a) a mesh network or series of pole-mounted wireless antennas at the neighborhood level to collect and transmit wireless information from all SmartMeters in that area back to the utility; b) collector meters, which are a special type of SmartMeter that collects the radiofrequency or microwave radiation signals from many surrounding

buildings (500-5000 homes or buildings) and sends the information back to the utility; and c) proposed for the future, a power transmitter to measure the energy use of individual appliances (e.g. washing machines, clothes dryers, dishwasher, etc) and send information via wireless radio frequency signal back to the SmartMeter. The primary rationale for SmartMeters and grid networks is to more accurately monitor and direct energy usage.

The public health issue of concern in regard to SmartMeters is the involuntary exposure of individuals and households to electromagnetic field (EMF) radiation. EMFs are everywhere, coming from both natural and man-made sources. The three broad classes of EMF are:

- extremely low frequency, ELF (from the sun or powerlines)
- radio frequency, RF (from communication devices, wireless devices, and SmartMeters)
- extremely high frequency, known as ionizing radiation (x-rays and gamma rays)

Much of this exposure is beyond our control and is a matter of personal choice; however, public exposure to RF fields is growing exponentially due to the proliferation of cell phones, and wireless fidelity (Wi-Fi) technology. To understand the relationship between EMF from SmartMeters and other sources, it is helpful to view the electromagnetic spectrum:

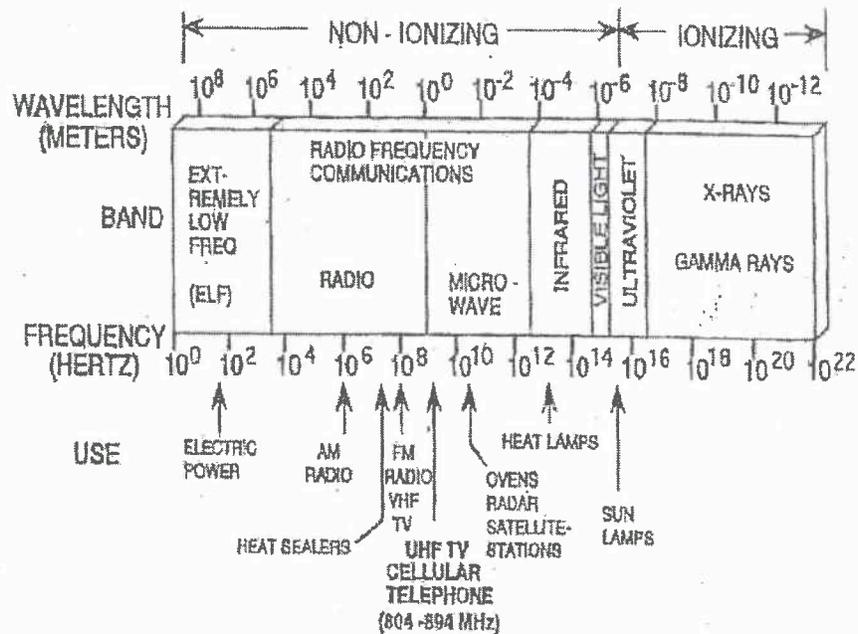

Fig. 1: The electromagnetic spectrum, showing the relations between ELF and RF fields, wavelength and frequency, and the ionizing and non-ionizing portions of the spectrum.

The Federal Communications Commission (FCC) has adopted limits for Maximum Permissible Exposure (MPE) that are based on exposure guidelines published by the National Council on Radiation Protection and Measurements (NCRP). The limits vary with

the frequency of the electromagnetic radiation and are expressed in units of microwatts per centimeter squared. A SmartMeter contains two antennas whose combined time-averaged public safety limit of exposure is  $655\mu\text{W}/\text{cm}^2$  (Sage, 2011). According to the California Council on Science and Technology (CCST) Report (2011), within distances of three to ten feet, SmartMeters would not exceed this limit. However, CCST did not account for the frequency of transmissions, reflection factors, banks of SmartMeters firing simultaneously, and distances closer than three feet. There are numerous situations in which the distance between the SmartMeters and humans is less than three feet on an ongoing basis, e.g. a SmartMeter mounted on the external wall to a bedroom with the bed placed adjacent to that mounting next to the internal wall. That distance is estimated to be one foot. The CCST Report also states that SmartMeters will generally transmit data once every four hours, and once the grid is fully functional, may transmit "more frequently." It has been aptly demonstrated by computer modeling and real measurement of existing meters that SmartMeters emit frequencies almost continuously, day and night, seven days a week. Furthermore, it is not possible to program them to not operate at 100% of a duty cycle (continuously) and therefore it should not be possible to state that SmartMeters do not exceed the time-averaged exposure limit. Additionally, exposure is additive and consumers may have already increased their exposures to radiofrequency radiation in the home through the voluntary use of wireless devices such as cell and cordless phones, personal digital assistants (PDAs), routers for internet access, home security systems, wireless baby surveillance (baby monitors) and other emerging devices. It would be impossible to know how close a consumer might be to their limit, making safety a uncertainty with the installation of a mandatory SmartMeter.

This report will focus on the documented health risks of EMF in general, the relevance of that data to SmartMeters exposure, the established guidelines for RF safety to the public at large, and then provide recommendations to ameliorate the risk to the public's health.

### **Evidence-based Health Risks of EMFs**

There is no scientific literature on the health risks of SmartMeters in particular as they are a new technology. However, there is a large body of research on the health risks of EMFs. Much of the data is concentrated on cell phone usage and as SmartMeters occupy the same energy spectrum as cell phones and depending on conditions, can exceed the whole body radiation exposure of cell phones (see Attachment B1, Figure 4). In terms of health risks, the causal factor under study is RF radiation whether it be from cell phones, Wi-Fi routers, cordless phones, or SmartMeters. Therefore all available, peer-reviewed, scientific research data can be extrapolated to apply to SmartMeters, taking into consideration the magnitude and the intensity of the exposure.

Since the mid-1990's the use of cellular and wireless devices has increased exponentially exposing the public to massively increased levels of RF. There is however, debate regarding the health risks posed to the public given these increased levels of radiation. It must be noted that there is little basic science funding for this type of research and it is largely funded by industry. An intriguing divide, noted by Genuis, 2011 is that most

research carried out by independent non-government or non-industry affiliated researchers suggests potentially serious effects from many non-ionizing radiation exposures; most research carried out by independent non-government or non-industry affiliated researchers suggests potentially serious effects from many non-ionizing radiation exposures research funded by industry and some governments seems to cast doubt on the potential for harm. Elements of the controversy stem from inability to replicate findings consistently in laboratory animal studies. However, analysis of many of the conflicting studies is not valid as the methodology used is not comparable. Despite this controversy, evidence is accumulating on the results of exposure to RF at non-thermal levels including increased permeability of the blood-brain barrier in the head (Eberhardt, 2008), harmful effects on sperm, double strand breaks in DNA which could lead to cancer genesis (Phillips, 2011), stress gene activation indicating an exposure to a toxin (Blank, 2011), and alterations in brain glucose metabolism (Volkow, 2011).

In terms of meta-analyzed epidemiological studies, all case-control epidemiological studies covering >10 years of cell phone use have reported an increased risk of brain tumors from the use of mobile phones (Hallberg, 2011). Other studies have pointed to an increasing risk of acoustic neuroma, salivary gland tumors, and eye cancer after several years of cell phone use and the tumors occur predominantly on the same side of the head as the phone is used. The analysis of brain cancer statistics since the mid 20<sup>th</sup> century in several countries reveals that brain tumor formation has a long latency time, an average of over 30 years to develop from initial damage.(Hallberg, 2011). Therefore using studies such as the Interphone Study which looked at shorter latency periods for the development of specific brain cancers will result in inconclusive data.

Another potential health risk related to EMF exposure, whose legitimacy as a phenomenon remains contentious, is electromagnetic hypersensitivity (EHS). In the 1950's, various centers in Eastern Europe began to describe and treat thousands of workers, generally employed in jobs involving microwave transmission. The afflicted individuals often presented with symptoms such as headaches, weakness, sleep disturbance, emotional instability, dizziness, memory impairment, fatigue, and heart palpitations. Clinical research to verify the physiological nature of this condition did not begin in earnest until the 1990's and found that the EMF involved was usually within the non-ionizing range of the electromagnetic spectrum. In the early 2000's, estimates of the occurrence of EHS began to swell with studies estimating the prevalence of this condition to be about 1.5% of the population of Sweden (Hilleert et al., 2002), 3.2% in California (Levallios et al., 2002), and 8% in Germany (infas Institut für angewandte Sozialwissenschaft GmbH, 2003).

In 2004, WHO declared EHS "a phenomenon where individuals experience adverse health effect while using or being in the vicinity of devices emanating electric, magnetic, or electromagnetic fields (EMFs)...Whatever its cause, EHS is a real and sometimes debilitating problem for the affected persons (Mild et al., 2004)."

Currently, research has demonstrated objective evidence to support the EHS diagnosis, defining pathophysiological mechanisms including immune dysregulation in vitro, with

increased production of selected cytokines and disruption and dysregulation of catecholamine physiology (Genuis, 2011).

Until recently, the diagnosis of EHS has not received much support from the medical community due to lack of objective evidence. In an effort to determine the legitimacy of EHS as a neurological disorder, however, a collection of scientists and physicians recently conducted a double-blinded research study that concluded that "EMF hypersensitivity can occur as a bona fide environmentally-inducible neurological syndrome (McCarty et al., 2011).

### **Safety Guidelines**

The guidelines currently used by the FCC were adopted in 1996, are thermally based, and are believed to protect against injury that may be caused by acute exposures that result in tissue heating or electric shock. FCC guidelines have a much lower certainty of safety than standards. Meeting the current FCC guidelines only assures that one should not have heat damage from SmartMeter exposure. It says nothing about safety from the risk of many chronic diseases that the public is most concerned about such as cancer, miscarriage, birth defects, semen quality, autoimmune diseases, etc. Therefore, when it comes to nonthermal effects of RF, FCC guidelines are irrelevant and cannot be used for any claims of SmartMeter safety unless heat damage is involved (Li, 2011).

There are no current, relevant public safety standards for pulsed RF involving chronic exposure of the public, nor of sensitive populations, nor of people with metal and medical implants that can be affected both by localized heating and by electromagnetic interference (EMI) for medical wireless implanted devices. Many other countries (9) have significantly lower RF/MW exposure standards ranging from 0.001 to 50  $\mu\text{W}/\text{cm}^2$  as compared with the US guideline of 200-1000  $\mu\text{W}/\text{cm}^2$ . Note that these recommended levels are considerably lower than the approximately 600  $\mu\text{W}/\text{cm}^2$ . (time-averaged) allowed for the RFR from SmartMeters operating in the low 900 MHz band mandated by the FCC based on only thermal consideration.

In summary, there is no scientific data to determine if there is a safe RF exposure level regarding its non-thermal effects. The question for governmental agencies is that given the uncertainty of safety, the evidence of existing and potential harm, should we err on the side of safety and take the precautionary avoidance measures? The two unique features of SmartMeter exposure are: 1) universal exposure thus far because of mandatory installation ensuring that virtually every household is exposed; 2) involuntary exposure whether one has a SmartMeter on their home or not due to the already ubiquitous saturation of installation in Santa Cruz County. Governmental agencies for protecting public health and safety should be much more vigilant towards involuntary environmental exposures because governmental agencies are the only defense against such involuntary exposure. Examples of actions that the public might take to limit exposure to electromagnetic radiation can be found in Attachment B2.

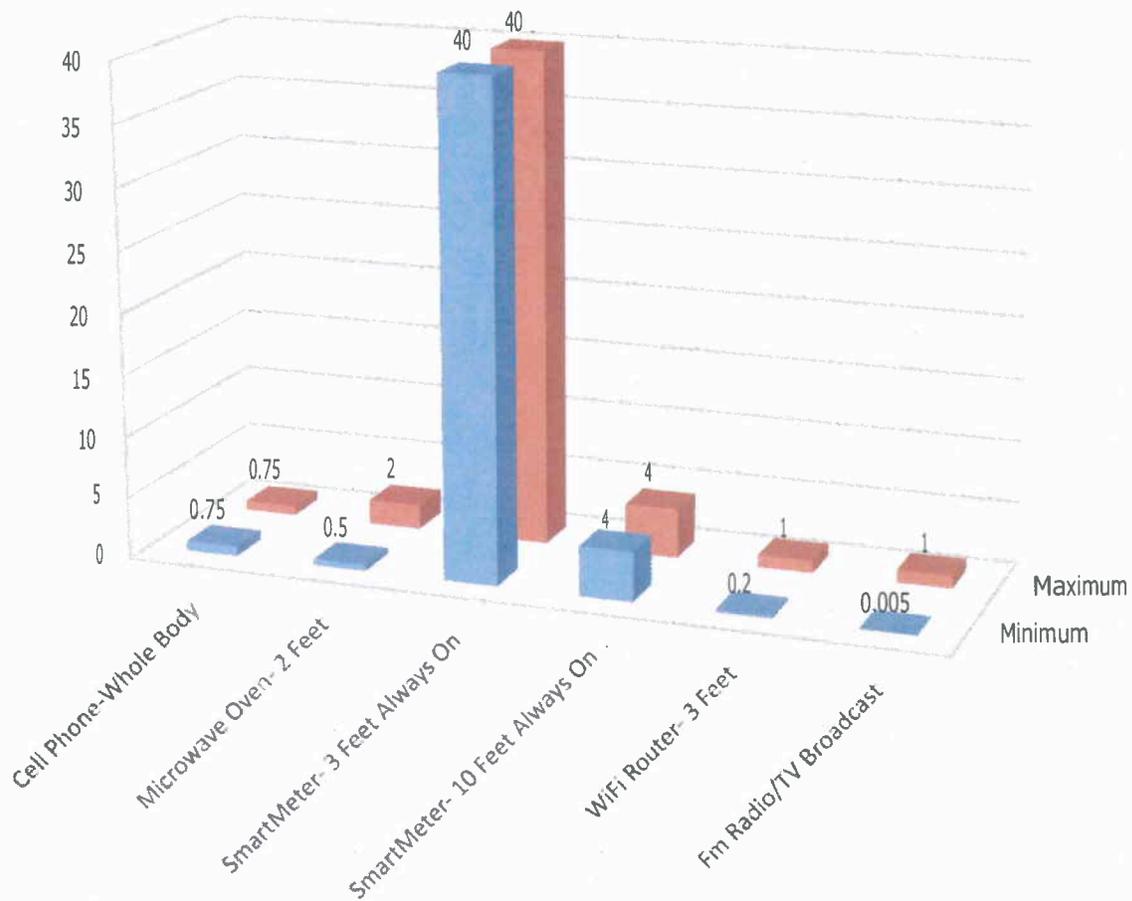

Figure 4. Comparison of Radio-Frequency Levels to the Whole Body from Various Sources in  $\mu$ W/cm<sup>2</sup> over time [corrected for assumed duty cycle and whole body exposure extrapolated from EPRI/CCST SmartMeter estimated levels at 3 feet].

Examples of strategies to reduce electromagnetic radiation.

(Genuis SJ, 2011)

Sources of adverse EMR	Considerations to reduce EMR exposure
Cell phones and cordless phones	<ul style="list-style-type: none"> <li>• Minimize use of cell and cordless phones and use speaker phones when possible</li> <li>• Leave cell or cordless phone away from the body rather than in pocket or attached at the hip.</li> </ul>
Wireless internet	<ul style="list-style-type: none"> <li>• Use wired internet</li> <li>• Turn off the internet router when not in use (e.g. night-time)</li> <li>• Use power line network kits to achieve internet access by using existing wiring and avoiding wireless emissions.</li> </ul>
Computers releasing high EMR	<ul style="list-style-type: none"> <li>• Limit the amount of time spent working on a computer</li> <li>• Avoid setting a laptop computer on the lap</li> <li>• Increase the distance from the transformer.</li> <li>• Stay a reasonable distance away from the computer</li> </ul>
Handheld electronics (electric toothbrush, hair dryer, Smart phone, electronic tablets, etc.)	<ul style="list-style-type: none"> <li>• Limit the use of electronics and/or revert to using power-free devices</li> <li>• Turn devices off before going to sleep</li> <li>• Minimize electronics in bedrooms</li> </ul>
Fluorescent lights	<ul style="list-style-type: none"> <li>• Consider using alternate lighting such as incandescent (Uncertainty exists about the safety of LED lights)</li> <li>• Rely on natural sunlight for reading</li> </ul>
Household power	<ul style="list-style-type: none"> <li>• Measure levels of EMR and modify exposures as possible</li> <li>• Avoid sleeping near sites of elevated EMR</li> <li>• Filters can be used to mitigate dirty power</li> </ul>
High voltage power lines substations, transmission towers, and emitters (cell phone tower, radar, etc.)	<ul style="list-style-type: none"> <li>• Consider relocating to an area not in close proximity to high voltage power lines</li> <li>• Maintain considerable distance from emitters</li> <li>• Consider forms of shielding (shielding paints; grounded metal sheets)</li> </ul>
Utility neutral-to-ground bonded to water pipes	<ul style="list-style-type: none"> <li>• Increase size of neutral-wire to substation and install dielectric coupling in water pipe.</li> </ul>

Petition to the California Public Utilities Commission Re: PG&E SmartMeter Opt-out Application, A.11-03-014

We the undersigned elected officials urge the Commission to delay consideration of President Peevey's preliminary decision until further public hearing and input are completed. The decision, which calls for charging fees to customers who elect to opt out of the SmartMeter program, conflicts with local planning authority, does not protect the health or safety of all residents and imposes a prejudicial financial burden on ratepayers who chose to opt out of the program. We therefore urge the Commission to continue consideration of this matter until further public hearings are completed to ensure the due process rights of all stakeholders.

The order does not provide an empirical basis for the amount of the fees to be charged to opt out customers nor does it consider the net financial impact of PG&E's latest proposal to permit customer retention of analogue meters. Hence the order effectively eliminates a full and fair hearing process for these contested issues of fact to be considered and resolved.

Historically, telecommunications carriers throughout this state have complied with local planning codes which provide notice to residents as to the construction of transmission facilities. Pacific Gas and Electric Company ignored such codes in the deployment of the Smart Meter telecommunications network. Currently many of our jurisdictions have passed ordinances which impose a moratorium on wireless SmartMeters and have petitioned to opt out on a jurisdictional basis. The current order is silent on these issues and effectively discards them without consideration.

The decision also ignores the longstanding controversy and concern about the health impacts associated with electro-magnetic fields. A 1998 California Department of Health Services study commissioned by the California Public Utility Commission itself found that 3.2% of Californians reported hypersensitivity to electro-magnetic fields. A May 2011 study released by the World Health Organization/International Agency for Research on Cancer reclassified RF radiation of the type emitted by wireless equipment throughout the Smart Meter system as "possibly carcinogenic" to humans. President Peevey's order effectively imposes a different rate on many utility customers who need to avoid exposure in violation of California Public Utilities Code section 453(b) which states in pertinent part that "No public utility shall prejudice, disadvantage, or require different rates or deposit amounts from a person because of ancestry, medical condition, marital status or change in marital status, occupation..."

President Peevey's decision does not address these concerns nor does it the financial viability of wired equipment alternatives. In so doing, it eliminates a much anticipated public hearing process.

For all of the foregoing reasons, we respectfully urge the Commission to continue Petition A.11-03-014 matter for further hearings.

**Subject:** re: smart meter opt-out letter and moratorium on smart meters  
**Auto forwarded by a Rule**

This letter is directed to the whole Board of Supervisors, and, as such, should be included in the public record.

Dear Chairperson Stone,

Having attended the board meeting on Dec. 13, and witnessed the Board's active interrogation of the P.G.&E. rep's woeful defense of her employer's shutting off of electricity to customers who dared to protect their health and that of their children by removing their smart meters, I'm very disappointed to read the agenda for tomorrow's meeting only to find that the expected follow-through re: smart meters was no where to be found. While you did approve a letter to the CPUC expressing your opposition to opt-out charges, many of us need you to go further and protect our right to analog meters, as many health problems have been linked to smart meters that have their wireless component turned off. Despite PG&E's crying "public safety concerns", the analog meters have proven to be safe for decades, unlike the recently installed smart meters which have already been linked to health problems, fires, and overcharging. Unfortunately, the CPUC is supposed to decide this issue as early as Jan.12, leaving you no time to write a stronger letter to the CPUC given that the issue is not on the agenda. While I applaud the strong stance you took with the PG&E's rep at the last meeting, that in itself does little to protect us, your constituents. Even the smart meter moratorium as been little more than window dressing as the Sheriff continues to use his power to protect PG&E contractors, instead of the local citizenry. I reiterate my call for you, the Board of Supervisors, to use your power of the purse strings to make it clear to the Sheriff that he is expected to support the moratorium/citizens, not the profiteering corporations.

Regardless of what you eventually decide, you, like the rest of us, are equally at the mercy of these meters. What you allow to be done unto us by PG&E is also being done unto you.

Theodora Kerry  
Santa Cruz, CA 95060

## Oakland residents hope to get issues with smart meters heard at state level

Carole Garcia, 58, with the smart meters that sit outside her Rochester Hills home. Garcia says the meters are causing her health problems she never had before moving in.

Tuesday, October 7, 2014. Tim Thompson-The Oakland Press

By [John Turk](#), The Oakland Press

Posted: 10/12/14, 8:30 AM EDT|Updated: on 10/13/2014

### FYI

DTE has installed more than 1.1 million of the new meters in southeast Michigan, and has a goal of 2.6 million by 2015. For more about smart meters, visit [dteenergy.com](http://dteenergy.com).

Carole Garcia keeps all her bloody tissues in a gallon Ziplock bag she's saved.

The Rochester Hills resident wants evidence, she said, because it's her smart utility meter causing her nose to bleed every day. She wants her old analog meter back, but can't get it due to a policy she says doesn't give her an option.

"I've done everything I could possibly do to get these things removed ... and I have three doctors that have written letters saying the smart meters on my home should be taken off," said Garcia, 58, a laid off auto worker.

"The people should have a voice, and I don't feel like I'm being heard."

Garcia said she's reached out to numerous legislators who haven't gotten back in touch. But she — along with over 100 people across Michigan — could have her story heard at the state level if Rep. Tom McMillin has anything to say about it. He's pushing for those who don't want smart meters installed on their homes to put their testimony on record before the end of the year.

[Smart meters, or advanced meters](#), use radio frequency networks similar to those in cell phones or microwaves to record the amount of electricity used in a home or business.

[Groups against the meters have mounted an opposition to the devices over the past four years nationwide, but major utilities such as DTE Energy contend they are safe](#), and have published studies saying so.

Garcia and nine others went to Lansing in mid-September to get their stories heard. They met with State Rep. Aric Nesbitt, R-District 66, the chairman of the House Energy and Technology Committee, to inquire about a hearing on the smart meter issue. Nesbitt has not responded to the group yet, and was not immediately available for comment

on the meeting.

Garcia, who moved to Rochester Hills from Sterling Heights in 2012, said she started getting symptoms within the first six months of moving in, and began to visit doctors because she didn't know why.

"I have two smart meters outside my bedroom wall. I would wake up with severe headaches, very nauseated and dizzy, with a bloody nose. I found I had fatigue, chest palpitations, blurred vision in my left eye and also noticed both my shoulders started to hurt when I woke up," said Garcia, 58. "I'm tossing and turning at night."

[Romeo-based doctor and preventive medicine specialist James Ziobron](#) wrote on Garcia's behalf that since her exposure to smart meters, she developed an entirely new set of symptoms she hadn't experienced before her move. "I feel that her recent problems are all due to the smart meter ... (and) in any event, Carole should have her smart meters removed as soon as possible," Ziobron wrote.

DTE Energy's Joseph McCormick, the utility's manager of the smart metering program, did not return calls for comment. However, spokesman Alejandro Bodipo-Memba said DTE is confident that its AMI, or Advanced Metering Infrastructure, meters are safe.

"There are a number of studies that show that," said Memba. "Customers who choose to opt out are required to pay a \$67.20 initial one-time fee to install a non transmitting advanced meter and \$9.80 a month for a manual meter reading and related services."

One of those studies — published in [2011 by the Edison Electrical Institute and others — can found on DTE's website](#). It states that radio frequency exposure for a person standing three and 10 feet from a continuously operating smart meter would result in 125 and 1,250 times less exposure than a person talking on a cell phone.

Scott Simons, another DTE spokesman, added: "Advanced meters typically broadcast signals for less than two minutes in any 24-hour period. Even baby monitors have more RF exposure than advanced meters."

Simons cited another study from the American Cancer Society that stated there was no clear evidence that radio frequency waves cause adverse health effects.

#### **No choice?**

A main concern for Garcia and others, however, is that DTE's opt-out policy doesn't allow them to fully opt out of having an advanced meter at their homes. DTE confirms that a customer who chooses to opt out would have the radio frequency shut off on their smart meters, but would still have the device connected to their home.

Simons said the reason the advanced meters would stay on a home is that analog meters are "obsolete and we're not making them anymore. Meters have progressed in the last 100 years, and we're taking advantage of the technology so our customers can benefit from it."

Former residential builder Dominic Cusumano, 60, and his wife, Lillian — who were sued in 2012 by DTE for \$25,000 and a felony charge for replacing a smart meter on their home with an analog meter — said the [policy, which the Michigan Public Safety Commission ruled last year was allowed](#), is being contested in appeals courts because it doesn't give homeowners the choice to replace smart meters with analog meters.

Cusumano, who owns homes in Addison Township and St. Clair Shores, said his family replaced their smart meter in Addison because his wife was falling ill, and the smart meter was causing it.

Oakland Circuit Judge Shalina Kumar has since placed the Cusumanos' case on hold — and they're keeping their analog meter for now — pending as many as six Michigan Court of Appeals cases dealing with the opt-out policy. If any of those cases come back favorably, noted Cusumano, his case has a chance of going to trial in circuit court, and he thinks he could win. He also said that opposition to smart meters is growing.

#### **More against smart meters**

There are about 150 people throughout Michigan who Cusumano keeps in contact with, and networks of thousands "from Maine to California" who share with others across the country their issues with the device, he said.

Cusumano, Garcia and others say that stateside, Rochester Hills Rep. Tom McMillin — [who introduced a bill last year that would address DTE's opt-out policy and the health, safety and privacy issues claimed by many about the smart meter](#) — has been a champion for their cause.

Since the bill was introduced, McMillin has pushed for hearings for Garcia, Cusumano and others to get their issues

on the record in the Energy and Technology Committee — and if not there, in the House Oversight Committee, which he chairs.

McMillin also wrote letters to DTE's McCormick, saying many complaints have come from constituents who said DTE Energy threatened to turn off their power due to their objection of the installation of a smart meter in their home. He asked McCormick how many customers have had their power turned off, whether DTE planned on shutting off power to elderly residents — “potentially putting their lives in danger due to their non-compliance” — and whether McCormick believed DTE's response to the objections could create physical confrontations.

McCormick wrote back on April 2 that the “recent correspondence (McMillin) referenced was sent in response to a very small number of customers who have replaced DTE equipment with unauthorized, non-DTE meters.

“Customers who resort to this type of action have placed themselves and others, including DTE employees ... at risk of being seriously or fatally injured.”

DTE's Simons said that so far, out of two million meters installed by DTE, there have been 3,200 requests to opt out. He added that DTE takes every case on an individual basis, “but the meters are owned, operated and maintained by us. To take our meter and replace it with something else is against the law.”

McMillin said while he doesn't know what health concerns smart meters pose, he thinks people should at least be given a choice to keep their analog meters.

“We have to figure this stuff out now. I feel the frustration of these citizens and feel like they should be able to get their concerns dealt with on the record.”

## Testimony of Rebecca M. in the

### DTE Advanced (Smart) Meter Opt-Out Case, U-17053

*What follows are the relevant portions of the testimony Rebecca M. offered in the DTE opt-out case, U-17053. The judge refused to allow any of this health testimony, stating that it was impermissible because the only thing to be decided at the hearing was whether DTE's proposed radio-off smart meter opt-out fulfilled cost-of-service principles. An appeal has been filed an appeal with the Michigan Court of Appeals.*

#### DIRECT TESTIMONY OF REBECCA M.

**Q. What are your qualifications to testify?**

A. I take my electric service from Detroit Edison. My health has been extremely affected by the smart meter that was first on my home and the nontransmitting Itron digital meter that is now on my home.

**Q. How long have you lived at your current residence?**

A. 25 years.

**Q. Are you retired?**

A. I am a retired.

**Q. Before a smart meter was installed on your home, did you have problems with wireless technology?**

A. No. Prior to the installation of my smart meter, I did not have any problems with wireless technology. I did not experience symptoms when using a cell phone; I did not experience symptoms when I used wireless internet or when I entered a facility that offered wireless internet; and I did not experience symptoms from the wireless technology that was already in my home, which, at the time of the smart meter installation, included a wireless water meter, and a cordless phone.

**Q. Prior to the installation of a smart meter on your home, were you affected by other electrical devices?**

A. No, not that I was aware of.

**Q. When was a smart meter installed on your home?**

A. A wireless smart meter was installed on my home on the morning of Saturday, March 10, 2012, while I was not home.

**Q. Did you know the meter was going to be installed?**

A. Yes. A few weeks before the installation, I had received a notice from DTE that a new, upgraded, wireless meter would be installed on my home. When I got the notice, I called DTE indicating

that I would rather not have the wireless meter. I was told that I had no choice. Although I would have preferred not to get it, I was not anticipating a problem with it either. It was a "preference" not to have it, as opposed to an aversion.

**Q. You say you preferred not to get one, then tell us why you didn't want it.**

A. As I said, it was just a preference. When I got my first cell phone, I read the manual, and it indicated that, for safety reasons, I should hold the cell phone about an inch from my head when using it. I believed the manufacturer's warnings which indicated there may be risks involved with this technology. I have used, and still use, lots of wireless devices. It's not that I worry about their effects and avoid them; it is more that I weigh the benefits, and I purchase the ones which I see as highly beneficial, I choose not to use the ones that are not. The meter did not fall into the "highly beneficial" category. I am concerned about the environment and I am already conscientious regarding my energy usage at home. I keep my thermostat lower and wear warm clothing in the winter, I turn down my heat at night and when I am gone, I don't often use air conditioning during the summer, I have replaced older appliances for newer, more efficient ones, My TV is very small and I rarely watch it, I turn off the lights I don't need. In weighing the proposed benefits a smart meter, it didn't seem like something I needed. However, when I called DTE, I was told I didn't have a choice. I didn't get upset or argue. I just accepted it. Had I had any idea what an impact it would have on my life, though, I would have protested immediately

**Q. What happened when you returned home after the meter had been installed?**

A. I returned home a little after 1 p.m.. There was a note on my door indicating the new meter had been installed. I didn't think much about it. Shortly after arriving at home, I went into my kitchen to prepare lunch. There are no words that can adequately describe what happened next. Here's my best effort:

As I stood at my kitchen sink (a stainless steel sink, opposite my refrigerator), I felt a very uncomfortable vibration, like a low-level electric current, going through my body; there was a buzzing sound in my head; and I experienced a jittery feeling in my body.

When I stepped away from the sink, the feeling lessened considerably, but was still noticeable, especially whenever I was in close proximity to the back wall of my home.

My first thought was, "That must be the new meter. This will take some getting used to." At that point, I wasn't upset and I didn't panic. I honestly thought that my body would just need some time to adjust to it, and then everything would be okay.

Later, a friend who is a physics professor explained that my extreme reaction may have been because radio waves were bouncing off the metal surfaces of the sink and/or the refrigerator. I don't know what caused it; I just know it was weird and extremely uncomfortable.

**Q. So you weren't worried about the new meter?**

A. No. not yet. I wasn't worried prior to the installation, and when I first had the reaction, I just thought it was something my body would adjust to. Looking back, of course, I think, "How could I have been so stupid? Why didn't I leave my house immediately?" At the time, though, as strong as my initial reaction was, it didn't occur to me that exposure to a meter could cause problems, or have prolonged consequences. I assumed I'd get used to it and the weird feeling and buzzing in my head would go away. It was seeing my blood pressure suddenly shoot up, that suggested to me that the meter was causing more than a "weird feeling." That's what triggered my concern.

**Q. Had you heard of smart meters prior to having one installed on your home?**

A. Yes and no. I was not aware of any controversy. I had seen an article that said energy companies were installing new meters; that in some locations, people were being forced to accept the meters whether they wanted them or not; and that it wasn't right. I tend to be more accepting of things, and because I considered the views of this person to be a little extreme, I hadn't taken the article seriously. I hadn't given it much thought, that is, until my personal experience with smart meters.

**Q. What happened next, the day the meter was installed?**

A. As the day progressed, I developed a dull headache and I had a hard time focusing and concentrating. I also became hoarse. At first, I didn't make a connection between these symptoms and the meter. I did later, though, when these symptoms persisted, and when they developed at home, but went away after being away from home for awhile.

That first day, in addition to the headache and lack of focus, by early evening, my blood pressure had gone up significantly. High blood pressure had not been an issue for me. I had had a blood pressure monitor, and for several years I had checked it occasionally. There had never been cause for concern.

**Q. Why had you made the decision several years ago to check your blood pressure from time to time?**

A. I care about my health. Checking it occasionally was a precautionary measure.

**Q. Why are you so sure that the smart meter influenced your blood pressure readings?**

A. Quite by coincidence, I had taken lots of readings right before smart meter installation. I do Bikram Yoga almost every day. It is a 90 minute, rigorous series of 26 postures, that is done in a room that is 105 degrees. It is a good workout. A fellow classmate had mentioned health benefits she attributed to her yoga practice, lower blood pressure being one of them. As I said, I didn't have blood pressure issues, but I wondered what effect, if any, my yoga practice had on mine. I decided to do an experiment: My plan was to take my blood pressure three times a day: before class, after class, and a reading later in the day. It was because of this experiment that I noticed the immediate spike in my blood pressure.

**Q. What were your blood pressure readings prior to the smart meter installation?**

A. Exhibit A is my record of blood pressure readings from March 1 through March 12. Prior to March 10 (installation day), the range in readings was 108/61 to 133/75. The average reading was 119/64.

**Q: What were your readings the day of the installation?**

A. Before yoga, my blood pressure was 118/72. After yoga, it was 125/72. By 5:00 p.m. it was 150/90. Later, it was 157/86. I remember that right before going to bed that night it was 165/90, but I did not record that reading.

It was the rise in my blood pressure that triggered my concern. It made me aware that my body was being affected on more levels than I had realized. and that the weird feeling I was experiencing was not something to take lightly

**Q. What did you do then?**

A. That night, rather than sleep in my own bed, I slept in the upstairs bedroom furthest away from my smart meter. The next day, Sunday, March 11, I called a friend and I arranged to stay at her house. I slept at her house from Sunday until I left for a three-week trip to Brazil on March 18.

**Q. The second night, you slept at a friend's house. Did you notice a difference when you slept at your friend's house?**

A. I didn't experience the buzzing sound in my head at her house, and the next morning my blood pressure was down again. I slept better than I had at my own house, and I didn't wake up with a headache. The weird, jittery feeling I had when at home lessened, but was still noticeable.

**Q. Did you return to your home?**

A. Yes. I could not totally avoid being in my own home that week because, in addition to packing for my trip, I had many things I had to take care of before leaving. However, I stayed away from home as much as I could.

**Q. What happened when you were in your own home that week?**

The weird, jittery feeling and difficulty focusing persisted; I had headaches. Also, my eyes hurt, I became hoarse, and I developed a dry cough. For the first time in my life, I started on blood pressure medicine.

**Q. Did you call DTE?**

A. Yes. Monday, March 12, the first business day after my meter was installed, I called DTE from home. I was told there was no way to opt out of a smart meter. I explained that the meter was making me sick and that I couldn't stay in my house. I said I wanted to be transferred to someone who could help me. The person I talked to said she could not transfer me to a supervisor, but that she would arrange for someone to call me back. I indicated again that it was very uncomfortable for me to be in

my house, but that I would wait there for the call. I said it was an emergency, and that I needed to talk to someone as soon as possible. No one called back. I called again that day or the next, and got no response.

How were you feeling inside your home waiting for the call? The jittery feeling, the difficulty concentrating, and the buzzing in my head were worse. I was also upset that I was getting such a run-around from DTE. I knew I was leaving the country in a few days. I had hoped that I'd be able to come back to a home with a normal, comfortable environment.

**Q. Did DTE get back to you?**

A. Not right away. When I had not heard back by Wednesday, March 14, two days after being told someone would call me back, I sent an email to DTE via their online complaint site.

I was eventually told I was being referred to Elaine Curtis. I talked to Elaine on Friday, March 16.

**Q. What did she tell you?**

She said DTE would remove my meter if I could provide a letter from my doctor indicating my smart meter was making me ill.

**Q. Had you seen a doctor?**

A. Yes. I had seen my doctor earlier in the week, on Wednesday, March 14. At that time, of course, I had not yet talked with Elaine Curtis, so I did not know I would need a letter. Since it was Friday by the time I learned about the need for a doctor's letter; and I was scheduled to leave for Brazil early on Sunday, I was unable to talk to her before I left. I called her office on Friday afternoon, and when I didn't reach her, I left a message.

I had contacted my doctor immediately; I had been concerned about all of my symptoms, but especially the high blood pressure readings. I wanted to get in to see someone before leaving on my trip. My appointment was on Wednesday, March 14. Following the appointment, I started taking a beta blocker. She said it should lower my blood pressure without making it go too low when I was away from smart meters. She was right, it did. It also helped relieve the persistent jittery feeling I was having. I continued to sleep at my friend's and spend as little time at home as I could.

**Q. You were gone for three weeks. How did you feel in Brazil?**

A. I was fine in Brazil. I felt great and I slept very well. The headaches, the buzzing in my head, and the weird jittery feeling all went away and did not come back until I returned home.

**Q. Did your doctor write the letter?**

A. Yes. In spite of the fact that communicating from Brazil proved to be a challenge because phone lines and access to email were not always available or consistently working, my doctor did send the letter to DTE. Six days prior to my returning home, I received an email from Elaine Curtis indicating

that she had received the letter from my doctor, and that the meter would be removed. Dr. Kyle Morgan faxed her letter directly to DTE; DTE has the letter. I do not have a copy.

**Q. Did DTE follow your doctor's instructions?**

Not exactly. In addition to indicating the meter was making me ill, Dr. Morgan had specified an analog meter. DTE replaced my smart meter with a different digital meter, not an analog meter.

Elaine Curtis said that DTE no longer had a distributor for analog meters. From Brazil, I sent an email to DTE via the DTE complaint link.

The many typographical errors exist because, after losing power in the middle of writing my letter several times (and therefore, losing what I had written), I finally sent this one, errors and all.

DTE ignored both my request for an analog meter and my doctor's letter specifying the need for an analog meter. If DTE had wanted to install an analog meter, it would have been very easy to do so. Hundreds, even thousands of used analog meters, in good working condition, were available.

**Q. Was the smart meter removed?**

A. Yes, but it took awhile. Since I had received the email from Elaine Curtis on April 4th indicating that my meter would be replaced, and since I wasn't coming home until April 10th, I had hoped that my smart meter would be gone when I got home. As soon as I arrived home, I walked to the back of my house and checked. It hadn't been changed. I went back to stay at my friend's house, and I called Elaine Curtis immediately. I don't remember if I actually talked to her that day, or if I left a message and she called me back. When we talked, she thought that my smart meter had already been removed. She said she would check into it and get back to me. She did. When she called me back, she assured me it would be removed within a few days. It was. I don't remember what day it actually came off.

**Q. Why did you request an analog meter?**

A. I had not had any problems with the old analog meters; and, although I didn't understand the concept, I had heard the term "dirty electricity" associated with digital technology. At that point, I wanted my old, familiar, healthful home back.

**Q. Did replacing the smart meter with a digital meter solve the health problems caused by the smart meter?**

A. No. Although there was an improvement, the new digital meter did not solve the problem. My symptoms were not as severe as they had been with the smart meter, but the weird jittery feeling, the headaches, the buzzing sound in my head, the cough, memory problems, and the difficulty focusing—all came back, just to a lesser degree.

**Q. What did you do?**

A. I contacted Elaine Curtis again. She said she didn't think the new meter could cause problems, but that she would look into it. When she got back to me, she said that the new digital could not be the problem because it did not send a signal.

In the meantime, I had talked to my friend who teaches physics. She said that because radio frequencies travel long distances, my current problems might be caused by the RF from my neighbors' meters. She recommended putting up heavy duty tinfoil, shiny side toward the meters, where I suspected the RF might be entering my home. The tin foil would help shield my home, since radio waves are reflected by metal and shiny surfaces. She also explained that there are materials which diffuse radio frequencies.

Someone else said that the problem could be that the new digital meter was dumping dirty electricity into my home, and that could be causing the problem.

**Q. What did you do then?**

A. I did what I could to solve the problem:

My first intervention was to line my garage and cover an outside wall with heavy duty tin foil to shield my house from my neighbor's smart meter that was closest to my house, and where I felt it the most. That helped....a little. The buzzing in my head was definitely still there, but not quite as intense. The other symptoms remained.

Next, I lined the inside wall with tin foil that shares the wall with my meter, On top of that, I put 3 layers of absorbing material. After this intervention (and every other intervention), I waited awhile to see what, if any, effect it had on how I felt or on my symptoms.

**Q. Did it help?**

A. Yes. Although better, it was still difficult to be in my home.

Now that I was spending more time at home, other symptoms surfaced. I wasn't sleeping through the night: I'd wake up after three, four or five hours and not be able to go back to sleep. I'd feel tense, jittery. I became hoarse, and I developed a cough. After being home for about three weeks, I began to notice breathing problems: I would get out of breath just by going upstairs, and I had difficulty breathing in my Bikram Yoga Class when doing postures that I had done with ease prior to the smart meter installations. Also because of my yoga practice, I noticed a slight weakness on my left side, that had not been there earlier. I was not able to do some of the strength building postures I had done earlier.

The buzzing sound in my head would seem louder late at night and early in the morning, and I would always wake up with a headache and a buzzing sound in my head.

**Q. Have the interventions you've done helped?**

A. There is no question that each intervention has helped. The problem is that my home has never gone back to being what it was before: I still can't tolerate being in my home for more than a week or two without experiencing very worrisome symptoms. At this point, I still have concerns regarding smart meter effects on my blood pressure; and I have even bigger concerns about my breathing and my lungs. If I am home for more than a week, I get out of breath when I go up stairs, or when it is humid outside, and in I am no longer able to do some of the Bikram Yoga breathing exercises and postures that I formerly did with ease. So far, all of these symptoms improve or go away entirely when I leave my home for an extended period of time. I can't keep searching for people and places to visit, and as more smart meters are installed, there will be fewer places I can go for relief.

**Q. What else have you done to your home?**

A. Since my first attempt at using tin foil as a shield had helped . . . a little. . . I put up more. I put tin foil on some inside walls. I also put tin foil in my bathroom, and on the back wall of the bedroom that shares a wall with the meter.

I ordered material which is designed to absorb radio frequencies from [lessemf.com/](http://lessemf.com/). I put three layers of that material over the tin foil lining the back wall of the bedroom closest to my digital meter. I also lined one of the walls in my bedroom with this material.

The RF absorbing material is black; not exactly my color I'd choose for my bedrooms.

Because I was still experiencing symptoms, a few months ago I ordered a Graham - Stetzer meter and filters. I had read that the EMF levels can be measured and reduced by adding the filters. Again, I did notice a difference with the filters in place, but not enough of a difference to keep me symptom free.

Last month, I covered the back wall of my home with tin foil. It looks awful, but it made a difference. Again, it helped, but it has not totally taken care of the problem. With each intervention, I have felt a little calmer and the symptoms seem a little less intense, but none of the interventions has totally solved my problems. As I mentioned, I am especially concerned about the breathing difficulties I experience after being in my home for awhile. My blood pressure remains a concern as well, although I have been getting normal readings without medication since my last intervention of putting tin foil on the entire back side of my home.

I tried to spend as much time out of my home as possible. I left whenever I could. I went on trips for one to three weeks. Some were planned; others were trips I took just to get away from my house. Some symptoms, such as coughing, would go away as soon as I left my home. Others would go away after being out of my home for a period of time. The amount of time required for it to go away, depended on the symptom.

**Q. How long can you stay in your house before noticing symptoms?**

A. The length of time before I experience symptoms depends on the symptom: If I return home after being away for a week, I feel jittery and get a buzzing sound in my head immediately upon entering my home. Within a few hours of being home, my eyes may hurt and become dry, and I will become hoarse and develop a cough. Things like breathing problems and weakness on my left side surface after being home for a week or more.

**Q. How are things now?**

A. I'm still spending as much time as possible away from home. From March 10, 2012, when smart meters were installed in my neighborhood, to the present, the longest stretch of time I will have been at home at one time is 30 days. Usually I am home only a few weeks before leaving again. When I leave, I try to be away for one to three weeks.

So far, when I have spent time away from my home, my symptoms have all lessened or completely gone away. When I return, they return.

Although being in my home is more tolerable than it was, even with all that I had done, my health while in my home is still not back to what it had been prior to the smart meter installations

**Q. Did these interventions help? Is the digital meter no longer a problem?**

A. The interventions have helped, but all the problems remain. Whenever I return home, I immediately experience a buzzing sound in my head, I become hoarse, and I get a dry cough. My reactions are systemic: If I am at home for an extended period of time (a few weeks), additional symptoms surface:

- weakness on my left side,
  - joint pain,
  - chest pain,
  - difficulty focusing,
  - hot flashes,
  - breathing problems,
  - shortness of breath,
  - skin things (a rash above my right eye; rough hardened skin on my knuckles)
- my eyes hurt and become dry,  
all my teeth on my upper left jaw ache.

**Q. Did you make any more attempts at mitigation?**

A. I had not shielded the back of my house, both because I didn't think I could get tinfoil to stay up, and because I knew it would look terrible. Finally, though, in October, out of desperation to make

my home more livable, I lined the entire back of my house with tinfoil. It looks awful. Again, it has not totally taken care of the problem and it is only a temporary measure, but it helped. I still haven't spent more than a few weeks in my home since this latest addition of tinfoil, but so far my sleep is more normal, the jittery feeling is not as intense, I don't feel as spacey. I am still getting hoarse, but less often, and my eyes hurt less. The weird, unsettled sensation in my body and the uncomfortable buzzing sound in my head persist.

With each intervention I have seen an improvement in my symptoms, but my house is in no way back to what it was before smart meters were installed in my neighborhood or the digital meter was installed on my home.. In addition, the tinfoil, besides being ugly, is a temporary solution that won't hold up over time.

**Q. How do you know that it is the digital meter that is causing these health effects?**

Although I know it seems unbelievable that a meter could trigger all these health effects, the meter was the only thing that has changed in my home environment. Furthermore, at least so far, all these problems go away when I leave my home: some go away immediately upon leaving; others go away in time. The symptoms return when I return.

**Q. So when you go to someone else's house that has a smart meter, do you have problems?**

A. Yes, to varying degrees. I always experience the buzzing sound and a jittery feeling. I may or may not experience other symptoms.

**Q. When you go into public buildings that have smart meters, do you have problems?**

A. Fortunately, most of the places I frequent do not have smart meters yet, so I can't answer this adequately. However, the spiritual center I attend has a smart meter and it is very uncomfortable to go there, so I have not been going.

**Q. Have you been in any home besides your own that has a digital meter?**

A. Yes. I have a friend who lives on Lake Tahoe. She remodeled her home several years ago, and has a digital meter. It is not a smart meter. I really don't know if it is the same as my meter. Her home is very deep, and the meter is way at the back. I couldn't sleep when I stayed in a back bedroom. I was able to sleep when I slept on her sofa, in the front of the house. The weather was great when I was there, and we spent most of our time outside hiking or by the water. I didn't have as much trouble there as I do at my own home. Her meter is older; I don't know if it is like mine.

**Q. In your experience, will the nontransmitting digital meter (the kind now on your home and the kind DTE is proposing as the alternative to the smart meter) solve the health problems you experience with smart meters?**

A. No.

**Are the nontransmitting digital meters an acceptable alternative to the smart meter?**

A. No

**Q. Please list all the health effects you experience from smart and nontransmitting digital meters, whether on your own home or elsewhere.**

- buzzing in my head
- Elevated blood pressure
- Muscle weakness, especially on my left side
- headaches
- cramps in legs and feet, extremely cold feet
- eyes hurt, blurry vision
- breathing problems, shortness of breath
- joint pain, arthritis like symptoms
- chest pain
- concentration and memory problems
- All of my teeth on one side aching

**Q. How do you know that it was the smart meter that first caused these health effects and not something else?**

A. The symptoms surface when I spend time at home. They go away when I leave. They surface when I am home again. I don't know if the symptoms are caused by my digital meter or my neighbors' smart meters, but the installation of smart meters in my neighborhood is the only thing that has changed in my environment.

**Q. Please list all the health effects you currently experience from the digital meter on your home.**

A. Without the remediation or if I am around other people's smart meters, I sometimes experience all of them, especially buzzing in my head.

With the mitigation, I still experience buzzing in my ears and a I am not as calm, I'm more agitated. To date, I haven't stayed at home long enough to know if the other symptoms will surface again.

**Q. Please list all the health effects you in the past experienced from the digital meter on your home but do not currently experience.**

A. Since putting tin foil on the back of my home, my blood pressure has been normal without medication as long as I avoid smart meters.

**Q. Has anything else changed that would account for the subsiding of these effects?**

A. No

**Q. Did you experience any of the health problems you have enumerated prior to the installation of smart meters?**

A. In 2007 I became ill after being exposed to a very toxic paint. The symptoms I did not experience were the buzzing in my head and the elevated blood pressure. I did experience the other symptoms. I recovered from that injury, and, until the smart meter was installed, I had not had experienced any of these symptoms since my recovery in 2008.

**Q. Did you have health problems prior to the installation of smart meters? If so, what were they and when did they begin?**

A. Prior to the installation of my smart meter, I was healthy, I exercised regularly, I ate a good diet, and I was on no medication..

**Q. Did you do anything else to deal with this problem?**

A. Like I said, I put up shielding materials and I started spending as much time as possible away from home. I took several trips. Although some had been planned, I have taken others for the sole purpose of getting away from my house. From March 10, 2012, when my smart meter was installed, to present, the longest stretch of time I will have been home at one stretch is 30 days. When I have spent time away from home, I have generally left for one to three weeks at a time. Each time I left, my symptoms went away within a day or two of being out of my house. I am still spending as much time away from my house as possible.

At this point, I have spent about \$2000 in materials and devices to tolerate living in my home, and I still have only a temporary fix that doesn't completely solve the problem. And, DTE is proposing additional charges to opt out.

DTE could probably use my home as an example of a smart meter success story: Their records should show that my energy usage has gone down since smart meters were installed in my neighborhood. It's a good example of how misleading it can be to just look at one source of data. My "real" energy usage is up—considerably. I consumed a lot more energy when you consider:

- transportation to doctors,
- products purchased to remediate my home
- medications I will need that I would otherwise not have needed
- driving and flying to destinations in order to stay away from home
- utilities consumed at visiting destinations

These are not just monetary expenses for me. They involve energy expenditures that far outweigh any energy savings DTE might claim.

My home no longer feels like "home." The number of places I can go and remain symptom-free is dwindling as Ann Arbor, the rest of Michigan, and the rest of the country is being installed. I would sell my house and move, but, at this point, I don't know where I could go.

**Q. Please list all of the health problems you currently experience from the digital meter on your home?**

A. Since my last mitigation, my most common symptoms are buzzing in my head, jitteriness, and breathing problems. The breathing problems are the ones that concern me the most.

**Q. Do you experience problems when you enter homes or other buildings with smart meters?**

Yes. I can tell immediately if there is a smart meter.

**A. Have the health effects you experience as a result of smart meters affected your ability to interact socially with others? If the answer is yes, describe how.**

A. Yes, of course. I am avoiding going places that have smart meters. It limits where I can go and who I spend time with.

**Q. Have the health effects you experience as a result of smart meters affected your ability to access public services, such as the public library, government offices? If the answer is yes, describe how.**

A. Not yet.

**Q. Have the health effects you experience as a result of smart meters affected your ability to access religious or spiritual services? If the answer is yes, describe how.**

A. I am involved with a meditation group. I have not been attending programs because I experience symptoms if I am in the building for an extended period of time.

**Q. Have the health effects you experience as a result of smart meters affected your ability to freely access health services? If the answer is yes, describe how.**

A. Not yet.

**Q. Have the health effects you experience as a result of smart meters affected your ability to perform one or more major life activities not already mentioned? If the answer is yes, describe what activities and how the effects have affected your performance of these activities.**

A. So far I have been lucky. Most of the places I frequent do not have smart meters yet. I am not looking forward to the day when smart meters are everywhere. It will be a nightmare for me.

**Q. What do you feel is a reasonable accommodation to allow you to perform major activities of daily living?**

A. A free opt out for everyone.

An analog meter option.

The Establishment of Smart Meter Free Zones and/or Facilities

The removal of smart meters everywhere.

# Symptoms after Exposure to Smart Meter Radiation

People from coast to coast in the USA, and from one side of the world to the other, are becoming ill after exposure to the radiofrequency radiation emitted by Wireless Smart Meters. Attached are the results of two surveys of the symptoms being reported.

The first survey comes from the United States and includes 318 adults, from 28 states from California to New York, and addresses wireless utility meters that are principally Wireless Smart Meters. The second survey comes from the other side of the world, Victoria, Australia, and includes 92 adults and children, and addresses Wireless Smart Meters exclusively. Altogether, 410 adults and children are included. Both surveys report new or worsened symptoms after the installation of wireless utility meters in a given individual's environment.

The attached two graphs show the percentage of individuals in each survey who experienced each symptom. The two surveys group the symptoms into somewhat different clusters, but these clusters are similar enough to enable comparison between the surveys. Of the top seven clusters of symptoms in both surveys, six clusters are similar in both description and order of occurrence: (1) sleep disruption; (2) headaches; (3) ringing or buzzing in the ears; (4) fatigue; (5) loss of concentration, memory, and learning ability; and (6) disorientation, dizziness, and loss of balance. Most individuals in the surveys developed multiple symptoms.

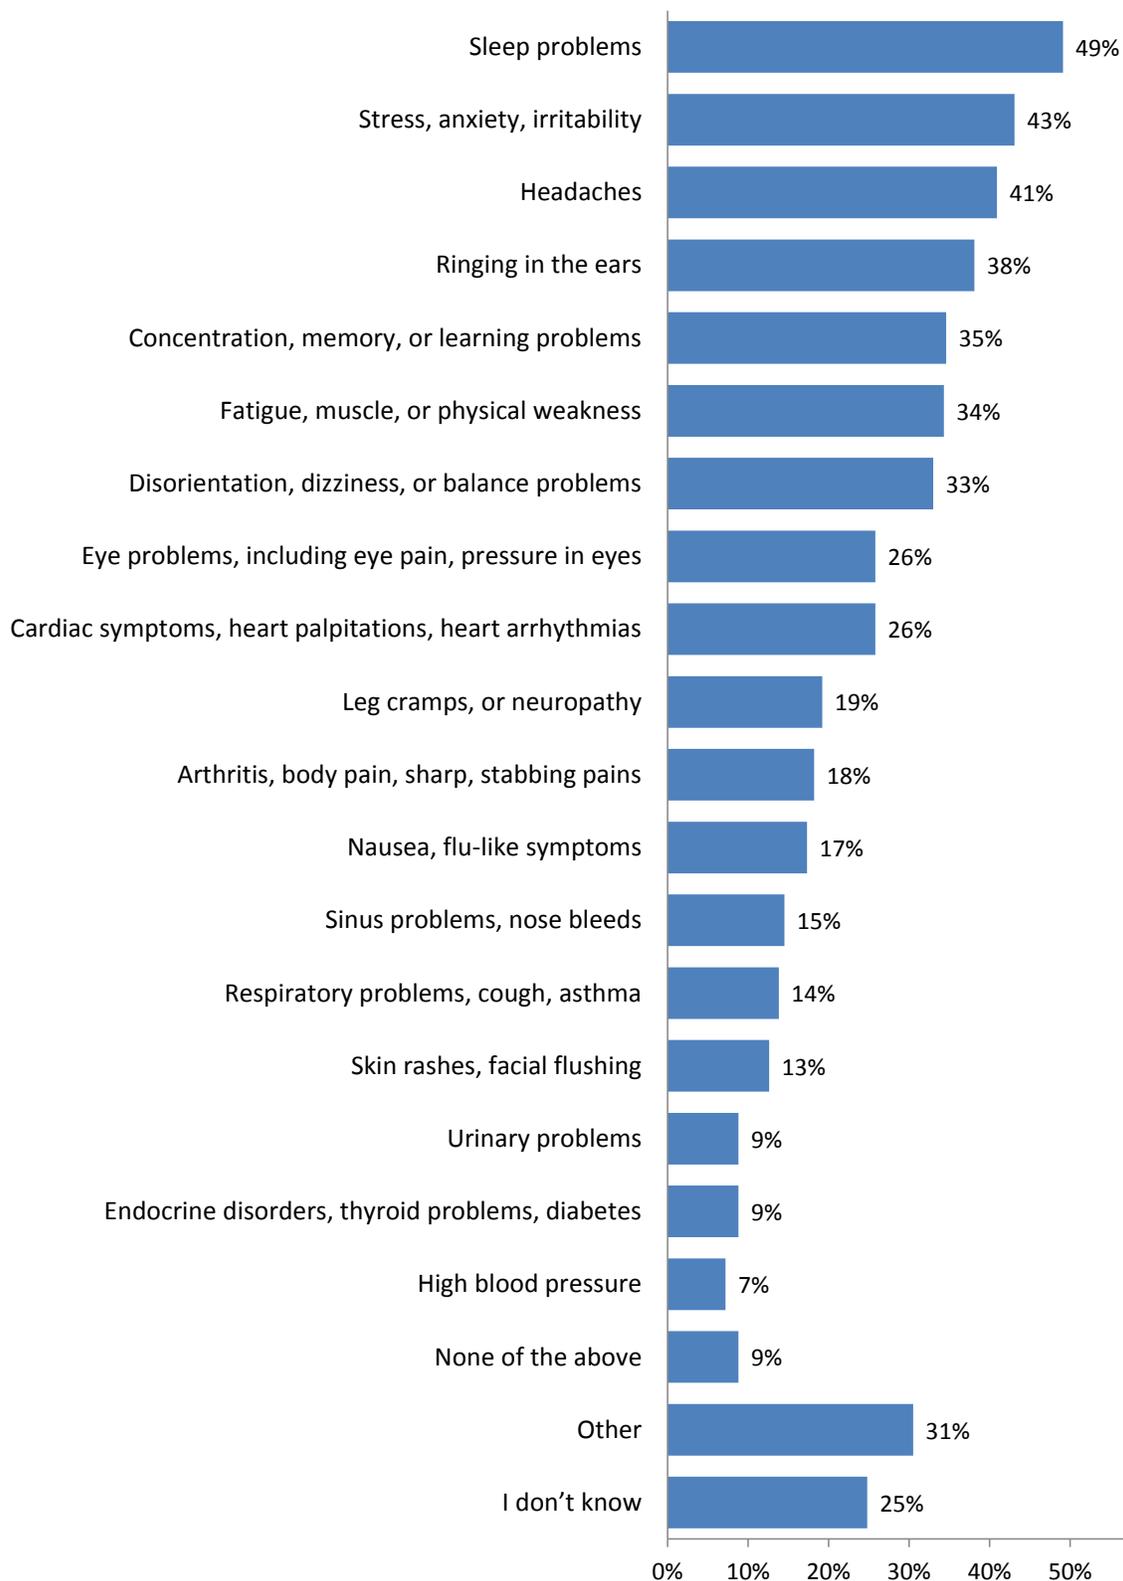

The surveys do not tell us how likely a given individual is to become symptomatic after exposure to the radiation from Wireless Smart Meters. But the surveys do tell us which symptoms a person who does become symptomatic is most likely to experience. The many symptoms found reflect the many body systems that are disrupted by such radiation.

A symptom, of course, is something that can be sensed by an individual, and thus can serve as a warning. Unfortunately, many health effects caused by radiofrequency radiation have no early symptoms and thus give no warning. These health effects become evident only after significant harm has been done. Examples are DNA damage, cancer, and reproduction effects.

# New or Worsened Symptoms Reported by 318 Individuals after Exposure to Wireless Utility Meters in the USA<sup>1</sup>

<sup>1</sup> Ed Halteman, Ph.D., statistics, Final Results Summary: Wireless Utility Meter Safety Impacts Survey, September 13, 2011, p. 22 (<http://emfsafetynetwork.org/wp-content/uploads/2011/09/Wireless-Utility-Meter-Safety-Impacts-Survey-Results-Final.pdf>). 97 percent of respondents to full survey were in the USA, from 28 states with most in California (78 percent) and New York (16 percent).

# Executive Summary by Ed Halteman, Ph.D.

## Wireless Utility Meter Safety Impacts

### OBJECTIVES

- To investigate reported public health and safety complaints about wireless utility meters.
- To evaluate the impacts on health and safety due to wireless utility meters.
- To determine whether further study is warranted.

### METHODS

- Survey was designed by the EMF Safety Network (Network).
- The survey was circulated online through various social media outlets including Network's email list, Facebook, and the California EMF Safety Coalition (a discussion group).
- The survey was also posted on Network's website: [www.emfsafetynetwork.org](http://www.emfsafetynetwork.org) where visitors were invited to take the survey.
- 443 responses were received from 7/13/2011 through 9/2/2011. *(318 of the 443 answered the health questions that formed the basis for the bar chart on symptoms. RMPowell)*
- Network commissioned Survey Design and Analysis (SDA) to provide this report of the survey findings.

### RESPONDENT MAKEUP

- 93% are over 40 years old and 43% are over 60 years old.
- 73% are women.
- 78% are from California.
- 68% have Pacific Gas and Electric (PG&E) as their utility provider.
- 49% are EMF Sensitive.
- 41% have had a new wireless meter installed in their home; of these . . .
  - 56% have had it installed for at least six months
  - 89% have electric meters, 53% gas meters and 10% water meters
  - 35% saw an increase in their utility bill
  - 26% have experienced some type of interference
  - 8% experienced burned out appliances or damaged electronics including TV, stereo, computer, refrigerator and other.
- 76% indicated they have wireless utility meters installed in their neighborhood, town or city.
  - 44% near their home
  - 36% in town

### TOP HEALTH ISSUES SINCE NEW METERS INSTALLED

- Sleep problems (mentioned by 49%)
- Stress, anxiety and irritability (43%)
- Headaches (40%) *(Intentionally listed at 41% on symptoms bar graph, rounded up from 40.9%. RMPowell)*
- Ringing in the ears (38%)
- Heart problems (26%)

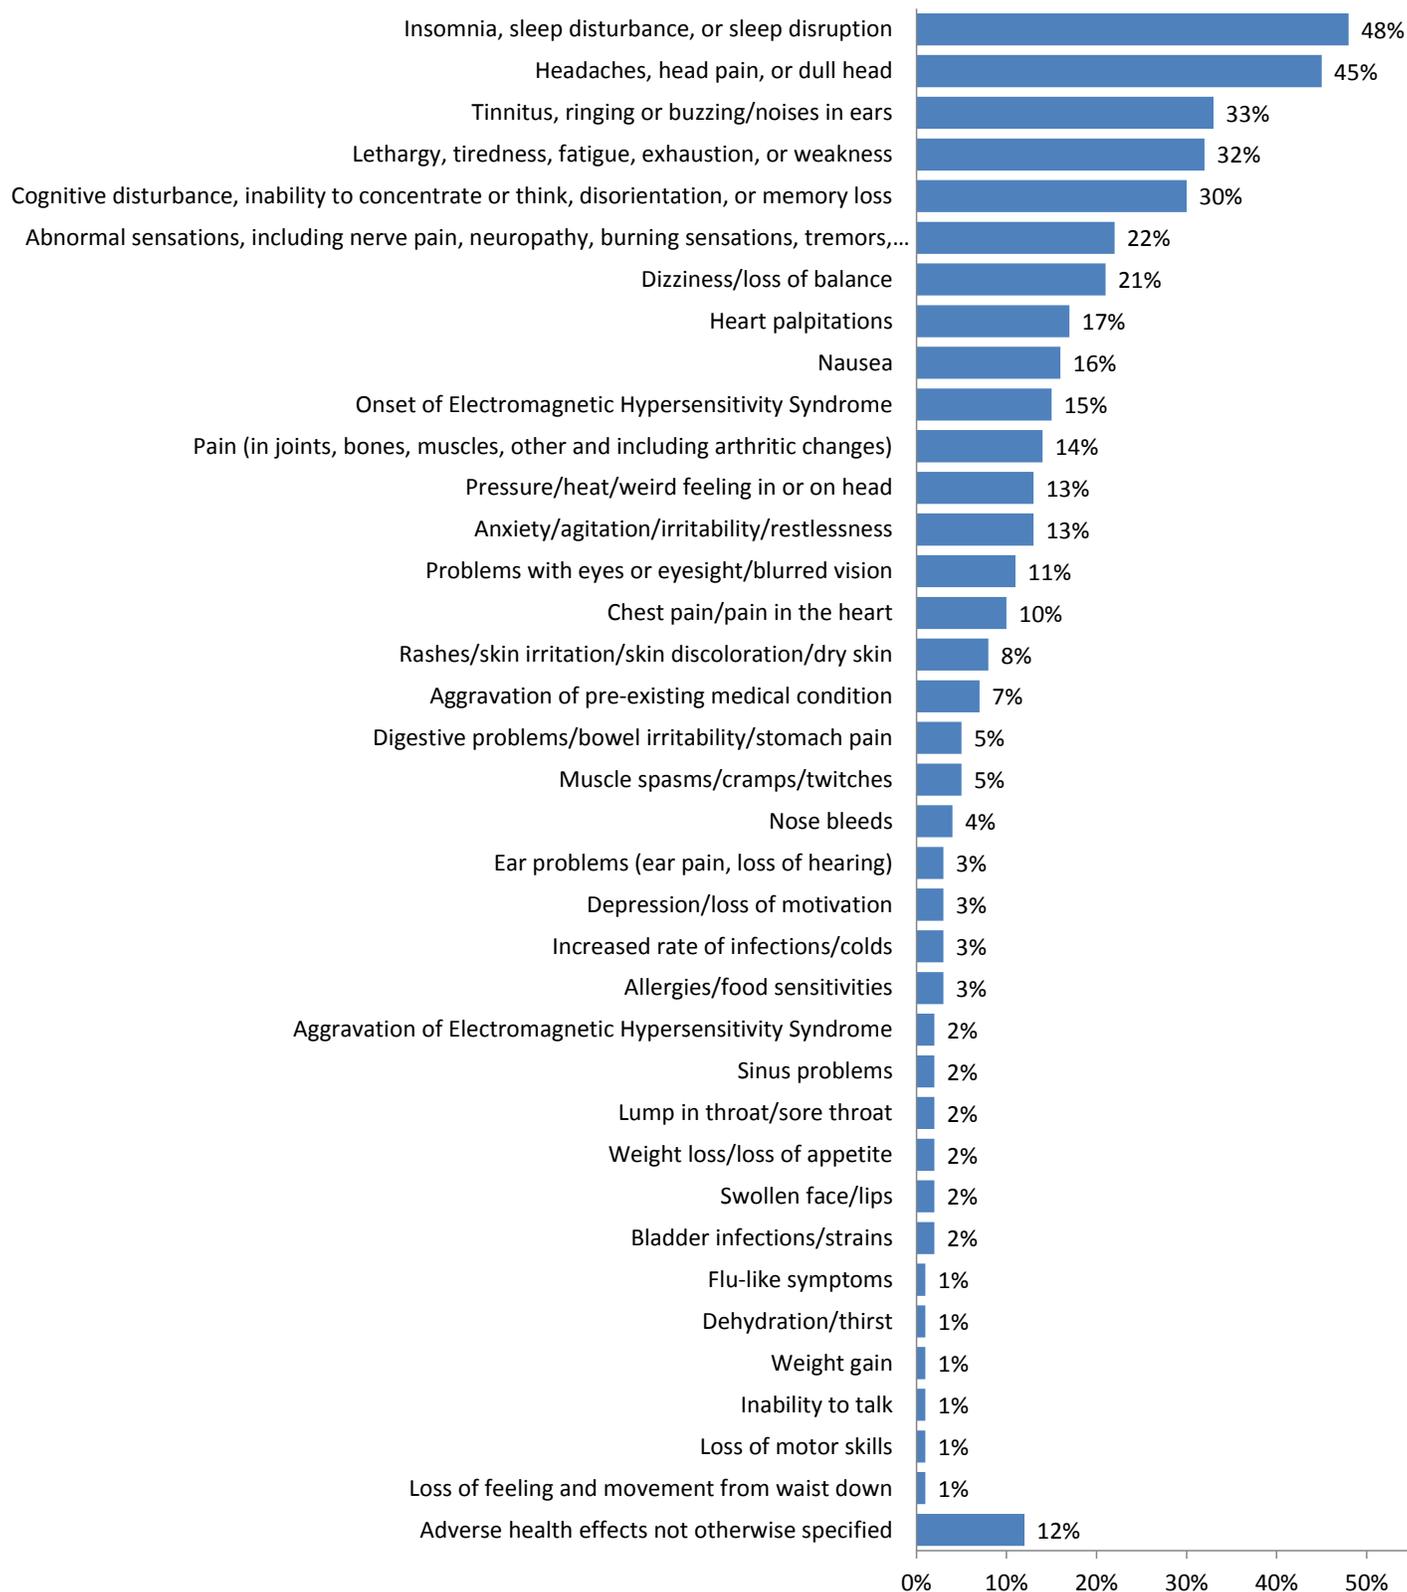

### UTILITY and PUBLIC UTILITY COMMISSION INTERACTIONS *(Title inserted by RMPowell.)*

- 40% (111 people) of those having wireless meters in their homes or community have complained to their utility provider.
  - 96% of these people were either "Unsatisfied" or "Very Unsatisfied" with the handling of their complaint.
- 32% (88 people) complained to the utilities commission.
  - 96% of these people were either "Unsatisfied" or "Very Unsatisfied" with the handling of their complaint
- 94% of respondents want to retain or restore their analog meters and 92% of these respondents do not think they should have to pay any additional money.

### STATISTICAL TESTING SHOWS THE TOP HEALTH SYMPTOMS ARE POSITIVELY ASSOCIATED WITH

- EMF Sensitivity
- Wireless meters installed in the home

# New or Worsened Symptoms Reported by 92 Individuals after Exposure to Wireless Smart Meters in Australia<sup>1</sup>

<sup>1</sup> Federica Lamech, MBBS, Self-Reporting of Symptom Development from Exposure to Radiofrequency Fields of Wireless Smart Meters in Victoria, Australia: A Case Series. *Alternative Therapies*, Nov/Dec 2014, Vol. 20, No. 6, pages 28-38. NIH PMID 25478801 (<http://www.alternative-therapies.com> and <http://www.ncbi.nlm.nih.gov/pubmed/25478801>).

## **Abstract of Dr. Federica Lamech's Article from the National Institutes of Health PubMed Index**

Altern Ther Health Med. 2014 Nov-Dec;20(6):28-39.

### **Self-reporting of symptom development from exposure to radiofrequency fields of wireless smart meters in Victoria, Australia: a case series.**

Lamech F.

Abstract

#### **CONTEXT:**

In 2006, the government in the state of Victoria, Australia, mandated the rollout of smart meters in Victoria, which effectively removed a whole population's ability to avoid exposure to human-made high-frequency nonionizing radiation. This issue appears to constitute an unprecedented public health challenge for Victoria. By August 2013, 142 people had reported adverse health effects from wireless smart meters by submitting information on an Australian public Web site using its health and legal registers.

#### **OBJECTIVE:**

The study evaluated the information in the registers to determine the types of symptoms that Victorian residents were developing from exposure to wireless smart meters.

#### **DESIGN:**

In this case series, the registers' managers eliminated those cases that did not clearly identify the people providing information by name, surname, postal address, and/or e-mail to make sure that they were genuine registrants. Then they obtained consent from participants to have their deidentified data used to compile the data for the case series. The author later removed any individual from outside of Victoria.

#### **PARTICIPANTS:**

The study included 92 residents of Victoria, Australia.

#### **OUTCOME MEASURES:**

The author used her medical experience and judgment to group symptoms into clinically relevant clusters (eg, pain in the head was grouped with headache, tinnitus was grouped with ringing in the ears). The author stayed quite close to the wording used in the original entries. She then calculated total numbers and percentages for each symptom cluster. Percentages were rounded to the nearest whole number.

#### **RESULTS:**

The most frequently reported symptoms from exposure to smart meters were (1) insomnia, (2) headaches, (3) tinnitus, (4) fatigue, (5) cognitive disturbances, (6) dysesthesias (abnormal sensation), and (7) dizziness. The effects of these symptoms on people's lives were significant.

#### **CONCLUSIONS:**

Review of some key studies, both recent and old (1971), reveals that the participants' symptoms were the same as those reported by people exposed to radiofrequency fields emitted by devices other than smart meters. Interestingly, the vast majority of Victorian cases did not state that they had been sufferers of electromagnetic hypersensitivity syndrome (EHS) prior to exposure to the wireless meters, which points to the possibility that smart meters may have unique characteristics that lower people's threshold for symptom development.

**David Mark Morrison**, individually,

Plaintiffs,

v.

**Portland Public Schools**,

Defendant.

Civil Action No. 3:11-cv-00739-MO

**Second Amended Declaration  
of Curtis Bennett**

I, Curtis Bennett, under penalty of perjury pursuant to 28 U.S.C. § 1746, hereby make the following declaration in support of a preliminary and permanent injunction enjoining Portland Public Schools' use of WI-FI:

1. I am the world's foremost authority on applying infrared technologies at molecular levels. I am committed to contributing to the overall improvement of the Earth's ecosphere by extending mankind's vision beyond the visible.

2. I am a Canadian Interprovincial Journeyman Electrician (Red Seal) with a theoretical and practical background in electromagnetic field designing. My education included extensive mathematical theory substantiated in a practical, laboratory environment. Ultimately, I earned Canadian provincial and national credentials.

3. I earned a construction engineering technologist (building construction and design) Diploma from the Northern Alberta Institute of Technology. This education consisted of every aspect of construction, from contracts to completion.

4. I completed an education in engineering, magnetic fields, heat transfer, and electron flow specifically to compliment my extensive background with a technology that allows us to see temperature beyond our visible spectrum.

5. I have consulted with defense agencies, oil, gas, lumber, mine, and manufacturing industries, hydrologists, fire departments, medicine, energy, governments, municipalities, and insurers.

6. As a first response consultant, I consulted the Defense Minister for the Canadian Military (Canada's Chief in Command) on the vulnerability of Canadian (and other countries') ports after 9/11.

7. I have extensively studied theory on magnetic and electromagnetic fields, including radiofrequency fields, for many years. It is how we produce electricity.

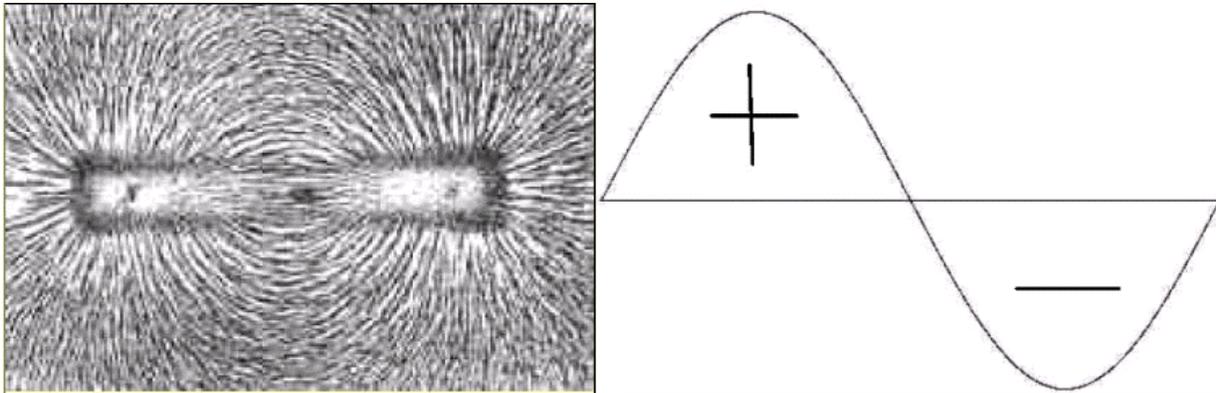

8. I have presented to Canada's Standing Committee on Health specific to 'An Examination of the Potential Health Impacts of Radiofrequency Electromagnetic Radiation.' <http://www.magdahavas.com/wordpress/wp-content/uploads/2010/04/HESA-Report-final.pdf>. Prior to presenting to the committee, I informed Health Canada of the error in safety code as our jurisdictional authority regarding the dangers of radio frequency interaction with humans. I reported

that safety standards and Canada's Safety Code 6 (Canada's requirements for the use of radiation emitting devices) contained errors or omissions substantiating harm is being done. Specifically, in September, 2010, I discovered an error in Health Canada's Safety Code 6, which I reported to Health Canada and followed-up in October as expert witness for Canadian Parliament's Standing Committee. The error is that Safety Code 6 failed to consider that any given person is an intricate unprotected electrical unit with its own frequencies and voltages. Safety Code 6 treats humans as a piece of tissue or furniture and negates to mention human frequencies or electrical sensitivity. Safety standards negating the electrical conflicts made the process miss causation or the mechanism scientifically linking harm with electromagnetic frequencies (EMFs). Thus, the failure to include people has resulted in no consideration for the frequency conflicts between radiofrequency radiation and humans. The only reason I picked up on the missing electrical aspects of humans is because of the rollover of our work into medical education. As electrical professionals we don't deal with human electrical properties, we aren't allowed to use them for conductors.

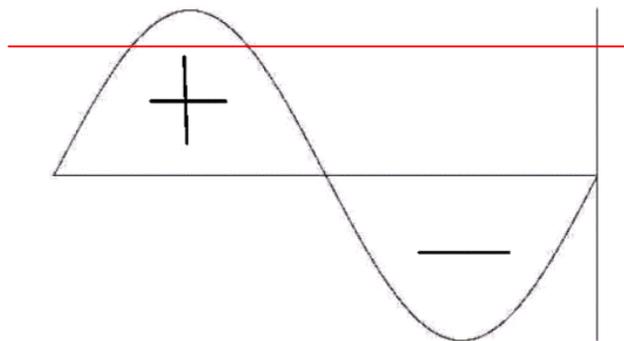

9. Academia of the world is literally blind to temperature, and after decades of advanced research as an infrared consultant (all applications), I now lecture for education credits needed for medical licensing(see CurtisBennett credentials). I have presented in the United States & Canada to Medical Doctors and health professionals regarding the dangers of radio frequency interaction with humans(see cell phone radiation images from 2002). By employing infrared at the molecular level, we are able to see things such as breast cancer, below surface groundwater (nature's hidden treasure) [www.thermoguy.com/groundwater.html](http://www.thermoguy.com/groundwater.html) , and forest fires through blinding smoke <http://www.thermoguy.com/blog/index.php?itemid=39> . Another application is showing how solar electromagnetic fields are causing buildings to 'burn,' or generate extreme heat, which they are not designed <http://youtu.be/dKGHKtkqeMc> . It is a program where concepts of cellular energy and the function of the human body are integrated with the growing focus on the dangers of radiofrequency radiation, including WI-FI, and cellular technology.

My participation in the medical program includes magnetism, electromagnetic frequencies, and the mechanism as to how they are dangerous <http://youtu.be/jcBDxpSWA4k>. Additionally, I lecture regarding buildings and their toxins, groundwater, forest fires and their toxicity, medical imaging including before and after images of physiology changes with treatment. My presentation of environmental pollution is of electromagnetic fields versus magnetic fields. In the application of schools and electromagnetic fields, what I teach and offer as testimony herein, includes the following:

a. The following show a magnetic field versus an electromagnetic field:

The picture top left is a magnetic field of a bar magnet. The top right diagram is an electromagnetic field, represented by a frequency. Unlike the electromagnetic field, the magnetic field doesn't have a frequency and would measure as a straight line (red) which is demonstrated below:

b. To create electricity you need a **magnetic field, a conductor, and motion.**

We create electricity by moving a conductor through a magnetic field or by moving the magnetic field around the conductor. When it comes to children in a WI-FI environment, the WI-FI router is providing the magnetic field while also moving the field (at 2.4 or 5 GHz),

children are the conductors. The admitted power density in the classrooms is effectively putting the unprotected children as well as the teachers inside the circuit.

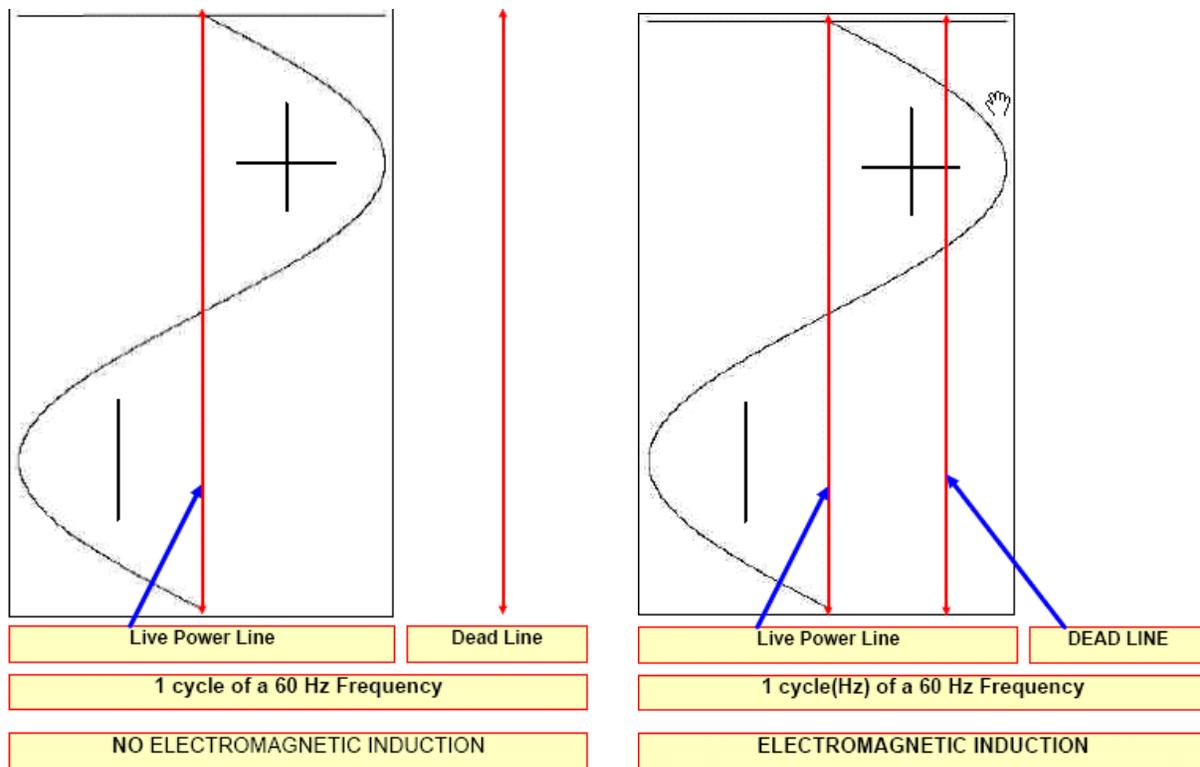

c. As conductors within the electromagnetic fields, children, teachers, and staff are very precise, as well as intricate, electrical beings functioning healthily at approximately 7.8 Hz and 25 to 100 Mv.

d. WI-FI is installed to communicate with the wireless devices called computers. The other wireless devices in the room, called children, do not function at wireless frequencies. Human cells operate at low voltage, their own frequencies, and to impose a very fast foreign frequency at GHz speeds on the human electrical system causes serious electrical problems.

e. At a molecular level, these fast radiofrequency waves are going through humans causing atoms and molecules to change direction or polarize at twice the frequency. Other results are *electrical induction of and* eddy currents within human biological systems. We know with absolute certainty that induction must be happening because SAR values themselves are the Specific Absorption Rate, which is caused by induction. The resultant heat can be caused by electromagnetic induction as (i) heat is a byproduct of creating currents in the body, (ii) the body polarizing at twice the frequency produces heat (microwave effect), or (iii) heat<sup>1</sup> could result from electrical failure from mixing frequencies. The diagrams below evidence electrical induction (the 'Dead Line' represents a conductor/child):

---

<sup>1</sup> Safety standards admit heat is generating, which is why a power load (volts times amps) (specific absorption rate) was assigned to tissue of 1,000 microwatts/cm<sup>2</sup> of localized heat. What causes the heat is electromagnetic induction. The error or mechanism missing in safety standards is they negated to consider all the frequencies or electromagnetic fields, such as humans.

f. Electromagnetic induction on a bare conductor (a child) running at its own frequency brings on a host of electrical problems for the unprotected child including nerve and muscle depolarization (stimulation), in addition to heat. Canada’s Safety Code 6, which is based on similar international standards as used in the United States, provides that the unintentional excitation of tissue is to be **avoided** as is **heat effect** because studies show it can lead to nerve and muscle depolarization.<sup>2</sup> Depolarization is part of the natural process but should not be initiated because of electromagnetic induction (electromagnetic triggers like opening a car door from inside.

<sup>2</sup> ‘For frequencies from 3 to 100 kHz, *the predominant health effect to be avoided is the unintentional stimulation of excitable tissues*, since the threshold for electrostimulation in this frequency range will typically be lower [less radiation or slower frequencies] than that for the onset of thermal effects. *Experimental studies have demonstrated that exogenous electric and magnetic field exposures can induce in situ electric fields and currents within biological tissue that can lead to nerve and muscle depolarization \* \* \**. Limits for maximum external electric and magnetic field strengths have been established in Safety Code 6 to avoid *in situ* electric field strengths greater than that of the minimum excitation threshold for excitable tissues.’ (Italics added) Health Canada, Limits of Human Exposure to Radiofrequency Electromagnetic Energy in the Frequency Range from 3 kHz to 300 GHz Safety Code 6 (2009), [http://www.rfsafetysolutions.com/PDF%20Files/Health%20Canada%20Safety%20Code%206%20Standard\\_2009.pdf](http://www.rfsafetysolutions.com/PDF%20Files/Health%20Canada%20Safety%20Code%206%20Standard_2009.pdf).

the building). By way of example, recent work by Zhou *et al.*, suggests intermediate frequency fields allow large segments of the DNA molecule, but not its entire length, to become polarized. This polarization causes charge to pile up at bends or clumps, which then attract one another, causing the DNA polymer to collapse. Zhou *et al.*, *Collapse of DNA in ac Electric Fields*, Phys Rev Lett 106, 248103 (June 16, 2011), quoted from *The DNA also collapses* <http://physics.aps.org/synopsis-for/10.1103/PhysRevLett.106.248103>. On June 22, 2011, this phenomenon was discussed by the The Lancet, summarizing the latest International Agency for Research on Cancer's reclassification of radiofrequency electromagnetic frequencies as a 'possibly carcinogenic to humans' (Group 2B): (with the reported mechanism linking the frequencies to adverse health effects, if Health Canada had shared the mechanism, the W.H.O. would have reclassified the frequencies as a Group 1 as causing cancer).

*EMFs generated by RF sources couple with the body, resulting in induced electric and magnetic fields and associated currents inside tissues.* The most important factors that determine the induced fields are the distance of the source from the body and the output power level. Additionally, the efficiency of coupling and resulting field distribution inside the body strongly depend on the frequency, polarisation, and direction of wave incidence on the body, and anatomical features of the exposed person, including height, body-mass index, posture, and dielectric properties of the tissues. Induced fields within the body are highly non-uniform, varying over several orders of magnitude, with local hotspots. See, [http://www.natap.org/2011/newsUpdates/062311\\_01.htm](http://www.natap.org/2011/newsUpdates/062311_01.htm). (there is no acceptable induction allowed)

g. A 2009 study found an underestimation of exposure to children in the 1,900 MHz (220 percent) and 835 MHz (144 percent) frequencies, and which will be true for 2.45 GHz and 5 GHz frequencies as well:

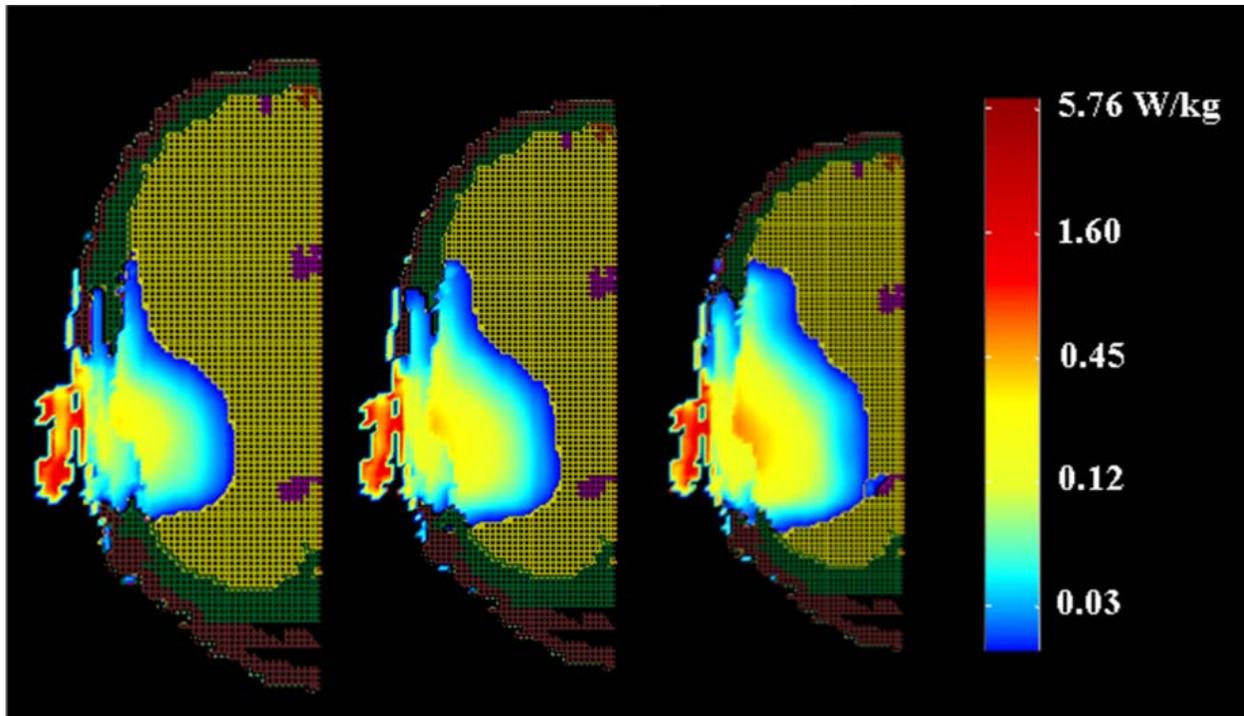

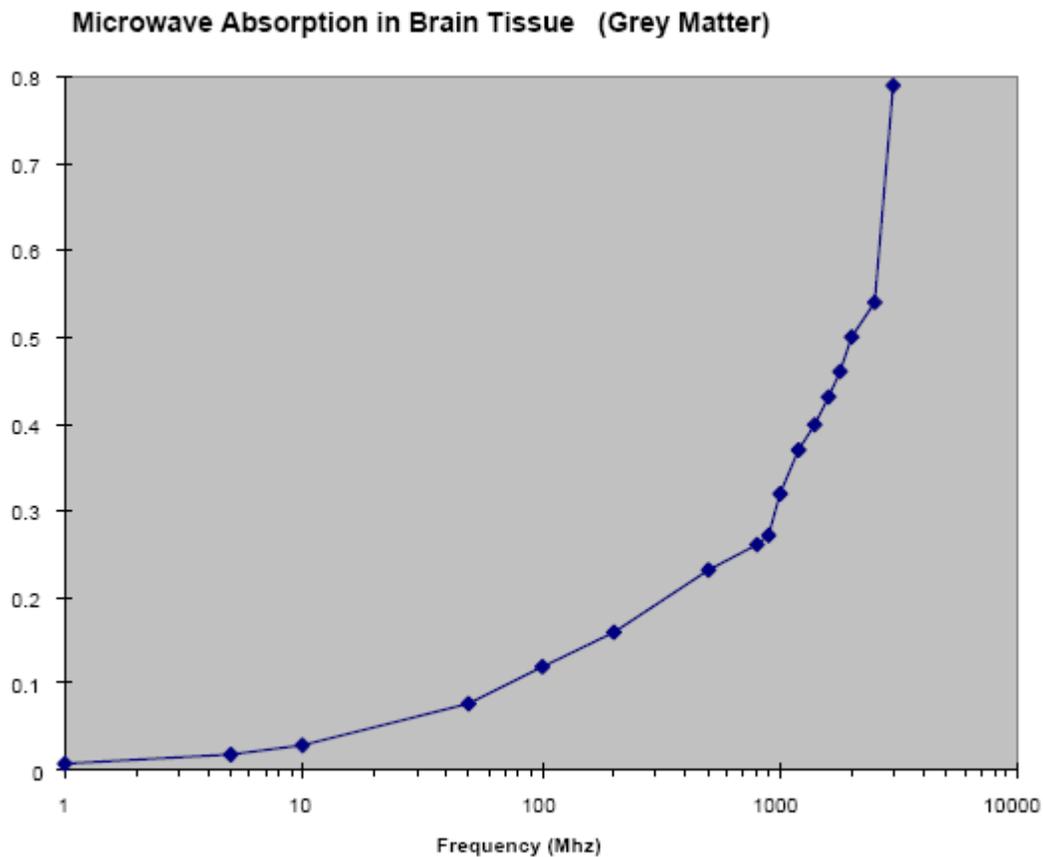

Figure 2. SAR distribution at 1900 MHz: (a) 11.1% larger, (b) average, and (c) smaller, Gandhi & Kang, *Phys. Med. Biol.*, 47, 1501-18, 2002.

The underestimation of exposure was due to the thinner pinna and the skull for the smaller models which results in closer placement of the mobile telephones to the brain of children. This is Because of the larger height, the adult head is generally in the weaker magnetic field region resulting in lower induced current densities for the brain for adults. The heads of children, on the other hand, are in the stronger magnetic field regions resulting in higher induced currents for the brain as compared to adults. Underestimation of EMF/NIR Exposure for Children for Mobile Telephones and for Electronic Article Surveillance(EAS) Systems. Om P. Gandhi, [www.icems.eu/docs/brazil/Gandhi\\_09.ppt](http://www.icems.eu/docs/brazil/Gandhi_09.ppt). Present frequency exposure is based on 6 minute exposure for adult males.

h. The graph below, from physicist William Curry PhD,'s presentation Wireless LANs in the Schoolroom, shows how absorption in brain tissue (grey matter) increases exponentially toward the ultra-high frequency (UHF) area of the microwave oven and WiFi. (I have included a link to a declassified military document where they refer to microwave hearing? Popping noises they found were associated with the thermal elasticity of the brain)  
[http://www.thermoguy.com/pdfs/Bioeffects\\_of\\_Selected\\_Non-Lethal\\_Weapons.pdf](http://www.thermoguy.com/pdfs/Bioeffects_of_Selected_Non-Lethal_Weapons.pdf)

Curry, Wireless LAN's in the school room, <http://www.stayonthetruth.com/wireless-lans-in-the-school-room---bill-p-curry.php>

i. The graph above, from physicist William Curry PhD,'s presentation Wireless LANs in the Schoolroom, shows how absorption in brain tissue (grey matter) increases exponentially toward the ultra-high frequency (UHF) area of the microwave oven and WI-FI.

j. In the case of the Portland Schools, the additional, unused but still deployed carrier frequency of 5 Hz would likely increase absorption in other, smaller organs, such as the thyroid.

k. The graph also illustrates the problem with the drive of the wireless industry toward ever-higher frequencies within the cm microwave band. While nearly all the lower frequency bands have already been allocated by the FCC for specific types of radio transmissions, and transmission of ever more information content on any given channel requires greater bandwidth, each new deployment undermines further the integrity of the population's health. Engineers who design these systems have no training that would qualify them to consider the effects on biologic systems, which is why public health scientists need to be called in to policymaking prior to contracting and deployment, not after the fact.

l. I also wish to speak about the direct effects of RF/MW radiation upon the human organism are not the only known effects. According to Howard Bassen, PhD of the Food and Drug Administration (FDA), there are 'increased reports that medical devices, such as pacemakers, apnea monitors, electrically powered wheelchairs, etc., have failed to operate correctly because of interference from various emitters of radiofrequency energy \* \* \* Reasons for this problem are twofold: 1) increasing numbers of electronically controlled medical devices with inadequate electronic protection against RFI, and 2) a significant increase in the number of RF sources in the environment.' <http://ewh.ieee.org/soc/embs/comar/interfer.htm>. This is another strong reason why WI-FI should not be introduced into the school environment. Central Maine Power is installing smart meters and admit the frequencies are interfering with electrical devices inside buildings. In recent public forums, I have been asked specifically about pacemakers and health monitoring equipment in extended care facilities with disabled patients. The frequencies will affect health and possibly interfere with health monitoring equipment which administers medications plus much more. <http://www.dslreports.com/shownews/Power-Utility->

m. Dr. Bassen also acknowledges the scale of this problem: ‘Hundreds of incidents of RFI induced medical device failure have been reported, studied, and summarized \* \* \* The consequences have ranged from inconvenience to serious injuries and death. However, many more incidents may occur that are not reported because most users of medical devices are unaware that RF fields are present when problems are recognized and because of the intermittent nature of the failures that could cause them to be unobserved.’ *Id.*

n. This problem is not new, but long-established, and interference can occur even from very distance infrastructure, and at exceedingly low radiation levels. As Dr. Bassen states: ‘In the mid-1980s, \* \* \* FDA had become aware that approximately 60 infants died in the United States while being monitored for breathing cessation by one model of apnea monitor. Subsequent tests have shown that this particular monitor is extremely susceptible to low level RF fields, including those from *mobile communication base stations several hundred meters away and FM radio broadcast stations more than one kilometer away.* [Emphasis added.] Other apnea monitors have been shown to be similarly susceptible to malfunction...Cellular phones have also been shown to cause unintended firings of implantable cardiac defibrillators. Governments and taxpayers are funding health costs, wireless technologies are contradicting those objectives. Sudden Infant Death Syndrome rates in British Columbia, Canada are up 30 percent over 2010. The B.C. Coroner's Office under the Solicitor General of BC is investigating. In our inquiry as to electromagnetic triggers from wireless technologies contributing to vulnerable babies stopping breathing, we are asked to submit electrical information to the Coroner's Office on the EMFs as well as the medical education program lecturing the dangers of Wi-Fi in medical education. I have provided additional information to the Coroner's Office on the BC Smart Meter program bringing emfs to people's homes.

o. Dr. Bassen also acknowledges FDA's awareness that pulse-modulated wave, such as wifi deploys, exacerbates interference: 'Modulation also affects the degree of interference for a given set of exposure conditions; amplitude modulation (including pulsed RF) is usually the most significant for RFI. *Id.*

p. We see biological effects in water lines conditioned with a weak electrical signal. Goldsworthy A (1999), Whitney H, Morris E, Biological Effects of Physically Conditioned Water (available upon request), Biology Department, Imperial College of Science Technology and Medicine, London, Wat. Res. Vol. 33, No. 7, pp. 1618-1626, 1999. It shows that ordinary town water supplies, when treated with pulsed radio frequencies (as used to remove lime scale from plumbing) becomes biologically active in yeast, probably by removing calcium from cell membranes. The results were broadly similar to those of direct exposure to electromagnetic fields and is what prompted Dr. Goldsworthy to conclude that calcium removal from cell membranes was a likely mechanism for the observed biological effects on animals. The chilling possibility to emerge from this was that the biological effects of electromagnetic fields could be transmitted in the bloodstream (like the water) and exposure in any part of the body could have an effect all over the body, not just the parts that are directly exposed; nowhere is safe.

10. I have personal knowledge of Portland Public Schools WI-FI installation, which operates at carrier signals of 2.45 and 5 GHz or 2.45 and 5 billion Hz (cycles per second). Conflicting electromagnetic frequencies (electromagnetic compatibility) between WI-FI and children (approximately 7.8 Hz & 25 to 100 mV) are producing severe electrical problems that would cause function failure in similarly tuned electro-mechanical devices in use for commercial industry or homes, computers. See for example, *Effects of 6-10 Hz ELF on Brain Waves*, Article by David S. Walonick, originally printed in *Borderlands* (Vol. XLVI, Nos. 3&4, May – August 1990), <http://journal.borderlands.com/1999/effects-of-6-10-hz-elf-on-brain-waves/>. This study found evidence that ELF magnetic waves can affect brain waves. The

specific ELF frequencies in studying were 6-10 Hertz, the same as those produced by the human brain in the theta and alpha states. It further stated that, generally, specific brain wave frequency ranges can be associated with mood or thought patterns. Frequencies below 8 Hertz are considered theta waves. While these seem to be some of the least understood frequencies, they also seem to be associated with creative, insightful thought. Alpha frequencies are from 8 to 12 Hertz and are commonly associated with relaxed, meditative states. Most people are in an alpha state during the short time immediately before they fall asleep. Alpha waves are strongest during that twilight state when we're half asleep and half awake. Beta frequencies (above 12 Hertz) coincide with our most 'awake' analytical thinking. *Id.*

11. Based upon a review of the Mount Tabor Middle School WI-FI Floor Plan (Complaint, Ex. A), a given child is subject to signals from multiple WI-FI transmitters and numerous laptops. Each child has different DNA, hydration, toxicity, nutrition, lifestyle, etc.; with the point being every one of them is a different electrical device in the WI-FI application. WI-FI is interacting with each child differently and as it goes through walls, it is going through the children, as well as teachers and staff.

12. RF/MW radiation will interact differently with all material depending on that material's emissivity. Emissivity is a material's ability to absorb or emit wavelengths of radiation. The more absorbent the material, the higher the emissivity. Reflective materials will reflect the EMF radiation and it may hit absorbent material with the reflected angle. The children, and other absorbent material will be interacting with the frequencies. The radiation ultimately is absorbed by children's body tissue, which is one of several substances that rather ideally, meaning maximally, absorbs such radiation. The only upside is that the absorbent materials including the children will heat the classrooms by some tiny increment. But this will not save Portland Public Schools on energy costs; since the WI-FI system itself requires and wastes enormous amounts of energy, as do all wireless infrastructures.

13. The digital wireless signals used in WI-FI are pulsed, ultra high (2.45 GHz) and super high (5 GHz) frequency signals, emitted in bursts, at regular intervals, in very rapid succession. Imposed on these pulsed ultra and super high frequency microwaves are extremely low frequency modulations of the RF carrier waves. Carrier waves transport data and are also referred to as Information Carrying Radio Waves. This man-made and very complex RF/MW electromagnetic radiation product cannot be compared to the naturally occurring and biologically compatible radiation of our environment, where electromagnetic frequencies are now billions of times higher than levels from which all life evolved. See, Adamantia Fragopoulou, Yuri Grigoriev, Olle Johansson, Lukas H Margaritis, Lloyd Morgan, Elihu Richter and Cindy Sage. Scientific Panel on Electromagnetic Field Health Risks: Consensus Points, Recommendations, and Rationales. REVIEWS ON ENVIRONMENTAL HEALTH VOLUME 25, No. 4, 2010. see <http://www.iemfa.org/index.php/all>.

14. WI-FI is not even installed for the superficial cost convenience because a safe operational cabled system is already installed into, upon information and belief, each room. Even if the additional initial installation costs of setting up additional wireless routers/switches in each room may at first appear more 'cost effective,' this does not take into account their long-term, overall costs. Moreover, it would have saved money to keep the system that's already in place, and not to override it with a redundant and energy-wasteful one - or two in this instance, since they have 5 GHz deployment that is not even being used, too! Also, the staff and equipment required to manage wireless capacity and to monitor usage, puts the overall costs much higher. So-called 'smart' wireless devices associated with wireless networks can cause unexpected congestion, adding to the costs. Additionally, wired computer stations deliver data faster, safer, and more sustainably, while providing real economy and advancing technology in education. Educational technology advancements are important and can be achieved safer and faster, and without taking from children their privacy rights, as WI-FI does by way of its cyber-insecurity. Wiring is the only option, and represents real, sustainable economic growth.

15. Within the relevant scientific community it is generally accepted many bioeffects and adverse health effects occur as a result of low-level RF/MW radiation exposure, with unrealized domino-effect costs of many kinds, some of which all people will suffer, sooner or later. Specialists also consider the secondary effects to human society of losses of wildlife, essential insects, plants and other environmental damages from ubiquitous and unnatural PM RF/MW radiation.

16. In my opinion as a professional with Canadian national and pro AHM, other students, and school staff and faculty adverse health effects and should be discontinued immediately as this as a national and global emergency.

Dated this 19<sup>th</sup> day of December, 2011.

**David Mark Morrison**, individually,

v.

**Portland Public Schools,**

Defendant.

Civil Action No. 3:11-cv-00739-MO

**Declaration of  
Dr. Magda Havas, B.Sc., Ph.D.**

I, Dr. Magda Havas, B.Sc., Ph.D., under penalty of perjury pursuant to 28 U.S.C. § 1746, hereby make the following declaration in support of an injunction enjoining Portland Public Schools' use of WI-FI:

1. I am a scientist researching the adverse health outcomes of electromagnetic radiation exposure, including from sources such as WI-FI networks and cell towers. Ironically, Portland Public Schools has decided against lucrative cell tower contracts based on health, yet uses inside schools WI-FI networks and laptops that can emit higher levels of electromagnetic radiation at user distances than do cell towers outside schools.

2. My Curriculum Vitae may be found below.

### **Guidelines**

3. The Federal Communication Commission (FCC) and the school WI-FI provider infer, respectively by their guidelines and assertions of product testing, that school WI-FI deployment is not harmful, provided that exposures to radio frequency (RF) radiation from the WI-FI remain below FCC guidelines. This is false.

4. FCC guidelines were established in 1991 by the ASTM-IEEE Committee chaired by microwave oven co-developer John Osepchuk, who is now retired from Raytheon. These guidelines apply only to an average exposure measured for a maximum of 30-minutes, and neither assure or infer safety for greater than 30-minute exposure durations. FCC guidelines apply only to 'thermal' exposure levels, and do not protect or claim to protect against biologic effects at subthermal or microthermal exposure levels.

5. The specific carrier frequency deployed by the Portland Public Schools for WI-FI is the same as that used by the microwave oven: 2.45 GHz. This frequency, which has a wavelength of approximately 12.24 cm or 4.8 inches, not only maximizes absorption-per-exposure in living tissues approximating dimensions of the human head and brain, but also has a specific harmonic resonance with the water molecule, for the intended purpose of agitating at the molecular level. Water molecule agitation occurs in all biological tissues that contain water exposed to 2.45 GHz, including to those exposed to WI-FI radiation, not only to those placed in

an oven and exposed to the higher exposure levels an oven produces.

6. Duration is a very potent contributing factor toward adverse health effects. Chronic exposure, a maximum (24/7) or near-maximum duration of constancy over hours per day, will increase adverse effects.

7. FCC guidelines are not safety standards, but rather mere guidelines. I am informed that FCC has neither authority over nor expertise in health matters.

8. There is a voluminous and ever growing number of primary, peer-reviewed scientific publications relevant to school WI-FI deployment, publications which conclude adverse health and biological effects below 'short-term, thermal-based' guidelines (see [www.bioinitiative.org](http://www.bioinitiative.org)). These studies are consistent in demonstrating harmful outcomes. A large and growing number of scientific, public health and medical organizations, and individuals therefrom, have publicly pronounced the need for stricter policy, including even to ban certain hazardous activities that deploy pulse-modulated microwave radiation. For these reasons it is unthinkable to introduce WI-FI microwave radiation into a school environment where young children and school employees must spend hours each day.

9. Public exposure standards and guidelines for microwave (MW) radiation, which radiation WI-FI deploys, differ by five orders of magnitude (10,000 times) around the world. The strictest standards are in Salzburg, Austria, and Liechtenstein, where the public exposure limit is  $0.1 \mu\text{W}/\text{cm}^2$  (microwatt per square centimeter). See short video (<http://videos.next-up.org/SfTv/Liechtenstein/AdoptsTheStandardOf06VmBioInitiative/09112008.html>). In Switzerland the limit is  $1.0 \mu\text{W}/\text{cm}^2$ . However, in both Canada and the United States the guideline, not even a 'standard' or 'limit,' for WI-FI frequencies is  $1,000 \mu\text{W}/\text{cm}^2$ ! FCC guidelines allow considerable radiation at the more hazardous microwave frequencies.

**Guidelines for various countries**

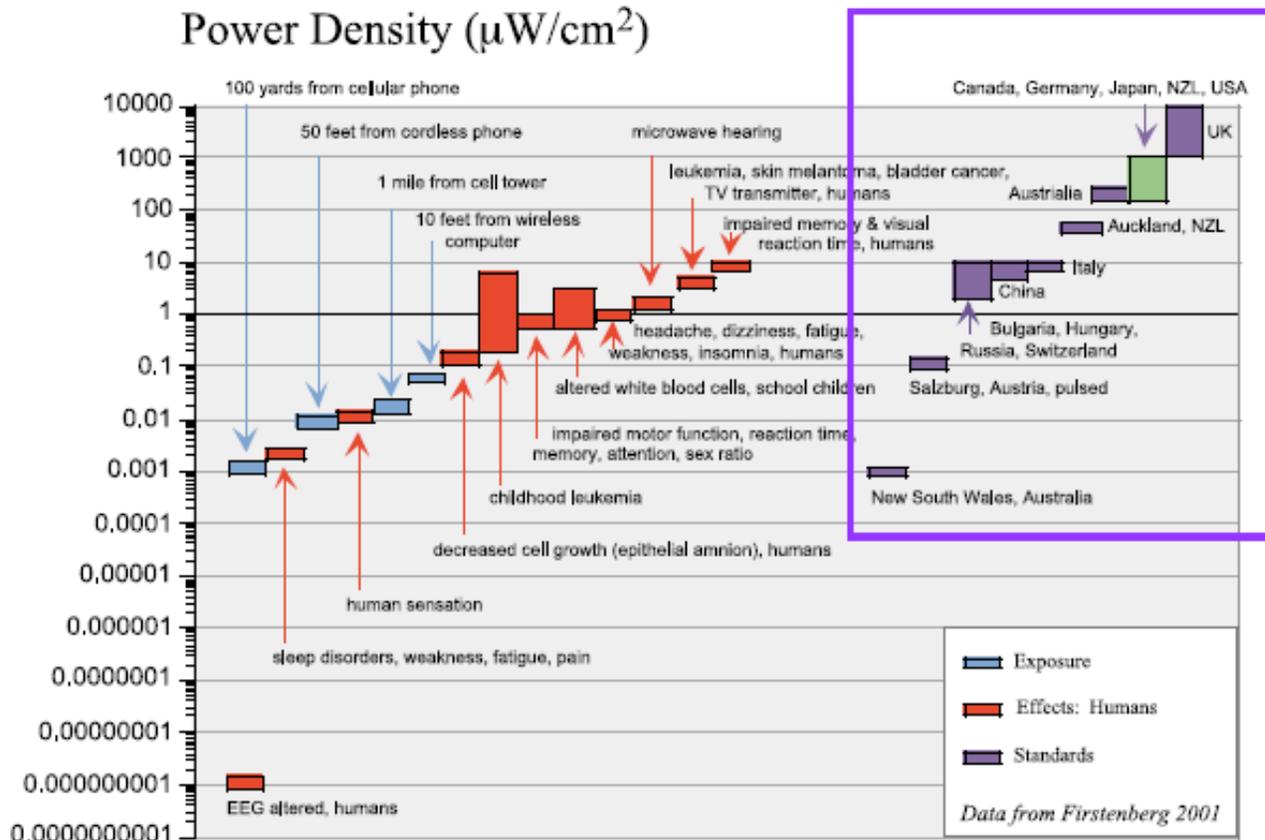

Figure 1. Guidelines, exposures and effects of radio frequency radiation at various power densities. Data from Firstenberg, A 2001 Radio Wave Packet, Cellular Phone Taskforce.

10. The Public Health Department Salzburg recommends for **all kindergartens and schools** in the region of Salzburg not to use WI-FI or DECT cordless phones, based on health grounds.

11. The FCC guideline is similar to the International Commission on Non-ionizing Radiation Protection (INCIRP) guideline, which is based on 30-minute exposure of public and 6-minute exposure of those occupationally exposed. Both are purported to protect against **heat occurrence in a 6-foot, 200-pound adult male**. The guideline for RF radiation is frequency-specific and ranges from 200 to 1,000  $\mu\text{W}/\text{cm}^2$  for the frequencies 0.3 MHz to 100 GHz, with the higher exposure ( $1000 \mu\text{W}/\text{cm}^2$ ) for frequencies between 1.5 and 100 GHz

(i.e. WI-FI range). The latter includes Portland school WI-FI frequencies. This guideline is based on the false assumptions that below these frequency-specific power densities there exists no heating of human tissues; and that if RF (including MW) radiation does not heat tissue, there is no harm.

12. Established adverse biological outcomes of RF and MW radiation exposure (power density) levels below the FCC guidelines include, without limitation, the increased permeability of the blood brain barrier, nerve damage, alterations in calcium efflux kinetics, increased DNA breakage, induced stress proteins, decreased immune-protection markers, and—at the whole-body level—cognitive and sleep impairments, headaches, dizziness, weakness, tinnitus, cardiac irregularities, hormonal and reproductive aberrations, skin dermatitis, reproductive problems, cancer and more.

13. According to Norbert Hankin, Chief EMF Scientist, US Environmental Protection Agency:

The U.S. Federal Communications Commission, (FCC's) exposure guidelines are considered protective of effects arising from a thermal mechanism but not from all possible mechanisms. Therefore, the generalization by many that the guidelines protect human beings from harm by any or all mechanisms is not justified. <http://www.protectschool.org/epa%20letter.pdf>.

14. ANSI/IEEE and ICNIRP may infer RF/MW radiation exposure can be 'safe' in the context of an exposure level too weak to produce a rise in body temperature, i.e., too weak to produce a 'thermal' effect, which is defined as 'Biological effects that result from heating of tissue by RF/MW energy.' See, *Questions and Answers about Biological Effects and Potential Hazards of Radiofrequency Electromagnet Fields*, FCC OET Bulletin 56, 4<sup>th</sup> Ed (1999) [http://transition.fcc.gov/Bureaus/Engineering\\_Technology/Documents/bulletins/oet56/oet56e4.pdf](http://transition.fcc.gov/Bureaus/Engineering_Technology/Documents/bulletins/oet56/oet56e4.pdf). The claim is misleading and false. First, all RF/MW radiation deposits heat, and there is always at least microthermal temperature increase in exposed persons. Further, it is untrue that exposure levels less than 1,000  $\mu\text{W}/\text{cm}^2$  for radiation between 1.5 and 100 GHz cannot produce a thermal

increase; since body tissues vary in their water content, producing internal hot spots, and since wavelength also significantly influences absorption.

15. Moreover, there is no question that non-thermal or microthermal adverse biologic events do occur. These adverse outcomes of RF (including MW) exposure may be amplified per other contributing factors including duration of exposure, frequency/wavelength, complexity of the radiation microenvironment, and the recipient's vulnerability and susceptibility.

### **Guidelines Extrapolated**

16. As stated above, the current FCC guideline is based on flawed assumptions concerning a heating effect mechanism, set at 6 minutes for those occupationally exposed and 30 minutes for public exposure. A guideline based on a 30-minute (or 6-minute) exposure does not apply in the case of exposure likely to be 24/7 for decades. However, were this guideline extrapolated for long-term exposure, the exposure limit would decrease, approaching and exceeding guidelines and standards established by other countries (Table 1):

Table 1. FCC Guideline for public exposure to radio frequency radiation extrapolated for longer exposure and compared to Russia and Salzburg.

<b>Exposure Time</b>	<b>Time (hr)</b>	<b>Guideline (microW/cm<sup>2</sup>)</b>	<b>Comments</b>
30 minutes	0.5	<b>1000</b>	FCC Guideline, public exposure
60 minutes [casual computer use]	1	<b>500</b> =1000/2	extrapolation of FCC guideline for 1 hour exposure daily
daily computer use [6 hrs/day]	6	<b>83</b> =500/6	extrapolated FCC <i>daily</i> exposure limit
weekly computer use [6 hr/day x 5 d /wk]	30	<b>16.7</b> =500/30	extrapolated FCC <i>weekly</i> exposure limit
		<b>10</b>	<b>Russian Guideline</b>
monthly computer use [as above for 4 weeks]	120	<b>4.17</b> =500/120	extrapolated FCC <i>monthly</i> exposure limit
annual computer use [as above for 40 weeks]	1200	<b>0.42</b> =500/1200	extrapolated FCC <i>annual</i> exposure limit
		<b>0.1</b>	<b>Salzburg Guideline outdoor environments</b>
10-year computer use [as above for 10 years]	12,000	<b>0.04</b>	extrapolated FCC <i>10-year</i> exposure limit
		<b>0.01</b>	<b>Salzburg Guideline indoor environments</b>

17. For better protection of young, healthy *adults* who use a wireless computer daily for one year, their exposure should not exceed **0.42**  $\mu\text{W}/\text{cm}^2$  (a value similar to Salzburg). In fact, in 1999, the European Parliament had proposed a limit of **0.3**  $\mu\text{W}/\text{cm}^2$  for all of Europe. For better protection over **13 years'** wireless computer use, young, healthy adults' exposure should not exceed **0.03**  $\mu\text{W}/\text{cm}^2$ . (Thirteen years is the number of years that students in the public schools, K-12, will have to be exposed to WI-FI, if it is not banned.) These extrapolated exposure limits do not take into account other exposures from RF/MW sources such as infrastructural antennas, cell and cordless phones, Wii, 'smart' boards, smart meters and grids, microwave ovens, and the many other manmade, environmental exposures. Nor do they protect vulnerable persons, for whom one would have to extrapolate further, making WI-FI unfeasible.

18. FCC will tell you their guideline is not intended for long-term extrapolation in this manner. However, since FCC, EPA and FDA all lack a long-term guideline and have no Standard whatsoever; and given that the extrapolated values fit the scientific data for long-term health effects, the potential exposure limits of 0.42  $\mu\text{W}/\text{cm}^2$ , 0.03  $\mu\text{W}/\text{cm}^2$  and less for vulnerable persons respectively recommended above can help Portland officials to determine more appropriate exposure limits for schools until realistic guidelines and standards are established at the federal level for non-thermal or microthermal effects, for chronic and long-term durations of exposure, and for vulnerable subgroups and specific occupational and environmental conditions. Until such time as real standards exist, no further wireless systems or infrastructures should be imposed upon society for involuntary exposure.

19. Firstenberg (Firstenberg, A, 2001, Radio Wave Packet, President, Cellular Phone Taskforce, [http://www.goodhealthinfo.net/radiation/radio\\_wave\\_packet.pdf](http://www.goodhealthinfo.net/radiation/radio_wave_packet.pdf).) also compiled a list of studies (many more recent studies exist) showing adverse biological outcomes at RF/MW radiation exposure levels below FCC guidelines (Table 2):

Power Density ( $\mu\text{W}/\text{cm}^2$ )	Reported Biological Effects	References
0.000000000001	Altered genetic structure in E. Coli	Belyaev 1996
0.0000000001	Threshold of human sensitivity	Kositsky 2001
0.000000001	Altered EEG in human subjects	Bise 1978
0.0000000027	Growth stimulation in <i>Vicia fabus</i>	Brauer 1950
0.00000001	Effects on immune system in mice	Bundyuk 1994
0.00000002	Stimulation of ovulation in chickens	Kondra 1970
0.000005	Effect on cell growth in yeast	Grundler 1992
<b>0.00001</b>	<b>1/100 million<sup>th</sup> of FCC guidelines</b>	
0.00001	Conditioned "avoidance" reflex in rats	Kositsky 2001
0.000027	Premature aging of pine needles	Selga 1996
0.002	Sleep disorders, abnormal blood pressure, nervousness, weakness, fatigue, limb pain, joint pain, digestive problems, fewer schoolchildren promoted	Altpeter 1995, 1997
0.0027	Growth inhibition in <i>Vicia fabus</i>	Brauer 1950
0.0027 to 0.065	Smaller tree growth rings	Balodis 1996
<b>0.01</b>	<b>1/1000<sup>th</sup> of FCC guidelines</b>	
0.01	Human sensation	Kolbun 1987
0.06	Altered EEG, disturbed carbohydrate metabolism, enlarged adrenals, altered adrenal hormone levels, structural changes in liver, spleen, testes, and brain—in white rats and rabbits	Dumanskij 1974
0.06	Slowing of the heart, change in EEG in rabbits	Serkyuk, Reported in McRee 1980
0.1	Increase in melatonin in cows	Stark 1997
0.1 to 1.8	Decreased life span, impaired reproduction, structural and developmental abnormalities in duckweed plants	Magone 1996
0.13	Decreased cell growth (human epithelial amnion cells)	Kwee 1997
0.168	Irreversible sterility in mice	Magras 1997
0.2 to 8.0	Childhood leukemia near transmitters	Hocking 1996
0.3	Impaired motor function, reaction time, memory and attention of schoolchildren, and altered sex ratio of children (fewer boys)	Kolodynski 1996
0.6	Change in calcium ion efflux from brain tissue	Dutta 1986
0.6	Cardiac arrhythmias and sometimes cardiac arrest (frogs)	Frey 1968
4	Altered white blood cell activity in schoolchildren	Chiang 1989
1	Headache, dizziness, irritability, fatigue, weakness, insomnia, chest pain, difficulty breathing, indigestion (humans—occupational exposure)	Simonenko 1998
1	Stimulation of white cells in guinea pigs	Shandala 1978
<b>1</b>	<b>Within 16 feet (5 meters) of a Wi-Fi node in San Francisco</b>	<b>Maifeld 2007</b>
2	"Microwave hearing"—clicking, buzzing, chirping, hissing, or high-pitched tones	Frey 1963, 1969, 1971, 1973, 1988, Justeson 1979, Olsen 1980, Wieske 1963, Lin 1978
2.5	Breakdown of blood-brain barrier (used a digital cellular phone to provide the radiation)	Salford 1997
5	Leukemia, skin melanoma and bladder cancer near TV and FM transmitter	Dolk 1997
5	Biochemical and histological changes in liver, heart, kidney, and brain tissue	Belokrinitskiy 1982
<b>10</b>	<b>1% of FCC guideline</b>	
10	Damaged mitochondria, nucleus of cells in hippocampus of brain	Belokrinitskiy 1982a
10	Impaired memory and visual reaction time in people living near transmitters	Chiang 1989
10	Decreased size of litter, increased number of stillborns in mice	Il'Chevich (reported in McRee 1980)
10	Redistribution of metals in the lungs, brain, heart, liver, kidney, muscles, spleen, bones, skin, blood	Shutenko 1981
<b>1000</b>	<b>FCC Guideline, 6-minute occupational exposure and 30 minute public exposure based on heating</b>	

Table 2. Reported biological effects associated with radio frequency radiation. Data from Firstenberg. Shaded sections were not part of the original report.

20. Assuming, arguendo, that guidelines were protective of children, since the measurement of Portland Public School's laptops revealed in excess of **2.0  $\mu\text{W}/\text{cm}^2$** , a child could only be exposed for **41.7 hours**, or less than **42 school days** [=500/2.0/6 hours] according to Table 1. Similarly, the school's WI-FI routers measured as high as **1.65  $\mu\text{W}/\text{cm}^2$** , allowing for exposure of **50.5 school days** before exceeding guidelines [=500/1.65/6 hours]. However, there is no safe amount of radiation for children. Many peer-reviewed studies conclude harm at levels and durations below these levels, and to humans less vulnerable than schoolchildren, and under less coercive circumstances than school WI-FI. Per the many variables contributing to biologic effects, as stated earlier, there is no safe amount of radiation for children. The late physics Professor Neil Cherry PhD of Lincoln University, New Zealand, stated it best:

Electromagnetic fields and radiation damage DNA and enhance cell death rates and therefore they are a Ubiquitous Universal Genotoxic Carcinogen that enhances the rates of Cancer, Cardiac, Reproductive and Neurological disease and mortality in human populations. ***Therefore there is no safe threshold level. The only safe exposure level is zero, a position confirmed by dose-response trends in epidemiological studies.*** <http://www.neilcherry.com/>.

21. The Environmental Protection Agency has recommended that electromagnetic radiation (which includes WI-FI radiation) be classified as a 'probably human carcinogen.' United States Environmental Protection Agency, Evaluation of the Potential Carcinogenicity of Electromagnetic Fields, External Review Draft, No. EPA1600/6-901005B, October 1990. The following is a statement from Norbert Hankin PhD, EPA Environmental Scientist, December 19, 2000:

This \* \* \* should not be overlooked \* \* \* the potential for an impact by wireless communications technology on a child's educational process, i.e., by possibly affecting learning ability. [It] stems from recent studies involving short-term exposures that demonstrated subtle effects on brain functions, produced by low-intensity, pulse-modulated radiofrequency radiation \* \* \* [E]ven a slight degree of impairment of learning ability over years of exposure \* \* \* may negatively affect the quality of life that could be achieved by these individuals when adults.

22. If WI-FI is not turned off in the Portland schools children will be exposed over a thirteen-year period to 15,600 hours of so-called 'low-level' microwave radiation. The term 'low-level' is not accurate since the radiation received from WI-FI is billions to trillions of times higher than natural background levels at the same frequencies. Even the industry-funded INTERPHONE study showed that exposure of *adults* to cell phone radiation, for more than 1,640 hours over a ten-year period (which is 30 min per day of intermittent exposure for cell phone use v. 6 hours per day of constant exposure in a school with WI-FI) resulted in a 40 to 80 percent increased risk of brain tumors [<http://www.ncbi.nlm.nih.gov/pubmed/17636416>]. Cell phone MW radiation is very similar in frequency and nature to WI-FI MW radiation, though by frequency and duration not quite as harmful as that of WI-FI. Any effects that occur to adults are more likely to occur, and to occur more severely, in children from WI-FI. A constant, chronic exposure, such as WI-FI deploys, is likely to be more damaging than the intermittent duration of cell phone usage.

### **Studies**

23. Through my studies, I have personally seen and/or become aware of thousands of military (and therefore previously classified) documents as well as hundreds of Eastern European and Russian studies showing adverse health outcomes of radio frequency and microwave exposure. The results from these early studies are confirmed by more recent studies. Some of the studies that I may offer as evidence include the following. They are classified according to effects: neurological/sleep/learning/behavior/electrohypersensitivity; stress/hormones/blood-brain-barrier/immune system/enzymes; cardiac; reproduction; cancer/DNA damage/anti-oxidants/death and are ordered according to whether they are human studies; animal (*in vivo*) studies; or *in vitro* studies. Within each category the studies are in alphabetic order according to author. Attached as Addendum 'A,' are some of the studies on which I have based my

conclusions and opinions.

### **Electro-hyper-sensitivity**

24. A condition identified by Russian researchers many decades ago, Microwave Sickness, is generally referred to in the West as Electro-Hyper-Sensitivity (EHS). These names are sometimes used loosely as a catch-all for a variety of adverse health outcomes of RF/MW radiation, other than cancer and genotoxicity. But they should not be confused. In EHS, either a single, acute or a long-term, low-level exposure to electromagnetism, including RF/MW radiation, induces limbic sensitization, producing abnormal brainwave spikes, such that successive exposures amplify the person's responses to electromagnetism over time. By this mechanism, a person has difficulty functioning in a society with inescapable RF/MW radiation (and ELF or extremely low frequency fields). Again, this is to be distinguished from other temporary effects of RF/MW radiation in non-sensitized persons, and by way of other mechanisms. After EHS has been induced, symptoms are retriggered by ever lower levels of RF/MW radiation (and/or ELF fields). The phenomenon thus represents *injury* into an ongoing condition, and is not merely a set of isolated symptoms.

25. Because EHS is induced by exposure, there is a growing population worldwide that is adversely affected by lower-intensity electromagnetic frequencies. The World Health Organization (WHO) defines EHS as:

\* \* \* [a] phenomenon where individuals experience adverse health effects while using or being in the vicinity of devices emanating electric, magnetic, or electromagnetic fields (EMFs) \* \* \* EHS is real and sometimes a debilitating problem for the affected persons, while the level of EMF in their neighborhood is no greater than is encountered in normal living environments. Their exposures are generally several orders of magnitude under the limits in internationally accepted standards.

26. Symptoms of EHS include cognitive dysfunction (in memory, concentration, problem-solving); balance, dizziness and vertigo; facial flushing, skin rash; chest pressure, rapid heart rate; depression, anxiety, irritability, fatigue, poor sleep; body aches, headaches; ringing in the ear (tinnitus) and more. It is estimated that three percent of the adult population is severely affected and another 35 percent has moderate symptoms. Since prolonged exposure to RF/MW and ELF can result in sensitization and EHS, it is imperative that children's exposure to RF/MW radiation, such as from WI-FI, be minimized, particularly at school, given the many hours per year that attendance is required.

27. Mount Tabor Middle School, with a population of approximately 600 children, may already have 18 (3 percent of the school population) or more who are severely affected by RF/MW radiation and up to 210 children (35 percent) who have moderate symptoms. This does not include those children who are not specifically sensitized into EHS, but do have symptoms. These consider that the percentages of children with EHS would be the same as those in adult populations. Since the percentages might actually tend to be higher in children, these numbers are conservative. The Portland schools should look to identify those children, whether with EHS or not, who suffer symptoms in response to WI-FI. In so doing, administrators and teachers may, in then accommodating these students, find improved school work, cognitive and social functioning.

### **Children**

28. Children are more sensitive to environmental contaminants, and these include RF/MW radiation. The Stewart Report (2000) recommended that children not use cell phones except for emergencies. The cell phone exposes the head to pulse-modulated (PM) MW radiation. A wireless computer (WI-FI) exposes the entire upper body to PM MW radiation; and if one has the computer on one's lap, it exposes reproductive organs as well. Certainly this is not

desirable, especially for younger children and teenagers. For this reason adults need to discourage the use of wireless technology by children. That does not mean that students cannot go on the Internet. It simply means that access to the Internet needs to be through wires rather than through the air.

29. Children generally are very susceptible to MW radiation; as they do not have developed nervous or immune systems. As well, their skulls are thin and their bones (which are producing stem cells that make their immune systems and all other parts of their bodies) are soft, allowing microwaves to penetrate easily (Cherry 1999, <http://www.emfguru.org/EMF/genotoxic/Genotoxic-EMR-paper.htm>, scroll down to figure 45).

30. Some parents in Collingwood (Ontario, Canada), observed their children being exposed to WI-FI and returning from school with headaches, nausea, dizziness, difficulty concentrating, weakness, pressure in the head, and a racing or fluttering heart). These symptoms occur only in classrooms with WI-FI. They do not occur in portables that do not have WI-FI, and they do not occur in homes that do not have wireless technology.

31. The heart palpitations are perhaps the most serious: several students have experienced sudden cardiac arrest. The incidence of this in the Collingwood region seems abnormally high for a small community in Canada; and such symptoms should be extremely rare in children. One student was encouraged to have exploratory heart surgery. However, her parents provided her a MW-free environment at the end of the school year and her symptoms disappeared. No surgery was required.

32. Students and teachers at a private school in Collingwood were encouraged to do research on the best Internet technology for the school. They decided wired Internet access was superior to wireless for many reasons. They now use power line adaptors instead of WI-FI and are satisfied with the results.

## Direct Effect

33. I conducted a study that showed immediate and dramatic changes in both heart rate and heart rate variability associated with microwave exposure to a frequency of 2.4 GHz at levels well below (0.5 percent) federal guidelines ( $1000 \mu\text{W}/\text{cm}^2$ ). Havas *et al.*, *Provocation Study using Heart Rate Variability shows Radiation from 2.4 GHz Cordless Phone affects Autonomic Nervous System*, Eur J Oncol Library, Vol 5 at 28, <http://www.magdahavas.com/wordpress/wp-content/uploads/2010/10/Havas-HRV-Ramazzini1.pdf>; see also, video demonstrating the direct effects of cordless phones on heart rates, [http://www.youtube.com/watch?v=\\_EI9fZX4iww](http://www.youtube.com/watch?v=_EI9fZX4iww).

34.

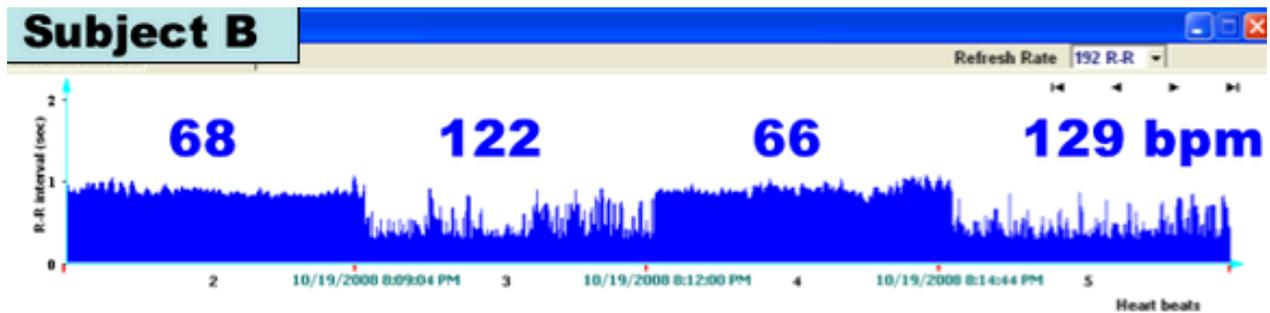

Figure 2. The sympathetic nervous system up regulated and the parasympathetic nervous system down regulated during exposure, which is the typical ‘flight-or-fight’ stress response. Feelings of anxiety as well as pain or pressure in the chest were associated with the rapid or irregular heart beat among some of the participants tested. <http://www.magdahavas.com/2010/10/21/new-study-radiation-from-cordless-phone-base-station-affects-the-heart/>.

35. The study documents that some individuals are hypersensitive to specific frequencies, and supports reports people make when they are exposed to RF/MW radiation. The reactions include heart irregularities, a rapid heart rate, up-regulation of the sympathetic nervous system, and down-regulation of the parasympathetic nervous system. These are biological effects and do not involve heating. One potential outcome is that the body goes into a fight-or-flight response when exposed to very low levels of MW radiation at the same frequency used for

WI-FI. Since children are generally more susceptible to environmental hazards than are adults, I would expect that children's hearts are generally more affected as well. *This video shows a WI-FI router directly affecting an adult heart rate: [www.youtube.com/watch?v=KN7VetsCR2I](http://www.youtube.com/watch?v=KN7VetsCR2I) !*

36. Heart irregularities, including out-of-hospital sudden cardiac arrest, are becoming increasingly common. At least some of these phenomena may be related to increasing exposure to RF/MW radiation from wireless devices and infrastructures, as documented for the first time in this study. A child must not be exposed to a technology that causes tachycardia or arrhythmia. Under certain circumstances with undiagnosed heart problems and with a demand on the heart (during exercise for example) the outcome can be deadly.

37. In addition to heart abnormalities, there is evidence of damage to sperm for males who use a laptop computer in WI-FI mode. WI-FI laptops can affect sperm motility and damage DNA. By allowing MW radiation through WI-FI in schools, adults may be adversely affecting children's ability to reproduce, as well as and the very genetics of future generations.

### **Removal of WI-FI**

38. Most people do not want to live near either cell phone towers or WI-FI antennas because of their MW radiation. Yet when WI-FI (wireless routers) are used inside buildings, many antennas are placed inside as well as outside the building. This is much worse with respect to exposure levels, duration and coercive occupational conditions, since building occupants are closer to the sources of emission and cannot remove themselves from the radiation.

39. Libraries in France are removing WI-FI because of the refusal of MW radiation by the scientific community, library employees and patrons.

40. The Vancouver School Board passed a resolution in January 2005 that prohibits construction of cellular antennas within 1,000 feet from school property.

41. Palm Beach, Florida, Los Angeles, California, and New Zealand have all prohibited cell base stations and antennas near schools by reason of safety, based on the fact that children are more susceptible to pulse-modulated MW radiation. Clearly if antennas do not

belong near schools, they certainly do not belong *inside* schools! The only route to safety is to have wired rather than wireless Internet.

42. The Superintendent of Education, Area 3 (Mr. John Dance) hired a consultant to measure MW exposure in two schools: Mountainview Elementary School (where the children were complaining of ill health) and Collingwood Collegiate Institute (see Muc Report at <http://www.magdahavas.com/wordpress/wp-content/uploads/2011/06/SCDSB-Feb-9-2011-B-F-Use-of-WI-FI.pdf> ). In the Mountainview School, levels above FCC guidelines were measured ( $1,342 \mu\text{W}/\text{cm}^2$  or  $1.342 \text{mW}/\text{cm}^2$ , NOTE: These are the same values expressed by different units); and this intensity of radiation was downplayed because it was close to the computer. Yet this is precisely where children sit and work for many hours per day: close to computers! Fifty percent of the locations measured in these two schools exceeded the radiation levels that affected adult hearts in our cardiac study. Testing at Collingwood Collegiate was after school hours; hence these measurements likely underestimate real-life exposure levels. The school with levels above federal guidelines is the same school where children were complaining of ill health!

### **Advisories**

43. Advisories to limit cell phone use have been issued by various countries and organizations including the United Kingdom (2000), Germany (2007), France, Russia, India, Belgium (2008) as well as the Toronto Board of Health and the Pittsburgh Cancer Institute (July 2008). While these advisories relate to cell phone use, they apply to WI-FI exposure as well since both use pulse-modulated microwave radiation. Boston public health physicians and scientists (1997) called for a ‘halt’ to pulse-modulated microwave radiation-based cell phone infrastructure based on the ‘biological plausibility of harm.’ WI-FI infrastructure and WI-FI-connected computers expose large parts of the body to this radiation especially when uploading or downloading information. Attached as Addendum ‘B,’ is the Boston Petition.

44. Attached, as Addendum ‘C,’ is a summary of 18 appeals or resolutions released by expert scientific groups around the world since the 1997 Boston Petition, regarding the biological and health effects of both low frequency electromagnetic fields (EMF) associated with electricity and RF electromagnetic radiation (EMR) generated by wireless devices. Anyone who reads these cannot be left with the illusion (or delusion) that this form of energy is without adverse biological and health consequences at levels well below existing guidelines. Children are particularly vulnerable. It is irresponsible of governments to maintain the status quo in light of thousands of studies that have been published and statements by these experts.

### **Conclusion**

45. It is important that children be exposed to the important education, life experiences, and social structures that public education offers, but they must not be risking their health to do so! Children must not be exposed to a constant background of pulsed microwave radiation from WI-Fi (or other sources) while at school. Most parents don’t have the option of home-schooling or finding a school free of WI-FI. Most teachers are discouraged to speak out against school board decisions, and most municipalities are unaware of the growing literature about the harmful effects of this technology. This needs to change. Municipalities must keep their public schools free of WI-FI.

46. Access to the Internet is possible through wires or through the air (wireless). The wireless option (WI-FI) exposes people in that environment to microwave radiation, which is a possible human carcinogen. Wired Internet is available at low cost. At least 3 options currently exist: Ethernet cable, which is present in many schools; fibre optics that offer fast reliable service but may be inappropriate in some districts; and the power line adaptor that is perhaps the most cost-effective option. This last option is faster, more secure, more energy efficient, less expensive than WI-FI and does not exposure people to microwave radiation. Under the

Americans with Disabilities Act, an accommodation is 'reasonable' based on minimal cost. And this 'accommodation' serves not one but all building occupants, so is highly valuable. Innocent children, who are wards of their parents and of the schools, deserve every legal protection from adults who make unwise decisions. Adult decision-makers are both morally responsible for their actions and should also be held legally liable where harm occurs and since wired alternatives to WI-FI are available.

47. Portland Public Schools use of WI-FI will expose young children (and their teachers) to microwave radiation for 6 hours each school day, 5 days a week, for 40 weeks each year. This exposure will be 1200 hours each year, year after year. Never in history have children been exposed to this much microwave radiation. Indeed, if I wanted to conduct such human experiments at Trent University using these levels and durations of exposure to microwave radiation, they would be deemed unethical and I would be denied permission to proceed!

48. In my own work, I use wired Internet access at home and, whenever possible, I use wired Internet access at Trent University, although wireless is available. So we are not limiting access to the Internet if we use wired connections; with wired connections, we are simply flowing the radiation through wires rather than through the air and through the bodies that are in the area.

49. The two most important environments in a child's life are the home (especially the bedroom) and the school. For this reason it is imperative that these environments remain as electromagnetically clean as possible, and therefore as free as possible from MW radiation.

50. It is hard to imagine that Portland parents are required to give permission with signed consent forms for student bus trips and photographs but are not consulted and asked for permission to expose their children to pulse-modulated MW radiation.

51. Based on the evidence that leading scientists have assembled in the past decade, if Portland Public Schools continues to use wireless internet (WI-FI), some students and teachers in its schools (an estimated 3% to 35% of the adult population and possibly a higher percentage of students) will become ill. Heart problems may be aggravated, other internal and external body injuries may be caused, and various pre-existing medical conditions may be worsened. Children and adults with undiagnosed, undetected heart problems may die. All students, teachers and administrators will be affected to some degree, even if their symptoms are not consciously attributed to the exposure or positively diagnosed. Portland Public Schools must be willing to make a decision that protects and does not harm the health and lives of those for whom it is responsible. It should not leave the Board open to legal action from families of children with heart and other MW radiation-related problems. There may be class-action lawsuits; the Board's decisions may jeopardize the long-term financial sustainability of the school board.

52. Submitted herewith as Addendum 'D' is a KeyNote presentation that I will use during my testimony.

53. I will receive \$250 per hour for my time (plus expenses) from this date forward and that money will be used to support research in this area.

54. I reserve the right to amend to add new relevant studies as they may arise and pending analysis, additional testing, and recently received voluminous discovery.

55. The Internet is an important learning device that should not be taken away. I simply urge that its access be made available through wires rather than WI-FI. Surely when it comes to threats of serious or irreversible damage to the health of students and teachers, not to mention privacy matters where students deserve in their formative years freedom from surveillance and hackers, using wired systems is of minimal cost and not too much to ask. There is no place for wireless Internet in schools—especially since wired Internet access is safer, faster, and more secure than wireless.

Dated this 21st day of December, 201

A handwritten signature in black ink, appearing to read 'M. Havas', with a long horizontal stroke extending to the right.

NSERC University Research Fellowship, 1983-1988

NSERC NATO Postdoctoral Fellowship, 1981-1983

Ann Wintercorbyn Prize, 1981, Department of Botany, University of Toronto

NRC Graduate Scholarship, 1975-1977, 1978-1979

Gulf Oil Scholarship, 1975

Bell Canada Scholarship, 1975

#### *Nominations for . . .*

Symons Award for Excellent in Teaching: 2002, 2003, 2004, 2005, 2010

Award for Educational Leadership and Innovation: 2010-11

### *Non-Academic*

Certificate of Appreciation, Department of Veterans Affairs, USA in collaboration with Michael E. DeBakey VA Medical Center, Texas, March 31, 2008.

Certificate of Appreciation, Uxbridge Community Care, May, 1989.

## **2 ACADEMIC HISTORY**

### **Employment and Positions**

2002-present	Member, Centre for Health Studies [originally Institute for Health Studies], Trent University, Peterborough, Ontario.
1995-7 & 1992-4	Board of Governors, Trent University, Peterborough, Ontario.
July 1993-1994	Senate, Trent University, Peterborough, Ontario.
Nov 1990-pres	Cross Appointed to Biology Department, Trent University, Peterborough, Ontario.
Aug 1989-pres	Associate Professor, Science Education and Environmental and Resource Studies, Trent University, Peterborough, Ontario.
June 1985-1989	Cross Appointed to Faculty of Forestry, University of Toronto, Toronto, Ontario, Canada.
Sept 1983-1988	NSERC University Research Follow/Assistant Professor, Institute for Environmental Studies, University of Toronto, Toronto, Canada.
Feb 1981-1983	NSERC NATO Postdoctoral Fellow, Section of Ecology and Systematics, Cornell University, Ithaca, New York, USA, in laboratory of Professor G.E. Likens.

## **3 PUBLICATIONS**

<b>Year</b>	<b>#</b>	<b>Reference</b>	<b>Type</b>
2011	134	<b>Havas, M.</b> , D. Stetzer, E. Kelley, R. Frederick, and S. Symington. Compact Fluorescent Light Bulbs, Electromagnetic Emissions, and Health. <i>Science of the Total Environment</i> (accepted with minor revisions).	R

- [8] 133 **Havas, M.** Open Letter to the Honourable Aglukkaq (Federal Minister of Health) and Ms Pieteron (Director-General, Environmental and Radiation Health Sciences Directorate, Health Canada needs to issue warning about wireless baby monitors. October 24, 2011, 6 pp L
- 132 **Havas, M.** Open Letter to Peterborough Mayor Bennett and City Councilors in response to “City council disagrees with cell tower site,” Peterborough Examiner, October 12, 2011. L
- 131 **Havas, M.** and D. Colling. Wind Turbines Make Waves: Why some residents near wind turbines become ill? **Bulletin of Science, Technology & Society, September 2011.** R
- 130 **Havas, M.** School Boards Gaggling Dissent over WiFi, Peterborough, Peterborough Examiner, June 6 (?), 2011. L
- 129 **Havas, M.** Report on Smart Meters Request for input regarding Smart Meters, California Council on Science and Technology (CCST), October 12, 2010, 6 pp G
- 128 **Havas, M.** September 2011 Update regarding: Veronica Ciandre, 2 Regal Road, Toronto, Ontario, September 30, 2011, 2 pp ET
- 127 **Havas, M.** August 2011 Update regarding: Veronica Ciandre, 2 Regal Road, Toronto, Ontario, August 25, 2011, 5 pp ET
- 2010 126 **Havas, M.** Expert Report Re: 411 Saint-Francis Blvd, Chateauguay, Quebec, Rogers vs City of Chateauguay, December 15, 2010, 18 pp. ET
- [6] 125 **Havas, M., J. Marrongelle, B. Pollner, E. Kelley, C. Rees, and L. Tully.** 2010. Provocation study using heart rate variability shows microwave radiation from 2.4 GHz cordless phone affects autonomic nervous system. *European Journal of Oncology, Vol. 2:273-300.* R
- 124 **Havas, M.** Open Letter to Medical Officer of Health about WiFi in Schools. September 29, 2010. L
- 123 **Havas, M.** Re: Veronica Ciandre, 2 Regal Road, Toronto, Ontario, Landlord and Tenant Board Hearing, May10, 2010, 5 pp. ET
- 122 **Havas, M.** Urgent need to revise Safety Code 6 as it does not protect the health of Canadians. Expert Testimony to the House of Commons Standing Committee on Health regarding Radio Frequency Radiation and Health, April 20, 2010, 8 pp. ET
- 121 **Havas, M.** Comparison of Industry Canada measurements on February 18, 2010 and those take by Dr. Havas on February 13, 2010 at 2 Regal Road, Toronto, March 16, 2010, 3 pp, T
- 2009 120 **Havas, M., 2009.** Open Letter to Parents, Teachers, School Boards Regarding Wi-Fi Networks in Schools, 2 pp. L

- [3] 119 **Havas, M.** 2009. Letter to the Editor, Toronto Star, February 1, 2009 response to “Jury’s out on link between migraines, fluorescent tubes.” by Joe Schwarcz. L
- 118 **Havas, M.** 2009. Breast Cancer and Occupational Exposure to Electromagnetic Fields. Response to Request from Heidi Evelyn, Tribunal Counsel Office, Workplace Safety and Insurance Appeals Tribunal, Jan 7&9, 2009; February 9, 2009, 42 pp. ET
- 2008 117 **Havas, M.** 2008. Are Cell Phones Safe? An Ounce. Prevent Cancer Now. Fall 2008, page 1 P

#### 4. CONFERENCES/WORKSHOPS/LECTURES/INVITED TALKS

<b>Year</b>	<b>#</b>	<b>Presentation</b>
2011	265	Havas, M. Wi-Fi in Schools–Is it Safe? Ontario English Catholic Teachers’ Association, Toronto, Ontario, November 3, 2011
[23]	264	Havas, M. Zoomer Radio, Toronto, October 27, 2011.
	263	Havas, M. Symptoms of Electrohypersensitivity. MediConsult Convention 2011, Museum of Contemporary Art, San Diego, California, , October 2, 2011.
	262	Havas, M. Therapeutic pulsed magnetic fields travelogue. MediConsult Convention 2011, Museum of Contemporary Art, San Diego, California, , October 2, 2011.
	261	Havas, M. Electrosensitivity and Electrosmog Exposure, MediConsult Convention 2011, Museum of Contemporary Art, San Diego, California, , October 1, 2011.
	260	Havas, M. The History of RF Microwave Radiation, MediConsult Convention 2011, Museum of Contemporary Art, San Diego, California, , October 1, 2011.
	259	Havas, M. and R. Connolly. Therapeutic pulsed magnetic fields travelogue. MediConsult Convention 2011, Science Centre, Toronto, Ontario, September 25, 2011.
	258	Havas, M. Electrosensitivity and Electrosmog Exposure, MediConsult Convention 2011, Science Centre, Toronto, Ontario, September 24, 2011.
	257	Havas, M. The History of RF Microwave Radiation, MediConsult Convention 2011, Toronto, Ontario, September 24, 2011.
	256	Havas, M. Smart Meters, Broadband and WHO, Milagro, Tucson, Arizona, July 17, 2011.
	255	Havas, M. Workshop on EHS and various diagnostic technologies, Joshua Creek, Oakville, Ontario, July 9, 2011.
	254	Havas, M. and S. Symington. Wi-Fi in Schools, Community Centre, Bobcaygeon, Ontario, May 30, 2011.
	253	Havas, M. 2-hour Lecture on low EMF buildings, course at Fleming College, Peterborough, Ontario, May 18, 2011.
	252	Havas, M. How to minimize your exposure to potentially harmful electrosmog, Peterborough Wellness Expo, Evinrude, Peterborough, Ontario, May 7, 2011
	251	Havas, M. Women’s Business Network, Speakers Group, Peterborough, Ontario, May 5, 2011.
	250	Havas, M. Switzerland, April 25 to 30, 2011

- 249 Havas, Windturbines, dirty electricity, and ground current, Lakeville, Connecticut, April 16, 2011.
- 248 Havas, D. Davis, and S. Sinatra, Panel Discussion, Total Health Show, Toronto, Ontario, April 8-10
- 247 Havas, Taming the Microwave Dragon, How to survive in a Wireless world, Total Health Show, Toronto, Ontario, April 8-10
- 246 Havas, @, Atlanta, Georgia, April 1-4, 2011.
- 245 Havas and Symington, Wi-Fi in Schools, Buckhorn Community Centre, March 1, 2011.
- 244 Havas, Health Committee Toronto, WiFi in Schools: Health Issues, Feb 14, 2011
- 243 Havas, Ground Current, Ripley Ontario, February 11 to 13, 2011.
- 2010 242 Havas, Dirty Electricity, Microwaves and Ground current Joshua Creek, Oakville, December 4, 2010.
- [35] 241 Havas, Workshop, HRV and live blood, Joshua Creek, Oakville, December 4, 2010.
- 240 Havas, 2010, Introduction to Devra Davis, University of Toronto, Toronto, November 23, 2010
- 239 Havas, 2010, History of Microwave Research. San Francisco Commonwealth Club, November 18, 2010
- 238 Havas, 2010, Microwave Exposure in Schools. San Francisco Commonwealth Club, November 18, 2010
- 237 Havas, 2010. Weston A Price Conference, Pennsylvania, November 14, 2010.
- 236 Havas, 2010. Israel, Tel Avive, October 27, 2010
- 235 Havas, 2010. Israel, Tel Avive, October 26, 2010
- 234 Havas, 2010. Israel, Tel Avive, October 26, 2010
- 233 Havas, 2010. Evenrude Centre talk on WiFi in Schools, Peterborough, ON, October 20, 2010.
- 232 Havas, 2010. Kingston Club of the Canadian Federation of University Women, Queens University, Kingston, October 13, 2010.
- 231 Havas, 2010. Montreal, Best Western Europa, September 26, 2010.
- 230 Havas and Cline, 2010. Webinar, September 10, 2010.
- 229 Havas, 2010, LA Cancer Conference, September 5, 2010.
- 228 Havas, 2010. Talk, Los Angeles, California, September 2, 2010.
- 227 Havas, 2010. Barry Trower and History of EMFs, University of Toronto, Aug 24, 2010.
- 226 Havas, 2010. Crystal Beach, Ontario, August 9, 2010.
- 225 Havas, 2010. Webinar with Dr. John Cline in BC via skype. June 11, 2010.
- 224 Havas, 2010. WiFi in Schools. Collingwood, Ontario, June 10.

- 223 Havas, M. 2010. William Rae Conference, Dallas Texas, May 3-6, 2010.
- 222 Havas, M. and C. Rees. 2010. Full Signal. Long Island, NY, May 5, 2010
- 221 Havas, M. and C. Rees. 2010. Full Signal. New York City, NY, May 4, 2010
- 220 Havas, M. and C. Rees. 2010. Electrosensitivity, How do diagnose it. Kinghardt Academy, Madison, NY, May 1, 2010
- 219 Havas, M. and C. Rees. 2010. Full Signal. New York City, NY, April 29, 2010
- 218 Havas, M. and C. Rees. 2010. Congressional Briefing, Washington, DC, April 28, 2010
- 217 Havas, M. 2010. Lecture: Electrosmog and Electro-Sensitivity, Johns Hopkins, Baltimore, Maryland, April 27, 2010
- 216 Havas, M. 2010. HESA House of Commons Committee, Ottawa, presentation via phone, Baltimore, Maryland, April 27, 2010
- 215 Havas, M. 2010. Workshop on Monitoring Electrosmog at Johns Hopkins, Baltimore, Maryland, April 26, 2010
- 214 Havas, M. 2010. Proposed Roger's Antennas on Condominiums in Brampton, Ontario. April 7, 2010.
- 213 Kroh, C. and Havas, M. 2010. Is the government doing enough to protect our health? Panel Discussion. Total Health 10, Toronto Metro Convention Centre, Toronto, March 14, 2010.
- 212 Havas, M. 2010. Mobile Phones, Antennas, Computers, and Compact Fluorescent Lights . . . What you need to know to protect your health. Total Health 10, Toronto Metro Convention Centre, Toronto, March 14, 2010.
- 211 Havas, M. Electro-hyper-sensitivity (EHS): An emerging health issue. University of Ottawa, Ottawa, ON, March 3, 2010.
- 210 Havas, M. 2010. Electrosmog and Electrosensitivity. Health Impacts of Exposure to Wireless Radiation, Lakehead University, Thunder Bay, Ontario, February 22, 2010.
- 209 Havas, M. 2010. Electrosmog and Electrosensitivity: What you need to know to protect your home environment. Electrosmog: Introduction and Training. Toronto, January 23, 2010.
- 208 Havas, M. 2010. Ground Current in Urban Environments. Electrosmog: Introduction and Training. Toronto, January 23, 2010.
- 2009 207 Havas, M. 2009. Electro-hyper-sensitivity and the Nerve Express and Electro-Interstitial Scans. LD Symposium 2009, Miami, Florida, December 10-12, 2009.
- [27] 206 Havas, M. Health Effects of Low Frequency Electromagnetic Fields. RETA, Edmonton Alberta, November 24, 2009.

- 205 Havas, M. Live Blood Analysis. MRS 2000 Meeting, Toronto, Ontario, November 21, 2009.
- 204 Havas, M. Evidence of Harm from Electromagnetic Radiation. Electromagnetic Radiation Impacts on Human Health. EMR Policy Institute Scientific Conference. Colorado School of Mines, Golden Colorado, November 8, 2009.
- 203 Havas, M. and J. Marrongelle. Heart Rate Variability (HRV): A diagnostic tool for detecting chronic fatigue, adrenal exhaustion, and electrical hypersensitivity (EHS). Holistic Health Now Conference, American Holistic Medical Association. Cleveland Ohio, November 6, 2009.
- 202 Havas, M. Live Blood Analysis. A Public Lecture, Frequency Matters. Bridgenorth, Ontario, September 26, 2009.
- 201 Havas, M. Cigarettes and Cell Phones: What do they have in common? Stinson Beach, California, September 20, 2009.
- 200 Havas, M. Cell Phones and Cigarettes. What do they have in common? San Leandro High School, San Leandro California, September 18, 2009.
- 199 Havas, M. and D. Fancy. Conference call with Health Canada regarding Standards. August 31, 2009.
- 198 Havas, M. Public Meeting regarding Rogers Tower. Marmora, Ontario, August 27, 2009.
- 197 Havas, M. and D. Fancy. Meeting with Health Canada regarding Radio Frequency Radiation Standards, Ottawa, Ontario, August 5, 2009.
- 196 Havas, M. The Truth about Wired and Wireless Technology. Royal Roads University, Victoria, BC, July 22, 2009.
- 195 Havas, M. An Inconvenient Truth: Climate Change. Consequences of Convenience: Electrosmog. Gabriola Island, BC, July 20, 2009
- 194 Havas, M. Consequences of Convenience. Langley ,BC, July 17, 2009.
- 193 Havas, M. Transmission Lines and Health. Sto:Lo Nation. BC, July 14, 2009.
- 192 Havas, M. Wireless Technology-the tobacco of the 21<sup>st</sup> Century. Ontario Health Promotion Summer School, University of Toronto, Toronto, Ontario. July 9, 2009.
- 191 Havas, M. Public Health SOS: The Shadow Side of the Wireless Revolution. Ontario Health Promotion Summer School, University of Toronto, Toronto, Ontario. July 8, 2009.

- 190 Havas, M. What Health Care Professionals need to know about Electro-Smog and Electro-Sensitivity. Integrating Biophysics-based Technologies in Clinical Practice, Phoenix Arizona, May 8, 2009.
- 189 Havas, M. What Health Care Professionals need to know about Electromagnetic Pollution and Health. Rural Life and the Healthy Employee, IHLP, Education Symposium, Medical Laboratory Technologists, Stratford, May 6, 2009.
- 188 Havas, M. Our love affair with wireless technology and the consequences. U-Links Centre for Community-Based Research, Haliburton County, April 20, 2009.
- 187 Havas, M. Our love affair with wireless technology and the consequences. Women's Institute Bailieboro-Cavan-Milbrook-North Monaghan, Ontario, April 7, 2009.
- 186 Havas, M. Electrical Pollution on Farms: Poor power quality and stray voltage effects on humans and animals. National Mutual Insurance Convention, Toronto, Ontario, March 26, 2009.
- 185 Havas, M. Electro-smog and Electro-hyper-sensitivity: How to protect yourself, your family, and your community. University Women's Club, Toronto, Ontario, March 12, 2009.
- 184 Havas, M. When "green" is not enough. What do windmills and CFL bulbs have in common? Sir Sanford Fleming College, Lindsay Ontario, January 30, 2009.
- 183 Havas, M. Rapid Aging Syndrome & Electrosmog: Part 2. Physicians Meeting, Renfrew Ontario, January 23, 2009.
- 182 Havas, M. Electrical Sensitivity. University of Ottawa, Ottawa, Ontario, January, 23, 2009
- 181 Havas, M. Wind Turbines & Health: The effect on Individuals, Prince Edward County, Picton Ontario, January 15, 2009.
- 2008 180 Havas, M. Hearing on Breast Cancer and Magnetic Field Exposure, Bell Canada, Expert Testimony, Toronto, Ontario, December 16-17, 2008.
- [31] 179 Havas, M. When "green" is not enough. Lecture, First Year Environmental Science Course (ERSC 100), Trent University, Peterborough, Ontario, December 2, 2008.
- 178 Havas, M. Poor Power Quality & Stray Voltage Effects on Human and Animal Health, Ontario Mutual Insurance, Annual Meeting, University of Guelph, Ridgetown Campus, Ridgetown, Ontario, November 27, 2008.
- 177 Havas, M. Why do residents near wind turbines get sick? Wind Turbines Make Waves. Township Council Public Meeting, Dawn-Euphemia Township, Florescent & District Community Centre, Florence Ontario, November 17, 2008.
- 176 Havas, M. EMFs Electromagnetic fields--an emerging health issue.

- CAUT Health and Safety Conference, Ottawa, Ontario, November 7-9, 2008.
- 175 Havas, M. Electro-smog & Electro-sensitivity: what you need to know to protect yourself. RCEN, Canadian Environmental Network, Annual General Assembly, Richmond Hill, Ontario, October 23-26, 2008.
- 174 Havas, M. Electromagnetic Factors in Health: What do Scientists know about the effects of wireless technologies about humans, animals, and nature? Panel on Health & Environmental Concerns of the Wireless Revolution. Bioneers, Boulder Colorado, October 18, 2008.
- 173 Havas, M. Electrosmog & Electrosmogitis (Electro-hypersensitivity). HRV & EIS Workshop, Mississauga, Ontario, October 9-11, 2008.
- 172 Havas, M. Health Effects of Electrosmog. Round Table Discussion, Budapest, Hungary, September 26-28, 2008.
- 171 Havas, M. Rapid-Aging Syndrome and Electrosmog. Renfrew United Church, Renfrew, ON, 10:30 am, August 29, 2008.
- 170 Havas, M. Electrosmog and Electrohypersensitivity. Ottawa Area Physicians, Kanata ON, 7 pm, August 28, 2008,
- 169 Havas, M. Electromagnetic Fields: Best Kept Secret. Ontario English Catholic Teachers' Association. The Way Forward: Putting the Act into ACTION. Biennial Conference on Health, Safety and the Environment. Toronto, August 13-15, 2008.
- 168 Rees, C. and M. Havas. Meeting with Marc Sorenson regarding design of a Health Spa for those with EHS, Nevada Fitness Institute, Hidden Canyon, Nevada. July 30-Aug 2, 2008.
- 167 Ripple, J., M.Havas, and R. Lear. Meeting with Senator Boxer's Staff--Megan Miller regarding Health Concerns of WiFi and WiMax, Marin County, July 25 2008, noon-2 pm.
- 166 Ripple, J., M.Havas, and R. Lear. Meeting with Assemblyman Huffman's Staff regarding the Banning of Compact Fluorescent Lights. 3501 Civic Center Drive, Suite 412, Marin County, July 25, 2008, 3-4 pm.
- 165 Havas, M. Public Forum, Cell/Transmission Towers, Colwood Pentecostal Church, Colwood, Vancouver Island, BC, June 25, 2008.
- 164 Havas, M. Cell Towers and Your Health. PACT Precautionary Approach to Cell Towers, Richmond Hill, ON, May 12, 2008.
- 163 Havas, M. Wind Farms and Health. Community Centre, Summerside, PEI, noon, May 3, 2008.
- 162 Havas, M. Transmission Lines and Health, Duffy Theatre, University of PEI, Charlottetown, PEI, 7 pm, May 2, 2008,
- 161 Havas, M. Transmission Lines and Health, Members of the

- Legislative Assembly, Charlottetown, PEI, noon, May 2, 2008,
- 160 Havas, M. Transmission Lines and Health, French School, Summerside, PEI, 7 pm, May 1, 2008.
- 159 Havas, M. A Tale of Two Pollutants: Dirty Electricity & WiFi. Natural Building, Health Building, Building Biology Conference, Nashville, TN, April 19-20, April 19, 2008.
- 158 Havas, M. Electromagnetic Pollution & Health. Natural Building, Health Building, Pre-Conference Seminar, Building Biology Conference, Nashville, TN, April 19-20, April 18, 2008.
- 157 Havas, M. Best Kept Secret. Women's institute, Warsaw Town Hall, Warsaw, ON, April 16, 2008.
- 156 Havas, M. Dialogue on Electromagnetic Fields and Health. THINK<sup>2</sup>: A Symposium on Academic Safety and Risk, Brock University, April 8-9, 2008.
- 155 Havas, M. Cell Towers and Schools: Tip of the Iceberg. Coalition for Healthier Schools, 90-minute Conference Call, April 4, 2008.
- 154 Havas, M. Electro-hyper-sensitivity (EHS): An Emerging Public Health Issue. Michael, E. DeBaakey Veterans Affairs Medical Center, Houston Texas, March 31, 2008.
- 153 Lai, H., S. Milham, M. Havas, and L. Kelley. We are all exposed! Biological and Health Effects of Electromagnetic Fields (EMF), Radio Frequency Radiation (RFR), and Dirty Electricity (DE). City Club, San Francisco, Breakfast Meeting Panel Discussion, Sponsored by Council on Wireless Technology Impacts, March 21, 2008.
- 152 Havas, M., C. Sage, D. Carpenter, C. Rees. The Shadow Side of the Wireless Revolution. A Health Policy Discussion on an Emerging Global Public Health Issue. Panel Discussion, Commonwealth Club, San Francisco, California, March 19, 2008.
- 151 Havas, M. Electromagnetic Radiation, Peterborough, March 3, 2008.
- 150 Havas, M. An Inconvenient Truth, Part 2: Our Love Affair with Wireless Technology, Lecture Sponsored by The Lewis School, Princeton Public Library, New Jersey, February 12, 2008.
- 2007 149 Newton, J. and M. Havas, Meetings with Congressional and Senate Staff about EMR Regulations and Guidelines. Washington DC, December 3-7, 2007.
- [17] 148 Havas, M. Health Concerns associated with Electromagnetic Pollution. Gave talks at 5 Churches, Jamaica, October 29-30, 2007.
- 147 Havas, M. Radio Frequency Radiation & Health. New Mexico Bioneers Conference, Santa Fe, New Mexico, College of Santa Fe, October 19-21, 2007.
- 146 Newton, J. and M. Havas. Meetings with Congressional and Senate Staff about EMR Regulations and Guidelines. Washington, DC, October 15-18, 2007.

- 145 Havas, M. 2007. Ground Current on Farms, Ecological Agriculture Course, Trent University, Peterborough, ON, October 4, 2007.
- 144 Havas, M. 2007. The link between cancer and exposure to electromagnetic energy. Cancer Conference, Ottawa, Ontario. May 25-26, 2007.
- 143 Havas, M. 2007. Panel Discussion on WiFi, RFR, and our Health. World Congress on Integrated Medicine, Sante Fe, New Mexico, May 4-6, 2007.
- 142 Havas, M. 2007. Electromagnetic Hygiene in Schools. Pegasus School, California, April 23, 2007.
- 141 Havas, M. 2007. Ground Current Pollution Act Bill 154: Why should we care? Chattam, Ontario, April 18, 2007.
- 140 Havas, M. Radio Frequency Radiation, Cell Phone Towers and your Health. Public Meeting, Charlottetown, PEI, April 17, 2007.
- 139 Havas, M. Electromagnetic Hygiene in the Home. Holistic Health, SSF, March 20, 2007.
- 138 Havas, M. Radio Frequency Health Concerns and WiFi at Trent. Committee on Technology for Teaching and Learning (COTTL), Trent University, March 8, 2007.
- 137 Havas, M. 2007. Shifting Paradigms: Flat earth/round earth and our concept of electromagnetic power. Ontario College of Art and Design, Toronto, March 7, 2007.
- 136 Havas, M. 2007. Dirty Electricity in Schools. Teacher Education Program, Trent University, March 7, 2007.
- 135 Havas, M. 2007. Is the electricity in your home making you sick. Health Freedom Expo, Long Beach, California, March 2-4, 2007.
- 134 Havas, M., B. Fraser, and R. Frederick. 2007. Ground Current Pollution Act 154, Council Chamber, Toronto City Hall, Toronto, Ontario, January 29, 2007.
- 133 Havas, M. Gilbert, F, Macfarlane, R., and R. Bradley. 2007. Panel discussion on WiFi. Wireless Communities Summit, Toronto, Ontario. January 23 & 24,
- 2006 132 Havas, M. Radio Frequency Health Concerns and WiFi at Trent. COTTL, Trent University, December 18, 2006
- [19] 131 Havas, M. 2006. *Electromagnetic Pollution and Your Health*. Bermuda, October 14, 2006.
- 130 Havas, M. 2006. *Ground Current on Farms*. Guest Lecture: Ecological Agriculture, Trent University, Peterborough, ON, October 5, 2006.

- 129 Havas, M. 2006. Health Effects of Dirty Electricity. Dane County Chapter, Save Our Unique lands Coalition Against Electromagnetic Pollution, Pitchburg, Wisconsin, July 27, 2006.
- 128 Havas, M. 2006. Electromagnetic Pollution and Your health. Trent/Shad Valley Program, Trent University, Peterborough, ON July 6, 2006.
- 127 Havas, M. 2006. Electromagnetic Pollution and Electrical Hypersensitivity. American Society of Dowsers, Vermont, June 22, 2006.
- 126 Havas, M. 2006. Electromagnetic pollution: What can you do to have a cleaner environment and protect your health? Aurora, ON, June 14, 2006.
- 125 Havas, M. 2006. Health Effects of Dirty Electricity. Nassau, Bahamas, June 8, 2006.
- 124 Havas, M. 2006. Radio Frequency Antennas. Simcoe, Ontario, June 6, 2006.
- 123 Havas, M. 2006. Simcoe Cell Tower Rogers, Simcoe, ON. Public Meeting, Town Hall, April 19, 2006.
- 122 Havas, M. 2006. Part 2: No Place to Hide: Wireless Technology. Total Health Show, Toronto, ON, April 1, 2006.
- 121 Havas, M. 2006. Panel Discussion: Energy Medicine. Total Health Show, Toronto, ON, April 1, 2006.
- 120 Havas, M. 2006. Part 1: Electromagnetic Hygiene: Dirty Electricity in homes and schools. Total Health Show, Toronto, ON, April 1, 2006.
- 119 Havas, M. 2006. Biological Effects of Dirty Electricity with Emphasis on Diabetes and Multiple Sclerosis. Precautionary EMF Approach: Rationale, Legislation and Implementation, 5<sup>th</sup> ICEMS International Workshop, Benevento Italy, 22-25, 2006.
- 118 Havas, M. 2006. Biological Effects of Dirty Electricity. Peterborough Public Library, Peterborough, ON, February 16, 2006.
- 117 Havas, M. 2006. Electromagnetic Pollution: No place to hide! Markham ON, February 15, 2006.
- 116 Havas, M. 2006. Dirty Electricity, Electrical Hypersensitivity and your Health. Toronto, ON, February 13, 2006
- 115 Havas, M. 2006. Electromagnetic Pollution and Your Health. Sir Sanford Fleming College, Peterborough, ON, February 6, 2006.

- 114 Havas, M. 2006. *Dirty Electricity, Diabetes and Multiple Sclerosis*. Centre for Health Studies Research, Trent University, Peterborough, ON, January 25, 2006
- 2005 113 Havas, M. 2005. *Electrical Pollution & the Need for Better Health Guidelines*. Meeting with Belinda Stronach, **Aurora, Ontario**, December 14, 2005.
- [29] 112 Havas, M. 2005. *Electromagnetic Sensitivity and Electromagnetic Pollution*, Faculty of Medicine, University of Toronto, **Toronto, Ontario**, December 9, 2005.
- 111 Havas, M. 2005. *Dirty Electricity, what it is, what it does, and what we can do to protect ourselves*. Nutritionists Network Group Meeting, **Richmond Hill, Ontario**, November 15, 2005.
- 110 Havas, M. 2005. *Cell Tower Radiation and Fire Fighter Exposures*. Health and Safety for the Professional Fire Fighter, The IAFF John P. Redmond Foundation Symposium on the Occupational Health and Hazards of the Fire Service. **Honolulu Hawaii**, October 23-27, 2005.
- 109 Havas, M. 2005. Health and Safety Round Table Question Period, Health and Safety for the Professional Fire Fighter, The IAFF John P. Redmond Foundation Symposium on the Occupational Health and Hazards of the Fire Service. **Honolulu Hawaii**, October 23-27, 2005.
- 108 Havas, M. 2005. *Dirty Electricity, Diabetes, Multiple Sclerosis, Electrical Hypersensitivity and Sick Building Syndrome . . . Is there a connection?* Occupational Hygiene Association of Ontario, **Toronto**, October 20, 2005
- 107 Havas, M. 2005. *Electrical Pollution: No Place to Hide*. SWEEP, Safe Wireless Electromagnetic and Electrical Policy, Breast Cancer Research and Education Fund and the Niagara Healthy Environment Initiative, **St. Catharines, Ontario**, October 15, 2005.
- 106 Havas, M. 2005. *Radio Frequency Radiation and Adverse Biological Effects*. **Salisbury, North Carolina**, October 13, 2005.
- 105 Havas, M. 2005. *Earth Energy, Life Energy, and Techno Energy Interactions. How is electromagnetic Technology affecting Life on our Planet? It's a Shocker!* Toronto Dowsers, Latvian Centre, Credit Union Drive, **Toronto**, October 11, 2005.
- 104 Havas, M. 2005. *Electromagnetic Pollution*. Ontario Ministry of Health, **Toronto**, September 20, 2005
- 103 Havas, M. 2005. *Health Effects of Dirty Electricity*. **Bermuda**, September 3, 2005.
- 102 Havas, M. 2005. *Radio Frequency Radiation: Cell Phone and Cell Towers*. **Bermuda**, September 3, 2005.

- 85 Havas, M. 2005. *Radio Frequency Radiation: Cell Phone Antennas*, Barbados Radiation Conference, Sherbourne Conference Centre, **Barbados**, January 18, 2005.
- 2004 84 Havas, M. 2004. *Health Concerns Associated with Part 1. Radio Frequency Radiation, Part 2. Magnetic Fields (ELF), Part 3. Dirty*

- Electricity*. Public Seminar, **Tobago**, November 20, 2004.
- [10] 83 Havas, M. and D. Stetzer. 2004. *Health Concerns Associated with Dirty Electricity and Power Frequency Fields*. Public Seminar, Port-of-Spain, **Trinidad**, November 17, 2004
- 82 Havas, M. 2004. *Health Concerns Associated with Radio Frequency Radiation*. Public Seminar, Port-of-Spain, **Trinidad**, November 17, 2004
- 81 Havas, M. 2004. *Dirty Electricity and Electrical Hypersensitivity (EHS): Five Case Studies*, Bio-Ag Conference, **Wellesley, Ontario**, November 10, 2004.
- 80 Havas, M. 2004. Dirty Electricity and Multiple Sclerosis, MS Society **Pickering, Ontario**, November 2, 2004.
- 79 Havas, M. 2004. Dirty Electricity and Multiple Sclerosis, MS Society **Oshawa, Ontario**, November 2, 2004.
- 78 Havas, M and J. Mackay. *Street level magnetic fields within the City of Kingston, Ontario, Canada*. Biological Effects of EMFs, 3<sup>rd</sup> International Workshop, Kos, **Greece**, 4-8 October, 2004.
- 77 Havas, M., M. Illiatovitch, and C. Proctor. *Teacher and student response to the removal of dirty electricity by the Graham/Stetzer filter at Willow Wood School in Toronto, Canada*. Biological Effects of EMFs, 3<sup>rd</sup> International Workshop, Kos, **Greece**, 4-8 October, 2004.
- 76 Havas, M. and D. Stetzer. 2004. *Graham/Stetzer Filters Improve Power Quality in Homes and Schools, Reduce Blood Sugar Levels in Diabetics, Multiple Sclerosis Symptoms, and Headaches. Children with Leukemia* International Conference in **Westminster, London**, September 6-10, 2004.
- 75 Havas, M. 2004. *Wireless Communication Antennas on Fire Halls: Dumb and Dangerous!* International Association of Fire Fighters Conference, **Boston**, August 2004.
- 2003 74 Havas, M. *Health Effects Associated with Power Lines*. Expert Testimony. National Energy Board Hearing regarding Sumas Energy, **Abbotsford, BC**, July 2003
- 2002 73 Havas, M. National Research Policy Conference, Ottawa, ON., October 22-25, 2002
- [15] 72 Havas, M. *Cell Phone Towers and their Biological Effects*. Behind the Scenes, Trent University, **Peterborough, Ontario**, October 19, 2002
- 71 Havas, M. *Electromagnetic Fields in Schools: What can be done to reduce exposure*. Health and Safety Conference, **Toronto, Ontario**, August 15, 2002.
- 70 Havas, M. *How to reduce your exposure to wired and wireless electromagnetic energy*. Invited Speaker, Presented at People and the

- Planet Conference, Sierra Club of Canada, Queen's University,  
**Kingston, Ontario**, June 3-9, 2002
- 69 Havas, M. Health Concerns Associated with Wireless  
Telecommunication.. Invited Speaker, Public Lecture, Caledonia,  
PEI, May 29, 2002.
- 68 Havas, M. *Mapping Magnetic Fields in the School Environment*.  
**Guelph Ontario**, May 24, 2002
- 67 *Electromagnetic fields (EMF) and Electromagnetic Radiation (EMR):  
An overview of Health Concerns and a Call for Action*. Presented to  
the Standing Committee on Environment and Sustainability,  
**Parliament Hill, Ottawa, Ontario**, May 21, 2002
- 66 Havas, M. *Biological Effects of Low Frequency Electromagnetic  
Fields*, **London, England**, May 16-17, 2002
- 65 Lund-Lucas, E., R. Silvestri, M. Havas, D.J. Cunningham, and L.  
Thomas. 2002. Everything students should know about Thinking and  
Learning. Destination Success 2002: Building Accessible Learning  
Communities, Sponsored by Learning Opportunities Task Force,  
Ministry of Training, Colleges & Universities, Government of Ontario  
& Georgian College; **Barrie, Ontario**, May 6 & 7, 2002.
- 64 Havas, M. *Electromagnetic Fields in a School Environment, the Need  
for Mapping*. Presented to School Health and Safety Officers,  
**Mississauga, Ontario**, May 3, 2002.
- 63 Havas, M. *Sources of electromagnetic fields in the home*. Presented to  
Environmental Homes, **Grand Valley, Ontario**, April 27, 2002.
- 62 Havas, M. *Corporatization of the University*, Smith Conference  
Room, Trent University, **Peterborough, Ontario**, April 6<sup>th</sup>.
- 61 Havas, M. *Electromagnetic fields in the home and childhood cancers:  
An overview from Wertheimer to Wartenberg*. Presented at the  
International Centre for Electromagnetic Biocompatibility (ICEB)  
Conference, **Montreal, Canada**, March 6-8, 2002
- 60 Havas, M. Rapporteur, Simply Water? Workshop, Trent University,  
**Peterborough, Ontario**, February 18-20, 2002
- 59 Havas, M. Expert Testimony on the health effects of power line  
electromagnetic fields. Mendota Heights, Public Meeting, Planning  
Commission, **Minnesota**, January 2002.
- 2001 58 Havas, M. *Electromagnetic fields and breast cancer*. Eyes Wide  
Open, Conference on Breast Cancer, **Peterborough, Ontario**.  
October 2001.
- 2000 57 Havas, M. Toronto Round Table on Cell Phone Towers, RFR, Public  
Meeting with Panel Discussion, City of Toronto Department of  
Health, **Toronto, Ontario**, February 7, 2000
- [2] 56 Havas, M. Expert Testimony of the Biological Effects of Power Line  
electromagnetic fields, **Mendota Heights, Minnesota**, Public

- Meeting, January, 2000.
- 1999 55 Havas, M. Power lines on London Street Peterborough and the  
[1] Literature on Health Effects. Presented to the PUC, **Peterborough, Ontario**, June 22, 1999.
- 1995 54 POSTER: Acid Reign '95 Conference, **Gothenburg, Sweden**, June  
1995. 1) Can Sodium Regulation be used to Predict Relative Acid  
Sensitivity of Aquatic Fauna?; 2) Biological Recovery in Two  
Previously Acidified, Metal-Contaminated Lakes, near Sudbury,  
Ontario, Canada; 3) Chemical Response of Two Previously  
Acidified, Metal-Contaminated Lakes, near Sudbury, Ontario,  
Canada.
- [3] 53 PLENARY SPEAKER: Acid Reign '95 Conference, **Gothenburg, Sweden**, June 1995.
- 52 LECTURE: at the KEY Workshop on Biodiversity in Ontario,  
August 1995. Solving Environmental Problems: A framework.
- 1994 51 INVITED SPEAKER: conference in **Kathmandu, Nepal**, March  
1994. Environmental Education in Developing Countries.
- [4] 50 LECTURE: at the KEY Workshop on Chemicals in the  
Environment, **Regina**, July 1994. Environmental Science and  
Decision Making
- 49 LECTURE: at the KEY Workshop on Biodiversity, **Ontario**,  
August 1994.  
Solving Environmental Problems: A framework.
- 48 PARTICIPANT: First International Symposium on Ecosystem  
Health and Medicine: Integrating Science, Policy and Management.  
**Ottawa, Ontario**, June 19-23, 1994.
- 1993 47 PARTICIPANT: Evaluating and Monitoring the Health of Large-  
Scale Ecosystems, NATO Advanced Research Workshop,  
**Montebello, Quebec**, October 10-15, 1993.
- [4] 46 POSTER: International Conference on Heavy Metals in the  
Environment, in **Toronto**, September 1993.
- 45 LECTURES: at the KEY Workshop on Chemicals in the  
Environment, Regina June 1993, **Sarnia** August 1993; 1) DDD: A  
Case Study; 2) Environmental Decision Making; 3) Solving  
Environmental Problems: A framework.
- 44 INVITED SPEAKER: conference in **Toluca, Mexico**, February,  
1993.
- 1992 43 LECTURES: at the KEY Workshop on Chemicals in the  
Environment, **Regina** July 1992, **Sarnia** August 1992.
- [2] 42 LECTURES: at the KEY Workshop on Chemicals in the  
Environment, **Regina** July 1992, **Sarnia** August 1992; 1) DDD: A  
Case Study; 2) Environmental Decision Making; 3) Solving  
Environmental Problems: A framework.
- 1991 41 LECTURES: at the KEY Workshop on Chemicals in the  
Environment, August 16-25, 1991. 1) View of Environmental Issues

- 1990 40 from a Scientist's Perspective; 2) DDD: A Case Study  
 SEMINAR: "Science Reporting and Journalism", Campbellford  
 District High School, Your Science Future, **Cambellford, Ontario**,  
 November 14, 1990.
- [4] 39 LECTURES/DISCUSSIONS: at the KEY (formerly SEEDS)  
 Workshop on Chemicals in the Environment, August 18-25,  
**Mississauga, Ontario**, 1) Environmental Problems: An Overview;  
 2) Acid Rain: An Historical Perspective; 3) DDD: A Case Study;  
 4) Agricultural Practices: synthetic vs organic chemicals  
 38 CONFERENCE PRESENTATION: Enviro Mystery: An  
 Educational Computer Game, Third International Show & Tell for  
 Ontario Universities and Colleges, May 28-29, 1990, oral  
 presentation and computer demonstration, with Robert Loney;  
**Guelph Ontario**.
- 37 SEMINAR: Scientific Research in the Canadian Arctic, Science  
 Day, Trent University, **Peterborough, Ontario**, April 10, 1990.
- 1989 36 LECTURE: Science in the Canadian Artic. Environmental and  
 Resource Studies, Trent University, **Peterborough, Ontario**, July  
 1989.
- [3] 35 LECTURES: at the SEEDS Workshop on Chemicals in the  
 Environment, August 5-12, **Kingston, Ontario**, 1) Acid Rain: An  
 Overview; 2) DDD: A Case Study  
 34 TELEVISION INTERVIEW (TVO): Panel Discussion on  
 Sustainable Development, **Toronto, Ontario**. May 1989.
- 1988 33 POSTER PRESENTATION: Needle Chemistry as an Early Warning  
 Indicator of Decline in Balsam Fir, Red Spruce, and Norway Spruce.  
 Forest Decline Symposium, October 20-21, 1988, **Rochester, N.Y.**  
 (with R. Loney, M. Scott, and T.C. Hutchinson)
- [4] 32 POSTER PRESENTATION: Influence of Climate and Air Pollution  
 on Decline of Sugar Maple in Eastern North America. Forest  
 Decline Symposium, October 20-21, 1988, **Rochester, N.Y.** (with R.  
 Loney)
- 31 THREE LECTURES: at the SEEDS Workshop on Chemicals in the  
 Environment, August 12-21, 1988, **Sarnia, Ontario**. 1) Chlorinated  
 Hydrocarbons-Friend or Foe? A Case Study; 2) Principles of  
 Chemistry as they Pertain to the Environment; 3) Principles of  
 Ecology as they Pertain to Chemicals in the Environment  
 30 INVITED LECTURE: Later Life Learning: "Scientific  
 Developments and Inventions at the University of Toronto, Topic  
 was "Acid Rain in the Canadian Artic", March 10, 1988, Innis  
 College, U of T, **Toronto, Ontario**.
- 1987 29 ORAL PRESENTATION: Can Aquatic Mosses and Macrophytes be  
 used as Bioindicators of Metal Pollution? Intern. Conf. Heavy  
 Metals. September, 1987, **New Orleans**.

- [5] 28 LECTURE: Use of DDD in Clear Lake-a Case Study. SEEDS  
Workshop on Chemicals in the Environment, August, 1988, **Sarnia,  
Ontario**
- 27 LECTURE: Science Careers for Women. Open Doors for  
Tomorrow, Peel's Career Conference for young women, Glenforest  
Secondary School, **Peel County, Ontario** May 9.
- 26 ORAL PRESENTATION: Does hemoglobin enhance the acid  
tolerance of aquatic invertebrates? International Symposium on  
Ecophysiology of Acid Stress in Aquatic Organisms, Jan 13-16,  
1987, **Antwerp, Belgium**.
- 25 ORAL PRESENTATION: Effects of calcium and pH on aluminum  
toxicity and bioaccumulation by *Daphnia magna*. International  
Symposium on Ecophysiology of Acid Stress in Aquatic Organisms,  
Jan 13-16, 1987, **Antwerp, Belgium**.
- 1986 24 ORAL PRESENTATION: Chemical recovery of 2 lakes near  
Coniston, Ontario. SLANT/TRESLA meeting, April 11-13, 1986,  
**Peterborough, Ontario**.
- [3] 23 SEMINAR: Aluminum toxicity in aquatic invertebrates, Department  
of Biology, Trent University, **Peterborough, Ontario**, February 28,  
1986.
- 22 ORAL PRESENTATION: Aluminum toxicity and salt regulation in  
aquatic invertebrates, Society of Canadian Limnologists (SCL),  
Conference held in **Ottawa, Ontario**, January 7 & 8, 1986.
- 1985 21 POSTER PRESENTATION: "Aluminum localization in aquatic  
plants and animals", **Muskoka** Acid Rain Conference, Sept 15-20,  
1985.
- [5] 20 POSTER PRESENTATION: "Recovery of acidic metal-  
contaminated lakes near Coniston Ontario", with T.C. Hutchinson,  
**Muskoka** Acid Rain Conference, Sept 15-20, 1985.
- 19 SEMINAR: "Aluminum toxicity, uptake and localization in aquatic  
invertebrates", Department of Biology, McMaster University,  
**Hamilton, Ontario**, August 29, 1985
- 18 PARTICIPANT: Impact of Nuclear Winter on Natural Ecosystems,  
Workshop, SCOPE, **Toronto**, March 1985.
- 17 ORAL PRESENTATION: "Does hemoglobin enhance acid  
tolerance of aquatic invertebrates?", SLANT/TRESLA Conference,  
**Quebec**, April 12-15, 1985.
- 1984 16 ORAL PRESENTATION: "Aluminum uptake and toxicity to  
Daphnia magna at low pH in soft water." 11th Annual Aquatic  
Toxicity Workshop, **Vancouver, B.C.**, November 13-15.
- [3] 15 INVITED SPEAKER: Physiological effects of acidity and  
associated water chemistry (aluminum) on freshwater invertebrates  
Department of Biology, Dalhousie University, **Halifax, Nova Scotia**,  
October 18.
- 14 INVITED SPEAKER: Acid rain and the future of Ontario Lakes  
Dallington Public School, **Toronto**, Ontario, April.

- 1983 13 INVITED SPEAKER: Natural and Manmade Acid Rain Audubon Society, Darien, **Connecticut**, U.S.A., February 3.
- [2] 12 INVITED SPEAKER: Aluminum toxicity to aquatic invertebrates Norwegian Institute for Water Research, **Oslo, Norway**, May.
- 1982 11 INVITED SPEAKER: Causes of Acid Rain and Acid Deposition Conference on Acid Rain, Pennsylvania Environmental Council, 14th Annual Meeting, Lock Haven State College, , **Pennsylvania**, October 21.
- [4] 10 INVITED SPEAKER: Effects of acid rain on aquatic animals Acid Rain Effects Workshop, JASON MITRE Corporation, Cornell University, **Ithaca, N.Y.**, Sept 30 to Oct. 1.
- 9 LECTURES: Neutron Activation Analysis as an Analytical Tool. Section of Ecology and Systematics, Cornell University, **Ithaca, N.Y.**
- 8 LECTURE: Response of aquatic invertebrates to acidification Aquatic Entomology Course, Cornell University, **Ithaca, N.Y.**
- 1981 7 PARTICIPANT: Ecotoxicology Workshop, Ecosystem Research Center, Cornell University, **Ithaca, N.Y.**, November 2-5.
- [5] 6 POSTER PRESENTATION: Acid/Rain Fisheries Symposium, Northeastern Division of the American Fisheries Society, Cornell University, **Ithaca, N.Y.**, August 2-5.
- 5 SEMINAR: The Smoking Hills and Sudbury: Two case studies Department of Biology, State University of New York College, **Cortland, N.Y.**, April
- 4 SEMINAR: Does hemoglobin reduce acid-stress of *Daphnia magna*? Entomology Seminar, Cornell University, **Ithaca, N.Y.**, March.
- 3 SEMINAR: Extreme acidification at the Smoking Hills: Chemical and Biological Consequences Section of Ecology and Systematics, Cornell University, **Ithaca, N.Y.**, February.
- 1980 2 PARTICIPANT: Effects of sulphur and nitrogen oxides on plants International Workshop on Environmental Implications and Strategies for Expanded Coal Utilization, UNEP/Beijer Institute, **Moscow, USSR**, October 20-24.
- [2] 1 SEMINAR: Toxicity of metals at low pH to aquatic invertebrates. Department of Botany, University of Toronto, **Toronto**.

## 5 WEBSITE ARTICLES

I have two websites [www.magdahavas.com](http://www.magdahavas.com) and [www.magdahavas.org](http://www.magdahavas.org). The dot com website is an educational website designed to inform the public about electrosmog and electrosensitivity. The dot org website is a more formal website that provides a list of my publications. Both websites went live on October 14, 2009.

Below is a list of articles (blogs) on the website in reverse chronological order.

DATE	#	TITLE
Dec 2011	140	Dr Oz on PEMF therapy and pain relief, in prep.
Oct 2011	139	Want to learn more? Course on Electrosmog & Electrosensitivity
[4]	138	Health Canada needs to issue warning about Wireless Baby Monitors
	137	Peterborough City Council disagrees with cell tower site
	136	Advice for Health Canada regarding Wi-Fi, cell phone antennas, and other forms of radio frequency emitting devices
Sept 2011	135	Ontario School replaces Wi-Fi with Wired Internet
Aug 2011	134	Open Letter to Steve Jobs
[3]	133	Cell Phones and Head Blemishes in Adolescents: Is it Melanoma?
	132	How to properly read a scientific paper–Adolescent brain tumours and mobile phones.
July 2011	131	Mercury in broken CFL bulbs can exceed safe exposure levels for humans!
[3]	130	Conflict of Interest: The Wireless Industry and ICNIRP
	129	Health Canada confused about WHO Classification
June 2011	128	International Experts' Perspective on the Health Effects of Electromagnetic Fields (EMF) and Electromagnetic Radiation (EMR)
[5]	127	KPRD School Board silences opposition to WiFi in Schools
	126	Workers Health and Safety Centre, Radiation from Cell Phones
	125	School boards gagging dissent over WiFi, Peterborough
	124	WHO's new classification of RFR: What does this mean for Canada?

May 2011	123	May 2011: A month in review–IARC, WHO radio frequency possible human carcinogen; PACE dangers of electromagnetic fields
[2]	122	CN Tower Edgewalk: Thrill seekers may get more than they paid for. Pick of the Week 26
Apr 2011	121	Pick of the Week 25: Review of International Microwave Exposure Guidelines form 1957 to 1968
Mar 2011	120	Multiple Sclerosis and Dirty Electricity
[3]	119	Pick of the Week 24: Microwave Radiation affects the Heart
	118	Cell phones affect brain–what about cell towers?
Feb 2011	117	Cell Phone Study Warning
[9]	116	Musing #2: Truth Speaking vs Fear Mongering
	115	Musing #1: WiFi in Schools–a Ticking Time Bomb
	114	Pick of the Week 23: Research on Biological effects of Radio Frequency Radiation in Eurasian Communist Countries, 1976
	113	Pick of the Week 22: A Very Important Symposium!
	112	Pick of the Week 21: Physical Basis of Electromagnetic Interactions with Biological Systems
	111	Pick of the Week 20: Early Research on the Biological effects of Microwave Radiation: 1940-1960
	110	Pick of the Week 19: Index of Publications on Biological Effects of Electromagnetic Radiation (0-100 GHz)
	109	Oregon introduces cellphone radiation legislation
Jan 2011	108	Swiss Government’s advice about Mobile Phone Use
[4]	107	Multiple Sclerosis and Electrohypersensitivity
	106	Havas Report on Smart Meters for CCST
	105	Population Control and Microwave Radiation
Dec 2010	104	Taming the Microwave Dragon
[7]	103	WiFi in Alberta Schools: A debate
	102	Science 101: Weight-of-Evidence and Weight-of Warning
	101	Canada House of Commons Microwave Radiation now Available
	100	Smart Meter Installation Challenged
	99	Are Wireless Smart Meters Safe?
	98	Pick of the Week #18: Effect of Microwaves on the Central Nervous System 1965–German translation

	97	Wireless Smart Meter Kills Plant
Nov 2010	96	School Board threatens to fine Parents and expel Students because of WiFi concerns
[9]	95	If WiFi harms trees, what about children?
	94	Wireless internet via LED “Smart” Lighting
	93	Pick of the Week #17: Power Frequency Electromagnetic Fields
	92	Brain Tumour risk and Mobile Phone use
	91	DECT Baby Monitors may be Dangerous
	90	Non-thermal Effects and Mechanisms between EMFs and Living Matter
	89	Important Review on Biological Effects of Antennas by Levitt and Lai 2010
	88	Pick of the Week #16: Russian Translation Microwave Radiation influence on Man and Animals (1970)
Oct 2010	87	New Study: Radiation from Cordless Phone Base Station affects the Heart
[6]	86	Free Fiber for Swiss Schools–WiFi Warnings
	85	Pick of the Week #15: Russian Translations on Biological Effects of Magnetic Fields and Radio Frequency Radiation.
	84	Pick of the Week #14: Proposal for Legislation: Non-ionizing Radiation (1979)
	83	Is induction Cooking Safe?
	82	Pick of the Week #13: Microwave Studies with Human Subjects, 1966.
Sept 2010	81	Open Letter to Medical Officer of Health about WiFi in Schools
[12]	80	Disconnect–The Corruption of Science
	79	Pick of the Week #12: Why Pulsed Microwave Frequencies are more Harmful.
	78	Is What Space Super WiFi Dangerous?
	77	OAHPP Comments on WiFi and Health
	76	Pick of the Week #11: Potentially Harmful Radio Frequencies used in the Packaging and Food Industry
	75	Lady Gaga–Lupus and Electrosensitivity?
	74	Pick of the Week #10: Navy Tested Microwaves on Military Volunteers

	73	Cell Phones and WiFi are Safe = Not
	72	Pick of the Week #9: 0.95 and 2.45 GHz most Lethal Microwave Frequencies
	71	WHO admits “conflicts of interest”
	70	Pick of the Week #8: Repacholi Revises Safety Code 6
Aug 2010	69	Barrie Trower speaks about Microwave Radiation
[7]	68	Real estate devalues when cell towers are erected.
	67	Pick of the Week #7: Hazards of Microwave Radiations–Review from 1960
	66	Digital portable phones affects the Heart!
	65	Pick of the Week #6: Clinical and Hygienic aspects of exposure to Electromagnetic Fields
	64	WiFi in Schools and the Health Effects of Microwaves
	63	Pick of the Week #5: Why the double standard?
July 2010	62	Study finds Vatican Radio causes cancer
[7]	61	WiFi “Laptops” affect male fertility
	60	Pick of the Week #4: Cancer Mortality near Air Force Bases
	59	Adding light to heat of WiFi debate
	58	Pick of the Week #3: 1967 EMR Review, copy 5/15
	57	Pick of the Week #2: Origins of 1966 U.S. Safety Standards for Microwave Radiation
	56	Pick of the Week #1: More than 2000 Documents prior to 1972 on Bioeffects of Radio Frequency Radiation.
June 2010	55	New iPhone 4 reception problem is good news.
May 2010	54	Lessons from the Interphone Study
[2]	53	Interphone Study: It’s not just brain tumors!
April 2010	52	Moore’s Cancer Centre Doctor discusses cell phone tumour link
[5]	51	How to BRAG Rate your School
	50	CBC Podcast on the dangers of wireless technology
	49	BRAG School Report–Media Advisory
	48	Welcome to Planet Irth
March 2010	47	Live Blood Cells and Electrosmog
[4]	46	Diabetes and Electrosensitivity
	45	Wireless Concerns at Lakehead University

	44	Dr. Havas lectures at Total Health Show in Toronto
Feb 2010	43	From Zory's Archive
[4]	42	What do dancing cows and zapped dogs have in common?
	41	Cell phone antennas on apartment buildings?
	40	Google offers alternative to WiMax
Jan 2010	39	EM Hypersensitivity Awareness Month, Harbour Grace, NFL
[5]	38	Mobile-Boro Man
	37	Cell Phone Antennas and Cost of Electricity
	36	Open Letter–WiFi in Libraries
	35	Open Letter–WiFi in Schools (#2)
Dec 2009	34	University says “NO” to WiFi and Cellular Antennas
[6]	33	What is Dirty Electricity?
	32	Prevention exposes Dirty Electricity
	31	Dirty Electricity and GS Units
	30	Electrification causes “disease of civilization”
	29	New EMF website by Dr. Mercola
Nov 2009	28	Don't stand in front of the microwave
[8]	27	Power Line Protest
	26	Thousands turn up for the Power-Line Protest
	25	Residents Fight Proposed Power Expansion
	24	Edmonton Power Line Protest
	23	Prevention Magazine on CFL Bulbs
	22	Heart murmur and Portable Digital Phones
	21	Cell Phones & Cigarettes: What do they have in common?
Oct 2009	20	Open Letter: WiFi in Schools (#1)
[20]	19	WiFi Proposal for San Francisco
	18	Expert Testimony Broadcast Antenna
	17	Dirty Electricity in Schools
	16	Expert Testimony High Voltage Transmission Line
	15	Cell Tower Blues
	14	Mechanisms of Action, Dr. Andrew Goldsworthy
	13	Cell Transmission Towers

12	CWTI: Libby Kelley and Magda Havas
11	Conference: Holistic Health NOW, AHMA, Ohio, Nov 2009
10	Epilepsy 360 degrees
9	Electromagnetic Sensitivity Awareness Month
8	The Dark Side of CFL Bulbs
7	Dr. Martin Blank Lecture on EMF and Cancer
6	Rethink Breast Cancer
5	EHS Quiz
4	Cell Phones
3	Wind Power and Dirty Electricity
2	Conference: EMF Impacts on Human Health, Colorado, Nov 2009
1	Global TV–dirty electricity

## 9 COURSES AT TRENT UNIVERSITY

### UNDERGRADUATE COURSES AT TRENT UNIVERSITY, 1989 TO PRESENT

**First Year Courses:**

INTRODUCTION TO ENVIRONMENTAL ISSUES, science course for 1<sup>st</sup> year undergraduate students, 1989-2004 and 2005-present; team taught. (Course coordinator 1991-1994.)

THINKING AND LEARNING first year course, 2001-2003, course coordinator, co-taught with instructors from Psychology, Education, English, Anthropology, Native Studies, Special Needs, and Academic Skills.

**Second Year Courses:**

SCIENCE AND POLICY, course for 2<sup>nd</sup> year students, co-taught with Professor Stephen Bocking, 1999-2000.

DISCOVERING SCIENCE, science course for 2<sup>nd</sup> year arts students, 1992-93.

**Third Year Courses:**

BIOLOGICAL EFFECTS OF ELECTROMAGNETIC FIELDS science course for 3<sup>rd</sup> and 4<sup>th</sup> year students, 1995 to present.

POLLUTION ECOLOGY, environmental science course for third and 4<sup>th</sup> year students, 1994-present, co-taught with Professor Tom Hutchinson. Offered alternate years (even-numbered years)

ENVIRONMENTAL SCIENCE, for 3<sup>rd</sup> and 4<sup>th</sup> year undergraduate science students, Science Education, 1989-2008. Offered alternate years (odd-numbered years).

ENVIRONMENTAL COMMUNICATION, (*replaced Communicating Science 2003/4*) for 3<sup>rd</sup> and 4<sup>th</sup> year undergraduate science students, Science Education, 2009-present. Offered annually.

AQUATIC TOXICOLOGY, for 3<sup>rd</sup> and 4<sup>th</sup> year undergraduate students, Environmental and Resource Studies, Trent University, 1990-1991, co-taught with Professor Doug Evans.

WATER POLLUTION, for 4<sup>th</sup> year undergraduate students, co-taught with Professor Jim Buttle, 1989/90.

**Forth Year Courses:**

GROUP PROBLEM SOLVING, arts course for senior undergraduates, co-taught with Professor Stephen Regoczei, 1995 to 2003. Offered alternate years.

HONOURS THESIS, thesis management and communication skills for 4<sup>th</sup> year undergraduate students, 1989-present. Coordinator 2000-2004; 2011-2012

READING COURSE, various topics dealing with the environment or with education, 1989-present

**Graduate Courses:**

WATERSHED ECOSYSTEM GRADUATE PROGRAM, science communication for graduate students, Trent University, 1990-2003.

TECHNICAL SCIENCE WRITING, for senior graduate students, WEGP, half credit course running full year, 2003-2006.

**Guest Lectures in following Trent Courses:**

FIRST YEAR ENVIRONMENTAL SCIENCE, when I am not normally lecturing in this course

BIOREGIONALISM, Wadland and Whillans

HONOURS THESIS (ES401/402): four 2-hour guest lectures annually

ENVIRONMENTAL IMPACT ASSESSMENT AND ECOLOGICAL PRINCIPLES (ER308)

PHILOSOPHICAL APPROACHES TO SCIENCE (WF 500a)

ECOLOGICAL AGRICULTURE, Tom Hutchinson

WASTE MANAGEMENT, Barbara Wallace

**Non-Trent Summer Course for High School Students**

SHAD VALLEY SUMMER PROGRAM for exception high school students, Co-Director; Trent-Bark Lake-Shad Valley, June 1997; Co-Director again in 2005.

**10 COMMITTEES**

**INTERNATIONAL**

- 2011-pres INVITED GUEST EDITOR: Special Issue *Bulletin of Science, Technology and Society*, Electromog, Electrosensitivity, Electrodiagnostics and Electrotherapies.
- 2010-pres SCIENCE ADVISOR: Electromagnetic Radiation Research Foundation of South Africa (EMRRFSA); [www.emrrfsa.org/](http://www.emrrfsa.org/)
- 2006-pres. ADVISOR: Nationaal Platform Stralingscrisico's in the Netherlands  
ADVISOR: HESE, UK  
ADVISOR: EM Radiation Trust, UK  
ADVISOR: Council on Wireless Technology Impacts  
MEMBER: International Commission on Electromagnetic Safety (ICEMS)
- 2004-pres. ADVISOR: EMR Policy Institute, Marshfield Vermont.
- 2003-4 ADVISOR: International Association of Fire Fighters
- 1996-7 ADVISOR: Great Lakes Science Advisory Board Workgroup on Emerging Issues. International Joint Commission, Canada/US.
- 1993-96 ADVISOR: Environmental Science Program for Tribhuvan University,

- Nepal.
- 1988 SCIENCE ADVISOR: Public Focus; BARK (Backyard Acid Rain Kit) Program which is to be used in school across Canada and the United States.
- 1988 SCIENCE ADVISOR: Lakes 2000, on their Great Lakes Public Awareness Program.
- 1981 MEMBER: Forest Sub-Committee, US/Canada Scientific Committee on Acid Rain, Huntington Forest, N.Y., September 1-3, 1981.
- 1980 ADVISOR: Acid Rain Coalition, Joint US/Canadian Committee on Acid Rain, Michigan 1980.
- 1978 CO-ORGANIZER (with T.C. Hutchinson): NATO Advanced Institute Workshop on Effects of Acidic Deposition on the Terrestrial Ecosystem, Toronto, May 21-25, 1978.

---

## NATIONAL

---

- 2010-pres. CO-FOUNDER: Electro Sensitive Society, [www.electrosensitivitysociety.com](http://www.electrosensitivitysociety.com)  
 ADVISOR: Citizens for Safe Technology Society, [www.citizensforsafetechnology.org](http://www.citizensforsafetechnology.org)
- 2009 RETA, Responsible Electricity Transmission for Albertans, Edmonton Alberta, November 2009
- 2006-pres. CO-FOUNDER and ADVISOR: WEEP Initiative, Canada. [www.weepinitiative.org](http://www.weepinitiative.org)
- 2005 Adviser, SWEEP (Safe Wireless Electrical and Electromagnetic Policy), July 2005
- 2002 PEI, Cell Phone Towers, May 2002
- 2002 REVIEWER: National Policy Research Awards.
- 1993-1998 ASSOCIATE DIRECTOR: KEY Foundation (Knowledge of the Environment for Youth).
- 1991-1993 EDITOR: *KEYnotes*, Environmental Newsletter sent to 17,000 educators across Canada.
- 1988 SCIENCE ADVISOR: Trees for Today and Tomorrow on their Tree-Decline School Program
- 1988 SCIENCE ADVISOR: Boy Scouts of Canada on their Tree-Decline Program
- 1985-1993 DIRECTOR: KEY Foundation (Knowledge of the Environment for Youth).
- 1988-1990 MEMBER: Science and Technology Advisory Committee, CBC.
- 1987 COORDINATOR: Twenty-Second Canadian Symposium on Water Pollution Research, University of Toronto, February 19, 1987.

---

**PROVINCIAL**

---

- 2011-present MEMBER: Expert Working Group on Ground Current, Ontario Ministry of the Environmental
- 2006 ADVISOR: Private Member's Bill, Ground Current Pollution Act, Mpp2006.080.e5-CW in Ontario.
- 2005 TRAHVOL, Tsawwassen Residents Against Higher Voltage Overhead Lines, Vancouver, BC. October 2005
- 2004 Adviser, STOP (Stop Power lines Over People), Markham, Ontario
- 1988-1990 MEMBER: Environmental Appeal Board, Ontario.

---

**LOCAL**

---

- 1999-2004 EDITOR: View from Trent, in cooperation with the Peterborough Examiner, fortnightly column written by Trent Faculty. See end of this section for list of articles.
- 1998, 2000 JUDGE: Science Fair, Trent University, Peterborough, ON.
- 1996 MEMBER: Co-ordinating Committee, Conference on Environmental Health and Alternative Medicine.
- 1992 EVALUATOR: Science Fair Competition, Peterborough.
- 1989-1991 MEMBER: Peterborough Committee on Sustainable Development, Mayor's Committee.

---

**TRENT UNIVERSITY (incomplete list)**

---

- 2011-12 Student Awards, ERS
- 2010-11 Hill Tenure Committee, ERS  
Student Awards, ERS
- 2008-9 Curriculum Committee, ERS  
Hill Probationary Reappointment Committee, ERS  
Merit Committee, ERS  
Student Awards, ERS  
Website Committee, ERS
- 2002-pres MEMBER: Institute for Health Studies (now Centre for Health Studies)
- 2002-3 CHAIR: Senate Budget Subcommittee on Graduate Studies
- 2002-3 MEMBER: Senate Budget Subcommittee, Trent University
- 2002-3 MEMBER: Senate, Trent University
- 2002 MEMBER: Management Committee, Oliver Ecological Centre
- 2002 CO-ORDINATING TEAM: Simply Water? Workshop, Trent

University, Peterborough, On, February 18-20, 2002

2000-04 MEMBER: Interactive Learning Centre (ILC)

2000-01 MEMBER: Search Committee for Chair of ERS Program

2000-01 MEMBER: COTTL

2000-01 MEMBER: Indigenous Environmental Studies Program (IESP)  
Steering Committee

2000 ORGANIZER: David Shepperd Family Lecture Series with Dr. Sheela Basur, Medical Officer of Health, Toronto and later Ontario.

1995-97 Board of Governors  
Board of Governors-Development Committee  
Senate  
Faculty Council Steering Committee  
Faculty Board  
WEGP--ERS Representative  
ERS REPRESENTATIVE: Arctic College

1994-2000 MEMBER: Health Research Group Health Research Group

1994-97 Trent International Program Committee

1996 Trent International Program--Recruitment

1995-97 MEMBER: Board of Governors, Trent University.

1995-2004? CO-FOUNDER and MEMBER: TAcTIC, Trent Academic Technological Innovation Centre

1994-2002 MEMBER: Health Working Group, Trent University

1994-98 CO-ORDINATOR: Energy Fields Working Group, Trent University

1994 MEMBER: PEAC, President's Environmental Advisory Committee  
MEMBER: Tenure Committee for Raul Ponce, ERS Program  
MEMBER: Search Committee for Director of WEGS Program  
MEMBER: Search Committee for Chair of ERS  
MEMBER: PPP-CMT, Computer and Technology for Teaching Committee

1992-1994 MEMBER: Senate, Trent University  
MEMBER: Board of Governors, Trent University  
MEMBER: President's Advisory Environmental Committee

1992-pres MEMBER: ERS Personnel Committee

1991-92 MEMBER: Adjusting our Focus Forum, Teaching Methods Subcommittee

1991-1993 MEMBER: Chemistry, First Year Courses Committee  
COORDINATOR: Library Acquisitions for Environmental & Resources Studies.  
COORDINATOR: Environmental Resource Centre

- 1990-93 MEMBER: Committee on Educational Development, (originally known as the Teaching Effectiveness Committee), Trent University Committee  
MEMBER: Visitors Committee, Lady Eaton College
- 1990-92 COORDINATOR: BEGIN newsletter
- 1990 COORDINATOR: Science in Developing Countries, Trent International Program, Trent University, Peterborough, Ontario, March 2 to 30.
- 1989-pres. MEMBER: Watershed Ecosystem Graduate Program.
- 1989-94 COORDINATOR: Library Acquisitions for Science Education.
- 1989-93 COORDINATOR: Library Acquisitions for Science Education.
- 1989-90 MEMBER: Admissions and Scholarships

---

## UNIVERSITY OF TORONTO

---

- 1985-87 COORDINATOR: Drinking Water Working Group (DWWG), Institute for Environmental Studies, University of Toronto.
- 1986-89 COORDINATOR: Ecology Seminar Series, Institute for Environmental Studies, University of Toronto.
- 1983-89 MEMBER: Acid Rain Working Group, Institute for Environmental Studies, University of Toronto.
- 1983-89 MEMBER: Metals Working Group, Institute for Environmental Studies, University of Toronto.
- 1983-89 MEMBER: Forest Decline Working Group, Institute for Environmental Studies, University of Toronto.
- 1987-89 MEMBER: Research Advisory Committee, Faculty of Forestry, University of Toronto.
- 1987 MEMBER: Graduate Studies Advisory Committee, Faculty of Forestry, University of Toronto.

## 11 INITIATIVES IN TEACHING AND COMMUNITY OUTREACH

- 2002-4 EXECUTIVE EDITOR: Trent Times, Newspaper of the Trent University Faculty Association
- 2000-4 COORDINATOR: SPARK, NSERC funded program for student writing about research
- 1997 DESIGNER: Trent Research Map indicates research of Trent faculty around the globe. Also indicates where students come from (International Program)

- 1996 MEMBER: TacTic, Trent Academic Technological Innovation Centre, to design educational software and other educational initiatives
- 1994-6 COORDINATOR: Energy Fields Working Group brought together members of the Peterborough Community with Trent faculty and students to discuss energy fields. Meetings held every other month.
- 1992 PRINCIPLE INVESTIGATOR: Design, Development and Marketing of Education Software DDAMES; computer program development designed to enable students to interact with the virtual world and solve environmental problems.

## 12 REVIEWER: GRANTS AND MANUSCRIPTS

- 2010 The American Journal of Medical Sciences,  
2008 Parlar Scientific Publications, Fresenius Environmental Bulletin,  
Germany,  
2008 Acta Pharmacologica Sinica,  
2007 British Medical Journal, London  
1995 Rutledge Press,  
1992 Environmental Reviews,  
1986 International Association on Water Pollution Research and Control,  
1985 Water, Air and Soil Pollution,  
1985 Hydrobiologia,  
1985 Canadian Journal of Zoology,  
1984 Environmental Science and Technology,  
1984 Canadian Journal of Fisheries and Aquatic Sciences,  
1982 Science,  
1981 National Science Foundation, (Grant Reviewer)

## 13 ENVIRONMENTAL ORGANIZATIONS

I am Co-founder of the **WEEP Initiative** and the **Electrohypesensitivity Society**. Both are non-profit organizations dedicated to helping people who have developed electrohypersensitivity.

I am Co-founder and Past President of the **Uxbridge Conservation Association**, which is a local non-profit organization aimed to promote a deeper understanding of and a greater appreciation for the natural environment and agricultural land. This group act as a liaison between government and local citizens, they organize lectures and field trips, they also co-ordinate projects within our community that contribute to a cleaner, safer, healthier environment for people and wildlife (1988-1991).

I was a member of the Board of Directors of the **KEY** (Knowledge of the Environment for Youth), which is a non-profit organization dedicated to educational excellence in Canada (1985-1994). One of our projects is the *Chemical Literacy Series*, which is aimed at promoting a better understanding of chemicals in the environment and is intended for teachers (kindergarten to high school) and their students across Canada. We organize workshops for teachers and co-ordinate the production of classroom material. In 1992 I became editor of *KEYnotes*, an environmental newsletter that is sent to every school in Canada (13,000) 3 times during the academic year.

## 14 VOLUNTEER WORK

I taught a Creative Writing course called *Writing Your Memoirs* to Senior Citizens through **Community Care** in Uxbridge (1988-92). In 1990 we wrote a “book” called *Capturing Memories*, and in 1991 we wrote a children’s book. The Seniors have continued and have written several more books. They regularly contribute articles to the local newspaper (*Uxbridge Times*); give guest workshops in the Uxbridge High School; visit homes for senior citizens and read form their stories; give advice to other senior groups wanting to start a writers’ group; and have appeared on *CBC Ideas*.

I also worked with chronically ill patients in the **Uxbridge Cottage Hospital** (1988-1991).

## 15 OTHER

For 18 years I lived on a farm and raised heritage breeds (rare in Canada of sheep (Cotswolds), pigs (British Large Black); and chickens (several breeds) along with non-heritage breeds of ducks, geese, and donkeys. We were members of the Rare Breeds Conservancy of Canada and helped maintain important and dwindling pools of genetic diversity of farm animals.

her Guardian *ad litem* and father,  
David Mark Morrison, and  
**David Mark Morrison**, individually,

v.

**Portland Public Schools,**

Defendant.

Civil Action No.

**Declaration of  
Dr. David O. Carpenter, M.D.**

I, Dr. David O. Carpenter, M.D., under penalty of perjury pursuant to 28 U.S.C. § 1746, hereby make the following declaration in support of a preliminary and permanent injunction enjoining Portland Public Schools' use of WI-FI:

1. I am a public health physician, educated at Harvard Medical School. My current title is Director of the Institute for Health and the Environment at the University at Albany and Professor of Environmental Health Sciences within the School of Public Health. Formerly, I was the Dean of the School of Public Health at the University of Albany and the Director of the Wadsworth Center for Laboratories and Research of the New York State Department of Health.

2. I served as the Executive Secretary to the New York State Powerlines Project in the 1980s, a program of research that showed children living in homes with elevated magnetic fields coming from powerlines suffered from an elevated risk of developing leukemia. After this I became the spokesperson on electromagnetic field (EMF) issues for the state during the time of my employment in the Department of Health. I have published several reviews on the subject and have edited two books.

3. I am a Co-Editor and a Contributing Author of the *BioInitiative: A Rationale for a Biologically-based Public Exposure Standard for Electromagnetic Fields (ELF and RF)*, [www.bioinitiative.org](http://www.bioinitiative.org). It documents bioeffects, adverse health effects and public health conclusions about impacts of non-ionizing radiation (electromagnetic fields including extremely-low frequency ELF-EMF and radiofrequency (RF) /microwave or RF-EMF fields). The public health chapter from this report was subsequently published in a peer reviewed journal.

4. Additionally, I am a Co-Author of *Setting Prudent Public Health Policy for Electromagnetic Field Exposures*, *Reviews on Environmental Health*, Volume 23, No. 2, 2008, attached as Addendum A-2.

5. In addition, in 2009, I was invited to present to the President's Cancer Panel on the subject of powerline and radiofrequency fields and cancer, and have testified on this issue before the United States House of Representatives.

6. I am a public health physician who has been involved in issues related to EMF for a number of years.

7. It is generally accepted within the relevant scientific community and has been established beyond any reasonable doubt that many bioeffects and adverse health effects occur at far lower levels of RF exposure than those that cause measurable heating; some effects are shown to occur at several hundred thousand times below the existing public safety limits, which are set based on the fallacious assumption that there are no adverse health effects at exposures that do not cause easily measureable heating.

8. Exposure to EMF has been linked to a variety of adverse health outcomes. The health endpoints that have been reported to be associated with ELF and/or RF include childhood leukemia, adult brain tumors, childhood brain tumors, genotoxic effects (DNA damage and micronucleation), neurological effects and neurodegenerative disease (like ALS and Alzheimer's), immune system dysregulation, allergic and inflammatory responses, breast cancer in men and women, miscarriage and some cardiovascular effects. The strongest evidence for adverse health effects of EMFs comes from associations observed in human populations with two forms of cancer: childhood leukemia and chronic lymphocytic leukemia in occupationally exposed adults.

9. There is also strong evidence for elevated risk of brain cancer following long use of cell phones, but only on the side of the head where the cell phone is used regularly.

10. There is suggestive to strongly suggestive evidence that RF exposures may cause changes in cell membrane function, cell communication, metabolism, activation of proto-oncogenes, and can trigger the production of stress proteins at exposure levels below current regulatory limits. Resulting effects can include DNA breaks and chromosome aberrations, cell death including death of brain neurons, increased free radical production, activation of the endogenous opioid system, cell stress and premature aging, changes in brain function including memory loss, retarded learning, performance impairment in children, headaches and fatigue, sleep disorders, neurodegenerative conditions, changes in immune function (allergic and inflammatory responses), reduction in melatonin secretion and cancers.

11. There is also strong and consistent evidence for increased risk of leukemia in individuals who live near to high power AM radio transmission towers. This is particularly relevant because like WI-FI, radio transmission towers give continuous whole body radiation, not just to the head. In addition WI-FI transmitters are indoors, where children may be very close to them.

12. Like second-hand smoke, EMF is a complex mixture, where different frequencies, intensities, durations of exposure(s), modulation, waveform and other factors are known to produce variable effects. *Many years of scientific study has produced substantial evidence that EMF may be considered both carcinogenic and neurotoxic.*

13. Sources of concern include, but are not limited to, power lines, cell and cordless phones, cell towers, Portland Public Schools' WI-FI, WiMax and wireless internet.

14. Based on existing science, many public health experts believe, myself included, that it is possible we will face an epidemic of cancers in the future resulting from uncontrolled use of cell phones and increased population exposure to WI-FI and other wireless devices. Thus it is important that all of us, and especially children, restrict our use of cell phones, and limit exposure to background levels of WI-FI.

15. Children are more vulnerable to RF fields because of the susceptibility of their developing nervous systems. RF penetration is greater relative to head size in children, and they have a greater absorption of RF energy in the tissues of the head at WI-FI frequencies because their skulls area thinner, their brains are smaller, and their brain tissue is more conductive than that of adults since it has a higher water content and ion concentrations. The Presidential Cancer Panel found that children 'are at special risk due to their smaller body mass and rapid physical development, both of which magnify their vulnerability to known carcinogens, including radiation.'

16. The exposure of children to RF has not been studied extensively, although one study from Sweden reports that regular use of a cell phone by children increases risk of development of brain cancer by a factor five times greater than that observed in adults. However, the FCC standards for exposure to radiofrequency radiation are based on the height, weight and stature of a 6-foot tall man, not scaled to children or adults of smaller stature. They do not take into account the unique susceptibility of growing children to exposures. Moreover, there is clear and strong evidence that intensive use of cell phones increases the risk of brain cancer, tumors of the auditory nerve, and cancer of the parotid gland, the salivary gland in the cheek by the ear. WIFI uses similar radiofrequency radiation (1.8-2.5 to 5.0 GHz), although the intensity of exposure in the immediate environment is much lower than what one gets from holding a cell phone close to their head. The difference between a cell phone and a WI-FI environment, however, is that while the cell phone is used only intermittently a WI-FI environment is continuous. In addition WI-FI transmitters are indoors, where children may be very close to them. Because radiation is the same as those for cell phones, there is every reason to assume that the health effects would be the same, varying only in relation to the total dose of radiation. There is evidence from Scandinavian studies of cell phone usage that children who use cell phones are about five times more likely to develop brain cancer than if use starts as an adult. Thus, it is especially important to protect children.

17. There is reason to believe that children are susceptible to the effects of EMF exposure since they are growing, their rate of cellular activity and division is more rapid, and are at more risk for DNA damage and subsequent cancers. Growth and development of the central nervous system is still occurring well into the teenage years so that neurological changes may be of great importance to normal development, cognition, learning, and behavior. Prenatal exposure to EMF has been identified as a risk factor for childhood leukemia. Children are largely unable to remove themselves from exposures to harmful substances in their environments. Their

exposure is involuntary.

18. When WI-FI is installed in a school, children and their parents have no choice but to allow the school to expose themselves/their children. In fact, the children will be exposed to as much as 30-40 hours per week of constant digitally encoded WI-FI signals from each wireless device in the child's vicinity. Based upon a review of the Mount Tabor WI-FI Floor Plan, a given child is subject to direct signals from multiple WI-FI transmitters and rooms full of students transmitting numerous laptop or other wireless signals. There is a major difference between an exposure that an individual chooses to accept and one that is forced on an individual who can do nothing about it, especially a child.

19. In biology and medicine there is nothing that is 100 percent proven. We rely on statistical significance and weight of evidence when drawing conclusions about health effects. When one uses these definitions there is strong scientific evidence for adverse health effects of WI-FI in humans.

20. The evidence for adverse effects of radiofrequency radiation is currently strong (beyond just a known controversy) and grows stronger with each new study. Educating by way of the internet via cabled systems does not increase exposure.

21. Based on a high degree of medical certainty, Portland Public Schools' use of WI-FI is causing and will continue to cause Alexandra Morrison, other students, and school staff and faculty adverse health effects and should be discontinued immediately.

Dated this 1<sup>st</sup> day of June, 2011.

## **Wireless Smart Meters and Potential for Electrical Fires**

Commentary by Cindy Sage, Sage Associates and James J. Biergiel, EMF Electrical Consultant July 2010

Typical gauge electrical wiring that provides electricity to buildings (60 Hz power) is not constructed or intended to carry high frequency harmonics that are increasingly present on normal electrical wiring. The exponential increase in use of appliances, variable speed motors, office and computer equipment and wireless technologies has greatly increased these harmonics in community electrical grids and the buildings they serve with electricity. Harmonics are higher frequencies than 60 Hz that carry more energy, and ride along on the electrical wiring in bursts. Radio frequency (RF) is an unintentional by-product on this electrical wiring.

It may be contributing to electrical fires where there is a weak spot (older wiring, undersized neutrals for the electrical load, poor grounding, use of aluminum conductors, etc.). The use of smart meters will place an entirely new and significantly increased burden on existing electrical wiring because of the very short, very high intensity wireless emissions (radio frequency bursts) that the meters produce to signal the utility about energy usage.

There have now been electrical fires reported where smart meters have been installed in several counties in California, in Alabama, and in other countries like New Zealand. Reports detail that the meters themselves can smoke, smolder and catch fire, they can explode, or they can simply create over-current conditions on the electrical circuits.

Electrical wiring is not sized for the amount of energy that radio frequency and microwave radiation have. These unintended signals that can come from new wireless sources of many kinds are particularly a worry for the new smart meters that produce very high intensity radio frequency energy in short bursts. Electrical fires are likely to be a potential problem.

Electrical wiring was never intended to carry this – what amounts to an RF pollutant – on the wiring. The higher the frequency, the greater the energy contained. It's not the voltage, but it is the current that matters. RF harmonics on electrical systems can come from computers, printers, FAX machines, electronic ballasts and other sources like variable speed motors and appliances that distort the normal, smooth 60 hertz sine wave of electrical power and put bursts of higher energy RF onto the wiring.

Wireless smart meters don't intentionally use the electrical system to send their RF signal back to the utility (to report energy usage, etc). But, when the wireless signal is produced in the meter... it boomerangs around on all the conductive components and can be coupled onto the wiring, water and gas lines, etc. where it can be carried to other parts of the residence or building.

It is an over-current condition on the wiring. It produces heat where the neutral cannot properly handle it. The location of the fire does NOT have to be in close proximity to the main electrical panel where the smart meter is installed.

A forensic team investigating any electrical fire should now be looking for connections to smart meters as a possible contributing factor to fires. Every electrical fire should be investigated for the presence of smart meter installation. Were smart meters installed anywhere in the main electrical panel for this building? For fires that are 'unexplained' or termed electrical in nature, fire inspectors should check whether smart meters were installed within the last year or so at the main panel serving the buildings. They should question contractors and electricians who may have observed damage from the fire such as damage along a neutral, melted aluminum conductor or other evidence that would imply an over-current condition. They should also look for a scorched or burned smart meter, or burn or smoke damage to the area around the smart meter. Problems may be seen immediately, with a smart meter smoking or exploding. Or, it may be months before the right conditions prevail and a neutral circuit overloads and causes a fire. The fire may or may not be right at the smart meter.

- Any smart meter installed in a main panel might start an electrical fire in that building; it would not be necessary for the unit itself to have a smart meter. The RF emissions from any smart meter in the main panel might trigger an electrical fire at any location in the building served by this main panel because harmonics can and will travel anywhere on electrical wiring of that building.

Some questions that should be asked include:

- Were smart meters installed in the main electrical panel for this building? Problems may be seen immediately, with a smart meter smoking or exploding. Or, it may be months before the right conditions prevail and a neutral circuit overloads and causes a fire. The fire may or may not be at the smart meter.
- Is there damage at the smart meter itself (burning, scorching, explosion)?
- Was there fire damage, a source, or a suspicious area around the neutral where it connected to the main panel or at the breaker panel?
- Was the damage around a lug at a connection on the neutral conductor in the attic at Xanadu? Was there any indication of heating or scorching or other thermal damage around the neutral in the area of the fire?
- Was aluminum conductor present? Aluminum conductors that were installed in the '70s are today recognized as more of a problem for heating than copper wire. Was the aluminum, if present, showing heat damage or melting?

Even before smart meters were being installed widely in California, people who know something about EMF and RF were expressing concerns that this kind of thing would

likely happen (electrical fires due to overcurrent condition from RF signal). What is already postulated, and of concern, is that the rising use of equipment that put RF harmonics onto the electrical wiring of buildings may overload that wiring. Faulty wiring, faulty grounding or over-burdened electrical wiring may be unable to take the additional energy load.

PUC Docket 2011-262 Friedman on Remand  
Intervener DW et al Evidence 20 Evidence and Testimony from Other Cases  
Court Cases and Public Utilities Commission Cases

Category List Filed last updated 4/9/13, Item No.

Evidence 20 Evidence and Testimony from Other Cases, Court Cases and PUC

This category contains some documents from the original Smart Meter Opt Out Case at the Maine PUC, Elisa Boxer Cook et al 2010-0345, and the consolidated case numbers 2010-289, 2010-398, 2010-400 and 2011-085. It also contains expert testimony from an Oregon WiFi case that is currently proceeding in the Oregon courts. In that case, experts testified regarding RF radiation in the same frequency as our smart meters, and, if money were no object, these same experts could have been brought to Maine to testify by the OPA, the PUC or Interveners. Technology also allows us to Skype, and in this hearing, we should be doing so. This category also contains expert testimony from the Hydro Quebec proceedings on Smart Meters, and an Expert Witness Statement to Standing Committee off the Canadian House of Commons. In this way, the Interveners are presenting additional expert testimony that was not provided by the Complainant or PAO regarding adverse health effects caused by non-thermal radiation. These experts strengthen Intervener's submittals of peer-reviewed studies, as they attest to their value in determining the lack of safety of smart meters that emit at similar frequencies.

In the references below, the author is listed first. The title of the document as the title was entered into the docket is underlined. The actual/real document title is in brackets and bolded and italicized.

20.01 Suzanne Foley-Ferguson et al, ***Letter to Commissioners Urging No Cost Opt Outs***, MPUC Consolidated Docket 2010-345 et al; May 16, 2011. This document argues that any cost or fee for an opt out is discriminatory, unfair and unjust. Complainants point out that CMP identified health and other "Complaints to the Commission" as a High Risk in their Internal Risk Assessment of the approved AMI system. It argues that any cost to opt out of a device that even has the slightest possibility of causing harm to human health is discriminatory. Also discusses overstepping of easement.

[Filed in Docket 03/04/13; Item #375]

20.02 Marcinowski, Frank, Director, Radiation Protection Division, EPA  
ExhibitC\_SAFFcasefile ***Environmental Protection Agency [Letter to Janet Newton***  
***March 8, 2002]*** Summary: This document is a true copy of a response letter 20.03.

[Filed in Docket 03/04/13; Item #375]

20.03 Marcinowski, Frank, Director, Radiation Protection Division, EPA  
ExhibitCeparesponseSAFFcasefile ***Environmental Protection Agency Letter to Janet***  
***Newton March 8, 2002]*** This document combines two letters of the March 8, 2002 and July 16, 2002 in which the Environmental Protection Agency (EPA) replies to Janet Newton regarding the FCC standards. It states that FCC's standards do not apply to chronic, non-thermal exposure situations and that it is considered to be protective of

Category List Filed last updated 4/9/13, Item No.

effects arising from a thermal mechanism but not from all possible mechanisms. The EPA states that “*Therefore, the generalization by many that the guidelines protect human beings from harm by any or all mechanisms is not justified*”. It discusses the adverse effect level of 4W/kg, and points out that the FCC does not claim that their exposure guidelines provide protection for exposures to which the 4W/kg SAR basis does not apply (chronic and non-thermal). This letter was accompanied by a letter written in June of 1999 to Richard Tell of the Risk Assessment Work Group, in which the members of the RFIAWG identified certain issues that they had determined needed to be addressed in order to provide a strong and credible rationale to support RF guidelines. (See 20.04)

[Filed in Docket 03/04/13; Item #375]

20.04 Lotz, Gregory, ***Department of Health and Human Services, [Gregory Lotz, PhD, Chief, Physical Agents Effects Branch, Division of Biomedical and Behavioral Science, National Institute for Occupational Safety and Health, DHHS, June 17, 1999 DHHS Letter to Richard Tell Chair, IEEE SCC28 (SC4) Risk Assessment Work Group ExhibitD-DHHSlettTotell***

This letter outlines the RF Guideline Issues identified by members of the federal RF Interagency Work Group in June of 1999. The RFIAWG members believe that FCC needs to address all of these issues to provide credible rationale for FCC guidelines. Members and their organizations: Robert Cleveland, Senior Scientist, Federal Communications Commission (FCC), Larry Cress, US Food and Drug Administration (FDA), DCRH, Radiation Biology Branch, Robert A. Curtis, OSHA, US Department of Labor, Occupational Safety and Health Administration, Joseph A. Elder, US Environmental Protection Agency (EPA), Norbert N. Hankin, US EPA, Janet H. Healer, NTIA, Department of Commerce, Gregory W. Lotz, NIOSA, Russell D. Owen, US FDA, Chief, Radiation Biology Branch.

The seven-page letter outlines these issues that have yet to be addressed:

1. Biological basis for local SAR limit / dosimetry may not be applicable
2. Selection of an adverse effect level /
3. Addressing acute versus chronic exposures
4. One tier versus two tier guidelines
5. Controlled versus uncontrolled exposures / specific populations
6. Uncertainty factors/ how or if... extrapolate acute to chronic / variations among individuals/ inability for any single study to adequately address all possible adverse outcomes.
7. Intensity or frequency modulated (pulsed)
8. Time averaging / applicability to prolonged or chronic exposures?
9. Lack of peak limits for induced and contact current
10. Transient discharges
11. Limits for exposure at microwave frequencies/ issue of continuous exposure
12. Replication / Validation of studies/ definition should not be so restrictive to disallow reports that are valid but not exact replication of procedures or results.
13. Documentation of the Literature review process.

Category List Filed last updated 4/9/13, Item No.

14. Compatibility of RFR guidelines

[Filed in Docket 03/04/13; Item #375]

20.06a. Suzanne Foley-Ferguson et al, ***Exhibit A; Foley-Ferguson Letter To Dr. Dora Mills, Director of Maine Center for Disease Control (MCDC) and Prevention (MCDC)***. MPUC Docket 2010-345 & 398; November 11, 2010. This letter questions the thoroughness of the review by the Maine CDC because the conclusion of the report does not follow from the data. The MCDC admitted that it was not a comprehensive review, and they only reviewed the data for approximately three weeks. Dr. Bailey testified in this docket after questioning by Foley-Ferguson that it would be difficult to do a thorough review in that timeframe. The letter points out another review that lists the same studies but comes to a very different conclusion. (Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #375]

20.06b. Havas, Magda, ***Addendum A; Declaration of Expert Witness Dr. Magda Havas, in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools***, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, December 2011. This document from a court case in Oregon outlines the studies that Dr. Havas refers to in her expert testimony regarding RF radiation in similar frequencies as the Maine smart meters. She separates them into seven categories. The Interveners in the Maine PUC case, Friedman et al 2011-00262 present this as evidence to strengthen our presentation of studies in our other categories. We have uploaded many of the studies reviewed by Dr. Havas, however, this is an expert testifying that these are valid and good studies, not Interveners in this case simply stating it is so. She presents in this addendum some other studies that are also relevant to this case. [Copy filed in Docket]

20.06c. Havas, Magda, ***Addendum C; Declaration of Expert Witness Dr. Magda Havas, in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools***, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, December 2011. This document is relevant because Dr. Havas presents summaries of some “key” International Appeals on RF radiation based on current data. Interveners have listed and presented internet links to the full appeals in another category, but did not provide summaries of them. This seven-page addendum summarizes some of them for the Maine PUC in order for the MPUC to understand the relevance of the documents. [Copy filed in Docket]

20.07 Suzanne Foley-Ferguson et al, ***Exhibit B; Foley-Ferguson Letter to Maine PUC RE: Precautionary Principle***, MPUC Docket 2010-345 & 398; November 17, 2010. This letter explains the elements of the Precautionary Principle, which was, at that time found as the very first link on the Maine.gov site under cell phone information. Foley-Ferguson points out that it is important for the PUC to work under that principle when evaluating its’ decision to use wireless smart meters. Foley-Ferguson points out that new

Category List Filed last updated 4/9/13, Item No.

technology requires a paradigm shift in decision making principles due to the fact that often this technology is not pre-tested for safety. Precaution is required to prevent irreversible harm such as genetic damage from RF radiation in the population. The letter pulls the quotes from the Maine.gov website. It is presented as evidence that governmental commissions in Maine are allowed to determine when it is necessary to use the Precautionary Principle to protect the public. When absolute proof is not a given, and since the PUC “must ensure” safe utility service, then by necessity they need to use this principle. (Mislabelled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #375]

20.08 Suzanne Foley-Ferguson et al, ***Motion To Reconsider Order for Consolidated Cases; Order Part I & Part II; June 2011***, MPUC Docket 2010-345 & 398; July 12, 2011. This is the consolidated complainants motion to the Maine PUC to reconsider the Maine Opt Out Program with its initial charge and ongoing monthly charges. It notes that there is new information because the WHO reclassified RF radiation as a class 2B carcinogen after the deadlines for submission. The motion also argues that the PUC failed to address health effects and the adverse RF radiation effects created by meters other than those on ones own home. Complainants point to the Commission failing to address the legal issues surrounding CMP’s use of ones property to transmit other peoples data resulting in placing an antenna on someone’s home without permission (taking?) and / or charging them for not allowing their home to have the meter attached. It also argues that the initial opt out cost for Repeaters that may or may not even be purchased by CMP (per their statements), but will be paid for by opt out customers, is discriminatory. It also argues that requiring individuals to pay to maintain their long term health or short-term health (pacemakers, DBS) is also a discriminatory practice. Finally, the complainants argue that the opt out program is violating the Terms and Conditions of the easement and service. (Mislabelled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #375]

20.09 Suzanne Foley-Ferguson et al, ***Response to CMP’s Response to Reconsideration Request***, MPUC Docket 2010-345 & 398; August 4, 2011. These comments are pulled from the original opt out case to be included as evidence in this Docket. The letter pulls the quote from the Commission’s Order regarding their omission of determination of safety. The letter argued that one commissioner does have the knowledge to review the literature. Complainants also argued that the number of repeaters should be reconciled with actual numbers, and that the commission should re-visit wired meters. It says that the WHO’s classification and the fact that the EPA wanted to list RF radiation as a “probable carcinogen” in 1993 was “new” information to the docket. (Mislabelled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #375]

20.10 Suzanne Foley-Ferguson et al, ***Complaint to MPUC re: CMP AMI System***; MPUC Docket 2010-345; December 17, 2010. This complaint discusses FCC standards. It asks

Category List Filed last updated 4/9/13, Item No.

the Maine PUC to evaluate the health risks of wireless technology and the benefits of implementing alternatives to wireless AMI. Complainants allege that the original AMI proceedings did not fully evaluate all scenarios in light of possible health effects. This complaint specifically pushed for a wired alternative. It was consolidated with Boxer Cook and others 2010-345. The complainants argued for non-wireless meters in the form of PLC or Fiber Optic, and made the point that every Commission decision made at the conclusion of an adjudicatory proceeding shall include “findings of fact sufficient to apprise the parties and any interested member of the public of the basis for the decision.”(Commission Rules) However, no findings of facts regarding health or hardwiring were reported after original AMI hearing. (In this docket, this was mislabeled, as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #375]

20.11 Arthur Fitchenberg & Alan Golden testimony; *in Federal Communications Commission, In the Matter of Guidelines for Evaluating the Environmental Effects of Radiofrequency Radiation*, ET-Docket No. 93-62 and Report and Order FCC 96-326, Washington, D.C. 20554. This document is a combination of more than one letter. It includes a letter from Alan Golden, of Seattle Washington to the FCC opposing their rules. The letter attaches documents the FCC Docket (93-62) in the matter that included evaluating changes in the rules for the FCC in 1996 at the time when the current FCC standards were being considered. Mr. Golden points out a number of things including: Section 253 of the Telecommunications Act of 1996 Congress explicitly grants states authority to assure public safety - which includes jurisdiction to set state tort liability and share with the Commission other authority as long as complying with state law would make it impossible to also comply with Commission rules. This document also includes a letter from the EPA to David Fichtenberg in October of 1996 pointing out that the FCC does not claim that their new exposure guidelines provide protection for effects to which the 4W/kg SAR basis does not apply. When they developed their standards, they felt there was sufficient information on thermal exposure effects to develop a base standard, but they wanted more on non-thermal before setting a guideline. The EPA states, “*the effects information is not yet sufficient to be used to develop exposure criteria to protect the public against adverse human health effects*”; thus none were developed. EPA continues, “*The thesis that the 1992 ANSI/IEEE recommendations are protective of all mechanisms of interaction is unwarranted because the adverse effects level in the 1992 ANSI/IEEE standards are based on a thermal effect*”. (Mislabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #380]

20.12 Trower, Barry, *Amended Declaration of Expert Witness Barrie Trower, in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools*, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, December 2011. This document is the expert witness

Category List Filed last updated 4/9/13, Item No.

testimony of Barry Trower regarding microwaves in a case in Oregon. He explains that knowledge of microwave sickness, which is the same as EHS, was first reported in the 1930's. He cites many early studies on microwaves and health effects including the US Naval document already uploaded by Interveners, and John R. Goldsmith's study of the US Embassy in Russia. He notes that microwave illness / EHS was "well documented" by 1997 with over 100 other documents. He gives the review reference. As an expert, Mr. Trower substantiates evidence provided by the Interveners to this docket.

(Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #380]

20.13 Trower, Barry, *Addendum A; Declaration of Expert Witness Barrie Trower, in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools*, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, December 2011. This document is a drawing of the irreversible damage that is created by MW / RF radiation. Mr. Trower makes the point that genetic damage to female children's ovaries could cause multi-generational irreversible damage due to the fact that women have all of their "eggs" at birth.

(Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #380]

20.14 Havas, Magda, *Declaration of Expert Witness Dr. Magda Havas in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools*, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, December 2011. This document supports the evidence presented by Interveners in this case by presenting testimony from an expert that agrees with Interveners lay testimonies (not yet filed) and evidence uploaded in the form of peer reviewed journals and other reports that low level, chronic RF radiations, similar to smart meter emissions can cause adverse health effects. Dr. Havas includes her CV and references in this declaration. (Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #380]

20.15 Havas, Magda, *Addendum B to Declaration of Expert Witness Dr. Magda Havas, in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools*, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, December 2011. The signatures of these doctors and employees of Boston Medical Center are of significance to this case because the petition substantiates the concern of medical professionals regarding ubiquitous recurring microwave exposures and the "biological plausibility of harm". The petition reads that these doctors want to avert harmful public exposure to pulsed microwave transmissions. In the petition, Boston public health physicians and scientists called for a "halt to the pulsed microwave radiation based cell phone infrastructure. Nearly one hundred doctors and scientists sign the petition. The petition reads in part, "**Due to the plausibility of negative health impacts, particularly to the human nervous system, as well as**

Category List Filed last updated 4/9/13, Item No.

**anecdotal evidence from such exposures in cities where transmission has already been implemented and voluminous medical studies indicating human and ecological harm from microwaves**, we urge the suspension” ...of the implementation of putting cell towers up. The petition supports that there is reason to be concerned about long term exposure to low-level RF. It supports Interveners’ testimony from physician experts. (Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #380]

20.16 Havas, Magda, *Addendum D to Declaration of Expert Witness Dr. Magda Havas, in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools, Civil Action No. 3:aa-cv-00739-MO*. U.S. District Court of Oregon, December, 2011. This is Dr. Havas presentation to the Court in Oregon regarding 2.4GHz Wifi. It is a PowerPoint pdf that includes diagrams and explanations of some specific studies. It supports Interveners evidence that pulsed RF and constant exposure to RF can cause health effects. (Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #380]

20.17 Carpenter, David, *Declaration of David Carpenter in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools, Civil Action No. 3:aa-cv-00739-MO*. U.S. District Court of Oregon, December, 2011. Dr. Carpenter’s testimony in Oregon strengthens Intervener’s testimony and evidence in this case because his opinions, as an expert, coincide with Interveners, and he specifically discusses some of the same studies presented by Interveners. He also discusses FCC standards and standard setting and his CV is included. (Misabeled as Evidence 11 should be 20)

[Filed in Docket 03/04/13; Item #382]

20.18 Dr. David Carpenter Testimony, in *Quebec Energy Board - Docket no. R-3770-2011- Authorization of an Investment by Hydro-Quebec Distribution Advanced Metering Project Phase 1; Referred to in Section 41 of Dr. Carpenter’s Expert Report Cellular and animal studies on of cancer, genotoxicity, neurotoxicity and other health outcomes from RF/MS radiation*, Province of Quebec, District of Montreal, Canada; C-SE-AQLPA-0072, SE-AQLPA-7, Filed May 15, 2012. Dr. Carpenter lists the studies he cites as evidence of adverse health effects of RF/MW radiation. Dr. Carpenter explains that these studies explain the mechanisms of interaction between RF/MW radiation and biologic systems at the cellular level and include: cell membrane recognition process, signal transduction and heat-shock protein release, lipid peroxidation, free radical damage, mRNA and transcription, epigenetic changes, and micronuclei formation, DNA repair disruption, immune response suppression. It is the Interveners’ intent that all seven of the cited studies and full copies, be included as part of this MPUC docket (Sinha, 2008; Nittby H, 2008; Kimmel S; Panagopoulos, 2010; Everaert, 2007; Magras, 1997; Balmori,2009) along with this Expert Report. [Copy filed in Docket]

Category List Filed last updated 4/9/13, Item No.

20.19 Dr. David Carpenter Testimony, in ***Quebec Energy Board - Docket no. R-3770-2011- Authorization of an Investment by Hydro-Quebec Distribution Advanced Metering Project Phase 1; Referred to in Section 44 of David O. Carpenter's Expert Report Mechanisms of Interaction between RF/MW Radiation and Biological Systems at the Cellular Level***, Province of Quebec, District of Montreal, Canada; C-SE-AQLPA-0072, SE-AQLPA-7, Doc. 1.1, parag. 44, 55; Filed on May 15, 2012. Section 44 of Dr. Carpenter's report filed in the referenced court docket are citations for research studies that provide evidence of mechanisms for interaction between RF/MW radiation and biologic systems at the cellular level. It is the Interveners' intent that all thirty one of the cited studies and full copies along with this report be included as part of the subject MPUC docket (Litovitz, 1994; DiCarlo, 1998; Penafiel, 1997; Dicarlo, 1999; Litovitz, 1990; Litovitz, 1997; Litovitz, 1997; Litovitz, 1993; Serban, 1994; Vileno, 2010; Maaroufi, 2011; Nelson, 1994; Alvarez 1989; Devasagayam, 2003; Ozgur, 2010; Gutteridge, 1981; Yan, 2009; Yan, 2008; Simbürger, 1997; Chen, 2010; Migliore, 2009; Tice, 2002; Vijayalaxmi 2009; Sannino, 2009; Brusick, 1998; Belyaev, 2009; Sun, 2006; Lyle, 1983; Elekes, 1996; Dabala, 2008; Surcel, 2009). **[Copy filed in Docket]**

20.20 Dr. David Carpenter Testimony, in ***Quebec Energy Board - Docket no. R-3770-2011- Authorization of an Investment by Hydro-Quebec Distribution Advanced Metering Project Phase 1; Referred to in Section 40 of Dr. Carpenter's Expert Report, Neurologic, immune, endocrine, reproductive and cardiac adverse health effects from low-dose, chronic exposure to RF/MW radiation in humans***, Province of Quebec, District of Montreal, Canada; C-SE-AQLPA-0072, SE-AQLPA-7. Dr. Carpenter's Report includes full copies of studies that show neurologic, immune, endocrine, reproductive and cardiac, adverse health effects from low-dose, chronic exposure to RF/MW radiation in humans. It is the Interveners' intent that all of the cited studies be included as part of the subject MPUC docket (Volkow, 2011; McCarty, 2011; Papageorgiou, 2011; Altpeter, 200; Abelin, 2005; Hutter, 2006; Preece, 2007; Robertson, 2010; Buchner, 2011; Eliyahu, 2006; Barth, 2008; Augner, 2010; Avendano, 2012; Baste 2008). **[Copy filed in Docket]**

20.21 Curtis Bennett, ***Second Amended Declaration of Curtis Bennett; in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools, Civil Action No. 3:aa-cv-00739-MO.*** U.S. District Court of Oregon, December, 2011. Mr. Bennett provides a good basic discussion of the underlying plausibility of non-thermal adverse effects caused by RF radiation, and explains based on his knowledge of electricity, how some mechanisms may work. He cites a number of mechanistic studies that the WHO underemphasized: Zhou et al 2011, the study that suggests that intermediate frequency fields allow large segments of the DNA molecule, but not its entire length, to become polarized. This polarizing in turn causes clumping and DNA collapse (Zhou et al., *Collapse of DNA in ac Electric Fields*,

Category List Filed last updated 4/9/13, Item No.

Phys Rev Lett 106, 248103, 2011 and Baan et al, 2011, *EMFs generated by RF sources couple with the body, resulting in induced electric and magnetic fields and associated currents inside tissues*. The most important factors that determine the induced fields are the distance of the source from the body and the output power level. Additionally, the efficiency of coupling and resulting field distribution inside the body strongly depend on the frequency, polarization, and direction of wave incidence on the body, and anatomical features of the exposed person, including height, body-mass index, posture, and dielectric properties of the tissues. Induced fields within the body are highly non-uniform, varying over several orders of magnitude, with local hotspots.

[http://www.natap.org/2011/newsUpdates/062311\\_01.htm](http://www.natap.org/2011/newsUpdates/062311_01.htm). Mr. Bennett also discusses medical equipment interference with apnea monitors, cardiac defibrillators, etc.

[Filed in Docket 03/04/13; Item #382]

20.22 Dr Andrew Goldsworthy, ***Declaration of Dr. Andrew Goldsworthy, BSc, PhD; in Portland Division, AHM, by and through her Guardian ad litem and father, David Mark Morrison versus Portland Public Schools***, Civil Action No. 3:aa-cv-00739-MO; U.S. District Court of Oregon, 2010. Dr. Goldsworthy's testimony is valuable to this case because he is an expert botanist and biochemist. None of the experts presented by the Complainant or CMP hold these credentials. His CV is included. Dr. Goldsworthy, in his testimony, takes RF to the basic level of the cell and membrane potentials. He studied calcium efflux from cell membranes. RF/MW radiation that is far too weak to cause significant heating can remove calcium ions from cell membranes in the brain and elsewhere. He says that voltage gradients allow membranes, which are often only two molecules thick, to rectify themselves and demodulate. He gives an example of an artificially created radio set from a single carbon nanotube having a similar diameter to an ion channel in a membrane. This nanotube works, just as he believes the membranes do. In his testimony in Oregon, he explains a number of studies regarding RF radiation damage resulting from the peroxidation of polyunsaturated lipids in cell membranes and changes to the nucleic acid metabolism of cells. He gives examples of recent studies. Molecular effects caused by cell phone radiation (11 studies cited) DNA repair disruption (3 studies cited), Micronuclei formation, immune response suppression (7 studies cited). Then he discusses mechanisms and explains how the effects can arise, and describes how some of the consequences of Leaky Cell Membranes arise: Blood brain barrier loss of protection, effects on metabolism, cardiac arrhythmia, allergy effects, skin effects, hormonal effects. In his expert opinion virtually all share a common mechanism of "leaky membranes", and the evidence fits together leaving little doubt that reported effects are real and must be taken seriously

[Previously filed in Docket as Evidence 11 on 03/04/13; Item #382]

20.23 Dr. Andrew Goldsworthy, ***Expert Witness Statement***, Standing Committee off the Canadian House of Commons, April 2010. Dr. Goldsworthy notes that there are literally thousands of scientific papers written on the non-thermal effects of weak non-ionizing

PUC Docket 2011-262 Friedman on Remand  
Intervener DW et al Evidence 20 Evidence and Testimony from Other Cases  
Court Cases and Public Utilities Commission Cases

Category List Filed last updated 4/9/13, Item No.

radiation such as that from our smart meters and / or cell phones, and well over half of them show some sort of biological effect. He believes that it is the “biological variability” of human beings, due to their genetic makeup that makes studying the effects of RF/MW difficult. In this testimony he suggest a more realistic approach is to look at frequently reported effects to see common underlying threads that may indicate a common mechanism. He suggests two: cryptochrome, which affects animal navigation, the immune system and circadian rhythms, and calcium efflux from cell membranes.

[Previously filed in Docket as Evidence 11 on 03/04/13; Item #382]

## **Smart Meter Testimony McMillin Hearing 12/2/14, notes taken by Barb Galster**

About 100 citizens were scheduled to speak at the hearing on Smart Meters – I was only able to hear the following testimony. The following information is highlights from my notes only and has misspelled names (I could only write down names to the best of my ability after hearing them spoken).

### **Dee Ann Hilbert - Rochester Hills, RN**

Smart meters are a transmitting device, not a meter, they are a recorder of 2 way communication  
She listed all communities where smart meters have been banned for the committee record

### **David Sheldon – Ferndale, head of Michigan Stop Smart Meters**

Says that the MPSC has never had a hearing that allowed expert testimony regarding the safety of smart meters and the privacy concerns related to them. He says the only hearing MPSC held was regarding rate charges

Reasons to keep analog meter

1. Once digital meter is installed, all transparency is gone as consumer is not able to read meter themselves
2. Analog meters do no cause any health issues and do not invade privacy

He requests that people be able to keep their analog meter without opt out fees and that opt out plan be extended to apartment buildings and small businesses. For example, electro-sensitive people should not have to fear entering their medical doctors offices if the doctors medical building has a smart meter attached.

He submits for the record the expert testimony of 45 doctors and scientists from all over the world stating that smart meter radiation is harmful

### **DTE Reps – Bob Sitkauskas– Joe McCormick—DTE AMI Department**

- Meters are property of DTE – it is against the law to block access to the meters
- Analogs are “no longer being manufactured”
- Question from McMillin – what is the harm in allowing people to keep analog meters
  - answer – this is a business decision, updated technology,
- In answer to another question DTE rep said that the meter can be moved from the home to another location at homeowners expense.
- McMillin statement – seems that DTE has a monopoly that does not offer customers any options other than their approved smart meter

### **Abigail Nobel**

Testimony – there are important principals in governing

1. to secure citizens rights to life
2. to secure safety in citizens own homes
3. to promote health in the community
4. to do everything possible to secure individual rights to health and happiness

[The role of government should not be primarily to care for corporations such as DTE and Consumers](#)

She requests that smart meter installation be placed on hold pending further study

### **Dominic and Lillian Cusmano – synopsis of their experience**

- Nov 2012 Lillian noticed flu symptoms whenever visiting their second home in Oakland county. Only experienced problems there, the symptoms would stop when residing in primary home.
- Someone mentioned that perhaps a smart meter had been installed on their Oakland county home. Sure enough, 800,000 meters had been installed in N. Oakland county, without any notice or authorization.
- DTE refused to remove smart meter. Customer removed meter and within 1 month DTE took them to court. They have been able to represent selves in court since 2012 since DTE only had “implied consent” to install.
- The DTE Opt Out plan is a sham. It is not an opt-out – it is a modification of the smart meter.
- Currently their case is on appeal in circuit court. Lillian Cusmano now has electro-sensitivity due to the smart meter exposure. She has letters from 2 doctors saying that she should not live in a home with a smart meter. She also has an expert list of scientists who give testimony of smart meter health issues.

### **Consumers Energy Rep (did not get name)**

- These meters represent great potential for technological advances
- She is proud of the Consumers Energy program and highlighted their communication with customers.
- **She was unable to answer Representative [Rose Mary Robinson's](#) question regarding what great advances were in store due to the new technology.**
- The consumers energy meters differ from the DTE meters in that they transmit directly to a cell tower. (DTE meters transmit to a hub and then after collecting all the hub data, the data is sent to a tower)
- In addition Consumers opt out meters do not contain a smart chip – All DTE meters have the chip but the chip is turned off for those in the opt out plan

### **Karen Spranger – Warren**

- States that the MPSC report only looked at expert testimony from those who promote smart meters, that they did not allow public testimony related to concerns regarding smart meters
- Since more and more technology – (smart meters, increasingly powerful cell towers, etc) there is a new form of pollution in the air. It is odorless, you cannot hear or feel it, but that it affects cellular structure and cellular DNA.
- Karen states that a persons home should be free from outside sources of pollution that is forced on people with smart meters.

### **Michele Ureste (West Bloomfield Twp Supervisor)**

- This (smart meters) is the most important issue in Lansing – the health and safety of its citizens
- People are already subjected to EMF from utility poles, microwaves, cell phones, wi- fi but to be forced to receive more EMF from smart meters is intrusive and harmful.
- DTE and Consumers are both highly profitable, being a monopoly in MI. Their goal is profit.
- **It is the role of the legislature to protect people's health and safety. It is her opinion that the state should be more concerned about children's health than improved service times the utility companies claim smart meters provide.**

### **Kathy Warras, Bloomfield Hills resident**

- I have lived in my home for 30 years. Came home from Florida last April and all of a sudden could not sleep.
- She was waking up each night around 4AM, then the headaches began. Her physician, Dr. Brownstein (and another, that I did not get name of) said the change could be due to the smart meter installation. She tried the Opt out plan provided by DTE (turn off chip in meter). It took 30 days for DTE to do this. The opt out plan did not improve her symptoms. Now she experiences ringing in the ears and heart palpitations.
- When she leaves her home, her symptoms, stop. She is currently living in a motor home on her property so that she can sleep.
- She requests freedom to have analog meter on her home.

#### **MSPC Rep Mike Byrne**

- Confirms that DTE has the right to disconnect power if not allowed access to the meters
- Other discussion regarding previous MSPC hearings.

#### **Georgetta Livingstone – Clarkston**

- She has 2 masters degrees and a Phd in engineering.
- States that the MSPC has made all cost effective for DTE, but has abandoned consumers
- After installation of smart meter a rash developed over 90% of her body
- She has measured the EMF being emitted from meter
- She approached DTE many times and was ignored. She finally paid an electrician to install a new analog meter and mailed the smart meter back to DTE by certified mail.
- July 10<sup>th</sup> DTE removed the analog meter, blocked access to the meter area and shut off her power. She has no water, no toilet, no shower, no heat, no ability to cook. [She has talked to 15-20 lawyers who are afraid to take her case to court \(she feels they do not want to go up against DTE.\)](#)

#### **David Lonier**

- States that all radiation is harmful to cells. All tests should be done to test the cumulative effects.

#### **Dick Manisseri – Rochester Hills**

- Wonders why a bill exempting Wind turbine companies from future lawsuits related to health could be brought to committee in 2 weeks time, while a bill protecting the health of citizens has been languishing without a hearing.
- He believes that the money contributed to politicians is controlling the legislature not concern for citizens health.

#### **Pam and Andy Wallace**

- Pam has become electro-sensitive. She wishes that were not the case but it is – for the rest of her life she will have to deal with chronic illness caused by this sensitivity.
- DTE is not offering people an option for their health and well being. Renowned scientists and medical doctors from around the world have researched the detrimental effects of smart meter radiation. She submitted data for the committee records.

#### **Andy –**

- has been a teacher for 20 years. He has monitored the emotional behavior of the students he has worked with over the past 8 years. He has noted a higher level of stress and anxiety as well as heightened aggression. At the same time there has been a negative change in teens attention span. He believes that these changes parallel the increased exposure of the students to EMF and RF exposure.
- According to the American Academy of Pediatrics children from 0-2 should have no exposure to EMF.
- Children from 3 – 18 should have limited exposure. He believes that more research and protection standards need to be provided for the safety of children. Children are more susceptible to RF energy exposure.
- Children's heads are inches away from smart meters while they are sleeping in their beds. Smart meters are affecting your children, your grandchildren, the future leaders of our country.
- Andy Wallace asks the legislature – who is going to protect us and our children?

**Laurie Ebaugh – Milford**

- After installation of a smart meter in her home Laurie experienced heart palpitations, insomnia, and ringing in the ears. Medical tests could not determine a medical cause. She tried the DTE opt out plan and did not have any relief of symptoms. She has needed to purchase an expensive EMF shielding canopy to be able to sleep in her own home.
- Her granddaughter's behavior is noticeable more erratic when she visits her grandmother's home where a smart meter has been installed.

**Declaration of**  
**L. Lloyd Morgan**  
**Addendum G – Poster –**  
**How Many Brain Tumors**

**IF CELPHONE USE IS A RISK FOR BRAIN TUMORS,  
WHEN AND HOW MANY CELPHONE-INDUCED  
BRAIN TUMORS MAY OCCUR?**

*L. Lloyd Morgan*

L. Lloyd Morgan [bilovsky@aol.com]

1  
Addendum G  
Page 2 of 14

# Brain Tumor Risk: Case-Control Studies to Date

- Early Studies [1-5]
  - No significant risk found
  - Cellphone use too short to expect tumor
- Interphone Studies [6]
  - Finds use of a cellphone *protects* the user from a brain tumor
    - 11 design flaws
      - 8 flaws underestimate risk
- Swedish Studies
  - Risk when cellphones or cordless phone use for 10+ years
  - Findings consistent wireless phone use is a risk for brain tumors
    - The higher the cumulative hours of use, the higher the risk [7]
    - The longer the time since first use, the higher the risk [7]
    - The higher the radiated power, the higher the risk [8]
    - The higher the exposure (ipsilateral use), the higher the risk [9,10]
    - The younger the user, the higher the risk [11]

# Conclusion

- Wireless (cellphones and cordless phones) are a risk for brain tumors

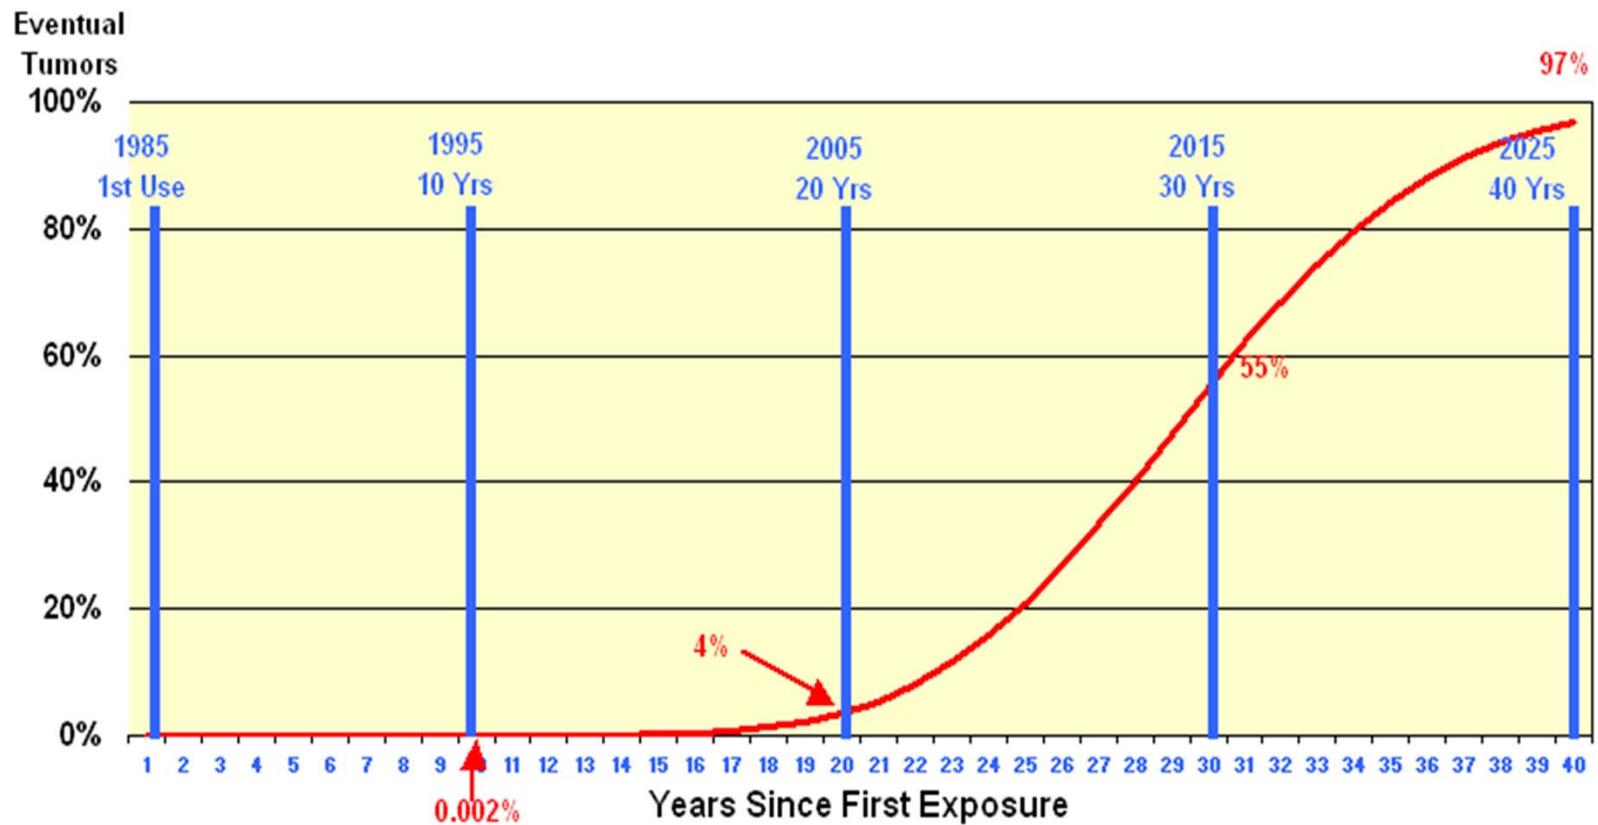

# What factors are important in predicting the number of cellphone-induced brain tumors?

- Latency time & percentage who will eventually be diagnosed with a tumor
  - Ionizing radiation exposure and brain tumors
    - 30 years & 0.9% [12]
  - Tobacco smoking and lung cancer
    - 30 years & 10% [13]
  - Asbestos exposure and mesothelioma
    - 30 years [14] & 28% [15]

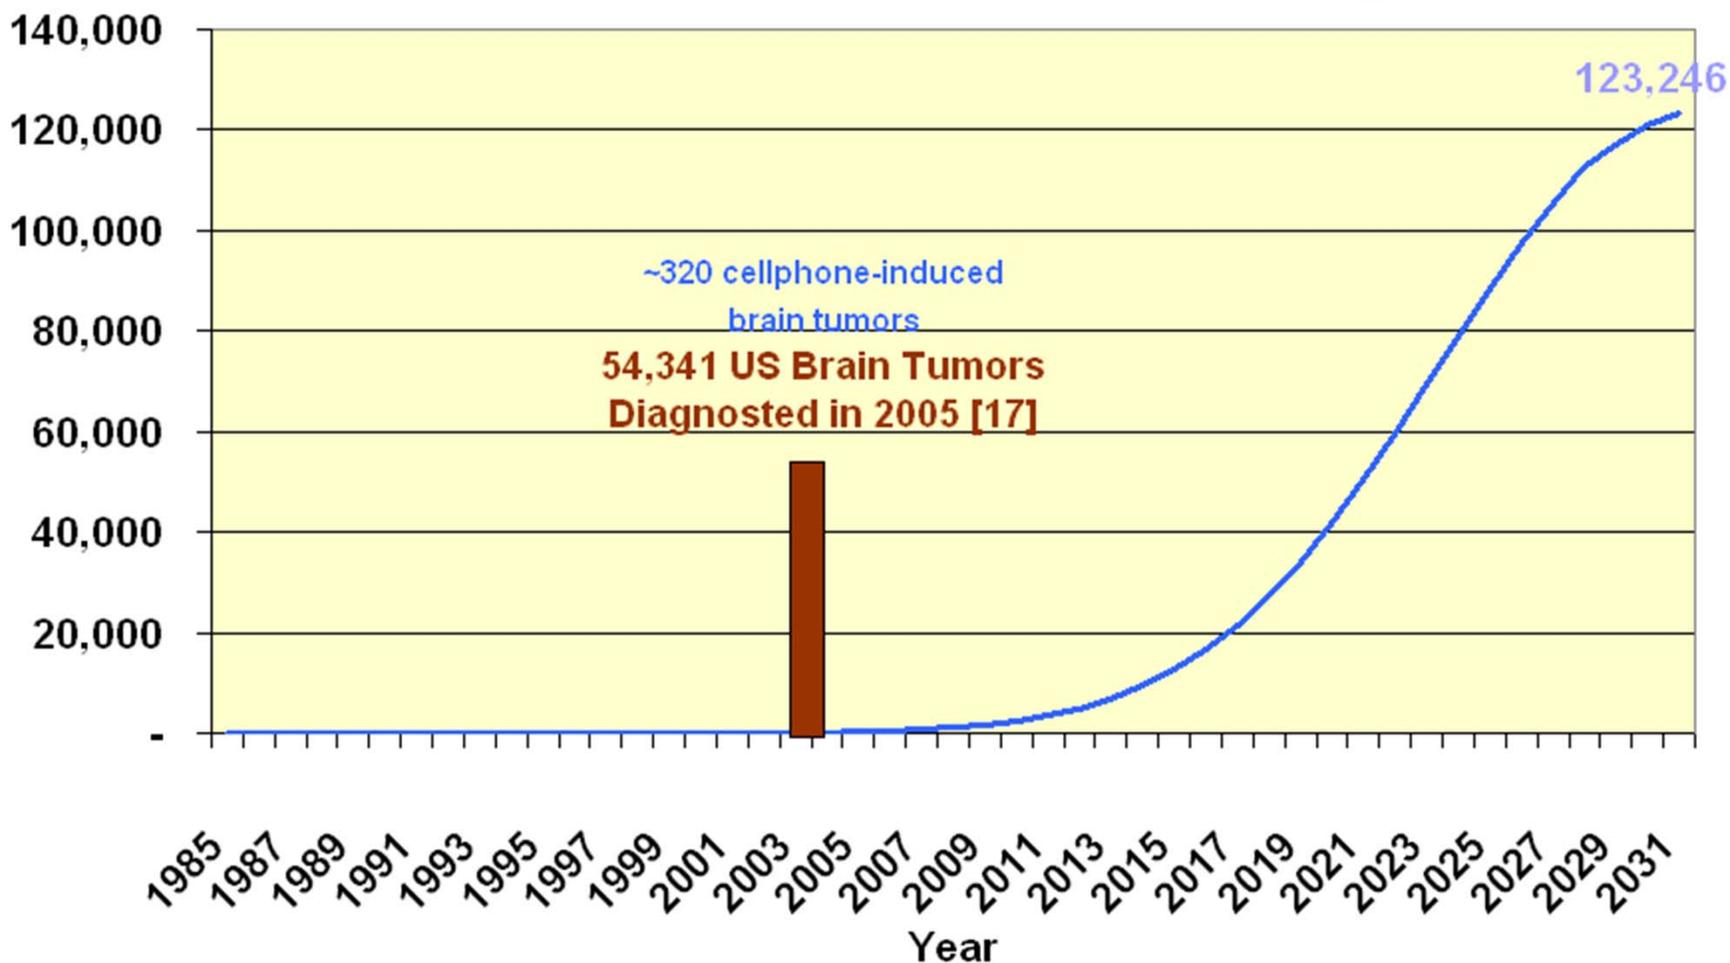

# Materials and Methods

An Excel spreadsheet was used to calculate the number of cellphone-induced brain tumors. The calculation required data for the number of US cellphone subscribers by year (the number of subscribers beyond 2008 was estimated). [16] A Poisson distribution for a 30-year latency was used to provide the probability of a cellphone-induced brain tumor for every year of use. This result was combined with the percent of exposed subjects who are eventually diagnosed with tumors from exposure to the 3 carcinogens to provide an estimate of the number of cellphone-induced brain tumors by year.

# 30-Year Poisson Distribution % of eventual tumor diagnoses

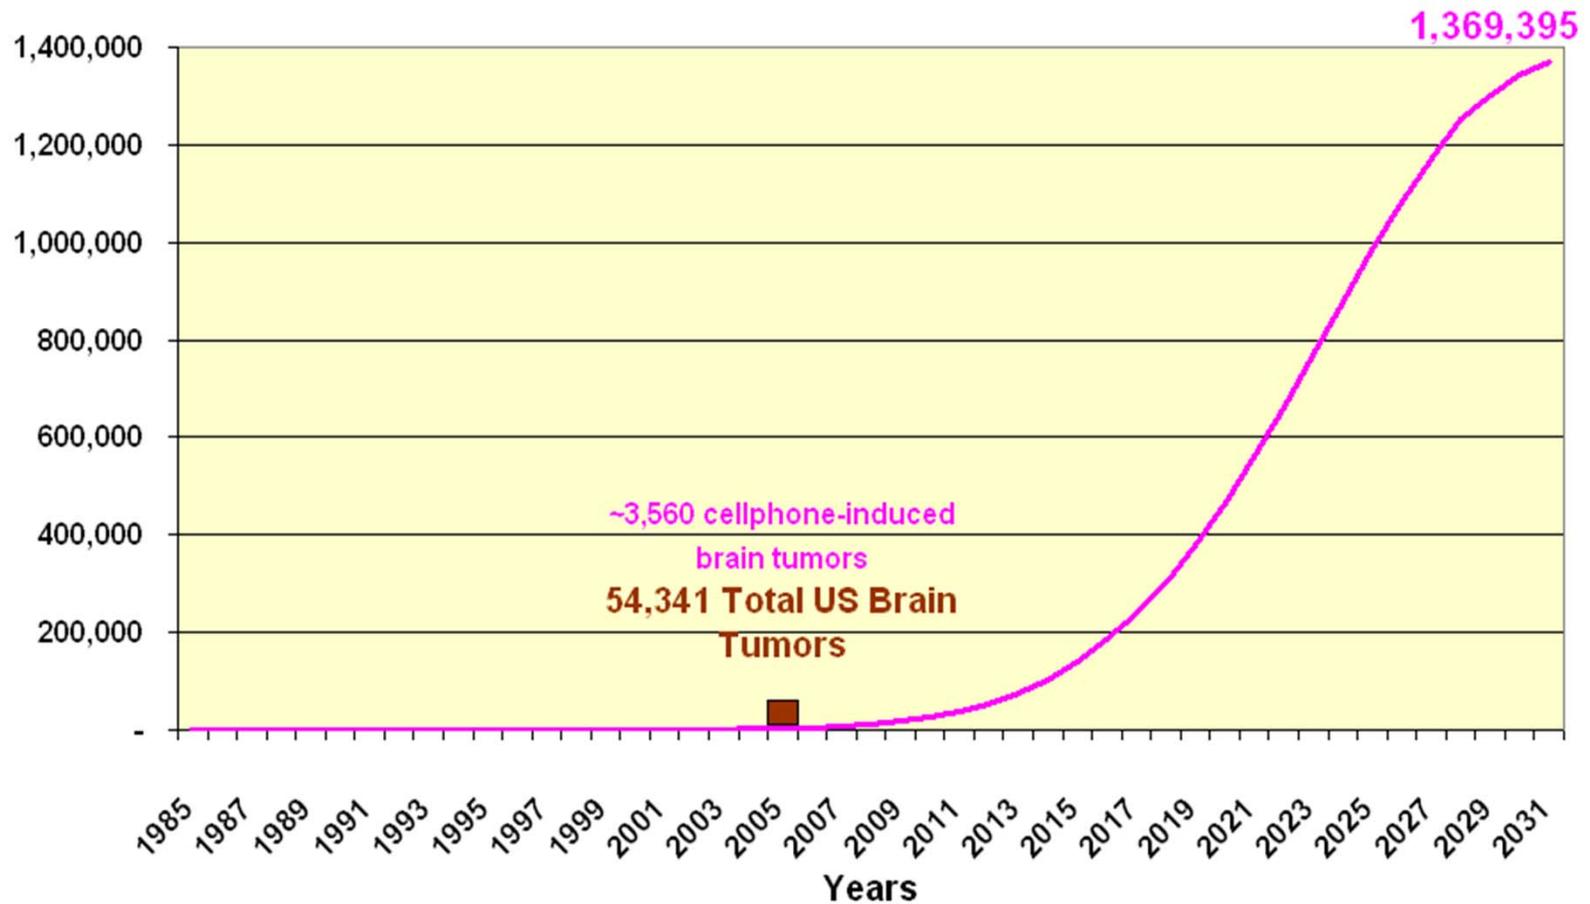

# Potential US Cellphone-Induced Brain Tumors by Year 30-Year Latency If Similar to Low-dose X-Radiation Exposure

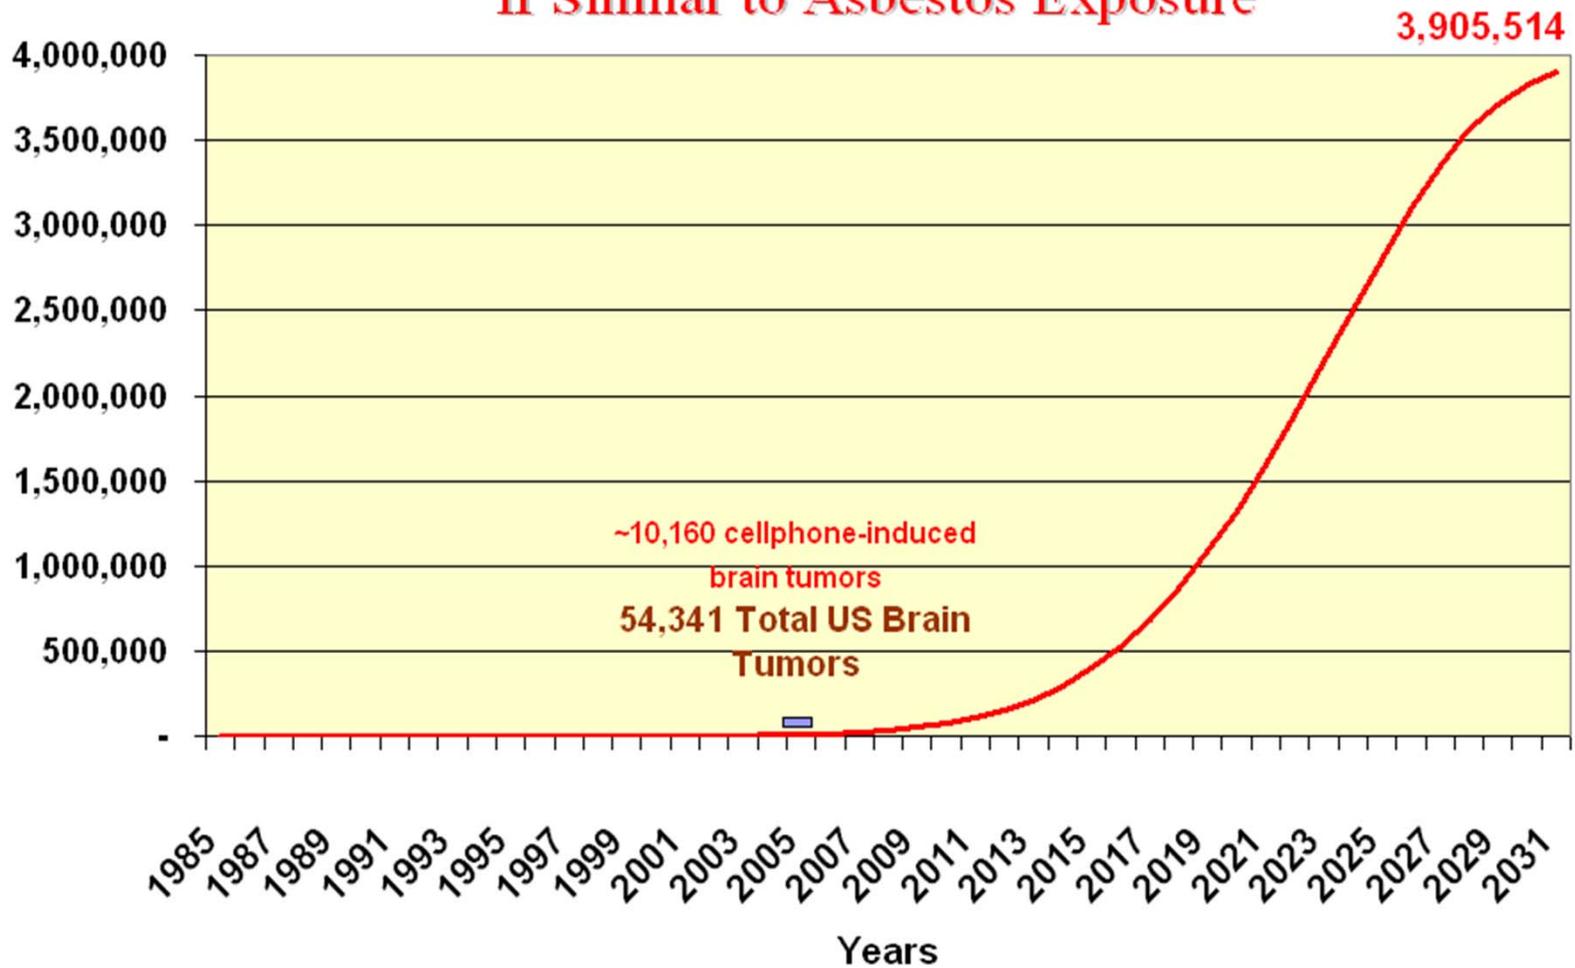

L. Lloyd Morgan [DHOVSKY@aol.com]

# Potential US Cellphone-Induced Brain Tumors by Year 30-Year Latency If Similar to Tobacco Smoking Exposure

L. Lloyd Morgan [bilovsky@aol.com]

**Potential US Cellphone-Induced Brain Tumors by Year**  
**30-Year Latency**  
**If Similar to Asbestos Exposure**

# Conclusion

**If cellphones are a risk for brain tumors,**

**no matter the assumption,**

**there will be a dramatic increase in brain tumors.<sup>1</sup>**

**Given the cost of treating a brain tumor is about \$250,000 per case, the cost to society will be large. [18]**

<sup>1</sup>It is still too early to see any increase in incidence for the entire population, and with a 4-year delay in USA incidence reporting, there will be at least a 4-year delay before it is recognized.

L. Lloyd Morgan [bilovsky@aol.com]

DR PALL SPOKE ON HIS CAREER AND ACHIEVEMENTS INVESTIGATING MULTIPLE CHEMICAL SENSITIVITIES AND HOW THAT HAS LED TO A PUBLISHED REVIEW ON THE “MECHANISM OF HARM” FROM EMF EXPOSURE, INCLUDING MICROWAVES IN WI-FI. DR. PALL DISCUSSED THE WIDE-REACHING SCIENCE THAT AMPLY DISPLAYS CAUSE FOR ALARM, INCLUDING AREAS OF CANCER AND AUTISM IN CHILDREN. DR. PALL’S LATEST PAPER UNDER SUBMISSION FOR PEER JOURNAL PUBLICATION DISCUSSES AUTISM CAUSATION DUE TO EMF EMISSIONS.**

**HERE IS A LIST OF DR. PALL’S AWARDS CREDENTIALLING HIS EXPERTISE ON THE DANGERS OF WI-FI TO CHILDREN:**

2005: Pall was appointed to the Advisory Board of the Environmental Law Center in London.

November 2008: Pall was the only person from outside of Europe, invited to address a special session of the European Union Parliament (“Council of Nations”) on Environmental Medicine.

2009: Pall was chosen from all scientists in the world to write an authoritative review on Multiple Chemical Sensitivity (MCS) for General and Applied Toxicology, 3<sup>rd</sup> Edition.

April 2010: Pall was appointed a “life-time, honorary ambassador and member of the Scientific Advisory Board of the International Society for Applied Preventative Medicine (I-GAP).

May 2010: Pall was the meeting ‘honoree’ at the Fundacion Alborada meeting in Spain, on the second time such an honoree had been chosen.

2011 and onward: Pall was chosen to be a founding faculty member of the new Environmental Medicine Faculty in Italy. He started that function in 2012.

2013: Pall was chosen to be the Jonathon Forman award recipient, the highest award Given by the American Academy of Environmental Medicine (AAEM).

**MERRY CALLAHAN, CO-FOUNDER WIRELESS EDUCATION ACTION.ORG; THE FOLLOWING IS HER SPEECH REFERRING TO THE CONSTITUTIONAL ARGUMENT FOR PARENTAL RIGHTS, TO REJECT WI-FI IN SCHOOLS, ON WHICH PORTLAND PUBLIC SCHOOLS- AND THEIR AGENTS- SPENT OVER \$200,000 TO DEFEND AGAINST. PPS’S DEFENSE WAS CHOSEN BY THEM INSTEAD OF INVESTIGATING DANGERS OF WIFI, TO CHILDREN, BROUGHT TO THEIR ATTENTION AMPLY AND OVER AN EXTENDED PERIOD, BY A PARENT, DAVID MORRISON.**

**Merry Callahan SCRIPT, Portland Public School Board Testimony, Portland, Oregon:**

I am Merry Callahan, Author of the Constitutional Argument in Morrison v. Portland Public Schools.

I am here to talk about legacy- mine and yours.

My legacy charges me – as a Hanford Nuclear Reservation ‘Downwinder’ survivor...

and as the daughter of a Marine Raider who volunteered to rescue victims of Nagasaki at ground zero...

- *my* legacy charges me with no less duty than the defense of another generation of innocents forcibly exposed to atomic radiation.

You call it ‘Wi-Fi- a cute marketing term. But wireless radiation cannot shed it’s ‘radiation’ identity- because that is what it is.

While a Nuclear Engineering student at Oregon State University I learned what the American Trial Lawyers now stand behind,

that wireless radiation health effects are equatable to the same disease latency as that from nuclear radiation exposure.

In fact, this biggest trial lawyer association in the world- The American Association For Justice- just last week- has thrown down the gauntlet to Federal Agencies and the Wireless industry,

- that Big Telecom and Wireless will go the way of Big Tobacco, of Asbestos and of lead paint litigation.

Meanwhile, players like Cisco, Apple, AT&T... promise any comers on School Boards, in local IT departments, that they *too* can have a personal, legacy-building path.

Just walk with us, they say. That you *too* can have a share of Wireless Pork Barrel kickbacks,

from Big Telecom’s gaming of the US Department of Education’s ‘E’ programs.

All you have to do is:

- turn a blind eye-
- believe the fable of harmlessness,
- ‘sold’ to you as the “Cost/benefit- value add” sales pitch fed to your MBA IT-guy, The Decider...

This Decider- for *all* of you- not only has no bio-sciences, has no health training, but professes in his deposition, on *your* record, that:

- He was never even ‘curious’ about the health effects of wireless radiation-

- and “anyway” he doesn’t ‘believe in it’...

...as if his confession were of some sort of ‘religion for efficiency’, on YOUR balance sheet.

So *this* is your legacy...

Like the *Emperor Who Has No Clothes*, you all have stood on the side-lines in a ‘fable’...

While the Wireless industry has paraded their naked untruths and misinformation-

have trotted out their ‘doubt’ about Wi-Fi health effects on children in schools,

As if Wi-Fi is magic that floats through the air like butterflies.

But WiFi not magic- and the Emperor has no clothes.

It took my Dad 27 years to die from Nagasaki. It took 35 years to figure out about Hanford Downwinders...

And, Wi-Fi radiation is predicted- by those who know,

to follow this same latency and disease period.

*Your* legacy will be to be on the wrong side of science,

- on the wrong side of history,
- on the wrong side, even, of 60,000 pediatricians who have sent a letter begging Congress to stop this exposure of children to a class 2B carcinogen
- this same class agent as DDT, Lead in Paint, and Gasoline fumes.

No kid will escape this Russian Roulette you are playing with their lives... their future.

So why did I come here today?

To talk about legacy....

In three minutes or less ...

*My* legacy will stand on the right side of history. Will *yours*?

## Abstract

Global exposures to emerging wireless technologies from applications including mobile phones, cordless phones, DECT phones, WI-FI, WLAN, WiMAX, wireless internet, baby monitors, and others may present serious public health consequences. Evidence supporting a public health risk is documented in the BioInitiative Report. New, biologically based public exposure standards for chronic exposure to low-intensity exposures are warranted. Existing safety standards are obsolete because they are based solely on thermal effects from acute exposures. The rapidly expanding development of new wireless technologies and the long latency for the development of such serious diseases as brain cancers means that failure to take immediate action to reduce risks may result in an epidemic of potentially fatal diseases in the future. Regardless of whether or not the associations are causal, the strengths of the associations are sufficiently strong that in the opinion of the authors, taking action to reduce exposures is imperative, especially for the fetus and children. Such action is fully compatible with the precautionary principle, as enunciated by the Rio Declaration, the European Constitution Principle on Health (Section 3.1) and the European Union Treaties Article 174. © 2009 Elsevier Ireland Ltd. **Keywords:** Wireless technology; Brain cancer; Radiofrequency; Cell phones; Wireless antenna facilities; Childrens' health

## 1. Introduction and background

Exposure to electromagnetic fields (EMF) has been linked to a variety of adverse health outcomes that may have significant public health consequences [1–13]. The most serious health endpoints that have been reported to be associated with extremely low frequency (ELF) and/or RF include childhood and adult leukemia, childhood and adult brain tumors, and increased risk of the neurodegenerative diseases, Alzheimer's and amyotrophic lateral sclerosis (ALS). In addition, there are reports of increased risk of breast cancer in both men and women, genotoxic effects (DNA damage and micronucleation), pathological leakage of the blood–brain barrier, altered immune function including increased allergic and inflammatory responses, miscarriage and some cardiovascular effects [1–13]. Insomnia (sleep disruption) is reported in studies of people living in very low-intensity RF environments with WI-FI and cell tower-level exposures [85–93]. Short-term effects on cognition, memory and learning, behavior, reaction time, attention and concentration, and altered

brainwave activity (altered EEG) are also reported in the scientific literature [94–107]. Biophysical mechanisms that may account for such effects can be found in various articles and reviews [136–144].

The public health implications of emerging wireless technologies are enormous because there has been a very rapid global deployment of both old and new forms in the last 15 years. In the United States, the deployment of wireless infrastructure has accelerated greatly in the last few years with 220,500 cell sites in 2008 [14–16]. Eighty-four percent of the population of the US own cell phones [16]. Annualized wireless revenues in 2008 will reach \$144 billion and US spending on wireless communications will reach \$212 billion by 2008. Based on the current 15% annual growth rate enjoyed by the wireless industry, in the next 5 years wireless will become a larger sector of the US economy than both the agriculture and automobile sectors. The annualized use of cell phones in the US is estimated to be 2.23 trillion minutes in 2008 [16]. There are 2.2 billion users of cell phones worldwide in 2008 [17] and many million more users of cordless phones.

Over 75 billion text messages were sent in the United States, compared with 7.2 billion in June 2005, according to

\* Corresponding author. Tel.: +1 805 969 0557; fax: +1 805 969 5003.  
E-mail address: sage@silcom.com (C. Sage).

CTIA, the Wireless Association, the leading industry trade group [16]. The consumer research company Nielsen Mobile, which tracked 50,000 individual customer accounts in the second quarter of this year, found that Americans each sent or received 357 text messages a month then, compared with 204 phone calls. That was the second consecutive quarter in which mobile texting significantly surpassed the number of voice calls [17].

The Electronics Industries Alliance (EIA) represents 80% of the \$550 billion US electronics industry “that provides two million jobs for American workers.” Its members include companies from the consumer electronics and telecommunications industries, among others [17].

There is intense industry competition for market share. Telecom taxes form an immense revenue generator for the government sector. Sale of the airwaves (auctions selling off wireless bandwidth) is a multi-million dollar industry for governments, and multi-billion dollar global advertising budgets are common. Lobbying dollars from the telecom-related industries are estimated to be \$300 million annually. The media is nearly silent on health issues, perhaps in part because of global advertising revenues that compromise journalistic independence and discourage balanced coverage of health, equity and economic issues.

## 2. Evidence supporting a public health risk

Even if there is only a small risk to health from chronic use of and exposure to wireless technologies, there is the potential for a profound public health impact. RF radiation now saturates the airwaves, resulting in exposure to both users and non-users. The effects are both short-term (sleep disruption, hormone disruption, impairment of cognitive function, concentration, attention, behavior, and well-being) and they are almost certainly long-term (generational impacts on health secondary to DNA damage, physiological stress, altered immune function, electrosensitivity, miscarriage risks, effects on sperm quality and motility leading to infertility, increased rates of cancer, and neurological diseases including Alzheimer’s disease and ALS—at least for ELF exposures). (Chapters 5–12 of the BioInitiative Report [1] and papers in this Supplement.)

There is credible scientific evidence that RF exposures cause changes in cell membrane function, metabolism and cellular signal communication, as well as activation of proto-oncogenes and triggering of the production of stress proteins at exposure levels below current regulatory limits. There is also generation of reactive oxygen species, which cause DNA damage, chromosomal aberrations and nerve cell death. A number of different effects on the central nervous system have also been documented, including activation of the endogenous opioid systems, changes in brain function including memory loss, slowed learning, motor dysfunction and performance impairment in children, and increased frequency of headaches, fatigue and sleep disorders. Melatonin secretion

is reduced, resulting in altered circadian rhythms and disruption of several physiological functions. (Chapters 5–12 of the BioInitiative Report [1] and papers in this Supplement.)

These effects can reasonably be presumed to result in adverse health effects and disease with chronic and uncontrolled exposures, and children may be particularly vulnerable [1,19]. The young are also largely unable to remove themselves from such environments. Second-hand non-ionizing radiation, like second-hand smoke may be considered of public health concern based on the evidence at hand.

### 2.1. Malignant brain tumors

At present, the most persuasive evidence for cancer resulting from RF exposure is that there is a significantly increased risk of malignant glioma in individuals that have used a mobile phone for 10 or more years, with the risk being elevated only on the side of the head on which the phone is used regularly (ipsilateral use) [1,3,4,6–8,18]. While the risk for adults after 10 or more years of use is reported to be more than doubled, there is some evidence beginning to appear that indicates that the risk is greater if the individual begins to use a mobile phone at younger ages. Hardell et al. [18] reported higher odds ratios in the 20–29-year-old group than other age ranges after more than 5 years of use of either analog or cordless phones. Recently in a London symposium Hardell reported that after even just 1 or more years of use there is a 5.2-fold elevated risk in children who begin use of mobile phones before the age of 20 years, whereas for all ages the odds ratio was 1.4. Studies from Israel have found that the risk of parotid gland tumors (a salivary gland in the cheek) is increased with heavy cell phone use [7]. The risk of acoustic neuroma (a benign but space-occupying tumor on the auditory nerve) is also significantly increased on the ipsilateral side of the head after 10 or more years of mobile phone use [1,3]. This relationship has also been documented in some of the published reports of the WHO Interphone Study, a decade-long 13-country international assessment of cell phone risks and cancer [6,8].

Kundi reports that “(E)pidemiological evidence compiled in the last 10 years starts to indicate an increased risk, in particular for brain tumors (glioma, meningioma, acoustic neuroma), from mobile phone use. Considering biases that may have been operating in most studies the risk estimates are rather too low, although recall bias could have increased risk estimates. The net result, when considering the different errors and their impact is still an elevated risk” [19].

The latency for most brain tumors is 20 years or more when related to other environmental agents, for example, to X-ray exposure. Yet, for cell phone use the increased risks are occurring much sooner than twenty years, as early as 10 years for brain tumors in adults and with even shorter latencies in children. This suggests that we may currently be significantly underestimating the impact of current levels of

use of RF technology, since we do not know how long the average latency period really is. If it is 20 years, then the risk rate will likely be much higher than an overall doubling of risk for cell phone users if the peak comes later than 10 years. It may also signal very troubling risks for those who start using cell phones, and perhaps all wireless devices, in early childhood. We may not have proof of effect for decades until many hundreds of thousands of new cases of malignant gliomas are set in motion by long-term cell phone use.

The preliminary evidence that mobile phone use at younger ages may lead to greater risk than for older persons is of particular concern. There is a large body of evidence that childhood exposure to environmental agents poses greater risk to health than comparable exposure during adulthood [20,21]. There is reason to expect that children would be more susceptible to the effects of EMF exposure since they are growing, their rate of cellular activity and division is more rapid, and they may be more at risk for DNA damage and subsequent cancers. Growth and development of the central nervous system is still occurring well into the teenage years so that neurological changes may be of great importance to normal development, cognition, learning, and behavior.

A greater vulnerability of children to developing brain cancer from mobile phone use may be the consequence of a combination of patterns of use, stage of development and physical characteristics related to exposure. In addition to the fact that the brain continues to develop through the teen years, many young children and teenagers now spend very large periods of time using mobile phones. The brain is the main target organ of cell phones and cordless phones, with highest exposure to the same side as the phone is used. Further, due to anatomical reasons, the brain of a child is more exposed to RF radiation than the brain of an adult [22,23]. This is caused by the smaller brain size, a thinner pinna of the ear, thinner skin and thinner skull bone permitting deeper penetration into the child's brain. A recent French study showed that children absorb twice the RF from cell phone use as do adults [24].

In addition to concerns about cancer, there is evidence for short-term effects of RF exposure on cognition, memory and learning, behavior, reaction time, attention and concentration, altered brainwave activity (altered EEG) [95–108], and all of these effects argue for extreme caution with regard to exposure of children. The development of children into adults is characterized by faster cell division during growth, the long period needed to fully develop and mature all organ systems, and the need for properly synchronized neural development until early adulthood. Chronic, cumulative RF exposures may alter the normal growth and development of children and adversely affect their development and capacity for normal learning, nervous system development, behavior and judgment [1,97,102].

Prenatal exposure to EMF has been identified as a possible risk factor for childhood leukemia (1). Maternal use of cell phones has been reported to adversely affect fetal brain development, resulting in behavioral problems in those children by

the time they reach school age [25]. Their exposure is involuntary in all cases. Children are largely unable to remove themselves from exposures to harmful substances in their environments.

## 2.2. Plausible biological mechanisms for a relationship between RF exposure and cancer

### 2.2.1. DNA damage and oxidative stress

Damage to DNA from ELF and from RF cell phone frequencies at very low intensities (far below FCC and ICNIRP safety limits) has been demonstrated in many studies [1,2,26–35]. Both single- and double-strand DNA damage have been reported by various researchers in different laboratories. This is damage to the human genome, and can lead to mutations which can be inherited, or which can cause cancer, or both.

Non-ionizing radiation is assumed to be of too low energy to cause direct DNA damage. However both ELF and RF radiation induce reactive oxygen species, free radicals that react with cellular molecules including DNA. Free-radical production and/or the failure to repair DNA damage (secondary to damage to the enzymes that repair damage) created by such exposures can lead to mutations. Whether it is greater free-radical production, reduction in anti-oxidant protection or reduced repair capacity, the result will be altered DNA, increased risk of cancer, impaired or delayed healing, and premature aging [36–54]. Exposures have also been linked to decreased melatonin production, which is a plausible biological mechanism for decreased cancer surveillance in the body, and increased cancer risk [34,39,44,46,47,49,50,54]. An increased risk of cancers and a decrease in survival has been reported in numerous studies of ELF and RF [55–69].

### 2.2.2. Stress proteins (heat shock proteins or HSP)

Another well-documented effect of exposure to low-intensity ELF and RF is the creation of stress proteins (heat shock proteins) that signal a cell is being placed under physiological stress) [70–80]. The HSP response is generally associated with heat shock, exposure to toxic chemicals and heavy metals, and other environmental insults. HSP is a signal of cells in distress. Plants, animals and bacteria all produce stress proteins to survive environmental stressors like high temperatures, lack of oxygen, heavy metal poisoning, and oxidative stress.

We can now add ELF and RF exposures to this list of environmental stressors that cause a physiological stress response. Very low-level ELF and RF exposures can cause cells to produce stress proteins, meaning that the cell recognizes ELF and RF exposures as harmful. This is another important way in which scientists have documented that ELF and RF exposures can be harmful, and it happens at levels far below the existing public safety standards. An additional concern is that if the stress goes on too long, the protective effect is diminished. The reduced response with prolonged exposure means the cell is less protected against

damage, and this is why prolonged or chronic exposures may be harmful, even at very low intensities.

### 2.2.3. RF-induced gene expression changes

Many environment agents cause diseases, including cancer, not by direct damage to DNA but rather by up- or down-regulation of genes that regulate cell growth and function. Usually there are many genes whose expression is changed, and it is difficult to determine the exact changes responsible for the disease. Both ELF and RF exposures have been shown to result in altered gene expression. Olivares-Banuelos et al. [81] found that ELF exposure of chromaffin cells resulted in changed expression of 53 transcripts. Zhao et al. [82] investigated the gene expression profile of rat neurons exposed to 1800 MHz RF fields (2 W/kg) and found 24 up-regulated genes and 10 down-regulated genes after a 24-h exposure. The altered genes were involved in multiple cellular functions including cytoskeleton, signal transduction pathways and metabolism. Kariene et al. [83] exposed human skin to mobile phone radiation, and found by punch biopsy that 8 proteins were significantly altered in expression, consistent with gene induction. Several other studies have found altered gene expression following RF exposure, although none have been found that explain specific disease states [84].

DNA activation at very low ELF and RF levels, as in the stress response, and DNA damage (strand breaks and micronuclei) at higher levels, are molecular precursors to changes that are believed to lead to cancer. These, along with gene induction, provide plausible biological mechanisms linking exposure to cancer.

The biochemical pathways that are activated are the same for ELF and for RF exposures, and are non-thermal (do not require heating or induced electrical currents). This is true for the stress response, DNA damage, generation of reactive oxygen species as well as gene induction. Thus it is not surprising that the major cancers resulting from exposure to ELF and RF are the same, namely leukemia and brain cancer. The safety standards for both ELF and RF, based on protection from heating, are irrelevant and not protective. ELF exposure levels of only 5–10 mG have been shown to activate the stress response genes (<http://www.bioinitiative.org>, Sections 1 and 7 [1]).

## 3. Sleep, cognitive function and performance

The relationship of good sleep to cognition, performance and healing is well recognized. Sleep is a profoundly important factor in proper healing, anti-inflammatory benefits, reduction in physical symptoms of such as tendonitis, over-use syndrome, fatigue-induced lethargy, cognition and learning. Incomplete or slowed physiological recovery is common when sleep is impaired. Circadian rhythms that normalize stress hormone production (cortisol, for example) depend on synchronized sleep patterns.

People who are chronically exposed to low-level wireless antenna emissions report symptoms such as problems in sleeping (insomnia), as well as other symptoms that include fatigue, headache, dizziness, grogginess, lack of concentration, memory problems, ringing in the ears (tinnitus), problems with balance and orientation, and difficulty in multi-tasking [85–93,99]. In children, exposures to cell phone radiation have resulted in changes in brain oscillatory activity during some memory tasks [97,102]. Cognitive impairment, loss of mental concentration, distraction, speeded mental function but lowered accuracy, impaired judgment, delayed reaction time, spatial disorientation, dizziness, fatigue, headache, slower motor skills and reduced learning ability in children and adults have all been reported [85–108].

These symptoms are more common among “electrosensitive” individuals, although electrosensitivity has not been documented in double-blind tests of individual identifying themselves as being electrosensitive as compared to controls [109,110]. However people traveling to laboratories for testing are pre-exposed to a multitude of RF and ELF exposures, so they may already be symptomatic prior to actual testing. There is also evidence that RF exposures testing behavioral changes show delayed results; effects are observed after termination of RF exposure. This suggests a persistent change in the nervous system that may be evident only after time has passed, so is not observed during a short testing period.

### 3.1. Plausible biological mechanisms for neurobehavioral effects

#### 3.1.1. The melatonin hypothesis

While there remains controversy as to the degree that RF and ELF fields alter neurobehavioral function, emerging evidence provides a plausible mechanism for both effects on sleep and cognition. Sleep is controlled by the central circadian oscillator in the suprachiasmatic nucleus, located in the hypothalamus. The activity of this central circadian oscillator is, in turn, controlled by the hormone, melatonin, which is released from the pineal gland [111]. There is considerable evidence that ELF exposure reduces the release of melatonin from the pineal gland—see Section 12 of the Bioinitiative Report [1]. There has been less study of the effects of RF exposure on melatonin release, but investigations have demonstrated a reduced excretion of the urinary metabolite of melatonin among persons using a mobile phone for more than 25 min per day [112]. In a study of women living near to radio and television transmitters, Clark et al. [113] found no effect on urinary melatonin metabolite excretion among pre-menopausal women, but a strong effect in post-menopausal women.

The “melatonin hypothesis” also provides a possible basis for other reported effects of EMFs. Melatonin has important actions on learning and memory, and inhibits electrophysiological components of learning in some but not all areas of the brain [114,115]. Melatonin has properties as a free-radical scavenger and anti-oxidant [116], and consequently,

a reduction in melatonin levels would be expected to increase susceptibility to cancer and cellular damage. Melatonin could also be the key to understanding the relationship between EMF exposure and Alzheimer's disease. Noonan et al. [117] reported that there was an inverse relationship between excretion of the melatonin metabolite and the 1–42 amino acid form of amyloid beta in electric utility workers. This form of amyloid beta has been found to be elevated in Alzheimer's patients.

### 3.1.2. Blood–brain barrier alterations

Central nervous system effects of EMFs may also be secondary to damage to the blood–brain barrier (BBB). The blood–brain barrier is a critical structure that prevents toxins and other large molecules that are in peripheral blood from having access to the brain matter itself. Salford et al. [118] have reported that a 2-h exposure of rats to GSM-900 radiation with a SAR of 2–200 mW/kg resulted in nerve cell damage. In a follow-up study, Eberhardt et al. report that 2-h exposures to cell phone GSM microwave RF resulted in leakage of albumin across the blood–brain barrier and neuronal death [119]. Neuronal albumin uptake was significantly correlated to occurrence of damaged neurons when measured at 28 days post-exposure. The lowest exposure level was 0.12 mW/kg (0.00012 W/kg) for 2 h. The highest exposure level was 120 mW/kg (0.12 W/kg). The weakest exposure level showed the greatest effect in opening the BBB [118]. Earlier blood–brain studies by Salford and Schirmer [120,121] report similar effects.

## 4. What are sources of wireless radiation?

There are many overlapping sources of radiofrequency and microwave emissions in daily life, both from industrial sources (like cell towers) and from personal items [cell and cordless phones, personal digital assistants (PDAs), wireless routers, etc.]. Published data on typical levels found in some cities and from some sources are available at <http://www.bioinitiative.org> [1,122–124].

Cell phones are the single most important source of radiofrequency radiation to which we are exposed because of the relatively high exposure that results from the phone being held right against the head. Cell phones produce two types of emissions that should be considered. First, the radiofrequency radiation (typically microwave frequency radiation) is present. However, there is also the contribution of the switching battery pack that produces very high levels of extremely low frequency electromagnetic field [125–127].

Cordless telephones have not been widely recognized as similar in emissions to cell phones, but they can and do produce significant RF exposures. Since people tend to use them as substitutes for in-home and in-office corded or traditional telephones, they are often used for long periods of time. As the range of cordless phones has increased (the distance away that you can carry on a conversation is related to the power

output of the phone), the more powerful the RF signal will be. Hence, newer cordless phones may in some cases be similar to the power output of cell phones. The cumulative emissions from cell and cordless phones taken together should be recognized when considering the relative risks of wireless communication exposures.

PDAs such as the BlackBerry, Treo and iPhone units are 'souped-up' versions of the original voice communication devices (cell phones). They often produce far higher ELF emissions than do cell phones because they use energy from the battery very intensively for powering color displays and during data transmission functions (email, sending and receiving large files, photos, etc.) [125–127]. ELF emissions have been reported from PDAs at several tens to several hundreds of milligauss. Evidence of significantly elevated ELF fields during normal use of the PDA has public health relevance and has been reported in at least three scientific papers [125,128,129]. In the context of repetitive, chronic exposure to significantly elevated ELF pulses from PDAs worn on the body, relevant health studies point to a possible relationship between ELF exposure and cancer and pregnancy outcomes [130–133].

We include discussion of the ELF literature for two reasons. As mentioned above ELF activates the same biology as RF, it contributes to the total EMF burden of the body. In addition, PDAs and cell phones emit both radiofrequency/microwave radiation (RF) and extremely low frequency ELF from the battery switching of the device (the power source). Studies show that some devices produce excessively high ELF exposures during voice and data transmission. ELF is already classified as a 2B (Possible) Carcinogen by IARC, which means that ELF is indisputably an issue to consider in the wireless technology debate. ELF has been classified as a Group 2B carcinogen for all humans, not just children. The strongest evidence came from epidemiological studies on childhood leukemia, but the designation applies to all humans, both adults and children [1,25].

Wireless headsets that allow for conversations with cell phones at a distance from the head itself reduce the emissions. Depending on the type of wireless device, they may operate (transmit signal) only during conversations or they may be operational continuously. The cumulative dose of wireless headsets has not been well characterized under either form of use. Substantial cumulative RF exposure would be expected if the user wears a wireless headset that transmits a signal continuously during the day. However a critical factor is where the cell phone is placed. If worn on a belt with a headset, the exposure to the brain is reduced but the exposure to the pelvis may be significant.

Cell towers (called "masts" in Europe and Scandinavian countries) are wireless antenna facilities that transmit the cell phone signals within communities. They are another major source of RF exposures for the public. They differ from RF exposures from wireless devices like cell phones in that they produce much lower RF levels (generally 0.05 to 1–2  $\mu\text{W}/\text{cm}^2$  in the first several hundred feet around them) in comparison to several hundred microwatts per centimeter

squared for a cell phone held at the head. However they create a constant zone of elevated RF for up to 24 h per day, many hours per day, and the exposure is whole body rather than localized at the head. These facilities are the distribution system for wireless voice communications, internet connections and data transmission within communities. They are often erected on free-standing towers. They may be constructed on telephone poles or electrical poles. They may be built into the façade or rooftops of buildings behind wood screening. These are called stealth installations for wireless antenna facilities. Some installations are camouflaged to resemble ‘false trees or rocks’. They emit RF to provide cell service to specific “cells” or locations that receive the signal.

Other forms of wireless transmission that are common in areas providing cell service are wireless land area networks (WLAN), (WiMAX) and WIFI networks. Some cities are installing city-wide WIFI service to allow any user on the street to log into the internet (without cables or wire connections). WIFI installations may have a signal reach for a few hundred feet where WiMAX installations may transmit signal more than 10 miles, so produce a stronger RF emission for those in close proximity. Each type has its particular signal strength and intended coverage area, but what they have in common is the production of continuous RF exposure for those within the area. We do not know what the cumulative exposure (dose) might be for people living, working or going to school in continuously elevated RF fields, nor are the possible health implications yet known. However, based on studies of populations near cell sites in general, there is a constellation of generally observed health symptoms that are reported to occur [85–107]. In this regard it is important to note that children living near to AM radio transmitters have been found to elevated risks of leukemia [134,135]. While AM radio RF fields are lower in frequency than that common in mobile phones, this is a total body irradiation with RF. The fact that leukemia, not brain cancer, is apparent in these studies suggests that leukemia is the cancer seen at the lowest levels of both ELF and RF fields under the circumstances of whole-body exposure.

Commercial surveillance systems or security gates pose an additional source of strong RF exposures. They are ubiquitous in department stores, markets and shops at the entry and exit points to discourage shoplifting and theft of goods. Security gates can produce excessively high RF exposures (although transitory) and have been associated with interference with pacemakers in heart patients. The exposure levels may approach thermal public safety limits in intensity, although no one expects a person to stand between the security gate bars for more than 6 min (safety limits for uncontrolled public access are variable depending on the frequency, but are all averaged over a 6-min exposure period).

RFID chips (radiofrequency identification chips) are being widely used to track purchases and for security of pets, and in some cases to keep track of patients with Alzheimer’s disease and of children. RFID chips are implanted in fabrics, inserted in many types of commercial goods, and can be implanted

under the skin. They create a detectable signal to track the location of people and goods.

## 5. Problems with existing public health standards (safety limits)

If the existing standards were adequate none of the effects documented above should occur at levels to which people are regularly exposed. The fact that these effects are seen with our current ambient levels of exposure means that our existing public safety standards are obsolete. It also means that new, biologically based public exposure standards for wireless technologies are urgently needed. Whether it is feasible to achieve low enough levels that still work and also protect health against effects of chronic RF exposure – for all age groups – is uncertain. Whether we can protect the public and still allow the kinds of wireless technology uses we see today is unknown.

The nature of electromagnetic field interactions with biological systems has been well studied [136–144]. For purposes of standard-setting processes for both ELF and RF, the hypothesis that tissue damage can result only from heating is the fundamental flaw in the misguided efforts to understand the basic biological mechanisms leading to health effects.

The thermal standard is clearly untenable as a measure of dose when EMF stimuli that differ by many orders of magnitude in energy can stimulate the same biological response. In the ELF range, the same biological changes occur as in the RF, and no change in temperature can even be detected. With DNA interactions the same biological responses are stimulated in ELF and RF ranges even though the frequencies of the stimuli differ by many orders of magnitude. The effects of EMF on DNA to initiate the stress response or to cause molecular damage reflect the same biology in different frequency ranges. For this reason it should be possible to develop a scale based on DNA biology, and use it to define EMF dose in different parts of the EM spectrum. We also see a continuous scale in DNA experiments that focus on molecular damage where single and double strand breaks have long been known to occur in the ionizing range, and recent studies have shown similar effects in both ELF and RF ranges [144].

Existing standard-setting bodies that regulate wireless technologies, assume that there are no bioeffects of concern at exposure levels that do not cause measurable heating. However, it has been established beyond any reasonable doubt that bioeffects and some adverse health effects occur at far lower levels of RF and ELF exposure where no heating (or induced current) occurs; some effects are shown to occur a thousand times or more below the existing public safety limits. New, biologically based public exposure limits are urgently needed. New wireless technologies for cell and cordless phones, other wireless communication and data transmission systems affect living organisms in new ways that our antiquated safety limits have not foreseen, nor protected against.

The exposure of children to electromagnetic fields has not been studied extensively; in fact, the Federal Communications Commission (FCC) standards for exposure to radiofrequency radiation are based on the height, weight and stature of a 6-foot tall man, not scaled to children or adults of smaller stature. They do not take into account the unique susceptibility of growing children to exposures, nor are there studies of particular relevance to children.

In addition there is a problem in the consideration of the level of evidence taken into consideration by these bodies. There have not been adequate animal models shown to have cancer as an endpoint, and a perception that no single mechanism is proven to explain these associations. Thus these committees have tended to ignore or minimize the evidence for direct hazard to humans, and believe there is no proof of cause and effect. These bodies assume from the beginning that only conclusive scientific evidence (absolute proof) will be sufficient to warrant change, and refuse to take action on the basis of a growing body of evidence which provides early but consequential warning of risks.

The Radiofrequency Interagency Working Group of the US governmental agencies involved in RF matters (RFI-AWG) issued a Guidelines Statement in June of 1999 that concluded the present RF standard “may not adequately protect the public” [145]. The RFI-AWG identified fourteen (14) issues that they believe are needed in the planned revisions of ANSI/IEEE RF exposure guidelines including “to provide a strong and credible rationale to support RF exposure guidelines”. In particular, the RFI-AWG criticized the existing standards as not taking into account chronic, as opposed to acute exposures, modulated or pulsed radiation (digital or pulsed RF is proposed at this site), time-averaged measurements that may erase the unique characteristics of an intensity-modulated RF radiation that may be responsible for reported biologic effects, and stated the need for a comprehensive review of long-term, low-level exposure studies, neurological-behavioral effects and micronucleus assay studies (showing genetic damage from low-level RF) [145]. This important document from relevant US agencies questions existing standards in the following ways: (a) selection of an adverse effect level for chronic exposures not based on tissue heating and considering modulation effects; (b) recognition of different safety criteria for acute and chronic exposures at non-thermal or low-intensity levels; (c) recognition of deficiencies in using time-averaged measurements of RF that does not differentiate between intensity-modulated RF and continuous wave (CW) exposure, and *therefore may not adequately protect the public*; (d) having standards based on adult males rather than considering children to be the most vulnerable group.

## 6. Prudent public health responses

Emerging environmental health problems require preventative public health responses even where scientific and

medical uncertainties still exist, but where policy decisions today may greatly reduce human disease and societal costs tomorrow.

Policy decisions in public health must address some amount of uncertainty when balancing likely benefits and estimated costs. Although new insight will allow better appreciation of difficult issues, such as those occurring in environmental and occupational health, an expanded perspective may also enlarge the list of problems that need to be managed. Ignoring the problems carries its own costs (as deferring a decision is a decision in itself). With environmental and other public health problems becoming increasingly complex and international in scope, scientific documentation alone rarely justifies simple solutions [146].

Social issues regarding the controversy over public and occupational exposures to ELF and RF center on the resolute adherence to existing ICNIRP and FCC/IEEE standards by many countries, in the face of growing scientific evidence of health risks at far lower levels [10]. The composition of these committees, usually with excessive representation of the physics and engineering communities rather than public health professionals, results in a refusal to adopt biologically based exposure standards. Furthermore, there is widespread belief that governments are ignoring this evidence and there is widespread distrust of and lack of confidence in governments and their health agencies. The basis on which most review bodies and standard-setting agencies have avoided the conclusion that the science is strong enough to warrant new safety limits for ELF and RF is to require a demonstration of absolute proof before taking action. A causal level of evidence, or scientific certainty standard is implicit in nearly all reviews of the ELF and RF science, although this runs counter to good public health protection policies.

There is no question that global implementation of the safety standards proposed in the Bioinitiative Report, if implemented abruptly and without careful planning, have the potential to not only be very expensive but also disruptive of life and the economy as we know it. Action must be a balance of risk to cost to benefit. The major risk from maintaining the status quo is an increasing number of cancer cases, especially in young people, as well as neurobehavioral problems at increasing frequencies. The benefits of the status quo are expansion and continued development of communication technologies. But we suspect that the true costs of even existing technologies will only become much more apparent with time. Whether the costs of remedial action are worth the societal benefits is a formula that should reward precautionary behavior. Prudent corporate policies should be expected to address and avoid future risks and liabilities, otherwise, there is no market incentive to produce safe (and safer) products.

The deployment of new technologies is running ahead of any reasonable estimation of possible health impacts and estimates of probabilities, let alone a solid assessment of risk. However, what has been missing with regard to EMF has been an acknowledgement of the risk that is demonstrated by

the scientific studies. There is clear evidence of risk, although the magnitude of the risk is uncertain, and the magnitude of doing nothing on the health effects cost to society is similarly uncertain. This situation is very similar to our history of dealing with the hazards of smoking decades ago, where the power of the industry to influence governments and even conflicts of interest within the public health community delayed action for more than a generation, with consequent loss of life and enormous extra health care costs to society. New standards are warranted now, based on the totality of scientific evidence; the risks of taking no-action, the large population at risk, costs associated with ignoring the problem in new and upgraded site selection and construction, and the loss of public trust by ignoring the problem.

Direct medical and rehabilitative health costs associated with treatment for diseases that are reasonably related to wireless technologies may be very large. Although there is uncertainty involved in how much disease is related to wireless exposures, the mere scale of the problem with several billion users of cell phones and even larger impacts on bystander populations (from cell site exposures, from other WI-FI and wireless exposures in-home and commercial use, etc.) the associated public health costs will likely be monumental. Furthermore the costs to families with cancers, neurological diseases or learning disabilities in children related in part or in whole to wireless technologies extend beyond medical costs. They may reasonably extend to family disruption and family psychological problems, losses in job productivity and income loss.

The history of governments and their official health agencies to deal with emerging and newly identified risks to health is not good [147–149]. This is particularly true where industry investments in new products and technologies occur without full recognition, disclosure or even knowledge of possible health consequences. Large economic investments in polluting industries often make for perilously slow regulatory action, and the public health consequences may be very great as a result [150,151].

Free markets do not internalize the costs to society of “guessing wrong”. Unexpected or hidden health costs of new technologies may not be seen for many years, when the ability to recall or to identify the precise exposures related to disease outcomes is difficult or impossible. The penalty nearly always falls to the individual, the family or the taxpayer and not to the industry that benefits economically—at least in free-market economies. Thus, the profits go to industry but the costs may go to the individual who can suffer both diminished quality of life and health and economic disadvantage. If all disease endpoints that may be reasonably related to chronic exposure to electromagnetic fields are considered even a small attributable fraction for one or more industries, it will have enormous global impact on public health. The public health implications are immense. But they can be reduced by strong government and public health interventions providing information on alternatives to wireless technologies, public education campaigns, health advisories,

Table 1

Public health implications of wireless technologies argue for change in governmental and health agency actions.

---

Secure US and EU legislative mandates for safer technologies for communication and data transmission, for security and surveillance needs.
Promote wired alternatives for voice and data communication (cable, fiber-optic)
Discourage or ban use of cell phones by children and young teen-agers
Provide permanent (unremovable) labels on cell phones “Not for use by children under the age of 16”
Implement national public education campaigns on health issues (cell phones, cordless phones, PDAs, wireless internet, city-wide WI-FI, WLAN and WiMAX exposures
Promote industry redesign for safer products: support innovation for alternatives and solutions
Slow or stop deployment of wireless technologies to discourage reliance on wireless technologies for communication and security needs
Put the burden of proof on industry to show “new wireless tech” is safe before deployment
Adopt and enforce restricted use areas for sensitive or more vulnerable segments of society including low-EMF environments in public areas and “No Cell” zones in airports, hospitals, schools
Acknowledge FCC and ICNIRP thermal safety standards are obsolete for wireless technologies
Appoint new standard-setting bodies familiar with biological effects to develop new guidelines for public safety limits.
Develop new biologically based standards that address low-intensity, chronic exposures
Require standard of evidence and level of proof = public health
Reject “causal” standard of evidence for taking action on science
Make industry financially liable for “guessing wrong” and ignoring health risks

---

requirements for redesign of wireless devices, proscription of use of wireless devices by children and teenagers, strong and independent research programs on causes and prevention of EMF-related diseases, and consultation with all stakeholders on issues relating to involuntary exposures (bystander or second-hand radiation exposures from wireless technologies) (Table 1).

The scientific information contained in this Supplement argues for thresholds or guidelines that are substantially below current FCC and ICNIRP standards for localized exposures to wireless devices and for whole-body exposure. Uncertainty about how low such standards might have to go to be prudent from a public health standpoint should not prevent reasonable efforts to respond to the information at hand. No lower limit for bioeffects and adverse health effects from RF has been established, so the possible health risks of wireless WLAN and WI-FI systems, for example, will require further research. No assertion of safety at any level of wireless exposure (chronic exposure) can be made at this time. The lower limit for reported human health effects has dropped 100-fold below the safety standard (for mobile phones and PDAs); 1000–10,000-fold for other wireless (cell towers at distance; WI-FI and WLAN devices). The entire basis for safety standards is called into question, and it is not unreasonable to question the safety of RF at any level.

It is likely that for both ELF and RF, as for other carcinogens, there is no threshold of exposure that is without risk, but the magnitude of the risk increases linearly with the level of exposure. Our society will not go back to the pre-electric and pre-wireless age, but the clear evidence of health hazards to the human population from exposure mandates that we develop ways in which to reduce exposure through education, new technologies and the establishment of biomedically based standards.

## 7. Conclusions and recommended actions

New ELF limits are warranted based on a public health analysis of the overall existing scientific evidence. These limits should reflect environmental levels of ELF that have been demonstrated to increase risk for childhood leukemia, and possibly other cancers and neurological diseases. ELF limits should be set below those exposure levels that have been linked in childhood leukemia studies to increased risk of disease, plus an additional safety factor. It is no longer acceptable to build new power lines and electrical facilities that place people in ELF environments that have been determined to be risky. These levels are in the 2–4 milligauss (mG) range (0.2–0.4  $\mu$ T), not in the 10 s of mG or 100 s of mG. The existing ICNIRP limit is 1000 mG (100  $\mu$ T) and 904 mG (90.4  $\mu$ T) in the US for ELF is outdated and based on faulty assumptions. These limits are can no longer be said to be protective of public health and they should be replaced. A safety buffer or safety factor should also be applied to a new, biologically based ELF limit, and the conventional approach is to add a safety factor lower than the risk level.

While new ELF limits are being developed and implemented, a reasonable approach would be a 1 mG (0.1  $\mu$ T) planning limit for habitable space adjacent to all new or upgraded power lines and a 2 mG (0.2  $\mu$ T) limit for all other new construction. It is also recommended that a 1 mG (0.1  $\mu$ T) limit be established for existing habitable space for children and/or women who are pregnant (because of the possible link between childhood leukemia and *in utero* exposure to ELF). This recommendation is based on the assumption that a higher burden of protection is required for children who cannot protect themselves, and who are at risk for childhood leukemia at rates that are traditionally high enough to trigger regulatory action. This situation in particular warrants extending the 1 mG (0.1  $\mu$ T) limit to existing occupied space. “Establish” in this case probably means formal public advisories from relevant health agencies. While it is not realistic to reconstruct all existing electrical distribution systems, in the short-term; steps to reduce exposure from these existing systems need to be initiated, especially in places where children spend time, and should be encouraged. These limits should reflect the exposures that are commonly associated with increased risk of childhood leukemia (in the 2–5 mG (0.2–0.5  $\mu$ T) range for all children, and over 1.4 mG (0.14  $\mu$ T) for children age 6 and younger). Nearly all of

the occupational studies for adult cancers and neurological diseases report their highest exposure category is 4 mG (0.4  $\mu$ T) and above, so that new ELF limits should target the exposure ranges of interest, and not necessarily higher ranges.

Avoiding chronic ELF exposure in schools, homes and the workplace above levels associated with increased risk of disease will also avoid most of the possible bioactive parameters of ELF discussed in the relevant literature.

It is not prudent public health policy to wait any longer to adopt new public safety limits for ELF. These limits should reflect the exposures that are commonly associated with increased risk of childhood leukemia (in the 2–5 mG (0.2–0.5  $\mu$ T) range for all children, and over 1.4 mG (0.14  $\mu$ T) for children age 6 and younger). Avoiding chronic ELF exposure in schools, homes and the workplace above levels associated with increased risk of disease will also avoid most of the possible bioactive parameters of ELF discussed in the relevant literature.

The rapid deployment of new wireless technologies that chronically expose people to pulsed RF at levels reported to cause bioeffects, which in turn, could reasonably be presumed to lead to serious health impacts, is a public health concern. There is suggestive to strongly suggestive evidence that RF exposures may cause changes in cell membrane function, cell communication, metabolism, activation of proto-oncogenes and can trigger the production of stress proteins at exposure levels below current regulatory limits. Resulting effects can include DNA breaks and chromosome aberrations, cell death including death of brain neurons, increased free-radical production, activation of the endogenous opioid system, cell stress and premature aging, changes in brain function including memory loss, retarded learning, performance impairment in children, headaches and fatigue, sleep disorders, neurodegenerative conditions, reduction in melatonin secretion and cancers (BioInitiative Report Chapters 5–10, 12) [1].

This information now argues for thresholds or guidelines that are substantially below current FCC and ICNIRP standards for whole-body exposure. Uncertainty about how low such standards might have to go to be prudent from a public health standpoint should not prevent reasonable efforts to respond to the information at hand. No lower limit for bioeffects and adverse health effects from RF has been established, so the possible health risks of wireless WLAN and WI-FI systems, for example, will require further research and no assertion of safety at any level of wireless exposure (chronic exposure) can be made at this time. The lower limit for reported human health effects has dropped 100-fold below the safety standard (for mobile phones and PDAs); 1000–10,000-fold for other wireless (cell towers at distance; WI-FI and WLAN devices). The entire basis for safety standards is called into question, and it is not unreasonable to question the safety of RF at any level.

A cautionary target level for pulsed RF exposures for ambient wireless that could be applied to RF sources from cell tower antennas, WI-FI, WI-MAX and other similar sources

is proposed. The recommended cautionary target level is 0.1 microwatts per centimeter squared ( $\mu\text{W}/\text{cm}^2$ ) (or 0.614 V per meter or V/m) for pulsed RF where these exposures affect the general public; this advisory is proportionate to the evidence and in accord with prudent public health policy. A precautionary limit of 0.1  $\mu\text{W}/\text{cm}^2$  should be adopted for outdoor, cumulative RF exposure. This reflects the current RF science and prudent public health response that would reasonably be set for pulsed RF (ambient) exposures where people live, work and go to school. This level of RF is experienced as whole-body exposure, and can be a chronic exposure where there is wireless coverage present for voice and data transmission for cell phones, pagers and PDAs and other sources of radiofrequency radiation. An outdoor precautionary limit of 0.1  $\mu\text{W}/\text{cm}^2$  would mean an even lower exposure level inside buildings, perhaps as low as 0.01  $\mu\text{W}/\text{cm}^2$ . Some studies and many anecdotal reports on ill health have been reported at lower levels than this; however, for the present time, it could prevent some of the most disproportionate burdens placed on the public nearest to such installations. Although this RF target level does not preclude further rollout of WI-FI technologies, we also recommend that wired alternatives to WI-FI be implemented, particularly in schools and libraries so that children are not subjected to elevated RF levels until more is understood about possible health impacts. This recommendation should be seen as an interim precautionary limit that is intended to guide preventative actions; and more conservative limits may be needed in the future.

Broadcast facilities that chronically expose nearby residents to elevated RF levels from AM, FM and television antenna transmission are also of public health concern given the potential for very high RF exposures near these facilities (antenna farms). RF levels can be in the 10 s to several 100 s of  $\mu\text{W}/\text{cm}^2$  in residential areas within half a mile of some broadcast sites (for example, Lookout Mountain, Colorado and Awbrey Butte, Bend, Oregon). Like wireless communication facilities, RF emissions from broadcast facilities that are located in, or expose residential populations and schools to elevated levels of RF will very likely need to be re-evaluated for safety.

For emissions from wireless devices (cell phones, personal digital assistant or PDA devices, etc.) there is enough evidence for increased risk of brain tumors and acoustic neuromas now to warrant intervention with respect to their use. Redesign of cell phones and PDAs could prevent direct head and eye exposure, for example, by designing new units so that they work only with a wired headset or on speakerphone mode.

These effects can reasonably be presumed to result in adverse health effects and disease with chronic and uncontrolled exposures, and children may be particularly vulnerable. The young are also largely unable to remove themselves from such environments. Second-hand radiation, like second-hand smoke is an issue of public health concern based on the evidence at hand.

In summary, the following recommendations are made:

- ELF limits should be set below those exposure levels that have been linked in childhood leukemia studies to increased risk of disease, plus an additional safety factor. It is no longer acceptable to build new power lines and electrical facilities that place people in ELF environments that have been determined to be risky (at levels generally at 2 mG (0.2  $\mu\text{T}$ ) and above).
- While new ELF limits are being developed and implemented, a reasonable approach would be a 1 mG (0.1  $\mu\text{T}$ ) planning limit for habitable space adjacent to all new or upgraded power lines and a 2 mG (0.2  $\mu\text{T}$ ) limit for all other new construction. It is also recommended for that a 1 mG (0.1  $\mu\text{T}$ ) limit be established for existing habitable space for children and/or women who are pregnant. This recommendation is based on the assumption that a higher burden of protection is required for children who cannot protect themselves, and who are at risk for childhood leukemia at rates that are traditionally high enough to trigger regulatory action. This situation in particular warrants extending the 1 mG (0.1  $\mu\text{T}$ ) limit to existing occupied space. "Establish" in this case probably means formal public advisories from relevant health agencies.
- While it is not realistic to reconstruct all existing electrical distributions systems, in the short-term; steps to reduce exposure from these existing systems need to be initiated and should be encouraged, especially in places where children spend time.
- A precautionary limit of 0.1  $\mu\text{W}/\text{cm}^2$  (which is also 0.614 V per meter) should be adopted for outdoor, cumulative RF exposure. This reflects the current RF science and prudent public health response that would reasonably be set for pulsed RF (ambient) exposures where people live, work and go to school. This level of RF is experienced as whole-body exposure, and can be a chronic exposure where there is wireless coverage present for voice and data transmission for cell phones, pagers and PDAs and other sources of radiofrequency radiation. Some studies and many anecdotal reports on ill health have been reported at lower levels than this; however, for the present time, it could prevent some of the most disproportionate burdens placed on the public nearest to such installations. Although this RF target level does not preclude further rollout of WI-FI technologies, we also recommend that wired alternatives to WI-FI be implemented, particularly in schools and libraries so that children are not subjected to elevated RF levels until more is understood about possible health impacts. This recommendation should be seen as an interim precautionary limit that is intended to guide preventative actions; and more conservative limits may be needed in the future.

# Smart Meters are now Big Brother

Tuesday, August 25, 2015 by: J. D. Heyes

Tags: [smart meters](#), [Big Brother](#), [Fourth Amendment](#)

(NaturalNews) There has been a great deal of news over the past few years about how the federal government is increasingly spying on the American people, especially via the National Security Agency and the FBI. But it is becoming increasingly apparent that Americans' privacy is being invaded more frequently, and on a wider scale, by private industry.

Consider just some of the latest technology to hit the market and you can see that we Americans are being watched, monitored, measured and profiled 24 hours a day, seven days a week - and in many ways, we're helping the process:

## "Smart" meters

In recent days, California Gov. Jerry Brown ordered residents of the drought-stricken state to cut water usage by as much as 25 percent. It wasn't a recommendation, per se; officials are serious about implementing it.

As reported by *CBS Los Angeles*, state and local officials are going after "water wasters" [through the installation](#)

of ["smart meters"](#) that gauge water use and report it back to water authorities, wirelessly.

"It collects the data every five minutes, then after midnight, the cellphone that's built in here comes on, makes one call, and calls it in to the database that we and the customer, through a password security system, have online access to their consumption," Long Beach Water Department General Manager Kevin Wattier told the local affiliate. "The accuracy is just incredible, because we get the data the next day."

In February, when water [smart meters](#) were installed around the city, Wattier used the data to catch the owners of local McDonalds restaurant who were said to be over-watering the lawn there.

Wattier went onto say he believes smart meters will increasingly be used to measure [water](#) usage at both homes and businesses throughout Southern California. But no one is talking about getting rid of them once the drought subsides.

## Location-trackers for automobiles

Hyped as a way for parents to "virtually" follow their kids (to make sure they go where they say they are going, for instance) there is a bevy of new tracking technology on the market today. Beginning as early as [2006](#), driver tracking of children has grown in popularity (unfortunately).

"New gadgets can let parents know every time their children drive too fast or visit someone they shouldn't," says an *NPR* story on the subject.

And while it may sound like a good idea, the problem is that we're raising our children to accept living in a society in which every move they make is monitored by someone or something - all the while telling them that they have a "Fourth Amendment right to privacy."

Technology is also being used [to track drivers for the purposes of paying highway tolls](#), and to monitor speeds.

## "The Internet of things"

Even our home appliances, like our televisions, are being used to track our activities. As we have reported, the "Internet of things" is a concept in which home appliances are [linked together wirelessly](#) into systems that can be monitored, hacked or altered.

## Social media

Do you Facebook? Use Google+ forums? Text? Own a smart phone? If so, you are being monitored, [both by the social media companies](#) themselves and [and by government entities](#).

In more ways than we can even imagine, corporations are becoming Big Brother - not just government.

# All new smart TV emits high radiation – wifi blasts all day long

admin July 15, 2014

I just got a new LG 650 55 inch TV, smart tv, beautiful picture, sound, A perfect package. But what is hidden is that it emitted the high-frequency fields every 5 minutes. I measured the intensity of that emission and it was really strong. Imagine being bombarded with high-frequency fields that are known to be harmful all day long from a freaking TV.

The bad thing is that you can't turn it off! There is no switch whatsoever. All the new smart TVs emit radiation all day long. Some Sony models have the option to turn off the WIFI, but I am not sure which and if it really works. Other models like Samsung, Panasonic, do not...

We have come to the era that is really not respecting our health. We are being bombarded with all kind of wireless emissions all the time. So beware when buying a smart TV..I know Samsung emits WIFI all the time.....

But I took the TV to the LG service and they unplug the wifi emitter inside the TV. But beware, if you do that also your Bluetooth might not work. Because in my TV WiFi and Bluetooth are both joined in one module. So the repairman just disabled the whole module. Now my so-called magic remote does not work anymore, a remote that works like a mouse. But the regular IR remote still works.

Also, be careful that is you have active 3D glasses, that might stop working too. Because freaking glasses from Samsung have inbuilt emitter in glasses. Bt my LG has a passive 3D system, so the glasses do not have any emitter and are just regular plastic 3D glasses.

So now my LG tv is perfectly health friendly, it emits no WIFI radiation and very low-frequency fields, that are not harmful at all.

I am very happy. Nowadays you need EMF meters to check your surroundings all the time. WIFI could be hidden also in baby monitors, and who knows where...

**That is why I put together [EMF home protection DVD](#) guide, to protect yourself against this new man-made dangerous radiation that is causing chronic health problems.**

# Popular electricity smart meters in Spain can be hacked, researchers say

\* Researchers find security flaws in some smart meters

\* Says weaknesses could lead to fraud, blackouts

\* Spain one-third done with nationwide meter upgrade

By Eric Auchard

FRANKFURT, Oct 7 Network-connected electricity meters installed in millions of homes across Spain lack essential security controls, according to two researchers who say the vulnerabilities leave room for hackers to carry out billing fraud or even cause blackouts.

Security experts Javier Vazquez Vidal and Alberto Garcia Illera said in an interview on Monday that so-called smart meters installed by a Spanish utility to meet government energy efficiency goals lack basic safeguards to thwart hackers.

The researchers said flawed code in reprogrammable memory chips enable them to remotely shut down power to individual households, switch meter readings to other customers and insert network "worms" that could cause widespread blackouts.

"You can just take over the hardware and inject your own stuff," Vazquez Vidal said, referring to the threat that hackers could insert malicious code into one box and use it to control nearby meters, and thereby cascade an attack across the network.

Traditionally, energy utilities have kept power plants and mechanical electricity meters safe from cyber attack by keeping them insulated from the open Internet.

Smart meters are connected over power line networks to give customers and utilities instant data about when, where and how much energy households use, enabling energy providers to monitor and adjust energy flows.

The European Union wants more than two thirds of Europe's electricity users to have smart meters by 2020, an initiative it hopes will reduce energy use by three percent.

Over the last decade, most countries in Europe have mandated that smart meters be installed in homes and businesses. But as nationwide deployments have taken place in Italy and Sweden and are now in motion across France, Spain and the United Kingdom, experts have begun to uncover cybersecurity threats posed by some meters.

The two researchers declined to identify the utility or European-based hardware manufacturer of the smart meters found to be vulnerable to attack. They will discuss their findings at the Black Hat Europe hacking conference in Amsterdam next week.

"We are not releasing the exact details; we are not going to say how we did this," Garcia Illera said. "This issue has to be fixed."

The top power utilities in Spain are Endesa, Iberdrola and E.ON. Collectively, 8 million smart meters have been installed, or 30 percent of households.

The researchers said they had identified security flaws only in boxes from one meter manufacturer. Vazquez Vidal said he believes the utility may be able to patch the problem remotely, without being forced to send repair staff to upgrade each box physically.

An expert with Spain's markets and competition regulator, which oversees the smart meter mandate, said the agency was finishing a study on the threat of meter hacking and had not found any evidence it was taking place or at risk of occurring.

## LEAVING THE DOOR OPEN

The security impact of a vast array of connected devices from smart meters to automobile controls to wearables such as smartwatches and health monitors are only now being seriously considered by industry, despite their growing use in daily life.

The Spanish researchers said they hacked the meters by bypassing encryption that was designed to secure their communications.

Vazquez Vidal and Garcia Illera said the meters use relatively easy to crack symmetric AES-128 encryption. The limited security appeared to be designed largely to prevent tampering with billing systems by fraudsters, they said.

Once through this first level of security, they said they could take full control of the box, switching its unique ID to impersonate other customer boxes or turning the meter itself into a weapon for launching attacks against the power network.

"Oh wait? We can do this? We were really scared," Vazquez Vidal said. "We started thinking about the impact this could have. What happens if someone wants to attack an entire country?" he said.

They say they tested the devices in their own lab, where they were able to reproduce various attacks in miniature using several of the smart meters.

The same researchers last year uncovered weaknesses in computer chips found in many automobiles, which they said could boost performance or be used to hotwire a car or cause crashes.

Vazquez Vidal, who said he was "unemployed and bored" at home in Cadiz when he carried out the smart meter research, subsequently was hired by a major European automaker based on his earlier work on car security.

Garcia Illera works for a California-based software maker. The two asked that their employers not be identified because their research projects do not involve their employers.

Mike Davis, a top security researcher with cybersecurity consulting firm IOActive, identified similar threats in U.S. smart meter devices five years ago.

"It was strange. Pretty much none of the utilities deploying smart meters at the time were considering the meters themselves as part of their threat problem," Davis said.

Disclosure of his findings was a wake-up call for U.S. utilities, leading to increased government scrutiny and industry action to better secure the devices against cyberattack.

Davis said the vulnerabilities described by the Spanish research team sounded feasible given the slow response by utilities and meter makers to overhaul their meters' security.

"The industry is starting to be much more intelligent," Davis said. "Although for something that is attached to the side of your house, it still has a ways to go." (Editing by Mark Potter)

# **ELECTROMAGNETIC HYPERSENSITIVITY (EHS)**

## **A PERSONAL CASE STUDY**

**A briefing on EHS for Health Professionals, Research Scientists, Government Officials and concerned members of the Public**

**11<sup>th</sup> April 2014**

**Author: Steven Weller**

Bachelor of Science, Monash University

## Introduction

I felt compelled to write this personal case study because through my own personal experiences I have found that there is a serious lack of understanding of what Electromagnetic Hypersensitivity (EHS), also commonly referred to as Electrosensitivity (ES), is and its cause. For some people EHS can be completely disabling and in some extreme situations can lead to hospitalisation due to aggravation of pre-existing medical condition(s), development of tachyarrhythmia, which at times can result in a loss of consciousness, and other acute effects on the neurological system.

The main problem being faced by people who are suffering from EHS is that they are left in a tenuous position where there is a complete absence of government support. EHS is declared to be “not a medical diagnosis” [1] by the World Health Organisation (WHO) and so sufferer’s symptoms are ignored by government health authorities and often misdiagnosed by the medical profession. This then can lead to the prescription of unnecessary and ineffective medication. Only Sweden recognises EHS as a functional impairment while the Austrian Medical Association has provided guidelines on the diagnosis and treatment of Electromagnetic Radiation (EMR) related illnesses [2]

My hope in writing this case study is to dispel misconceptions some members of the scientific community, government bodies and the general public have on this functional impairment. I also hope that by detailing my own personal experience with EHS that I can help those who may be suffering similar symptoms recognise the cause and help them understand how they can manage their condition, and to some degree, protect themselves.

### Conflict of Interests Declaration:

I would like to declare that I have no conflicts of interests. I stand to make no financial or political gains by writing this personal case study and declaring my sensitivity to EMR. By making such a declaration regarding my sensitivity, there is a real possibility that I am putting my career in IT at risk.

## What is Electromagnetic Hyper Sensitivity (EHS)

EHS, as a functional impairment, has been known by the scientific community for many years. In the 1970’s it was referred to as microwave sickness or radiowave sickness – same symptoms as EHS, just a different name. The website Powerwatch.org.uk lists a total of 130 studies relating to the topic of EHS and has categorised them as follows: 69 studies with positive findings, 27 studies with null findings and 24 studies that offered important insights but were neither a positive or a null finding. Further descriptions of EHS symptoms are provided below.

*“Individuals living within 100 metres of a wireless facility of any kind tend to report symptoms such as dizziness, nausea, memory loss, inability to concentrate, irritability, rise in blood pressure, peculiar pressure behind the eyeballs, joint pains moving around the body, hurt of feet sole, high-pitched noises in their ears, itchy systemic rash and even internal bleeding -- all symptoms of radiowave sickness. Clinics report an immediate increase in respiratory illness: bronchitis, flu, pneumonia and asthma during the first weeks of PCS base station start-up and hospitals become inundated.”*

### ***The Microwave Syndrome: A Preliminary Study in Spain. Epidemiological Study***

"Insomnia, cancer, leukemia in children, and brain tumors are the clinical entities more frequently described (Dolk et al., 1997; Hocking et al., 1996; Maskarinec et al., 1994; Minder and Pfluger, 2001; Selvin et al., 1992). Moreover, the clinical consequences of being exposed to microwave radiation such as radar has been evaluated from military and occupational studies (Balode, 1996; Garaj-Vrhovac, 1999; Goldsmith, 1997; Johnson-Liakouris, 1998; Robinette et al., 1980).

A specific symptomatology, linked to radar exposure at low levels of RF, has been termed "microwave sickness" or "RF syndrome." (Johnson-Liakouris, 1998) With few exceptions, functional disturbances of the central nervous system have been typically described as a kind of radiowave sickness, neurasthenic or asthenic syndrome. Symptoms and signs include headache, fatigue, irritability, loss of appetite, sleepiness, difficulties in concentration or memory, depression, and emotional instability. **This clinical syndrome is generally reversible if RF exposure is discontinued....**

...There is a large and coherent body of evidence of biological mechanisms that support the conclusion of a plausible, logical, and causal relationship between RF exposure and neurological disease."

Source: <http://www.emf-portal.de/viewer.php?aid=13498&l=e>

### ***"Symptoms of Radio Wave Sickness" excerpt from 'No Place To Hide' April 2001***

**Neurological:** headaches, dizziness, nausea, difficulty concentrating, memory loss, irritability, depression, anxiety, insomnia, fatigue, weakness, tremors, muscle spasms, numbness, tingling, altered reflexes, muscle and joint pain, leg/foot pain, "Flu-like" symptoms, fever. More severe reactions can include seizures, paralysis, psychosis and stroke.

**Cardiac:** palpitations, arrhythmias, pain or pressure in the chest, low or high blood pressure, slow or fast heart rate, shortness of breath.

**Respiratory:** sinusitis, bronchitis, pneumonia, asthma.

**Dermatological:** skin rash, itching, burning, facial flushing.

**Ophthalmological:** pain or burning in the eyes, pressure in/behind the eyes, deteriorating vision, floaters, cataracts.

**Others:** digestive problems; abdominal pain; enlarged thyroid, testicular/ovarian pain; dryness of lips, tongue, mouth, eyes; great thirst; dehydration; nosebleeds; internal bleeding; altered sugar metabolism; immune abnormalities; redistribution of metals within the body; hair loss; pain in the teeth; deteriorating fillings; impaired sense of smell; ringing in the ears."

Source: <http://www.electricalpollution.com/solutions.html>

## What are the key issues?

The main problem faced by EHS sufferers today in many countries around the world is there is a complete absence of government support. In addition, there are a number of other concerns that I have listed below that are by no means the complete story on this issue:

1. The general public as well as the medical profession as a whole appear to lack an understanding of what EHS is and its cause. Medical practitioners neither have the tools nor the methodology (training) to identify or treat those who are suffering. Although my doctor indicated that he had read some material on EHS, he suggested I was most likely suffering a migraine (exhibits similar symptoms – band of pressure around the head) and that I should take Ibuprofen (an anti-inflammatory/pain killer) which in my case is ineffective in treating the symptoms and certainly does not address the cause. Of greater concern is the chance of misdiagnosis and prescription of unnecessary medications that could result in further health complications due to unwanted side effects some medications may have as a result of prolonged usage.
2. There appears to be no consensus within the scientific community on Radio Frequency (RF) safety. Some scientists and scientific bodies are suggesting there is no proof of harm while others such as the WHO and IARC have classified all microwave transmitters as potentially carcinogenic. [3]
3. There is very little research being performed on EHS to validate it as a real condition or to confirm the cause.
4. While scientists debate whether EHS is a psychological and/or a physiological illness and whether sufficient proof can be established to link it to EMR, sufferers are left in limbo without any adequate protection, support or recognition of their health issues. It is unclear why a “diagnosis of exclusion” method cannot be adopted to verify EHS as a health impairment.
5. The burden of proof for the existence of EHS as an impairment, like proof of RF safety in general appears to be set unreasonably high. RF emitting devices are not handled in a manner which is consistent with the handling of other substances that may affect health, including drugs, medications and medical prostheses and devices, where manufacturers have to prove absence of health risk to the population and maintain post-marketing surveillance for years after a drug or device is first marketed.
6. Current testing methodology to verify sensitivity is often not biologically based and typically uses a provocation test, which I will describe in further detail on in this study, has some potentially serious flaws.
7. *‘Positive studies, studies showing effects of EMF, are being analysed in depth for the possible errors that lead to observation of effects. Negative studies are most commonly accepted for their face value and their quality is not being questioned because they provide evidence “as expected.”’* [4]

## My experience with EHS

I am 45 years of age and have been using computers all my adult life. I am an IT professional who has a Bachelor of Science degree in Biochemistry and Microbiology. I have always considered myself as an earlier adopter of technology and discovered quite by accident that I was sensitive to certain Electromagnetic Radiation (EMR) frequencies. My discovery also occurred well before I had learned through my subsequent research that there was a label for my condition, otherwise referred to as EHS or Electromagnetic Hypersensitivity.

My earliest memory of being sensitive to radiofrequencies was in late 2001 when wireless networking was beginning to become popular. I had no preconceived ideas or fears about the technology nor was I aware that RF could be potentially harmful. I was looking forward to the freedom it would afford me. No more wires cluttering the desk, free to do my work on my laptop at the kitchen table while I had breakfast. Being IT savvy, I had decided to buy the most powerful wireless Wi-Fi router available at the time, capable of transmitting 108Mbps per second and having an effective range of 100m+, which was twice as fast and twice the range of the cheaper more common wireless routers at the time. On first using my wireless router I began to feel pressure in my head, pressure in my chest, tingling sensations in my hands and face within a few minutes of use. I also noted (and so did my wife) that my temperament changed from my normally relaxed manner to being more agitated and short tempered when using my Wi-Fi enabled router. After turning off my wireless router I was left with a headache that persisted for several hours. At first, I thought nothing of it and did not immediately associate it to my use of wireless. It was only on subsequent usage that I felt the same symptoms. If I persisted for longer durations I found that on top of the symptoms mentioned above I felt a burning sensation in my intestinal region and the pressure on my chest would sometimes lead to my heart beating irregularly (arrhythmia) followed by stronger than normal heart beats (like my heart was trying to jump out of my chest).

I soon realised that a consistent pattern was developing when using my wireless router and symptoms that I was feeling. This was no placebo effect – it was real, consistent and most unpleasant. It was at this point that I had made a conscious decision to not use a wireless network to connect to the internet.

#### Definition of **nocebo effect**:

Firstly, the word **nocebo** (Latin for "I shall harm") is a harmless substance that creates harmful effects in a patient who takes it. The **nocebo effect** is the negative reaction experienced by a patient who receives a nocebo. These reactions result from a subject's expectations about how the substance will affect him or her. Though they originate exclusively from psychological sources, nocebo effects can be either psychological or physiological. Source Wikipedia

In 2007, I purchased a Sony PlayStation 3 (PS3). I did not use the inbuilt wireless network feature because I had a hard wired LAN that I could connect to. The PS3 controller however is a wireless Bluetooth device operating at 2.4 GHz, same as my router but at a significantly lower power density (the PS3 controller is a class 2 Bluetooth device so it'll only be kicking out a maximum of 2.5mW). I found that I did not get the same feelings that I felt with the router (not completely absent but barely noticeable and easily tolerable). Realising that I could possibly use low powered wireless devices without major issues I decided to purchase a Nintendo Wii for my children for Christmas several years later but after using the Wii a couple of times I had to dispose of it as I will now explain. The Wii controllers also use Bluetooth 2.4GHz (documentation on the internet suggests they operate with a maximum of 3.83mW output) which is the same frequency as the PS3, yet the all too familiar EHS symptoms reappeared and they were not pleasant. The difference in the levels of transmission power could be a potential cause and cannot be completely ruled out but I would say it is very unlikely. Instead, there is a noticeable difference in the amount of data being transmitted. My PS3 controller will only occasionally send information such as when a button is pressed which is a lot more infrequent than a Wii controller which is practically always transmitting as it needs to send telemetry data to indicate the position and movement of the controller through space and time. The amount of information being passed does seem to be a key in my sensitivity because I have a very similar issue with regards to 3G USB modems when compared to 3G mobile phones. A person can be 3 - 5 m away talking on a mobile phone and I do not feel anything significant as compared to someone using a laptop at the same distance that is connected to a 3G USB internet stick downloading streaming video which can be quite

intense. The amount of data being packed onto the signal appears to be a differentiating factor. This of course does not mean I am not sensitive to mobile phones – I most certainly am. I can only use a mobile phone near my head for 30 seconds or so before I find myself swapping the phone to my other ear due to severe discomfort that I feel. Today I rarely use my mobile phone and only keep it for emergencies. I switch it to flight mode most of the time, but if I do need to use it, I operate it using hands free.

Prior to the rollout of smart meters in my street, but subsequent to me finding out that I am sensitive to certain RF frequencies, I took precautionary measures in my home by ensuring that I only used wired connections for internet connectivity and that all wireless capable devices had said features configured to disabled. I was able to function normally and had no major issues with sleep or health. I did not suffer any further headaches or heart palpitations. I could say I was in good health. However in late August/early September 2011, Powercor rolled out wireless enabled smart meters in my street. I resisted the installation of a smart meter. However, not having a smart meter installed on my property did not help me as I became severely affected by my neighbours' 2 smart meters that were installed next to my bedroom 3m away. It was soon after installation that I found I was waking at specific times every night. Sometimes I felt like someone had taken a long sharp needle and quickly pushed it into my head. Once awoken, I found it very difficult to fall back to sleep. The timings were falling in a fairly consistent range in the early hours of the morning. Every morning I would wake up with a serious headache which would last all day and make concentration and performing simple duties quite difficult. On a number of occasions I would wake up with a feeling of pressure on my chest and my heart beating irregularly. I was feeling the very same symptoms that I had previously experienced with my wireless router.

2012 was a very difficult year for me because for 6 months I had to travel interstate every Sunday night to work on an IT project for an interstate customer. I would be put up in hotels that had DECT (Digital Cordless Telephones) that transmit constantly, even when not in use, as well as being irradiated by the hotel wireless internet. The office I worked at was located under a mobile phone tower and also had wireless access points for staff with wireless notebooks to access the corporate network. I would fly with a domestic airline that began to allow their business class passengers to use iPads with wireless enabled. By the time I got home I was in a terrible state which was further exacerbated by smart meter emissions. To make matters worse, I had become sensitised to things that normally did not bother me. Standing near transformers (phone charges, laptop power modules, light dimmers) left me feeling the same very symptoms I felt when exposed to wireless RF. Standing near my electric hotplate and range hood also affected me. I became allergic to my deodorant which I had been using for 10 years without issue and suggests RF was interfering with my immune system. I had constant headaches, felt extremely lethargic and completely lost motivation to do anything with the family. I would wake up feeling just as tired when I got out of bed in the morning as I had before I went to bed. I even found that I had become a rudimentary mobile phone base station detector. I could sense a mobile phone tower well before I even saw it. I can no longer drive through suburbs where smart meters have just been rolled out without developing a serious headache that can last for days. I have been to my local GP many times and he is at a loss to explain what is wrong with me. Blood tests, ECG tests all come back as normal. Of course an ECG will only show heart beat irregularities in my case if I am being exposed to high levels of EMR (but still within ARPANSA's RF Standard basic restrictions), which was absent in the doctor's office at that time. Pain killers were prescribed but offered very little relief. I was referred to a neurologist who indicated he had never heard of EHS, said he did not fully understand wireless technology so could not give me an informed opinion. He suggested I have an EEG and MRI to verify that I do not have any brain disorders or tumours. Of course the results came back negative.

It is important to understand that when I say I feel a headache, it is not a normal headache where sudden movements cause sharp pain such as when you are having a hangover or are dehydrated. Instead, it is a constant pressure and dull ache in my head. My face feels drained like I have been doing a 24 hour shift and sometimes can be accompanied by a prickling feeling over my skin (head and face) when in the presence of microwave RF frequencies.

EHS is not restricted to certain age groups. I was 32 when I determined I was sensitive to wireless. My condition has been getting progressively worse as the amount of man-made RF in our environment increases. I know without a doubt that wireless RF is causing these issues because when I go to remote areas where there is very low EMR I feel fine after several days. A recent trip away from large population centres for a few weeks, proved to me that my health issues were EMR related. It is important to understand that it does take time for the effects to dissipate in some people i.e. there is no instantaneous relief. I have recently painted my house with RF shielding paint and installed RF blocking curtains and my sensitivity has greatly reduced. I can now sleep better, stand near transformers and electric hot plates without feeling off, but mobile phone usage and wireless network usage is still a problem for me and something that I avoid as much as possible.

Despite taking precautionary measures in my own home at great expense, I am deeply concerned at the lack of support, care and understanding by the power utilities and the various government departments that I have contacted over this issue. I am forced to sleep at the back of the house because the master bedroom on the first floor is still getting RF penetration through the floor which is not shielded. Effectively the front parts of my house are denied to me if I don't want my health to substantially decline.

## **What other sufferers have said:**

Case 1: "I feel extremely isolated and marginalized by the community in which I live. My husband and mother both think that I am simply making the symptoms up, or that they are psychosomatic in nature. The condition seems very hard to grasp for people who do not hear the ringing, have the headaches or the sleeplessness, and even when people do have these symptoms."

Case 2: "It was unlike the occasional headache I have experienced in the past where the slightest movement produced a pounding sensation. This headache consisted of a pressure over my entire skull with a tingling sensation on my scalp.....My zest for life faded."

Case 3: "I experience intense ear ringing and burning/searing sensations on sides of my head since moving to our neighbourhood"

Case 4: "Fatigue, Depression, Excessive Sleep, Stress, Sometimes Anger, Aches, Hard to Focus, Inability to Concentrate, Housework also hard to do" [5]

There are countless example cases on the internet all over the world. Stop Smart Meters Australia has been maintaining a EHS register and has documented close to 200 cases as of January 2014.

## How do scientists try to verify whether a person is EHS?

Most scientists will perform what is called a provocation test. The provocation test is performed using a radio transmitting device that is usually operating at a specific frequency i.e. 914MHz to simulate a mobile phone.

Such tests are usually conducted in a double blind fashion. What this means is the scientist performing the test and the person who is subject to the test do not know whether the box is transmitting or not. The box will typically have a readout with some numeric codes that can be recorded and used later by the tester to work out whether the transmitter was active or not and then correlate this with the subject's "feelings".

Limitations of the provocation test are numerous and include:

1. Probably the most important fact that people need to realise is that the provocation test is not a biologically based test, instead it requires the subject to respond with how they feel which of course is very subjective.
2. Some provocation tests require the subject to give feedback as to the severity of the symptoms and rate it against previous exposures (provocation tests are usually conducted as a series of sequential staggered exposure tests) – again this is very subjective and cannot be considered objective as most people cannot remember exactly how something felt hours or days later. If we could remember what pain felt like, along with the intensity, I would seriously doubt women would choose to willingly get pregnant and opt for a natural birth more than once! Pain is a private, emotional experience. Pain intensity cannot be directly measured; responses to putatively painful stimuli can be measured, but not the experience itself.
3. They are set to a specific frequency of operation that the subject may not actually be sensitive to. Testers claim that the device simulates a mobile phone but this is debateable as it is not communicating to one or more cell towers nor is it clear what kind of data is being sent (simulation of a voice call – low data rate vs data/video streaming – high data rate or just a carrier signal), the modulation pattern used to send the data or if even data transmission is simulated at all. My EHS experience has shown that the amount of information being transmitted is a key contributor to my feelings of ill health.
4. Tests often do not simulate the environment that the person claims is affecting them. We are surrounded by EMF's from a variety of sources every day. When I was suffering from my router's RF emissions I was also using a computer which was also emitting RF (from the wireless card and to a lesser extent from the CPU due to its internal clock speed), I was also sitting in front of a 19" CRT monitor, there was also a number of power transformers present in the room. Using these devices without the wireless enabled did not cause me any issues. However the effects of EMR from multiple devices is additive.
5. The test procedure is often poorly defined due in part to those conducting the test not fully understanding the subject's EHS condition i.e. delayed reaction and delayed recovery times not always considered. EHS is not like flicking on a light switch resulting in an instant reaction, although there are some sufferers who can feel emissions shortly after they are switched on. There can be considerable delay times between signal transmission start and onset of symptoms. The same is true for the recovery time which can take hours to several days. One can see where a situation may arise where a subject has not fully recovered from an active signal and is then tested with a sham signal and asked how they feel. Guess what? They will give an answer indicating they are still suffering leading to a conclusion that EHS is not real or at least not related to EMR. Some

provocation test protocols do try to take this into account by having the subject try to rate the intensity against past experiences which is of dubious value as I have previously mentioned (see point 2 above).

6. Each subject is unique (body mass, current health ailments, medications, allergies, age, immune system sensitivity, genetic predisposition etc.) and so a set of standard tests with set exposure times and time intervals between exposures may not be sufficient or appropriate.
7. There is a definite psychological component that is going to influence test results and reinforce the belief that EHS is a Nocebo effect (psychosomatic). An analogy would be to conduct a test with a mouse by connecting electrodes to it and shocking it whenever a light is turned on. After sometime the mouse will be conditioned so that just switching the light on will result in the mouse reacting the same as though it was actually feeling electric shock effects. The same is true with humans. Use a phone a lot and get serious headaches and then present the user with a phone like device and tell them you are testing their sensitivity to mobile frequencies without them knowing whether the transmitter is active or not and you can bet that there is a good chance that they will develop some form of reaction. This reaction is natural and a result of conditioning as we try to avoid situations where we feel uncomfortable/pained by applying learned behaviour through experience as a result of previous painful episodes. Refer to “Nocebo effect or real deal” detailed further in this case study. A similar experiment as described above on mice was reported on the BBC recently and can be viewed by clicking on the link provided <http://www.bbc.co.uk/news/science-environment-23447600>
8. For those who are suffering EHS, the provocation test is a form of torture. It creates unnecessary anxiety which in itself can lead to the onset of similar symptoms that can interfere with the test leading to a confounding result.
9. Depending on where the test is conducted, the results can be contaminated by other EMR sources which can include nearby computers or wireless routers, DECT phones, mobile phone towers, EMR from transformers, fluorescent lights etc. Even the device itself may not actually be emitting RF but while it is powered on it is certainly creating EM fields that can interfere with the test particularly when performing a test with a sham signal.
10. When conducting group studies, people who have to pull out of the test prematurely due to the disabling effects they are experiencing are often not included in the study results.

Current methodology to test sensitivity is inconsistent and often based on poorly defined test protocols. This is partly due to the fact that there appears to be a general poor understanding of people's electrical sensitivity by the scientific community and the fact that most tests are not biologically based - i.e. the provocation test, which we know is very subjective can be manipulated to show inconclusive results.

Even though the provocation test is typically performed as a double blind study – that is the scientist and the study participant are not aware if the device is transmitting or in sham mode – the testing protocol can be set-up such that an insufficient recovery time is allowed before conducting the next test. Subjects can through learned behaviour also affect the results particularly in the case where the testing protocol requires the subject to compare feelings of a current exposure test with previous exposures.

For EHS testing to be meaningful and realistic, scientists should be looking at establishing biological tests that are used in conjunction with a provocation device which can measure heart rate variability, heart palpitations (as Dr Magda Havas recently demonstrated this in 2010 and reconfirmed in a repeat experiment <http://www.ncbi.nlm.nih.gov/pubmed/23675629> ), brain responses (EEG), brain scans, immune response, sleep studies, live blood chemistry etc.

Dr. Dominique Belpomme, Professor of Oncology at Paris Descartes University, is conducting research on electro hypersensitivity with the Association for Research and Treatments Against Cancer (ARTAC) in Paris. The ARTAC group has been following several hundred patients with EHS over the last four years, and has documented that these patients have clear and consistent changes in oxidative metabolism, and also in blood flow to the limbic system (as measured by Doppler studies). Dr. Belpomme considers these changes in the limbic system to directly correlate with many of the cognitive changes (memory problems, difficulty with concentration, etc.) that are experienced by these patients. The ARTAC group expects to publish a series of papers on their findings during the next year (Dart, 2012) [6]. I am looking forward to his research results when they are published, which will demonstrate and confirm that EHS is real and not a nocebo effect as some scientist would have us believe.

The big question I have is whether we need to find biological markers before we accept that this is real? There is enough evidence to make a diagnosis on the symptoms' pattern alone – this is what I believe happens in Sweden. While scientist squabble over test methodology and the industry demands proof, people are left to suffer.

It is also interesting to note that an email I received from an Australian scientist who offered to test me with a provocation test device for EHS indicated the following:

*“I would require you to sign a consent form as the testing is likely to generate symptoms that you would find uncomfortable.”* This to me is a tacit acknowledgment that EHS is likely to be real and linked to EMR.

## Nocebo effect or the real deal

It is readily known by scientists that we learn to withdraw from, or alter our behaviour in response to, a conditioned stimulus.

Definition of conditioned stimulus

*“A previously neutral stimulus that, after repeated association with an unconditioned stimulus, elicits the response effected by the unconditioned stimulus itself.”*

In the context of EHS, an analogy I would suggest is an inactive mobile phone, router or provocation test device (physical object) being considered as the neutral stimulus and RF that it emits when switched on as the unconditioned stimulus which causes pain or results in some form of health impact.

It is therefore very plausible for EHS sufferers, through learned behaviour, to visually and aurally (hearing nearby people talking on a mobile phone or the phone ringing) associate items capable of emitting RF such as a mobile phone, iPad, mobile telephone base station mast and other aerials with their condition and leading to their bodies reacting accordingly. Such behaviour reinforces the belief held by some scientists that EHS is a nocebo affect.

What scientists need to understand is the original mechanism that triggered off this learned behaviour in the majority of cases is real and not a psychologically based induced condition. People only need to review my particular case history to see evidence of this, which is as follows:

1. I work in IT and embrace technological advancements and was looking forward to freedom that wireless offers.

2. I had no pre-conceived ideas and was completely uninformed of potential health impacts when I first used Wi-Fi.
3. The physiological reaction I experience in the presence of Wi-Fi is real and reasonably consistent with each exposure. I say “reasonably consistent” because depending on my state of health (did I have a cold? Did I get a good night’s sleep? Am I still recovering from a previous exposure etc.), the duration and intensity of exposure will see the type of symptoms varying within a common set that I have experienced previously. One hour of exposure does not always induce heart palpitations. But they have only ever occurred when I am exposed to (pulsed) wireless RF.
4. Symptoms disappear when I go to remote locations away from wireless transmitters suggesting that an underlying health issue is not the cause.
5. RF Shielding alleviated my symptoms suggesting other environmental concerns or stress are not a significant factor.

I mentioned “majority of cases” above because I do not doubt that there may be instances where there are some people who have a neurotic disposition, may have read an article suggesting harm, become obsessed and anxious to the point where they experience a real nocebo event. Such cases are the exception rather than the norm.

## Smart Meters and EHS

Unfortunately some authorities assume that because Smart Meter radiation emissions are short in duration and apparently lower in power density than other wireless devices typically found in and around people’s homes, they are therefore safe. What many people are unaware of is the number of times these meters are actually communicating. We are told that the smart meter transmits SMS like messages 4 -6 times a day (depends on your service provider), which may be true for your personal house hold data, but what is not being said is that for mesh networks, the average duty cycle also includes transmissions to maintain the network, time sync and network message management (i.e. pass on other houses’ data). This can lead to anywhere from 10,000 transmissions to 190,000 transmissions or more per day. Nobody sends this many SMS messages on their mobile phone. Many of these devices are situated on a wall/in wall cavities where people spend a significant amount of time (i.e. bedroom/lounge room walls).

It has been shown in a recent Victorian medical report entitled “SELF-REPORTING OF SYMPTOM DEVELOPMENT FROM EXPOSURE TO WIRELESS SMART METERS’ RADIOFREQUENCY FIELDS IN VICTORIA, AUSTRALIA - A CASE SERIES” that smart meters appear to be causing people who were not previously sensitive to RF frequencies to become EHS. Additionally, people who were previously self-diagnosed as being EHS found their condition was made dramatically worse. This medical report has been written by a medical doctor using de-identified data obtained from an EHS register that was being independently maintained by Stop Smart Meters Australia. Close to 200 people have registered their health complaints. The case study only looks at those who were fully identifiable and agreed to have their de-identified data made publically available in a medical report which amounts to a total of 92 people.

As I described in my introduction, I am self-diagnosed as being EHS having identified my sensitivity over 13 years ago. In terms of the medical report findings mentioned above I fit into the second category where my condition (despite being able to manage it previously quite successfully) has been made worse after mesh networked wireless smart meters were installed in my neighbourhood. My condition has also been aggravated by the deployment of other non-consensual microwave transmitters in the community

especially mobile phone base stations with 4G towers being worse in their ability to affect me than 3G, 2G etc.

Below I have listed my specific smart meter EHS symptomatology:

1. Constant headaches - pressure encompassing my head
2. Insomnia – I find it very difficult to get a good uninterrupted night's sleep
3. Lethargy and concentration difficulties
4. Sharp pains like a hot spike being driven into my head and occasionally in my intestinal region
5. Burning pain in intestinal region
6. Joint pain particularly my elbows, fingers and sometimes my knees
7. Irritability and feelings of anxiousness – I find I am more prone to angry outbursts when exposed to smart meter RF. My wife can certainly attest to that!
8. Heart beat irregularities and occasionally heart palpitations when in close proximity to a smart meter for a long duration

The problem I am faced with now is that I have effectively become a prisoner in my own home. To venture out of my house to an environment that has ever increasing EMR leaves me feeling drained, pained and trapped. Moving interstate where there currently are no smart meters is an option, but if there continues to be rollouts of new mobile phone towers, high speed wireless networks as part of the NBN rollout and other states follow Victoria's lead of mandating the rollout of wireless enabled smart meters I will eventually run out of places to go and will become an EMR refuge as I move to increasingly more remote locations. Career options will diminish and my job is already under threat as I struggle to continue working in the IT industry where wireless networks and smart wireless devices are becoming common place. I am being faced with the dilemma of how do I support my family? What kind of life will they have and what kind of opportunities are they missing out on as we move to isolated locations to escape this manmade threat to mine and my families health and wellbeing?

## What measures can you take to protect yourself?

The most important actions one can take to protect oneself from exposure to ubiquitous manmade RF emissions are as follows:

- 1) Turn off all wireless devices in the home – avoidance is the best protective measure. It is important to understand that the effects of wireless are additive when exposed to multiple frequencies and the damage caused is accumulative over a lifetime. ARPANSA's RF standards say "*In situations of simultaneous exposure to fields of different frequencies and depending upon the nature of exposure and the distribution of RF absorption within the body, the combined effects of exposure to multiple frequency exposure sources may be additive.*" (rps3 page 18). [7]  
If you must use wireless enabled devices then at least turn them off before you go to bed at night.
- 2) Replace digital cordless (DECT) phones with corded phones. Most DECT base units transmit all the time irrespective of whether you are on a call or not. Again, if your cordless phone is precious to you then make sure it is not in your bedroom.
- 3) Turn your iPad to flight mode when you do not need internet access. Additionally, do not rest it on your lap when using wireless as "*epidemiological studies of men assessed for infertility were consistent in demonstrating decreased sperm motility associated with use of mobile phones. Most of the in vitro (laboratory) studies, which involved exposing human semen samples to controlled mobile phone RF exposure, generally noted a decrease in sperm motility, among other adverse*

*effects. Similar findings were noted in animal studies of a specific type of rat. Oxidative stress or decreased antioxidants are suggested as plausible mechanisms for these non-thermal effects from RF exposure.*"[8]

- 4) Distance is your friend as the intensity of the wireless signal drops following the inverse square rule i.e. Intensity =  $1/\text{Distance}^2$ . Put as much distance between yourself and transmitters including smart meters. This may mean moving your bed to another room if the smart meter is located on your bed room wall.
- 5) Rooms can be shielded with special carbon based paint and windows can be covered with RF shielding curtains.
- 6) Install bed canopies made of the same RF shielding materials as the curtains mentioned above.
- 7) Fortify your body by doing regular exercise and eating good healthy foods that are high in natural anti-oxidants. This will put less stress on your body giving it a chance to deal with the manmade, potentially damaging, RF emissions. Although the energy from RF is not sufficient to damage DNA directly it has been shown by independent researchers to cause damage through indirect pathways. *"A large body of research has shown that microwave RF causes an increased production of free radicals and reactive oxidant species in living tissues, and that this increased oxidant stress damages DNA. This damage can and does occur at power levels well below those levels that could produce damage by thermal mechanisms."* [6] Special note: damage to DNA can potentially lead to cancer.
- 8) Try to maintain regular sleeping habits by not varying the time you go to bed too much if possible. Ensure that all sources of EMF (including radiofrequency) are not close to the bedhead. This would include clock radios, small appliance transformers, mobile phones, and cordless phones. And remember to turn off electric blankets before you lay down in bed to go to sleep, if used. Do not have the bed located immediately behind or close to where the power meter is installed.
- 9) Despite the medical profession generally not knowing what EHS is or how to treat it, a visit to the doctors is essential to confirm that other possible serious causes of your symptoms are excluded with appropriate medical tests.

In my case, I have no wireless devices in my house. My master bedroom was located at the front of the house on the first floor. My neighbour had 2 smart meters fitted on his garage which is 3m from my bedroom. I moved my bed to back of the house on the ground floor. My home office is also located at the front of the house and was unusable, as an 8 hour shift would see me suffering major headaches, concentration issues and extreme lethargy. To reclaim these rooms I decided to have the front rooms painted with carbon paint. By coupling the carbon paint with RF shielding curtains it is possible to reduce RF penetration into a room to negligible levels. Carbon paint works by reflecting most of the signal. However, shielding paint needs to be applied with caution because it is conductive and so needs to be grounded properly. Another issue is that because of the carbon paint's reflective qualities it is important that you do not use wireless devices in these rooms, otherwise the majority of the RF is not able to escape and will bounce around and will therefore increase your exposure. After taking these protective measures I am able to use my office again but I am reluctant to move in to my master bedroom as the RF emissions from the smart meter can infiltrate my room through the floor which has no shielding (I was living in a 2-story house). Heart palpitations and endless headaches are not something I would want to endure every day of my life.

## What I believe needs to happen

First and foremost, governments need to recognise that EHS is real and can be a serious health impairment, like Sweden does. Furthermore, medical professionals need to be educated on what EHS is, how to diagnose it and how to treat it. Education programs need to be established at Universities that cover this topic. The public also needs to be educated and informed of the risks of using wireless devices clearly and without prejudice or unwanted influence from those who market these devices. The media often portrays those who are suffering in a poor light leading to hurtful comments and ridicule from unformed members of the public, this needs to change. Scientist often weigh in on the argument suggesting that EHS is a psychosomatic illness based on what I believe to be faulty scientific studies that use only the provocation test as the basis for their claims. Further research maybe required but those who are suffering should not be held hostage by wrangling scientists and politician's as they argue the validity of EHS and testing techniques. The symptomology and causative factors of EHS is known and has been known for years.

I urgently request all the World RF Standard Bodies/ Health Advisory Bodies (ICNIRP, FCC, IEEE, WHO, ARPANSA etc.) to take this issue seriously and investigate claims made by people who are self-diagnosed as EHS rather than simply capturing statistics. There should be more funding to research EHS that includes biological tests as well as conducting a post smart meter rollout surveillance study with a focus on health rather than emission levels against a RF Standard or guideline.

It is also recommended that regulatory bodies in each country implement a precautionary principle, especially now that the IARC released its monograph last year justifying why RF is categorised as a Group 2B possible carcinogen. As there has been no research performed since this announcement that seriously contests this finding and Dr Lennart Hardell, one of the scientists whose research was a key contributor to the classification of microwaves as a Group 2B Possible Carcinogen, releasing further studies that re-affirms his original findings, we should apply caution when it comes the rollout of new wireless technologies.

There should be no wireless access points and mobile phone towers located near or within schools, libraries or hospitals. All schools should be required to adopt a wireless free policy and use hard wired inter/intranet connections until Wi-Fi can be proven without any doubt that it is safe. We should not be risking our children's health at any cost.

Governments should provide more funds to independent research scientists (and not those who have ties with the Industry as appears to occur today) to further investigate the potential biological effects RF may have. This is particularly important when leading scientists suggest that there are still gaps in our knowledge with respect to wireless biological effects especially in the area of non thermal interactions. Are they real or are they artefacts of the testing process? Let's make a concerted effort to find out as the future health of billions of people depends on it.

Prior to installation of mobile phone base stations or rollout of smart meters in our towns and cities, a health surveillance study should be conducted that measures the current state of health of householders to create a baseline reference point and to avoid potential issues of recall bias. Further surveillance studies should be conducted after the installation of the radio transmitters at set intervals to determine whether there have been any noticeable changes in public health.

Telecommunication companies should be required to rationalise their deployment of mobile phone base stations such that resources are shared between service providers where capacity is undersubscribed, especially as our neighbourhoods are being ringed by base stations without any due consideration to the

IARC and WHO announcement. Public health should have a higher priority than technological conveniences particularly when there is no proof of safety and lots of people are complaining of insomnia, headaches, neurological disturbances and other disabling symptoms.

***“Strange times are these in which we live when old and young are taught falsehoods in school. And the person that dares to tell the truth is called at once a lunatic and fool.”*** Plato 427 B.C.

## Glossary

The majority of the definitions provided in this glossary were sourced from Wikipedia.

<b>Acronym/Term</b>	<b>Definition</b>
2G/3G/4G	Short for second/third or fourth generation wireless telephone technology
ARPANSA	The Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) the main government body dealing with ionizing and non-ionizing radiation and publishes material regarding radiation protection
Bluetooth	Bluetooth is a wireless technology standard for exchanging data over short distances using short-wavelength UHF radio waves in the ISM band from 2.4 to 2.485 GHz) from fixed and mobile devices.
CPU	A central processing unit (CPU) (formerly also referred to as a central processor unit) is the hardware within a computer that carries out the instructions of a computer program by performing the basic arithmetical, logical, and input/output operations of the system
CRT	Cathode ray tube, a type of vacuum tube used for information displays such as computer monitors or TVs.
DECT	Digital Enhanced Cordless Telecommunications (Digital European Cordless Telecommunications), usually known by the acronym DECT, is primarily used for creating cordless phone systems
DNA	Deoxyribonucleic acid (DNA) is a molecule that encodes the genetic instructions used in the development and functioning of all known living organisms and many viruses
ECG	Electrocardiography (ECG or EKG from Greek: kardia, meaning heart) is the recording of the electrical activity of the heart.
EEG	Electroencephalography (EEG) is the recording of electrical activity along the scalp. EEG measures voltage fluctuations resulting from ionic current flows within the neurons of the brain. In clinical contexts, EEG refers to the recording of the brain's spontaneous electrical activity over a short period of time
EHS	Electromagnetic Hypersensitivity is an idiopathic environmental intolerance attributed to electromagnetic fields is a descriptive term for symptoms caused by exposure to electromagnetic fields. Other terms include electro-sensitivity and electrical sensitivity (ES).
EMF	An electromagnetic field (also EMF or EM field) is a physical field produced by electrically charged objects. It affects the behaviour of charged objects in the vicinity of the field.
EMR	Electromagnetic radiation (EM radiation or EMR) is a form of radiant energy, propagating through space via electromagnetic waves and/or particles called photons.
FCC	The Federal Communications Commission (FCC) is an independent agency of the United States government, created to regulate interstate and international communications by radio, television, wire, satellite, and cable.
IARC	The International Agency for Research on Cancer (IARC; French: CIRC) is an intergovernmental agency forming part of the World Health Organisation of the United Nations.

GHz	Gigahertz (GHz), a unit of frequency
ICNIRP	The International Commission on Non-Ionizing Radiation Protection (ICNIRP) is an international commission specialized in non-ionizing radiation protection
IEEE	The Institute of Electrical and Electronics Engineers
IT	Information Technology is the application of computers and telecommunications equipment to store, retrieve, transmit and manipulate data, often in the context of a business or other enterprise.
LAN	A local area network (LAN) is a computer network that interconnects computers within a limited area such as a home, school, computer laboratory, or office building using network media
MHz	Megahertz (MHz), a unit of frequency
Microwave	Microwaves are a form of electromagnetic radiation with wavelengths ranging from as long as one meter to as short as one millimetre, or equivalently, with frequencies between 300 MHz (0.3 GHz) and 300 GHz
PS3	The PlayStation 3 (PS3) is a home video game console produced by Sony Computer Entertainment.
RF	Radio frequency (RF) is a rate of oscillation in the range of around 3 kHz to 300 GHz, which corresponds to the frequency of radio waves. The term "radio frequency" or its abbreviation "RF" are also used as a synonym for radio – i.e. to describe the use of wireless communication, as opposed to communication via electric wires.
RPS3	Radiation Protection Series No. 3 is published by ARPANSA and specifies limits of human exposure to radiofrequency fields in the range 3kHz to 300GHz to prevent adverse effects.
USB	Universal Serial Bus (USB) is an industry standard developed in the mid-1990s that defines the cables, connectors and communications protocols used in a bus for connection, communication, and power supply between computers and electronic devices.
WiFi	Wi-Fi, also spelled Wifi or Wi-Fi, is a technology that allows an electronic device to exchange data or connect to the internet wirelessly using microwaves in the 2.4 GHz and 5 GHz bands.
WHO	The World Health Organization (WHO) is a specialized agency of the United Nations (UN) that is concerned with international public health. It was established on 7 April 1948, with its headquarters in Geneva, Switzerland.

# Stray Voltage and Dairy Farms Can Lead to Large Damage Awards

Mary Francque\*  
May 16, 2018

## History of Stray Voltage Suits

Stray voltage causing damages to dairy farms is a problem that has been facing the dairy industry for year with damages cases dating back to 1984. Stray voltage is caused when a power line's neutral line is "leaking" electrical currents into the ground. A common cause of stray voltage is a neutral wire that is either too small or damaged and allows the current to go into the ground. Even when the stray voltage current is at a low level, specifically anything above 0.5 volt, it can still be harmful to livestock. These currents put stress on the animals, which in turn lowers their immune systems, leading to a variety of issues. Dairy cows have shown to be more sensitive to stray voltage than any other livestock. Voltage has been shown to cause decreased milk production, due to a lowered water intake and in turn a lowered feed intake. Farmers have also noted a range of issues relating to breeding and calving. Dairy farmers have even reported extremely sick cows, some of which have later died.

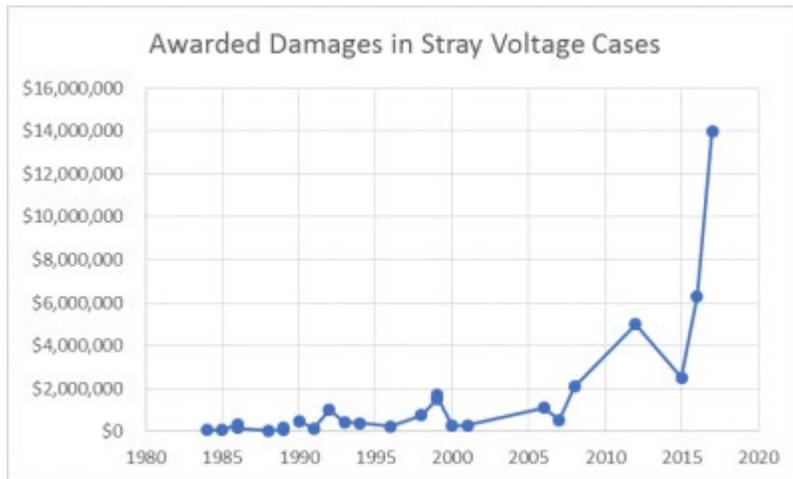

Since the 1980s farmers have been filing a variety claims against electrical utility companies across the United States relating to stray voltage, including claims for trespass, negligence, strict liability, and nuisance. Additionally, dairy farmers have filed suits against milk system suppliers for stray voltage. However, a majority of these suits have been unsuccessful or have resulted in limited relief due to the economic loss doctrine that prevents the

collection of damages when it relates to a loss in profit due to defective goods. A majority of courts have held that unlike milking systems, the utility companies are providing a service rather than a good.

In suits relating strictly to electrical utility companies we have seen an evolution in damages from the 1980s to today. These suits have proven to be successful on multiple occasions and the awarded damages continue to grow.

## Evolution of Damages in Stray Voltage Cases Heard throughout the United States

Since 1984 many farmers have received damages awards. However, those awards have grown from \$36,500 up to \$14 million. While there has been variation in damages awards throughout the years, there has been an upward trend overall. While some of this growth in awarded damages is due to growing farm sizes, a majority of the growth is due to an increase in understanding and research.

Year	Case Name	State	Claims brought	Relief granted to Farmer
1984	Zorn v. Electrical Research & Manufacturing Coop.	Wisconsin	negligence	\$79,786
1985	Schriner v. Pennsylvania Power & Light Co.	Pensylvania	Strict Liability	\$81,374
1986	Public Service Indiana, Inc. v. Nichols	Indiana	Strict Liability	\$343,000
1986	Hensley v. Howell-Oregon Electric Coop.	Missouri	Negligence	\$172,091
1988	Otte v. Dayton Power & Light	Ohio	Negligence	\$36,500
1989	Lipke v. Waushara Electric Coop.	Wisconsin	Negligence	\$70,000
1989	Taplin Farms, Inc. v. Ryder Sales & Service	Wisconsin	Negligence (Co-defendant <i>Northern State Power</i> found negligent)	\$178,684
1990	Fink v. Lafayette Electric Coop.	Wisconsin	Negligence and strict liability	\$500,000
1991	Kolpin v. Pioneer Power & Light Co.	Wisconsin	Negligence, strict liability, and nuisance	\$133,326
1992	ZumBerge v. Northern States Power Co.	Minnesota	Strict liability and negligence	\$1,000,000
1993	Cook v. Goodhue County Coop.	Minnesota	Negligence	\$450,000
1994	Matchey v. Trempealeau Electric Coop.	Wisconsin	Negligence	\$400,000
1996	Vogel v. Grant-Lafayette County Electric Coop.	Wisconsin	Negligence and Nuisance	\$240,000
1998	Vandenberg v. Consumers Power Co.	Michigan	Negligence and Nuisance	\$750,000
1999	James v. Beauregard	Louisiana	Negligence	\$1,500,000
1999	Tipmont Rural Electric Membership Corp. v. Fisher	Indiana	Negligence	\$1,700,000
2000	Scullion v. Wisconsin Power and Light Co.	Wisconsin	Negligence	\$277,500
2001	Iowa Lakes Electric Coop. v. Schmitt	Iowa	Negligence	\$303,022
2006	Muth v. Wisconsin Electric Power Co.	Wisconsin	Nuisance and negligence	\$1,107,289
2007	Gumz v. Northern States Power	Wisconsin	Nuisance	\$532,000
2008	Chapman v. New Mac Electric Coop.	Missouri	Nuisance	\$2,094,184
2012	Bollant v. Scenic Rivers Energy Coop.	Wisconsin	Nuisance and negligence	\$5,000,000
2015	Poppler v. Wright-Hennepin Cooperative Electrical Association	Minnesota	Negligence, nuisance, and trespass	\$2,500,000
2016	Norman v. Crow Wing Power	Minnesota	Nuisance and negligence	\$6,300,000
2017	Haldersons v. Northern States Power	Wisconsin	Nuisance and Negligence	\$14,000,000
2017	Burdick v. Interstate Power and Light	Iowa	Nuisance and negligence	\$500,000

## Recent Stray Voltage Case in Iowa

The Iowa Court of Appeals recently decided in favor of a dairy farm awarding them \$500,000 in damages. Burdicks, a family dairy in Northern Iowa, filed suit against Interstate Power & Light Co. The Burdicks claimed that Interstate was negligent in its maintenance of its system, which caused stray voltage damages to the Burdicks’

dairy herd. They also filed a nuisance claim against Interstate. The jury found for Burdicks on the issue of negligence, awarding them \$500,000. After the trial, Interstate filed a motion for a new trial claiming that Burdicks did not provide enough evidence for the jury to calculate the damages. The district court granted Interstate's motion for a new trial.

The case decided by the Iowa Court of Appeals found that if there is proof a party has sustained damages, then that party can recover, even if there is uncertainty in the amount of the damages. There must just be a basis from which the amount of damages can be inferred. While parties should still aim to provide detailed evidence showing damages, the court here allowed the party to recover even without such evidence.

Burdicks appealed the district court's grant of a new trial. The appellate court found for Burdicks, as Interstate's case-in-chief provided adequate information to support a determination of damages by the jury. In addition, Interstate did not appeal the jury's finding of its negligence. The court has held that "there is a distinction between proof of the fact that damages have been sustained and proof of the amount of those damages."<sup>[1]</sup> The proof of the amount of damages only needs to be presented to a point where the jury can come to an approximate estimate of the loss, not to an exact mathematical conclusion.

Therefore, even though Burdicks failed to present significant evidence that would aid the jury in determining the *amount* of damages, there were no grounds for the court to order a new trial. This was especially true because Interstate's expert witness' testimony and admitted exhibits provide sufficient evidence. Previous courts have shown that the court must look at evidence presented in the whole trial, not just the evidence presented by one side.

Here, Interstate's expert submitted graphs which showed expense figures and other important financial data. This along with his testimony allowed the jury to determine an estimate of the loss. Therefore, the Iowa Court of Appeals upheld the jury's previous holding that Interstate was negligent for \$500,000 in damages.

The case was *Burdick v. Interstate Power & Light Co.*, No. 16-0821 (Iowa Ct. App. October 25, 2017).

## [Author information](#)

### Abstract

Although the modulation of Ca(2+) channel activity by extremely low-frequency electromagnetic fields (ELF-EMF) has been studied previously, few reports have addressed the effects of such fields on the activity of voltage-activated Na(+) channels (Na(v)). Here, we investigated the effects of ELF-EMF on Na(v) activity in rat cerebellar granule cells (GCs). Our results reveal that exposing cerebellar GCs to ELF-EMF for 10-60 min significantly increased Na(v) currents (I(Na)) by 30-125% in a time- and intensity-dependent manner. The Na(v) channel steady-state activation curve, but not the steady-state inactivation curve, was significantly shifted (by 5.2 mV) towards hyperpolarization by ELF-EMF stimulation. This phenomenon is similar to the effect of intracellular application of arachidonic acid (AA) and prostaglandin E(2) (PGE(2)) on I(Na) in cerebellar GCs. Increases in intracellular AA, PGE(2) and phosphorylated PKA levels in cerebellar GCs were observed following ELF-EMF exposure. Western blottings indicated that the Na(V) 1.2 protein on the cerebellar GCs membrane was increased, the total expression levels of Na(V) 1.2 protein were not affected after exposure to ELF-EMF. Cyclooxygenase inhibitors and PGE(2) receptor (EP) antagonists were able to eliminate this ELF-EMF-induced increase in phosphorylated PKA and I(Na). In addition, ELF-EMF exposure significantly enhanced the activity of PLA(2) in cerebellar GCs but did not affect COX-1 or COX-2 activity. Together, these data demonstrate for the first time that neuronal I(Na) is significantly increased by ELF-EMF exposure via a cPLA2 AA PGE(2) EP receptors PKA signaling pathway.

[Home](#) > ROBERT KENNEDY, JR.'S LEGAL TEAM SUES FCC OVER WIRELESS HEALTH GUIDELINES

---

# **ROBERT KENNEDY, JR.'S LEGAL TEAM SUES FCC OVER WIRELESS HEALTH GUIDELINES**

**Robert Kennedy Jr.'s Legal Team Sues FCC – The team includes RFK, Jr., IRREGULATORS' Attorney Scott W. McCollough & Dafna Tachover, CHD's Director of Stop 5G & Wireless Harms**

Reprinted with permission from Children's Health Defense, Inc.

February 18, 2020 (San Diego's East County) -- Robert Kennedy, Jr., Chairman of Children's Health Defense (CHD), is committed to be proactive on the concerns regarding excessive exposure of our children to 5G and wireless radiation. To fulfill this promise, CHD submitted a lawsuit on February 2, 2020 against the FCC for its December 4, 2019 decision to decline to review its 1996 guidelines, and for its determination that the guidelines are protective of human health.

To have the best chances of succeeding, they have assembled a team of attorneys to lead this case. Each one brings different strengths to the case:

**Robert F. Kennedy Jr.**, CHD's Chairman, is a leading Environmental Attorney who has been involved with many groundbreaking lawsuits including the recent successful cases against Monsanto. He was a senior attorney for the NRDC and now leading cases for the protection of children's health rights.

**Scott W. McCollough** is the Attorney who is representing the **IRREGULATORS** in their lawsuit against the FCC, a case that will help expose a multi-billion-dollar fraud by Telecom companies. Scott has decades of experience as a Telecommunications and Administrative Law Attorney, leading the type of lawsuits we are submitting against the FCC.

**Dafna Tachover** is an expert on wireless and 5G health effects and has recently been brought on board at CHD to spearhead the Stop 5G effort. Dafna brings specialized knowledge and experience for this case. She is an Attorney, and holds a MBA, and has a Telecommunications background. She has been involved in cases focusing on wireless harms including a Supreme Court case in Israel against Wi-Fi in schools, a case that led to the first limitations on Wi-Fi worldwide!

## **About The Case**

On December 4, 2019, the FCC adopted an [order](#) affirming the adequacy of their 1996 wireless radiation exposure safety guidelines. These guidelines are at the core of the fraud perpetrated on the public that wireless technology is safe. Their guidelines ignore the overwhelming evidence of harm, scientific and human. By adopting and maintaining irrelevant guidelines, the FCC has enabled and forced the uncontrolled proliferation of wireless technology and now 5G. This has led to a growing epidemic of sickness among children and adults, and it has caused harm to animals, plants and the ecosystem at large.

In 2012, the General Accountability Office of Congress published a [report](#), recommending that the FCC reassess its 1996 guidelines. As a result, in 2013, the FCC opened [docket 13-84](#) asking for public comment. This docket was open for 6 years. On December 4, 2019, the FCC officially closed the docket and affirmed the adequacy of its guidelines without proper assessment.

Now that the docket is closed, they [are] suing the FCC under the Administrative Procedure Act (APA). The petition will ask the court to set aside the FCC order, asserting that the order is arbitrary, capricious and an abuse of discretion. **The case had to be submitted by February 3rd.**

# Summary of Evidence on Smart Meter Fires

In California and around world, smart meters have been linked to fires, explosions, and damaged appliances. For every fire started at the meter, in an appliance, or on wiring, smart meter causality should be suspected.

In 2012 a Pacific Gas and Electric (PG&E) whistleblower Pat Wrigley, who worked as a meter reader for 9 1/2 years testified at California Public Utilities Commission judicial hearing:

- **Smart meters cause fires**
- **PG&E is covering up the risk**

<https://youtu.be/EnxIoltNUek>

Matt Beckett, a California fire department captain stated, *“Two years ago PG&E replaced that meter [analog] with a “Smart Meter”. Immediately following we noticed power surges in the form of our refrigerator motor intermittently speeding up simultaneously with our lights becoming brighter. As a seventeen year veteran and current Fire Captain this caused me to become very concerned.”* The Smart meter on his house was replaced with an analog, and there were no problems, until a new Smart Meter was reinstalled. This time he had two surge protectors burn out. <http://emfsafetynetwork.org/fire-captain-finds-hazardous-power-surges-follow-smart-meter-installations/>

Another California fire captain, Ross writes, *“I was at home doing yard work in the late afternoon when my wife came outside and told me that “half the power was off again”. This had been happening on and off for about two weeks ... I then went outside to*

where my meter was and I could instantly smell the burnt electrical smoke. As I was looking at the meter I inadvertently placed my hand on the meter itself and almost burned my hand...the metal box into which all the home's wiring from the meter is stored was also too hot to touch with a bare hand." <http://emfsafetynetwork.org/smart-meter-arcing/>

## California Public Utilities Commission, and PG&E's response

**In 2009 PG&E reported to the California Public Utilities Commission (CPUC) smart meters interfered with AFCI's and GFI's** *"During the second quarter of 2009, PG&E discovered a limited number of cases of SmartMeter™ radio interference with customer electronics, including ground fault circuit interrupters (GFCI) and arc fault circuit interrupters (AFCI). Pages 6-7 Advanced Metering Infrastructure; January 2010 Semi-Annual Assessment Report and SmartMeter™"*[http://emfsafetynetwork.org/wp-content/uploads/2010/03/Updated-Semi-Annual-AMI-Report\\_Jan\\_2010-12.pdf](http://emfsafetynetwork.org/wp-content/uploads/2010/03/Updated-Semi-Annual-AMI-Report_Jan_2010-12.pdf)

**January 2011:** PG&E, The Utility Reform Network, CPUC Office of Ratepayer Advocates, California Energy Commission, CPUC Energy Division and others discussed "smart meter incidences involving fires..." Meeting agenda: [http://emfsafetynetwork.org/wp-content/uploads/2016/01/TAP-Agenda-1282011-inc-smart-meter-fires-SB\\_GTS\\_0652075.pdf](http://emfsafetynetwork.org/wp-content/uploads/2016/01/TAP-Agenda-1282011-inc-smart-meter-fires-SB_GTS_0652075.pdf)

2.	Provide insight (incident rates) on TURN-identified issues: smartmeter incidences involving fires and electrical shorts; interference (900MHz, garage and consumer devices) and 'dead sockets' (Dec meeting)	Jim Meadows	January meeting
----	--	-------------	-----------------

**2013: PG&E Data Response on smart meter fires.** <http://emfsafetynetwork.org/wp-content/uploads/2010/03/Data-Response-PGE-smart-meter-fires.pdf> Much of the document is redacted, and PG&E states, *"In no instance has PG&E found that a SmartMeter™, either gas or electric, has caused a fire."* However, PG&E now monitors temperature and voltage readings of smart meters for hazardous conditions. *"PG&E issues field orders to perform safety inspections at potentially overloaded and or high temperature sites. The data has led to panel inspections at customer premises that have found undersized wiring, physical panel damage, and overloaded conditions."*

**The CPUC is charged with overseeing utility safety.** In the CPUC's Annual Report to the Governor and the Legislature May 2014, they state, *"There was some concern regarding fires in smart meters but this was investigated by CPUC staff in 2013. Staff determined that, of reported fires involving smart meter installation, none were actually caused by the smart meter."* (p.5) **EMF Safety Network sent a records act request in December 2014 for the details of that investigation, however the CPUC has not provided any details.** <http://emfsafetynetwork.org/wp-content/uploads/2016/01/Smart-Grid-Annual-Report-2013-.pdf>

## Smart meter fires, surges, exploding meters, and damaged appliances in California and around the world

**Bakersfield, California, Smart Meter Blows Up At Business (2009):** “employees at Henry M.M. Engines said their Smart Meter caught fire, which sparked concern and questioned the safety of these new meters. On Wednesday, a PG&E technician was called out to replace the meter after employees found the device burned up and lying on the ground.” “Basically it was an explosion. I saw the meter on the ground and the face plate was blew off and the whole meter was blackened. Even the breaker box that housed the meter was blackened by what

seemed to be an electrical short,” said Vernon Nelson, an employee.” <http://www.turnto23.com/news/your-neighborhood/north-river-county/smart-meter-blows-up-at-business>

**Berkeley California Fire Department report (2010)** states, “Investigation revealed the newly installed PG&E Smart Meter in the kitchen was hot to touch and smoking, with a orange glow inside the meter housing” <http://emfsafetynetwork.org/wp-content/uploads/2010/07/Berkeley-Smart-Meter-Fire.pdf>

**Stockton California (2015):** Dozens of smart meters exploded and caught fire after an electrical surge cut power to about 5800 homes near Stockton CA. CBS News reports, “A power surge left thousands without power for most of the day in Stockton after smart meters on their homes exploded on Monday.” “Neighbors in the South Stockton area described it as a large pop, a bomb going off, and strong enough to shake a

house.” <http://emfsafetynetwork.org/dozens-of-smart-meters-explode-from-power-surge/>

**Santa Rosa, California (2011):** Three smart meters explode at a shopping mall. According to the incident report from the Santa Rosa Fire Department firefighters found the electrical room at the Santa Rosa Mall “charged with smoke” and “upon investigation found 3 PG&E meters that had blown off the electrical panel causing damage to the interior wiring of the electrical panel. A fire was still smoldering...” <http://emfsafetynetwork.org/3-pge-smart-meters-explode-at-santa-rosa-mall/>

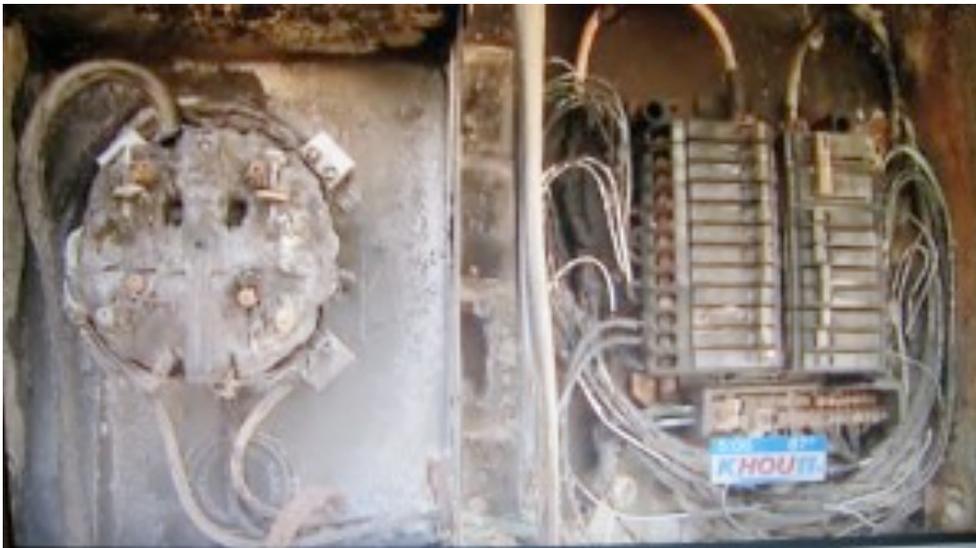

**Palo Alto** (2011): 80 PG&E smart meters caught on fire and burned out after a power surge. The incident raised questions for residents and utilities officials about smart meter safety. *“Mindy Spatt, communications director for The Utility Reform Network (TURN), said the utility-consumer advocacy group received many complaints about surges damaging appliances when the SmartMeters were first installed. Comparing analog to the new meters, she added, “In the collective memory of TURN, we have not seen similar incidents with analog meters.”* <http://www.paloaltoonline.com/news/2011/09/04/power-surge-raises-questions-about-smartmeters>

**Power mishap damages appliances for Livermore residents** (2012): 28 smart meters were replaced by PG&E when a power line replacement caused a power surge which fried appliances, TVs and air conditioners. *“The surge of electricity ripped through 28 homes on Hudson Way in Livermore.”* <http://abc7news.com/archive/8770840/>

**Nevada** (2014): Reno and Sparks fire chiefs call for smart meter fire investigation, *“in the wake of a troubling spate of blazes they believe are associated with the meters, including one recent fire that killed a 61-year-old woman.”* <http://www.rgj.com/story/news/2014/09/13/reno-sparks-fire-chiefs-call-smart-meter-probe/15580069/>

**Florida, News Investigative report** (2011): *“I went over to the FPL meter and it had caught on fire, it was all black smoke and charred,”* <http://www.wptv.com/news/region-c-palm-beach-county/some-homeowners-concerned-about-meter-installation#ixzz1d3MvQ4r5>

**Chicago Illinois** (2012): 2012 ComEd confirms smart meter fires. [http://articles.chicagotribune.com/2012-08-30/business/chi-comed-confirms-smart-meters-involved-in-small-fires--20120830\\_1\\_smart-meters-comed-customers-poor-connection](http://articles.chicagotribune.com/2012-08-30/business/chi-comed-confirms-smart-meters-involved-in-small-fires--20120830_1_smart-meters-comed-customers-poor-connection)

**Philadelphia Pennsylvania (2012):** utility PECO suspended smart meter installation due to fires. <https://youtu.be/g8nwrRchtuk>

**Texas (2012):** Customers of Centerpoint report smart meter fires. <http://www.khou.com/story/news/2014/07/21/11803806/>

Oncor Changing Smart Meter Installation After Fires « CBS Dallas / Fort Worth: *“The Chief Executive Officer of Oncor says the company has a new procedure for installation of smart meters after two house fires in Arlington last week. Robert Shapard says old wiring in two homes could not support the new smart meters.”*

<http://dfw.cbslocal.com/2010/08/24/oncor-changing-smart-meter-installation-after-fires/>

**Canada:** Nanaimo mother of two left without power for two days after smart meter smoked and caused a power outage <https://youtu.be/9NO6wIx8UFc>

**New Zealand:** Fire Prone Meter boxes causing concern. *“Front line firefighters are concerned about the number of household power meter boxes that are bursting into flames. There have been 67 callouts in Christchurch to electrical malfunctions so far this year, and new smart meters have*

*been involved in three in the last five days.”*<http://www.3news.co.nz/nznews/fireprone-meter-boxes-causing-concern-2010060317#axzz3vYE7LXcr>

#### **Australia:**

- **“Smart Meter Disaster”** is a 2012 Australian TV news report on smart meter hazards, including fires. [https://youtu.be/4e71qAr\\_qGk](https://youtu.be/4e71qAr_qGk)
- **Smart meter shock: electrical hazards found in 3500 homes** *“Victoria's energy regulator has conceded smart meter contractors might lack required skills and is reviewing the qualifications of workers rolling out the \$2 billion scheme.”* *“smart meter installers have identified dangerous and possibly life-threatening electrical hazards in 3500 Victorian homes.”* [http://www.theage.com.au/victoria/smart-meter-shock-electrical-hazards-found-in-3500-homes-20110212-1are0.html?from=age\\_sb](http://www.theage.com.au/victoria/smart-meter-shock-electrical-hazards-found-in-3500-homes-20110212-1are0.html?from=age_sb)
- **Smart meter blasts covered up 2012:** A whistleblower claims power companies know smart meters are exploding and are lying to consumers to cover it up. 'John' works for Jemena and claims at least six smart meters have exploded in and around Pascoe Vale, since Christmas. John was installing a meter yesterday which burst into flames in front of him. He's told Neil Mitchell under strict anonymity power companies are misleading the public and smart meters are dangerous. <http://www.3aw.com.au/blogs/breaking-news-blog/smart-meter-blasts-covered-up/20120222-1tmqr.html>

## Thousands of smart meters replaced due to fire risk

- Portland General Electric Oregon replaced 70,000 smart meters due to fire risk. [http://www.oregonlive.com/business/index.ssf/2014/07/pge\\_replacing\\_some\\_electricity.html](http://www.oregonlive.com/business/index.ssf/2014/07/pge_replacing_some_electricity.html)
- Lakeland Florida replaced 10,657 smart meters due to fire risk: <http://www.theledger.com/article/20140826/NEWS/140829388/1410?Title=Overheating-Concerns-Lakeland-Electric-to-Replace-10-657-Residential-Smart-Meters->
- In Canada SaskPower replaces 105,000 smart meters due to fire risk. <http://www.cbc.ca/news/canada/saskatchewan/saskpower-to-remove-105-000-smart-meters-following-fires-1.2723046>
- Ontario, Canada Thousands of smart meters in Ontario to be removed over safety worries: “Some 5,400 of Ontario’s 4.8 million smart meters are being removed and replaced because of a risk they could heat up, cause an electrical short and possibly spark a fire.” <http://www.thestar.com/news/queenspark/2015/01/22/thousands-of-smart-meters-in-ontario-to-be-removed-over-safety-worries.html>

### Industry and expert commentary

**IEEE** [professional technological association]: “Obviously all companies with smart meter programs, and all their suppliers and sub-contractors, are going to have to take a close look at the issue of fire hazards. This is just the beginning of a difficult story.” <http://spectrum.ieee.org/energywise/energy/the-smarter-grid/smart-meter-fire-reports>

**TESCO:** According to research by TESCO smart meters are more prone to “hot socket” than analog meters. Failure modes include catastrophic (expected) “Catastrophic failure” is defined as “a meter which has burnt, melted, blackened, caught fire,

arced, sparked, or exploded.” See: <http://smartgridawareness.org/2015/11/03/catastrophic-failures-expected-with-smart-meters/> See also: <http://emfsafetynetwork.org/wp-content/uploads/2010/03/TESCO-Lawton-on-Hot-Sockets.pdf>

**Wireless Smart Meters and Potential for Electrical Fires.** Commentary by Cindy Sage, Sage Associates and James J. Biergiel, EMF Electrical Consultant July 2010: Smart meters can create an over-current condition on the wiring and produce heat, which the neutral cannot properly handle, which can lead to fires.

- “The use of smart meters will place an entirely new and significantly increased burden on existing electrical wiring because of the very short, very high intensity wireless emissions (radio frequency bursts) that the meters produce to signal the utility about energy usage.”
- “The location of the fire does NOT have to be in close proximity to the main electrical panel where the smart meter is installed.”
- “A forensic team investigating any electrical fire should now be looking for connections

*to smart meters as a possible contributing factor to fires.”*

- <http://emfsafetynetwork.org/wp-content/uploads/2011/06/Smart-Meters-Risk-for-fire.pdf>

**Ontario Fire Marshall Report:** *“During our initial research of the new meters we encountered an unusual amount of fire incidents involving smart meters. “Anecdotal information supported [the fact that] problems occurred after the old analog meters were updated to the new digital smart meters.” The report noted the possibility of a fire resulting from “a loose connection in the meter base.”*

*“What could be the reason for this? The old meter base connections may not have been in a condition for seamless exchange to a new meter. New meters may have defects that cause electrical failures or misalignment with old meter base. Careless installation during changeover.”*

<http://www.oafc.on.ca/article/unusual-number-fires-smart-meters-linked-ontario-fire-marshall-says-faulty-base-plates-could>

**American Electric Power (AEP) How hot are your meters? 2015:** *“Today’s meters are light. The old ones were heavy and dissipated heat a lot better, actually,” said Ken Dimpfl, of American Electric Power (AEP). In 2010, they started seeing smart meter failures due to high temps or thermal overload. “This began our journey of looking at ‘hot sockets,” Dimpfl said. “Over the course of a two-year period, AEP analyzed roughly 25 meters that failed. Post event analysis concluded that the root cause was a poor connection at the meter.”*

<http://www.intelligentutility.com/article/15/10/how-hot-are-your-meters>

**Hydro Quebec requires 3 meters distance between a smart meter and gas tank**

<http://ofsys.hydroquebec.com/T/OFSYS/SM2/2/S/F/4947/13087532/Dnm3qyNW.html>

**Norm Lambe, an insurance claims adjustor, contends the utility companies are tampering with the evidence by immediately removing smart meters when there’s a fire.** *“A dangerous precedent is being followed in the insurance industry concerning the investigation of smart meter fires... When the local electrical utility arrives and determines that a smart meter is the issue, they have been removing the meter, and preventing the inspection of the meter by the experts... This is a serious situation, as the utility company, upon removal of the meter is tampering with what is evidence concerning the cause of the fire and can be held criminally responsible.”* <http://www.examiner.com/article/are-insurance-companies-avoiding-the-smart-meter-problem>

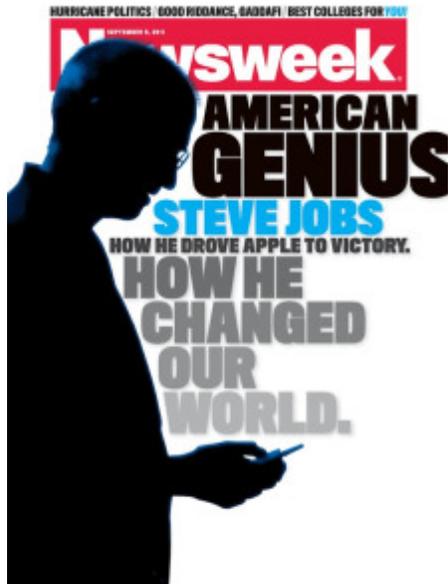

*Summary of Evidence on Smart Meter Fires compiled by Sandi Maurer, EMF Safety Network Director, January 2015. Sandi Maurer has intervened on smart meter proceedings at the CPUC since 2010. # Technology Killed Steve Jobs

Posted on [October 7, 2011](#) | [13 Comments](#)

Technology Killed Steve Jobs

That's not Steve Jobs "killed technology" or spawned "killer technology" *in the awesome, sick, hot, cool product sense.*

[Though iTunes and Steve Jobs killed the record & CD industry.](#)  
**killed Steve Jobs in a quite literal sense.**

***Rather, it was technology***

Steve Jobs replied to my email years ago in Silicon Valley. I asked him why he's not touting Apple's great security. He replied he just didn't want to draw publicity to it for fear hackers may focus on Apple products. *Always a step ahead.*

The world could've used 25 more years of his pig-headed brilliance, this 'Future by Steve Jobs'.

I wish to draw attention to what killed him. **Technology is the killer.**  
nano-robots or mutant bacteria?

Was it a remote death ray,  
No, nothing like that. Well, *almost* nothing like that.

We're killed by the things we love; addiction to cigarettes, alcohol, gambling, McDonald's and the list. We pick our poisons and go to the well, habitually. One who loves violence may die by the sword. Lovers die by the object of their affections.

*If you want to learn what kills us, find out what we love.*

Far from junk food, Steve Jobs was meticulous about what he ingested as a pescetarian (vegetarian + fish). He kept his own fresh food garden. And as a Buddhist, he likely cultivated discipline while avoiding most bad lifestyle choices. One may expect Steve to live a long, healthy life. ***One ‘addiction’ Jobs would never shake was technology.***

Steve Jobs loved technology. These warm and fuzzy technology things – the Mac, iPod, iPhone and iPad – are things he loved. They’re the things we all love. They’re why we loved Steve.

The iPhone (slash iPad) is the technology that absorbs our lives.

Researchers contend brain scans show it’s far more than mere brand recognition (New York Times, “You Love Your iPhone. Literally”).

The iPhone was a game-changer.

***It was also a game-changer in terms of man-made radiation.***

*The iPhone emits more electromagnetic radiation than any other smartphone in the world.* It’s always ‘talking’ to other iPhones. You can ‘bump’ iPhones to exchange e-cards. ***It’s so cool!***

*And it’s so deadly.* Like a bunch mini-transmitters, it’s radiation is “always-on” and all around. We’re swimming in electromagnetic fields ***which have increased a million-fold in the past 40 years.***

*iPhone takes this radiation exposure to a whole new level.*

Not so cool.

We’ve welcomed this ubiquitous hazard into our lives this past century. *The scientific case is not herein with copious links to distract our radiation-addled brains.* Ask your mother or grandmother. Mine once said about TV, ‘*Stay back from that thing, it can’t be good for you*’. ***Turns out, TVs once emitted X-rays!***

Anyway, go look it up. What am I, your mother?

Let me get off our fav devices (er, ‘loved ones’) and instead focus on Steve Jobs.

Steve Jobs reputedly had a hand in every design detail, his obsession with interface and usability means *he was immersed in electromagnetic field radiation.* Not like you or me or even the bench engineers at Apple.

In terms of humans on the planet and without benefit of environmental audit, *it’s safe to say he was in the 99.9th percentile of exposure to this radiation.* ***Steve Jobs was Guinea Pig Number One.***

[ *Actually, Dr. Robert Kane, Motorola’s top patent holder/cellphone tester – wrote the book, ‘Cellular Telephone Russian Roulette’ in 2001 and died of a brain tumor – was likely ‘Number One’* ]

***Technology is addictive*** – not just in the better-known psychological sense of reinforced behavior and subsequent triggering of endorphins, dopamine and all these neurotransmitters involved in addiction.

Beyond this, *the radiation itself is addictive.* Electromagnetic radiation – *independent of other factors*– triggers endorphins, impacts dopamine, serotonin, norepinephrine, epinephrine, GABA – the addiction keys.

This covert, man-made radiation we heartily embrace affects our mental health and then directly impacts our physical health. Cancer is one of the troubling by-products. ***Technology kills... in a warm & fuzzy way.***

***What of pancreatic cancer and Steve Jobs?*** He first got pancreatic cancer in 2004. Those chemo treatments doubtless resulted in the liver toxicity which necessitated a liver transplant. The liver’s ‘the General’ in this war as they say in Chinese medicine. Without the liver, no chance. Oncologists agree.

After pancreatic cancer in 2004, *rather than quit and concentrate on getting healthy, Steve Jobs was just getting started.* Then came the liver transplant in 2009. *That's the heroic part.* We think it's all great fun designing the future. Sometimes, one expects it's hellish hard work.

Steve Jobs made technology accessible and indispensable and the object of all our affections. No longer stuck in the realm of 'need' Steve Jobs made technology a matter of 'want'. Technology became happy and helpful and mostly... *Simple.*

Like the genius Nikola Tesla and his alternating current, Jobs brought wondrous technology into our lives. Electricity is the backbone of our technological advance. *Ironically, with its own hazardous radiation, electricity is the unindicted toxic co-conspirator lurking.*

Technology... for good or evil. The good, we all know.  
The evil? Well, that's right now being discovered.

*Steve Jobs killed technology and technology killed Steve Jobs.*  
It's tantamount to being attacked by gummy bears (for some of us).

*This thing we love turned against us. And who'd think to blame gummy bears anymore than people would blame their various and sundry iStuff.*

Steve Jobs gave his life to give you this technology.  
He didn't know it.

And frankly, the collective "we" won't know it for a while yet.

*On technology and health, we need to think anew and act anew and all that jazz.*

Like Steve.

*This Blog is now officially open  
further inspired by Steve Jobs.*

Thanks.

# Embedded Wireless Solutions

## The Connected Hospital

A vision for a fully integrated hospital

[Home](#) » [Solutions](#) » [Embedded Wireless](#) » What is the Connected Hospital?

- **Solutions**

## What is the Connected Hospital?

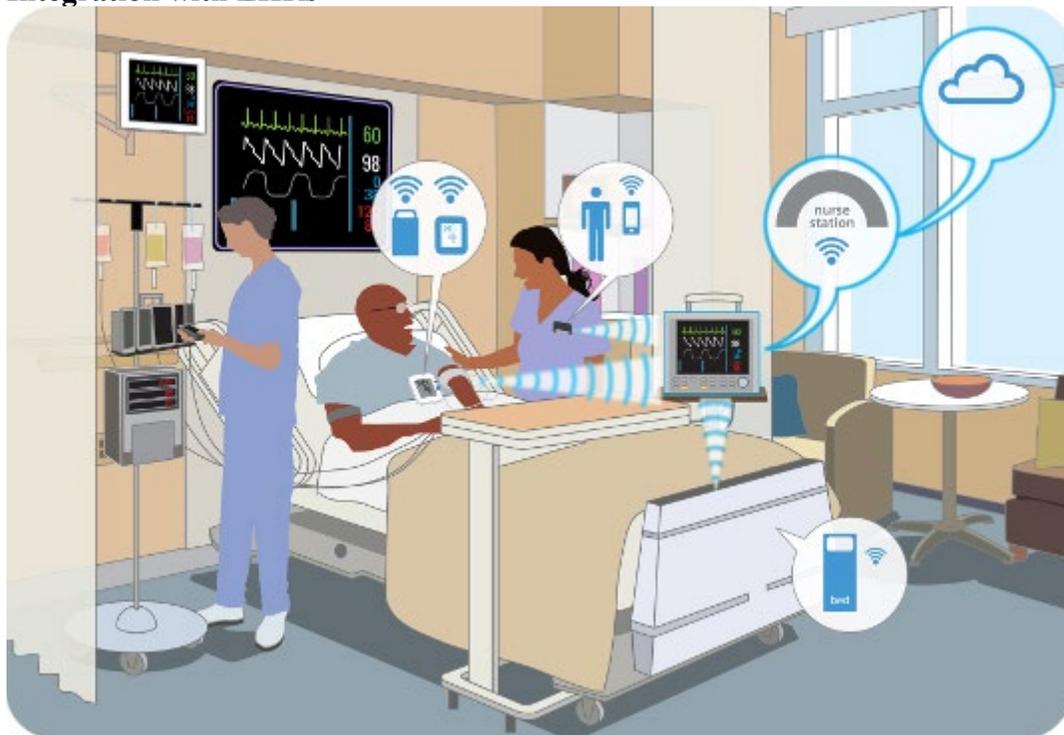

The Connected Hospital is a vision of a fully integrated hospital where wireless technology allows caregivers and patients to roam throughout the hospital while providing accurate and timely monitoring. In a Connected Hospital caregivers can focus on providing the best quality of care to their patients, instead of on administrative tasks. The vision of a connected hospital stems from the progression of an increasing number of wireless medical devices in a hospital. Connecting medical devices to Electronic Health Record (EHR) systems has reduced the time it takes to enter vitals from 7 to 10 minutes to less than one minute per patient. As the number of patients per nurse will unfortunately grow due to ever increasing nurse shortages, these gained efficiencies will be crucial to providing quality patient care. Wireless technology

won't just be used to connect existing medical devices, entire new waves of medical devices are being created to take advantage of the connectivity that wireless technology provides. Real-Time Location Systems (RTLS) are now used to quickly find usable equipment for treatments. Advanced bed and fall monitors can monitor patient movements and alert staff as soon as there is an issue. Mobile medical devices will allow patients to take home their medical devices so they can be monitored even after they leave the hospital. All of these technologies are being enabled by the underlying robustness of the wireless connection.

Patient safety, data accuracy, and mobility will all be fueled by wireless technology. In the Connected Hospital, every device is connected and communicating with the EHR (Electronic Health Records) for accurate patient records and real-time data analysis. Within the Connected Hospital, nurses can monitor many patients remotely from one main station, receiving alerts and observing data captured each second on the patients' health. Doctors can make more informed decisions with accurate and up-to-date patient information, leading to better patient outcomes. Patients and their family can feel safe, knowing that they will always receive the correct dosage of the right medication, will always receive the greatest care from medical staff, and will feel more comfortable not being tied down by wired medical devices. Read on to discover further benefits and challenges of the Connected Hospital.

## What are the Drivers and Benefits of the Connected Hospital?

### Integration with EHRs

Recent government regulations such as HIPAA, HITECH, and the Affordable Care Act provide incentives for hospitals to adopt EHR systems. Those that do not adopt an EHR may be susceptible to penalties down the line. In addition to the financial incentive, wireless medical devices communicating with the EHR ensure accurate patient information and more streamlined billing processes for hospitals.

### Prevent Hospital Readmissions

Hospital readmissions are a key driver for the Connected Hospital due to the Affordable Care Act. Medicare will not reimburse hospitals for readmissions within 30 days for the same cause. The Connected Hospital will prevent patient readmission by providing better patient care including educating patients on ways to improve and monitor

their health at home and ensuring a follow-up appointment before discharge. In addition, once patients are home, doctors can monitor their progress through remote home health monitoring.

### **Saving Nurses' Time**

Each patient within a hospital has on average 3-6 devices attached to them. If it takes a nurse approximately 5-15 minutes to visit each patient and check all vital signs, he or she can only visit approximately 4-12 patients per hour. This manual documentation of vital signs and changes can occupy a good portion of a nurse's day, especially when he or she has over 12 patients to monitor. Movements such as National Nurses United, Safe Patient Ratios, have organized to ensure safe nurse to patient ratios. In addition to safe nurse to patient ratios, remote monitoring can help immensely in reducing the amount of time spent manually entering patient information. According to the report from Transparency Market Research, Medical Device Connectivity Market, the current workflow for a nurse's round is:

- Nurse goes to patient room at scheduled intervals
- Checks each device that a patient is connected to (3-6 devices)
- Notes down any changes and vital signs
- Locate the patient's EHR
- Transcribes value
- Submits the info to EHR

Medical device connectivity solves this problem by automatically sending data from devices to the EHR, saving nursing time to increase productivity and allow for better patient care.

### **Improved Patient Outcomes**

In addition, the Medical Device Connectivity Market report states that various locations that have implemented CPOE (Computerized Physician Order Entry) systems have demonstrated a 20% decrease in hospital wide mortality rates. Automating the data transfer from medical devices to the EHR improves communication of accurate and up to date medical information, allowing medical staff to make proper diagnostic decisions. This frees up nurses' and clinicians' time to spend on improving patient care, rather than documentation of data.

### **Increased Need for Workflow Automation:**

Workflow automation helps with the following:

- Minimize transcription errors at point of care
- Remotely configure and monitor patient's dose and other key information
- Facilitates data analysis by doctors
- Improved patient outcomes due to complete picture of patient's conditions
- Automatic billing to prevent loss of revenue
- Provides clinical analytical capabilities for strategic decisions within a hospital

## **What Issues Should Hospitals and IT Administrators Keep in Mind When Implementing the Wireless Hospital?**

A hospital is a complex and often challenging RF environment with large multi-floor campuses and several obstructions such as human bodies, medical equipment, and liquids. It also deals with huge amounts of data, including critical and sensitive patient information. Much of that data is generated by the thousands of medical devices that operate in a hospital. Along with medical devices, a hospital also has to deal with interference from the increasing number of wireless devices being used by both hospital staff and guests.

For a hospital to function smoothly while delivering the highest quality patient care, its medical devices must operate reliably at all times. This means connecting anywhere, anytime. Medical devices must also ensure the highest level of security for their patients' safety and privacy.

### **Lack of Standards for Interoperability**

One path to making the connected hospital a reality is to join together a variety of perspectives from:

- Medical device manufacturers
- Wireless module manufacturers
- Infrastructure providers
- IT personnel

These organizations and personnel can lead the industry in generating guidelines and interoperability standards for wireless technology in hospitals. Once everyone is on the same page on how to create a secure and reliable network, it will make the vision of a fully connected hospital a reality that much sooner.

### **Security**

A hospital requires the highest level of security for their patient's safety and privacy and this especially applies to wireless medical devices. Medical devices must be protected by WPA2-Enterprise Security and FIPS 140-2. For more information about wireless security in hospitals, read our white papers below.

- [BLE Guide to Security and Privacy](#)
- [FIPS 140-2 and Wi-Fi Client Devices](#)

### **Lack of Wireless Adoption**

Despite the growth in wireless technology, hospitals are reluctant to adopt wireless medical devices due to uncertainty and distrust. It is understandable to be wary due to security and patient safety concerns. However, the opportunities for growth are increasingly outweighing the challenges associating with adopting wireless technology. Today there are a multitude of incentives, documentation, and assistance for hospital IT to make informed decisions by joining an entire ecosystem of medical device manufacturers, wireless module manufacturers, and infrastructure providers. Hospitals do not have to do it alone.

Visit our [Medical page](#) for more information about wireless in healthcare, the benefits of using Laird embedded wireless solutions in healthcare, and product suggestions for various applications.

# The Man Who Was Allergic to Radio Waves

Your cellphone does not in itself cause cancer. But in the daily sea of radiation we all travel, there may be subtler dangers at work, and science is only just beginning to understand how they can come to affect people like Per Segerbäck so intensely

By James Geary March 4, 2010

Per Segerbäck's Nearly Electricity-Free Home

The photographer shot on film, using daylight, to avoid setting off Segerbäck's hypersensitivity.

Jonathan Worth

Per Segerbäck lives in a modest cottage in a nature reserve some 75 miles northeast of Stockholm. Wolves, moose and brown bears roam freely past his front door. He keeps limited human company, because human technology makes him physically ill. How ill? On a walk last summer, he ran into one of his few neighbors, a man who lives in a cottage about 100 yards away. During their chat, the man's cellphone rang, and Segerbäck, 54, was overcome by nausea. Within seconds, he was unconscious.

Segerbäck suffers from electro-hypersensitivity (EHS), which means he has severe physical reactions to the electromagnetic radiation produced by common consumer technologies, such as computers, televisions and cellphones. Symptoms range from burning or tingling sensations on the skin to dizziness, nausea, headaches, sleep disturbance and memory loss. In extreme cases like Segerbäck's, breathing problems, heart palpitations and loss of consciousness can result.

A cellphone has to be in use -- either making or receiving a call, or searching for a signal, when radiation levels are highest -- for it to have this kind of effect on Segerbäck. Phones that are on but neither sending nor receiving usually don't produce enough radiation to be noticeable. But it's not the sound of the phone that sets him off. Once, while on a sailboat with friends, he recalls, he was on the front deck when, unknown to him, someone made a call

belowdecks. Headache, nausea, unconsciousness. When Segerbäck is within range of an active cellphone (safe distances vary because different makes and models produce different radiation levels), he experiences the feeling that there is "not enough room in my skull for my brain."

Sweden is the only country in the world to recognize EHS as a functional impairment, and Segerbäck's experience has been important in creating policy to address the condition. Swedish EHS sufferers -- about 3 percent of the population, or some 250,000 people, according to government statistics -- are entitled to similar rights and social services as those given to people who are blind or deaf. Today, local governments will pay to have the home of someone diagnosed with EHS electronically "sanitized," if necessary, through the installation of metal shielding.

## **SEA OF RADIATION**

Electromagnetic fields (EMFs) are inescapable. We are constantly exposed to them, mostly in the form of either extremely low-frequency (ELF) radiation from things like domestic appliances and power lines or radio-frequency (RF) radiation from things like cellular and cordless phones, telecom antennas, and TV and radio transmission towers. Our bodies even produce faint EMFs of their own, from the electrical activity in the brain and heart.

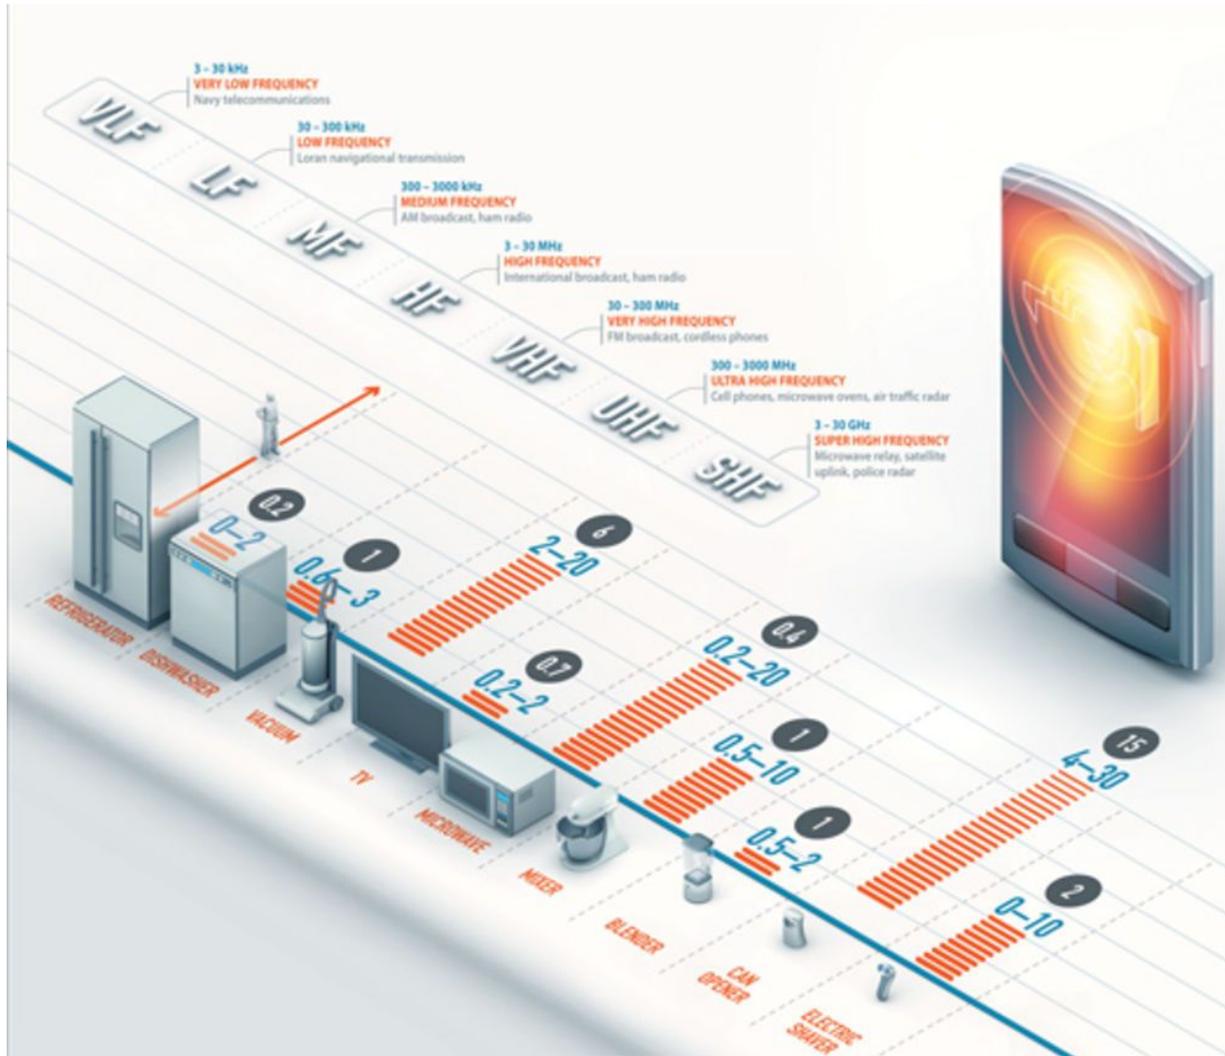

Ionizing radiation -- the kind produced by x-rays, CT scans and nuclear bombs -- can do terrible damage to the body. It is classified as a carcinogen. But ELF and RF are types of non-ionizing radiation, which is thought to be nearly harmless. Non-ionizing radiation isn't powerful enough to break molecular bonds, so it cannot directly cause the cellular damage that leads to disease. This type of radiation is everywhere. "We are bathed in a sea of non-ionizing radiation," says John Boice, a professor of medicine at Vanderbilt University School of Medicine and scientific director of the International Epidemiology Institute, a biomedical research firm in Rockville, Maryland.

This sea, most scientists agree, is harmless. Cellphones are safe and conditions like EHS cannot exist, they argue, because the EMFs involved are too weak to have any health effect. The non-ionizing radiation from cellphones has almost no known influence on the human body. In fact, the only universally recognized effect of non-ionizing radiation is a very minor heating of nearby tissue. The Federal Communications Commission sets EMF limits for cellphones -- measured as "specific absorption rates" (SARs) -- below which significant heating does not occur. Segerbäck's symptoms and those of other EHS sufferers, according to many researchers, may be either misdiagnosed or imaginary. Some experts suggest that people like Segerbäck perhaps suffer from a psychological disorder, or that their cases may illustrate the "nocebo" effect, in which the expectation that something will make you sick actually does make you sick. A review published last year in the journal *Bioelectromagnetics* found no evidence that hypersensitive individuals had an improved ability to detect EMFs, and the study found evidence of the nocebo effect in those same people.

The cellphone industry's position on the subject is clear. "The peer-reviewed scientific evidence has overwhelmingly indicated that wireless devices do not pose a public-health risk," says John Walls, vice president of public affairs at CTIA -- The Wireless Association, the international industry body. "In addition, there is no known mechanism for [EMFs] within the limits established by the FCC to cause any adverse health effects." A host of major institutions -- including the U.S. Food and Drug Administration, the International Commission on Non-Ionizing Radiation Protection (ICNIRP), the American Cancer Society and the World Health Organization -- agree with this assessment. (Although the ICNIRP says scientific assessment of the health aspects of wireless devices should continue as the technology becomes more widespread.)

Boice points out that data from cancer registries, such as the National Cancer Institute's SEER program, shows that brain-cancer rates haven't gone up since the early 1990s. The trends are also relatively flat from the mid-1970s to the early 2000s in Denmark, Finland, Norway and Sweden, where cellphones have been in use longer than in the U.S. If cellphones were causing brain cancer, an obvious uptick in reported cases would be expected. "If you look

at the totality of biological and experimental studies," Boice says, "the vast amount of evidence is that there is no association between cellphones and malignancies."

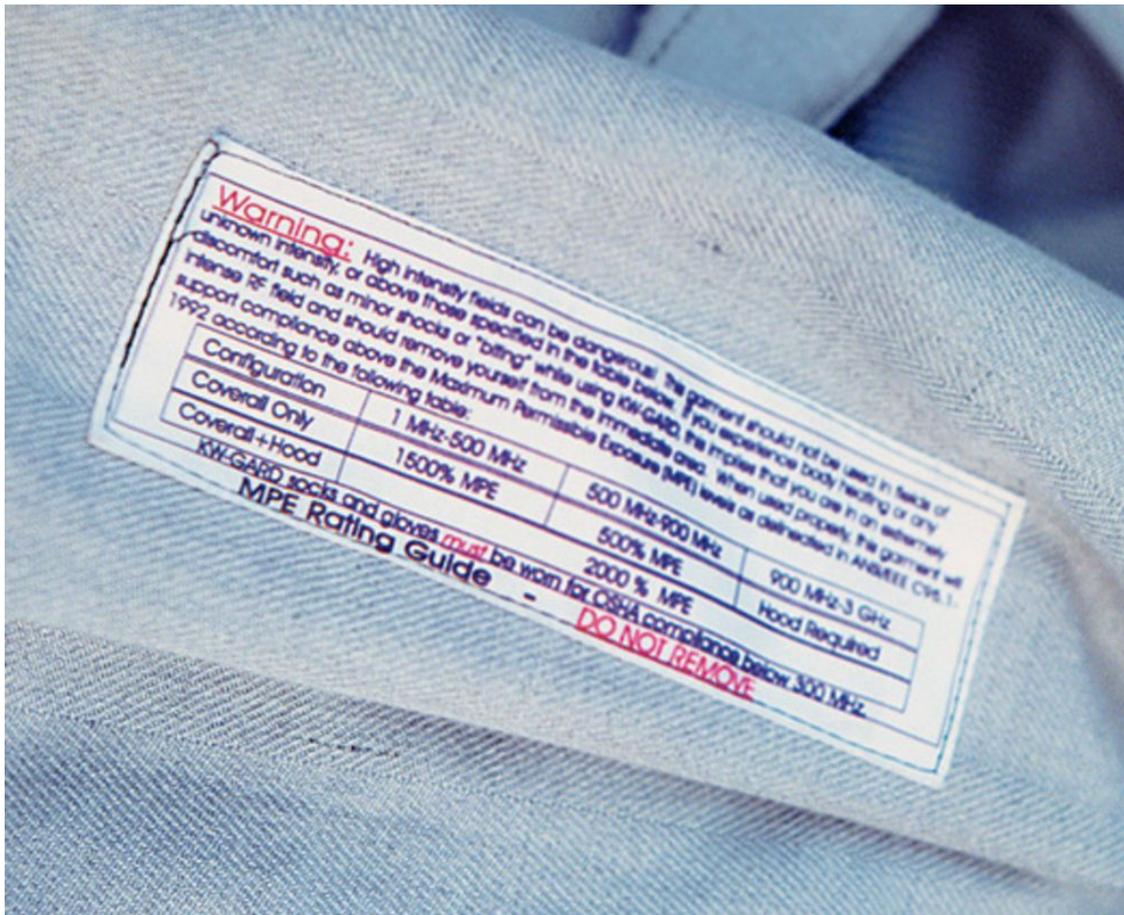

## Signal Strength

Cellphones are one of a number of household items that give off electromagnetic radiation

[Davvi.com](http://Davvi.com)

- Your cellphone gives off radiation largely through the antenna when you make and receive calls and when it searches for a signal.
  - Cellphones operate in the radio-frequency range of the spectrum, along with radar and FM radio broadcasts.
  - Daily life exposes us to radiation from many sources, and electromagnetic fields vary [the circled number is the median field strength]. The combined effect is difficult to determine.

Warning Label

Jonathan Worth

## WHAT IT FEELS LIKE

Segerbäck was once an elite telecommunications engineer. He worked for Ellemtel, a division of the Swedish telecom giant Ericsson, for more than 20 years, leading an engineering group that designed advanced integrated circuits for prototype telecommunication systems. He used the newest and most advanced computer and telecom equipment available, the kind of stuff only Ericsson and the Swedish military had access to. He was, as a result, up to his eyeballs in a non-ionizing radiation bath, from computers, fluorescent lights and the telecom antenna located right outside his window.

He noticed his first symptoms -- dizziness, nausea, headaches, burning sensations and red blotches on his skin -- in the late 1980s, a decade into his telecommunications research work. All but two of the 20 or so other members of his group reported similar symptoms, he says, although his were by far the most severe. His EHS worsened and now, he says, even radar from low-flying aircraft can set it off. Segerbäck is convinced that the perfect storm of EMFs in his office, combined with potentially toxic fumes from his brand-new computer, were responsible for his condition. "The company doctors didn't understand what was going on," he says.

Agne Fredriksson, who managed Segerbäck's group at Ellemtel and retired from Ericsson in 2006, says a commonly reported symptom was "a feeling of heat in the face," which everyone attributed to the new computer workstations. When members of Segerbäck's group started calling in sick and people from other departments began

reporting similar symptoms, Fredriksson recalls, "that's when we started to look into what could be done about it. There was a lot of worry from the groups in which people reported the most symptoms."

A new office space was created for the worst-affected employees; about half a dozen people shared this fully shielded room. Others switched to different computer workstations, while others managed by spending less time in front of their screens. No one had ever encountered anything like it before. "Why are we so special?" Fredriksson remembers wondering. He later learned that other companies faced similar situations at the time, although that information remained internal.

Ericsson went to great lengths to keep Segerbäck, a key member of the firm's design team, on the job. In the early 1990s, the company installed metal shields around his bedroom and study at home so he could sleep and work without radiation exposure. To enable him to go outside, medical authorities gave Segerbäck an EMF-resistant suit like the ones worn by engineers working in close proximity to live telecom towers and high-voltage power lines. The firm even modified a Volvo so he could travel safely to and from work. His commutes ended when cellphone towers began to spring up around Stockholm in the mid-1990s, eventually forcing his retreat to the woods.

In 1993 Ericsson produced a report, "Hypersensitivity in the Workplace," about what happened at Segerbäck's lab. In the foreword, Ellemtel's vice president Örjan Mattsson and administrative chief Torbjörn Johnson wrote: "A new problem in the work environment has appeared: hypersensitivity. When dealing with traditional occupational injury, as a rule you can establish a cause and effect relationship. Not so with regard to hypersensitivity. When the first serious cases occurred at Ellemtel at the end of the 1980s, we were not prepared. Soon, we came to look upon hypersensitivity as a serious threat to the company business. . . . We started wondering if we were faced with a modern-day scourge."

EMF-Resistant Suit

Segerbäck's employers installed shielding in his home, and medical authorities issued him this EMF-resistant suit.

Jonathan Worth

A year later, Ericsson closed the lab in which Segerbäck and his group worked. The company dismissed Segerbäck in 1999. "He could not perform the work he was employed to do," according to an Ericsson spokesperson. Segerbäck challenged the dismissal in a Swedish labor court and lost. He admits that there is no way to prove what caused his condition. "It's hard to know what is causing what," he says. "No one can say what made us feel ill." And it is impossible for him to seek treatment in a medical facility. A trip to the hospital, with all its electronic equipment, would probably kill him, he says.

Ulrika Aberg, a Swedish physician specializing in EHS who treated Segerbäck in the early days of his condition, has worked with more than 800 hypersensitive patients. She says she's seen a sliding scale of symptoms, from sleep disturbance and dizziness on one end to the more severe effects experienced by Segerbäck on the other. "There is electrical activity going on in all cells all the time, so it's no wonder the whole body [of an EHS patient] is affected," she says.

For those reporting milder symptoms, Aberg suggests removing any wireless electronics from the home, including cell and cordless phones and wireless Internet connections. But that still leaves people exposed to the wireless devices of others. There are several hundred EHS "refugees" in Sweden, she says, people who have had to move, some more than once, to escape the effects of EMFs. She describes one hypersensitive couple that lives in a mobile home so they can quickly relocate if their symptoms worsen. "EHS is a controversial diagnosis, and many people don't know or care about it," Aberg says. "But many [EHS sufferers] can't feel safe where they live. We shouldn't produce more and more EMFs without taking account of how people react to them."

## **WHAT WE KNOW**

The main source of EMFs from cellphones is the antenna, located inside the handset. When sending signals and held against the side of the head, the phone produces radiation that can penetrate into the brain. The precise depth depends on the frequency of the EMFs; the higher the frequency, the lower the depth of penetration. Cellphones typically operate in a range of frequencies between 800 and 2,200 megahertz. Radios and TVs operate at slightly lower frequencies, and microwave ovens and radar operate at higher frequencies.

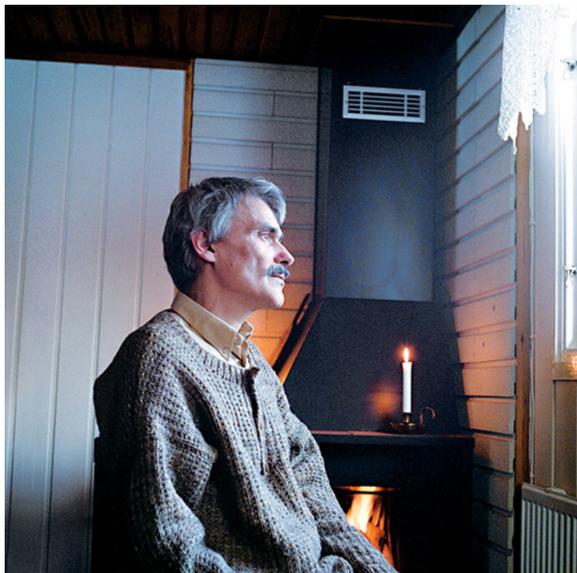

Research into the health effects of EMFs started in the 1950s, when scientists began studying medical applications and radar. As microwave ovens started appearing in kitchens in the 1960s, EMF research entered the mainstream, and with the proliferation of computer display terminals in the 1970s and cellphones in the 1980s, the research really took off. "With every new device, people worry," says Michael Repacholi, the former coordinator of the World Health Organization's Radiation and Environmental Health Unit and now a visiting professor at the University of Rome. Repacholi launched the WHO's International EMF Project in 1996 in response to growing public concern. That group's conclusion: There is no evidence to indicate any health effects from cellphone EMFs. There was a clutch of lawsuits in the mid-1990s alleging that cellphones had caused brain cancer in specific individuals; none succeeded.

The Interphone project, a collaboration among 13 countries that carried out studies between 2000 and 2005 coordinated by the WHO's International Agency for Research on Cancer, was set up to settle the matter of whether cellphones cause brain cancer. It, however, has been plagued by controversy over methodology, bias and contradictory results. Interphone spans a period during which cellphones and their use have changed greatly. Children were not included in the study, for instance, because cellphone use by kids was low when it began in 2000.

Bias is a concern for all studies of this type, says the head of the Interphone study, Elisabeth Cardis of the Centre for Research in Environmental Epidemiology in Barcelona, Spain. "We have from the beginning made efforts to minimize bias as much as possible, to identify and quantify any remaining bias, and to try and take it into account in the most scientific way," she says.

The results are inconclusive. A Danish Interphone study of 106 cases of acoustic neuroma, a kind of brain tumor, showed no elevated risk from long-term cellphone use, although only two cases were long-term users. A Swedish Interphone study of 148 cases found a slightly elevated risk.

When the Interphone results are finally released, after years of closed-door debate, they are not expected to settle anything. In the end, Cardis says, "further studies will be needed to confirm the Interphone results, particularly with regard to the use of phones by children."

Cause Vs. Promoter

Jonathan Worth

## **CAUSE VS. PROMOTER**

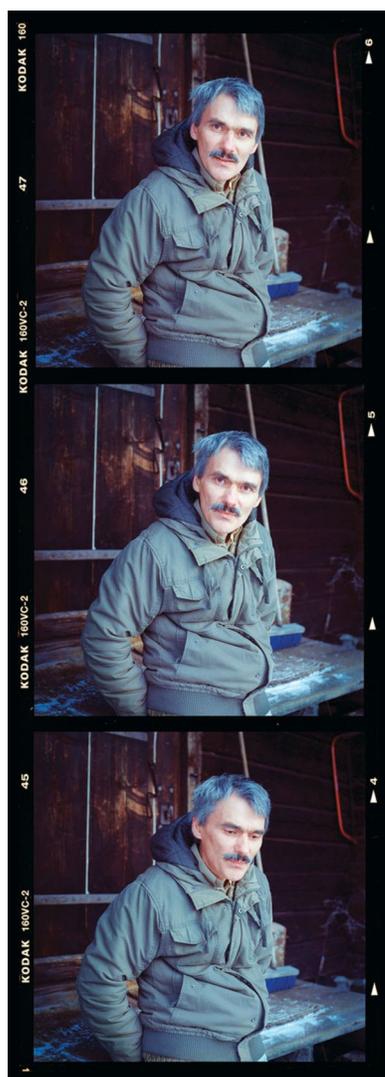

Let's be clear: Cellphones are not like cigarettes. There is a proven mechanism by which cigarettes cause cancer, even if you live an otherwise healthy life. There is as yet no proven mechanism by which cellphones do the same. Most experts say there is no such mechanism. "There is no dramatic evidence of a health effect," says Michael Kundi of the Institute of Environmental Health at the Medical University of Vienna. "Otherwise, we all would be terribly sick." But, he says, there is another crucial distinction to understand. Even though EMFs are in all likelihood not cancer initiators -- they don't cause cancer the way that tobacco does -- the radiation might well be a cancer promoter, allowing precancerous cells time to grow and metastasize, especially in concert with other factors.

While most of the rest of the scientific community argue that cellphones pose no health risks at all, Kundi and others suspect that radiation from prolonged cellphone use may indeed lead to an increased risk of brain cancer. As to electro-hypersensitivity, among the limited studies of EHS sufferers (who are reluctant to subject themselves to hours in an electronics-laden facility), some have shown that cellphone-frequency EMFs do produce physiological

effects in some people, both those who report EHS symptoms and those who do not (although the EHS patients performed no better than chance when asked whether they were being exposed).

A growing number of studies show that we may not understand the effects of EMFs at all, especially the ones that emanate from cellphones. We may have been asking the wrong question. Research is beginning to shift from asking, "Do cellphones cause cancer?" to asking, "What mechanism, if any, could cause an adverse health effect?"

In 2001, doctors diagnosed Catherine Woollams, a 22-year-old Briton, with a glioblastoma, a brain tumor of the type studied in connection with EMF radiation. Her father, Christopher, had studied biochemistry at Oxford, specializing in viruses and cancer, before going into advertising. In the early 1990s, he helped develop the launch campaign for Mercury One-2-One, one of the first digital cellphone services in Great Britain. After Catherine's diagnosis, he founded CANCERactive, a charity that provides information on cancer treatments. Catherine died in 2004.

Per Segerbäck

Jonathan Worth

Woollams has a surprisingly measured opinion of the cancer risk in cellphone use. He says his daughter smoked cigarettes, didn't eat well, and lived on her cellphone. Are cellphones responsible for her death? "I don't think it helped," he says, "but there is no single cure for or single cause of cancer."

He argues that research should not focus solely on brain cancer. "It is very, very hard to prove a direct link," he says. "The evidence is tenuous at best." Woollams believes researchers should also pursue the possible mechanisms by which EMFs might impair the body's overall defenses. He suggests that the daily sea of EMFs -- combined with other environmental factors, such as toxic chemicals and poor nutrition -- may have a collective influence on our health. "I am far, far more worried about how [cellphones] could lead to a diminution of the immune system," he says. "Mobile phones add to the problems that bring about brain tumors. Phones should carry a warning, the same as cigarettes."

Investigating the relation between cellphones and health risks remains terribly difficult and inconclusive. Brain-cancer studies are particularly hard to conduct -- the tumors are rare and can take decades to develop -- but they do exist. Most studies have addressed either malignant tumors such as glioma or benign tumors such as meningioma or acoustic neuroma. Some studies have also focused on salivary gland tumors. The majority have found no link between cellphones and these types of cancer. But a few have. Lennart Hardell of the department of oncology at University Hospital in Örebro, Sweden, found increased risk for glioma and acoustic neuroma after 10 or more years of regular cellphone use. He concluded that current radiation limits for cellphones are unsafe.

Other developments are also unsettling. According to a 2004 report from the U.K. Office of National Statistics, the rate of childhood brain and spinal-cord tumors in Britain rose from just under 20 per million in the early 1970s to just under 30 per million in the late 1990s. Citing concern over "continuing uncertainties about possible health risks" of EMFs, the European Parliament has suggested an awareness-raising campaign geared toward young people between the ages of 10 and 20; the French Ministry of Health, Youth and Sports has warned against "excessive" cellphone use among youngsters; and U.S. senator Arlen Specter of Pennsylvania, who survived a brain tumor, has held Senate hearings on the issue. State legislators in Maine are debating whether cellphones sold there should display warnings about brain cancer, and the municipal government in San Francisco is considering requiring information about radiation levels on cellphone packaging.

Study results are invariably criticized for methodological failings, such as insufficient sample size (many people need to be studied to get a meaningful result) or recall bias (people often incorrectly remember their past cellphone use). A recent review of 23 cellphone/cancer papers found that studies the authors rated as of the highest methodological quality (mostly by Hardell) reported an increased risk of tumors in long-term cellphone users, whereas in studies the authors rated as of lower methodological quality the results actually showed a decreased risk among cellphone users. Yet a different review singled out Hardell's results as most likely the result of poor methodology.

## **POSSIBLE THREATS**

What, then, should we study? Kundi points out that according to current research, cellphone radiation does have "non-thermal effects" -- biological effects beyond the mere heating of tissue -- that could influence human health. Identify the mechanisms behind these effects, he urges, and design phones that don't produce them. There are three main lines of investigation into non-thermal effects: the potential influence on melatonin production, gene expression and intracellular signaling.

### **Melatonin**

Melatonin is mostly known as an antidote to jet lag. Produced in the pineal gland of the brain, the hormone regulates much of our sleep-wake cycle. But it also has a crucial role as an antioxidant, protecting against the DNA

damage that can lead to cancer and the neurological damage that can lead to diseases like Alzheimer's. EMFs have been shown to suppress melatonin production in rats. If suppression also occurs in humans, one of the body's defenses would be weakened.

Epidemiological studies have found an increased risk of leukemia in people living near high-voltage power lines. The IARC now classifies extremely low-frequency EMFs (such as those from power lines) as a possible human carcinogen. Denis L. Henshaw, a physicist at the University of Bristol in England, cites evidence that power-line EMFs disrupt melatonin production, thereby impairing the immune system's ability to prevent and repair genetic damage.

Power lines operate at lower frequencies (around 50 hertz) than cellphones. But cellphones produce regular pulses that fall in the extremely low-frequency range of 1 to 300 hertz. It is therefore possible, according to Henshaw, Kundi and others, that cellphone EMFs could also have an effect on human cells and, potentially, on melatonin production.

While acknowledging that some researchers have found alterations in melatonin levels, former WHO coordinator Repacholi says, "It must be something else, because [power-line EMFs] hardly penetrate into the body. There is no mechanism by which the fields could cause melatonin change." Counters Henshaw, "There are thousands of papers documenting the effect of power-line EMFs. We don't know yet if this is true for cellphones, but for power-line EMFs there clearly are non-thermal effects."

### Electro-Magnetic Model

Electro-magnetic waves from the phone's antenna penetrate the brain several centimeters deep.

Paul Wootton

### Gene Expression

Research by Igor Belyaev, an associate professor in the Department of Genetics, Microbiology and Toxicology at Stockholm University, has shown that EMFs can affect gene expression -- the mechanism by which genes are activated and "speak out" -- in human and animal cells. Belyaev exposed human lymphocytes, a type of white blood

cell involved in the body's immune response, to EMFs at 915 megahertz, a common cellphone frequency. The samples were taken from healthy people and those reporting EHS symptoms. In cells from both types of subjects, Belyaev observed a stress response that altered gene expression. The stress response induced by EMFs at 915 megahertz disrupted the body's DNA-repair machinery, he concluded, thus making it harder to fix the kind of cellular damage that can lead to cancer. In other research, Belyaev has found that cellphone-frequency EMFs inhibit DNA repair in stem cells; DNA breaks in stem cells are critical to the onset of leukemia and some tumors, including gliomas.

Stress response does indeed cause changes in gene expression; however, says Repacholi, "lots of experiments can find effects, but that doesn't translate into the whole organism, because the whole organism compensates. The gap between a biological effect and an adverse health effect is a big one."

### **Intracellular Signaling**

Rony Seger of the Weizmann Institute of Science in Rehovot, Israel, has found that EMFs in the 900-megahertz range also influence intracellular signaling pathways -- how cells talk to each other. Working with rat cells, Seger and his colleagues found that cellphone radiation changes the activity of certain enzymes, prompting them to start producing free radicals. Free radicals are rogue atoms that can cause damage when they interact with DNA and other crucial cellular components.

Seger emphasizes that the effect "produces a small amount of free radicals, which in themselves are not harmful." But he also says that intracellular signaling could be part of a more general cancer-inducing mechanism that is not yet understood. "It is possible that this system could cause the activation of another system," he says, which could in turn create a cascade of intracellular events whose cumulative effect could be harmful. He cautions, though, "The amplification [of the free radicals] has to be much stronger in order to induce these adverse effects." Boice points out that free radicals are produced all the time as a by-product of our metabolism. "The body has processes that take care of them," he says. "You can't extrapolate from a petri dish to humans."

### **WHAT WE DON'T KNOW**

Henshaw, Belyaev and Seger do not argue that their work proves that EMFs either initiate or promote cancer. They do insist, however, that these non-thermal effects cannot be dismissed and that they merit further study. "We need to decide now if there is a risk," Kundi says. "If we know the mechanism, then we can design phones not related to increased risk."

## The Disconnected Life

Jonathan Worth

Boice believes there is a need for continued research into cellphones and EMFs. "We should never just assume, 'Oh, it's non-ionizing radiation, so there is no need for further research.' But," he adds, "we have conducted studies, and the studies show there is nothing going on."

Another study, the International Cohort Study of Mobile Phone Users (COSMOS), might help determine what, if any, future research is needed. COSMOS will be monitoring some 250,000 Europeans over the next 20 to 30 years, looking at potential links between cellphones and brain tumors as well as EHS-like symptoms such as headaches, sleep disorders, and neurological and cerebro-vascular diseases. But results are not due until 2029 at the earliest, and between now and then, the technology will change and proliferate in ways we cannot predict. A study under way at the IIT Research Institute in Chicago, examining the effects of EMF exposure on rats and mice over several generations, should also provide important evidence. A similar experiment, in which mice were exposed to cellphone EMFs 24/7 across four generations, found no harmful effects on the animals' fertility or development. "If [the IIT Research Institute in Chicago study] doesn't find an effect, then we're unlikely to find anything at all," Repacholi predicts.

In a recent report on EMFs and health effects, the ICNIRP concluded, "Whilst it is in principle impossible to disprove the possible existence of non-thermal interactions, the plausibility of the non-thermal mechanisms . . . is very low." Still, Seger says, "there are more and more indications that [non-thermal effects] must be real. What is the mechanism? No one knows. If there is an effect, the mechanism is absolutely new to science. We have to start thinking about it in a different way."

## THE DISCONNECTED LIFE

Segerbäck is convinced that cellphones are dangerous. "I'm an engineer, and even I don't know how to design a phone that doesn't affect health," he says. Radiation limits "are all based on thermal effects, and that's wrong." In the early stages of his condition, Segerbäck was still able to lead a fairly normal life. His daughter, Anna, was just a

child when he became ill. She used to run ahead of him at home switching off all the lights in every room before he entered. It is everyday family life that Segerbäck misses the most, something as simple as the chat and laughter on the morning drive to school.

Today he cooks all his meals on a wood-burning stove. The fireplace is his only source of heat. He has electric lights, a phone and a computer, but their power source -- a 12-volt battery -- is buried in an underground cellar about 30 yards from his house, far enough away that the EMFs can't reach him. His computer and his mouse are both surrounded by metal plates so no radiation escapes. His neighbors all know about his condition and (with occasional, painful exceptions) know not to carry cellphones near his house.

Segerbäck is surprisingly sanguine about his situation. "Of course it's a very sad thing that happened to me," he says, "but it can only be regarded as an accident. I am a positive person, from a line of very stubborn people able to survive under tough conditions." He is determined, in his affable, soft-spoken way, to gain greater recognition and greater credibility for EHS. Not by banning cellphones -- he's still too much a telecom engineer for that -- but by somehow making cellphones safer. In fact, he even takes some responsibility for being part of an industry that designed devices he now believes are hazardous to people's health. "Guys like me were so far ahead of society," he says. "We didn't know medicine. We didn't think what we were developing could harm anyone. It's hard to admit we've been wrong for so long."

**How about the researchers? Do the people who study cellphone radiation use their phones with caution? On the next page.**

## **Cellphone Habits of the Experts**

### **Rony Seger**

*Weizmann Institute of Science*

"I try not to exceed a half hour or an hour a day," Seger says of his cellphone use. "Everything is a matter of dosage." He suggests keeping cellphones at least 12 inches from the body and using the speakerphone.

### **Christopher Woollams**

*Founder and CEO of CANCERactive*

Woollams uses his cell sparingly and puts it on speakerphone. His older kids -- aged 14, 23 and 26 -- "are encouraged to only text at most. I don't want them to carry the phone on their bodies when they are on."

### **Michael Repacholi**

*Former coordinator of the WHO's Radiation and Environmental Health Unit*

Repacholi owns two cellphones and says he has no concerns about using them. For those who do, he recommends using a hands-free kit, which can reduce exposure levels by a factor of between 10 and 100.

### **John Boice**

*Vanderbilt University School of Medicine and the International Epidemiology Institute*

Boice makes approximately five cellphone calls a day. He uses a wired earpiece -- not for fear of EMFs but because "I'm getting older and don't hear so well anymore," he says.

## **Ulrika Aberg**

*Electro-hypersensitivity specialist*

Aberg removes her phone's battery when she visits patients. She advises against wireless phones and wireless computer connections at home because, she says, "you are exposed to EMFs all day and all night."

## **Elisabeth Cardis**

*Centre for Research in Environmental Epidemiology and head of Interphone*

Cardis is not a heavy talker ("I have little time!") but says, "If consumers are worried about a possible risk, the use of hands-free kits or earpieces is a very good way to reduce exposure."

## **Michael Kundi**

*Institute of Environmental Health, Medical University of Vienna*

Kundi dials on a landline whenever available and suggests not using cellphones where reception is weak, because they boost their signal to maintain connectivity, thus increasing EMF exposure.

## **Voices on the Line**

*Opinions from the researchers, interviewed by Christopher Ketcham*

"We really cannot say for certain what the adverse effects are in humans, but the indications are that **there may be—and I use the words 'may be'**—very serious effects ... The biggest concern about cellphones is the evidence coming out of studies in Northern Europe, where cellphones were invented and where they have been used for a longer period of time than in the U.S. These studies are pretty consistent in showing **an increased risk of brain cancer and tumors** of the auditory nerve in individuals who have used cellphones for more than 10 years, but **only on the side of the head where the cellphone is used**. Studies from Israel have also found tumors of the parotid gland, the salivary gland in the cheek, but again only on the side of the head where the cellphone is used."

—**David Carpenter** is director of the Institute for Health and the Environment and founding dean of the School of Public Health at the State University of New York at Albany. He co-edited the 2008 Bioinitiative Report on cellphone risks.

"The Interphone study was initiated by the WHO agency, the International Agency for Research on Cancer, to have 16 case-control studies conducted in 13 countries to determine whether use of mobile phones is associated with head or neck cancers. Until the Interphone study results are published, the best indicator of the likely result is shown in the combined British and Nordic country study, which has over 60 percent of all the cases and controls that the full Interphone study has. In this study, **they found little evidence of any head or neck cancers among people who have used their phones for less than 10 years** ... It is not possible to make any conclusions at present about the risks of mobile phones for more than 10 years."

—**Michael Repacholi** was coordinator for the Radiation and Environmental Health Unit at the World Health Organization from 1996 to 2006.

"When a nerve is stimulated—say, the optical nerve stimulated by light—all sorts of electrical activity goes on. **The nervous system uses electrical fields to function**. It would be expected that certain extraneous electromagnetic fields would affect the nervous system. **If you apply a correctly tuned EM field**, you're going to affect nervous-system function, which is going to affect all sorts of functions and behaviors. Some of my research in the 1970s

found that when you expose a frog's heart to EM frequencies that were modulated just so, **you can produce arrhythmias in those hearts and even stop the hearts.** I also showed that EM frequencies could open the blood-brain barrier. This means that substances in the blood can leak into the highly stabilized systems in the brain."

—**Allan Frey** is a neuroscientist formerly with the GE Advanced Electronics Center at Cornell University who conducted some of the first experiments showing the biological effects of radio-frequency radiation.

"In the 1940s, kids' shoe shops were equipped with shoe-fitting machines that used strong x-rays, and wristwatches in the 1950s glowed in the dark because they were coated with radioactive paint. At the same time, scientists and doctors started to realize that the warm and beautiful sunshine actually can harm our cells and their DNA, leading to the development of skin cancer ... **We don't know what will happen when, 24 hours around the clock, we allow ourselves and our children to be whole-body irradiated by new, man-made electromagnetic fields for the rest of our lives.** This question is more valid and important than ever, and it is up to our society, with its governments, parliaments and authorities, to answer it."

—**Olle Johansson** is an associate professor at the Karolinska Institute and the Royal Institute of Technology in Sweden and has been investigating the health effects of man-made electromagnetic fields since the 1980s.

# Barrie Trower – The Truth about 5G and Wi-Fi

## Part 1

Part 1 of the lecture '[The Truth about 5G and Wi-Fi](#)', held on February 3, 2020, by physicist Barrie Trower, in which he revealed his findings on 5G, ICNIRP, WHO, 5G-alike radiation experiments in Russia in 1977, top secrets, military, industry, governments, Wi-Fi, cell phones, children at risk, schools, trees, birds, bees, fishes, and... the abyss, if 5G will not be stopped.

Video: [Lecture](#). Transcript: Antoinette Janssen / Multerland blog

- *Lecture part 1 - 01:05 - 48:26*
- *Lecture part 2: 48:26 - 1:32:03*
- *Questions and Answers: 1:33.00 – 1:50:46*
- [Video](#)

01:05

Anything I say I have evidence documentary for, in total 1700 papers. I do not say a single word, unless I have documentary evidence.

Between 1949 and 1962 everything we needed to know about microwaves was known and published. By 1962 all of the dangers, all of the hazards, everything was known. When I say "all of them": between the super powers and us[Britain, Admin], the brain at that time had been studied for brainwaves and microwaves could be used to penetrate the brain and cause behavioural changes. By 1962, with the resonance frequencies of the organs, the brain, the cyclotron frequencies, the circadian frequencies, a statement was made in 1962 by the governments that all birth-defects, organs, whole organisms, all cells, brain-functions, all moods, could be altered, changed and destroyed. By 1962. Microwaves then, as now, were used as stealth weapons, before they became cellphones.

In 1965 cellphones were used by the military, I had them. By 1965 the prospects of cellphones and everything from cellphones was seen as a really, really lucrative market for the general public. And, knowing the dangers that cellphones could cause -the military are exempt[free from obligation, Admin]: you do not have, in the military, when you sign, any danger that comes your way for using whatever, you don't have any recourse for that. But the general populations do. The military, and the industry of several countries: the United States, Canada, us[Britain, Admin], some of the NATO countries, Australia and New Zealand, the people got together and they knew that cellphones and all the other gadgets you have today, they knew they would not be allowed under current safety limits. We needed a safety limit that could never be taken to court and never challenged if these things were to progress.

In 1965 they adopted an old 1953 thermal level by an engineer by the name of [Schwan](#) and in order to prevent to be taken to court the industries and the people who are making decisions they adopted the Schwan 1953 level which basically says: "If a certain weight of your tissue does not heat up by a certain temperature in 6 minutes then everything will be deemed for a lifetime exposure for adults, men, women, children,

pregnant women, everybody. The 6 minute level is the one that is still used today.

They totally ignored and put aside the electromagnetic vectors of the wave and the harm that the electromagnetic vectors can do. They interfere with the electrical conductivity of the cells, the electromagnetic conductivity of the neurons, the electromagnetic conductivity of the brain. They interfere with the resonant frequency of the circadian resonant cells the electronic ions, they interfere with everything.

All of these were brushed aside. We stuck with the 6 minutes thermal limit. Sometimes they extended to 30 minutes, but basically it is 6 minutes and that is what is enforced today in 42% of the planet, of what we are in that part today.

You have really no protection against the electromagnetic vectors. That is enforced today. That comes from the International Non Ionizing Radiation Protection[ICNIRP, Admin] who advise our, what was the government scientists, now [Public Health England](#), who advise governments, who advise councils, and it comes all the way down, and it is still in force today.

08:34

[Top-Secret Document 1 / Military, Admin] 5G is not new. 5G was causing a nuisance in 1972. The only thing new is its name, fifth generation. That's it. That is the only thing new. It is well documented, there are many research papers on it, and finally, in 1972, sorry, in 1971, cancer was proven to be caused by low-level microwave radiation and has been kept secret ever since along with all the other illnesses and diseases. In the early seventies this document was published, it was by the American military, it is top-secret, classified top-secret, and it lists 2000 research papers, 2000, and each of those took many many years to construct. Two thousand research papers—in that days the military did the research within the universities—and it covers all of the illnesses which you can expect to get and die from, from low-level radiation.

10:19

[Top-Secret Document 2 / World Health Organization, Admin] This is I think the *most shameful* document ever to be published. It is by the World Health Organization. We pay *them* to protect *us*. And we trust them to protect us. In 1973 the WHO had a conference in Warsaw: biological effects and health hazards of microwave radiation below thermal radiation, which you have in your cellphones. 350 pages documenting *harm* to the ordinary person. 107 different chapters. Chapter 40 deals with cancer, I think 28 reproductive forms, but instead of telling the world, I don't know who made them make the decision, instead of telling the world it was stamped "Top Secret", with a big red top secret stamp, and it still is, and it still will not be told about it, they will not admit to it, until today.

11:40

[Top-Secret Document 3 / US Defense Intelligence Agency, Admin] The second *most shameful* document is, I think is this one. this was published between 1972 and 1976, the final part was 1976, it is from the US Defense Intelligence Agency and the document says: "If the more advanced nations of the West are strict in the enforcement of exposure standards there could be unfavourable effects on industrial output— industrial output is profit—and military function."

In other words, what they wanted us to do was: "Set a level of radiation for the NATO

countries, set a level of radiation that would not be strict." Hence, we came in with the 6 minute thermal level that is still in place today and what councils are advised to adhere to.

13:01

[Top Secret Document 4 / World Health Organization, Admin] At that time the WHO again what they did not tell you, on their website, or what they had in these days, 80% of the published papers linked cancer to low level microwaves. And the others, you had neurological damage, birth defects.

There was no secret among the decision makers then.

13:41

And every so often, generally when a new "G" comes out, one of the new makes of the cellphone, the International commission for Non-Ionizing Radiation Protection put out an addendum to their original report, which clears the way for whatever generation is coming out. There's a new one coming out in a couple of days to clear the way for 5G[the lecture is from February 3, 2020, Admin].

This is the original[Barrie Trower shows document, Admin], or a copy of the original International Commission document, and it is of interest to decision makers, all decision makers, because I think I am not legally trained and I cannot understand people when they talk to me who are legally trained, but I will give you my interpretation of this, and this is for council decision makers and all other decision makers. they actually say in this that their recommendations are guidelines. They are not law. You do not have to adhere to them. They are guidelines. They say they only consider involving the heating of tissue. They go on to say for example: children, the elderly and some chronicle ill people, may have a lower tolerance for one or more forms of these microwaves than the rest of the population. They will be deemed sensitive. And then they say on page 574: "In practice the critical steps in applying these general procedures may differ across the spectrum. Several steps in these procedures require scientific judgements. For example: on reviewing the scientific literature and determining appropriate reduction factor." In other words in my simple brain: If you are told that something is dangerous, as a decision maker, you have the authority to say: "This says this level will cause this. I am instructed to reduce the levels to a point that is deemed safe."

You do not have somebody walk into your school or somewhere and say: "Sign here, these are radio waves, we've had radio for a hundred years, no problems, and then, zonk, a transmitter, and you come back a week later and like Lego some other people have gone dong dong dong dong and you've a mess of things that you don't understand and nobody will tell you what they are anyway.

17:31

I brought a couple of books along not because I get any money if they are sold or anything like that, but, along with the whistleblowers of which I am one, I have known for many many many many years a captain who is an electronics warfare specialist captain, he worked at the Canadian military government and CIA, and he published a book and in this book, and I can give you the title and he has updated it -[this is the original](#)- he has updated it for 5G - [Captain Jerry G. Flynn - [Hidden Dangers 5G: How governments, telecom and electric power utilities suppress the truth about the known hazards of electro-magnetic field \(EMF\) radiation](#), Admin] and in it, whereas Snowden,

the whistleblower of a few years ago, put everything on the internet, he has put all of the top-secret papers into a book, given the websites where you can download them if you are a decision maker and you want proof of something—he includes our government, the International Commission—and he has put them all in the book under different categories, everything to do with cellphones, Wi-Fi, 5G, government, and all that.

The reason I want to quote this one is because he has quoted that before this bubble bursts, with children and everybody running around with everything stuck to the side of their head:

19:16

"It is expected and anticipated, there will be two billion deaths."

Now, I questioned that in my own mind, and I thought: "That's a lot." And in my simple Janet and John brain I could not work out what two billion deaths actually means. But it is, if you imagine everybody who died in WWII, it is 28 times that number. And that is a lot. But when I started looking into this I thought, well, I remember when I was teaching and I remember the time in the early eighties, when I said to my science class: "We have just passed the one hundred thousand deaths a year rates in this country, for smoking related deaths. And then you start looking around the world for smoking. Smoking was linked to—they didn't know of the name then, but they knew you had left a lung congestion and died, with big black ugly bits—in 1870, smoking was linked to cancer and death. In 1939 all of the science was in place to have it stopped. The government scientists and industry scientists—who are often one and the same person—step in and they delay things for 50, 60 years which is what happened with smoking exactly, the same with led in petrol, and there are many other examples. So, when I looked at this and I thought, well, smoking is probably comparable to two billion by now, led in petrol certainly will be. I looked around a few figures, and a 10-year old international study around the world in various countries had many many thousands of miscarriages, suicides, deaths, around transmitters.

21:48

Lima, Peru, the country, is known as cancer city where it is unregulated—just two provinces in India, they have 50,000 brain tumours in children, and a +hundred-thousand in the provinces attributed to mobile phone masts and so it goes on.

When you start looking at examples like this in a paper I wrote—and anyone could come out to my house and read it and copy it—in a paper I wrote there was a survey done—I am trying to think, probably about 15 years ago—of some of the schools in France and Spain, and they found 200 schools with cancer clusters with eight or more different types of cancer, attributed to the transmitter in the playground.

I was involved in eleven children under 11 with leukaemia after a transmitter went up—they all died—it was taken to Parliament, the MP put forward a very very good case, it took 18 months to get to Parliament, and the MP Minister stood up and said: "We are in international guidelines." And sat down. And that was it.

In fact the minister lied: we are not within international guidelines.

There are, and I am not going to dwell on these, but just for the decision makers, I will just run through a couple of these....

23:51

There are already deaths from Wi-Fi in class from here to New Zealand. There are 136 studies of harm in schools, proper studies, from Wi-Fi and transmitters in schools. There are 48 studies on child suicide. It's going up around 4% every year. It is the pulses or modulations from the frequencies. Professor ..., of the [King Saud University](#), he has shown especially in a child's brain where the tissue is particularly soft. He has shown that the microwaves penetrate deep into all areas of a child's brain. and a scientist [cannot hear the exact words and name, Admin] in 97, he listed now a list of 1 to 600 pulse frequencies that could cause neurological and physiological damage in the body. In the paper I had there from the military they list all of the symptoms that you can be warned about if you are taken to court, and the last one is severe neurological damage, including death.

25:54

The five most common ESTs [probably an abbreviation of Electro Sensitive Types, but the web does not offer any matching research result, Admin] from microwaves going into the brain—and I am not a neurosurgeon, I just know from experience—the five most common ESTs are the same symptoms, the same symptoms that you would receive from morphine or marijuana: 1. hunger, excessive hunger 2. aggression 3. and if the pulse frequency is a certain frequency—which I won't say on camera—the aggression manifests itself as sexual aggression. So you can get aggressive from the microwaves and particular port frequency will manifest itself as sexual aggression, particularly from men. The last one, I am not a medical doctor, I describe it as the same symptoms as lead arsenide poisoning, where you just want to go to bed and die and if somebody would come in with a bag and said here's a million pound, and spend it, you wouldn't be bothered. These are the most common ESTs, symptoms that you get from microwaves in the brain at varying degrees, and any neurologist here can take a look in these papers if you wish.

27:50

Pregnant women are particularly vulnerable because the womb of course is mostly fluid and microwaves are attracting and stay in and rearrange the chemical structures of the fluid in many ways. there is a 20-fold higher concentration of damage within the womb. A paediatrician with a neurologist, a medical neurologist, went into a school—I don't know the size of the school—but he found 31 children with physical and neurological damage related to the transmitter. The WHO published a paper that showed that a level of microwave irradiation for a pregnant woman can reach 47,7% as a miscarriage, [stillbirth](#) or genetically damaged child rate. A paper, published a few years ago, by the [European Academy for Environmental Medicine](#), who are an incredibly talented bunch of doctors and clever people, they looked at their own research and came up with 48% for school children.

I have taught pregnant school children and I have worked with pregnant teachers. For school children you can add a risk factor of between 10 and 20% more—I don't know exactly, and I don't know anybody who does.

Due to the increased electrical conductivity in their bodies, the absence of a full working immune system—there isn't really up and running till they are 18 or so—the absence of the hardness of the bones and the easiness of the microwaves to penetrate the bones which are not really fully developed till they are around 27, the last being the [clavicle](#), and of course in the bones you have the bone marrow, which helps with the

immune system—so, children are particularly vulnerable between 40 and 60 percent.

30:46

When I am talking to governments, or royalty, or people like that abroad, the one question I say to them is: If you do nothing—and a lot of them are, this isn't all bad news, 58% of the world are doing a lot. We're not [Britain, Admin]. But 58% of the world are—and my aim is to get us [Britain, Admin] doing something—if we'll not say to them: if you do nothing, just look at the let's take an average of 50%.... the mathematics is relatively simple. It is like a [decay curve](#), a nuclear decay curve.

In one generation of exposed children, let's say 20 years, a half of your newborns are going to have some sort of defect—if they are alive. Another 20 years we are down to a quarter, another 20 years you are down to an eighth. So, in 60 years, I say to them—and this isn't MY work, this is the work of proper real professionals doing this job—in 60 years only 1 in 8 of your children can be born, or expected to be born, healthy.

How are you going to run your infrastructure, how are you going to run your health service, who's going to pay for it, where are the taxes coming from, who's going to man the factories, where are they coming from? The only answer to this is mass immigration. That is the only answer if you wish to survive as a country.

I will come to the trees and animals later but it is worth mentioning it here while I think about it. The scientists will know this, but we all have the same four chemical basis in our DNA. Any tree can read your DNA sequence. The [nucliotides](#) won't do it any good because it doesn't interest a tree because a tree doesn't do what we do, but any tree can read your DNA sequence. Anything that damages our DNA—and if there are any professionals here who would like to know the sequence through the cell or happily give it to—anything that will damage our DNA will damage all other living species' DNA, all of them. Plants, animals. The figures are showing this, and as far as I know there are only three living things on the planet that seem impervious to microwaves. [Later in the lecture Barrie Trower mentions bacteria, Admin]

33:59

There are 48 papers in childhood suicide which manifests itself quite a lot with cellphones. There are as many papers on breast cancer—and I can't go into the breast cancer now, it's a mammoth topic, but I can do questions—. I have a picture here—which I won't show but you are welcome to have a look if you wish—of a lady who tucked a cellphone into her bra. Breast cancer is phenomenally high rating among people who carry cellphones in their handbags or have the metal stains in the bra. And finally on this little section: a surgeon from Plymouth, a brain surgeon, questioned why the amount of brain tumours he was seeing did not match the amount he was doing, the operations he was carrying out. The brain surgeon challenged to these statistics and we looked into this—I had a letter from him and I wrote to him, and I sent him a copy of this and our statistical office, office of statistics or whatever it is, they take, or they did then and it's as far I know still going—they are taking 40.000 brain tumours off these statistics every single year. 40.000. It is justified. What they are saying is, aha, the endocrine glands in the brain are not actually grey or white matter, we associate the brain with grey and white matter. Therefore they're not really brain, therefore the tumours of the endocrine glands are not brain so we can take off the 40.000 endocrine cancers a year.

And this is how it goes on, and this is how you get your figures down. But I did say to the doctor: "Surgeon, you work for the [NHS](#), if you try and raise this, I have known to Health Authority—whatever the chief person is called, the chief of the Area Health Authority—I have known one be threatened that she would lose her job in one half of one day if she brought this to anybody's attention and the other one that the best thing he could do was to keep quiet and stick to other things.

37:39

We put Wi-Fi on schools, you can go virtually into any state primary school and they will have twenty Wi-Fi's in the class, plus the routers on the ceiling, plus a transmitter, and there will be probably iPads as well. And they are all microwaves. What you are NOT told—and if you are a school governor, or a decision maker—what you are not told: when you put these in front of our five-year olds, or even four-year olds these days, what you are not told is that the Wi-Fi in your classroom, or your children's or grandchildren's classroom or their bedroom: Wi-Fi is in the same category for danger according to the WHO International Research on Cancer: they are in the same category, exactly the same, as mercury, led, DDT, benzene, which is the smell from petrol you get, exhaust fumes from cars, HIV type 2, and chloroform. If I walked into anybody's school with any of those, and said: "Hey, you can play with this for a day!", I would be certified sectioned, and jailed. And yet, we've got children with this on their laps. I think somebody worked out for 13 hours for a school lifetime or something.

39:42

But: the good news. The International Commission for Non-Ionizing Radiation Protection[ICNIRP, Admin] they have a very very tightly guarded body [secretive](#):

- you can't join them
- you have to be invited to join them
- they don't answer to anybody
- they are not elected
- and they have a very very close community.

But. Just Saturday—they are based in Germany[see [article](#), Admin]—on Saturday we have a [defector](#), and with 5G coming he is not prepared to do what they are doing, or be a member of their gang any more.[Barrie Trower probably refers to a publication on January 27, 2020, by Dr. James Lin, see [article](#), Admin] This arrived from Germany on Saturday[February 1, 2020, Admin] for me and he has said and he has gone public: "There are now two large well executed and solid studies that point in the same direction: cancer from exposure from all of these technologies. The data in the large study which found clear correlation between exposure to mobile radiation and cancer rates shows even greater cancer risks than revealed in the first reports. Therefore WHO hazard class 1 instead of today's class 2. It is an air-tight argued conclusion, which supports an overwhelming amount of research. He is asking the world to upgrade the cancer certification from grade 2 -which is mercury and led and benzene - up to grade 1. He said, the research substantiates that.

42:50

I am not alone running around the world to do this. There are a lot of people doing lots of things. We have some good news here. The industry themselves in the year 2000 studied the top, 220 research articles, and said that what they are putting out actually

does cause cancer. The Council of Europe, 47 countries, 800 million people, suing simple statements: ban Wi-Fi in schools. Dr. Annie Sasko, 22 years WHO cancer department: mobiles, cellphones and Wi-Fi will cause cancer. Switzerland, France, Germany, Belgium, England—this is not the state of course—have started to remove Wi-Fi from schools. UNICEF, the big children's charity who care for children, decided to look into this and they did their own study, nobody interfered, and they came up with their own conclusion: they found there was an 85% risk of brain and heart damage.

In fact in Canada I think it is, in the schools they've had heart attacks from children from Wi-Fi and now the classrooms have defibrillators in.

- 85% brain and heart damage,
- 36% epilepsy,
- 11% neurological harm,
- 82% blood-, immune- and foetal damage.

Iceland, Cyprus, Italy, Canada, Russia, USA are either removing or starting to remove Wi-Fi from schools.

45:37

I think this lady, internationally she is renowned for being particularly clever and I would like to read what she wrote here, she is a paediatric neurologist: Dr. Maier Cline [?], and she has said:

"Pregnant women deserve to know that wireless radiation can have an impact on the developing brain. We're seeing alarming increases in the number of children diagnosed with neurological disorders over the past decade.

And finally here a very large article published in a science journal and because he was so worried and with no disrespect to some of the people here, and I know some of the people here, are recognized nationally and internationally for their knowledge. With no disrespect to the people here, professor Yuri Grigoriev—who is chair of the Russian Federation for nuclear and atomic sciences and probably the most knowledgeable person on the planet concerning microwaves and harm—he came over here for one specific purpose. He wanted this article published, which it was, and he gave a lecture and he wanted to warn our governments: "Do not put microwaves in schools. Do not put Wi-Fi in schools. Wi-Fi will have severe neurological damage and physical damage to our children."

He came all over here just to say that and to warn us. Anyone who wants to see the article you can come to my house and read it and photograph it.

End part 1.

## Part 2. Barrie Trower – Lecture: ‘The Truth about 5G and Wi-Fi’

Part 2 of the lecture ‘[The Truth about 5G and Wi-Fi](#)’, held on February 3, 2020, by physicist Barrie Trower, in which he revealed his findings on 5G, ICNIRP, WHO, 5G-alike radiation experiments in Russia in 1977, top secrets, military, industry, governments, Wi-Fi, cell phones, children at risk, schools, trees, birds, bees, fishes, and... the abyss, if 5G will not be stopped.

Video: [Lecture](#). Transcript: Antoinette Janssen / Multerland blog

- *Lecture part 1 - 01:05 - 48:26*
- *Lecture part 2: 48:26 - 1:32:03*
- *Questions and Answers: 1:33.00 – 1:50:46*
- [Video](#)

48:35

[Important note: From 48:35 to 48:58 Barrie Trower mentions two books written by Captain Jerry G. Flynn: [Hidden Dangers 5G](#), published November 13, 2019, and [Hidden Dangers](#), published September 25, 2018.

However, Barrie Trower mentions Amazon, where these books are available, but since Amazon is already orbiting 5G satellites into low orbit and is going to orbit thousands more, next to Elon Musk's Starlink 5G satellites, I have decided to leave this part away, and to ask you friendly to try to order the recommended books in an ordinary bookshop, as an honourable, conscious act to stop 5G. More about the emergency to stop orbiting 5G satellites: number 16 in the list of EMF links: [Satellites](#).Admin]

### Lecture, part 2

48:58

I bought [this book](#) specifically because there is a chapter here for decision-makers, counsellors decision-makers. I just want to read this bit here and everything in here you have the websites and everything you need to get it. This is for decision-makers from 2015 and it says:

"School districts boards, medical health officers, now know [Lloyds of London](#) will not provide liability coverage for injuries, directly or indirectly arising out of, resulting from, or contributed to, by electromagnetic fields, electromagnetic radiation, radio-waves, noise, this applies to Wi-Fi, and all wireless devices in schools."

50:01

And I believe, I don't know if I am correct, I believe Lloyds insure other insurance companies and if I were a decision-maker, one thing I would ask for in writing, because apart from the harm—which my brain can't even contemplate—apart from the harm: if you are taken to court over the death or injury of a child, and you have no insurance, no

insurance cover, and I have had parents and people come to me and say, what do I do about injury, and I say well, there will be insurance or there will not be insurance, it's depending on—ask your school people or your counsel, or whoever, for the specific sentence, in their policy, that says we will cover your child whatever from electromagnetic illness. There should be a specific sentence there that says. If there is not then I don't know the law, if as a decision maker you are taken to court .... I have spent a whole day in court being cross-examined by an incredibly ambitious tenacious [barrister](#), and I was defending a girl who did not want to have an unhealthy child and wanted Wi-Fi taken out of school. And I thought after that—Andrew Goldsworthy who works with [ES UK](#) as an advisor, he was the medical expert—and I thought: I am glad I was on my side because I can stand my ground, and I thought, if I were a decision-maker, against such a barrister, I would be taken to pieces with the information that is there. And I think it's something that decision-makers just need to bear in mind.

52:38

Trees. I'm quoting this from the magazine [ES UK](#), which I think - there are some copies over there—but it's quarterly or four times a year—and they do cover lots of legal aspects and they have their doctors, scientific advisors and it is well worth getting, and it is not expensive.

In [ES UK](#) there is an article here on trees, subjected to low-level microwave irradiation, 29 pages, the red oak, cherry, willow, black poplar, and all trees suffer the same. They all start losing their immune system once you bombard them with communications microwaves.

53:42

Trees are designed to pick up radiation, they are not designed to pick up microwaves, they do not like microwaves, even children in school do experiments with [watercress](#), near cellphones or microwaved water.

It is patently obvious that not any tree likes microwaves and the moment you start microwaving a tree two things happen.

First is: the tree starts to lose its immune system and secondly—there were three species on earth that I know of that are impervious to microwaves one of them is [bacterium](#), microorganisms, they seem to thrive under the energy from microwaves, I don't know why, it is explained to me by a professor but I couldn't understand what he was saying—but two things happen with trees: first the bacterium start to thrive and invade the tree and secondly the tree starts to lose its immune system and it is only a matter of time.

55:01

Where 5G is going up, all around the world where 5G is going up trees are coming down. The reason is: trees [inhibit](#) the progress of 5G. 5G is not a big around circular wave that you get from transmitters. 5G is a beam, a sort of a cross between the torch and a laser. It is a beam, and that beam has trouble going through a tree trunk or the density of leaves especially if they're wet. And especially along roads. I have had calls from all over the world saying: "Barrie, why are they cutting our trees down?" and I say: "Is 5G going up?" Yes, there is your answer.

In Malta, the lady that rang me, said: "They're cutting the trees down and the reason is that motorists can see better." In the USA they're not just giving an explanation, they're just cutting them down. Sydney is the only place I know, Sydney, Australia where they're telling the truth and the application into the government is the submission to the

government, 5G inquiry. Sacrificed trees for network performance and overwhelming numbers of small cells. In Australia they've just said: "If you want 5G we cut the trees down." Simple as that.

56:50

Here our local paper, or my local paper, [?.] Bovey Tracey, the advertiser here: "We are culling,"—now the reason given to us—"...we are culling in Tunbridge area[Note: it is very difficult for a not Brit like me, to analyse the sound of the name that is mentioned. I came finally to maybe Tunbridge (Wells) and when checking for it on the web, it seems to be a tree-rich area, and indeed 3G, 4G and even 5G are covered there, see website: [here](#), so I name this city in the following sentences as well, Admin] , I come under Tunbridge, 90.000 trees for, or to stop the prevention of dieback." I don't know what [dieback](#) is, I am not a tree expert, but we are cutting down 90.000 trees and we are also cutting down, it is 440.000 trees along the road, so that they don not pose a danger to motorists.

Now. I wrote a letter to the newspaper along with a lot of other people, and I've said: "Is it a coincidence that we have to cut down 440.000 trees suddenly posing a danger at the exact location that 5G needs to go up on the lamppost?" 5G has to go up every hundred, hundred and fifty meters.

56:18

Magazines—I am not the only one with research—there is an article here, that birds, bees, insects, trees, the migration of animals, colony collapse, a big study on aspen trees, there are twenty studies here, proper university studies on all of these, and it is the same thing really, all of those ... you suppress the immune system and for the animals, the navigating animals, the ones that use the sun or the earth's magnetic field, even the creepy crawlies that go along the ground, they use navigation from the earth and from the sun, but, for the scientists here: I'm talking about the [cryptochromes](#) pigments, double electron absorption system, that has been published in "[Nature](#)" for [robins](#)—we know the birds have it, the other animals have it—animals lose their immune system, all animals, and those that use the sun or the earth's magnetic field they become disoriented. Migrating birds get lost, butterflies get lost, and you have quite a lot of harm particularly on insects. They have a large surface area to body volume. Their surface area absorbs more radiation than the body can hold.

1:00.32

It's known that one of the 5G frequencies, when it was tested on a bee, just absolutely [saturated](#) the bee, the bee lost its immune system and the whole thing turned to [pus](#) inside.

1:00:50

I'm going to mention just a couple of studies here. Two studies costing 30 million euros over a good 10, 12 years, found an increased cancer tumour in animals exposed to phone mast radiation.

1:01:39

Animals, facing extinction, have been reported in India, Netherlands, Japan, up to 40% of hives lost, insects extinction, from, in Germany, from studies by entomologists, and so it goes on. Nobody is immune from this.

I have given two of the [Glastonbury Festival](#) environmental lectures—you're welcome to come around and get them if you wish—but one of them has over 8000 research articles on animals, and a 20-page laboratory study citing the suppression of the immune system from ordinary low level microwaves on cows, cats, dogs, hamsters, whales, birds, birds, bees, bats, butterflies. Over 8000 studies there.

The second one I gave—the first one was predominantly bees—the second one was animals from all species, I quoted 14 properly independently peer-reviewed university studies, saying the same, and this isn't a UK problem.

1:03:52

A lovely gentleman here sends me a picture of his hives every year, he is a priest, living up in the mountains, the Rockies in the [Colorado mountains](#), and he sends me a letter every January with all of his hives, and to show this is not just an English or UK problem, they are fighting a battle. The beekeepers are fighting a battle and every year he tells me what he is doing. They're putting special protecting coating on or doing this or doing that or moving them, but he sends me a note saying what he is doing to try to protect his bees along with all the other United States bee keepers.

1:04:39

Now I want to come finally on animals to a study here, this is probably the biggest and comprehensive and legal study, this is a 15-year study, hundreds of papers, [Mount Nardi](#) / [Mount Matheson](#) World Heritage Sites in Australia—the study was for, and it was a legal study—for the United Nations Educational Scientific and Cultural Organization, [UNESCO](#), the [International Union for the Conservation of Nature](#) and the conclusion over [Mount Nardi](#), [Mount Matheson](#)—they only had a hundred and five transmitters, which isn't that many over 15 years, and I have never seen anything described like this, before—they said: [[See the PDF](#), page 36/39, conclusion]

1:06:16

"Over the last 15 years this affects not only the top of the life chain species but they are devastating the fabric of the community of the world heritage causing genetic deterioration in an insidious massive and ever escalating scale. To truly understand what these studies reveal is to stare into the abyss."

I have never seen the word abyss in a scientific paper and I thought I'll just look it up in my Oxford Dictionary to get the proper meaning—because this is coming here, with our nature, this is coming here—and under my Oxford Dictionary under "abyss", it is: an abyss of despair, a catastrophe, primal chaos, hell, and a bottomless [chasm](#). Now, you can choose any of those, but it doesn't look good.

1:07:34

Now, I summarized the whole of the document, and I summarized the document down here but these are groups of species, these are not species. Some of these are 66 and 86 species. and when you run down this whole list of species the common words appear. They either migrate and won't come back, they exhibit unnatural behaviour, and you have gone, gone, gone, gone, retreated to another area, rarely heard, gone, gone, moved to the valleys, and we're going right down with birds, butterflies, wasps, ants, termites, bees, frogs, you name it, they're all there. Those that haven't gone is that the ants have become aggressive, but the moths, butterflies, ants, bees, flies, they are down 80% and some of the other creatures here, like the [grey thrush](#), they list as "rare", and there are

several "rare"s but the problem is not whether they're rare but whether you have enough species to regenerate and this is before the 5G satellites start coming overhead and beaming down on them.

1:09:24

All of what I'm doing now is 5G and I have an important quote here—because I think it can be useful—from [Bug Life](#) and I want to tie it in because there may be a solution to this. This is published in 2018. However the charity Bug Life warns that despite good evidence of the harms there was little research on going to assess the impact or apply pollution limits: that is not true, actually. I've quoted nearly 40,000 research papers. ES-UK magazine publishes animal studies every time it comes out. There is generally one a day. But I'm not criticizing Bug Life because I think one of the answers to this—and I thought about that, so, only yesterday I thought how can we sort of solve this here[UK, Admin]? I have no authority, and not status and whoever I try and reach will never reply to my letters and I can't get through to them, but charities like Bug Life and the charities that control birds and the charities that look after the woodlands, they have—I don't know what you call them but people who control, what's the word I'm looking for, they, who, the people, who, like Prince Harry and all those— [From the audience sounds: "Patrons!"] —patrons, that's the word, thank you, they have patrons, and if, and this will be going out, if the people who have animal charities and tree charities, if they go to their patron, and they can ask their patron for me to come to them—I don't care where I go, my own expense—if I can go to the patron just for an hour, the patron, although the patron may not be able to do anything, the patron may be able to meet somebody at a social event that I would never even be letting the gate to, but he would meet somebody at social events and say "Hey, we've got this [bloke](#) here and you really want to talk to him." And we may be able to get a decision made. That's the only way. We, I think we can actually get a handle on this because the industry is immensely powerful, they stand aside for nobody, they have the money, they have tens of trillions of dollars, they can buy anybody, they can buy the scientific results they want.

1:12:33

And finally the last thing on trees. I think it is immensely important because the moment this went up we started to lose our trees and I haven't seen the research but I bet if anybody starts looking you will see that tree diseases are slowly creeping up over the last 20, 25 years. They have to. But what people don't understand about trees.... and I'm going to put this very briefly:

1:13:16

70% of a fish is tree. The reason is: when the trees shed the leaves, all of the broken down goodness gets washed into the streams, the rivers, the sea. It is fed on by microorganisms, bacterium, and they get on by bigger things, the food chains, the food webs, and into the fish. And any fish, any 70% of a fish is generally tree, or the goodness from a tree. But, there is a very important fact here. Among this enormous chain of microorganisms you have tiny little microorganisms called [Coccolithophores](#), and they do their share of feeding, and they are fed on, but they produce one important molecule. Coccolithophores produce a molecule called [dimethyl sulfide](#). It is the only molecule known at this point in time, the only molecule known, because it drifts out of the water into the air and this is the only molecule known to take part, and that is necessary: in cloud formation.

Now, if you go and cut down all of the trees in—I think we're going to cut down 70 million or something. You cannot replace 70 million trees with 70 million [saplings](#). The

average age will be about 100 years and the saplings will not do the same job. They will not absorb the [carbon dioxide](#) from the [atmosphere](#) for a start.

If you cut down the trees you are cutting down the formation of clouds in the atmosphere, which means you will get [droughts](#). It is as simple as that. We cannot go around cutting down that many trees if it isn't necessary and the only way to have 5G is to cut down trees. So, there is a balance there and it needs to be known to somebody.

1:15:38

Now with 5G, I'll go to finish on 5G, when I spoke in [Totnes](#) not too long ago, just before Christmas[2019, Admin] somebody was disagreeing with me, saying, we don't have that, we don't have that, and no, we don't, but it doesn't say that we will not have it. There's a lot more to 5G than just putting up little boxes on lampposts.

5G is the new generation. It is not a wave, it is a beam. It is going to be used by around 53 organizations in this country[Britain, Admin], plus the secret services, plus the military, plus the American bases, and their frequencies. There are quite a lot of frequencies that people don't know about that are going up when you have 5G transmitters and most of them are secrets. In fact there are a lot.

And 5G is going to merge. When I look at the frequencies, the spectrum across the whole range, 5G is going to merge basically with [Wi-Fi 6](#), and they're already producing [6G](#). 5G and Wi-Fi 6 are getting very very close together. They are going to be used in [UNISON](#).

For decision makers: two of the world's leading professors, in this area, wrote a letter to all of the Nordic prime ministers. It is a brilliant letter. I wish I had the skill to write this letter. I certainly don't. It is a brilliant letter. But before the letter, I just want to read the legal opinion from an international attorney at law office regarding 5G. This is for decision makers, and it says— and you're welcome to pop up at my house and get all this stuff—it says:

1:18:45

[Lee, an International law firm](#), it is the conclusion of this legal opinion that establishing and activating a 5G network, as it is currently described, would be in contravention of the current human and environmental laws enshrined in the [European Convention of Human Rights](#), the [UN convention on the rights of the child](#), [EU regulations](#), and the [Bern and Bonn conventions](#).

Going through documents I have found, and these mean absolutely nothing to me: The [UN convention 1989](#), each state— and we[Britain, Admin] come under the United Nations—each state has a legal responsibility to protect children to ensure maximum developments. Articles 19 and 6. If you want to go to your [score on school](#), quote the law, the Children's Act 1989 part 3, section 17.

1:20:09

There's a legal obligation on local authorities to protect children against harm or the risk of. This stands apart as a likelihood or perceived risk is all that is necessary. It does not need proof. I believe, that this only applies, and I'm not sure to children who are in care, children who are fostered or adopted, but every school has one of those anyway, I would imagine. You have the [Nuremberg code UN 1950, article 7](#), prohibits any experiment without consents. 5G is an experiment. In fact all of them are experiments. [Tetra air wave](#) is an experiment, but under the Nuremberg code any experiments that affects you body or your health is illegal unless you give your consent. There is only one exception and I've only known it to be done once: any doctor can experiment on his or her self.

That is the only exception. That's part 5.

Under EU law a strategic environmental—now whether we are agree whilst we [Britain, Admin] were under EU law, I don't know—a strategic environmental assessment should be carried out before 5G, and if there is a problem, and it wasn't carried out, the polluter—in other words the decision-maker—pays the principle or the costs for the clean-up and that can be millions.

A legitimate government must preserve the right to life, liberty, health, of all of its citizens. That is the treaties of civil government. Second treaties chapter 2.

And finally the [health and safety acts 588 law](#) in this country [Britain, Admin], 1st of July, 2016: employers must protect those of higher susceptibility, monitor health for electromagnetic radiation both thermal and non-thermal, for example auditory sensory disturbance, change in brain function. That is the law.

1:23:00

The letter from the two professors to Nordic populations, that it is a mistake to assume that the populations are guinea pigs for the largest-ever biological experiment on humans. Such experiments are totally unlawful according to the Nuremberg code, the Declaration of Human Rights, the Declaration of Children's Rights. According to "the polluter pays the principle, has to pay for all harm they have caused to humans".

1:24:02

Now an experiment was carried out on 5G. An experiment was carried out in Russia. In 1977, I have the paper, an experiment was carried out on animals and humans using 5G [Barrie Trower explained earlier in this lecture that the there used radiation levels and frequencies used are similar with what we name now 5G, Admin]. I won't go into the units but the radiation level unions, the humans [volunteering humans, Admin] and the animals were subjected to was at a level of 62. They were subjected to a level of 62 for 15 minutes a day, for 60 days. In other words: 15 hours. That's it.

1:25:05

You can legally, under the International Commission [ICNIRP, Admin] and our government, under the thermal regulations, you, and all of the animals and all of the trees, if 62, and I am going to list the illnesses caused from a level of 62 you can legally be given for 24 hours a day, non-stop, for ever, a level of 140: more than twice.

1:25:31

The professors listed damage to the skin, liver, heart, brain, adrenal glands, blood, the foetus, children, stem cells, human sperm, honeybee. and that was just from one paper. There's the paper [Barrie Trower shows a paper, Admin], it's a top-secret paper from Russia that I had sent to me.

1:26:09

So, with 5G on as I hold it up to show you, on the right is a normal transmitter, and on the left you have the pulses of the 5G signal [Barrie Trower shows paper, Admin]. And you can, if you want, there is an excellent article on 5G, this is from ES-UK magazine which you can download from the internet, this is really good because it goes into the frequencies and everything, if you want it, it is the [ES-UK magazine, summer 2019, volume 17, number 2](#).

And if you can't remember that give me ring tomorrow and I'll have it by the phone and

I'll tell you.

1:27:27

And one last thing about 5G, and this isn't known by most people: two things. One is: there is a paper by the World Health Organization, that one of the 5G frequencies is known to cause eye-damage, and skin cancer. That is published. There is something which is being tried—I get lots from the universities, because, believe it or not, the university people developing this are more scared about what they are doing, whereas "I'm prepared to take the risk"—the mathematicians and physicists will know this: it is called the [Brillouin Precursor](#), it's what is being tried out.

It is a one-second pulse that will precede the laser beam, to say one-second pulse, that will precede the laser beam, up to 10 gigabyte in strength and you really, really don't want anything like that flushing across your eyes or your skin. Nothing does. That is being tried out through, as a burst of energy, so that you can download a whole movie or whatever[on your cellphone, Admin].

1:29:05

I am just to finish off. There it's not all gloom and doom. There's a very simple answer to this, all of this. There is a solution. All you have to do is: run cables[named ethernet cables, Admin].

Many countries don't have smart meters that use Wi-Fi. All of the smart meters run on cable. All of the cables into the schools, all of the Wi-Fi in schools that's not Wi-Fi, that's cable from source, there are no microwaves in the air.

If we took the trouble to run cables, just like telephone cables, everybody could have everything they wanted, even better, more secure and better and faster. But we[Britain, Admin] have 500 companies that are immensely powerful. They are pushing the Wi-Fi because they're getting as much money as they can and this is how they are progressing. But the easy answer is just to have cable. If we run a cable along a forest the trees are happy, the animals are happy, everybody is happy, you can have them in schools, and if we turn down all of the transmitters just turn them down so that only the emergency services need them if you're in a car and you break in the middle of [Dartmoor](#) you can ring. If we just had that system, which is what it was originally designed for, there would be no problem. But the problem is, and was unforeseen in the 70s, this system has been hijacked by children and addicts, and everybody else, and the use was not thought-up before they released this.

And they are chemically and physically addictive, and I have articles from [Scientific American "Mind"](#), that show that children will demonstrate severe aggression, where a child has threatened to murder her parents if they so much as touched her equipment and a child has punched the mother in the face for touching the equipment. We're getting to that stage.

But there is a solution. But the problem with the solution, and we go right back to the very first document: you will lose profits.

And this really all comes down to money.

End part 2.

## Part 3. Barrie Trower – Lecture / Questions and Answers

**Questions and Answers** - part 3 of the lecture '[The Truth about 5G and Wi-Fi](#)', held on February 3, 2020, physicist Barrie Trower revealed his findings on 5G, ICNIRP, WHO, top secrets, military, industry, governments, Wi-Fi, cell phones, children at risk, brain cancer, heart attacks, schools, trees, birds, bees, fishes, and... the abyss, if 5G will not be stopped.

- [Lecture part 2: 48:26 – 1:32:03 – Transcript, PDF](#)
- [Lecture part 3: Questions and Answers: 1:32:44 – 1:50.46](#)

### Questions and Answers

1:32:44

#### Barrie Trower:

There is a gentleman who asked very very early, he gas a desperate question—Jonathan—to do with eyes.

#### Jonathan:

It's about the 5G infrastructure and part of that is going to be LED street lighting. There is in America a research and lighting design mathematician who says that LED in the form of new street lights and car headlights is going to cause irreparable damage to anyone's eyesight because LED light is rather like a laser light, generated from a flat projector and have a beam like capability. Could you talk about the health concerns in respect of LED light and how it might affect the optics?

#### Barrie Trower:

Well, I will go as far as I can. Yes, to eye damage, yes to skin-cancer. that's documented. Blue light: I'm assuming the blue light you're looking at is 450 to 500 [nanometres](#). There are radiation sensors, [ganglions](#), on the sides of the eyes. The full function isn't fully understood but it is known they pick up radiation and they send it back to the brain.

Blue light is also known to go to the [retina](#) at the back of the eye. It is known to go to the [hypothalamus](#). The hypothalamus has special [enzymes](#). The enzymes in the molecules or the cells in the hypothalamus in the brain—it is known that when, under normal conditions without blue lights, they travel to the outside of the molecule, or the outside of the cell, there's a chemical reaction, I don't know what it is, but then they come back. The complete cycle takes 24 hours.

Blue light is known to slow this down by up to 2 hours a day. The hypothalamus controls the internal [circadian resonant frequencies](#), our internal clocks. The hypothalamus is also connected to the [pituitary](#) which releases hormones and can be responsible for behaviour. That is as far my knowledge goes, but I'm just going to throw this out: are there any medical professionals here, I would like to know, if you slow down the hypothalamus for up to 2 hours a day and and it is continuous, is there any medical professional here that could enlighten me and everybody, on any [knock-on](#)

[effect](#) for organs or whatever it is I don't know about?

**Person 2:**

I am doing mental health studies in Malta and they did various studies and we had what we call blue rooms, mood rooms, which you were stating there with a [mitochondrial](#) and pituitary gland and around that area, and they found that there was mood suppressor and people got not depressed but you could stabilize the mood but it slowed also the functions of the mind.

**Barrie Trower:**

So what we're saying, because they couldn't hear us back, it will change moods and suppress processes in the mind.

**Person 2:**

Yes.

**Barrie Trower:**

Could ask something else sir, please, how—we're all adults and we have mechanisms—how could that affect sort of an ... I'm thinking of a teenager who is adolescence and probably is not in full control of her emotions or moods. Could you guess or give a professional opinion of how that would affect an adolescent?

**Person 2:**

I'm not quite on that level and I'm going back five years study.

**Barrie Trower:**

But it certainly would affect the stability of the mind anyway.

**Person 2:**

It does. My son is eight years old he next week [...] primary school. I have noticed mood change due to Wi-Fi activity there. [...]impossible to detect and analyse the words...]

**Barrie Trower:**

Can I just add one thing to that? I do know that in China they have opened up medical blocks now for this specific thing. For children and mood changes. And the professor has written a brilliant paper, I can't remember his name, and in the clinics right across China, the youngest child he is treating is two, for addiction and mood behaviour.

**Person 3:**

To the audience: put your hands up if you are now suffering from [tinnitus](#). Now, we weren't five years ago, but you're now suffering from tinnitus. Put your hands up. Right. Everyone can look around, how many people is that? That's 20%, 30% of the audience.

**Person 4:**

I have two questions. You said there were three organisms that were immune for electromagnetic radiation and you said one was bacteria, what were the other two?

**Barrie Trower:**

Ah! They're called [tardigrades](#). NASA has beamed them into space and brought them back and they've just come out of their little cocoon and thought, well, that was a nice rest. They seem [impervious](#) to everything and the other, bacterium thrive, and the other was scorpions.

**Person 4:**

The other thing was, the microwave technology, was it actually being [...] in the 50s and 60s, was it worked on by [ARPANET](#), US ARPA net, the defense, the defense people?

**Barrie Trower:**

I'm sorry I can't understand the question. In the 50s and 60s it was worked on by?

**Person 4:**

ARPANET.

**Barrie Trower:**

What! ARPANET?

**Person 4:**

ARPA, they were, did the defense....

**Barrie Trower:**

I don't know I am sorry.

**Person 4:**

You told you were working at the cold war microwave—

**Barrie Trower:**

By 1949 they knew the brain frequencies and they were changing behaviour, just by beaming microwaves into animals and human brains. The only organizations I know are the Soviets, the CIA, we[Britain, Admin] but I don't know that particular [acronym](#), sorry.

**Person 5:**

Thank you for the evening presentation. I just wonder, is there any truth in the idea that this is also not just about money but a weapon of war and an idea of depopulation, which is their intent?

**Barrie Trower:**

That is a particularly... is it a deliberate method of depopulation or a method of war. You've heard of [HAARP](#), in Alaska, that can be used, I'm not saying it is or has, it *can* be used, because the microwaves can be any frequency and they only need to turn it in, to tune it to a brain frequency and it can be bounced or reflected off of the [ionosphere](#)[part of the atmosphere where the tens of thousands of [5G satellites](#) are being orbited, Admin], which is [hydrogen](#) and [helium](#), down to any part of the planet. There isn't 1 HAARP, there are 16 around the planet. They can be used to change weather,

they can be used for bacterial warfare. I can't go into how and why now: they can be used to cause illness, but yes they have been used, the Soviet microwaves and the Americans, recently in one country: the [American Embassy was microwaved in Cuba](#). We [the British army, Barrie Trower is a former Royal Navy Microwave Weapons Expert and former cold-war captured spy debriefer for the UK Intelligence Services, Admin] have microwaved the Catholics in Northern Ireland [Statement by Barrie Trower, [video](#), Admin]. [The Americans microwaved the ladies at Greenham Common](#), to give them cancer, to make them sick.

But now, and I am not going to mention the country or the countries—why I like this: because I would like this to go out and I would like the people to take notice in these countries. I know one country from my travels where there is a very heavy, I think there are about two million, Muslim populations, the density of Muslims and the concentration of towers is within there. There are other areas of the planet where the extremely wealthy—and I'm not trying to start a civil war here—but they are [exempt](#) microwaves in their areas. There are areas of the planet where particular densities of poor—and I've been to them and I've fought a case for them and we won, and I have the King backing me—where the transmitters were always put in the poorest densest areas. So, you could argue that, but whether it is deliberate: I'm not in the mind of the decision-maker.

#### **Person 6:**

speaks to the audience: You know they're doing small cells, 5G small cells every hundred, every [...] and if you thought of it the other way, not the faster downloads speeds, so if you thought of it you had an AK-47 [known as a Kalashnikov, Admin] on every street corner, you might think again about 5G.

#### **Person 7:**

I was living in Bristol which is a 5G test city, and it gave me cancer on my skin and I nearly lost my vision. It made me extremely fatigued over and over in years and I tested the environment with a calibrated device and it's exposure levels are horrendous. So I left my whole life behind. My question to you would be: how do we protect ourselves from this stuff. I mean, I'm seeing a lot of products on the market like Blushield and stuff like that, but these things actually work, and first areas they're nothing to save from 5G, if we don't get it stopped.

#### **Barrie Trower:**

Protection. It can be very, very costly. As far as we know at the moment —and they all say—well that is a brilliant question, and I only had the information, some of the information, yesterday, from China. The new 5G, whether it is 5G or 6G, and I can't get my brain around why they're doing this at the moment, but a university has developed the 5G beam that will penetrate the metal casing on a cellphone. And my first thought was, well, if it can do that to the casing of a cell phone, what will it do to your eyes or your skin, and what is the purpose behind it.

But at the moment 5G: you won't pick up on any of your [Acoustimeters](#) anyway [Dr. Martin L. Pall explained in [this interview](#) that it is impossible to measure 5G radiation, because not any device to measure it exists, and if, once, it will be too expensive, Admin]. The mathematics for the beam is so complex that I don't know a mathematician in the world that can actually decipher what is actually inside the beam. There are many hundreds of frequencies being tested and tried. I don't know a single safe one. I can't

think of any form of screening that will stop 5G, unless.... Again, [ES-UK](#), they have a directory of I think 350 items, something like that, on their website that may stop different G's, I don't know. 5G will not penetrate far into the house. It can be stopped by walls unless they put a metal bid in, but 5G is having a carrier wave that will take it further. It's penetrative power is not strong when it comes to buildings and trees, but they are using carrier waves namely 3G or 4G, 700 megahertz, to bring it further into the house. But it is designed to marry up and work with smart meters, and the Wi-Fi, and everything else. So, at the moment, until 5G is established, we don't know how to block it. Because they haven't produced it. It's like saying: we want a bulletproof jacket but we haven't made the bullets. Until you've made the bullets, you won't know what works.

**Person 8:**

[It is impossible to detect and analyse the words, Admin].

**Barrie Trower:**

If I were a decision maker, a counsellor or school gov—I'm thinking of me—and somebody said: I want you to sign here. because this is coming on your land, your territorial property, I would say, very simply: "Give me the research paper. If I'm the signatory, I take responsibility and under this law it is the principle who pays the costs. If I'm signing for this, give me a research paper that says pregnant women, the animals, the trees, children, will be unharmed for the duration that they are in front of it. Give me one research paper. I will send it for independent peer-review to [Nature](#) publications or a top-rate journal and I will see what their reply is. And they will come back and say this: "There is no safe level for a child, ever." But I would safeguard myself, and I am not saying this as a threat, but I get a lot of counsellors and legal people coming to my house saying: "Can we take the council[could also be counsel, Admin] to court under civil law?" And I don't know, but the pot is boiling and if I were a decision maker I would want something cast iron[rock solid, Admin] to give this to me. I will make my own decision. I will not be bullied.

# Donald Trump victory used to hide holes in government's smart-meter roll-out

[Lucy Tobin](#) Tuesday 15 November 2016 11:28 GMT

Timing: New forecasts for the smart meter programme were published on the same day Donald Trump triumphed in the US election REUTERS

The Government has quietly chopped £500 million of forecast benefits off its flagship £11 billion [smart-meter](#) scheme — and the energy industry tried to bury the news in the aftermath of the [US election](#).

Ministers set out plans nearly a decade ago, when Gordon Brown was chancellor of the exchequer, to install smart meters in every UK home, claiming the roll-out would cost as little as £7 billion and save £11.8 billion, including £4 billion in cheaper bills for users.

However, a new, 12,000-word report from the Department for Business, Energy and Industrial Strategy — written in August yet published on the Government's website just hours after [Donald Trump](#) was declared president — dramatically reins in previous promises.

Total costs have shot up by £54 million since the previous forecast just two years ago, and benefits are now £415 million lower — just £11 per household in 2020, less than half the £26 estimated previously. BEIS could not be reached for comment.

The total value of rolling out smart meters across all UK homes and small and medium-sized business is now put at £5.75 billion — or £469 million less than earlier ministerial claims.

## **Li Ka-shing eyes £1bn deal for UK smart-meter firm Calvin Capital**

Big Six providers — which are being forced to pay for most of the roll-out, and are using the scheme as a way to try to boost their damaged reputations — have seemingly been trying to keep a lid on the diminished benefits.

One industry insider suggested to colleagues, in an email seen by the Standard, that the figures had been slipped out after the US election “in a very busy news week” to try to keep them under the radar.

The roll-out of smart meters — which work by recording gas and electricity consumption every 30 minutes and are supposed to encourage households to use less energy — has been the focus of a large publicity drive, with Sir Bob Geldof voicing ads of “out of control” cartoon characters Gaz and Leccy.

<http://thermoguy.com/category/smart-grid/>

## [Democratic Pennsylvania Attorney General Convicted On All Counts](#)

[September 10, 2016](#) [Cellular \(Phones\)](#), [Climate Change](#), [EMF](#), [GHG Emissions](#), [Global Warming](#), [News and Updates](#), [Pacemaker](#), [Radiation](#), [Safety Code 6](#), [Smart Grid](#), [smart meter fires](#), [Smart Meters](#), [WiFi](#), [WirelessThermoguy](#)

This is disgraceful to once again have political party interests take precedence over the people they were elected to represent. **This criminal was convicted, should be jailed without bail and sentenced longer for the abuse of power for what they did in that important office.** Then they should pay back **all** taxpayer dollars and all cost that were spent during their crimes. That includes the gas, oil and maintenance of every vehicle used, all man hours and literally every cent taxpayers spent. <http://www.nytimes.com/2016/08/16/us/trial-kathleen-kane-pennsylvania-attorney-general.html>

Is it true she was smiling leaving the courthouse? Why was this criminal allowed to resign?? The US Attorney General or Obama himself should have fired them and escorted them out of the building. If it were a Republican lawyer, would this Democrat President have allowed them to resign? Do you think Trump asks people who undermine his companies to resign? It doesn't reflect her undermining the office, government, people who elected them and their country.

What else did they get away with while undermining their office, state and country? Then I watch the commercials of the politicians slamming Trump and that he can't be trusted in office?? Do you think Donald allows people on his payroll of 1000s to perform like that? Do you think Warren Buffet, Bill Gates or any private company allows this? Would I hire a staff of political opposition to the direction of my company? The second I found out what they were I would fire them, kick their ass and then hold them liable to the full extent of the law.

CNN runs programs like "Why do they hate us"? How about when the people in power related to justice of the country are criminals. They didn't have leaders in industry globally come to them, it was a military directed by a political agenda. That isn't to blame the military, politics and special interest have no business directing policing or the military. Politicians and special interests should be lobbying behind the scenes on their dollars. I am a science professional specific to energy, engineering and a professor lecturing accredited medical education. I don't and can't trust any politicizing of electricity or any sciences or there would be liability.

I am one of the governments and industries science professional with no options but to perform to the highest standard or I am liable. I have had to carry errors and omission insurance for many millions of dollars per occurrence. That doesn't excuse me for criminal liability for being reckless or negligent. We are codes and standards where there are no politicians or opinion from them. This pisses me off because right now as this is going on, we are dealing with the reality Federal Governments(US Department of Energy) provided stimulus packages for the mass deployment of wireless smart meters that are supposed to save energy.

Not only are the meters not going to save 1 watt of energy, they have RF EMFs in them that are radiating populations, undermining economy, health, all industries, environment, climate change agenda of President Obama, National Security and all the United Nation's Members. The United Nation Climate Change Meeting in Paris came back with a global science consensus(not politics) that a 3.6 deg. F rise in atmospheric temperature would be globally catastrophic. That means man heating the atmosphere the whole world shares. The stimulus package for wireless smart meters and the required smart grid blanketing cities, states, provinces, countries will heat the atmosphere by themselves. When you blast high speed RF EMFs atmospherically, those high speed EMFs will oscillate billions of times per measurable second 24 hours a day. Exponent Inc's Electrical Engineer Yakov Shkolnikov admitted under direct cross examination in BC Government transcripts while under oath that the 900 MHz antenna in smart meters will oscillate 1.8 billion times PER second, the 2.45 GHz antenna for Wi-Fi 4.9 billions times PER second. That creates heat that can not be destroyed, it will mix globally. The stimulus packages of the U.S. and Canadian Government's provided money to states and provinces to mass install smart meters. Electricians can not mass install meters as meter bases can be decades old with very fragile electrical connections. Electrical connections are the weakest point in an electrical circuit and connections are usually maintained regularly.

Utilities in states and provinces used people not qualified to touch electrical as well as no legal authority to trespass to install meters. The utility has no authority or jurisdiction to work on a meter base, that is electrician's jurisdiction and the building owner's property. Now the utilities in states and provinces have created REAL fire issues as well as causing buildings to be non compliant with building codes.

This Attorney General did not protect the citizens of Pennsylvania against the assault with a deadly weapon created by Smart Meter RF EMFs or their properties that are no longer compliant with Building Codes. This Attorney General didn't represent to municipal governments and their critically important Building Inspection that the Specific Absorption Rate Test used to bypass Building Codes is a plastic body part with water in it. When buildings are not compliant with Building Codes, there is no mortgage, insurance, occupancy, no taxes for services and millions of buildings damaged. Pennsylvania and the federal government loses billions in taxes, no one is paying tax on an illegal building they can't live in or sell. The properties will revert back to the lender who will not be insurable.

Just as you see in this article by the NY Times, this Attorney General's actions show what happens when political interests weaken the professional gene pool. **If Obama and Hillary think Donald Trump is out of control, wait till they see what he does when he finds out they put meters on his own properties that will cause accelerated erosion and corrosion of his investments as well as adversely affect the health of his family and people within his investments. Trump will be liable and he will be passing on that liability. If Hillary or Obama think it isn't so, the federal government's lawyers will have to defend a plastic head as science when it should be an aquarium. Making it worse is the US Department of Energy literally blind to the energy they are trying to save and being reactive when they could create millions of taxpaying jobs immediately producing IMMEDIATE energy/emission reduction.**

While some reading this may think it is controversial, the Specific Absorption Rate Test the federal government, FCC, utilities are relying on for safety is a plastic head or body part with water in it. The following link is evidence of the British Columbia Government's BC Utilities Commission calling for the suspension of the smart meter programs. You can see the real energy losses and the U.S., Canada and beyond is wasting trillions of watts per hour reacting to the symptoms of solar EMFs interacting with building development. The UN Member's consensus was 3.6 deg. F rise in atmospheric temperature as globally catastrophic, look at page 18 and 19. It is an 85 deg. F day

and solar exposed building development is as hot as 197.7 deg. F. That means there is atmospheric warming 108 deg. F hotter than the 3.6 deg. F.

Brown outs, power demand wasting trillions of watts per hour and massive natural resource waste reacting to the symptoms of solar interaction making them non compliant with Building Codes. Look at page 19 and shade effect right after sunrise. [http://www.bcuc.com/Documents/Proceedings/2012/DOC\\_32604\\_C19-6\\_WKCC-Submission-RDCK-Nelson-Creston\\_Suspension.pdf](http://www.bcuc.com/Documents/Proceedings/2012/DOC_32604_C19-6_WKCC-Submission-RDCK-Nelson-Creston_Suspension.pdf)

Solar EMFs are interacting with absorbent exterior finishes and buildings are generating heat close to boiling temperature. Is that more than 3.6 deg. F? Any Nuclear Power Plants in Pennsylvania? These RF EMFs will cause accelerated erosion and corrosion of Nuclear Power Plants. Here is our unpopular submission to the Canadian Nuclear Safety Commission on the accelerated corrosion and the power plant NOT being compliant with Building Code. The first submission was politically and administratively rejected until the CNSC was informed of their liability. <http://thermoguy.com/submission-for-canadian-nuclear-safety-commission-on-rf-emfs-causing-accelerated-corrosion-making-the-power-plants-non-compliant-with-building-codes/>

Globally, what happens when there are nuclear failures within borders? This won't be popular but this is the real tradeoff. This former Attorney General better stop smiling, this is a very serious problem not being addressed.

# United States Department of the Interior

OFFICE OF THE SECRETARY  
WASHINGTON, D.C. 20240

**FEB - 7 2014**

In Reply Refer To: (ER 14/0001) (ER 14/0004).

Mr. Eli Veenendaal  
National Telecommunications and Information  
Administration  
U.S. Department of Commerce  
1401 Constitution Avenue, N.W.  
Washington, D.C. 20230

Dear Mr. Veenendaal:

The Department of the Interior (Department) has reviewed the above referenced proposal and submits the following comments and attachment for consideration. Because the First Responder Network Authority (FirstNet) is a newly created entity, we commend the U.S. Department of Commerce for its timely proposals for NEPA implementing procedures.

The Department believes that some of the proposed procedures are not consistent with Executive Order 13186 Responsibilities of Federal Agencies to Protect Migratory Birds, which specifically requires federal agencies to develop and use principles, standards, and practices that will lessen the amount of unintentional take reasonably attributed to agency actions. The Department, through the Fish and Wildlife Service (FWS), finds that the proposals lack provisions necessary to conserve migratory bird resources, including eagles. The proposals also do not reflect current information regarding the effects of communication towers to birds. Our comments are intended to further clarify specific issues and address provisions in the proposals.

The Department recommends revisions to the proposed procedures to better reflect the impacts to resources under our jurisdiction from communication towers. The placement and operation of communication towers, including un-guyed, unlit, monopole or lattice-designed structures, impact protected migratory birds in two significant ways. The first is by injury, crippling loss, and death from collisions with towers and their supporting guy-wire infrastructure, where present. The second significant issue associated with communication towers involves impacts from non-ionizing electromagnetic radiation emitted by them (See Attachment).

In addition to the 147 Birds of Conservation Concern (BCC) species, the FWS has listed an additional 92 species as endangered or threatened under the Endangered Species Act. Together with the bald and golden eagle, this represents 241 species of birds whose populations are in trouble or otherwise merit special protection, according to the varying criteria of these lists. The Department suggests that FirstNet consider preparing a programmatic environmental impact statement (see attachment) to determine and address cumulative impacts from authorizing FirstNet projects on those 241 species for which the incremental impact of tower mortality, when

added to other past, present, and reasonably foreseeable future actions, is most likely significant, given their overall imperiled status. Notwithstanding the proposed implementing procedures, a programmatic NEPA document might be the most effective and efficient method for establishing best management practices for individual projects, reducing the burden to individual applicants, and addressing cumulative impacts.

#### *Categorical Exclusions*

The Department has identified 13 of the proposed categorical exclusions (A-6, A-7, A-8, A-9, A-10, A-11, A-12, A-13, A-14 A-15, A-16, A-17, and A-19) as having the potential to significantly affect wildlife and the biological environment. Given this potential, we want to underscore the importance of our comments on FirstNet's procedural guidance under Environmental Review and Consultation Requirements for NEPA Reviews and its list of extraordinary circumstances in Appendix D.

#### *Environmental Review and Consultation Requirements for NEPA Reviews*

To ensure there are no potentially significant impacts on birds from projects that may otherwise be categorically excluded, the Department recommends including the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act to the list of requirements in this section.

#### *Extraordinary Circumstances*

To avoid potentially significant impacts on birds from projects that may otherwise be categorically excluded, the Department recommends including species covered under the Migratory Bird Treaty Act and the Bald and Golden Eagle Protection Act to the list of environmentally sensitive resources. Additionally, adding important resources to migratory birds such as sites in the Western Hemisphere Shorebird Reserve Network and Audubon Important Bird Areas to the paragraph on areas having special designation or recognition would help ensure their consideration when contemplating use of a categorical exclusion.

#### *Developing the Purpose and Need*

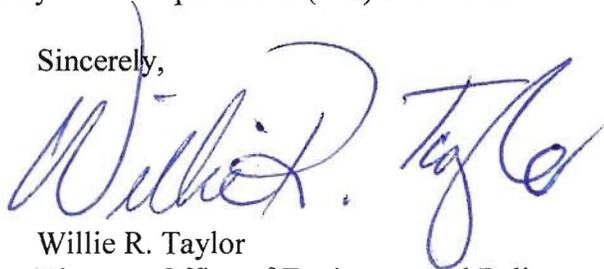

The Department recommends inclusion of language that would ensure consideration of all other authorities to which NEPA is supplemental as opposed to simply the FirstNet mission. As currently written, the procedures are limited to ensuring the purpose and need considers the FirstNet mission. If strictly applied, this approach would severely limit the range of reasonable alternatives, and likely preclude consideration of more environmentally benign locations or construction practices.

#### *Environmental Review Process, Apply NEPA Early in the Process, Where Action is by Non-Federal Entity*

The Department recommends that FirstNet be required to coordinate with federal agencies having jurisdiction by law or special expertise on construction and lighting of its network of towers.

Thank you for the opportunity to comment on the draft document. If you have any questions concerning the comments, please contact Diana Whittington, NEPA Migratory Bird lead, at (703) 358-2010. If you have any questions regarding Departmental NEPA procedures, contact Lisa Treichel, Office of Environmental Policy and Compliance at (202) 208-7116.

Sincerely,

A handwritten signature in blue ink, appearing to read "Willie R. Taylor". The signature is fluid and cursive, with the first name "Willie" being the most prominent part.

Willie R. Taylor

## Enclosure A

### Background

The placement and operation of communication towers, including un-guyed, unlit, monopole or lattice-designed structures, impact protected migratory birds in two significant ways.

The first is by injury, crippling loss, and death from collisions with towers and their supporting guy-wire infrastructure, where present. Mass mortality events tend to occur during periods of peak spring and fall songbird bird migration when inclement weather events coincide with migration, and frequently where lights (either on the towers and/or on adjacent outbuildings) are also present. This situation has been well documented in the U.S. since 1948 in the published literature (Aronoff 1949, see Manville 2007a for a critique). The tallest communication towers tend to be the most problematic (Gehring *et al.* 2011). However, mid-range (~400-ft) towers as proposed by the First Responder Network Authority (FirstNet, a newly created entity under the Department of Commerce) can also significantly impact protected migratory birds, as can un-guyed and unlit lattice and monopole towers (Gehring *et al.* 2009, Manville 2007a, 2009, 2013a). Mass mortalities (more than several hundred birds per night) at un-guyed, unlit monopole and lattice towers were documented in fall 2005 and 2011 in the Northeast and North Central U.S. (*e.g.*, Manville 2007a). It has been argued that communication towers including “short” towers do not impact migratory birds, including at the population level (*e.g.*, Arnold and Zink 2011), but recent findings have contradicted that assertion (Manville 2007a, 2013a, Longcore *et al.* 2012, 2013).

The second significant issue associated with communication towers involves impacts from non-ionizing electromagnetic radiation emitted by these structures. Radiation studies at cellular communication towers were begun circa 2000 in Europe and continue today on wild nesting birds. Study results have documented nest and site abandonment, plumage deterioration, locomotion problems, reduced survivorship, and death (*e.g.*, Balmori 2005, Balmori and Hallberg 2007, and Everaert and Bauwens 2007). Nesting migratory birds and their offspring have apparently been affected by the radiation from cellular phone towers in the 900 and 1800 MHz frequency ranges – 915 MHz is the standard cellular phone frequency used in the United States. However, the electromagnetic radiation standards used by the Federal Communications Commission (FCC) continue to be based on thermal heating, a criterion now nearly 30 years out of date and inapplicable today. This is primarily due to the lower levels of radiation output from microwave-powered communication devices such as cellular telephones and other sources of point-to-point communications; levels typically lower than from microwave ovens. The problem, however, appears to focus on very low levels of non-ionizing electromagnetic radiation. For example, in laboratory studies, T. Litovitz (personal communication) and DiCarlo *et al.* (2002) raised concerns about impacts of low-level, non-thermal electromagnetic radiation from the standard 915 MHz cell phone frequency on domestic chicken embryos – with some lethal results (Manville 2009, 2013a). Radiation at extremely low levels (0.0001 the level emitted by the average digital cellular telephone) caused heart attacks and the deaths of some chicken embryos subjected to hypoxic conditions in the laboratory while controls subjected to hypoxia were unaffected (DiCarlo *et al.* 2002). To date, no independent, third-party field studies have been conducted in North America on impacts of tower electromagnetic radiation on migratory birds. With the European field and U.S. laboratory evidence already available,

independent, third-party peer-reviewed studies need to be conducted in the U.S. to begin examining the effects from radiation on migratory birds and other trust species.

## **Discussion**

### ***Collision Deaths and Categorical Exclusions***

Attempts to estimate bird-collision mortality at communication towers in the U.S. resulted in figures of 4-5 million bird deaths per year (Manville 2005, 2009). A meta-review of the published literature now suggests, based on statistically determined parameters, that mortality may be 6.8 million birds per year in Canada and the U.S.; the vast majority in the United States (Longcore *et al.* 2012). Up to 350 species of birds have been killed at communication towers (Manville 2007a, 2009). The Service's Division of Migratory Bird Management has updated its voluntary, 2000 communication tower guidelines to reflect some of the more recent research findings (Manville 2013b). However, the level of estimated mortality alone suggests at a minimum that FirstNet prepare an environmental assessment to estimate and assess the cumulative effects of tower mortality to protected migratory birds.

A second meta-review of the published mortality data from scientific studies conducted in the U.S. and Canada (Longcore *et al.* 2013) strongly correlates population effects to at least 13 species of Birds of Conservation Concern (BCC, USFWS 2008). These are mortalities to BCC species based solely on documented collisions with communication towers in the U.S. and Canada, ranging from estimated annual levels of mortality of 1 to 9% of their estimated total population. Among these where mortality at communication towers was estimated at over 2% annually are the Yellow Rail, Swainson's Warbler, Pied-billed Grebe, Bay-breasted Warbler, Golden-winged Warbler, Prairie Warbler, and Ovenbird. Longcore *et al.* (2013) emphasized that avian mortality associated with anthropogenic sources is almost always reported in the aggregate, *i.e.*, "number of birds killed," which cannot detect species-level effects necessary to make effective and meaningful conservation assessments, including determining cumulative effects. These new findings strongly suggest the need for at least an environmental assessment by FirstNet, or more likely, an environmental impact statement.

### ***Radiation Impacts and Categorical Exclusions***

There is a growing level of anecdotal evidence linking effects of non-thermal, non-ionizing electromagnetic radiation from communication towers on nesting and roosting wild birds and other wildlife in the U.S. Independent, third-party studies have yet to be conducted in the U.S. or Canada, although a peer-reviewed research protocol developed for the U.S. Forest Service by the Service's Division of Migratory Bird Management is available to study both collision and radiation impacts (Manville 2002).

As previously mentioned, Balmori (2005) found strong negative correlations between levels of tower-emitted microwave radiation and bird breeding, nesting, and roosting in the vicinity of electromagnetic fields in Spain. He documented nest and site abandonment, plumage deterioration, locomotion problems, reduced survivorship, and death in House Sparrows, White Storks, Rock Doves, Magpies, Collared Doves, and other species. Though these species had historically been documented to roost and nest in these areas, Balmori (2005) did not observe these symptoms prior to construction and operation of the cellular phone towers. Balmori and Hallberg (2007) and Everaert and Bauwens (2007) found similar strong negative correlations

among male House Sparrows. Under laboratory conditions, DiCarlo *et al.* (2002) raised troubling concerns about impacts of low-level, non-thermal electromagnetic radiation from the standard 915 MHz cell phone frequency on domestic chicken embryos – with some lethal results (Manville 2009). Given the findings of the studies mentioned above, field studies should be conducted in North America to validate potential impacts of communication tower radiation – both direct and indirect – to migratory birds and other trust wildlife species.

# Verizon and rfXcel Partner to Protect Pharmaceutical Supply Chain

News Release

## Verizon Joins Forces with rfXcel to Protect Pharmaceutical Supply Chain

*Verizon Intelligent Track and Trace solution leverages the rfXcel Traceability System platform to provide product traceability and real-time monitoring*

**Basking Ridge, NJ and San Ramon, Calif. May 19, 2016** – Verizon and rfXcel have joined forces to deliver the newly available Verizon Intelligent Track and Trace solution, which helps monitor and trace pharmaceutical products in the supply chain and improve overall patient safety.

Leveraging Verizon's Internet of Things platform 'ThingSpace' and its world-class network, the rfXcel Traceability System platform enables pharmaceutical manufacturers to provide real-time monitoring of product temperatures, location and other key product attributes anywhere along the pharmaceutical supply chain. Verizon Intelligent Track and Trace can also create, manage, allocate and store large volumes of individual and hierarchical serial numbers to provide visibility and control and help detect counterfeit drugs more easily.

Verizon's Intelligent Track and Trace solution will help address some of the pharmaceutical industry's biggest issues, such as theft, channel diversion, counterfeiting and safe handling. The World Health Organization estimates 10 to 15 percent of the world's drug supply is counterfeit, with counterfeit drugs in the US approximately 1 percent and in some countries, the estimate is as high as 50 percent. According to American Health & Drug Benefits, the value of the counterfeit drug market is \$75 billion annually, leading to more than 100,000 patient deaths.

The solution delivers a host of benefits to pharmaceutical and healthcare clients, including:

- **Supply chain management:** This IoT technology gives users the ability to monitor, trace and serialize product hierarchies, by pallet, case or individual unit.
- **Improve patient safety:** Attributes such as temperature, light, location, shock and other key attributes can be monitored in real-time and provide valuable alerts if any attribute changes through the course of the supply chain.
- **Facilitate compliance with government regulations:** Verizon Intelligent Track and Trace will provide information that when managed by customer's compliance organization will relate to compliance with government regulations such as the US Drug Supply Chain Security Act (DSCSA).

The Verizon Intelligent Track and Trace cloud-based system is now commercially available and already includes some of the top global pharmaceutical manufacturers as pilot customers.

“The partnership between Verizon and rfXcel delivers tight integration between our products and leverages the vast Verizon network to provide unique benefits and real-time monitoring of product to secure the pharmaceutical supply chain,” said Glenn Abood, Chairman and CEO of rfXcel. “We’re both committed to making the drug supply chain safer and more secure for patients.”

“Our Intelligent Track and Trace solution is yet another example of IoT technology at work to solve real-world issues in a simplified way for customers,” added Tom Villa, Director of Product Development at Verizon. “The rfXcel platform seamlessly addresses the current and impending needs of pharmaceutical industry.”

Beyond healthcare, Intelligent Track and Trace technology can be applied to the serialization of virtually any asset, allowing any business with an asset to track to benefit.

### **About rfXcel**

rfXcel Corporation, headquartered in San Ramon, CA, is a pioneer in creating Product Serialization, Traceability and Compliance private cloud solutions for the Life Sciences industry. Leading manufacturers, distributors, packagers, dispensers and retailers leverage rfXcel solutions to meet global government regulations, track and trace product throughout supply chains, and enhance patient safety.

For more information, please visit [www.rfxcel.com](http://www.rfxcel.com).

### **About Verizon**

Verizon Communications Inc. (NYSE, Nasdaq: VZ), headquartered in New York City, generated nearly \$132 billion in 2015 revenues. Verizon operates America’s most reliable wireless network, with 112.6 million retail connections nationwide. The company also provides communications and entertainment services over America’s most advanced fiber-optic network, and delivers integrated business solutions to customers worldwide.

Verizon Enterprise Solutions helps clients improve customer experience, drive growth and business performance and manage risk. With industry-specific solutions provided over the company’s secure mobility, cloud, strategic networking, Internet of Things and advanced communications platforms, Verizon Enterprise Solutions helps open new opportunities around the world for innovation, investment and business transformation. Visit [www.verizonenterprise.com](http://www.verizonenterprise.com) to learn more.

# What's Not Being Said About Pfizer Coronavirus Vaccine

13.11.2020 Author: [F. William Engdahl](#)

Column: [Society](#)

Region: [USA in the World](#)

**Bill Gates is actively financing and promoting new untested vaccines supposed to keep us at least somewhat safe from a ghastly death from the novel coronavirus and supposedly allow us to resume somewhat “normal” lives. The Pharma giant Pfizer has now announced what they claim were spectacular results in initial human tests. They use an experimental technology known as gene editing, specifically mRNA gene-editing, something never before used in vaccines. Before we rush to get jabbed in hopes of some immunity, we should know more about the radical experimental technology and its lack of precision.**

The financial world went ballistic on November 9 when the pharma giant Pfizer and its German partner, BioNTech, announced in a company press release that it had developed a vaccine for Covid19 that was “90%” effective. The controversial US head of NIAID, Tony Fauci, rushed to greet the news and the EU announced it had purchased 300 million doses of the costly new vaccine. If you believe financial markets, the pandemic is all but past history.

## Suspicious events

However it seems Albert Bourla, the CEO of Pfizer, doesn't share the confidence of his own claims. On the day his company issued its press release on the proposed vaccine trials, he sold 62% of his stock in Pfizer, making millions profit in the deal. He made the sell order in a special option in August so it would not appear as “insider selling”, however he also timed it just after the US elections and the mainstream media illegitimately declared Joe Biden President-elect. It seems from appearances that Bourla had a pretty clear conflict of interest in the timing of his press release on the [same day](#).

Bourla lied and denied to press that his company had received any funds from the Trump Administration to develop the vaccine when it came out they contracted in summer to deliver 100 million doses to the US Government. Further adding to the suspect actions of Pfizer was the fact the company first informed the team of Joe Biden rather than the relevant US government agencies.

But this is far from the only thing alarming about the much-hyped Pfizer announcement.

## The German Partner

Pfizer, famous for its Viagra and other drugs, has partnered with a small Mainz, Germany company, BioNTech, which has developed the radical mRNA technique used to produce the new corona vaccine. BioNTech was only founded in 2008. BioNTech signed an agreement with the Bill & Melinda Gates Foundation in September, 2019, just before announcement in Wuhan China of the Novel Coronavirus and just before BioNTech made its stock market debut. The agreement involved cooperation on developing new mRNA techniques to treat cancer and HIV. Curiously that press release, “The Gates Foundation sees BioNTech potential to ‘dramatically reduce global HIV and tuberculosis’” 05. September 2019, has now been deleted.

BioNTech also has an agreement with one of the largest drug producers in China, Shanghai Fosun Pharmaceutical Co., Ltd (“Fosun Pharma”) to develop a version of its mRNA vaccine for novel coronavirus for the Chinese market. Ai-Min Hui, President of Global R&D of Fosun Pharma said in an August statement, “Dosing the first Chinese subject with BNT162b1 marks a milestone of the global co-development program in China. We are closely working with BioNTech and regulatory authorities to evaluate the safety and efficacy of BNT162b1 and other mRNA [vaccine candidates](#)...”

This means that the same German biotech company is behind the covid vaccines being rushed out in China as well as the USA and EU. The vaccine is being rushed through to eventual approval in an alarmingly short time.

Both US and EU authorities and presumably also Chinese, waived the standard animal tests using ferrets or mice and have gone straight to human “guinea pigs.” Human tests began in late July and early August. Three months is unheard of for testing a new vaccine. Several years is the norm. Because of the degree of global panic engendered by WHO over the coronavirus, caution is thrown to the wind. Vaccine makers all have legal indemnity, meaning they can’t be sued if people die or are maimed from the new vaccine. But the most alarming fact about the new Pfizer-BioNTech gene edited vaccine is that the gene edited mRNA for human vaccine application has never before been approved. Notably, two year peer reviewed tests with mice fed genetically modified corn sprayed with Monsanto glyphosate-rich Roundup first showed cancer tumors after nine months as well as liver and other organ damage. Earlier Monsanto company tests ended at three months and [claimed no harm](#). A similar situation exists with the gene edited mRNA vaccines that are being rushed out after less than 90 days human tests.

### “Explicitly experimental”

Dr. Michael Yeadon replied in a recent public social media comment to a colleague in the UK, “All vaccines against the SARS-COV-2 virus are by definition novel. No candidate vaccine has been... in development for more than a few months.” Yeadon then went on to declare, “If any such vaccine is approved for use under any circumstances that are not EXPLICITLY experimental, I believe that recipients are being misled to a criminal extent. This is because there are precisely zero human volunteers for...whom there could possibly be more than a few months past-dose safety [information](#).”

Yeadon is well qualified to make the critique. As he notes in the comment, “I have a degree in Biochemistry & Toxicology & a research based PhD in pharmacology. I have spent 32 years working in pharmaceutical R&D, mostly in new medicines for disorders of lung & skin. I was a VP at Pfizer & CEO.... of a biotech I founded (Ziarco – acquired by Novartis). I’m [knowledgeable](#) about new medicine R&D.” He was formerly with Pfizer at a very senior level.

## Human guinea pigs?

The Pfizer-BioNTech vaccine is experimental and far from guaranteed safe, despite the fact that Pfizer, the EU and the notorious Dr Tony Fauci seem ready to roll it out even before year end to hundreds of millions of humans. The experimental technology is based on a rather new gene manipulation known as gene editing.

In a major article in the 2018 New York Council on Foreign Relations magazine, Foreign Affairs, Bill Gates effusively promoted the novel gene editing CRISPR technology as being able to “transform global development.” He noted that his Gates Foundation had been financing gene editing developments for vaccines and other [applications for a decade](#).

But is the technology for breaking and splicing of human genes so absolutely safe that it is worth risking on a novel experimental vaccine never before used on humans? Contrary to what Bill Gates claims, the scientific answer is no, it is not proven so safe.

In a peer reviewed article in the October, 2020 journal Trends in Genetics, the authors conclude that “the range of possible molecular events resulting from genome editing has been underestimated and the technology remains unpredictable on, and away from, the [target locus](#).”

Dr. Romeo Quijano, retired professor of Pharmacology and Toxicology at the College of Medicine, University of the Philippines Manila, noted some of the dangers of the experimental gene editing when applied to human vaccines. Quijano warns of, “the danger that the vaccine might actually “enhance” the pathogenicity of the virus, or make it more aggressive possibly due to antibody-dependent enhancement (ADE), as what happened with previous studies on test vaccines in animals. If that should happen in a major human trial the outcome could be disastrous. This serious adverse effect may not even be detected by a clinical trial especially in highly biased clinical trials laden with conflicts of interest involving vaccine companies. Even when a serious adverse event is detected, this is usually swept under the rug.” He cites the case of another Gates mRNA vaccine candidate, Moderna, where “three of the 15 human experimental subjects in the high dose group suffered serious and medically significant symptoms. Moderna, however, concluded that the vaccine was “generally safe and well tolerated,” which the corporate-dominated media dutifully reported, covering-up the [real danger](#)...”

He notes, “Exogenous mRNA is inherently immune-stimulatory, and this feature of mRNA could be beneficial or detrimental. It may provide adjuvant activity and it may inhibit antigen expression and negatively affect the immune response. The paradoxical effects of innate immune sensing on different formats of mRNA vaccines are incompletely understood.” Quijano adds, “A mRNA-based vaccine could also induce potent type I interferon responses, which have been associated not only with inflammation but also potentially with autoimmunity... and may promote blood coagulation and pathological [thrombus formation](#).”

Quijano writes in the extensively documented article, “among other dangers, the virus-vectored vaccines could undergo recombination with naturally occurring viruses and produce hybrid viruses that could have undesirable properties affecting transmission or virulence. The...possible outcomes of recombination are practically impossible to quantify accurately given existing tools and knowledge. The risks, however, are real, as exemplified by the emergence of mutant types of viruses, enhanced pathogenicity and unexpected serious adverse events (including death) following haphazard mass vaccination campaigns and previous failed attempts to develop chimeric vaccines using [genetic engineering technology](#).”

Bill Gates, the mRNA vaccine makers including Pfizer/BioNTech and Moderna, and their close allies such as Dr. Tony Fauci of the NIAID are clearly playing fast and loose with human lives in their rush to get these experimental vaccines into our bodies. Notably, the same Dr. Fauci and his NIAID owns the patent on a vaccine for dengue fever known as Dengvaxia, marketed by Sanofi-Pasteur and promoted as an “essential” vaccine by Tedros’ WHO since 2016. Robert F. Kennedy jr. noted that Fauci and NIAID “knew from the clinical trials that there was a problem with paradoxical immune response,” but they gave it to several hundred thousand Filipino kids anyway.

**It was estimated that as many as 600 vaccinated children died before the government stopped the vaccinations.**

Clearly the well-established Precautionary Principle—if in serious doubt, don't— is being ignored by Fauci, Pfizer/BioNTech and others in rushing to approve the new mRNA vaccine for coronavirus. Messenger RNA technology has yet to produce an approved medicine, let alone a vaccine.

# Meters that Endanger: Shocking Details from a Whistleblower

Posted on [January 20, 2012](#) by [Josh Hart](#)

**Are smart meters just too complex?** Are they veritable blackboxes (well, beige) of assorted electronic components, jury-rigged and thrown together in an off-shore factory, and then slapped onto houses without proper safety testing? Sure, we all have electronic devices in the home, **but through this particular device passes all the electrical current for the house.** That's a set-up asking for trouble.

**From the beginning, smart meters have had problems leading to [fires](#) and other [electrical dangers](#).** News stories have run all over the U.S. and around the world about installations leading to devastating damage. ([Here's a local SF Bay Area fire](#) we'd like to see more fully investigated.)

**A lawsuit made available to us recently detailed just how such faulty equipment could end up attached to the electrical wiring on millions of homes.** In Alabama in 2009, a [Sensus](#) engineering employee named Don Baker was fired for repeatedly alerting his management to the presence of a multitude of dangerous defects in the smart meter they were manufacturing (model [iConA](#)). As he states in the complaint he filed, **this whistleblower reported serious flaws in design and functioning that could lead to electrical danger, overheating, and/or fire.** In fact, the failure rate of the meters was twenty times higher than it was supposed to be, and the engineer contends that at least [two house fires](#) were the result. Sensus meters are used by utilities across the U.S. and in Canada, such as [PECO](#), [Alliant Energy](#), [Alabama Power](#), and [NVE](#).

**In May 2010, Mr. Baker filed [a complaint \[PDF\]](#).** The type of suit is called "[qui tam](#)", where an individual alleges harm to his government. This complaint alleges that the manufacturer and the utility companies received federal monies but provided a defective product. The U.S. Attorney's office in

Alabama declined to pursue the case, because the utility said they had not received federal money for the metering project; **but the allegations about the dangerous defects in the smart meters made in the complaint have not been refuted or even addressed.**

In the complaint Baker relates in detail what makes the meters dangerous, and the allegations are damning—and alarming. A few highlights:

**[Meters] may fail dangerously when subjected to a sudden surge of electricity .... Meters found to contain ‘flux’ or loose solder residue .... Calibration equipment not properly designed .... Electric resistor component defective .... Internal temperatures up to 200° Fahrenheit .... Hot socket alarm .... Drastic overheating to the point of catastrophic failure, melting, and burning....**

Cutting corners in business and manufacturing is hardly something new; the difference here is just what is at stake: this product is installed in every house in a utility service area, and the electrical current for the house runs through it. **Even a half-percent failure rate can result in serious amounts of property damage, or even death, given the total number of “customers”**—though this word implies a voluntary acceptance of the product, when in fact installation of smart meters has been very largely involuntary. Truly optional consumer goods actually get more testing than smart meters.

**The sort of defects and failures enumerated in this suit might well have been caught with an independent safety-certification process such as Underwriters’ Laboratories (UL).** But these Sensus iConA smart meters, and every other type of smart meter, have [never been subjected to such testing.](#)

The suit states: “Mr. Baker has direct personal knowledge that Sensus and Southern Company [the utility] have installed approximately one million iConA meters in Alabama homes **with knowledge that the meters are seriously defective and pose a substantial fire hazard and that at least two Alabama homes have burned as a result....** [They] were well aware that the iConA was defective and the entire project flawed.” *[Emphasis ours.]*

Baker submitted the information he had to the Office of the U.S. Attorney and the FBI in Feb 2010. He contends that the defendants named in the suit, Sensus, Southern Company, and Alabama Power, “perpetuated a fraudulent conspiracy” to obtain \$165 million from federal stimulus funding.

**These meters were never tested—for either for safety or performance—instead they went straight to out for installation.** Then Sensus altered the components and design—again without safety testing. Only one percent of the Sensus meters were tested—for accuracy only—but never on a house while connected to the grid.

**“It quickly became apparent that the meters were fundamentally unsound.”** Baker states in the filing. “[The contract] carried an acceptable failure rate of 0.5%,” but in the first year, the meters were “failing at a rate of 9.0% per year.” Baker made reports to Sensus management about quality and safety issues, **but he was ignored and eventually fired.**

**What was technically wrong with the smart meters that Sensus was producing?** The suit alleges four categories of defects and failures: 1) Electrical Fast Transient Failures; 2) Flux Contamination and Inaccuracy Issues; 3) Faulty Components; and 4) “Hot Meters.” These technical issues are [explained below](#).

The suit goes on to make three charges against the defendants: 1) False Claims; 2) Conspiracy; and 3) Suppression, Fraud, and Deceit. These legal issues are explained in [more detail below](#).

**Corporate recklessness—and lack of regulation to curb it—has remained a core issue in the smart meter debacle.** From the Silver Springs Network antenna which increases the power of the radio over FCC limits ([see page 14 of this CPUC doc](#)), to [arcing problems](#) due to [unprofessional installation](#), to multiple [FCC violations](#), to the [lack of any independent safety testing](#)—it is clear that if there had been effective government regulation, it could have changed the face of this “deployment” dramatically.

If you don’t like the idea of more government regulation, **then how about consumer choice?** If individual customers could choose between utilities, even choose their own meter—again, the landscape would also look very, very different.

**But instead we are saddled with corporate utility monopolies, aided by government collusion, which adds up to a poisonous combination**—whatever your political beliefs might be. It is an arrangement designed to enrich corporations, with impunity.

**Why isn't the public up in arms about these risks of smart-meter fires and explosions?** There have been no comprehensive investigations by major media. Early in 2011, a major news station in the SF Bay Area was doing work on this. They interviewed us several times as part of an investigation into smart-meter fires. What happened? The story never aired, and calls to the investigative reporters were not returned.

Without coverage in the mainstream media, people will be left to find out about this issue through social networks or independent media—or worse, suffer their own fire or property damage from the meter.

This is yet another reason why [the proposed opt-out here in CA](#) is—even with analogs—incomplete and inadequate. Given the growing evidence of fire risk and safety, this is not a device we should be forced to pay to avoid. **Smart meters should not be installed on any home, any where, without a thorough safety investigation.**

---

### **Technical details from the lawsuit about Sensus meter defects:**

**1) Electrical Fast Transient Failures:** The manufacturer and the utility were both aware, the suit alleges, that the smart meters (iConA) were unsafe and could fail dangerously when subjected to a power surge. **[This was certainly evident for another make of smart meter, the [one installed in Palo Alto last October](#).]** One critical test was skipped for the Sensus meters, the Electrical Fast Transient Test (EFT). When this test was performed on a sample of the iConA Sensus meters, **they all failed**. This was after over 80,000 meters were already installed.

**2) Flux Contamination and Inaccuracy Issues.** The complaint states that production of the iConA meters was sloppy. Sensus performed two investigations and found 130,000 meters contained loose solder residue called “flux.” They also found that equipment used by the manufacturer to calibrate was not properly designed, calling into question the accuracy of the meters. This was after 400,000 meters were installed—non of which were recalled for testing. **Baker himself has investigated over-reporting meters, and found individual meters giving readings seven times the actual electrical usage.**

**3) Faulty Components.** Baker alleges Sensus and the utilities had reason to suspect that some components that were going into the iConA meter were faulty, with very high failure rates. Well into the delivery process, it was found that an electrical resistor was defective on **at least 85,000 meters**. **Over 170,000 meters** were also found to contain another faulty component made by Epsom.

**4) “Hot Meters.”** These Sensus meters, the complaint alleges, posed a risk of injury or death. Sensus knew that 19,000 installed meters were reporting a “hot socket alarm”—that is, the internal temperature was getting over 200°F. Sensus received reports of overheating to the point of melting and burning. **The plaintiff Baker documented himself meters reduced to lumps of blackened plastic, while the company insisted a meter couldn't melt at less than 500°F.**

Ultimately it was bringing to the attention of his supervisors a burned meter that resulted in a house fire that ended Don Baker's career at Sensus. **Instead of conducting an investigation, they fired him.**

=====

## Legal details alleged in the complaint:

**1) False Claims.** The defendant in the suit, the plaintiff alleges, presented false or fraudulent claims to the U.S. government that their smart grid project was eligible for [ARRA](#) funds when it was not. The equipment was defective and unfit.

**2) Conspiracy.** The defendants acted with the intent to defraud the U.S. by submitting false records to obtain the funds.

**3) Suppression, Fraud, and Deceit.** The defendants misrepresented or suppressed the fact that the smart meter that formed the basis of their smart grid architecture was dangerously defective.

Humanity on the BRINK –

Research Report from

Barrie Trower -

Frequencies that KILL . . .

Barrie Trower

September 2013

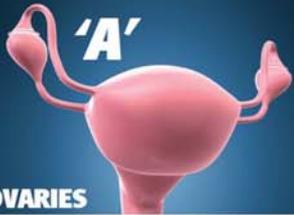

With Deference to all Scientists: this Research Report has  
been written for all students and non-scientists to  
understand.

## **Abstract**

As stated by University Researchers, Government Scientists and International Scientific Advisors; a minimum of 57.7% of schoolgirls exposed to low-level microwave radiation (Wi-fi) are at risk of suffering stillbirth, foetal abnormalities or genetically damaged children, when they give birth. Any genetic damage may pass to successive generations.

---

1

**OVARIES**

- = 400,000 FOLLICLES
- = 400 TO MATURE
- = 14 EACH CYCLE TO PRODUCE EGG(S) WHICH CAN BE FERTILIZED

**CHILD 'A' 5-16 YEARS EXPOSED TO WI-FI IN SCHOOL**  
Possible damage to first and subsequent generations.

Microwave irradiation can cause oxidative and nitrosative stress to mitochondria - this DNA is 10x more susceptible to low level chronic microwave radiation than other DNA.

Low histone protein content i.e. mitochondropathy  $N_2 O_2$  is essential for brain / immune system, any DNA damage is irreparable and can pass to every female hence forth.

57.7%

2

**CHILD 'B' FOETUS FROM CHILD 'A' NOW AS A PREGNANT STUDENT/ADULT**  
With possible DNA damage

- 100 days for follicles to form: no definite structure thence 150+120 d. to mature
- No protein 53 (x4) to fight radiation
- No nuclear core complex (x30) proteins for defence
- No factor 1 protein\* (apoptosis)
- Of 100,000 protein structures only 600 are known

- 7d = 100 Cells
- 28d = Heart
- \*40d = Eye
- 47d = fingers / toes

Body is initially inside out, i.e. major organs are the most irradiated

Woman may not know she is pregnant at this stage: Hence no precautions taken

\* PHOTOSENSITIVE GANGLIONS ABSORB RAD: EFFECT BODY FUNCTIONS

3

**CHILD 'B' IS NOW PREGNANT CHILD 'C'**  
Adult Child C may already have been irradiated

- Every aspect of Child 'C's life has been at maximum risk from stages 1,2 & 3.
- The greatest risk is yet to come. Biggest danger from school wi-fi irradiation on students and teachers

1st 56 days is when all embryos are most vulnerable. During the first 4-6 weeks, the mother may not know she is pregnant, therefore will not shield the embryo from radiation

25+ years

## Wifi – a Thalidomide in the Making – Who Cares?

Professor John R Goldsmith, International / Advisor Consultant for R.F. Communication, Epidemiology and Communications Sciences Advisor to the World Health Organisation, Military and University Advisor, Researcher; wrote concerning the low level exposure of microwave irradiation (below thermal level) incident upon women:

*“Of the microwave-exposed women, 47.7% had miscarriages prior to the 7<sup>th</sup> week of pregnancy...”(1)*

The level of irradiation incident upon the women was stated, as from, five microwatts per centimetre squared. This level of irradiation may seem meaningless to a non-scientist; however, when I say that it is below what most schoolgirls will receive in a classroom of wi-fi transmitters, from the age of approximately five years upwards, this level becomes more meaningful.

A distinction here must be made and a very important one: schoolgirls are not women. Schoolgirls are children and children are both neurologically and physiologically different from adults. A child’s brain tissue / bone marrow has different electrical conductivity properties than adults due to the higher water content (2) (this renders the Specific Absorption Rate obsolete). Children’s absorption of microwave radiation can be ten times higher than adults. Permanent low-level microwave exposure can induce chronic nitrosative and oxidative ‘stress’ thence, damage the cellular mitochondria (mitochondropathy). This ‘stress’ can cause irreversible mitochondrial DNA damage (mitochondrial DNA is ten times more susceptible to oxidative and nitrosative ‘stress’ than the DNA in the cell nucleus). Mitochondrial DNA is irreparable due to its low histone protein content, therefore any damage (genetic or otherwise) can be transmitted to all successive generations through the maternal line. (3)

Hence, we are subjecting each successive female generation to harm. Whether these two ten-fold increases ‘merge’ to become 57.7% or are additional, thence equal 67.7% of those to suffer, is a moot point. Either way we are facing the equivalent of a pandemic. I was invited to present a lecture at Brighton University recently and one Doctor commented on a +60% foetal birth rate damage from exposed farm animals. All mammalian species will of course suffer the same consequence resulting from low-level microwave irradiation. There is very little difference ‘biologically’ between our embryonic cells.

I invite the Reader to peruse my diagram and / or read my simple explanation concerning the microwaving of the ovarian follicles in schoolgirls.

## **Simple Explanation**

Imagine you are five years old, in school and sitting with a wi-fi laptop near your abdomen. Theoretically, your ovaries can become irradiated until you leave school at aged 16-18 years old. When you become pregnant, every one of your follicles (to become eggs) will have been microwaved. Hence, you may or may not deliver a healthy child.

Should you become a pregnant as a student, your embryo (for its first 100 days – if it is female) is producing approximately 400,000 follicles (within its ovaries) for future child-birth.

The problem is that these developing follicle cells do not have the cellular protection of mature adult cells. Consequently your ‘Grandchild’ may have had every single follicle cell irradiated and damaged prior to its conception. Therefore when your child becomes an adult (with its irradiated follicles) there is a greater likelihood of its child (your Granddaughter) suffering the ailments previously mentioned, during conception / embryonic and foetal development stages.

## **Beyond Belief**

The shocking truth is, not only was all of this known and documented long before wi-fi was ever put in front of children, but the dangerous biological effects were concealed (as they are to this day) from the general public, in order to protect the industries profit.

Professor Goldsmith writes:

*“.....effects from exposure to RF radiation in certain populations: reproductive effects.....increased spontaneous abortion.....increased incidence of childhood and other cancers.....” (1)*

Confirming this with more than 2000 references is the Naval Medical Research Institute in their document: ‘Bibliography of Reported Biological Phenomena (Effects) and Clinical Manifestations Attributed to Microwave and Radio-Frequency Radiation’ highlight ‘.....Altered Menstrual Activity / Altered Foetal Development.....’ (4)

The World Health Organization’s ‘International Symposium’ Research Agreement No. 05-609-04 ‘Biological Effects and Health Hazards of Microwave Radiation’ emphasizes in its 350 pages: Biological effects, health and excess mortality from artificial irradiation of Radio Frequency Microwaves. Section 28 deals with problems concerning Reproductive Function.

This document was classed as ‘Top Secret’ and its contents withheld by WHO and ICNIRP (International Commission on Non-Ionizing Radiation Protection). (5)

Eldon Byrd, a scientist for the Naval Surface Weapon Centre of the US Navy, in one of his 1986 lectures on the effects of low-level microwaves, is referenced as stating:

*'.....we can alter the behaviour of cells, tissue.....cause up to six times higher foetus mortality and birth defects....'. (6)*

Finally, the Mobile Telecommunications Industry carried out a very thorough and exhaustive scientific study on its own product. This industries conclusion was:

Sec. 7 *".....it can be concluded that electro-magnetic fields with frequencies in the mobile telecommunications range do play a role in the development of cancer."*

*".....Direct damage on the DNA as well as influences on the DNA synthesis and DNA repair mechanisms....." (7)*

(Note I have underscored the relevant words here.)

Note: DNA synthesis is essential for healthy embryonic / foetal / child's growth.

With these few of the roughly 8000 research articles showing this phenomena; in order to protect this industries' profit, the United States Defence Intelligence Agency sent a 'document' to 'advanced nations' describing the problem and suggesting 'how to deceive the public'.

It read:

*".....if the more advanced nations of the West are strict in the enforcement of stringent exposure standards, there could be unfavourable effects on industrial output.....exposed to microwave radiation below thermal levels experience more....."*  
(8)

NB: Industrial output is of course...profit. A very relaxed exposure standard also makes it very difficult to take the industry to court.

This (and two other documents with ref. 8) then continues to list many physiological and neurological dangers from low-level: below thermal, microwave irradiation inc: blood disorders, heart problems, psychiatric symptoms and 'menstrual disorders'.

\*Wi-fi is of course, below thermal low-level microwave irradiation.\*

In order to appease the US Government, some Governments adopted the ICNIRP guideline, whereby, the only safety limit is just six-minutes of warming. Which means: if you do not feel too warm in six minutes, wi-fi is deemed to be safe.

No consideration at all has been given to the published 'below thermal' cellular interaction as listed by several countries including the United States; which were (and are) known to cause: cancer, severe neuropathological symptoms, foetal defects and literally hundreds of illnesses related to cellular disorders.

Countries following ICNIRP continue to argue that their six minute warming effect is all that is required regarding microwave irradiation.

Should the Reader be wondering whether I am ‘as mad as a box of frogs’ and thinking ‘no government would ever harm its citizens for money, especially pregnant women’; I invite the Reader to investigate Government decisions behind: smoking, asbestos, BSE (mad-cow disease), lead in petrol, experiments on 20,000 UK serving military personnel serving in the 1960’s, thalidomide and of course Agent Orange sprayed over the food crops in Vietnam. To this day, many global birth defects stem from these Government / Government Scientific / Military decisions: with industrial advisors.

If further evidence is required, I invite the Reader to read documents released under the Freedom of Information Act; namely, Operations: Pandora, MK Ultra, MK Chaos, Cointelpro, MK Delta, MK Naomi, MK Search, Bluebird, Artichoke, Chatter, Sleeping Beauty and Grill Flame.

Here, secret experiments carried out by the Military / Government scientists upon unsuspecting civilians, namely: students, servicemen, psychiatric patients, poor, children over the age of 4 years, pregnant women, Muslims, Catholics, prisoners, handicapped, deaf, blind, homosexuals, single women, elderly, school children, ‘marginal groups’ and dissidents; served to increase their knowledge and understanding of; what is commonly known as...Stealth Warfare.

Progress on the study of illnesses caused by low-level microwave irradiation continues to this day. One current study on cancer and neurological harm continues until 2018 and involves women who could be pregnant. (9)

Progress Reports are also fed back to Governmental Scientists:

*“.....students will understand the nature of RF...bioeffects research, including human / animal studies.....students will become familiar with current state of knowledge on potential health effects RF, such as cancer, memory loss, and birth defects.” (10)*

NB: RF has become a generic term (Radio Frequency) to avoid using the term ‘microwave’. It poses less ‘safety queries’ as the word ‘radio’ itself, which used to refer to ‘long wave radio’ was domestically non threatening.

### **Intentional Ignorance**

Governmental Intransigence forces a moratorium upon the risks of exposure to future generations. Both the Communications Industry and Governmental studies have proved that protein synthesis (the using of chemical structures to ‘build’ the roughly 4050 foetal and 4500 adults designated biological / neurological structures) can be influenced by low-level microwave irradiation. This moratorium seems to spread to organizations either relying on Governmental funding, or for whatever reason; acquiescence. However, not all research departments suppress the truth.

A brilliant paper published by Dundee University confirms that low-level microwave irradiation, unable to cause any heating (thermal) effect, can affect cellular signalling processes. (11)

### **The Main Risks to Children**

These biological processes described as being 'influenced' by low-level microwave irradiation may not just damage foetal growth; relying on the same biological processes are:

Blood Brain Barrier – requires 18 months to form and protects the brain from toxins. It is known to be effected.

Myelin Sheath – requires 22 years to build its 122 layers. It is responsible for all thinking, organ and muscle processes.

Brain – requires 20 years to develop (I can assure you, cell phones do not help in its development).

Immune System – requires 18 years to develop. Bone marrow and Bone Density are known to be affected by low-level microwaves as are the immune systems' white blood cells.

Bones – requires 28 years to develop – as mentioned the moisture content of children makes both the 'soft bones' and marrow particularly attractive to microwave irradiation. Bone marrow produces blood cells.

Clearly, our decision makers are overlooking a child illness pandemic hitherto unknown in our 40,000 generations of civilization; which can involve over a half of the World's exposed mothers / children.

### **The Very Sad Truth**

I have been very honoured to address approximately 40 Royals, Governments, Leaders of Governments, Leaders of Peoples and Government Officials over the years.

My address (text) to one King concerning the numbers of ill children was placed on the internet. (12)

I referenced over 200 cancer / leukaemia clusters in schools (up to the time of data collection) from low level microwave transmitters in schools. There were many different types of cancers, leukaemias, miscarriages and breast cancers of staff. These continue, mostly only recorded locally, to this day.

When this was discussed in the English Parliament (as one of the EU Countries involved), a Minister dismissed it and lied to the House of Commons. My request to prove this lie was denied.

Possibly, the most respected children's charity in the World: UNICEF, joined forces with the World's leading authority on the effects of harm from low-level microwave irradiation:

The Russian National Committee on Non-Ionizing Radiation Protection: in their research document 'Health Effect on Children and Teenagers' found;

85% increase in Central Nervous System Disorders  
 36% increase in epilepsy  
 11% increase in mental retardation  
 82% increase in blood immune disorders and Risk to Foetus. (13)

NB. The Reader may think that the cell phone irradiation is different from wi-fi as it has more power. In fact wi-fi can be more harmful because of its lower power! Low power can enter the body and cause harm. All electromagnetic waves are accumulative. If they are below the body's threshold to cause activation of the necessary proteins required to defend and repair tissues, the damage accumulates very slowly and is undetectable like a cancer. Think of sunbathing on a cloudy day, you can still burn your skin.

### **The Good Guys**

I have a list of nine countries (some of whom I am working with) who are actively, either taking wi-fi out of schools or in the legal argument-stage of this process. I decline to publically name these countries as my actions may interfere with their legal negotiations.

The Parliamentary Assembly (Assemblée Parlimentaire) Council of Europe Document 12608, published on 6.5.2011 in section 8.3.2. states:

*'.....ban all mobile phones, DECTphones or Wi-Fi or WLAN systems from classrooms and schools.....'*

For legal reasons this had to be changed to a 'wired system is preferred'. However, the meaning is clear.

In a translated document, Professor Yuri Grigoriev of the Russian Committee for Non Ionizing Radiation Protection wrote on 19.6.2012

*'.....recommend the use of wired networks and not networks using the wireless broadband access systems, including wi-fi, in schools and educational establishments.'*

A document dated 25.3.2013 (updated from 19.3.2013) by the Executive Committee of the American Academy of Environmental Medicine wrote a letter to the Los Angeles Unified School District with the following recommendation:

*'.....do not add to the burden of public health by installing blanket wireless internet connections in Los Angeles Schools.'*

Just prior to this in December 2012 the American Academy of Pediatrics (representing 60,000 Paediatricians) wrote to Congress requesting more protection from low-level microwave irradiation for children and pregnant women: with regard to wi-fi in schools, they write:

*'.....this is an unprecedented exposure with unknown outcome on the health and reproductive potential of a generation.'* (14)

In 2002, 36,000 Physicians and Scientists etc. signed the 'Freiburg Appeal'. Ten years hence, it has been re-launched. It specifically warns against the use of Wi-fi and the irradiation of children, adolescents and pregnant women. 'Freiburg' is an International Doctors' Appeal.

The Reader will appreciate that collectively there are approximately 100,000 of the World's most knowledgeable professionals expostulating this same warning.

As an aside, should the Reader be wondering why I have not mentioned school-boys and whether they can be affected in a similar way to girls: the answer is 'yes'.

DNA sperm fragmentation from wi-fi levels of irradiation, have been published. (15) It would require many more pages to comment upon this phenomenon and there is already a plethora of data both available and published.

## **Pulsing / Modulations**

During the 'Cold War' conflict, whilst I was collating effects from microwave pulses / modulations caused by brain entrainment, resonance (both cyclotronic and circadian), rectification (at boundaries within the body) generated by electrically induced phase transition; it came to my attention that a list needed to be published for all microwave communication systems. (16)

In this Open Letter, I list 1 to 40 Hz (pulses / modulations per second) and their corresponding neurological / physiological response.

In his most explanatorily descriptive paper, Dr. Andrew Goldsworthy writes.....

*'.....For example, Grigoriev et. Al. (2010) showed that 30 days exposure to unmodulated 2450 MHz microwave radiation triggered a small but significant increase in anti-brain antibodies in the blood of rats.....which could then result in an auto immune attack on the brain and / or nervous system. An example of an auto immune disease of the brain is Graves disease in which the pituitary gland (at the base of the brain) is affected.'* (17)

**NB. 2450 M Hz is the wi-fi frequency.**

If you add the pulse / modulation frequency to the above; fatigue, depression, psychiatric problems (such as anger), loss of appetite and problems with movement can also be induced.

## **The Bad Guys**

With gargantuan profits to be made, it is of no surprise that the English Parliamentary system choose to follow ICNIRP and their well established 'Active Denial' policy.

I became familiar with our 'corruption' when during the late 60's – 70's, I was commissioned to investigate (under a programme initiated by Sir William Melvin (1911)) corruption within the hierarchy of the London Metropolitan Police and the non-elected Members of the English Parliament. Should the Reader be dismissive of such actions, I suggest looking at any of our Sunday newspapers over the past 45 years, including now.

When a Reverend lady wrote to a Minister, Nick Gibb MP, concerning Wi-fi in schools, his standard reply (which I have seen many times) stated:

*".....advice given.....by UK Health Protection Agency..... 'There is no consistent evidence of health effects from RF exposures below guideline levels and no reason why schools and others should not use Wi-fi equipment.'" (18)*

This letter is designed to deceive (and it is very successful). Look to the words 'no consistent evidence'. Let me explain please.

If I were to carry out an experiment on every single person who went through the doors of your main airport on any busy day and told them that they must drink one pint of beer and smoke ten cigarettes a day forever; some would react immediately, especially children. Others would react over days, weeks, months and years (many years in some cases). Then there would be those who would thoroughly enjoy the experiment and probably never be ill. That does not mean that alcohol and cigarettes are safe. It shows that people are not homogenous (all alike / identical). In other words, the conclusion of my experiment would be that there is: 'no consistent evidence'.

Other Ministerial letters usually say: *"most of our research"* or *"most of our scientists"* – both of which are equally meaningless.

What they never say is: Wi-fi is safe.

It will come as no surprise to the Reader to learn that I have been refused permission to have a face-to-face meeting with my MP, Mr Mel Stride. Hence my Member of Parliament has successfully brought the 'shutters down' on any access I may have had to Government. This act by Mr Stride became a 'feature' in our West Country newspaper by leading Journalist Paul James. (19)

During my last attempt to contact my MP, his Secretary, Dominic just hung-up the telephone on me.

Years ago, when I started to 'advise caution' re microwaving children / pregnant women; the Academic Registrar of my own University (Exeter) forbade me from ever communicating with it, ever again. A similar message came from Dr. Jamie Harle of the Open University (Medical Physics), who said: *"Your work is too political."*

Clearly in England, some universities and some parliamentary persons are more afraid of governmental 'reprisals' than telling the truth. Regardless of the consequences.

## **Two Womens' Stories**

The Real Price of Intentional Ignorance and Greed. Those Consequences.

Ten telephone calls a day would not be unusual for me. I even receive calls Christmas Day / Easter Sunday. Two calls which summarize those from women are illustrated below. Both are actual conversations.

- i) ".....my daughter had just died. I am holding her hand. She has just had her 11<sup>th</sup> birthday and she was number 11 to die since the transmitter for Wi-fi was put near her and others' desk....."
- ii) *".....my child is one of several with cancer / birth genetic problems. These only started after the transmitter was turned on. My worries are two-fold and take every second of my life. Will my child ever marry or find a partner and be happy? What will happen when I die? I know I will die worrying. Regardless of who is to blame, it is me, the Mother who carries guilt and responsibility....." (20)*

## **I Ask for Readers' Help, Please.**

Imagine 57.7% of all of the schoolgirls with Wi-fi in their classrooms: all day – all year – all through their school career, in every country using it, in the World!

In just two generations we could have more dead / sick infants than resulted from both World Wars. And, these are not my figures, they come from Government advisors / research.

Advanced requests for this 'Paper' have been received from Royalty, Governmental Officers (outside of the UK) and people I will describe as 'interesting'.

As shutters fall blocking every direction I try to turn, I ask: *"Can the Reader succeed in preventing this 'Pandemic' where I will fail?"*

I have two requests:

- i) Would a Royal or Leading Governmental Official please ask the British Prime Minister, face to face, why he told my MP, Mr Stride, that he is 'too busy' to see me for just one hour to discuss this issue.
- ii) If every Reader sends just two copies of this Paper to people who may be able make a decision (preferably influential women); with mathematical progression – the original 100 advanced requests will soon land on a desk of somebody who can make a difference.

## **International Challenge**

When I am invited to speak in countries, I invariably end up on the radio / TV news / documentary channels. Thence, I issue a challenge:

I ask for any scientist(s) from industry / government to 'humiliate' me live 'on-air' with their expert knowledge by answering one question:

*"What is the safe level of microwave irradiation for the ovarian follicles during the first 100 days development of the embryo?"*

To date, not a single scientist will appear and face me.

I mention this because it is a question the Reader can ask any decision maker, school Principal / Governor etc.

Should any person provide the answer, the next statement is:

*"Fine – we will send it to a Leading Scientific Journal for independent Peer Review."* (With your research). (21)

## **The Solution**

Education need not suffer if Wi-fi is withdrawn world-wide. We have telephone lines – fibre-optic cable.

The argument against these options is the cost. Compared to the future medical costs (forgetting the human cost), phone / fibre-cable shows to be a very cheap option.

Thank you.

## Epilogue

Please note – I have always worked free of charge and will represent any person in the world without cost.

**PLEASE SEE ADDENDUM**

## Addendum – Recent Publications

Professors' / Doctors' Panagopoulos, Johnsson and Carlo describe in their (June 2013 Published) Paper – how man-made electromagnetic waves (as used in the communications industry) can cause interference, hence induced oscillations, from these polarized waves. This in turn, can induce biological alterations and render the SAR (Specific Absorption Rate) obsolete.

They write:

- *Man-made electromagnetic waves...they are polarized...*
- *....can produce interference effect...This induced oscillation will be most intense on the free particles which carry a net electric charge...a part of its energy...is transferred to the charged / polar molecules of the medium...within biological tissue there will be additional energy absorption by the water dipoles...proteins, lipids or nucleic acids, which will also be forced to oscillate by the applied field.*
- *...man-made EMF's can produce severe biological alterations such as DNA damage without heating the biological tissue...may lead to cancer, neurodegenerative deceases, reproductive declines or even heritable mutations...conductivity varies for different tissues and different field frequencies..The relative permittivity of an adult brain is calculated to be around 40 while the corresponding value for a young child's brain is between 60 and 80 resulting in almost double the radiation absorption and SAR...*
- *...SAR offers no information at all with respect to frequency, waveform or modulation... (Ref (22))*

Dr Dimitris Panagopoulos, Dep. of Biology, University of Athens also writes in his 2013 paper: Electromagnetic Interaction Between Environmental Fields and Living Systems Determines Health and Well Being:

- *Disturbances in the communication between individual body clocks can desynchronize the circadian system, which in turn may lead to unwellness, chronic fatigue, decreased performance, obesity, neuropsychiatric disorders, and the development of different diseases...*
- *...endogenous electrical balance in living organisms cannot occur in the presence of unnatural – man-made – electromagnetic pollution..... GSM mobile phone radiation is found to cause DNA damage on insect reproductive cells (gametes) and adversely affect*

*reproduction for intensities down to 1 microwatt per centimetre squared after only a few minutes exposure..... (Ref (23))*

Department of Health:

I wish to submit the letter written by another concerned citizen below as a letter whose concerns are in agreement with mine. Please take in consideration the negative health effects from wireless radiation to our children. Please continue to study this issue and include scientists and doctors whose own concerns have been voiced regarding the negative impacts of wireless technology. Please read the letter attached from well known scientists.

Regards,  
Nancy Morris  
Seattle, WA

=====

Dear Gentlemen and Gentlewomen,

I would like to add my support to Karen Nold's plea for honesty, integrity and accountability in government with regard to the installation of WiFi in schools.

<http://meansforchange.org/Wireless-in-Schools/Correspondence-with-Washington-State>

This is a time when we need government officials and other's in decision making positions to be so aware of both sides of the story, Much is being concealed by industry's push for profits. The long term and even the short term health effects of extended exposure to wireless radiation is proving to be devastating to our health and particularly to the health of our children.

There is no shortage of evidence, both anecdotal and peer reviewed research.

You wrote:

The fields generated by Wi-Fi devices are in the RF part of the electromagnetic spectrum. Cell phones, cell towers, radar, microwaves, and radio and TV broadcasts also generate RF fields. Most studies regarding the health effects of RF fields have evaluated cell phones because the level of exposure from cell phones is far greater than that from other devices, including Wi-Fi. Therefore, cell phones can be used as an indicator for health risks from other RF devices, at least if no evidence of risk is found; if there is no evidence of risk associated with cell phone use, then there is also no evidence of risk from other RF devices.

This first premise, stated in the document "Responding to Wi Fi Safety Concerns in our Schools" is fatally flawed:

:

Please see:

A video of a congressional address. The subject is RF.

B Blake Levitt:

Peer reviewed research: Direct links between exposure to RF and tissue damage.

<http://www.nrcresearchpress.com/doi/pdf/10.1139/A10-018>

<http://www.nrcresearchpress.com/doi/abs/10.1139/A10-018#.UxUGO6XjLHg>

The siting of cellular phone base stations and other cellular infrastructure such as roof-mounted antenna arrays, especially in residential neighborhoods, is a contentious subject in land-use regulation. Local resistance from nearby residents and landowners is often based on fears of adverse health effects despite reassurances from telecommunications service providers that international exposure standards will be followed. Both anecdotal reports and some epidemiology studies have found headaches, skin rashes, sleep disturbances, depression, decreased libido, increased rates of suicide, concentration problems, dizziness, memory changes, increased risk of cancer, tremors, and other neurophysiological effects in populations near base stations. The objective of this paper is to review the existing studies of people living or working near cellular infrastructure and other pertinent studies that could apply to long-term, low-level radiofrequency radiation (RFR) exposures. While specific epidemiological research in this area is sparse and contradictory, and such exposures are difficult to quantify given the increasing background levels of RFR from myriad personal consumer products, some research does exist to warrant caution in infrastructure siting. Further epidemiology research that takes total ambient RFR exposures into consideration is warranted. Symptoms reported today may be classic microwave sickness, first described in 1978. Nonionizing electromagnetic fields are among the fastest growing forms of environmental pollution. Some extrapolations can be made from research other than epidemiology regarding biological effects from exposures at levels far below current exposure guidelines.

The American Academy of Environmental medicine has issued a position paper:

For over 50 years, the American Academy of Environmental Medicine (AAEM) has been studying and treating the effects of the environment on human health. In the last 20 years, our physicians began seeing patients who reported that electric power lines, televisions and other electrical devices caused a wide variety of symptoms. By the mid 1990's, it became clear that patients were adversely affected by electromagnetic fields and becoming more electrically sensitive. In the last five years with the advent of wireless devices, there has been a massive increase in radiofrequency (RF) exposure from wireless devices as well as reports of hypersensitivity and diseases related to electromagnetic field and RF exposure. Multiple studies correlate RF exposure with diseases such as cancer, neurological disease, reproductive disorders, immune dysfunction, and electromagnetic hypersensitivity.

[http://aaemonline.org/emf\\_rf\\_position.html](http://aaemonline.org/emf_rf_position.html)

There is a growing number of parents groups opposing both wifi and cell phone radiation in and around schools.

<http://www.indymedia.org.uk/en/regions/world/2003/06/272899.html>

Please read the beautiful story of a courageous and wise woman who listened to her heart and prevented countless tragedies.

[http://en.wikipedia.org/wiki/Frances\\_Oldham\\_Kelsey](http://en.wikipedia.org/wiki/Frances_Oldham_Kelsey)

We need wise and courageous people with a conscience making decisions that may affect millions of children and families. Please make an effort to look more deeply into this issue . At this point only perceived savings, efficiency and corporate profits are on the table.

I would like to call for a full out Ban of wifi in schools given the mounting evidence of its catastrophic effects on human health.

Sincerely  
Sandra Storwick  
Kirkland mother of two girls.

We, the undersigned are a group of scientists and health professionals who together have coauthored hundreds of peer-reviewed studies on the health effects of electromagnetic fields (EMFs). We wish to correct some of the gross misinformation found in the [letter regarding wireless “smart” meters that was published in the Montreal daily \*Le Devoir\* on May 24](#). Submitted by a group [Quebec engineers, physicists and chemists](#), the letter in question reflects an obvious lack of understanding of the science behind the health impacts of the radiofrequency (RF)/microwave EMFs emitted by these meters.

The statement that “Thousands of studies, both epidemiological and experimental in humans, show no increase in cancer cases as a result of exposure to radio waves of low intensity...” is [false \(1\)](#). [In fact, only a few such studies, case-control studies of mobile phone use](#), certainly not thousands, have reported no elevations of cancer, and most were funded by the wireless industry. In addition, these reassuring studies contained significant experimental design flaws, mainly the fact that the populations followed were too small, were followed for a too short a period of time and had used mobile phones for too short a period of time.

Non industry-funded studies have clearly demonstrated a significant increase in cancer cases among individuals who have suffered from prolonged exposure to low-level microwaves, transmitted notably by radio antennas. The effects were best documented in meta-analyses that have been published and that include grouped results from several different studies: [these analyses](#) consistently showed an [increased risk of brain cancer](#) among regular users of a cell phone who have been exposed to microwaves [for at least ten years](#).

### **Brain Cancer Rates**

Furthermore, the argument that brain cancer rates do not indicate an overall increase in incidence is not evidence that cell phones are safe: the latency for brain cancer in adults after environmental exposure can be long, up to 20-30 years. Most North Americans haven’t used cell phones extensively for that long. The evidence of the link between long-term cell phone use and brain cancer comes primarily from Northern Europe, where cell phones have been commonly used since the 1990s.

Children are especially at risk. In May 2012, the [U.K.’s Office of National Statistics reported a 50 percent increase in incidence of frontal and temporal lobe tumors in children between 1999 and 2009](#). This statistic is especially disturbing since in May 2011, after reviewing the published scientific literature regarding cancers affecting cell phone users, [the International Agency for Research on Cancer \(IARC\) classified radiofrequency radiation as a 2B, possible human carcinogen](#). Despite the absence of scientific consensus, the evidence is sufficiently compelling for any cautious parent to want to reduce their loved one’s exposure to RF/microwave emissions as much as possible, as recommended by [various countries](#) such as Austria, Belgium, [Germany](#), [Russia](#) and the [United Kingdom](#).

## **Electrosensitivity**

Public fears about wireless smart meters are well-founded. They are backed by various medical authorities such as those of the [Santa Cruz County](#) (California) Public Health Department. These authorities are worried about the growing number of citizens who say they have developed electrohypersensitivity (EHS), especially since for many of them, the symptoms developed after the installation of such meters (it takes some time for most people to link the two events).

Since the turn of the millennium, people are increasingly affected by ambient microwaves due to the growing popularity of wireless devices such as cell phones and Wi-Fi Internet. Therefore, the mass deployment of smart grids could expose large chunks of the general population to alarming risk scenarios without their consent. According to [seven surveys done in six European countries between 2002 and 2004, about 10% of Europeans have become electrosensitive, and experts fear that percentage could reach 50% by 2017](#). The most famous person to [publicly reveal her electrosensitivity is Gro Harlem Brundtland](#), formerly Prime Minister of Norway and retired Director of the World Health Organization (WHO).

[While there is no consensus on the origins and mechanisms of EHS](#), many [physicians and other specialists around the world](#) have become aware that EHS symptoms (neurological, dermatological, acoustical, etc.) seem to be triggered by exposure to EMF levels well below current international exposure limits, which are established solely on short-term thermal effects (2). Organizations such as the [Austrian Medical Association](#) and the [American Academy of Environmental Medicine](#) have recognized that the ideal way to treat of EHS is to reduce EMF exposure.

Therefore, caution is warranted because the growing variety of RF/microwave emissions produced by many wireless devices such as smart meters have never been tested for their potential biological effects.

## **Well-known bioeffects**

While the specific pathways to cancer are not fully understood, it is scientifically unacceptable to deny the weight of the evidence regarding the increase in cancer cases in humans that are exposed to high levels of RF/microwave radiation.

The statement that “there is no established mechanism by which a radio wave could induce an adverse effect on human tissue other than by heating” is incorrect, and reflects a lack of awareness and understanding of the scientific literature on the subject. In fact, [more than a thousand studies](#) done on low intensity, high frequency, non-ionizing radiation, going back at least fifty years, show that some biological mechanisms of effect do not involve heat. This radiation sends signals to living tissue that stimulate biochemical changes, which can generate various symptoms and may lead to diseases such as cancer.

Even though RF/microwaves don't have the energy to directly break chemical bonds, unlike ionizing radiation such as X-rays, there is scientific evidence that this energy can cause DNA damage indirectly leading to cancer by a combination of biological effects. [Recent publications](#) have documented the generation of free radicals, [increased permeability of the blood brain barrier](#) allowing potentially toxic chemicals to enter the brain, induction of genes, as well as altered electrical and metabolic activity in human brains upon application of cell phone RF/microwaves similar to those produced by smart meters.

These effects are cumulative and depend on many factors including RF/microwave levels, frequency, waveform, exposure time, bioavailability between individuals and combination with other toxic agents.

Clear evidence that these microwaves are indeed bioactive has been shown by the fact that low-intensity EMFs have proven clinically useful in some circumstances. Pulsed EMFs have long been used to successfully [treat bone fractures](#) that are resistant to other forms of therapy. More recently, frequency-specific, amplitude-modulated EMFs have been found useful to treat [advanced carcinoma](#) and chronic pain.

High frequency EMFs such as the microwaves used in cell phones, smart meters, Wi-Fi and cordless “DECT” phones, appear to be the most damaging when used commonly. Most of their biological effects, including symptoms of electrohypersensitivity, can be seen in the damage done to cellular membranes by the [loss of structurally-important calcium ions](#). Prolonged exposure to these high frequencies may eventually lead to cellular malfunction and death.

Furthermore, malfunction of the parathyroid gland, located in the neck just inches from where one holds a cell phone, may actually cause electrohypersensitivity in some people by reducing the background level of calcium ions in the blood. RF/microwave radiation is also known to [decrease the production of melatonin](#), which protects against cancer, and to [promote the growth of existing cancer cells](#).

### **Early warning scientists attacked**

In recommending that the Precautionary Principle be applied in EMF matters, the European Environment Agency’s Director [Jacqueline McGlade wrote in 2009](#): “We have noted from previous health hazard histories such as that of lead in petrol, and methyl mercury, that ‘early warning’ scientists frequently suffer from discrimination, from loss of research funds, and from unduly personal attacks on their scientific integrity. It would be surprising if this is not already a feature of the present EMF controversy...” Such unfortunate consequences have indeed occurred.

The statement in the *Le Devoir* letter, “if we consider that a debate should take place, it should focus exclusively on the effects of cell phones on health”, is basically an acknowledgement that there is at least some reason to be concerned about cell phones. However, while the immediate exposure from a cell phone is of much greater intensity than the exposure from smart meters, cell phone use is temporary.

### **Smart meters**

Wireless smart meters typically produce atypical, relatively potent and very short pulsed RF/microwaves whose biological effects have never been fully tested. They emit these millisecond-long RF bursts on average 9,600 times a day with a maximum of 190,000 daily transmissions and a peak level emission two and a half times higher than the stated safety signal, as the California utility [Pacific Gas & Electric recognized](#) before that State’s Public Utilities Commission. Thus people in proximity to a smart meter are at risk of significantly greater aggregate exposure than with a cell phone, not to mention the cumulative levels of RF/microwaves that people living near several meters are exposed to.

People are exposed to cell phone microwaves primarily in the head and neck, and only when they use their device. With smart meters, the entire body is exposed to the microwaves, which increases the risk of overexposure to many organs.

In addition to these erratic bursts of modulated microwaves coming from smart meters that are transferring usage data to electric, gas and water utilities, wireless and wired smart (powerline communication) meters are also a [major source](#) of “dirty electricity” (electrical interference of high frequency voltage transients typically of kilohertz frequencies). Indeed, some scientists, such as [American epidemiologist Sam Milham](#), believe that many of the health complaints about smart meters may also be caused by dirty electricity generated by the « switching » power supply activating all smart meters. Since the [installation of filters to reduce dirty electricity](#) circulating on house wiring has been found to relieve symptoms of EHS in some people, this method should be considered among the priorities aimed at reducing potential adverse impacts. Indeed, the Salzburg State (Austria) Public Health Department confirms its concern about the potential public health risk when in coming years almost every electric wire and device will emit such transient electric fields in the kilohertz-range due to wired smart meters.

### **Rather be safe than sorry**

The apparent adverse health effects noted with smart meter exposure are likely to be further exacerbated if smart appliances that use wireless communications become the norm and further increase unwarranted exposure.

To date, there have been few independent studies of the health effects of such sources of more continuous but lower intensity microwaves. However, we know after decades of studies of hazardous chemical substances, that chronic exposure to low concentrations of microwaves can cause equal or even greater harm than an acute exposure to high concentrations of the same microwaves.

This is why so many scientists and medical experts urgently recommend that measures following the Precautionary Principle be applied immediately — such as using wired meters — to reduce biologically inappropriate microwave exposure. We are not advocating the abolishment of RF technologies, only the use of common sense and the development and implementation of best practices in using these technologies in order to reduce exposure and risk of health hazards.

## LETTER TO THE EDITOR

## Illnesses caused by contact currents in showers

Recently, a patient complained of becoming ill in the shower of a vacation home in the California desert, but not in her home in northern California.

There are reports of inappropriate implantable cardioverter-defibrillator shock induced by electromagnetic interference while taking a shower (Fernengel *et al.* 2007). Kavet *et al.* (2000) has written extensively about contact currents that are a characteristic of the residence itself, reflecting its grounding characteristics and electrical supply. The National Institute of Environmental Health Sciences (NIEHS) Working Group 1998 (Kavet *et al.* 2000) associates chronic exposure to contact currents of 18  $\mu\text{A}$  ( $\mu\text{A}$  = microamperes) and above with the development of cancer. The grounded Wye electrical distribution system in North America and the fact that about 70% of neutral return currents now flow down the down ground wire at the transformers assure that most neutral return currents return to the substation via the earth (Final Report of the Science Advisors 1998). This is in violation of the National Electric Safety Code rules 92 D and 215 B, and the California Public Utility Commission Rule 33.2 which forbids the use of the earth for neutral return currents.

Using a Fluke 287 true RMS multimeter with an electrocardiography (ECG) patch over my sternum attached to one lead and the other lead to an outlet ground, I got the following results in the bathroom of my Indio, California residence with the electric service off:

- Sitting on toilet: feet off ground – 4.1  $\mu\text{A}$ 
  - bare feet on floor – 17.3  $\mu\text{A}$
  - hand-touching shower control – 40.5  $\mu\text{A}$
- Showering: hand-touching shower control – 55.0  $\mu\text{A}$

The same pattern of results was present in nearby residences and at the patient's California residence. My California residence is a fourplex built on a concrete slab. All metal connected to the slab, such as door frames and doors, had high contact current levels. The major source of contact current was the natural gas service pipes at the gas meters at each end of the fourplex.

My wood frame home in Olympia WA had high voltage in the down ground and the earth, but no contact currents in the house. The highest reading was 2.5  $\mu\text{A}$ . The floor was supported by vertical 4 × 4s on concrete pads with an asphalt shingle between the wood and concrete. The water and sewer pipes were plastic.

This situation can be remedied by the utilities adding increased current-carrying capacity to their neutral return wires and respecting existing electrical safety codes.

Samuel Milham and David Stetzer

# Wireless Devices & Wildlife

## The effects of EMR from wireless devices on wildlife

Excerpts and Resources from *An Electronic Silent Spring*

The radiofrequency (RF) signals that cellular antennas, mobile devices and “smart” utility meters require to function are now ubiquitously and continuously emitted.

*How do these signals affect wildlife?*

Scientists report that RF fields emitted by cellular antennas alone potentially cause the decline of animal populations, reduction of some species’ useful territory, and deterioration of plant health. Some species may experience reduction of their natural defenses, problems in reproduction and aversive behavioral responses. (1)

Here are summaries of studies about the effects of RF signals on trees, insects and birds:

### Trees

In a 2010 paper published in the International Journal of Forestry Research, researcher Katie Haggerty explained that the Earth’s natural radiofrequency environment has remained about the same within the lifespan of modern trees. “Before 1800,” Haggerty wrote, “the major components of this environment were broadband radio noise from space (galactic noise), from lightning (atmospheric noise), and a smaller RF component from the sun. (2) ...Plants may have evolved” to use these environmental signals, along with visible light in order to regulate their periodic functions. Therefore, they may be sensitive to man-made RF fields. “The background of RF pollution,” Haggerty continued, “is now many times stronger than the naturally occurring RF environment. From the perspective of evolutionary time, the change can be considered sudden and dramatic. (3,4) ...Growth rates of plants (5) and fungi (6) can be increased or decreased by RF exposure. Exposure to RF signals can induce plants to produce more meristems, (7) affect root cell structure, (8,9) and induce stress response...causing biochemical changes.”(10)

Ms. Haggerty went on to describe her study of the influence of RF signals on trembling aspen seedlings. Seedlings that were shielded in a Faraday cage (a metal container that prevents RF radiation from entering) thrived. Seedlings that were exposed to RF signals showed necrotic lesions and abnormal coloring in their leaves. (11)

According to British biologist Dr. Andrew Goldsworthy, “Trees are now dying mysteriously from a variety of diseases in urban areas all over Europe. They also show abnormal photoperiodic responses. Many have cancer-like growths under the bark

(phloem nodules). The bark may also split so that the underlying tissues become infected. All of these can be explained as a result of exposure to weak RF fields from mobile phones, their base stations, Wi-Fi and similar sources of weak non-ionizing radiation.” (12)

Other scientists have found that trees in areas with high Wi-Fi activity suffer from bleeding fissures in their bark, the death of parts of leaves, and abnormal growth. In 2010, in the Netherlands, 70% of urban ash trees suffered from radiation sickness, including a “lead-like shine” on their leaves, indicating the leaves’ oncoming death. In 2005, only 10% of ash trees suffered radiation sickness. (13)

## **Ants**

Perhaps the first study to demonstrate that insects have an electrical sense came out in 1992. Biologist William MacKay and his colleagues showed that several kinds of ants were attracted to electrical fields. Indeed, ants can damage equipment that produces “attractive” electrical fields. (14)

In 2013, Belgian biologist Marie-Claire Cammaerts and Swedish neuroscientist Olle Johansson exposed ants to common wireless devices. The scientists placed a mobile phone under a tray, then placed ants on the tray. When the phone was off or on standby-mode, the ants’ angular speed increased. Within two to three seconds of the scientists’ turning the phone on (able to receive or send calls), the ants’ angular speed increased and their linear speed decreased.

Exposed to a smartphone, the linear speed of “fresh” ants decreased; their angular speed increased. The ants’ speed changed similarly but more strongly when exposed to a DECT (cordless landline) phone. They had difficulty moving their legs and did not move toward their nest or their food site as usual. The ants were exposed to each of these two phones for three minutes, and took two to four hours to resume their normal behavior.

When Cammaerts and Johansson put a mobile phone on standby mode under the ants’ nest, the ants left their nest immediately, taking their eggs, larvae and nymphs with them. They relocated far from the phone. Once the phone was removed, the ants returned to their original location.

After thirty minutes of exposure to a Wi-Fi router, the ants’ speed changed again, as did their foraging behavior. It took them six to eight hours to resume normal foraging. Several ants never recovered and were found dead a few days later.

When the scientists placed an ACER Aspire 2920 about twenty-five centimeters away, the insects appeared disturbed as soon as the computer was switched on. When the PC was switched on with its Wi-Fi function de-activated, the ants appeared undisturbed.

The researchers concluded that ants can be used as bio-indicators to reveal the biological effects of RF signals from some wireless devices. They also advised users to de-activate the Wi-Fi function of their PCs. (15)

## **Bees**

Bees also have an electrical sense. Bees are positively charged, and flowers are negatively charged. These charges help pollen stick to bees' hair while they pollenate. In 2012, biologist Dominic Clarke and his colleagues showed that bees use their electrical sense to determine whether or not a flower has recently been visited by another bee—and is therefore worth visiting. (16,17)

In *Bees, Birds and Mankind: Effects of Wireless Communication Technologies* (Kentum, 2009), German scientist Ulrich Warnke states, “Bees and other insects, just as birds, use the Earth’s magnetic field and high frequency electromagnetic energy such as light. They accomplish orientation and navigation by means of free radicals as well as a simultaneously reacting magnetite conglomerate. Technically produced electromagnetic oscillations in the MHz range and magnetic impulses in the low frequency range persistently disturb the natural orientation and navigation mechanisms created by evolution.”

In his book, Warnke quotes Ferdinand Ruzicka, a scientist and beekeeper who reported, in 2003, after several transmitters (cellular antennas) were erected in the immediate vicinity of his hives: “I observed a pronounced restlessness in my bee colonies (initially about forty) and a greatly increased urge to swarm. As a frame-hive beekeeper, I use a so-called high floor. The bees did not build their combs in the manner prescribed by the frames, but in random fashion. In the summer, bee colonies collapsed without obvious cause. In the winter, I observed that the bees went foraging despite snow and temperatures below zero, and they died of cold next to the hive. Colonies that exhibited this behavior collapsed, even though they were strong, healthy colonies with active queens before winter. They were provided with adequate additional food and the available pollen was more than adequate in autumn.”

Ruzicka then organized a survey of beekeepers through the magazine *Der Bienen Vater*. All twenty of the beekeepers who replied to his questionnaire had a transmitter within 300 meters of their beehives. Compared to the bees’ behavior before and after the transmitters were in operation, 37.5% observed increased aggression from their bees.

25% found that their bees had a greater tendency to swarm.

65% reported that their colonies were inexplicably collapsing since the transmitters became operational.

Warnke says that monocultures, pesticides, the Varroa mite, migratory beekeeping, dressed seed, severe winters, and genetically modified seeds could also explain the bee colonies’ collapse. However, none of these convincingly explains “the fairly sudden and

country-spanning appearance two to three years ago of the dying bees phenomenon. Should the bees simply be too weak or ill, they should also die in or near the hive. But no ill bees were found in research into this phenomenon.”

In May, 2009, The U.S. Fish and Wildlife Service urged Congress to investigate the potential relationship between wireless devices and bee colony collapse. (18)

## **Frogs**

In 2010, Spanish biologist Alfonso Balmori published his study of a common frog habitat 140 meters from a cellular antenna. The experiment lasted two months, from the egg phase until an advanced phase of tadpole. Balmori placed some of the frogs inside a Faraday cage. These shielded frogs had a mortality of 4.2%. The unshielded frogs – exposed to the antenna’s RF fields–had a mortality of 90%. Balmori concluded that “this research may have huge implications for the natural world, which is now exposed to high microwave radiation levels from a multitude of phone masts.” (19)

## **Bird collisions with telecom equipment**

Albert Manville, PhD, wildlife biologist with the Division of Migratory Bird Management, U.S. Fish and Wildlife Service (USFWS), estimates that up to 6.8 million birds die per year in collisions with communications antennas or their guy-support wires in North America. The impacts of cellular antenna radiation on migratory birds in North America, especially those nesting close to these structures, remain suspect and unknown.

In January 2012, Dr. Manville wrote: *Recent studies from Europe raise troubling concerns about the effects of radiation from cellular communication antennas, especially on resident, breeding migratory birds. These apparent effects include feather deformities, weight loss, weakness, reduced survivorship and death, especially to those birds and their offspring nesting adjacent to cellular antennas. Where Before-After, Control-Impact (BACI) studies were performed during some of the European research, no effects to resident birds were detected prior to construction and operation of cellular communication antennas. Some laboratory studies in the U.S. have documented lethal effects of extremely low levels of radiation to chicken embryos in the frequencies of cellular telephones, (20) but research to better address cause and effect to wild birds in North America has yet to be conducted. To date, only anecdotal reports from instances in North America have been brought to the attention of authorities at the USFWS.*

*If we are to better understand the cumulative effects of human infrastructure on migratory birds—including communication technologies, research needs to be conducted to specifically address how radiation is affecting migratory birds and what resultant lethal and injurious effects are occurring. The explosive growth of hand-held technologies raises further concerns since potential impacts may grow.*

*The unpermitted killing or injury of a migratory bird, is called a “take” under the Migratory Bird Treaty Act (MBTA). The USFWS does not permit the ‘incidental or*

*accidental take' of any of the 1007 migratory bird species protected under MBTA. Therefore, studies need to be undertaken to determine how much 'take' is occurring as a result of radiation, and what steps can be undertaken to "avoid or minimize" future "take." The USFWS continues to suggest to the FCC the need for these North American studies based alone on cumulative effects that must be addressed under National Environmental Policy Act review. The studies need to better tease out how and at what level "takes" are occurring, then determine what conservation measures can be adopted to "avoid or minimize" future "take." Because of the controversial nature of this issue, any studies and outcomes need to be seamless and fully transparent.*

### **The white stork**

During the Springs of 2002, 2003 and 2004, biologist Alfonso Balmori monitored the reproduction of the white stork, a vulnerable bird species that usually lives in urban areas. White stork couples build their nests in pinnacles and other very high places that are now exposed to man-made microwaves. Balmori studied white stork nests within 200 meters of antennas and nests located more than 300 meters from antennas. He found that 40% of the nests within 200 meters of antennas had no chicks, while only 3.3% of nests further than 300 meters of antennas had no chicks. Also, near antennas, white stork couples frequently fought for sticks, their sticks fell to the ground while they tried to build nests, the nests did not get built and hatched white stork chicks frequently died. (21)

Common citizens have also observed changes in birds when technologies that emit EMR are deployed. After transmitting water meters were installed in Renton, Washington in December, 2012, a retired civil engineer who had spent thirty dollars per month on birdseed for years noticed that the feeders in his yard no longer emptied. His neighbors also noticed that immediately after the transmitting water meters were installed, the birds that had frequented their yard (beside a greenbelt) disappeared. (22)

### **Birds, bees and magnetically-sensitive cryptochromes**

*Why would RF signals disturb birds and bees? Here's an answer from biologist Andrew Goldsworthy, PhD: To navigate and also to control their immune systems, birds and bees use magnetically-sensitive substances called cryptochromes. These are pigments found in virtually all animals, plants and many bacteria. Cryptochromes absorb blue-green and ultra-violet light and use this energy to drive photochemical reactions where light energy is converted to chemical energy. Cryptochromes measure light to control and reset animals' and plants' biological clocks. Some animals also use cryptochromes to sense the direction of the Earth's magnetic field.*

*Unfortunately, cryptochromes are badly impaired by man-made oscillating fields that are orders of magnitude weaker than the Earth's steady magnetic field. Such impairment can disrupt insects' and animals' solar and magnetic navigational abilities. It can account for colony collapse disorder in bees, the loss of some migratory birds and butterflies, and immune system weakening in many more organisms.*

*An array of cryptochrome molecules oriented in different directions can be found in the compound eye of an insect, or in the retina of a vertebrate's eye. This cryptochrome found in the eyes is quite distinct from the regular visual pigments (rhodopsins) that are used in normal vision. However, the combination of these pigments gives the animal the potential to "see" the direction of the magnetic field, possibly as an extra color superimposed on its normal field of vision.*

*Robins can navigate in the Earth's magnetic field if they receive light from wavelengths absorbed by cryptochrome. (23) However, exposure to man-made frequencies between 0.1 and 10MHz at field strengths as little as 0.085 mT (about 500 times weaker than the Earth's magnetic field) made the birds completely unable to respond to the Earth's field.*

*Frequencies used by mobile devices, including cell phones, DECT cordless landline phones and Wi-Fi, can blot out "magnetic vision." Even lower field strengths are likely to disturb magnetic navigation, since radiation that is too weak to blot out magnetic vision totally may still be strong enough to distort a bird's perception of the Earth's field, causing the bird or insect to fly in the wrong direction.*

*The sheer number of wireless devices gives birds continuously conflicting navigational data – as if they're constantly bombarded by flashing disco lights. We should not be surprised that birds would leave such areas. Likewise, scientists who put DECT cordless phone base stations next to their beehives found that their bees behaved abnormally and were less likely to return to the hive. (24) (Beekeepers are thereby well advised not to carry their mobile phones when visiting their hives.)*

*Birds, bees and many other animals can also navigate by the sun's position. To do this, they must have an internal clock that adjusts to the sun's changing position throughout the day. Cryptochrome makes this clock sensitive to magnetic fields. A 300 mT steady field can alter the clock's speed or even stop it altogether. (25) Given that sensing light and magnetic fields by cryptochrome uses the same basic mechanics as the internal clock, it's likely that weak alternating fields would also disrupt a clock's normal functions. As a consequence, weak, man-made electromagnetic fields would render animals unable to adjust accurately to the sun's changing position. This leaves the animal unable to use either magnetic or solar navigation. If there were no landmarks to guide it, the animal would be completely lost. This could explain colony collapse disorder, when bees do not return to their hives.*

*Circadian (daily) metabolic rhythms, which occur in virtually all higher organisms, keep us in sync with the Earth's twenty-four hour rotation on its axis. Circadian rhythms are also driven by cryptochrome-containing internal clocks. They enable the organism to anticipate the coming of dawn and dusk, and they modify its metabolism to be ready for the new conditions. Circadian rhythms control the production of melatonin (a sleep hormone); at night, they divert metabolic resources to repair and immune system strengthening.*

*Losing or even weakening of the circadian rhythm – due to a failure of the internal*

*clock's exposure to man-made electromagnetic fields—would have serious consequences. In humans, this would result in tiredness during the day, poor sleep at night, and reduced production of melatonin. All of these effects have been reported in people exposed to continuous, weak, electromagnetic radiation from DECT phone base stations, Wi-Fi routers and cellular antennas.*

*Also, any weakening of the circadian rhythms' amplitudes means that processes controlled by them will never function at maximum power. The immune system may never be able to summon the massive power that is sometimes required to overcome pathogens or destroy developing cancer cells before they get out of control. In part, this could explain epidemiologists' findings that people living near cellular antennas have an increased cancer risk. It could also explain bee colonies' continuing decreased health and ability to resist pathogens.*

Bill Bruno, PhD biophysicist, retired from the Los Alamos National Lab: *Biology is very sophisticated in its ability to make use of electromagnetic fields. Cryptochromes are just one example. Despite centuries of discoveries in biology and advances in medicine, there is so much we don't know. For example, why do our brains, sinuses and other tissues have magnetic magnetite particles?*

*Our bones and collagen are piezoelectric: in an electric field, they expand and contract. What are the implications of that? And what about recent experiments that show that DNA is a semiconductor, and that melanin, including neuromelanin in the brain, is a conductor?*

## Board of Advisors

### Advisory Board:

- [Gene Barduson](#), Executive Chairman of the Board of Directors, PerfectServe Inc
- [Mike Doherty](#), Global Head of Regulatory Affairs, Strategic Innovation and Policy, Hoffmann-La Roche Ltd & Genentech
- [John D. Doyle](#), Executive Vice President, Ascension Health Alliance; President and CEO, Ascension Health Holdings
- [Michael Farrell](#), President, Americas, ResMed
- [Donald Jones](#), Co-Founder & Chairman, WLSA; Chief Digital Officer of the Scripps Translational Science Institute
- [Bruno Leroy](#), Vice President, Head of Global Access Strategies, Sanofi
- [Linda Myrick](#), Program Director, R&D, Air Liquide
- [Jim Parshall](#), Director of Digital Device Development, Eli Lilly and Company
- [Chris Penrose](#), Senior Vice President, Emerging Devices, AT&T
- [Leslie A. Saxon](#), Chief Division of Cardiovascular Medicine, Keck School of Medicine at USC; Executive Director, USC Center for Body Computing
- [Thomas Schwieterman](#), Medical Director, Midmark Cooperation
- [Ralph Simon](#), Chief Executive Officer, Mobilium Global Limited
- [Eric Topol](#), Director, Scripps Translational Science Institute; Chief Academic Officer, Scripps Health; Professor of Genomics, The Scripps Research Institute
- [Rick Valencia](#), Vice President & General Manager, Qualcomm Life

### Ex Officio Members: WLSA Board of Directors

- [Jeff Belk](#), Founder, Bright Light Management; Venture Partner, OurCrowd; Managing Director, ICT168 Capital LLC
- [M. Wainright Fishburn](#), Partner, Cooley LLP
- [Sharon Henry](#), President, Evolution Health

## Advisory Board:

**Gene Barduson**

Gene Barduson is Executive Chairman of the Board of Directors for Perfect Serve and is an information technology industry expert with a proven, 30-year track record of producing increased sales and profitability in large company, start-up and turnaround situations. Gene started his career with IBM and later became involved in three start-ups during the early stages of the CAD/CAM industry. In 1989, he took an executive position with Shared Medical Systems, Inc. (SMS), now part of Siemens, AG where he served as Senior Vice President for the Western Region and all national accounts. After SMS, Gene was recruited to serve as president and CEO of EDiX Corporation where he guided a turnaround and grew revenue from \$14 million to more than \$100 million over a five-year period. During that time he led the successful sale of EDiX to IDX — and positioned EDiX as the market-leading technology-based medical transcription company in the country.

Gene left IDX to serve as chairman and CEO of Apexion Technologies Inc., a start-up technology company providing health care supply and surgical instrument tracking applications which was acquired by Lawson Software. Prior to Perfect Serve, Gene served as president and CEO of Alteer Corporation, a software service provider to medical practices. While at Alteer, he raised \$20 million of venture capital and engineered a successful turnaround and sale to American Health.

Gene holds a Bachelor of Science in Mathematics from St. Cloud State University and Master of Mathematics from the University of Northern Iowa.

Gene presently serves on the Board of Independa. Gene also serves on the Board of Trustees at Western University of Health Sciences.

**Michael Doherty**

Michael Doherty is the Global Head of Regulatory Affairs, Strategic Innovation and Policy, Hoffmann-La Roche Ltd and Genentech, located in San Francisco. He has been head of Regulatory Affairs, Hoffman-La Roche Ltd. since 2002. He started his career in 1986 in regulatory Affairs in the Cyanamid Company (Lederle), based in the UK working primarily in the field of antibiotics registration with the UK health authority. He then joined Sandoz where he led the regulatory group in the UK undertaking the first European filings under the mutual recognition and centralized procedures with the EU commission. In 1992, he joined Rhone Poulenc Rorer (RPR) and took on global regulatory responsibility for the respiratory and endocrinology portfolios. He later joined Astra (to become AstraZeneca) where he took firstly the head of the Respiratory and Inflammation regulatory team and then became global head of drug development regulatory affairs. In 2002, he joined Hoffman-La Roche as global head, regulatory Affairs based in Basel. Prior to working in the Pharma industry he worked at the University of Manchester UK and Christie Hospital in the regional endocrinology laboratory. He has a BSc in Biochemistry and a

fellowship of the Institute of Medical Sciences, UK and a Diploma in Management studies from the University of Portsmouth, UK.

**John Doyle**

John D. Doyle serves as Executive Vice President, Ascension Health Alliance, the parent organization of Ascension Health. He is also President and Chief Executive Officer of AH Holdings, LLC, a subsidiary of Ascension Health Alliance.

He has responsibility for a portfolio of companies designed to add value to the organization by providing services to the Health Ministries of Ascension Health as well as other health systems in the United States and internationally. Mr. Doyle's, along with other executives, oversees incubation of transformational solutions and innovative relationships that have the potential to accelerate accomplishment of Ascension Health's Strategic Direction. He also serves as Chairman of the Board of TriMedx, a subsidiary of AH Holdings that provides clinical engineering services to healthcare organizations throughout the United States and internationally. He serves on the Board Trimedx International, a joint venture currently providing clinical engineering services in India.

Mr. Doyle previously served as Ascension Health's Chief Strategy Officer and General Manager, Transformational Development. Earlier he was Senior Vice President, Strategic Business Development & Innovation for Ascension Health. Before joining Ascension Health's System Office, he was Executive Vice President for Strategic Development for St. Vincent Hospitals and Health Services, Indianapolis, overseeing strategic planning, network development, managed care, marketing, corporate communications and government affairs.

Mr. Doyle is a former Vice President of Marketing, Public Affairs and Product Line Management for MacNeal Health Network in Chicago and served as director of marketing and public relations for the Educational Services Unit of ITT Corp. He began his career with St. Jude Children's Research Hospital. Mr. Doyle earned a bachelor's degree from Butler University, Indianapolis, and a master's degree from Ball State University, Muncie, Indiana.

**Mick Farrell**

Michael "Mick" Farrell is currently President, Americas at ResMed; he joined ResMed (San Diego, CA – NYSE: RMD) in September 2000. Mick has responsibility for sales, clinical education, customer service, channel marketing, and all commercial activities for North America, Central America, and South America. He previously held roles running a global business unit for ResMed's therapeutic and diagnostic medical devices for sleep apnea, as well as prior roles with responsibility for marketing and business development at the company. Before joining ResMed, Mr. Farrell worked in management consulting and biotechnology, as well as in chemicals and steel manufacturing at Arthur D. Little, Genzyme Corporation, The Dow Chemical Company, Vale and BHP Billiton. Mr. Farrell sits on the Board of Directors of the American Association for Homecare. Mr. Farrell holds a Bachelor of Engineering, with first-class honors, from the University of New South Wales, a Master of Science in Chemical

Engineering from the Massachusetts Institute of Technology, and an M.B.A. from the MIT Sloan School of Management.

**Donald Jones**

Donald Jones is the Chief Digital Officer of the Scripps Translational Science Institute in La Jolla, California, where he works with the Director, Eric Topol, MD and Steve Steinhubl, MD, Director Scripps Digital Medicine, one of the first clinical trial centers focused exclusively on digital health and medicine products.

Through February 2014, Mr. Jones served as Qualcomm Vice President of Wireless Health Global Strategy and Market Development. Mr. Jones is globally recognized as a leader in the field. In 2011, working with XPrize Foundation CEO, Peter Diamandis, and Qualcomm's CEO, Dr. Paul Jacobs, he conceived the \$10M Qualcomm Tricorder Xprize for a consumer device capable of making multiple diagnosis. In 2005, he founded and is Chairman of the Wireless Life Sciences Alliance ([www.wirelesslifesciences.org](http://www.wirelesslifesciences.org)). Mr. Jones is widely asked to speak and recent engagements have included the Milken Institute, Sanofi Executive Committee, J&J Innovations Master Class, MIT Emtech, the MEMS Industry Group, the NIH Directors Leadership Meeting, and the world's largest trade show, CES. He is a member of the Milken Institute Advisory Committee on Biomedical Innovation.

Jones holds a bachelors' degree in biology and bioengineering from the University of California, San Diego, a Juris Doctor from the University of San Diego and an MBA from the University of California, Irvine.

**Bruno Leroy**

Bruno Leroy is Vice-President Global Access Strategies in Integrated Patient-centered Solutions at sanofi. He is an MD, and was previously Assistant Professor in Pediatric Nephrology in Paris before joining the Pharmaceutical Industry in 1993. He has been directly involved in virtually all phases of compound life cycle in R&D and commercial operation, from dose selection to approval, market access and launch phases.

In its current role, his team mandate is to accelerate incorporation of efficient access strategies and innovative customer solutions at sanofi, looking to deliver new sources of value with a patient centric approach. To develop integrated patient-centered solutions, several dimensions of patients' needs are to be considered, including primary cause and symptoms of the disease, its associated symptoms and comorbidities, patient care pathways and disease continuum steps, lifestyle and social impact. This requires in depth, multifaceted insight and mapping of most important and under-addressed patients struggles, as well as evaluation of the health and cost burden of these care deficiencies. The extent of possible care offers should go beyond drugs, and include various services among which digital solutions. Rapidity of innovation and prototyping, identification of new funding and business model, scalability, and joint efforts of several actors in the health care value chain will be key to move from product to patient centric offers.

**Linda Myrick**

Linda is responsible for global R&D programs for Healthcare, Medical Technologies, and Biomarkets including Food, Pharma, Water Treatment and other biological-based processes located in Newark, Delaware. She relocated from Paris, France where she spent 3½ years as the R&D Group Manager for Medical Gases for Air Liquide Santé International. She began working for Air Liquide with the acquisition of Scott Specialty Gases, Inc. in 2007 where she was General Manager for Scott Medical Products in Philadelphia, Pennsylvania. Before joining Scott in 2004, she held general management positions with Rhodia, Inc. and FMC Corporation. Since 2006, she is an independent Director for Innophos, Inc., a NASDAQ- traded specialty phosphates and minerals corporation. She is a Board member of the Air Liquide healthcare affiliate, SEPPIC Inc., and the Advisory Board of the Wireless Life Sciences Association. She previously served as an independent Director for Berwind Pharmaceutical Services, Inc., offering pharmaceutical coatings and excipients. Ms. Myrick earned a B.S. in Chemical Engineering from the University of Delaware, where she is a member of the Alumni Association, the Chemical Engineering Advisory Board, and the Biomedical Engineering Advisory Board. She has an M.B.A. from the Wharton Graduate School of the University of Pennsylvania.

**Jim Parshall**

Jim Parshall is the director of digital device development at Eli Lilly and Company. He joined Lilly in 1999 and has held various technical and leadership roles in manufacturing and product development. Jim's career has been focused on software and technology, where he has developed and led high-performing teams, architected business-critical strategies, designed new and novel manufacturing processes, and partnered internally and externally to deliver multi-million dollar product and manufacturing programs. Recognizing the incredible opportunities with connected health, Jim and his team are focusing on applying mobile technology and cloud computing to medical devices.

Jim earned a bachelor's degree in electrical engineering from Kettering University and a master's degree in electrical engineering from Purdue University. As he can effectively represent and communicate very complex subjects, Jim has spoken and consulted on applications of technology from making ice cream to processing nuclear waste. His book, *Applying S88: Batch Control from a User's Perspective*, a tutorial on modular software for batch manufacturing, has influenced projects, operations, and thinking worldwide.

**Chris Penrose**

Chris Penrose is Senior Vice President of AT&T's Emerging Devices Organization. Penrose leads a team that is responsible for connecting AT&T's wireless network to consumer electronics including tablets, computers, tracking devices, eReaders, mHealth and portable navigation.

With more than two decades of experience with AT&T and its predecessor companies, Penrose has expertise in strategic planning, new product development, sales, marketing, distribution planning and customer service.

Prior to this role, Penrose was Vice President/General Manager of AT&T's South Texas Market, where he had complete P&L responsibility for both wireline and wireless products. He held a similar position with AT&T in Virginia and West Virginia.

Penrose earned a Bachelor of Science in Marketing and a Masters in Business Administration from Indiana University. He is active in the community, having served on the boards of directors of Junior Achievement, the University of Texas at San Antonio, the North Texas Chamber of Commerce and the San Antonio Sports Foundation.

**Leslie Saxon**

Leslie Saxon, M.D., is a Professor of clinical medicine at the USC Keck School of Medicine, specializing in the diagnosis and treatment of arrhythmias in patients with congestive heart failure. After serving as the director of the electrophysiology laboratory and implantable device services at UC San Francisco, Dr. Saxon was recruited to serve as the Chief of Cardiovascular Medicine at USC.

In addition to using state-of-the-art resynchronization devices in patients with arrhythmias, such as modified pacemakers and implantable defibrillators, Dr. Saxon also collaborates with medical device companies to evaluate the latest, most innovative interventional gadgets for patients with difficult-to-treat heart failure.

Dr. Saxon has completed over 75 publications in various medical journals and is an active member of a multitude of organizations, including the American College of Cardiology, the Heart Rhythm Society, The American Heart Association, and the Heart Failure Society of America.

In 2002, Dr. Saxon co-chaired the first Heart Rhythm Society Conference in Cardiac Resynchronization. On October 26, 2007, Dr. Saxon was proud to host the First Annual USC Body Computing Conference, which brought together leading authors and futurists as well as leaders from the fields of medicine, design, entertainment, the FDA, investment banking, and pharmaceuticals for a day of intense discussions about the nascent but exciting field of wireless physiologic monitoring.

**Tom Schwieterman**

Dr. Thomas (Tom) Schwieterman is the Medical Director for Midmark Corporation – the most trusted name in medical, dental and veterinary examination and procedure room equipment, dedicated to helping healthcare providers deliver the most efficient and effective patient care. In this position, “Dr. Tom” supports Midmark’s focus on potential breakthrough technologies and trends as they look toward future markets. His specific focus is on the optimal ways health information technology can improve provider efficiency and patient outcomes.

In his work with SleepView®, Midmark’s innovative solution for diagnosing obstructive sleep apnea (OSA), Dr. Tom has provided expert opinion in the field of OSA and home sleep testing. Dr. Tom’s advocacy activities for advancing sleep medicine include appearances on morning news broadcasts discussing the importance of good sleep, participation in panel discussions, interviews for articles published in industry magazines and research in primary care enabled diagnostics.

Prior to joining Midmark in 2007, Dr. Tom studied family medicine at Providence Hospital in Southfield, Michigan, attaining the role of chief resident and president of the hospital resident staff. After residency, he operated a successful private practice in rural Ohio. Seeing inefficiencies in his workflow, Dr. Tom created a medical software product called “Chartscribe.” This product made a significant impact on the way he practiced medicine. Microsoft Corporation recognized Dr. Tom as a leading innovator in health information technology in 2003.

Dr. Tom holds a Bachelor of Science in software engineering from Miami University, Ohio and a Doctor of Medicine degree from The University of Cincinnati College of Medicine. He remains board certified in family practice, serving as a member of the board of trustees for Compassionate Care of Shelby County (CCSC) and providing direct patient medical care there as a volunteer.

Dr. Tom and his wife, Maria, enjoy three children. He also takes pleasure in classical music, travel and participates on the board for the Miami Valley Council – Boy Scouts of America.

**Ralph Simon**

Ralph Simon is acknowledged as one of the founders of the modern mobile entertainment industry. Over the last 15 years, he has been a prominent global mobile trailblazer and innovator, helping grow the mobile entertainment and content industry, and playing a central role in its impact and presence worldwide.

Simon heads the London-based Mobilium International, which provides high-level strategic advice and guidance to mobile handset makers, telco operators, technology companies, media companies, movie studio & TV networks, global music artists, ad agency groups, brands, and platform providers around the world. Specifically, Simon recommends unique, practical ways to expand a company’s mobile business and achieve profitability by growing

revenues and maximizing impact from the use and distribution of mobile entertainment content, mobile music, messaging, mobile media technology and applications.

Currently, he serves on the boards of several companies, including Hungama Digital Media Entertainment, India's major mobile content producer, and also mobile games maker Tunewiki.com. In addition, Simon works closely with the GSM Association, the global governing body of the mobile phone industry, providing expert advice on the future of mobile use and mobile entertainment. He also has served for the past three years on the Visionary Committee for MIDEM, the international record industry's annual convention that helps shape the global music industry's best practices for use of intellectual property and music.

Ralph Simon is a Fellow of the Royal Society of Arts in the UK, where his "Future of Media" lecture series is popular, and he is a member of the Academy of Recording Arts & Sciences in the US.

**Eric Topol**

Cardiologist, Eric Topol, MD, believes that patients should be fully empowered. He ensures this by sharing information completely and building a partnership with his patients. Dr. Topol is also a believer that each patient is unique and therefore requires a specific care plan tailored to their individual needs. He uses the latest innovations in heart care to treat his patients and only turns to medication when absolutely necessary.

Dr. Topol was voted as the number one Most Influential Physician Executive in the United States in a 2012 national poll conducted by Modern Healthcare. A practicing cardiologist at Scripps Health, Dr. Topol has done much to expand our understanding of how genetics can determine a person's health risks, particularly their risk for a heart attack. He has been a spearhead in the discovery of multiple genes that increase susceptibility for heart attack and continues his research in this area with the Scripps Translational Science Institute. Here, physicians and scientist work together to discover and define the genes that may influence disease. In his productive career as a physician-scientist, he has built an international reputation for his ground-breaking research and expertise. He also started a medical school, with the goal of training future generations of physician-scientists. In addition, he ran the Cleveland Clinic heart program for 14 years, and brought it to the number one ranking by U.S. News and World Report for over 10 years consecutively.

Of special interest to Dr. Topol are genomics, wireless sensors, preventative cardiology (including heart attack prevention), coronary artery disease and preventative medicine. The research that Dr. Topol has done on genomic and wireless digital technologies continues to reshape the future of medicine. Despite his in depth research focus, he continues to see patients at Scripps Clinic, as he believes that research is only as good as what it can do to help others.

**Rick Valencia**

Rick is vice president of Qualcomm and the founder and general manager of Qualcomm Life, a wholly owned subsidiary of Qualcomm Incorporated. He is responsible for day-to-day operations as well as leading the company's product development and technology strategy in the wireless health market. Rick is a true champion of healthcare innovation as evidenced by his efforts at Qualcomm Life and in the broader industry. In addition to running Qualcomm Life, Rick oversees all corporate initiatives that drive innovation in wireless health at Qualcomm, including the strategic partnership with Rock Health and the \$100 million Qualcomm Life Fund. As an advisor to Telcare, Inc., an early-stage health care device manufacturer, Rick helped the company launch the first cellular enabled diabetes blood glucose meter. Rick is currently an active member of HIMSS and mHIMSS, both non-profit organizations, which are advancing the best use of information and technology for the betterment of healthcare.

Previously, Rick founded and served as Chief Executive Officer and Chairman of the Board of ProfitLine, a business he built up from a one-man show into a \$35 million enterprise, with 200 team members and 70 Fortune 1000 clients. ProfitLine made it to the Inc. 500 list of fastest growing companies for three consecutive years. Rick not only built a new business, but was also the driving force behind a lucrative new telecommunications industry. Following this experience, Rick brought his technology expertise and entrepreneurial spirit to HCL Expense Management Services Inc., a \$50 million subsidiary of HCL Technologies, as Chief Executive Officer. In recognition of his proven ability to succeed in business, Rick was awarded the highly coveted Ernst & Young Entrepreneur of the Year Award.

On a personal note, Rick is also a former Chairman and long-time board member of Big Brothers, Big Sisters of San Diego County and a Chairman of the local chapter of the Young Presidents Organization (YPO). Rick currently serves as a mentor at the Founder Institute and on the Executive Committee of the San Diego MIT Enterprise Forum where he helps fellow entrepreneurs launch meaningful and enduring technology companies. Rick earned a bachelor's degree in business administration and finance from California State University Northridge.

## **Ex Officio Members:**

**Jeffrey K. Belk**

Jeffrey Belk is Managing Director of ICT168 Capital, LLC, focused on developing and guiding global growth opportunities in the ICT (Information and Communication Technology space). Formerly, Belk spent almost 14 years at Qualcomm, where prior to his departure in early 2008, he was Qualcomm's senior vice president of strategy and market development, focused on examining changes in the wireless ecosystem and formulating approaches to help accelerate mobile broadband adoption and growth.

From 2000 until 2006, Belk was senior vice president, global marketing, leading a team responsible of all facets of the company's corporate messaging, communications, and marketing worldwide. In 1999-2000, Belk was SVP & GM of Qualcomm Eudora Products, Qualcomm's award winning email client. In 1997, Belk was named VP, marketing of Qualcomm Consumer Products, and initiated the company's global branding and communications efforts. Prior to Qualcomm, Belk spent ten years in the early growth years of the PC industry, primarily with Proxima Corporation. Belk joined the company in 1983, when the company was less than 25 employees, and was with the company through its IPO in the early 90's in several key distribution, product management, and international roles.

Belk is on the Board of Directors of Peregrine Semiconductors, InterDigital Corporation, as well as the Board of the Wireless Life Sciences Alliance. He has a BA in Economics from University of California, San Diego, and an

M.B.A. from the University of California, Irvine. He is known globally as a commentator and writer on wireless, mobile broadband, and technology evolution.

**M. Wainright Fishburn, Jr.**

Wain Fishburn is a founding partner of Cooley LLP's San Diego office and represents high growth technology and life sciences corporations ranging from start-up to public. Mr. Fishburn is an active community leader and has shaped many industry organizations. He is a founding board member of the Corporate Directors Forum, as well as BIOCOM, where he currently serves as Vice Chair of the BIOCOM Board of Directors. He is a member of the Board of Trustees and the Executive Committee of the Sanford-Burnham Institute for Medical Research. He serves on the Board of Directors for the Critical Path Institute, an independent institute created in part by the FDA, dedicated to improving the regulatory path for innovative medical therapies. Mr. Fishburn is a founder of two public companies and prior to law school, worked in the corporate environment assisting with the divestiture of a group of 12 operating companies.

He received his J.D. degree from the University of California, Hastings College of the Law, and has served as President of the Hastings Board of Governors.

**Sharon Henry**

Sharon Henry currently directs wireless initiatives for Emergency Medical Services Corporation (EMSC), the nation's leading provider of ambulance and outsourced physician services. American Medical Response provides the nation's largest emergency and non-emergency ambulance service, while EMCARE is the leading provider of outsourced physician services to hospital emergency departments, inpatient physician services, inpatient radiology management programs and anesthesiology services. EMSC also provides air ambulance service and offshore medical services to oil platforms in the Gulf. EMSC provides services each year to more than 10 million patients in more than 2,000 communities nationwide. Sharon's background in market application and implementation allows EMSC to move further into wireless digital medicine.

Sharon has been in the ambulance service business for thirty years, ten of which were in mergers and acquisitions during the roll-up of ambulance companies to large providers in the late 1990s. She co-founded MedicWest Ambulance in Las Vegas, Nevada which grew from a start-up to becoming a large provider in all of Clark County, including the famous Las Vegas Strip. MedicWest was sold to EMSC in 2007, and is now the sole provider of service in the Las Vegas market. Sharon has managed large national performance based ambulance contracts and 911 emergency call centers.

She has a B.S. Degree from Oregon State University and an M.B.A. from the University of California, Irvine.

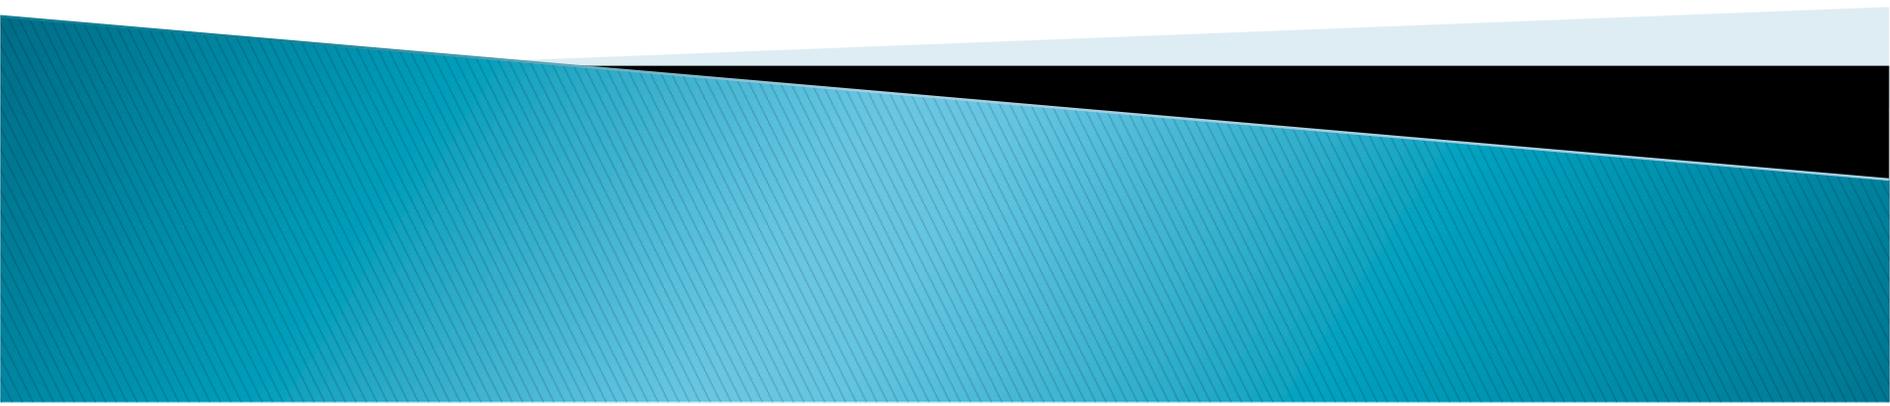

# Wireless Utility Meter Safety Impacts Survey

Final Results Summary

September 13, 2011

Ed Halteman, Ph.D., Consultant

303.818.3679

# Table of Contents

- Objective and Methods Page 3
- Executive Summary Page 4–6
- Demographics Page 7–11
- Wireless Meter Installations Page 12–17
- Wireless Meter Effects Page 18–23
- Complaints to Utility and PUC Page 24–28
- Factors Associated w/Health Symptoms Page 29–31
- Verbatim Comments Page 32–34
- Survey Questions Page 35

# Objectives

- ▶ To investigate reported public health and safety complaints about wireless utility meters.
- ▶ To evaluate the impacts on health and safety due to wireless utility meters.
- ▶ To determine whether further study is warranted.

## METHODS

- ▶ Survey was designed by the EMF Safety Network (Network).
- ▶ The survey was circulated online through various social media outlets including Networks email list, Facebook, and the California EMF Safety Coalition (a discussion group). The survey was also posted on Networks website: [www.emfsafetynetwork.org](http://www.emfsafetynetwork.org) where visitors were invited to take the survey.
- ▶ 443 responses were received from 7/13/2011 through 9/2/2011.
- ▶ Network commissioned Survey Design and Analysis (SDA) to provide this report of the survey findings.

# Executive Summary – Part I

- ▶ Respondent Makeup
  - 93% are over 40 years old and 43% are over 60 years old
  - 73% are women
  - 78% are from California
  - 68% have Pacific Gas and Electric (PG&E) as their utility provider
  - 49% are EMF Sensitive
- ▶ 41% have had a new wireless meter installed in their home; of these . . .
  - 56% have had it installed for at least six months
  - 89% have electric meters, 53% gas meters and 10% water meters
  - 35% saw an increase in their utility bill
  - 26% have experienced some type of interference
  - 8% experienced burned out appliances or damaged electronics including TV, stereo, computer, refrigerator and other.
- ▶ 76% indicated they have wireless utility meters installed in their neighborhood, town or city.
  - 44% near their home
  - 36% in town

# Executive Summary – Part II

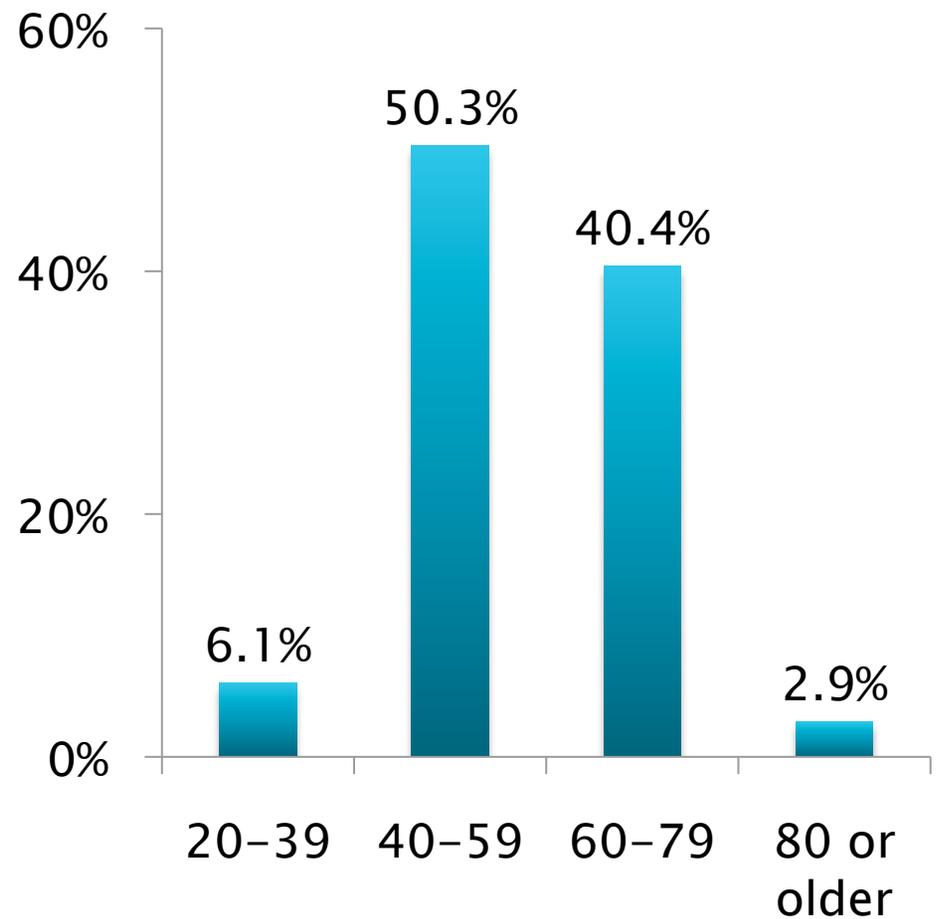

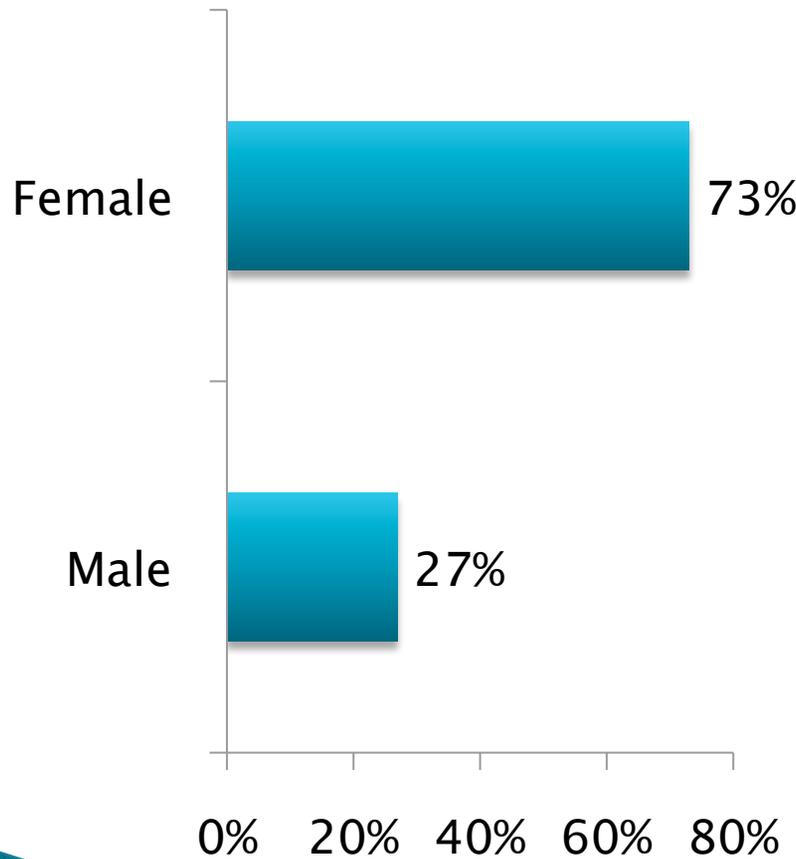

- ▶ Top health issues since new meters installed
  - Sleep problems (mentioned by 49%)
  - Stress, anxiety and irritability (43%)
  - Headaches (40%)
  - Ringing in the ears (38%)
  - Heart problems (26%)
- ▶ 40% (111 people) of those having wireless meters in their homes or community have complained to their utility provider.
  - 96% of these people were either “Unsatisfied” or “Very Unsatisfied” with the handling of their complaint.
- ▶ 32% (88 people) complained to the utilities commission.
  - 96% of these people were either “Unsatisfied” or “Very Unsatisfied” with the handling of their complaint
- ▶ 94% of respondents want to retain or restore their analog meters and 92% of these respondents do not think they should have to pay any additional money.

# Executive Summary – Part III

- ▶ Statistical testing shows the top health symptoms are positively associated with
  - EMF Sensitivity
  - Wireless meters installed in the home

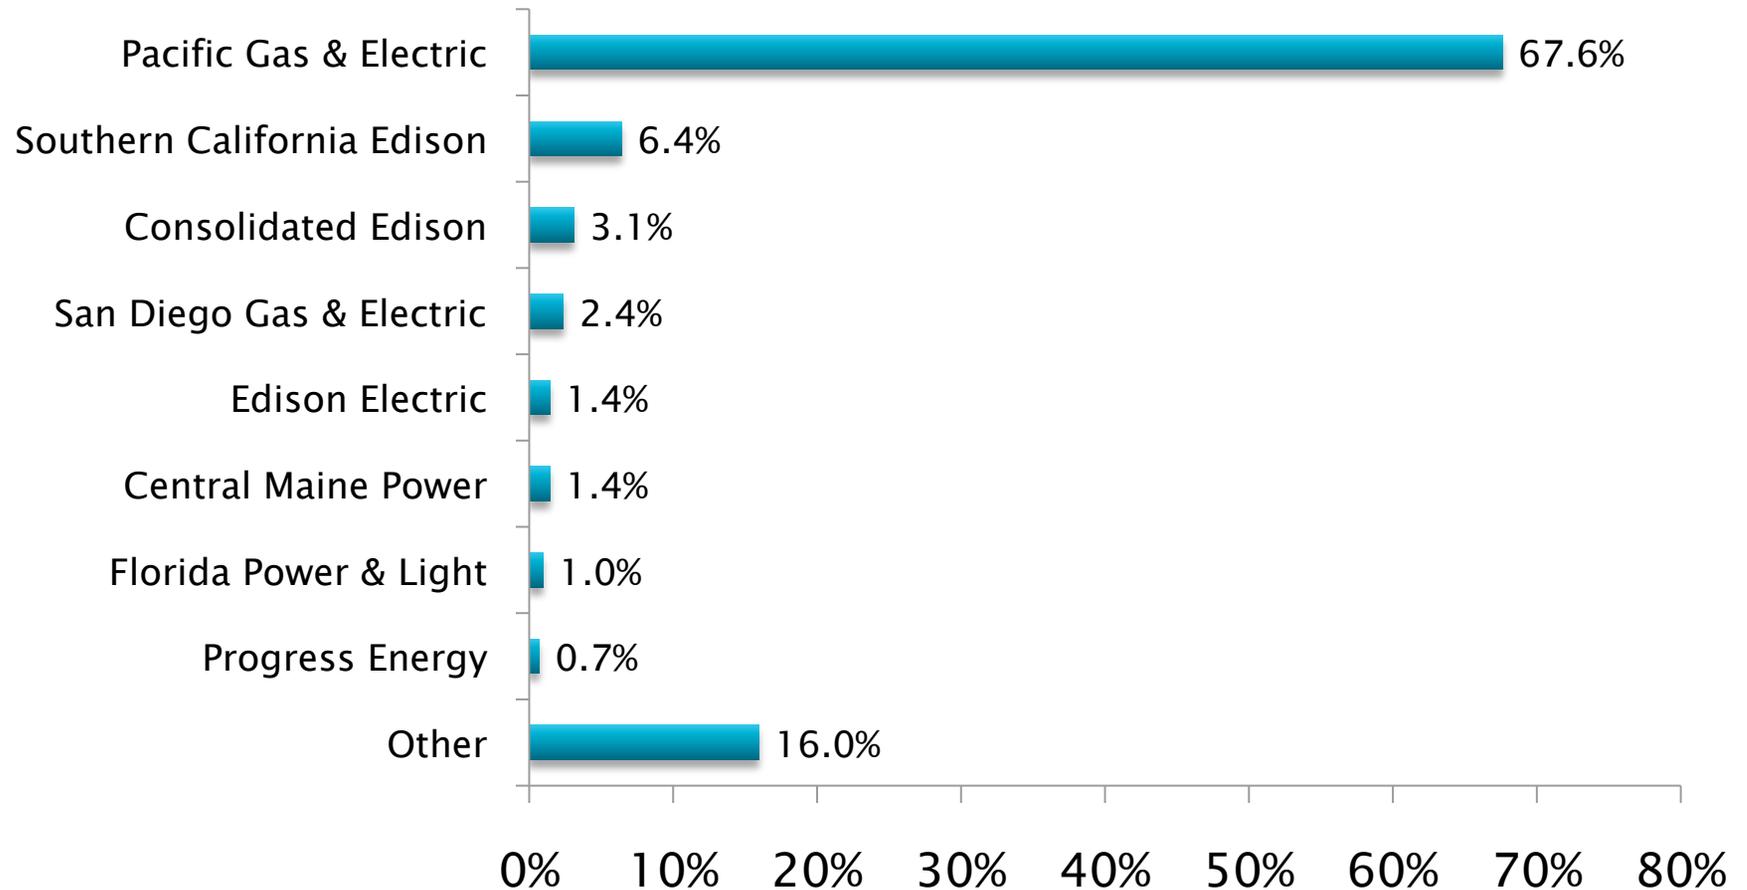

# Demographics

# Respondent Gender and Age

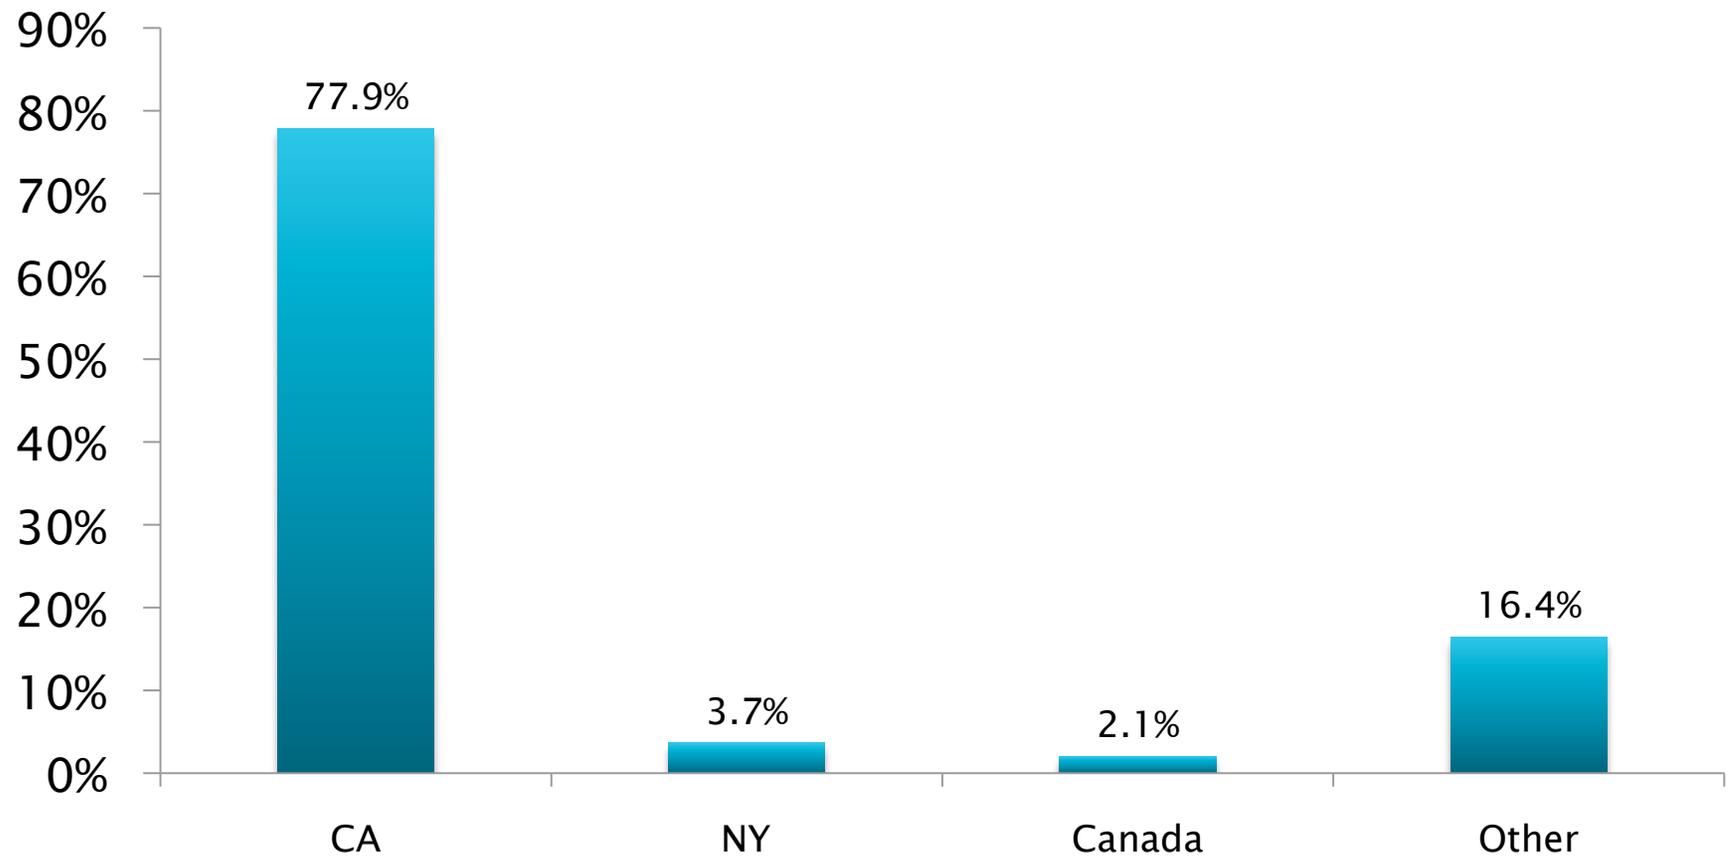

# Utility Provider

Please indicate the name of your utility provider(s). N=420

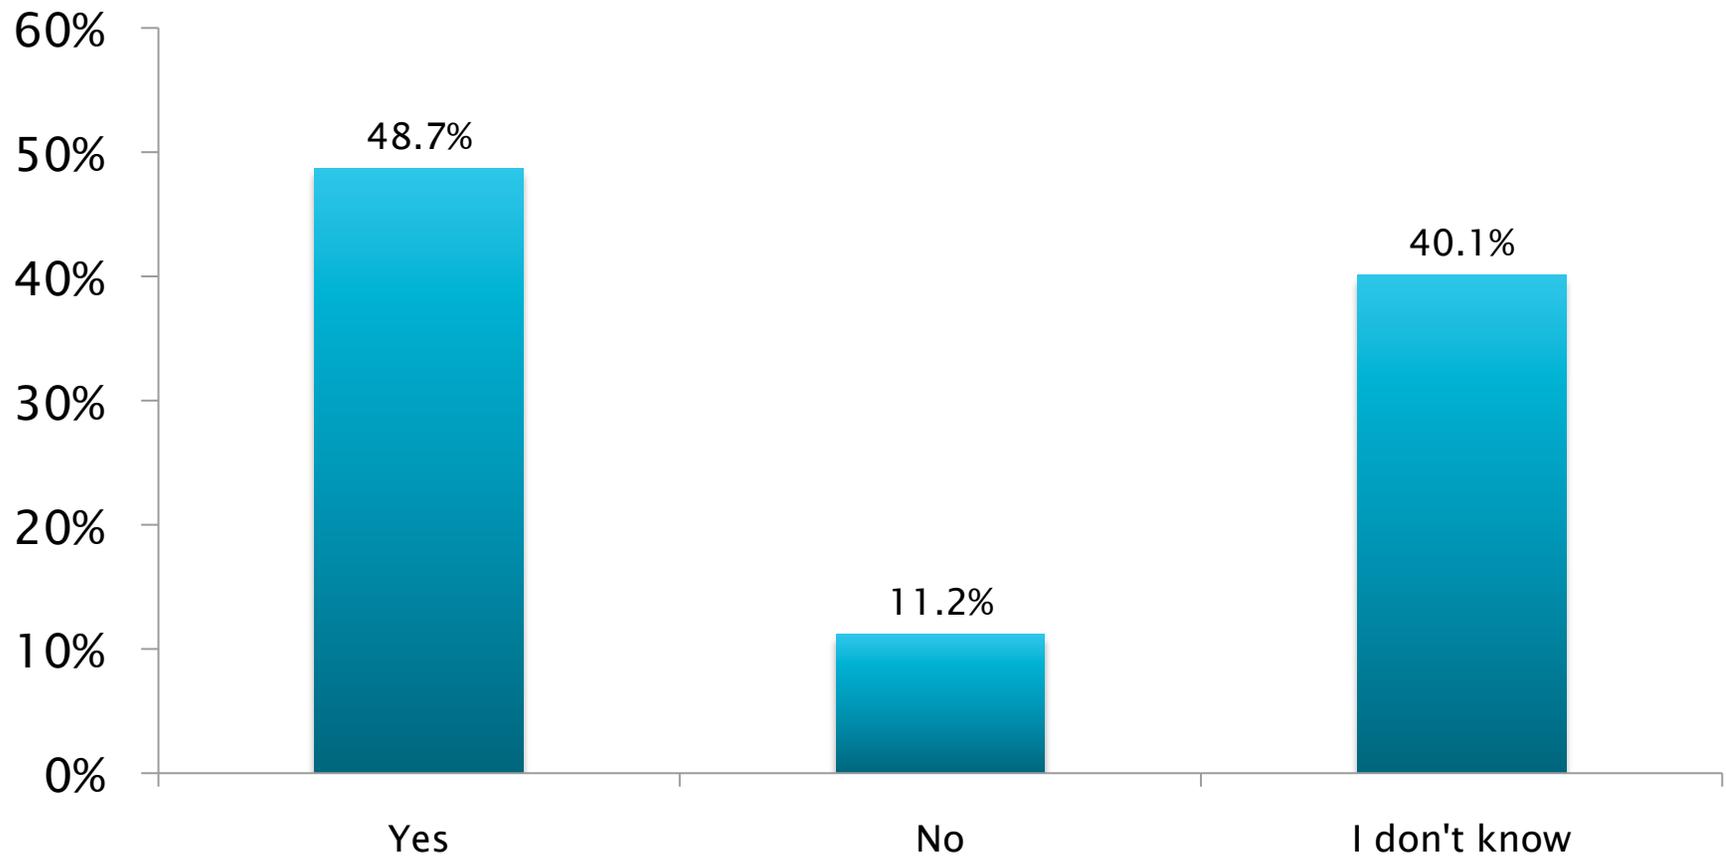

# Place of Residence

Where do you live? N=439

# EMF Sensitivity

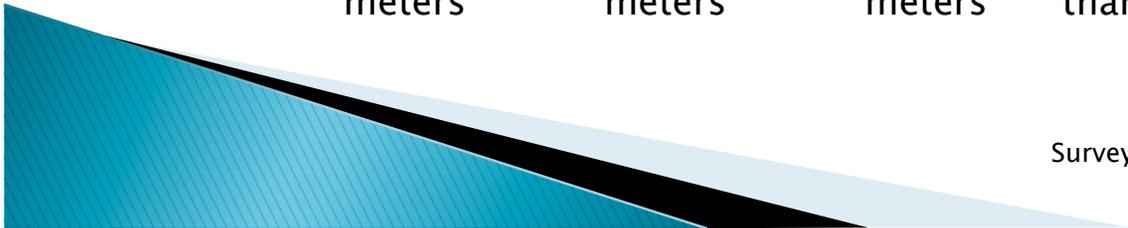

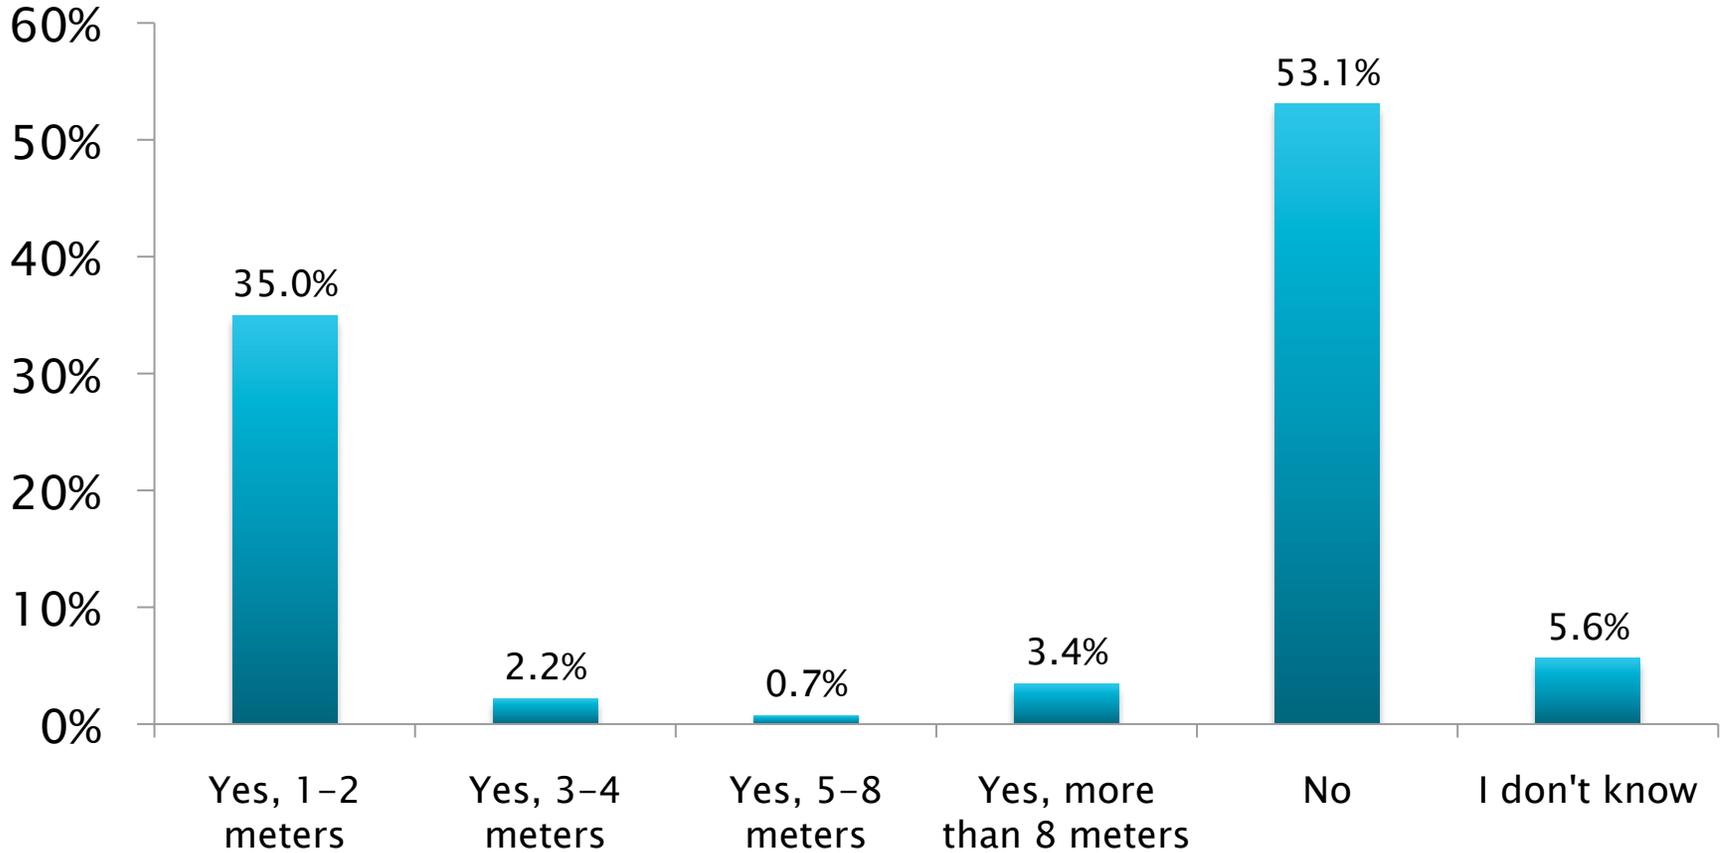

Are you, or is a member of your household, EMF sensitive? N=439

# Wireless Meter Installations

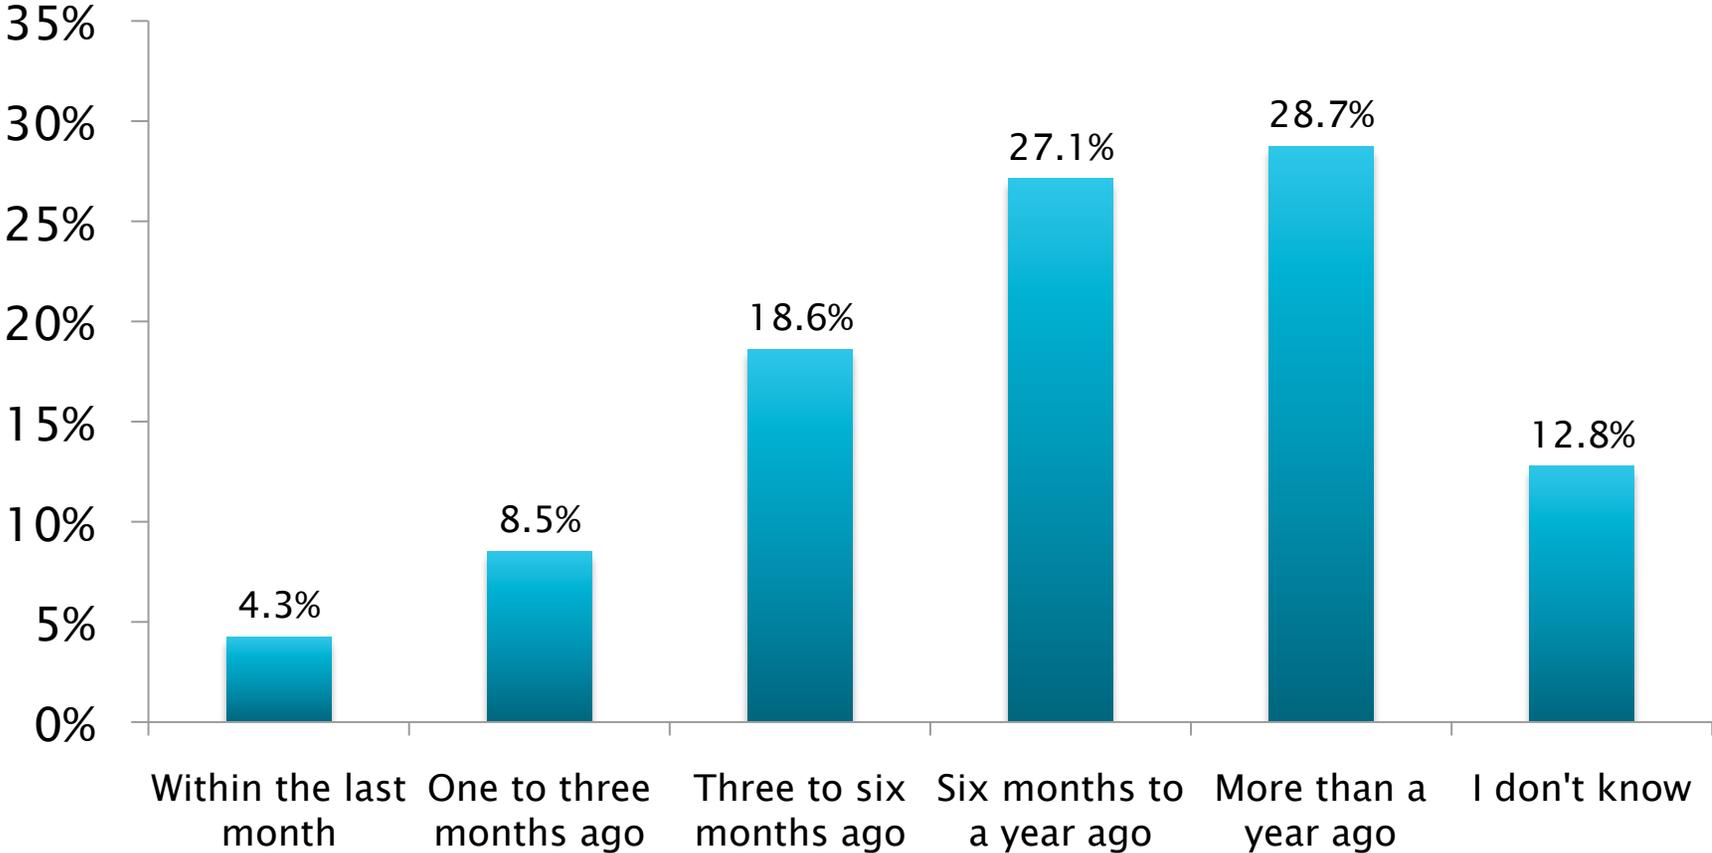

# Wireless Utility Meter Installed in Home

Have you had a new wireless utility meter installed on your home? N=409

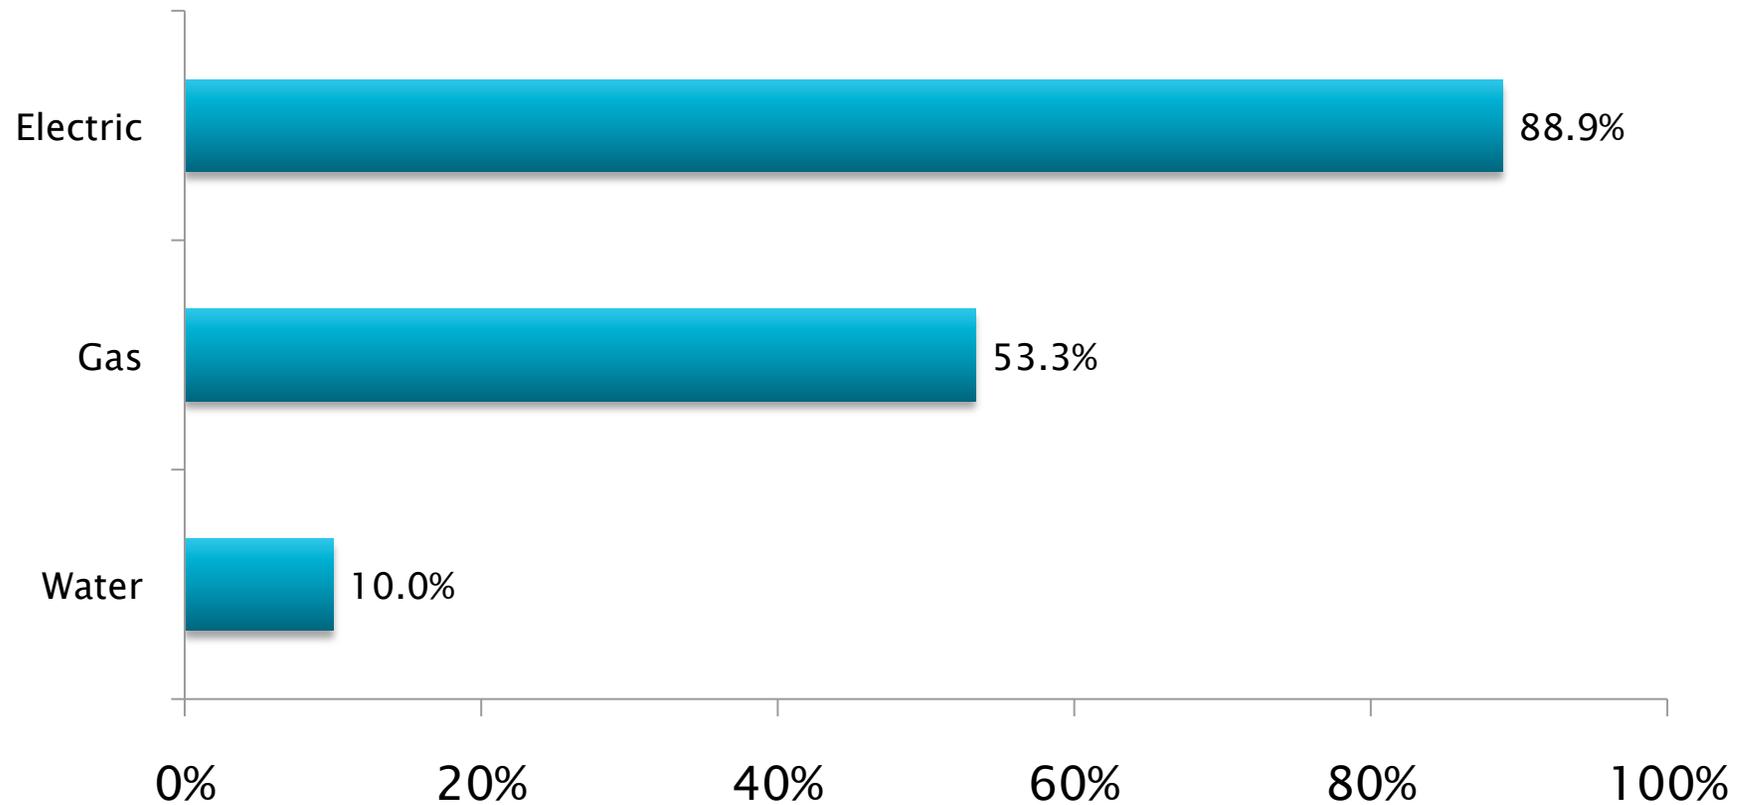

# Wireless Utility Meter Install Time

If yes, how long ago was it installed on your home? N=188

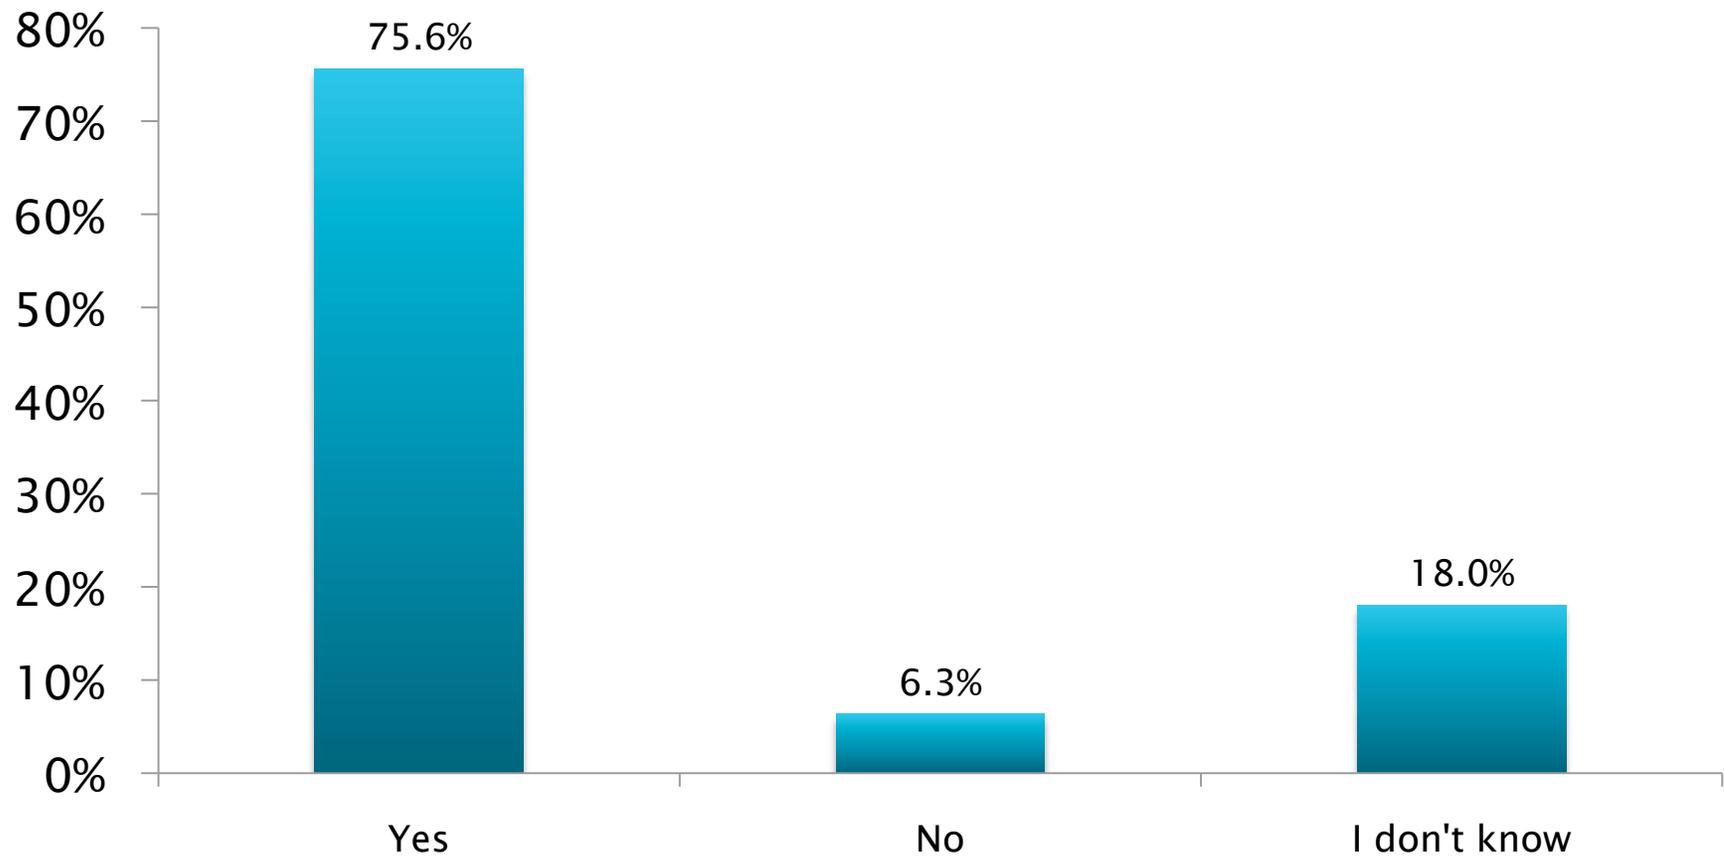

# Type of New Meter Installed

If yes, please indicate the type of new meter installed on your home. (Check all that apply)  
N=160

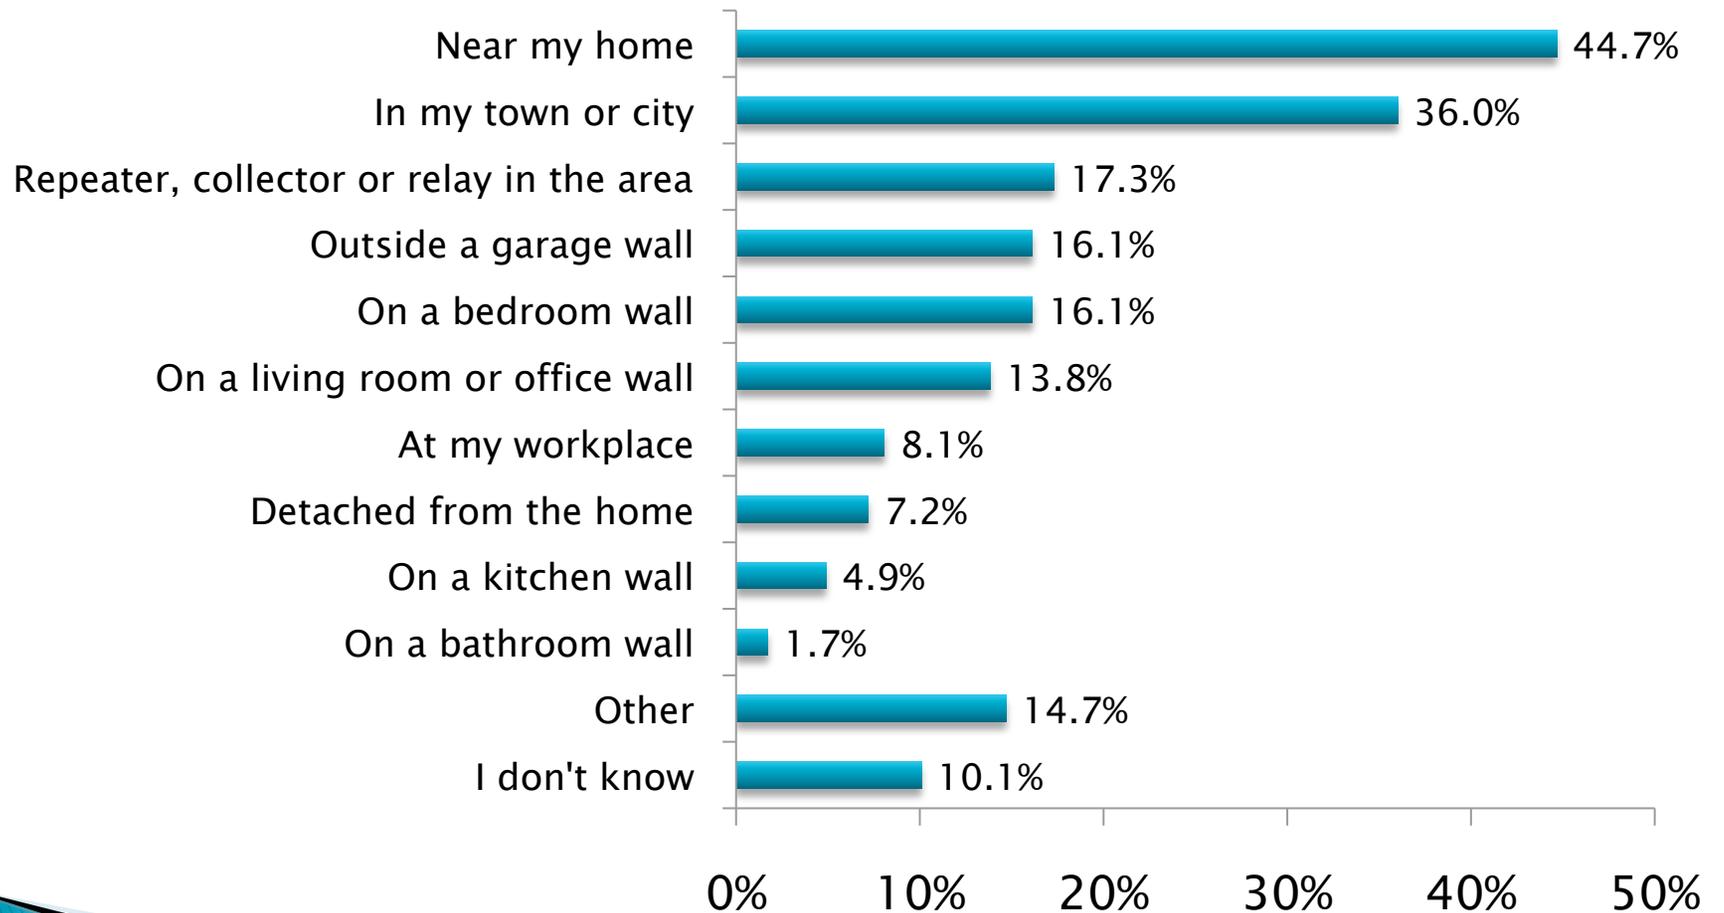

# Wireless Meters Deployed Near By

Do you have new wireless utility meters deployed in your neighborhood, apartment building, area, town or city? N=394

# Meter Placement

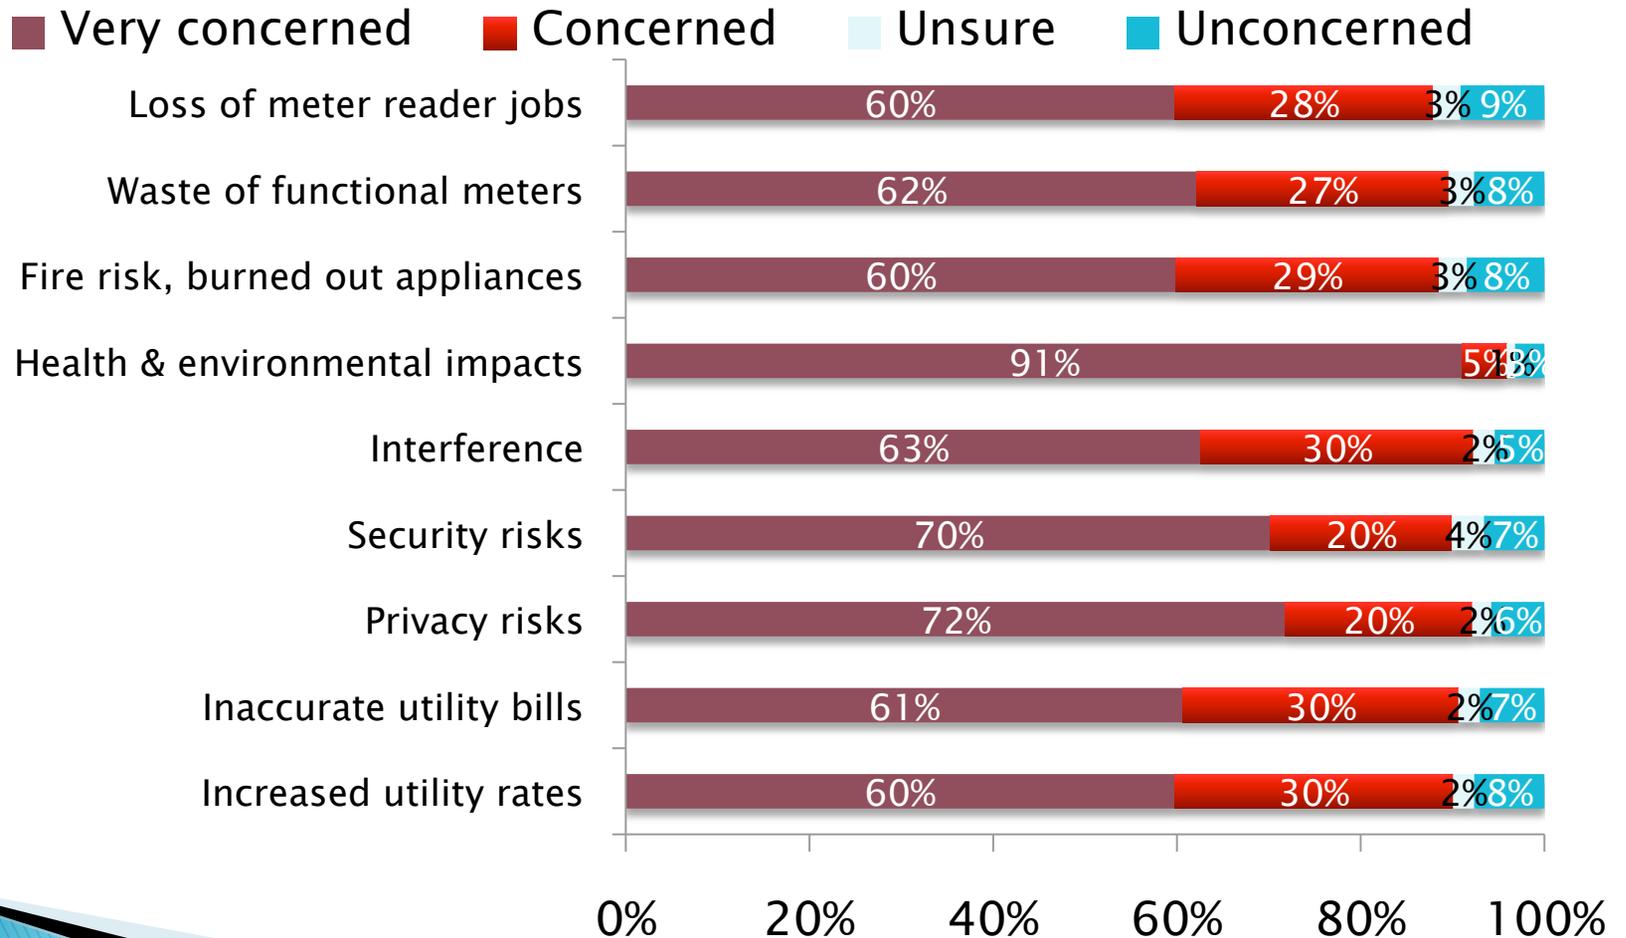

Please describe the placement of the wireless utility meters in relation to where you live.  
(Check all that apply. ) N=347

# Wireless Meter Effects

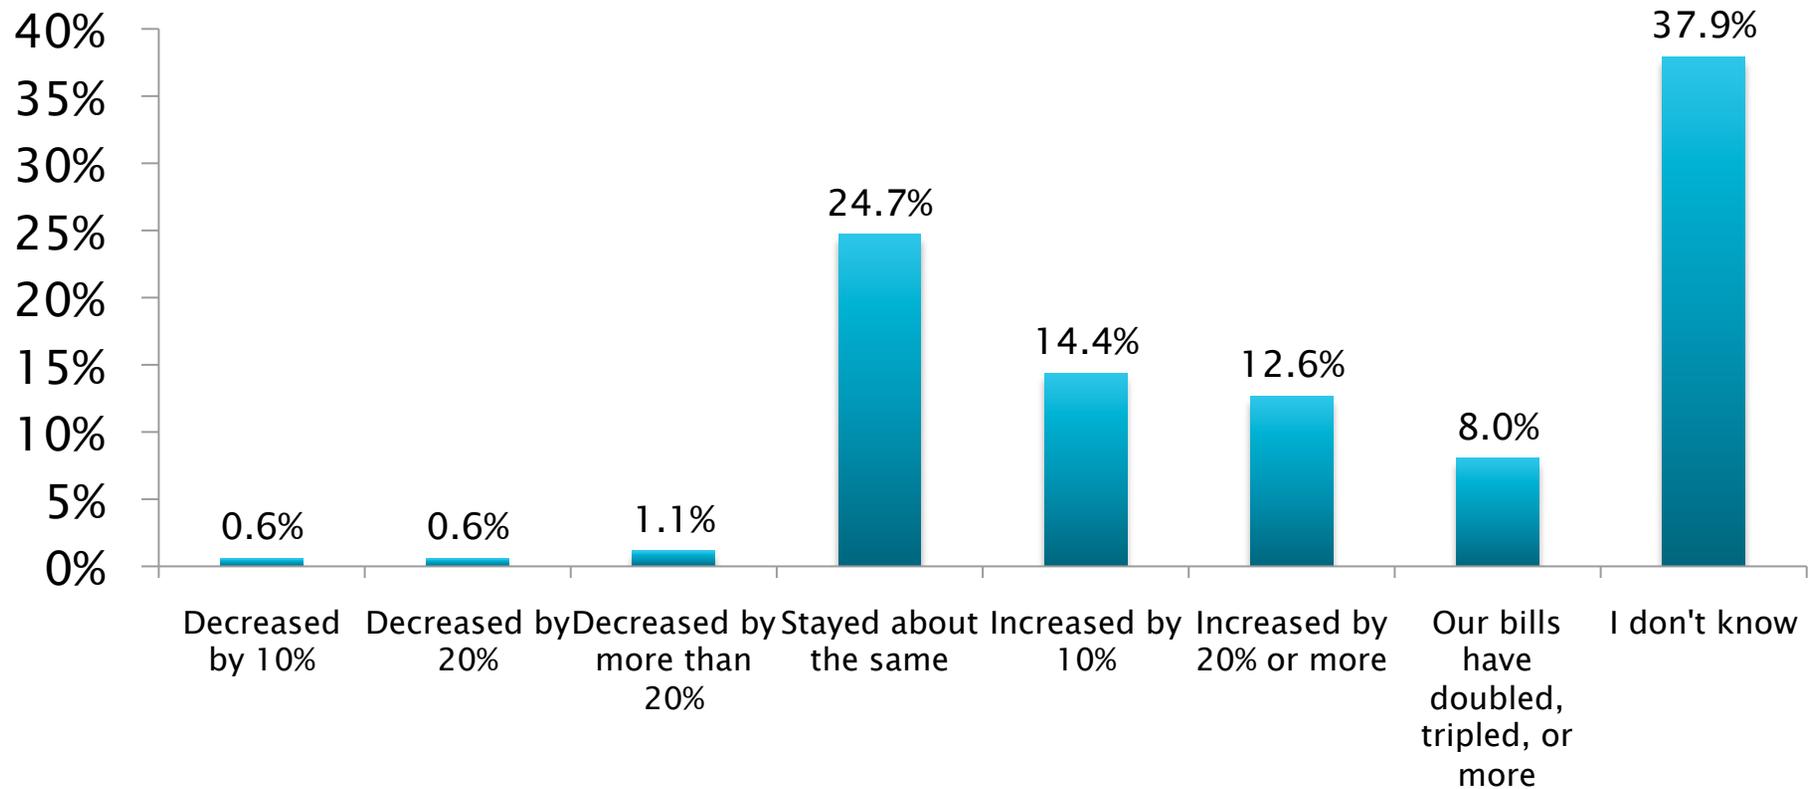

# Concern Over Wireless Utility Meters

How concerned are you about the reported problems with the new wireless Smart Grid utility meters, also known as Smart Meters (AMR, AMI, AED)? Check all that apply. N=425-432

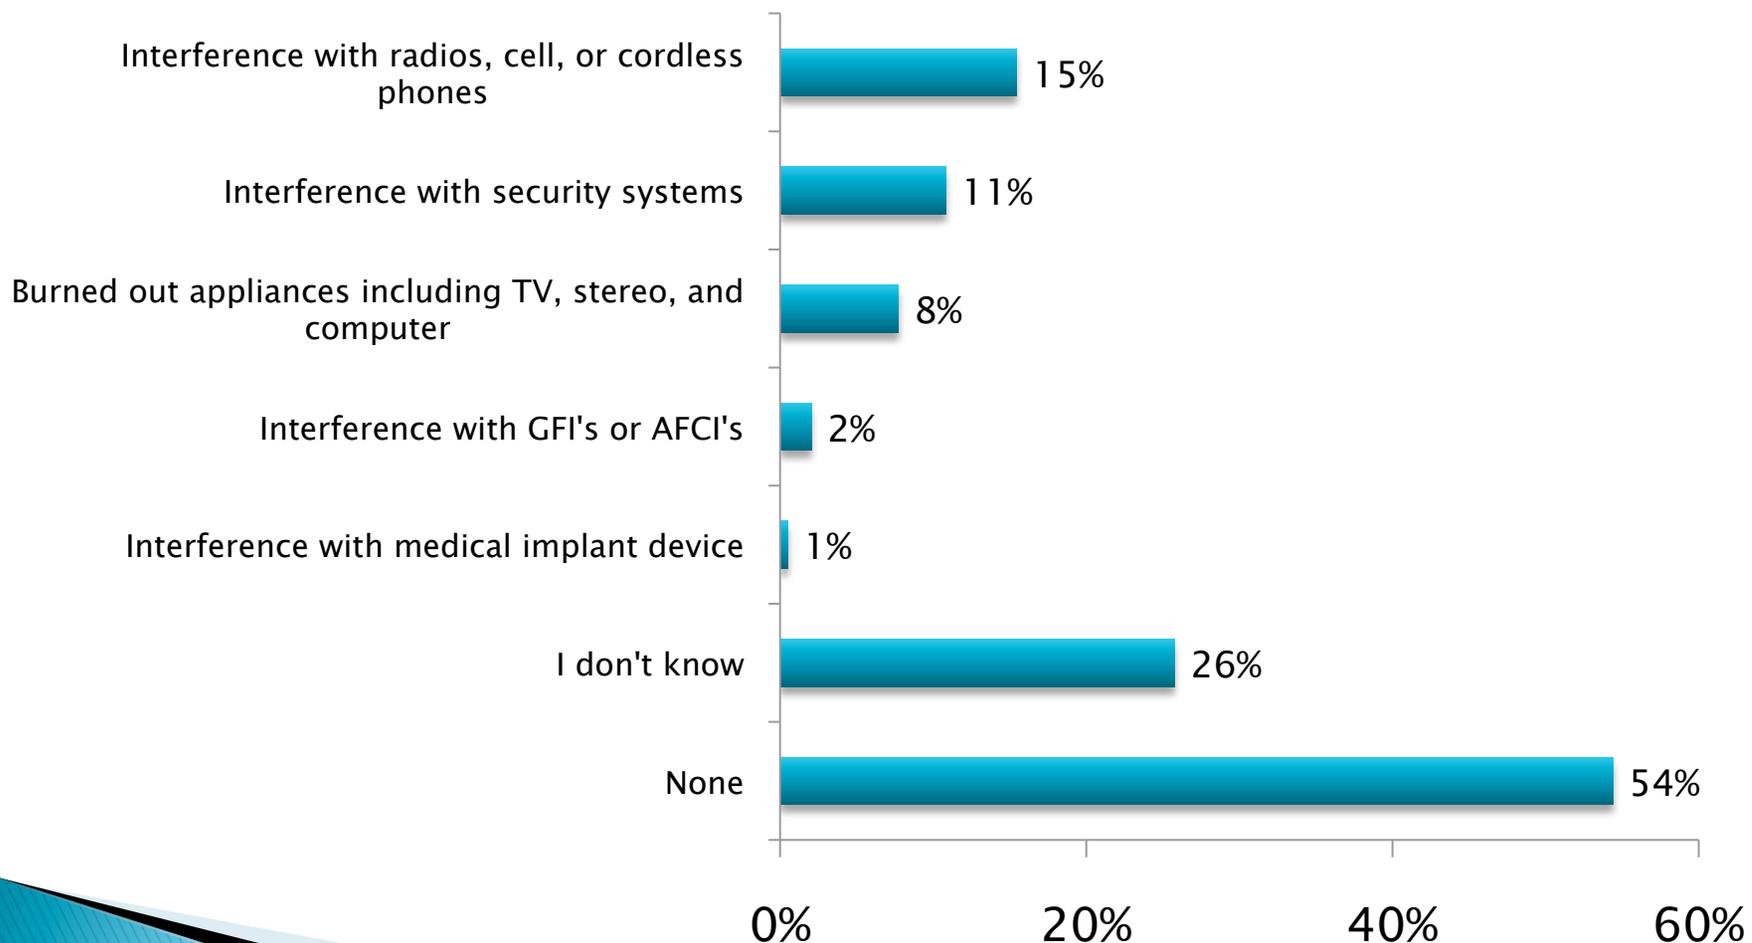

# Change in Utility Bill

If yes, have your bills increased, decreased or stayed about the same? N=174

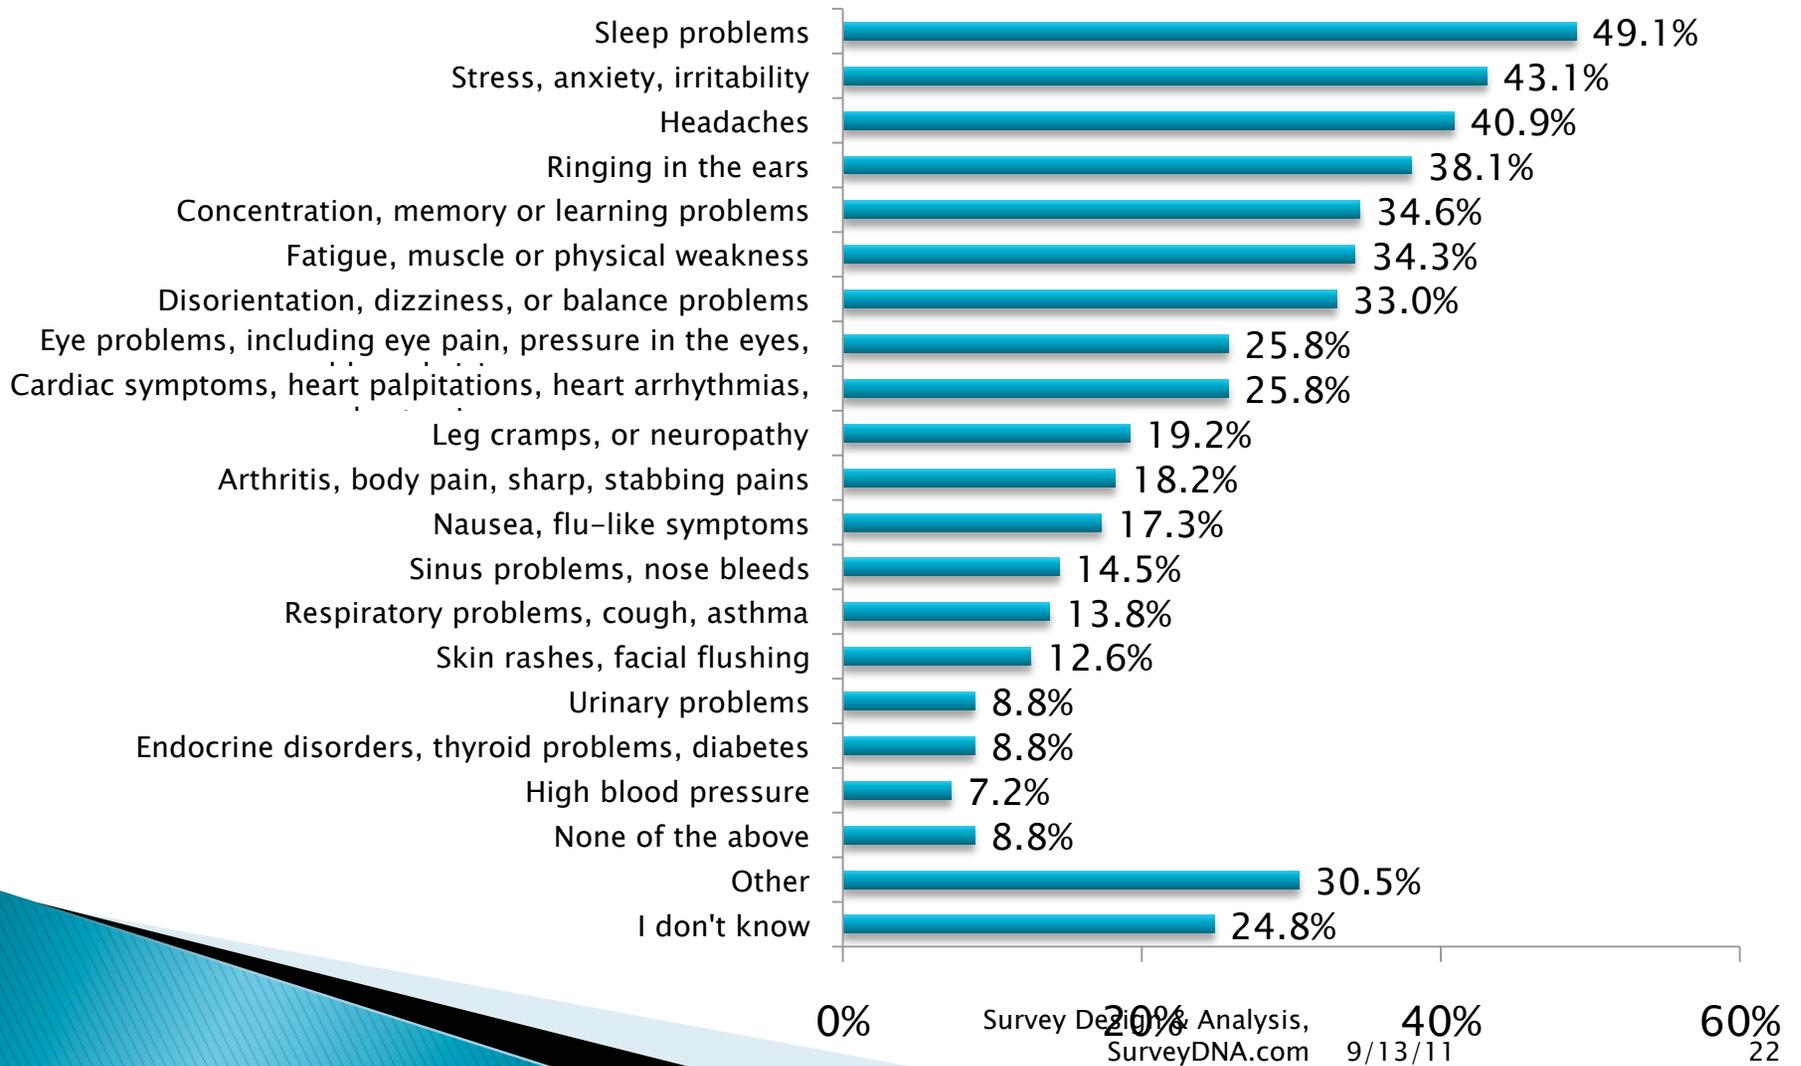

# Interference, Damage or Fire

If yes, have you experienced interference, damaged equipment, or a fire since the new meter(s) has been installed? (Check all that apply) N=194

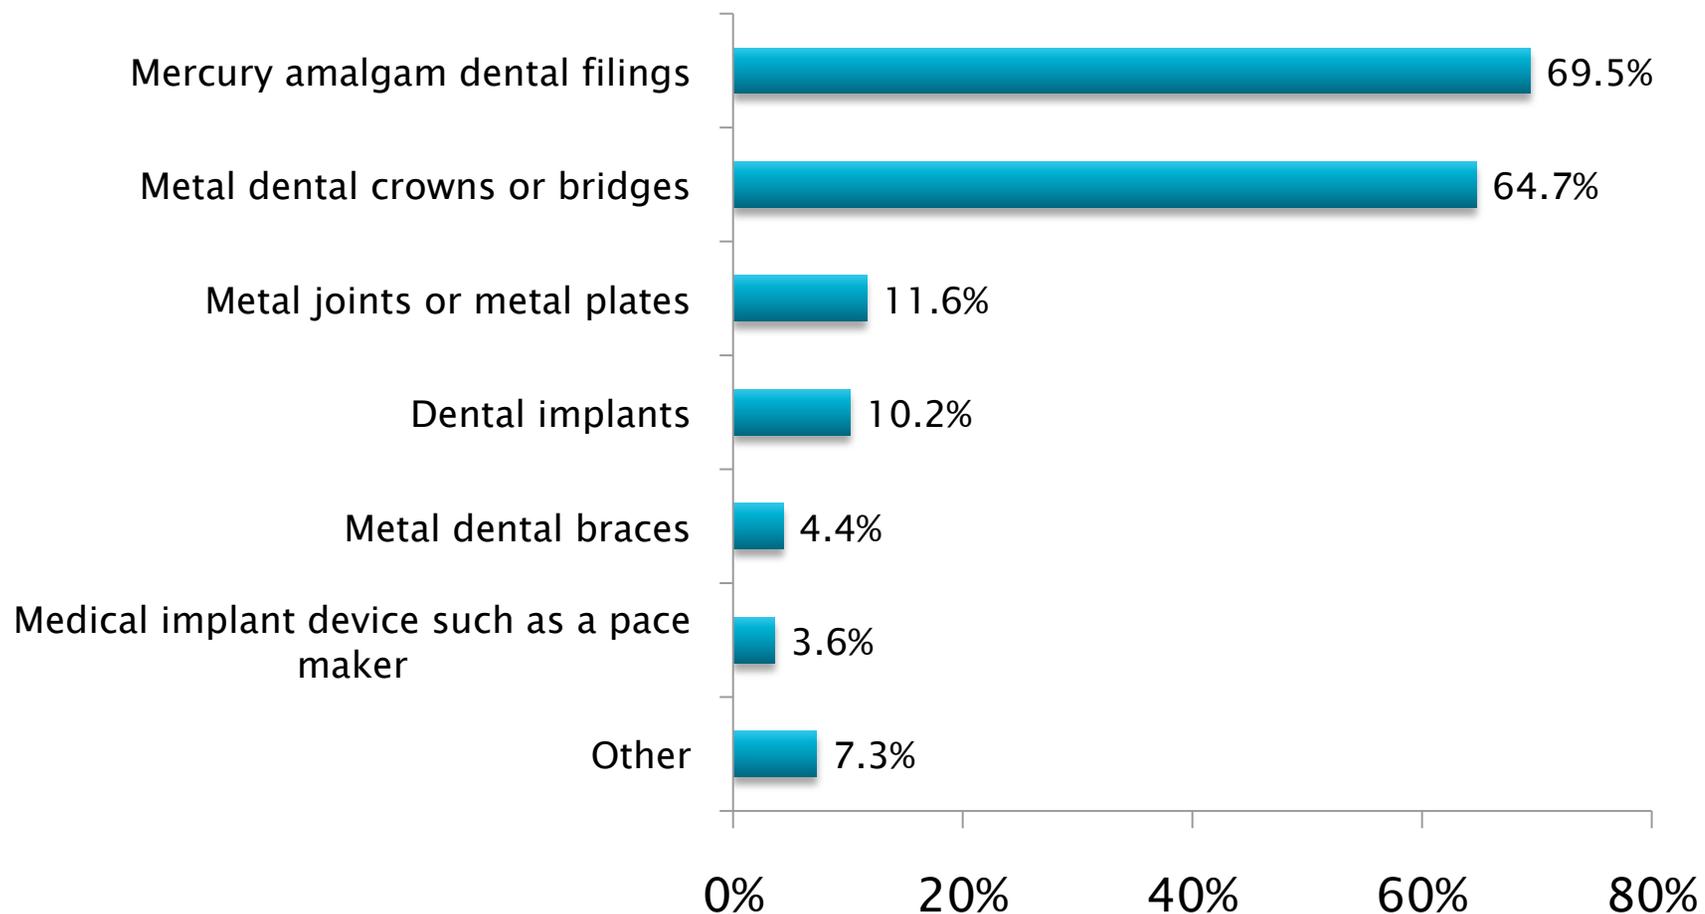

# New/Worsened Health Symptom

Have you, or anyone in your household, experienced new or worsened health symptoms since the new wireless utility meters have been installed on your home, in your neighborhood, apartment building, area, town or city? (Check all that apply) N=318

# Dental Work/ Metal Implants

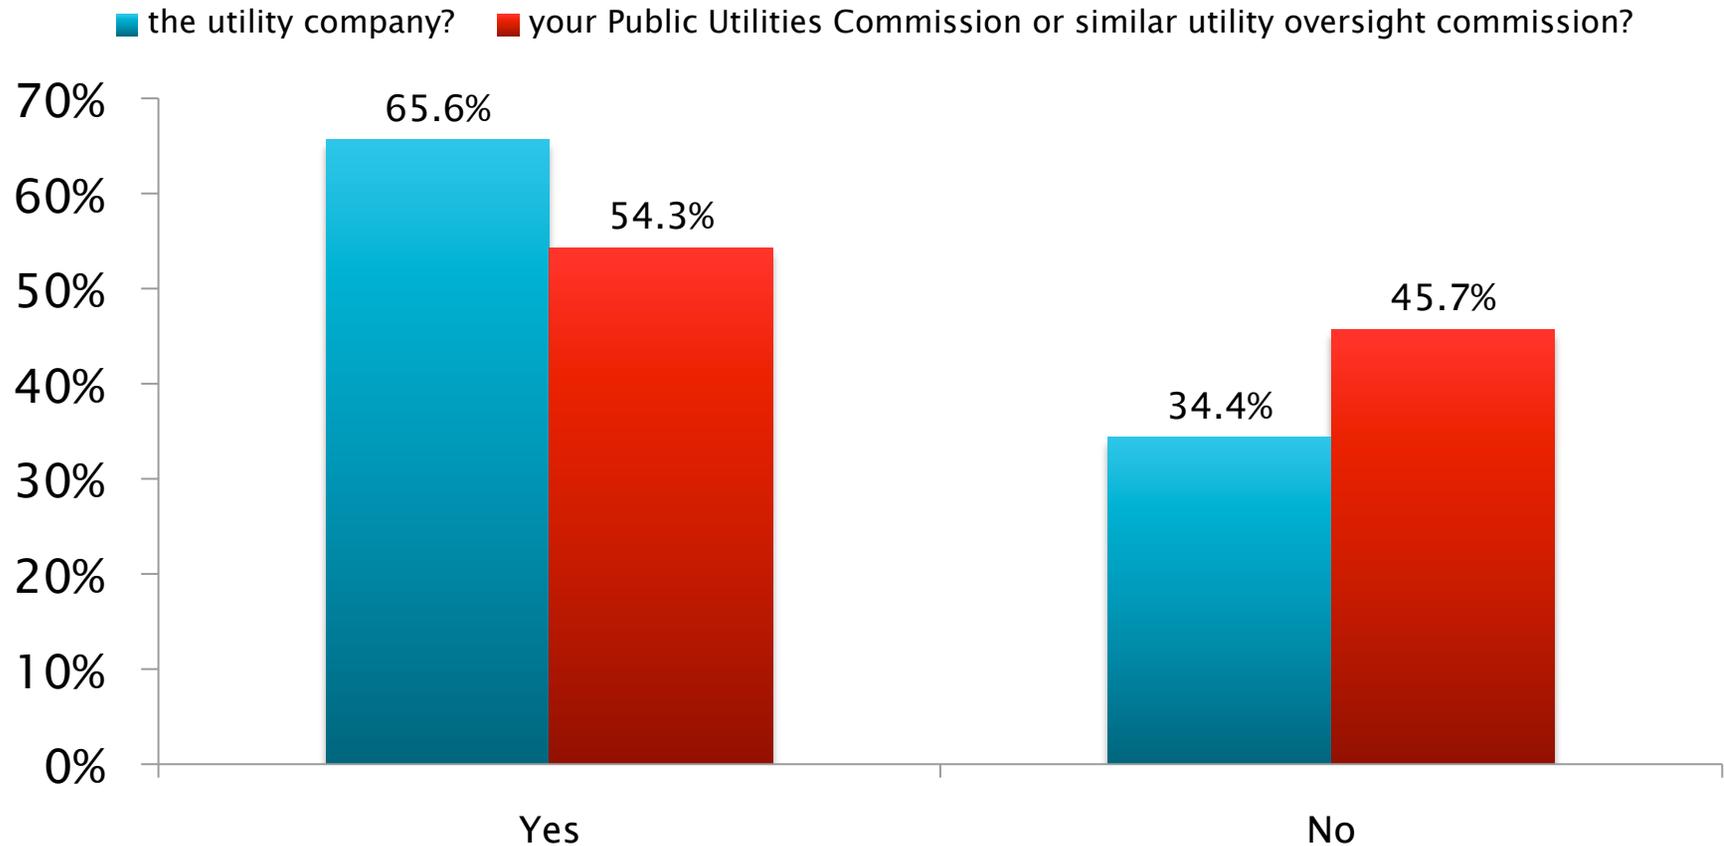

Do you have one or more of the following? (Check all that apply.) N=275

# Complaints to Provider and PUC

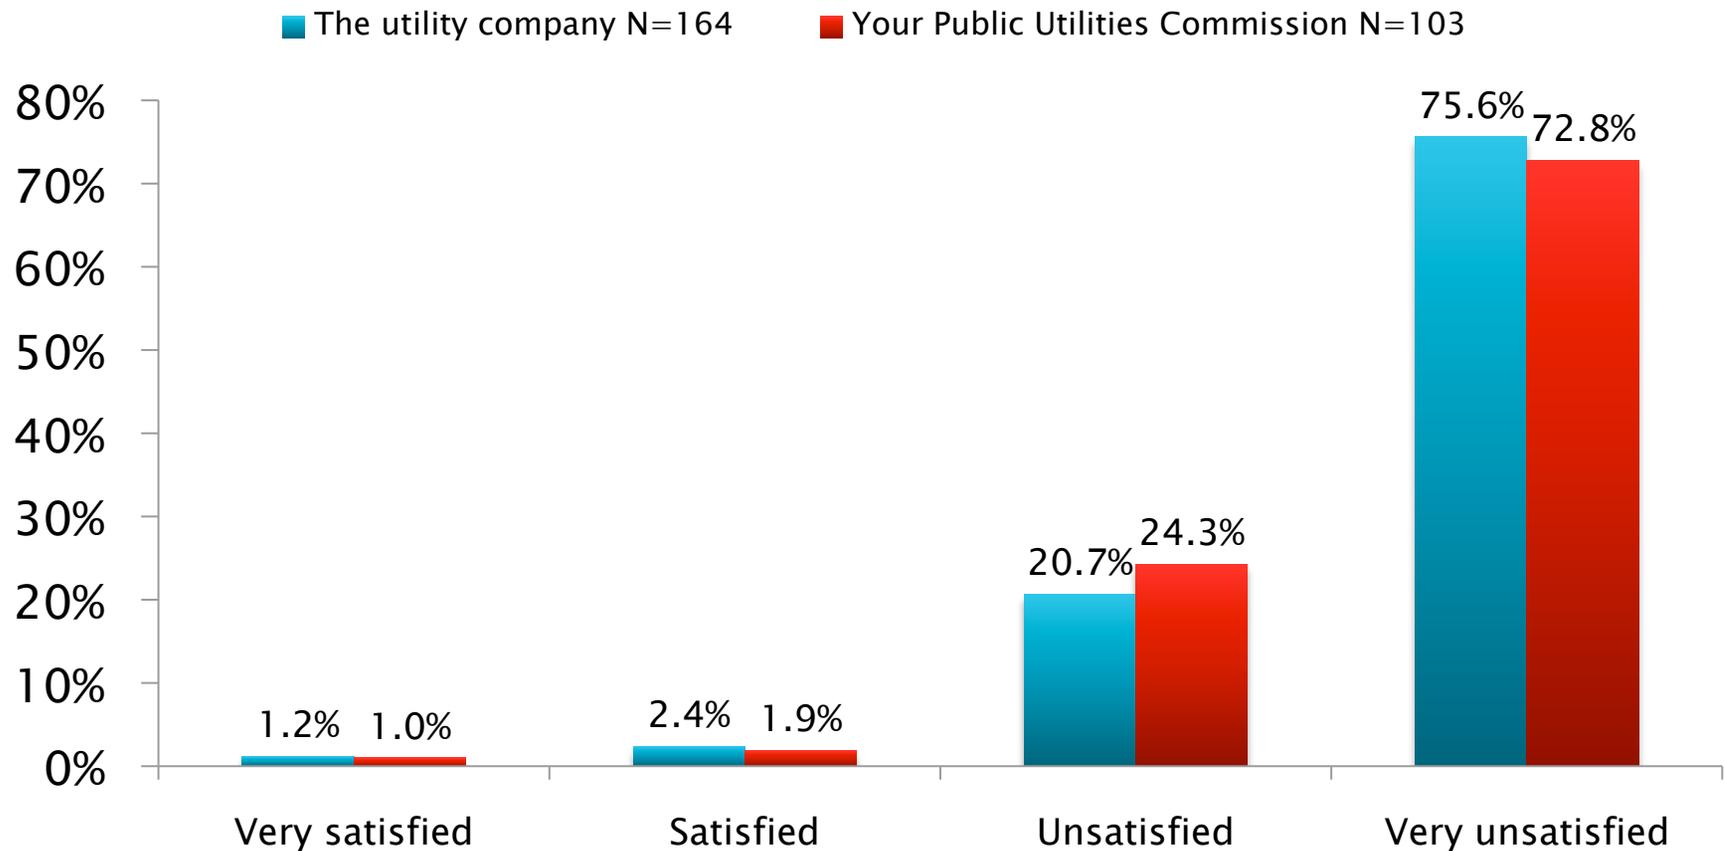

# Complained to Utility Company

If you have experienced problems with the new wireless utility meter(s), have you complained to... N=195

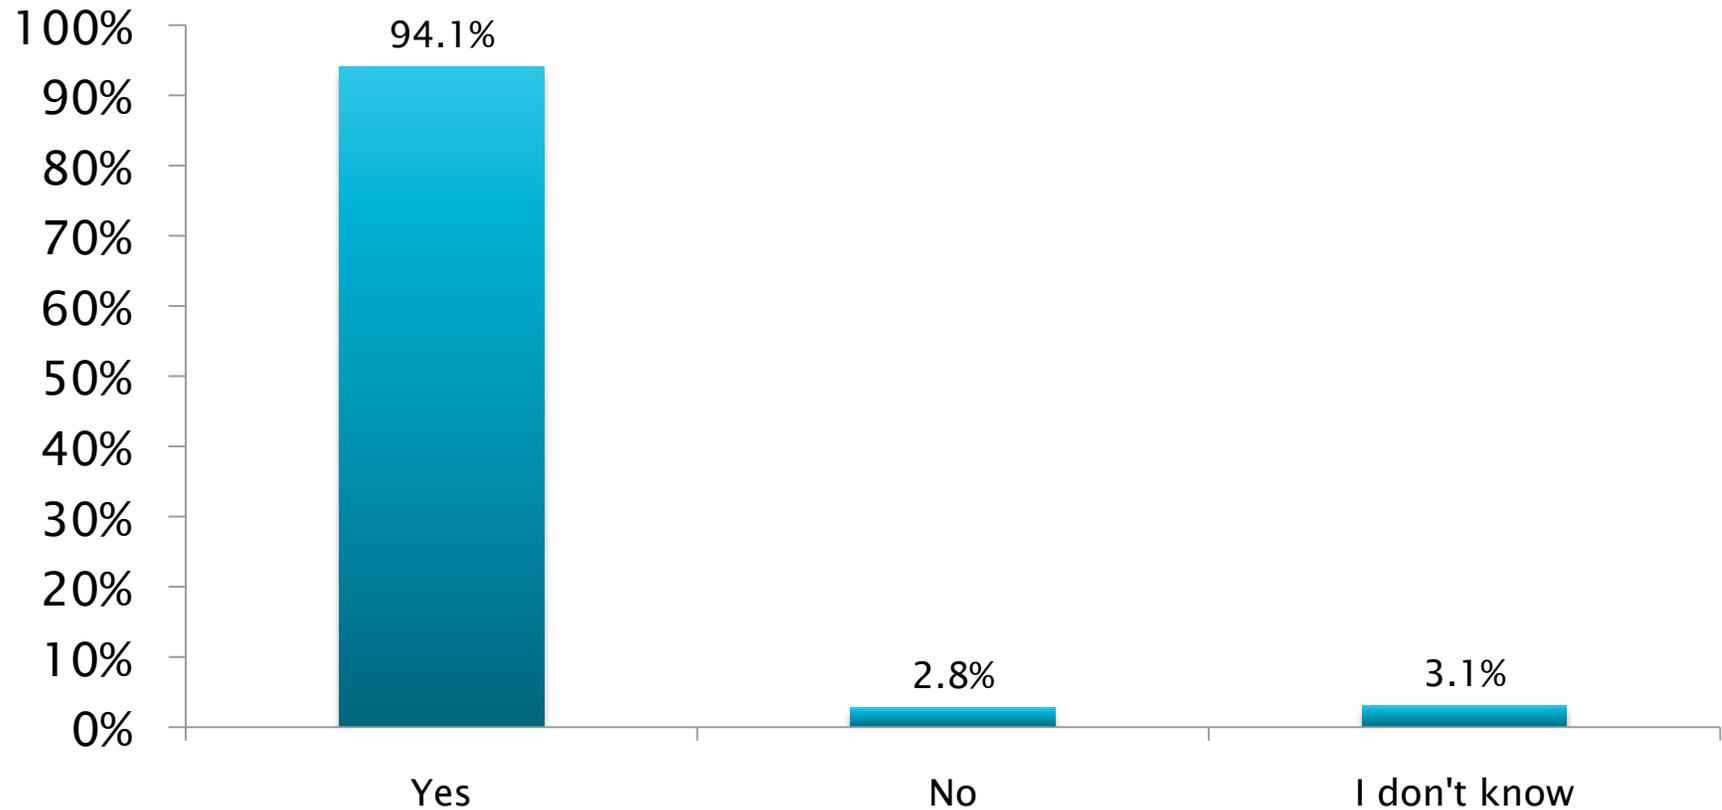

# Satisfaction with Complaint Handling

How satisfied are you about how they handled your complaint?

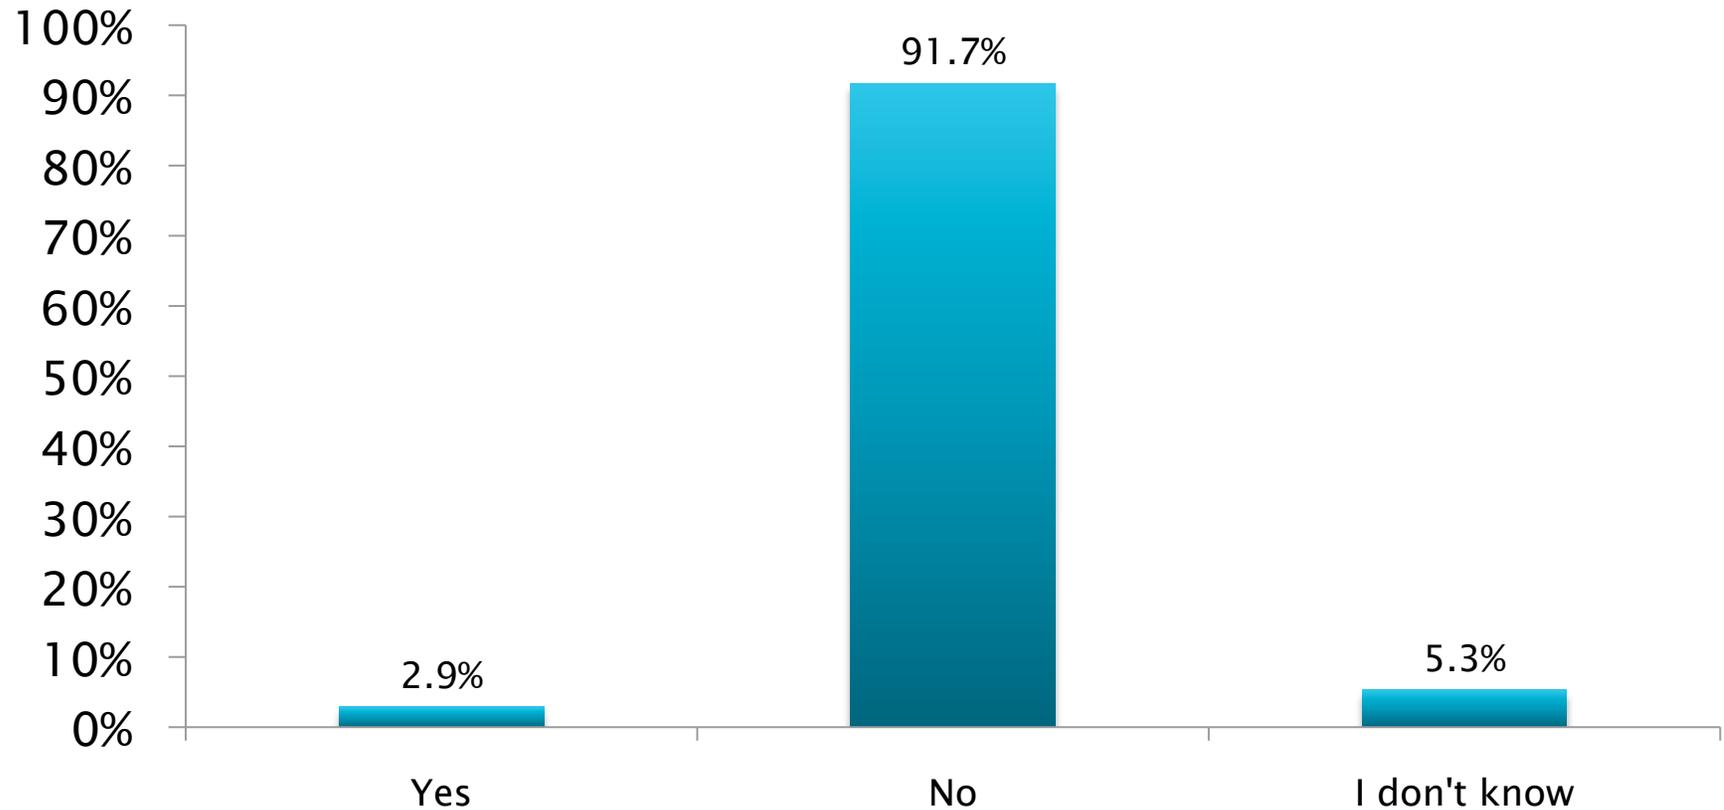

# Prefer to Retain Analog Meters

Would you prefer to retain or restore the analog (also known as electromechanical meter) utility meters and a meter reader? N=387

# Pay Extra for Analog Service

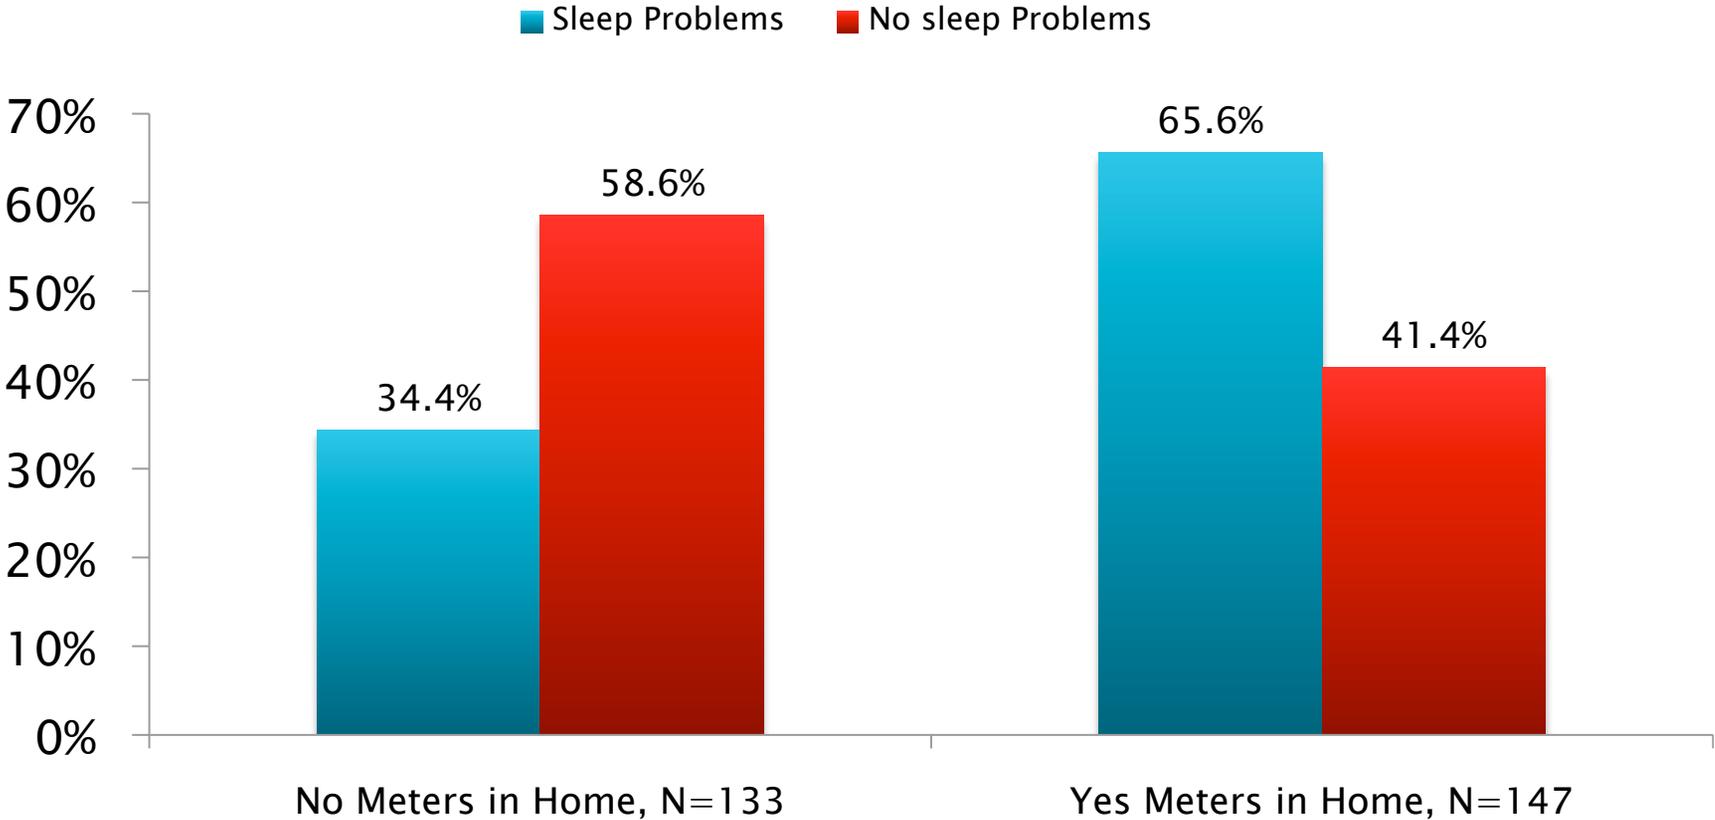

If yes, do you think you should pay more for the analog service? N=374

# Factors Associated with Health Symptoms

# Sleep Problems\* by Meters in the Home

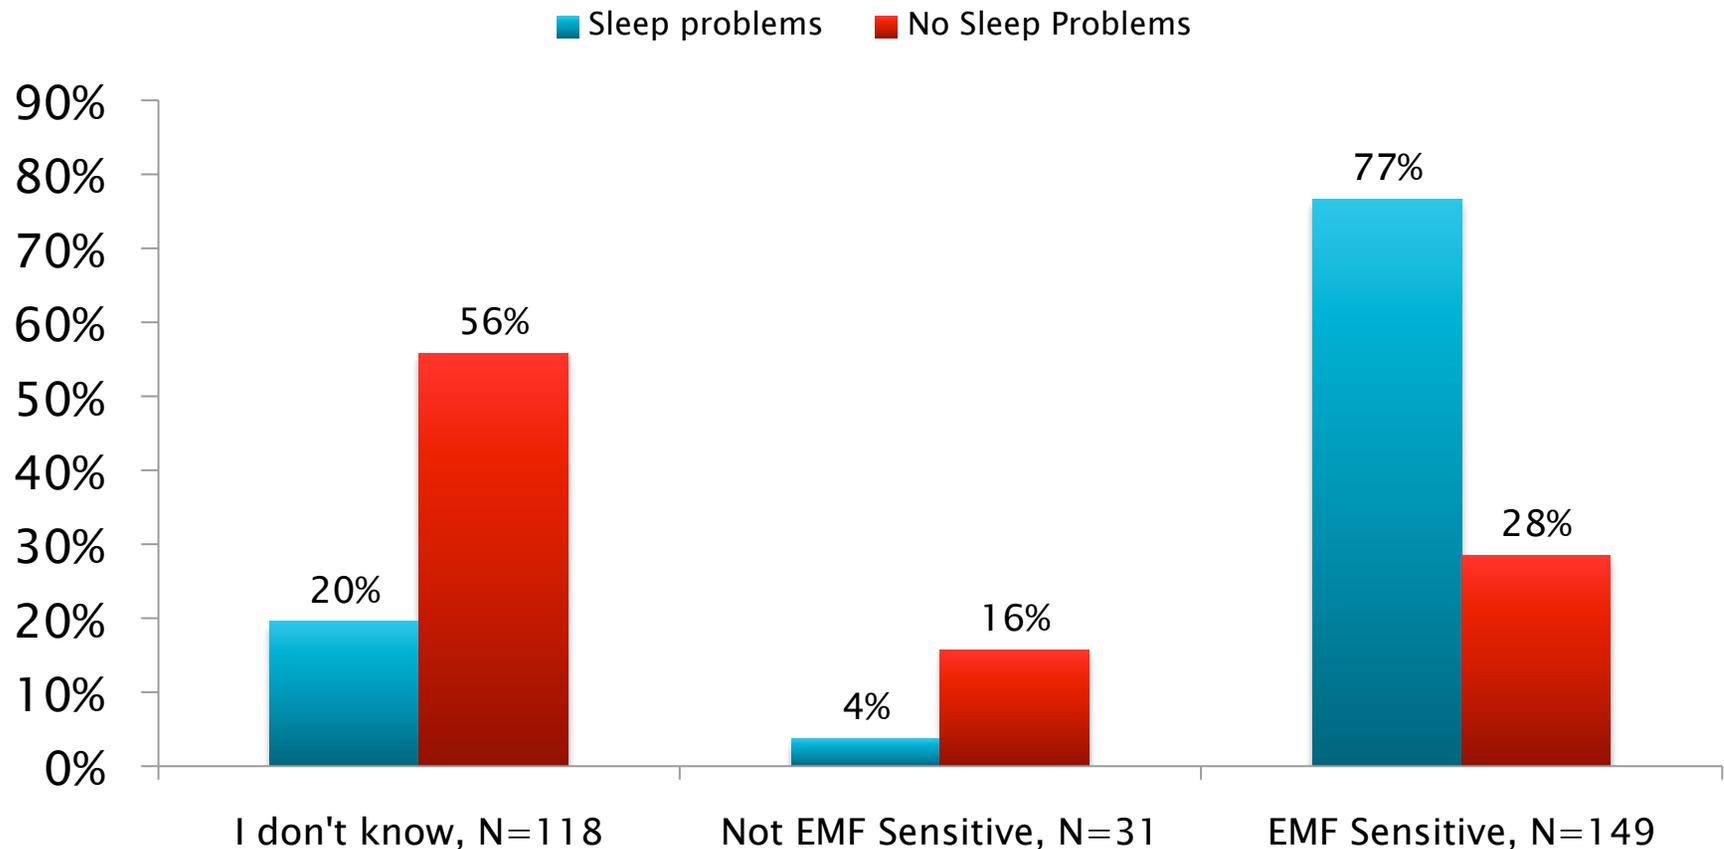

Have you, or anyone in your household, experienced new or worsened health symptoms since the new wireless utility meters have been installed on your home, in your neighborhood, apartment building, area, town or city? (Check all that apply.) N=298

*\* The relationship is the same for the top five Health Symptoms sited.*

# Sleep Problems\* by EMF Sensitivity

Have you, or anyone in your household, experienced new or worsened health symptoms since the new wireless utility meters have been installed on your home, in your neighborhood, apartment building, area, town or city? (Check all that apply.) N=298

# Verbatim Comments I

## Sampled from the 542 Comments Received

- ▶ *“We should not have to pay for NO CHANGE in electric service. We don't pay for not getting cable. We don't pay for not getting satellite. We don't pay for gas if we don't use gas appliances. “*
- ▶ *“I firmly believe that it is ILLEGAL to charge someone for services they are not receiving. I should not have to pay for the "privilege" of retaining my analog utility meter and I should not have my rates increase monthly whether my usage does nor not. That is RIDICULOUS ...”*
- ▶ *“I am almost ready to deny gas and electric service rather than pay for an analog or accept a SmartMeter. Then they would have the freezing death of an old lady on their hands and my kids could sue them.”*
- ▶ *“I am a Doctor of Chiropractic. Several patients have told me they become sick and weak in the presence of wireless devices. They get sicker the closer they are. Some are sensitive even blocks away. These are intelligent, educated, sincere people who ask if I know of anything that can help them mitigate their symptoms, given that such fields are increasingly common.”*
- ▶ *“I see absolutely NO BENEFIT from this expensive, wasteful change-out. I see nothing but trouble ahead, especially once hackers get into the network. I believe that human meter readers are a community benefit and am distressed to see them removed at a time when we need jobs and the extra oversight they provide in our communities.”*
- ▶ *“The electrical companies and investors should be forced to foot the bill on this one and not be allowed to pass the cost on to customers. They deserve to be sued and heavily fined and maybe some people belong in prison over this.”*

# Verbatim Comments II

## Sampled from the 542 Comments Received

- ▶ *“The radio transmissions of the meters could very well be affecting the presence of pollinators in our yards. Bees, hummingbirds and butterflies are small and sensitive creatures that are becoming less prevalent and I am certain it is due to the air wave pollution we are inflicting upon them . . .”*
- ▶ *“We should not have smart meters and their mesh network in our community (in any community) due to non-ionizing wireless RF radiation from these devices being classified by the WHO as a Class 2B carcinogen, on par with DDT. ... Chronic long-term exposure to this type of radiation is stressful on our cells and associated with increased risk of cancer, according to peer-reviewed health studies. ... This should not be mandatory, especially when the Federal government does not mandate these on our homes. This is a gross violation of our civil liberties, and endangers the privacy, security, public safety, health and lives of ourselves and our loved ones, neighbors, friends and family.”*
- ▶ *“I am so worried about these Smartmeters, that I don't want to leave home because the installers will put them on whether you want them or not. ... I do know many people who are suffering terribly from them.”*
- ▶ *“... it effected the equipment in the emergency medical operating unit. The doctor did not know what was causing this, he had the old back up ways before tech in his head, but maybe others do not have this. He almost lost an animal due to this. So I am very frustrated over all this. ... Appliances burned up, blender caught fire, stereo malfunctioned, two shredders burned up, a water fountain no longer works, a popcorn popper caught on fire, ...”*

# Verbatim Comments III

## Responses on utility company complaints

- ▶ *“In the beginning I called all around, talked to many people about my concern. I was told I had no choice – the meters are going in and I have no say. No one addressed my concerns or called me back to address my concerns as I had left messages and asked. Anyone who I spoke with to address my concerns skated right past them and told me the same thing, I have no choice but to have a SmartMeter installed.”*
- ▶ *“My interaction with PG&E has been entirely focused on keeping them from installing meters on my home. Each time I have called, I get only arguments that they are safe, no way to guarantee that we can opt out.*
- ▶ *“I have been thinking of contacting PG&E, but I dread it knowing that it will increase my already elevated stress levels. I'm feeling very frustrated and stuck. I've thought about taking a sledge hammer to the meter at some points.”*
- ▶ *“SCE basically told us that there was nothing they could do to help us. My husband has emailed every executive at SCE and CPUC and nobody will reply back. I even got a letter from my Dr. about my EMF/RF sensitivities and SCE said that they have no contingency plan for people with EMF/RF sensitivities or health problems that are caused by their Smart Meters.”*
- ▶ *“They do not care about the long-term health of their customers. They are a 100% monopoly, and the CPUC is their lapdog. This situation stinks.”*

# Survey Questions

- ▶ How concerned are you about the reported problems with the new wireless Smart Grid utility meters, also known as Smart Meters (AMR, AMI, AED)? Check all that apply.
- ▶ Do you believe wireless devices can cause health problems?
- ▶ Are you, or is a member of your household, EMF sensitive? (EMF sensitivity is also called electrical sensitivity, or electrohypersensitivity)
- ▶ Have you had a new wireless utility meter installed on your home?
- ▶ If yes, how long ago was it installed on your home?
- ▶ If yes, please indicate the type of new meter installed on your home. Check all that apply.
- ▶ If yes, have your bills increased, decreased or stayed about the same ?
- ▶ If yes, have you experienced interference, damaged equipment, or a fire since the new meter(s) has been installed? Check all that apply.
- ▶ Do you have new wireless utility meters deployed in your neighborhood, apartment building, area, town or city?
- ▶ Please describe the placement of the wireless utility meters in relation to where you live. Check all that apply.
- ▶ Have you, or anyone in your household, experienced new or worsened health symptoms since the new wireless utility meters have been installed on your home, in your neighborhood, apartment building, area, town or city? Check all that apply.
- ▶ Do you have one or more of the following? Check all that apply.
- ▶ If you have experienced problems with the new wireless utility meter(s), have you complained to the utility company?
- ▶ If you complained to the utility company about the new wireless utility meter(s), how satisfied are you about how they handled your complaint?
- ▶ If you have experienced problems with the new wireless utility meter(s), have you complained to your Public Utilities Commission or similar utility oversight commission?
- ▶ If yes, how satisfied are you with how they handled your complaint?
- ▶ Would you prefer to retain or restore the analog (also known as electromechanical meter) utility meters and a meter reader?
- ▶ If yes, do you think you should pay more for the analog service?

## **Study of deadly bat disease finds surprising seasonal pattern of infections**

*White-nose syndrome fungus can infect an entire bat colony during hibernation, but surviving bats are able to clear the infection after they become active again*

EMBARGOED: Not for release until 7:01 p.m. U.S. Eastern Time on Tuesday, December 2

SANTA CRUZ, CA--The deadly fungal disease known as white-nose syndrome has spread to bat colonies throughout eastern North America over the past seven years, causing bat populations to crash, with several species now at risk of extinction. The devastating impact of this disease is due in part to the seasonal dynamics of infection and transmission, according to a new study led by scientists at the University of California, Santa Cruz, and published December 3 in the *Proceedings of the Royal Society B*.

The researchers were surprised to discover that during the winter, when the bats are hibernating, the fungus can infect nearly every bat in a colony. Bats that survive the winter are able to clear the infection during summer when their body temperatures are above the growth limit of the fungus. But the remarkably high rate of infection during hibernation leads to high mortality rates at the time of year when bat populations are naturally at their lowest, before the females give birth in the summer.

"It hits when the population is at its smallest, and by the end of winter nearly 100 percent of the bats in a cave can be infected, which helps explain why it has such large impacts," said Kate Langwig, a graduate student at UC Santa Cruz and first author of the paper.

The study provides the first description of the dynamics of fungal infection and transmission in bats, and the findings are in striking contrast to most infectious diseases, said senior author Marm Kilpatrick, associate professor of ecology and evolutionary biology at UC Santa Cruz. "For many diseases, population density and social interactions play a big role in transmission, but these bats are actually very social and live in dense colonies in both summer and winter," he said. "In this case, transmission is tied to

hibernation and body temperature. When the bats start hibernating, it's almost like they become petri dishes for this fungus to grow on."

The fungus (*Pseudogymnoascus destructans*) thrives in cold environments and grows superficially on exposed skin on the bats' noses, ears, and wings. During hibernation, the body temperatures of bats drop to the cold ambient temperatures of their "hibernacula" (the caves and abandoned mines where the bats hibernate). The fungus proliferates at these temperatures, which range from 2 to 12 degrees Celsius (35 to 54 degrees Fahrenheit). Over the course of the winter hibernation period, which can last more than five months, the infection spreads throughout the colony and on individual bats. Most of the mortality is in late winter, when both infection prevalence (the number of infected bats) and infection loads (the amount of fungus on individual bats) are highest.

"The peak load in late winter is probably what's driving mortality," Langwig said. "Bats that survive the winter can clear the fungal infection once they warm up, so that by mid-summer, when the young of the year are born, almost no bats are infected any more."

The researchers studied six species of bats, testing them for infection with the fungus during three key periods of their annual cycle: fall, when the bats mate outside the hibernacula; winter, when they go into hibernation; and summer, when they migrate to maternity sites and the females give birth.

The researchers began to detect low levels of fungal infection in the fall, probably as a result of bats coming in contact with spores of the fungus inside the hibernacula. "The bats are still active then, so the infections are at a very low level and don't appear to be growing. But as soon as they go into hibernation and their body temperature drops, the infections ramp up really quickly," Langwig said.

The fact that bats are not transmitting the infection during the migratory period is important in limiting the rate at which it is spreading geographically, she added, noting that West Nile virus--which, like white-nose syndrome, was first detected in New York state--spread rapidly throughout most of North America because birds are infected during migration.

The study provides valuable information for planning strategies to manage white-nose syndrome. If scientists can develop an effective treatment, for example, this study indicates that the best time to apply it would probably be early winter, Langwig said. Kilpatrick and coauthor Winifred Frick, an adjunct professor of biology at UC Santa Cruz, are leading efforts to develop a "probiotic" treatment using bacteria to suppress the growth of the fungus. The researchers have isolated several bacterial species that occur naturally on bats and are measuring their ability to suppress the fungus in laboratory tests. Then they plan to use the most promising bacteria as a treatment to see if it can help bats survive through the winter.

"The idea would be to apply the bacteria on bats during hibernation and see if it suppresses the growth of the fungus," Kilpatrick said.

In addition to Langwig, Frick, and Kilpatrick, the coauthors of the paper include Joseph Hoyt and Tina Cheng at UC Santa Cruz; Rick Reynolds of the Virginia Department of Game and Inland Fisheries; Katy Parise, Kevin Drees, and Thomas Kunz of Boston University; and Jeffrey Foster of Northern Arizona University and the University of New Hampshire. This research was funded by the National Science Foundation, Bat Conservation International, and the National Geographic Society.

# White-Nose Syndrome

*The devastating disease of hibernating bats in North America*

*August 2014*

## What is white-nose syndrome?

White-nose syndrome (WNS) is a disease affecting hibernating bats. Named for a white fungus that appears on the muzzle and other parts of bats, WNS is associated with extensive mortality of these animals in eastern North America. First documented in New York in the winter of 2006-2007, WNS has spread rapidly across the eastern and midwestern United States and eastern Canada, and evidence of the fungus that causes WNS has been detected as far south as Mississippi.

Bats with WNS act strangely during cold winter months, including flying outside during the day and clustering near the entrances of caves and other hibernation areas. Bats have been found sick and dying in unprecedented numbers in and around caves and

mines. WNS has killed more than 5.5 million bats in the Northeast and Canada. In some areas, 90 to 100 percent of bats have died.

Many non-governmental organizations, universities and state and federal agencies are investigating the cause of the bat deaths. A newly discovered fungus, *Pseudogymnoascus* (formerly *Geomyces*) *destructans*, has been demonstrated to cause WNS. Scientists are investigating the dynamics of fungal infection and transmission and are searching for ways to control it.

## What bats are being affected?

More than half of the 47 bat species living in the United States hibernate to survive the winter. Seven cave-hibernating bats, including two endangered species and one species recently proposed for listing, are confirmed with WNS. The fungus has been detected on additional five species, including one endangered species, with no confirmation of disease.

Bat species confirmed with WNS:

- Big brown bat (*Eptesicus fuscus*)
- Eastern small-footed bat (*Myotis leibii*)
- Gray bat (*Myotis grisescens*) **endangered**
- Indiana bat (*Myotis sodalis*) **endangered**
- Little brown bat (*Myotis lucifugus*)
- Northern long-eared bat (*Myotis septentrionalis*) **proposed for listing**
- Tri-colored bat (*Perimyotis subflavus*)

Bat species on which *Pseudogymnoascus destructans* has been detected with no confirmation of disease:

Ryan von Linder/NYDEC

*Eastern small-footed bat with white fungus on nose, arms and wings*

- Eastern red bat (*Lasiurus borealis*)
- Southeastern bat (*Myotis austroriparius*)
- Silver-haired bat (*Lasionycteris noctivagans*)
- Rafinesque's big-eared bat (*Corynorhinus rafinesquii*)
- Virginia big-eared bat (*Corynorhinus townsendii virginianus*) **endangered**

Federally listed species found in the affected area that have not yet been confirmed with WNS or fungal infection:

- Ozark big-eared bat (*Corynorhinus townsendii ingens*) **endangered**

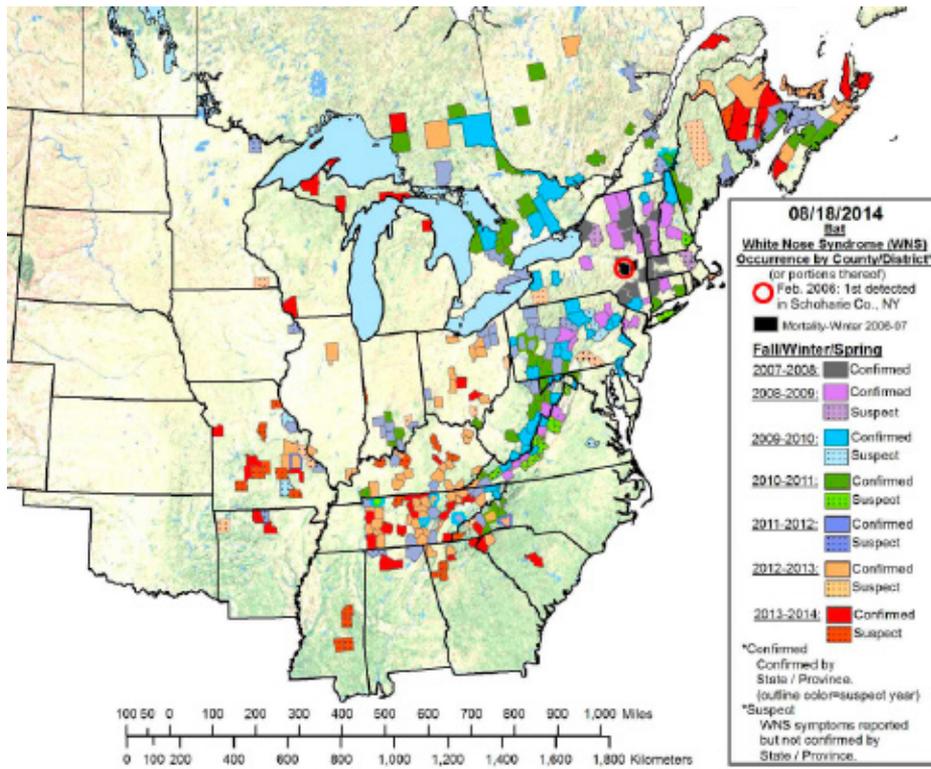

## Where is it now?

White-nose syndrome has continued to spread rapidly. As of August 2014, bats with WNS were confirmed in 25 states and five Canadian provinces:

### WNS National Plan

In 2009 and 2010, the Service led a team of federal and state agencies and tribes in preparing a national white-nose syndrome management plan to address the threat to hibernating bats. The plan is a framework for coordinating and managing the national investigation and response to WNS. *The National Plan for Assisting States, Federal Agencies, and Tribes in Managing White-Nose Syndrome in Bats* outlines the actions necessary for state, federal and tribal coordination, and provides an overall strategy for investigating the cause of WNS and finding ways to manage it.

### What have we learned?

- Biologists in New York and Vermont have found up to 50 percent of marked little brown bats at test sites surviving from one winter to the next in recent years, giving some hope that this species might one day be able to recover. Little brown bat populations at these sites remain at less than 10 percent of their pre-WNS size, however.
- Scientists have developed new ways to detect *Pseudogymnoascus destructans* on bats and in the environment, including using UV light and molecular analyses.
- Because of WNS investigation, researchers have discovered new unrelated bat disease agents.
- Researchers have made significant strides in understanding disease

Evidence of the fungus that causes WNS, *Pseudogymnoascus destructans*, has been detected in three additional states:

- Iowa
- Minnesota
- Mississippi

### What is being done?

#### Partnerships

The U.S. Fish and Wildlife Service leads an extensive network of state and federal agencies, tribes, organizations, institutions and individuals in working cooperatively to investigate the source, spread and cause of bat deaths associated with WNS and develop management strategies to minimize the impacts of WNS.

response of hibernating bats and factors that influence bat vulnerability to WNS.

- Studies of natural bacteria and skin chemistry of bats have led to new lines of research for treatments using biological or non-chemical agents for bats at risk of WNS infection.
- Other treatments under investigation include changing temperature and humidity in hibernation areas to slow fungus growth or improve bat survival, and vaccines to boost resistance to WNS.
- Researchers are looking into molecular and genetic tools to reduce the ability of *P. destructans* to cause disease.

### 2014 Research Funding

In 2014 the Service awarded research and state response grants totaling \$4.5 million.

Projects funded by these grants will improve and expand surveillance of the disease and *Pseudogymnoascus destructans*; help to develop a standardized monitoring program for bat populations in North America; and identify and develop non-chemical control options for treatment and prevention of spread of *P. destructans*.

2014 funding builds on approximately \$14 million that the Service has dedicated to WNS research and state capacity between 2008 and 2013.

For more information on recent research developments see [www.WhiteNoseSyndrome.org](http://www.WhiteNoseSyndrome.org)

August 2014

Welcome. I have a master's degree in engineering and had a successful career in Silicon Valley before I began to experience negative health effects from wireless technology and electrical pollution.

This website will help you quickly reduce the electromagnetic (EMF) pollution in your life. There are also many practical solutions if you are already experiencing the effects of EMF pollution.

[August 18, 2015](#) / [Jeromy](#) / [106 Comments](#)

## Why is Xfinity WiFi Harming People?

- [1529](#)

*Update July 2017: I recently dropped into a Comcast Xfinity store in the San Francisco Bay Area and the company is now offering two different modems with no WiFi capabilities to any customer that asks (possibly because of a [class action lawsuit](#) that has been filed and because many customers want to use their own router). The non-WiFi modem options available are the [Arris model TM722G/NU](#) (which has phone capability) and the [Cisco model DPC3008](#) (which only has internet capability – no phone jack). If your local Comcast provider is giving you a hard time by saying that you must have their Xfinity WiFi Modem/Router, I would simply purchase one of these modems on Amazon (links provided above) and then connect your own router, such as [this Netgear router](#), that has a simple on/off button for WiFi and four Ethernet ports so that you can have a [wired home](#). For a truly low-EMF wired internet set-up that is compatible with Comcast, [this article](#) will show you the steps to take.*

Thus far in 2015, I have been contacted by multiple people who have reported being injured by the new Xfinity WiFi routers. One woman wrote that it felt like she was “being microwaved.” Others have reported headaches, insomnia, brain fog, burning sensations on their skin and heart arrhythmia.

In this article I explain likely reasons why people are experiencing symptoms in response to Xfinity and also provide *some solutions* to this problem.

## First, what exactly is Xfinity WiFi?

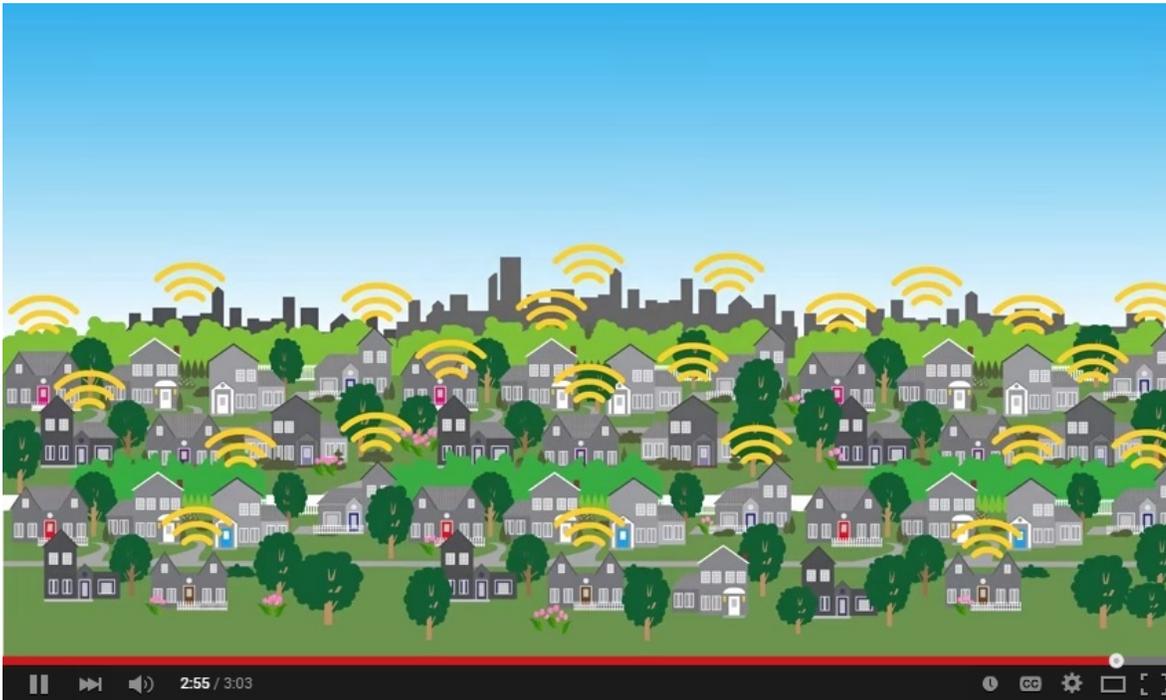

Xfinity is Comcast's new system for delivering content. However, rather than just delivering your internet and cable, Comcast is using your new Xfinity router as a gateway into your "smart home" and to deliver WiFi service to anyone within a few hundred feet of your home. The plan is to turn their customers' homes into public "hot spots" with the result that WiFi is nearly ubiquitous in our communities.

Comcast's stated ambition is to take away some of Verizon's or AT&T's business as people will be able to use Xfinity WiFi rather than the cellular networks for their mobile data. This will also give the company much more personal data on its customers, which has become very profitable for companies.

This is a brilliant business idea – if you believe that microwave radiation is perfectly safe. However, for the rest of us, there is now another layer of microwave radiation in our lives and a "hot spot" right in the center of our homes.

## What does Comcast say about Xfinity?

To be fair, I first want to share Comcast's side of this story. The following [promotional video](#) shows why Comcast believes this system is wonderful because of all the connectivity it will provide to its customers. You can tell how pleased they are with their product when they say "Xfinity will enrich communities – just like trees and flowers." My response to this is: Really? As you will see below, comparing WiFi to flowers and trees is the epitome of corporate greenwashing.

*Promo video via Comcast*

### **Why are people reacting to Xfinity WiFi?**

Every person who has contacted me (independent of one another) states that they were fine with the old Comcast WiFi routers, but they quickly reacted to the new Xfinity WiFi systems. I see three primary reasons for this:

1.) Unlike previous generations of WiFi routers, there are now at least two (possibly four) antennas within the Xfinity routers. One antenna is at the typical WiFi frequency of 2.4 GHz and now a second antenna emits microwave radiation at 5.0 GHz. There are also two channels within in each antenna – a private channel for your home and a public channel for any Comcast customer who is visiting or walking by. Simply put: more antennas and channels mean more microwave radiation exposure for people in the vicinity of the router.

The Business Wireless Gateway produces (4) WiFi networks:  
**1. XFINITY WiFi Hotspot 2.4 GHz and 5 GHz Networks**  
**2. Business Private WiFi 2.4 GHz and 5 GHz Networks**

*Image via Comcast*

2.) There is also evidence that the new Xfinity routers are more powerful than those of previous generations. Multiple EMF consultants have shared with me that when they measure these new routers, the readings are much higher than any consumer router they have ever measured previously. It could be that because Comcast wants to provide public access through your personal router, they have increased the power of the antennas in order to obtain the highest coverage area possible. This may be the only way their business plan of “ubiquitous WiFi” can work.

It is also possible that they have increased the power to the 5.0 GHz antenna because this frequency is more easily blocked by walls (and humans). Perhaps Comcast thinks they can fix the range issue simply by beefing up the power of this second antenna and hoped nobody would notice. I am still collecting information on power output of the Xfinity 5.0 GHz antennas. Please contact me with your router FCC ID# if you have Xfinity service.

3.) The 5.0 GHz transmission from this new antenna is likely particularly harmful to human biology. Basically, a 5.0 GHz frequency has twice as many waves per unit time as the 2.4 GHz channel. Each of these waves (called the “carrier wave”) has pulsed-modulated frequencies within it (this is the “information content” that makes your phone work). The 5.0 GHz channel allows for much faster download speeds because it contains more packets of information content per unit of time (i.e. more pulsed-modulated frequencies).

What is the problem with this configuration? Well, the issue is that [the research points to](#) these pulsed-modulated frequencies as being the dangerous part of wireless technology. These “information content” pulsed-modulated frequencies are likely interfering with fundamental biological processes occurring within the organs of your body – such as your brain. Thus, if the 5.0 GHz channel delivers twice as many pulsed-modulated frequencies as the 2.4 GHz channel, then it may be more harmful to our bodies.

*(Editor’s Note: It’s ultimately the nature of the pulses that is most important – do they penetrate the skin and eyes and do they contain frequencies that are resonant with living tissues? The primary factors that make a microwave radiation source biologically dangerous include: modulation, pulse frequency, resonance condition, duration and the state of the body receiving the dose (hydration, conductivity, permittivity, and the*

like). The sheer complexity of these new WiFi systems and their unknown interplay with our bodies is reason enough for us to shift to wired technology.)

### **If this all sounds complex, can we make a real world analogy?**

In nature, waves (or frequencies) are typically smooth, rhythmic sine waves. This is true for light and energy waves coming from the sun or ocean waves hitting the beach.

However, by analogy, let's substitute the natural waves from the ocean for the new 5.0 GHz Xfinity WiFi.

In this case, the waves would be coming ashore twice as fast as normal. Now imagine some people (or corporations) intentionally filling the water with oil and garbage that washes ashore with each and every wave. This oil and garbage represent the “information content” riding on the carrier wave and it would quickly pollute the beach, making it a stinking, unlivable mess.

It is quite possible that the pulsed-modulated 2.4 and 5.0 GHz WiFi frequency cocktail that Comcast is now exposing its customers to is causing similar damage to our bodies.

Not everyone will feel it right away (in fact, most do not). However, this does not mean that in 5-10 years' time a significant portion of exposed populations will not experience the exact same effects (or worse) as those who are currently affected. [Scientists increasingly say this will happen](#), so it's wise to start taking some basic precautions today.

### **So, what can you do? Here are some solutions when it comes to Xfinity WiFi:**

1.) For your own home, if Comcast is your only choice for internet service, you should be able to program your Xfinity router so that the WiFi component is off. Here are the basic directions which another EMF consultant,

[Oram Miller](#), was able to obtain directly from Comcast. You want to disable the NAT and set it to Bridge Mode by doing the following:

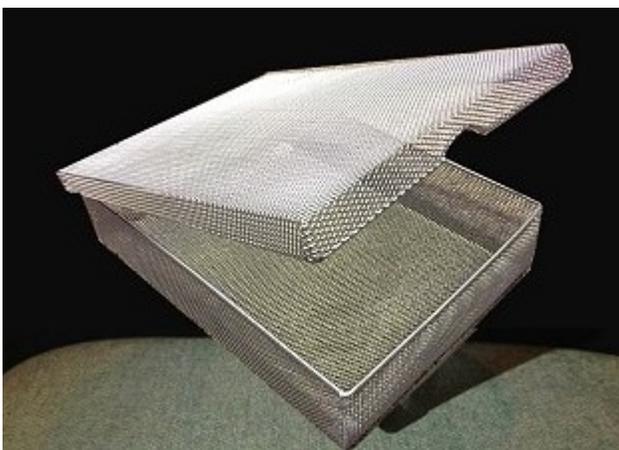

- Go to LAN settings — NAT
- Select Bridge, not “Router with NAT”
- This disables all WiFi.
- The router will then only recognize a hardwired LAN.
- To only disable the public “hot spot” option, here are Comcast’s [instructions](#).

However, please note there are some reports that when Comcast does a system wide reset (approximately once per month), the WiFi component is turned back on for all Xfinity routers. It would be prudent to own a [basic RF meter](#) to check this yourself every month or so. You will have to go through this process each time.

[*Editor’s Note:* The above directions are actually for a Time Warner modem (similar service to Comcast). In dealing with clients that have Xfinity modems, the Comcast tech support was called to disable the private and public WiFi antennas. However, there are still conflicting reports on whether the public hotspot stays off. The only way to know is to have a [basic RF meter](#) to double check. Comcast tech support emailed this link to disable the WiFi in the “My Account” page: <http://customer.xfinity.com/help-and-support/internet/disable-xfinity-wifi-home-hotspot/>]

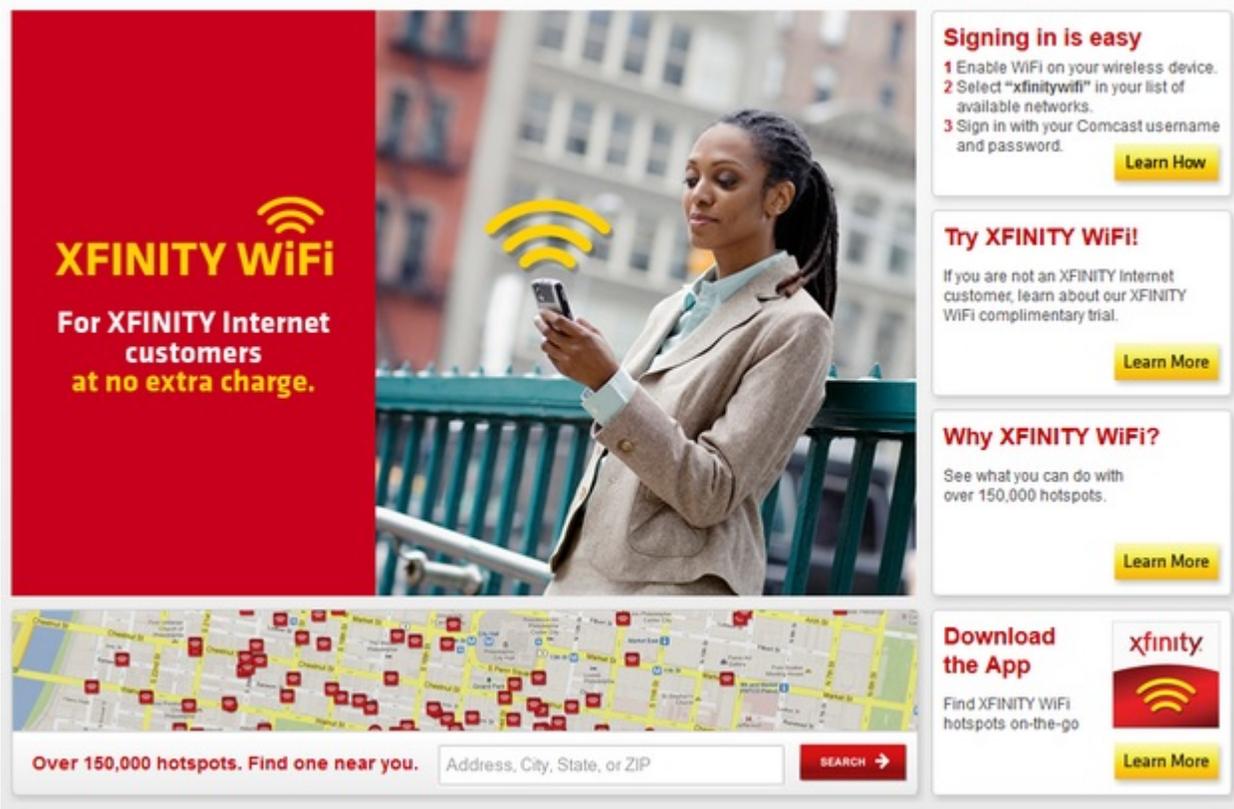

2.) If that sounds like a hassle, an easier route may be to purchase your own modem/router that integrates with Comcast. This will save you the \$10/month rental fee for the Xfinity router. This [article](#) from the San Francisco Chronicle summarizes how to find the right equipment. From my research, I would purchase this [Netgear modem/router combo](#) because it allows for fast internet speeds and has a simple WiFi On/Off button that easily allows you to disable all wireless functions. To add free home phone service, I would use [Ooma](#).

3.) You can also request an older model Arris modem from Comcast. Comcast is aware of this problem (they are even [being sued because of the public WiFi option](#)) and another EMF consultant, Liz Menkes, told me that Comcast has the older Arris modems available at the local offices for people who request it. You should be able to easily un-program any WiFi component in these older models and run safe, secure Ethernet cables.

4.) If you live in an apartment building or dense city, this issue is much more complex. You could have 4 to 8 of these powerful Xfinity routers within 50 feet of where you sleep (hence the insomnia complaints). Some people who have contacted me have had to move from their homes because of this. If moving isn’t an option, you could share this information with your neighbors and, considering the evidence, they may decide to turn off their Xfinity routers and use Ethernet cables. For other neighbors who want to keep their WiFi, you could purchase them a [Router Guard](#), which is a partial Faraday Cage for the router. It will reduce the microwave radiation output by 90% and the distance of the field by approximately 50%. For a typical apartment, this is still much more than is needed for an excellent signal, yet

the [Router Guard](#) will dramatically reduce the exposure within your living space. Having conversations with your neighbors and buying 5 or 6 router guards will likely be much less expensive than moving.

The image is a promotional banner for Xfinity WiFi. On the left, a red vertical bar contains the text "XFINITY WiFi" in yellow, with a yellow Wi-Fi symbol above it. Below this, it says "For XFINITY Internet customers at no extra charge." To the right of this bar is a photograph of a woman in a light-colored blazer looking at her smartphone. A yellow Wi-Fi symbol is overlaid on the phone. Below the photo is a map showing numerous red location pins representing hotspots. At the bottom left of the map area, it says "Over 150,000 hotspots. Find one near you." followed by a search input field with the placeholder text "Address, City, State, or ZIP" and a red "SEARCH" button with a right-pointing arrow. On the right side of the banner, there are four white boxes with rounded corners. The first box is titled "Signing in is easy" and lists three steps: 1. Enable WiFi on your wireless device. 2. Select "xfinitywifi" in your list of available networks. 3. Sign in with your Comcast username and password. A yellow "Learn How" button is at the bottom right. The second box is titled "Try XFINITY WiFi!" and says "If you are not an XFINITY Internet customer, learn about our XFINITY WiFi complimentary trial." with a yellow "Learn More" button. The third box is titled "Why XFINITY WiFi?" and says "See what you can do with over 150,000 hotspots." with a yellow "Learn More" button. The fourth box is titled "Download the App" and says "Find XFINITY WiFi hotspots on-the-go" next to the Xfinity logo and a yellow Wi-Fi symbol. A yellow "Learn More" button is at the bottom right.

*“Xfinity – The Future of Awesome”?*

Comcast’s tagline for this new system is “Xfinity – the future of awesome.” This may sound like a great marketing pitch, but [everything is not awesome](#). In reality, this is another huge corporation taking advantage of virtually [no safety regulations](#) in order to maximize profits at the expense of human health and the environment. Over one million Xfinity systems have already been installed, with a total of eight million planned. This will add yet another layer of dangerous EMF pollution to our lives.

There is a silver lining in all of this: with each new technology – including cell towers, wireless “smart” meters and the coming “Internet of Things” – more and more people are waking up to this issue. I see this every day as people contact me, unfortunately, with their stories of being injured by EMF pollution.

Another silver lining is that other internet providers, at least for now, do not appear to be emulating Comcast’s business plan. AT&T’s Uverse does not have the “public hot spot” option or the additional antennas that Xfinity uses (perhaps because AT&T is busy expanding its network of cell towers).

Until the tide of public opinion shifts in the coming years and the world wakes up to the danger of pulsed-modulated wireless technologies, the best thing you can do is to protect your family and friends by limiting what you are exposed to. Hopefully this article will give you more insight into how to do this, especially when it comes to Xfinity WiFi.
